  - **Adult:** Apply once weekly for 2 doses, apply preparation over whole body, allow to dry naturally, wash off after 12 hours or overnight.

- **Scabies**
  - **Child:** Apply once weekly for 2 doses, apply preparation over whole body, wash off after 24 hours, if hands are washed with soap within 24 hours, they should be retreated.
  - **Adult:** Apply once weekly for 2 doses, apply preparation over whole body, wash off after 24 hours, if hands are washed with soap within 24 hours, they should be retreated.

- **SIDE-EFFECTS**
  - Chemical burns - hypersensitivity reactions - skin irritation

- **PRESCRIBING AND DISPENSING INFORMATION**
  - For scabies, manufacturer recommends application to the body but to exclude head and neck. However, application should be extended to the scalp, neck, face, and ears.
  - Larger patients may require up to two 30-g packs for adequate treatment.

- **LESS SUITABLE FOR PRESCRIBING**
  - Lyclear® Creme Rinse is less suitable for prescribing.

### UNLICENSED USE

- **Not licensed for use in children under 6 months except under medical supervision.**

### CAUTIONS

- **Alcoholic lotions not recommended for head lice in children with severe eczema or asthma, or for scabies or crab lice - avoid contact with eyes - children under 6 months, medical supervision required - do not use lotion more than once a week for 3 consecutive weeks - do not use on broken or secondarily infected skin.**

### EXCIPIENTS:

- **May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), fragrances, hydroxybenzoates (parabens)**

**Permethrin**

### INDICATIONS AND DOSE

**Scabies**

- **Child:** Apply once weekly for 2 doses, apply preparation over whole body including face, neck, scalp and ears then wash off after 8–12 hours. If hands are washed with soap within 8 hours of application, they should be treated again with cream.

**Crab lice**

- **Child:** Apply once weekly for 2 doses, apply 5% preparation over whole body including face, neck, scalp and ears then wash off after 8–12 hours. If hands are washed with soap within 8 hours of application, they should be treated again with cream.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

- **Permethrin (Non-proprietary)**
  - Permethrin 50 mg per 1 gram
  - £7.46 DT price = £7.46

- **Lyclear (Omega Pharma Ltd)**
  - Lyclear 5% cream
  - 30 gram £5.71 DT price = £5.71

**Liquid**

- **Lyclear (Omega Pharma Ltd)**
  - Lyclear 1% creme rinse
  - 59 ml £3.55 DT price = £3.55
  - 118 ml £6.46 DT price = £6.46

### Antivirals > Nucleoside Analogues

**Aciclovir** *(Acyclovir)*

### INDICATIONS AND DOSE

**Herpes simplex infection (local treatment)**

- **Child:** Apply 5 times a day for 5–10 days, to be applied to lesions approximately every 4 hours, starting at first sign of attack.

3.1 Eczema and psoriasis

Eczema

Types and management

Eczema (dermatitis) has several causes, which may influence treatment. The main types of eczema are irritant, allergic contact, atopic, venous and discoid; different types may coexist. Lichenification, due to scratching and rubbing, may complicate any chronic eczema. Atopic eczema is the most common type and it usually involves dry skin as well as infection and lichenification.

Management of eczema involves the removal or treatment of contributory factors including occupational and domestic irritants. Known or suspected contact allergens should be avoided. Rarely, ingredients in topical medicinal products may sensitise the skin; the BNF lists active ingredients together with excipients that have been associated with skin sensitisation.

Skin dryness and the consequent irritant eczema requires emollients applied regularly (at least twice daily) and liberally to the affected area; this can be supplemented with bath or shower emollients. The use of emollients should continue even if the eczema improves or if other treatment is being used.

Topical corticosteroids are also required in the management of eczema; the potency of the corticosteroid should be appropriate to the severity and site of the condition. Mild corticosteroids are generally used on the face and on flexures; potent corticosteroids are generally required for use on adults with discoid or lichenified eczema or with eczema on the scalp, limbs, and trunk. Treatment should be reviewed regularly, especially if a potent corticosteroid is required. In patients with frequent flares (2–3 per month), a topical corticosteroid can be applied on 2 consecutive days each week to prevent further flares.

Bandages (including those containing ichthammol with zinc oxide p. 1151) are sometimes applied over topical corticosteroids or emollients to treat eczema of the limbs. Dry-wrap dressings can be used to provide a physical barrier to help prevent scratching and improve retention of emollients. See Wound management products and elasticated garments for details of elasticated viscose stockinette tubular bandages and garments, and silk clothing.

Infection

Bacterial infection (commonly with Staphylococcus aureus and occasionally with Streptococcus pyogenes) can exacerbate eczema and requires treatment with topical or systemic antibacterial drugs. Antibacterial drugs should be used in short courses (typically 1 week) to reduce the risk of drug resistance or skin sensitisation. Associated eczema is treated simultaneously with a topical corticosteroid which can be combined with a topical antimicrobial.

Eczema involving widespread or recurrent infection requires the use of a systemic antimicrobial that is active against the infecting organism. Products that combine an antiseptic with an emollient application and with a bath emollient can also be used; antiseptic shampoos can be used on the scalp.

Intertriginous eczema commonly involves candida and bacteria; it is best treated with a mild or moderately potent topical corticosteroid and a suitable antimicrobial drug.

Widespread herpes simplex infection may complicate atopic eczema and treatment with a systemic antiviral drug is indicated.

Management of other features of eczema

Lichenification, which results from repeated scratching is treated initially with a potent corticosteroid. Bandages containing ichthammol paste p. 1151 (to reduce pruritus) and other substances such as zinc oxide can be applied over the corticosteroid or emollient. Coal tar and ichthammol can be useful in some cases of chronic eczema. A non-sedating antihistamine may be of some value in relieving severe itching or urticaria associated with eczema. A sedating antihistamine can be used if itching causes sleep disturbance.

Exudative (‘weeping’) eczema requires a potent corticosteroid initially; infection may also be present and require specific treatment. Potassium permanganate solution (1 in 10,000) p. 1172 can be used in exudating eczema for its antiseptic and astringent effects; treatment should be stopped when exudation stops.

Severe refractory eczema

Severe refractory eczema is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system; Alitretinoin p. 1157 is licensed for the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to altretinoin than those with pompholyx.

Seborrhoeic dermatitis

Seborrhoeic dermatitis (seborrhoeic eczema) is associated with species of the yeast Malassezia and affects the scalp, paranasal areas, and eyebrows. Shampoos active against the yeast (including those containing ketoconazole p. 1130 and
Eczema and psoriasis, drugs affecting the immune response

Overview

Drugs affecting the immune response are used for eczema or psoriasis. Systemic drugs acting on the immune system are used under specialist supervision.

Pimecrolimus p. 1154 by topical application is licensed for mild to moderate atopic eczema. Tacrolimus p. 1155 is licensed for topical use in moderate to severe atopic eczema. Both are drugs whose long-term safety is still being evaluated and they should not usually be considered first-line treatments unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment of atopic eczema with topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in managing the condition. Topical tacrolimus and pimecrolimus have a role in the treatment of psoriasis.

A short course of a systemic corticosteroid can be given for eczema flares that have not improved despite appropriate topical treatment.

Ciclosporin p. 788 by mouth can be used for severe psoriasis and for severe eczema. Azathioprine p. 787 or mycophenolate mofetil p. 796 are used for severe refractory eczema [unlicensed indication].

Methotrexate p. 844 can be used for severe psoriasis, the dose being adjusted according to severity of the condition and haematological and biochemical measurements. Folic acid p. 937 should be given to reduce the possibility of side-effects associated with methotrexate. Folic acid can be given once weekly [unlicensed indication], on a different day from the methotrexate; alternative regimens of folic acid may be used in some settings.

Etanercept p. 1012, adalimumab p. 1008, and infliximab p. 1016 inhibit the activity of tumour necrosis factor (TNFs).

They are used for severe plaque psoriasis either refractory to at least 2 standard systemic treatments and phototherapy, or when standard treatments cannot be used because of intolerance or contra-indications; while either etanercept or adalimumab is considered to be the first choice in stable disease, infliximab or adalimumab may be useful when rapid disease control is required. Secukinumab p. 1004 and ixekizumab p. 1155 inhibit the activity of interleukin-17A. They are used for moderate to severe plaque psoriasis in patients who are candidates for systemic therapy.

Secukinumab is also licensed for psoriatic arthritis and ankylosing spondylitis. Ustekinumab p. 1006 (a monoclonal antibody that inhibits interleukins 12 and 23) can be used for severe plaque psoriasis that has not responded to at least 2 standard systemic treatments and phototherapy, or when these treatments cannot be used because of intolerance or contra-indications. Adalimumab is also licensed for the treatment of active moderate to severe hidradenitis suppurativa (acne inversa) in patients who have had inadequate response to conventional systemic therapy. Adalimumab, etanercept, infliximab and ustekinumab are also licensed for psoriatic arthritis.

Psoriasis

Management

Psoriasis is characterised by epidermal thickening and scaling. It commonly affects extensor surfaces and the scalp.

Occasionally, psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and ACE inhibitors. Psoriasis may not be seen until the drug has been taken for weeks or months.

Emollients, in addition to their effects on dryness, scaling and cracking, may have an anti-proliferative effect in psoriasis, and may be the only treatment necessary for mild psoriasis. They are particularly useful in inflammatory psoriasis and in plaque psoriasis of palms and soles, in which irritant factors can perpetuate the condition. Emollients are useful adjuncts to other more specific treatment.

More specific topical treatment for chronic stable plaque psoriasis on extensor surfaces of trunk and limbs involves the use of vitamin D analogues, coal tar p. 1152, dithranol p. 1151, and the retinoid tazarotene p. 1158. However, they can irritate the skin and they are not suitable for the more inflammatory forms of psoriasis; their use should be suspended during an inflammatory phase of psoriasis. The efficacy and the irritancy of each substance varies between patients. If a substance irritates significantly, it should be stopped or the concentration reduced; if it is tolerated, its effects should be assessed after 4 to 6 weeks and treatment continued if it is effective.

Scalp psoriasis is usually scaly, and the scale may be thick and adherent; this will require softening with an emollient cream, ointment, or oil. A tar-based shampoo is first-line treatment for scalp psoriasis; a keratolytic, such as salicylic acid, should also be used if there is significant scaling, to allow other treatments to work.

Some preparations prescribed for psoriasis affecting the scalp, combine salicylic acid with coal tar or sulfur. The product should be applied generously, and an adequate quantity should be prescribed. It should be left on for at least an hour, often more conveniently overnight, before washing off. The use of scalp preparations containing a potent corticosteroid or a vitamin D analogue, either alone or in combination, can also be helpful.

Facial, flexural and genital psoriasis can be managed with short-term use of a mild or moderate potency topical corticosteroid (a mild potency topical corticosteroid is preferred for the initial treatment of facial psoriasis). Calcipotriol p. 1159 or tacalcitol p. 1159 can be used for longer-term treatment, or if the response to mild or moderate potency topical corticosteroids is inadequate; calcipotriol p. 1158 may be more likely to cause irritation. Low strength tar preparations can also be used. Pimecrolimus p. 1154 or tacrolimus p. 1155 by topical application [unlicensed indication] can be used short-term, under specialist supervision, in patients whose condition has not responded adequately to other treatments, or who are intolerant of them.

Widespread unstable psoriasis of erythrodernia or generalised pustular type requires urgent specialist assessment. Initial topical treatment should be limited to using emollients frequently and generously; emollients should be prescribed in quantities of 1 kg or more. More localised acute or subacute inflammatory psoriasis with hot, spreading or itchy lesions, should be treated topically with emollients or with a corticosteroid of moderate potency.

Calcipotriol and tacalcitol are analogues of vitamin D that affect cell division and differentiation. Calcipotriol is an active form of vitamin D. Vitamin D and its analogues are used first-line for the long-term treatment of plaque psoriasis; they do not smell or stain and they may be more acceptable than tar or dithranol products. Of the vitamin D analogues, tacalcitol and calcipotriol are less likely to irritate.

Coal tar has anti-inflammatory properties that are useful in chronic plaque psoriasis; it also has antiscaling properties. Crude coal tar (coal tar, BP) is the most effective form, typically in a concentration of 1 to 10% in a soft paraffin base, but few outpatients tolerate the smell and mess. Cleaner extracts of coal tar included in proprietary preparations, are more practicable for home use but they are
less effective and improvement takes longer. Contact of coal tar products with normal skin is not normally harmful and they can be used for widespread small lesions; however, irritation, contact allergy, and sterile folliculitis can occur. The milder tar extracts can be used on the face and flexures. Tar baths and tar shampoos are also helpful.

Dithranol is effective for chronic plaque psoriasis. Its major disadvantages are irritation (for which individual susceptibility varies) and staining of skin and of clothing. Dithranol is not generally suitable for widespread small lesions nor should it be used in the flexures or on the face. Proprietary preparations are more suitable for home use; they are usually washed off after 5 to 60 minutes (‘short contact’). Specialist nurses may apply intensive treatment with dithranol paste which is covered by stockinette dressings and usually retained overnight. Dithranol should be discontinued if even a low concentration causes acute inflammation; continued use can result in the psoriasis becoming unstable.

Tazarotene, a retinoid, has a similar efficacy to vitamin D and its analogues, but is associated with a greater incidence of irritation. Although irritation is common, it is minimised by applying sparingly to the plaques and avoiding normal skin; application to the face and in flexures should also be avoided. Tazarotene does not stain and is odourless.

A topical corticosteroid is not generally suitable for long-term use or as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis (e.g. erythrodermic psoriasis or generalised pustular psoriasis) on withdrawal. Topical use of potent corticosteroids on widespread psoriasis can also lead to systemic as well as local side-effects. However, topical corticosteroids used short-term may be appropriate to treat psoriasis in specific sites such as the face or flexures (with a mild or moderate corticosteroid), and psoriasis of the scalp, palms, and soles (with a potent corticosteroid). Very potent corticosteroids should only be used under specialist supervision.

Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. Eczema co-existing with psoriasis may be treated with a corticosteroid, or coal tar, or both.

**Phototherapy**

Phototherapy is available in specialist centres under the supervision of a dermatologist. Ultraviolet B (UVB) radiation is usually effective for chronic stable psoriasis and for guttate psoriasis. It may be considered for patients with moderately severe psoriasis in whom topical treatment has failed, but it may irritate inflammatory psoriasis.

Photochemotherapy combining long-wave ultraviolet A radiation with a psoralen (PUVA) is available in specialist centres under the supervision of a dermatologist. The psoralen, which enhances the effect of irradiation, is administered either by mouth or topically. PUVA is effective in most forms of psoriasis, including localised palmar plantar pustular psoriasis. Early adverse effects include phototoxicity and pruritus. Higher cumulative doses exaggerate skin ageing, increase the risk of dysplastic and neoplastic skin lesions, especially squamous cancer, and pose a theoretical risk of cataracts.

Phototherapy combined with coal tar, dithranol, tazarotene, topical vitamin D or vitamin D analogues, or oral acitretin, allows reduction of the cumulative dose of phototherapy required to treat psoriasis.

**Systemic treatment**

Systemic treatment is required for severe, resistant, unstable or complicated forms of psoriasis, and it should be initiated only under specialist supervision. Systemic drugs for psoriasis include acitretin and drugs that affect the immune response (such as ciclosporin p. 788 and methotrexate p. 844).

Systemic corticosteroids should be used only rarely in psoriasis because rebound deterioration may occur on reducing the dose.

Acitretin p. 1156, a metabolite of etretinate, is a retinoid (vitamin A derivative); it is prescribed by specialists. The main indication for acitretin is psoriasis, but it is also used in disorders of keratinisation such as severe Darier’s disease (keratosis follicularis), and some forms of ichthyosis.

Although a minority of cases of psoriasis respond well to acitretin alone, it is only moderately effective in many cases and it is combined with other treatments. A therapeutic effect occurs after 2 to 4 weeks and the maximum benefit after 4 months. Consideration should be given to stopping acitretin if the response is inadequate after 4 months at the optimum dose. The manufacturers of acitretin do not recommend continuous treatment for longer than 6 months. However, some patients may benefit from longer treatment, provided that the lowest effective dose is used, patients are monitored carefully for adverse effects, and the need for treatment is reviewed regularly.

Apart from teratogenicity, which remains a risk for 3 years after stopping, acitretin is the least toxic systemic treatment for psoriasis; in women with a potential for child-bearing, the possibility of pregnancy must be excluded before treatment and effective contraception must be used during treatment and for at least 3 years afterwards (oral progestogen-only contraceptives not considered effective).

**Topical treatment**

The vitamin D and analogues, calcipotriol p. 1158, calcitriol p. 1159, and tacalcitol p. 1159 are used for the management of plaque psoriasis. They should be avoided by those with calcium metabolism disorders, and used with caution in generalised pustular or erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia).
Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use on these areas in certain circumstances. When topical treatment has failed, intralvesional corticosteroid injections may be used. These are more effective than the very potent topical corticosteroid preparations and should be reserved for severe cases where there are localised lesions such as keloid scars, hypertrophic lichen planus, or localised alopecia areata.

Perioral lesions
Hydrocortisone cream 1% p. 1145 can be used for up to 7 days to treat uninfected inflammatory lesions on the lips. Hydrocortisone with miconazole cream or ointment p. 1150 is useful where infection by susceptible organisms and inflammation co-exist, particularly for initial treatment (up to 7 days) e.g. in angular cheilitis. Organisms susceptible to miconazole include Candida spp. and many Gram-positive bacteria including streptococci and staphylococci.

Choice of formulation
Water-miscible corticosteroid creams are suitable for moist or weeping lesions whereas ointments are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is required. Lotions may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. Occlusive polythene or hydrocolloid dressings increase absorption, but also increase the risk of side effects; they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). The inclusion of urea or salicylic acid also increases the penetration of the corticosteroid.

In the BNF publications topical corticosteroids for the skin are categorised as ‘mild’, ‘moderately potent’, ‘potent’ or ‘very potent’; the least potent preparation which is effective should be chosen but dilution should be avoided whenever possible.

Absorption through the skin
Mild and moderately potent topical corticosteroids are associated with few side-effects but care is required in the use of potent and very potent corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushting’s syndrome, depending on the area of the body being treated and the duration of treatment. Absorption is greatest where the skin is thin or raw, and from intertriginous areas; it is increased by occlusion.

### Suitable quantities of corticosteroid preparations to be prescribed for specific areas of the body

<table>
<thead>
<tr>
<th>Area of body</th>
<th>Creams and Ointments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Face and neck</td>
<td>15 to 30 g</td>
</tr>
<tr>
<td>Both hands</td>
<td>15 to 30 g</td>
</tr>
<tr>
<td>Scalp</td>
<td>15 to 30 g</td>
</tr>
<tr>
<td>Both arms</td>
<td>30 to 60 g</td>
</tr>
<tr>
<td>Both legs</td>
<td>100 g</td>
</tr>
<tr>
<td>Trunk</td>
<td>100 g</td>
</tr>
<tr>
<td>Groins and genitalia</td>
<td>15 to 30 g</td>
</tr>
</tbody>
</table>

These amounts are usually suitable for an adult for a single daily application for 2 weeks

### Compound preparations
The advantages of including other substances (such as antibacterials or antifungals) with corticosteroids in topical preparations are uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for 1 week). Longer use increases the likelihood of resistance and of sensitisation.

The keratolytic effect of salicylic acid p. 1182 facilitates the absorption of topical corticosteroids; however, excessive and prolonged use of topical preparations containing salicylic acid may cause salicylism.

**Topical corticosteroid preparation potencies**

Potency of a topical corticosteroid preparation is a result of the formulation as well as the corticosteroid. Therefore, proprietary names are shown.

**Mild**
- Hydrocortisone 0.1–2.5%
- Dioderm
- Mildison
- Synalar 1 in 10 dilution

**Mild with antimicrobials**
- Canesten HC
- Daktapect

- Lotriderm
- Synalar C
- Synalar N

**Potent with salicylic acid**
- Diprosalic

**Very potent**
- Clarelux
- Dermovate
- Etrivex
- Nerisone Forte
Skin Clobetasol with neomycin. CAUTION S A potent corticosteroid may be appropriate for severe atopic dermatitis. Frequency not known as possible; inadequate treatment will perpetuate the condition. The aim is to control the condition as well as possible; the worst areas should be treated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. A mild corticosteroid such as hydrocortisone 0.5% or 1% is useful for treating nappy rash and hydrocortisone 1% for atopic eczema in childhood. A moderately potent or potent corticosteroid may be appropriate for severe atopic eczema on the limbs, for 1–2 weeks only, switching to a less potent preparation as the condition improves. In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition. A very potent corticosteroid should be initiated under the supervision of a specialist. Carers of young children should be advised that treatment should not necessarily be reserved to ‘treat only the worst areas’ and they may need to be advised that patient information leaflets may contain inappropriate advice for the patient’s condition.

Corticosteroids (topical)

INTERNATIONAL nonproprietary names (INNs) Beclometasone dipropionate cream and ointment. INN Beclometasone dipropionate is used as a cream or ointment. If a patient is using topical corticosteroids containing the INN beclometasone dipropionate cream. Use of topical corticosteroids should be initiated under the supervision of a specialist. Treatment should be limited to the affected areas. Once a day, to be applied thinly on the skin should be avoided where possible; several minutes should elapse between application of different preparations.

In children ‘Wet-wrap bandaging’ increases absorption into the skin, but should be initiated only by a dermatologist and application supervised by a healthcare professional trained in the technique.

PRESCRIBING AND DISPENSING INFORMATION The potency of each topical corticosteroid should be included on the label with the directions for use. The label should be attached to the container (for example, the tube) rather than the outer packaging.

PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer corticosteroid creams and ointments. If a patient is using topical corticosteroids of different potencies, the patient should be told when to use each corticosteroid. Patients and their carers should be reassured that side effects such as skin thinning and systemic effects rarely occur when topical corticosteroids are used appropriately.

Alclometasone dipropionate

INDICATIONS AND DOSE Inflammatory skin disorders such as eczemas TO THE SKIN Child: Apply 1–2 times a day, to be applied thinly Adult: Apply 1–2 times a day, to be applied thinly POTENCY Alclometasone dipropionate cream 0.05%: moderate UNLICENSED USE Licensed for use in children (age range not specified by manufacturer).

PATIENT AND CARER ADVICE Patients or carers should be counselled on the application of alclometasone dipropionate cream.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Cream CAUTIONARY AND ADVISORY LABELS 28 EXCIPIENTS: May contain Cetostearyl alcohol (including cetaryl alcohol), cholesterol, propylene glycol Alclometasone dipropionate (Non-proprietary) Alclometasone dipropionate 500 microgram per 1 gram Boots Dermar Care Eczema & Dermatitis Flare-Up 0.05% cream 15 gram p no price available

Beclometasone dipropionate (Beclohexasone dipropionate)

INDICATIONS AND DOSE Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis TO THE SKIN Child: Apply 1–2 times a day, thin layer to be applied Adult: Apply 1–2 times a day, thin layer to be applied POTENCY Beclometasone dipropionate cream and ointment 0.025%: potent.

UNLICENSED USE Not licensed for use in children under 1 year.

INTERACTIONS Appendix 1: corticosteroids

Very potent with antimicrobials
- Clobetasol with neomycin and nystatin

Use in children
Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. A mild corticosteroid such as hydrocortisone 0.5% or 1% is useful for treating nappy rash and hydrocortisone 1% for atopic eczema in childhood. A moderately potent or potent corticosteroid may be appropriate for severe atopic eczema on the limbs, for 1–2 weeks only, switching to a less potent preparation as the condition improves. In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition. A very potent corticosteroid should be initiated under the supervision of a specialist. Carers of young children should be advised that treatment should not necessarily be reserved to ‘treat only the worst areas’ and they may need to be advised that patient information leaflets may contain inappropriate advice for the patient’s condition.
Betamethasone is not licensed for use in children under 6 years.

**CAUTIONS** Use of more than 10 g per week of 0.1% preparation likely to cause adrenal suppression

**INTERACTIONS** → Appendix 1: corticosteroids

**PATIENT AND CARER ADVICE** Patient counselling is advised for betamethasone cream, ointment, scalp application and foam (application).

Stable plaque psoriasis
▶ TO THE SKIN
▶ Adult: Apply once daily for 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist, apply to a maximum 30% of body surface, when different preparations containing calcipotriol used together, maximum 10% calcipotriol 5 mg in any one week; maximum 15 g per day

ENSTILAR®

Psoriasis
▶ TO THE SKIN
▶ Adult: Apply once daily to be applied to the affected area for up to 4 weeks—consult product literature for further information; maximum 15 g per day

CONTRA-INDICATIONS

ENSTILAR® Erythrodermic psoriasis - pustular psoriasis

NATIONAL FUNDING/ACCESS DECISIONS

ENSTILAR®

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium (SMC) has advised (September 2016) that calcipotriol with betamethasone (Enstilar®) is accepted for use within NHS Scotland for the treatment of psoriasis vulgaris.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Butylated hydroxytoluene

Dovobet (LEO Pharma)
Calcipotriol (as Calcipotriol hydrate) 50 microgram per 1 gram, Betamethasone (as Betamethasone dipropionate) 500 microgram per 1 gram Dovobet ointment 30 gram POM £19.84 DT price = £19.84 | 60 gram POM £39.68 | 120 gram POM £73.86

Foam

Enstilar (LEO Pharma)
Calcipotriol (as Calcipotriol monohydrate) 50 microgram per 1 gram, Betamethasone (as Betamethasone dipropionate) 500 microgram per 1 gram Enstilar 50 micrograms/g | 0.5 mg/g cutaneous foam 60 gram POM £39.68 DT price = £39.68

Gel

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Butylated hydroxytoluene

Dovobet (LEO Pharma)
Calcipotriol (as Calcipotriol monohydrate) 50 microgram per 1 gram, Betamethasone (as Betamethasone dipropionate) 500 microgram per 1 gram Dovobet gel Applicator 60 gram POM £37.21 DT price = £37.21

Dovobet gel 60 gram POM £37.21 DT price = £37.21 | 120 gram POM £60.11

Clobetasol propionate

INDICATIONS AND DOSE

Short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas unresponsive to less potent corticosteroids

Psoriasis
▶ TO THE SKIN
▶ Child: Apply 1–2 times a day for up to 4 weeks, to be applied thinly
▶ Adult: Apply 1–2 times a day for up to 4 weeks, to be applied thinly, maximum 50 g of 0.05% preparation per week

ETRIVEX®

Moderate scalp psoriasis
▶ TO THE SKIN
▶ Adult: Apply once daily maximum duration of treatment 4 weeks, to be applied thinly then rinsed off after 15 minutes; frequency of application should be reduced after clinical improvement

POTENCY

Clobetasol propionate 0.05% cream, foam, ointment, scalp application, and shampoo: very potent.

UNLICENSED USE Dermovate® not licensed for use in children under 1 year.

PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer clobetasol propionate foam, liquid (scalp application), cream, ointment and shampoo.

Scalp application Patients or carers should be advised to apply foam directly to scalp lesions (foam begins to subside immediately on contact with skin).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment, paste

Foam

CAUTIONARY AND ADVISORY LABELS 15, 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, propylene glycol

Clarelux (Pierre Fabre Dermo-Cosmetique)
Clobetasol propionate 500 microgram per 1 gram Clarelux 500 micrograms/g foam 100 gram POM £11.06

Shampoo

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Beeswax, cetostearyl alcohol (including cetyl and stearyl alcohol), chlororesol, propylene glycol

Clarelax (Galderma (UK) Ltd)
Clobetasol propionate 500 microgram per 1 gram Clarelax 500 micrograms/g shampoo 125 ml POM £9.15 DT price = £9.15

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Beeswax, cetostearyl alcohol (including cetyl and stearyl alcohol), chlororesol, propylene glycol

Clarelax (Galderma (UK) Ltd)
Clobetasol propionate 500 microgram per 1 gram Clarelax 500 micrograms/g cream 50 g POM £12.75 DT price = £12.75

Ointment

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Propylene glycol

Clarelax (Galderma (UK) Ltd)
Clobetasol propionate 500 microgram per 1 gram Clarelax 500 micrograms/g ointment 50 g POM £14.50 DT price = £14.50

Hydrocortisone

● INDICATIONS AND DOSE
Mild inflammatory skin disorders such as eczemas

► TO THE SKIN
► Child: Apply 1–2 times a day, to be applied thinly
► Adult: Apply 1–2 times a day, to be applied thinly

Nappy rash
► TO THE SKIN
► Child: Apply 1–2 times a day for no longer than 1 week, discontinued as soon as the inflammation subsides

POTENCY
Hydrocortisone cream and ointment 0.5 to 2.5%: mild

● INTERACTIONS → Appendix 1: corticosteroids

● PRESCRIBING AND DISPENSING INFORMATION
When hydrocortisone cream or ointment is prescribed and no strength is stated, the 1% strength should be supplied. Although Dioderm® contains only 0.1% hydrocortisone, the formulation is designed to provide a clinical activity comparable to that of Hydrocortisone Cream 1% BP.

● PATIENT AND CARER ADVICE
Patient counselling is advised for hydrocortisone cream and ointment (application).

● PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary Hydrocortisone Cream 1% BP may be prescribed.

● EXCEPTIONS TO LEGAL CATEGORY
Over-the-counter hydrocortisone preparations Skin creams and ointments containing hydrocortisone (alone or with other ingredients) can be sold to the public for the treatment of allergic contact dermatitis, irritant dermatitis, insect bite reactions and mild to moderate eczema in patients over 10 years, to be applied sparingly over the affected area 1–2 times daily for max. 1 week. Over-the-counter hydrocortisone preparations should not be sold without medical advice for children under 10 years or for pregnant women; they should not be sold for application to the face, anogenital region, broken or infected skin (including cold sores, acne, and athlete’s foot).

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Chlortetracycline with triamcinolone

INDICATIONS AND DOSE
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids (associated with infection) | Psoriasis (associated with infection)
TO THE SKIN
- Adult: To be applied thinly (consult product literature)
POTENCY
Triamcinolone acetonide 0.1%, chlortetracycline hydrochloride 3% ointment: potent.

PATIENT AND CARER ADVICE Stains clothing. Patients or carers should be counselled on the application of chlortetracycline with triamcinolone products.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Ointment
CAUTIONARY AND ADVISORY LABELS 28
- Diprosalic propionate with neomycin sulfate and nystatin (Non-proprietary)
  Clobetasol propionate 500 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram, Nystatin 100000 unit per 1 gram Diprosalic propionate 0.05% with neomycin sulfate and nystatin cream and ointment: very potent.

PATIENT AND CARER ADVICE Patients or carers should be advised on application of clobetasol propionate, neomycin sulfate and nystatin containing preparations.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Ointment
CAUTIONARY AND ADVISORY LABELS 28
- Diprosalic propionate with neomycin sulfate and nystatin (Non-proprietary)
  Clobetasol propionate 500 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram, Nystatin 100000 unit per 1 gram Diprosalic propionate 0.05% with neomycin sulfate and nystatin cream and ointment: very potent.
Clobetasone butyrate with nystatin and oxytetracycline

The properties listed below are those particular to the combination only. For the properties of the components please consider, clobetasone butyrate p. 1143, oxytetracycline p. 536.

**INDICATIONS AND DOSE**

Steroid-responsive dermatoses where candidal or bacterial infection is present

- **TO THE SKIN**
- **Adults**: (consult product literature)

**POTENCY**

Clobetasone butyrate 0.05% with nystatin and oxytetracycline cream: moderate.

**PATIENT AND CARER ADVICE**

Stains clothing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**EXCIPIENTS**: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, sodium metabisulfite

- **Trimovate** (GlaxoSmithKline UK Ltd)
  Clobetasone butyrate 500 microgram per 1 gram, Oxytetracycline (as Oxytetracycline calcium) 30 mg per 1 gram, Nystatin 100000 unit per 1 gram Trimovate cream | 30 gram [FPs] £3.29

Fluocinolone acetonide with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluocinolone acetonide p. 1144, neomycin sulfate p. 492.

**INDICATIONS AND DOSE**

Inflammatory skin disorders such as eczemas associated with infection | Psoriasis associated with infection

- **TO THE SKIN**
- **Child 1-17 years**: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds
- **Adult**: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

**POTENCY**

Fluocinolone acetonide 0.025% with neomycin 0.5% cream and ointment: potent.

**PATIENT AND CARER ADVICE**

Patients or carers should be counselled on the application of fluocinolone acetonide with neomycin preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

**EXCIPIENTS**: May contain Propylene glycol, wool fat and related substances including lanolin

- **Synalar N** (Reig Jofre UK Ltd)
  Fluocinolone acetonide 250 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram Synalar N ointment | 30 gram [FPs] £4.36

**Cream**

**EXCIPIENTS**: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), propylene glycol

- **Synalar N** (Reig Jofre UK Ltd)
  Fluocinolone acetonide 250 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram Synalar N cream | 30 gram [FPs] £4.36

Fluocinolone acetonide with clioquinol

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluocinolone acetonide p. 1144.

**INDICATIONS AND DOSE**

Inflammatory skin disorders such as eczemas associated with infection | Psoriasis associated with infection

- **TO THE SKIN**
- **Adult**: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

**POTENCY**

Clioquinol 3% with fluocinolone acetonide 0.025% cream and ointment: potent

**PATIENT AND CARER ADVICE**

Patient counselling is advised for clioquinol with fluocinolone acetonide cream and ointment (application). Ointment stains clothing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

**EXCIPIENTS**: May contain Propylene glycol, wool fat and related substances including lanolin

- **Synalar C** (Reig Jofre UK Ltd)
  Fluocinolone acetonide 250 microgram per 1 gram, Clioquinol 0.25% Synalar C ointment | 15 gram [FPs] £2.66

**Cream**

**EXCIPIENTS**: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, hydroxybenzoates (parabens), polysorbates, propylene glycol

- **Synalar C** (Reig Jofre UK Ltd)
  Fluocinolone acetonide 250 microgram per 1 gram, Clioquinol 0.25% Synalar C cream | 15 gram [FPs] £2.66

Hydrocortisone with benzalkonium chloride, dimeticone and nystatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1145, dimeticone p. 1134.

**INDICATIONS AND DOSE**

Mild inflammatory skin disorders such as eczemas associated with infection

- **TO THE SKIN**
- **Child**: Apply 3 times a day until lesion has healed, to be applied thinly
- **Adult**: Apply 3 times a day until lesion has healed, to be applied thinly

**POTENCY**

Benzalkonium with dimeticone, hydrocortisone acetate 0.5%, and nystatin cream: mild.

**PATIENT AND CARER ADVICE**

Patients or carers should be advised on application of benzalkonium with dimeticone and hydrocortisone and nystatin preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**EXCIPIENTS**: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), hydrocortisone acetate (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), sodium metabisulfite, sorbic acid

---

**Hydrocortisone with oxytetracycline**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1145, oxytetracycline p. 536.

**INDICATIONS AND DOSE**

**Mild inflammatory skin disorders such as eczemas**

- TO THE SKIN
  - Child 1-17 years: (consult product literature)
  - Adult: (consult product literature)

**PORENCY**

Hydrocortisone 1% with oxytetracycline ointment: mild.

**CONTRA-INDICATIONS**
Children under 12 years

**PREGNANCY**
Tetracyclines should not be given to pregnant women. Effects on skeletal development have been documented when tetracyclines have been used in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child’s teeth.

**BREAST FEEDING**
Tetracyclines should not be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).

**PATIENT AND CARER ADVICE**
Patients should be given advice on the application of hydrocortisone with oxytetracycline ointment.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Ointment**
CAUTIONARY AND ADVISORY LABELS 28

- **Terra-Cortril** (Intrapharm Laboratories Ltd)
  Hydrocortisone 10 mg per 1 gram, Oxytetracycline (as Oxytetracycline hydrochloride) 30 mg per 1 gram Terra-Cortril ointment | 30 gram | £5.01 per 1 gram

**DERMATOLOGICAL DRUGS > ANTI-INFECTIVES**

**Ichthammol**

**INDICATIONS AND DOSE**

**Chronic lichenified eczema**

- TO THE SKIN
  - Child 1-17 years: Apply 1–3 times a day
  - Adult: Apply 1–3 times a day

**UNLICENSED USE**

- In children: No information available.

**SIDE-EFFECTS**
Skin irritation

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, paste

**Liquid**

- **Ichthammol (Non-proprietary)**
  Ichthammol liquid | 100 gram | G 111.42 DT price = £11.42

**Ichthammol with zinc oxide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ichthammol above.

**INDICATIONS AND DOSE**

**Chronic lichenified eczema**

- TO THE SKIN
  - Adult: (consult product literature)

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

**Impregnated dressing**

- **Ichthopaste** (Smith & Nephew Healthcare Ltd)
  Ichthopaste bandage 7.5cm x 6m | 1 bandage | £3.72

**Dermatological Drugs > Antracen Derivatives**

**Dithranol**

(Anthralin)

**INDICATIONS AND DOSE**

**Subacute and chronic psoriasis**

- TO THE SKIN
  - Adult: (consult product literature)

**DITHRCREAM®**

**Subacute and chronic psoriasis**

- TO THE SKIN
  - Adult: For application to skin or scalp, 0.1–0.5% cream suitable for overnight treatment, 1–2% cream for maximum 1 hour (consult product literature)

**MICANOL®**

**Subacute and chronic psoriasis**

- TO THE SKIN
  - Adult: Apply once daily, for application to skin or scalp, to be applied for up to 30 minutes, apply 1% cream, if necessary 3% cream can be used under medical supervision

**CONTRA-INDICATIONS**
Acute and postular psoriasis • hypersensitivity

**CAUTIONS**
Avoid sensitive areas of skin • avoid use near eyes

**SIDE-EFFECTS**
Local burning sensation • local irritation • stains hair • stains skin

**PREGNANCY**
No adverse effects reported.

**BREAST FEEDING**
No adverse effects reported.

**DIRECTIONS FOR ADMINISTRATION**
When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards. Dithranol should be applied to chronic extensor plaques only, carefully avoiding normal skin.

**MICANOL®**
At the end of contact time, use plenty of lukewarm (not hot) water to rinse off cream; soap may be used after the cream has been rinsed off; use shampoo
Dithranol with salicylic acid and zinc oxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, dithranol p. 1151, salicylic acid p. 1182.

- **INDICATIONS AND DOSE**
  - **Subacute and chronic psoriasis**
    - TO THE SKIN
    - Adult: (consult local protocol)

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, paste

**DERMATOLOGICAL DRUGS TARS**

**Coal tar**

- **INDICATIONS AND DOSE**
  - **Psoriasis** | **Chronic atopic eczema**
    - TO THE SKIN USING PASTE
    - Child: Apply 1–3 times a day, start application with low-strength preparations
    - Adult: Apply 1–3 times a day, start application with low-strength preparations
    - TO THE SKIN
    - Child: 100 mL/bath, to be added to an adult sized bath; add proportionally less for a child’s bath. Use Coal Tar Solution BP

- **Adult**: 100 mL/bath, to be added to an adult sized bath. Use Coal Tar Solution BP

**ALPHOSYL 2 IN 1® SHAMPOO**

- **Psoriasis** | **Seborrhoeic dermatitis** | **Scaling** | **Itching**
  - TO THE SKIN
  - Adult: Apply every 2–3 days

**Dandruff**

- TO THE SKIN
  - Adult: Apply 1–2 times a week as required

**EXOREX® LOTION**

- **Psoriasis**
  - TO THE SKIN
  - Adult: Apply 2–3 times a day, to be applied to skin or scalp; in elderly, lotion can be diluted with a few drops of water before applying

- **CONTRA-INDICATIONS**
  - Avoid broken or inflamed skin.
  - Avoid eye area.
  - Avoid genital area.
  - Avoid mucosal areas.
  - Avoid rectal area.
  - Infection: sore, acute, or pustular psoriasis

- **CAUTIONS**
  - Application to face.
  - Application to skin flexures

- **SIDE-EFFECTS**
  - Acne-like eruptions.
  - Photosensitivity.
  - Skin irritation

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Coal Tar Solution BP contains coal tar 20%, Strong Coal Tar Solution BP contains coal tar 40%.

- **HANDLING AND STORAGE**
  - Use suitable chemical protection gloves for extemporaneous preparation.
  - May stain skin, hair and fabric.

- **PATIENT AND CARER ADVICE**
  - May stain skin, hair and fabric.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: paste

**Bath additive**

- **Psoriderm** (Dermal Laboratories Ltd)

    - **Coal tar extract 20 mg per 1 gram**
      - Coal tar extract 2% shampoo
        - 125 mL (GSL) no price available DT price = £3.61 | 250 mL (GSL) no price available DT price = £5.38
      - Brands may include Alphosyl Z 2 in 1, Neutrogena T/Gel Therapeutic, Polytar Scalp

**Coal tar with arachis oil extract of coal tar, cade oil, light liquid paraffin and tar**

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar above.

- **INDICATIONS AND DOSE**
  - **Psoriasis** | **Eczema** | **Atopic dermatoses** | **Pruritic dermatoses**
    - TO THE SKIN
    - Child: 2–4 capfuls/bath, alternatively 15–30 mL, to be added in an adult-size bath and soak for 20 minutes (proportionally less for a child’s bath)
    - Adult: 2–4 capfuls/bath, alternatively 15–30 mL, to be added in an adult-size bath and soak for 20 minutes
Coal tar with calamine 31-Aug-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1152.

**INDICATIONS AND DOSE**

Psoriasis | Chronic atopic eczema (occasionally)
- **TO THE SKIN**
- Adult: Apply 1–2 times a day

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

**PREScribing AND DISPENSING INFORMATION**

When prepared extemporaneously, the BP states Calamine and Coal Tar Ointment BP, consists of calamine 12.5 g, strong coal tar solution 2.5 g, zinc oxide 12.5 g, hydrous wool fat 25 g, white soft paraffin 47.5 g.

Coal tar with coconut oil and salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1152, salicylic acid p. 1182.

**INDICATIONS AND DOSE**

Scaly scalp disorders | Psoriasis | Seborrhoeic dermatitis | Dandruff | Cradle cap
- **TO THE SKIN USING SHAMPOO**
- Child: Apply daily as required
- Adult: Apply daily as required

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

Coal tar with dithranol and salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1152, dithranol p. 1151, salicylic acid p. 1182.

**INDICATIONS AND DOSE**

Subacute and chronic psoriasis
- **TO THE SKIN**
- Child: Apply up to twice daily
- Adult: Apply up to twice daily

**UNLICENSED USE** Psorin® is licensed for use in children (age range not specified by manufacturer).

Coal tar with lecithin

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1152.

**INDICATIONS AND DOSE**

Psoriasis
- **TO THE SKIN**
- Child: Apply as required
- Adult: Apply as required

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Cream**
  - EXCIPIENTS: May contain Isopropyl palmitate, propylene glycol
  - Psoriderm (Dermal Laboratories Ltd)
  - Lecithin 4 mg per 1 gram, Coal tar distilled 60 mg per 1 gram
  - Psoriderm cream | 225 ml | £9.42

- **Shampoo**
  - EXCIPIENTS: May contain Disodium edetate
  - Psoriderm (Dermal Laboratories Ltd)
  - Lecithin 3 mg per 1 ml, Coal tar distilled 25 mg per 1 ml
  - Psoriderm scalp lotion | 250 ml | £4.74

Coal tar with salicylic acid 26-Aug-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1152, salicylic acid p. 1182.

**INDICATIONS AND DOSE**

Psoriasis | Chronic atopic eczema
- **TO THE SKIN USING OINTMENT**
- Adult: Apply 1–2 times a day

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment.

**PREScribing AND DISPENSING INFORMATION**

When prepared extemporaneously, the BP states Coal Tar and Salicyclic Acid Ointment, BP consists of coal tar 2 g, salicylic acid 2 g, emulsifying wax 11.4 g, white soft paraffin 19 g, coconut oil 54 g, polysorbate ‘80’ 4 g, liquid paraffin 7.6 g.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment.
Coal tar with salicylic acid and precipitated sulfur

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1152, salicylic acid p. 1182.

- **INDICATIONS AND DOSE**
  **COCOIS® OINTMENT**
  Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff
  - **INITIALLY TO THE SKIN USING SCALP OINTMENT**
  - Child 6–11 years: Medical supervision required
  - Child 12–17 years: Apply once weekly as required, alternatively (to the skin) apply daily for the first 3–7 days (if severe), shampoo off after 1 hour
  - Adult: Apply once weekly as required, alternatively (to the skin) apply daily for the first 3–7 days (if severe), shampoo off after 1 hour

  **SEBCO® OINTMENT**
  Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff
  - **TO THE SKIN USING SCALP OINTMENT**
  - Child 6–11 years: Medical supervision required
  - Child 12–17 years: Apply as required, alternatively apply daily for the first 3–7 days (if severe), shampoo off after 1 hour
  - Adult: Apply as required, alternatively apply daily for the first 3–7 days (if severe), shampoo off after 1 hour

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  **Ointment**
  EXCipients: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol).
  - Cocos (Focus Pharmaceuticals Ltd)
    - Salicylic acid 20 mg per 1 gram, Sulfur precipitated 40 mg per 1 gram, Coal tar solution 120 mg per 1 gram  Cocos ointment | 40 gram GEL £6.22 | 100 gram GEL £11.69
  - Sebco (Derma UK Ltd)
    - Salicylic acid 20 mg per 1 gram, Sulfur precipitated 40 mg per 1 gram, Coal tar solution 120 mg per 1 gram Sebco ointment | 40 gram GEL £5.91 | 100 gram GEL £11.11

Coal tar with zinc oxide

26-Aug-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1152.

- **INDICATIONS AND DOSE**
  **Psoriasis** | **Chronic atopic eczema**
  - **TO THE SKIN**
    - Child: Apply 1–2 times a day
    - Adult: Apply 1–2 times a day

- **IMPORTANT SAFETY INFORMATION**
  **MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING**
  See Emollient and barrier preparations p. 1118.

- **PRESCRIBING AND DISPENSING INFORMATION**
  No preparations available—when prepared extemporaneously, the BP states Zinc and Coal Tar Paste, BP consists of zinc oxide 6%, coal tar 6%, emulsifying wax 5%, starch 38%, yellow soft paraffin 45%.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, paste

Extract of coal tar with arachis oil

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1152.

- **INDICATIONS AND DOSE**
  **Scalp disorders** | **Psoriasis** | **Seborrhoea** | **Eczema** | **Pruritus** | **Dandruff**
  - **TO THE SKIN**
    - Child: Apply 1–2 times a week, to the scalp
    - Adult: Apply 1–2 times a week, to the scalp

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  No licensed medicines listed.

- **IMMUNOSUPPRESSANTS** | **CALCINEURIN INHIBITORS AND RELATED DRUGS**
  **Pimecrolimus**

- **INDICATIONS AND DOSE**
  Short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used (initiated by a specialist)
  - **TO THE SKIN**
    - Adult: Apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks)
  Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy (initiated by a specialist)
  - **TO THE SKIN**
    - Adult: Apply twice daily until symptoms resolve (maximum duration of treatment 4 weeks)

- **UNLICENSED USE**
  Pimecrolimus is not licensed for short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy.

- **CONTRA-INDICATIONS**
  Application to malignant or potentially malignant skin lesions · application under occlusion · congenital epidermal barrier defects · contact with eyes · contact with mucous membranes · generalised erythroderma · immunodeficiency · infection at treatment site

- **CAUTIONS**
  Alcohol consumption (risk of facial flushing and skin irritation) · avoid other topical treatments except emollients at treatment site · UV light (avoid excessive exposure to sunlight and sunlamps)

- **INTERACTIONS**
  Appendix 1: pimecrolimus

- **SIDE-EFFECTS**
  - **Common or very common** Burning sensation · erythema · folliculitis · pruritus · skin infections
  - **Uncommon** Herpes simplex · herpes zoster · impetigo · molluscum contagiosum
  - **Rare** Dryness · local reactions including pain · oedema · papilloma · paraesthesia · peeling · skin discoloration · worsening of eczema
  - **Frequency not known** Skin malignancy

- **PREGNANCY**
  Manufacturer advises avoid; toxicity in animal studies following systemic administration.

- **BREAST FEEDING**
  Manufacturer advises caution; ensure infant does not come in contact with treated areas.
**Tacrolimus**

**DRUG ACTION** Tacrolimus is a calcineurin inhibitor.

**INDICATIONS AND DOSE**

### Short-term treatment of moderate to severe atopic eczema (including flares) in patients unresponsive to, or intolerant of conventional therapy (initiated by a specialist)

- **TO THE SKIN**
  - Adult: Apply twice daily until lesion clears (consider other treatment if eczema worsens or no improvement after 2 weeks), initially 0.1% ointment to be applied thinly, reduce frequency to once daily or strength of ointment to 0.03% if condition allows

### Prevention of flares in patients with moderate to severe atopic eczema and 4 or more flares a year who have responded to initial treatment with topical tacrolimus (initiated by a specialist)

- **TO THE SKIN**
  - Adult: Apply twice weekly, 0.1% ointment to be applied thinly, with an interval of 2–3 days between applications, use short-term treatment regimen during an acute flare; review need for preventative therapy after 1 year

### Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy (initiated under specialist supervision)

- **TO THE SKIN**
  - Adult: Apply twice daily until symptoms resolve, 0.1% ointment to be applied thinly, reduce to once daily or switch to 0.03% ointment if condition allows, maximum duration of treatment 4 weeks

**UNLICENSED USE** Short-term treatment of facial, flexural, or genital psoriasis is unlicensed.

**CONTRA-INDICATIONS** Application to malignant or potentially malignant skin lesions - application under occlusion - avoid contact with eyes - avoid contact with mucous membranes - congenital epidermal barrier defects - generalised erythroderma - immunodeficiency - infection at treatment site

**CAUTIONS** UV light (avoid excessive exposure to sunlight and sunlamps)

**INTERACTIONS** → Appendix 1: tacrolimus

**SIDE-EFFECTS**

- **Common or very common** Application-site infections - application-site reactions - herpes simplex infection - irritation (at application-site) - Kaposi’s varicelliform eruption - pain at application-site - rash
- **Uncommon** Acne
- **Frequency not known** Cutaneous lymphoma - malignancies - other types of lymphomas - rosacea - skin malignancy

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to macrolides.

**PREGNANCY** Manufacturer advises avoid unless essential; toxicity in animal studies following systemic administration.

**MEDICINAL FORMS**

**Breast Feeding** Avoid — present in breast milk (following systemic administration).

**Patient and Carer Advice** Avoid excessive exposure to UV light including sunlight.

**NATIONAL FUNDING/ACCESS DECISIONS**

### NICE technology appraisals (TAs)

- **Tacrolimus and pimecrolimus for atopic eczema** (August 2004) NICE TA82
  - Topical tacrolimus is an option for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).
  - Tacrolimus is recommended for moderate to severe atopic eczema. Tacrolimus should be used within its licensed indications. [www.nice.org.uk/TA82](http://www.nice.org.uk/TA82)

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (March 2010) that tacrolimus ointment (Protopic) is accepted for restricted use within NHS Scotland for the prevention of flares in patients with moderate to severe atopic eczema in accordance with the licensed indications; initiation of treatment is restricted to doctors (including general practitioners) with a specialist interest and experience in treating atopic eczema with immunomodulatory therapy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Drug Action**

**IMMUNOSUPPRESSANTS > INTERLEUKIN INHIBITORS**

**Ixekizumab**

**DRUG ACTION** Ixekizumab is a human monoclonal antibody that binds to interleukin-17A and inhibits the release of pro-inflammatory cytokines and chemokines.

**INDICATIONS AND DOSE**

Moderate-to-severe plaque psoriasis (under expert supervision)

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 160 mg for 1 dose, followed by 80 mg after 2 weeks, then 80 mg every 2 weeks for 5 further doses (at weeks 4, 6, 8, 10 and 12) and maintenance 80 mg every 4 weeks, consider discontinuation of treatment if no response after 16–20 weeks

**CONTRA-INDICATIONS** Active infections (including active tuberculosis)

**CAUTIONS** Chronic infection — monitor carefully and discontinue if serious, unresponsive infection develops - Crohn’s disease - ulcerative colitis

**FURTHER INFORMATION**

- Severe hypersensitivity reactions
- Severe hypersensitivity reactions have been reported — discontinue treatment immediately if symptoms occur.
- Latent tuberculosis
- Manufacturer advises that patients with latent tuberculosis should complete anti-tuberculosis therapy before starting ixekizumab.
- Inflammatory bowel disease
- Manufacturer advises to monitor closely for exacerbation.
Acitretin

**DRUG ACTION** Acitretin is a metabolite of etretinate.

**INDICATIONS AND DOSE**

- **Severe extensive psoriasis resistant to other forms of therapy (under expert supervision)** | **Palmoplantar pustular psoriasis (under expert supervision)** | **Severe congenital ichthyosis (under expert supervision)**
  - **BY MOUTH**
  - Adult: Initially 25–30 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily, increased to up to 75 mg daily, dose only increased to 75 mg daily for short periods in psoriasis

- **CONTRA-INDICATIONS** Hyperlipidaemia

- **CAUTIONS** Avoid excessive exposure to sunlight and unsupervised use of sunlamps - diabetes (can alter glucose tolerance - initial frequent blood glucose checks), do not donate blood during and for 2 years after stopping therapy (teratogenic risk) - in children use only in exceptional circumstances and monitor growth parameters and bone development (premature epiphyseal closure reported) - investigate atypical musculoskeletal symptoms

**DIRECTIONS FOR ADMINISTRATION** Manufacturer advises avoid - limited information available.

**HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C).

**PATIENT AND CARER ADVICE**

Self-administration If appropriate, patients and their carers should be given training in subcutaneous injection technique.

**NATIONAL FUNDING/ACCESS DECISIONS**

*Scottish Medicines Consortium (SMC) Decisions*

The *Scottish Medicines Consortium* has advised (April 2017) that ixekizumab (Taltz)® is accepted for restricted use in NHS Scotland for the treatment of moderate-to-severe plaque psoriasis only in patients who have failed to respond to standard systemic therapies (including ciclosporin, methotrexate and phototherapy), are intolerant to, or have a contra-indication to these treatments. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland, or a list price that is equivalent or lower.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

*Solution for injection*

**EXCIPIENTS:** May contain Polysorbates

- **Taltz** (Eli Lilly and Company Ltd)
  - Ixekizumab 80 mg per 1 ml | Taltz 80mg/0.25ml solution for injection pre-filled syringes | 1 pre-filled disposable injection | £1,125.00 (Hospital only)
  - Taltz 80mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection | £1,125.00 (Hospital only) | 2 pre-filled disposable injection | £2,250.00 (Hospital only)

**RETINOID AND RELATED DRUGS**

Severe Darier's disease (keratosis follicularis) (under expert supervision)

- **BY MOUTH**
  - Adult: Initially 10 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily

- **CONTRA-INDICATIONS** Hyperlipidaemia

- **CAUTIONS** Avoid excessive exposure to sunlight and unsupervised use of sunlamps - diabetes (can alter glucose tolerance - initial frequent blood glucose checks), do not donate blood during and for 2 years after stopping therapy (teratogenic risk) - in children use only in exceptional circumstances and monitor growth parameters and bone development (premature epiphyseal closure reported) - investigate atypical musculoskeletal symptoms

- **INTERACTIONS** Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**

- **Common or very common** Infection - nausea - oropharyngeal pain
  - **Uncommon** Bone marrow suppression - urticaria
  - **Frequency not known** Hypersensitivity reactions (occasionally late-onset) - inflammatory bowel disease (new or exacerbation)

**PREGNANCY** Manufacturer advises avoid - limited information available.

**BREAST FEEDING** Manufacturer advises avoid - present in milk in *animal* studies.

**DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to avoid injecting into areas of the skin that show psoriasis; injection sites may be alternated. Patients may self-administer Taltz®, after appropriate training in subcutaneous injection technique.

**HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C).

**PATIENT AND CARER ADVICE**

Self-administration If appropriate, patients and their carers should be given training in subcutaneous injection technique.

- **INTERACTIONS** Appendix 1: retinoids

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - abnormal hair texture - alopecia (reversible on withdrawal) - arthralgia - brittle nails - dermatitis - diarrhoea - dryness and inflammation of mucous membranes - dryness of conjunctiva (causing conjunctivitis and decreased tolerance to contact lenses) - epidermal fragility - erythema - headache - myalgia - nausea - paronychia - peripheral oedema - pruritus - reversible increase in serum-cholesterol (with high doses) - reversible increase in serum-triglyceride concentrations (with high doses) - skin exfoliation - sticky skin - vomiting

- **Uncommon** Dizziness - hepatitis - photosensitivity - visual disturbances

- **Rare** Peripheral neuropathy

- **Very rare** Benign intracranial hypertension - bone pain - exostosis - night blindness - ulcerative keratitis

- **Frequency not known** Drowsiness - dry skin - flushing - granulomatous lesions - impaired hearing - initial worsening of psoriasis - malaise - rectal haemorrhage - sweating - taste disturbance - tinnitus

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Exostosis** Skeletal hyperostosis and extra-osseous calcification reported following long-term treatment with etretinate (of which Acitretin is a metabolite) and premature epiphyseal closure in children.

- **Benign intracranial hypertension** Discontinue if severe headache, nausea, vomiting, or visual disturbances occur.

**CONCEPTION AND CONTRACEPTION** Effective contraception must be used.

Pregnancy prevention In females of child-bearing potential (including those with a history of infertility), exclude pregnancy up to 3 days before treatment, every month during treatment, and every 1–3 months for 3 years after stopping treatment. Treatment should be started on day 2 or 3 of menstrual cycle. Females of child-bearing age must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 3 years after stopping treatment. Females should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods. Females should be advised to seek medical attention immediately if they become pregnant during treatment or within 3 years of stopping treatment. They should also be advised to avoid alcohol during treatment and for 2 months after stopping treatment.

- **PREGNANCY** Avoid—teratogenic.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment—risk of further impairment.
● RENAL IMPAIRMENT  Avoid in severe impairment; increased risk of toxicity.

● MONITORING REQUIREMENTS
  ▶ Monitor serum-triglyceride and serum-cholesterol concentrations before treatment, 1 month after starting, then every 3 months.
  ▶ Check liver function at start, then every 2–4 weeks for first 2 months and then every 3 months.

● PRESCRIBING AND DISPENSING INFORMATION
  Prescribing for women of child-bearing potential Each prescription for acitretin should be limited to a supply of up to 30 days’ treatment and dispensed within 7 days of the date stated on the prescription.

● PATIENT AND CARER ADVICE
  A patient information leaflet should be provided. Females of child-bearing potential must be advised on pregnancy prevention.

● MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule
  CAUTIONARY AND ADVISORY LABELS  10, 11, 21
  ▶ Acitretin (Non-proprietary)
    Acitretin 10 mg  Acitretin 10mg capsules  |  60 capsule  |  £23.80
    DT price = £23.80
    Acitretin 25 mg  Acitretin 25mg capsules  |  60 capsule  |  £55.24
    DT price = £55.24
  ▶ Neotigason (Teva UK Ltd)
    Acitretin 10 mg  Neotigason 10mg capsules  |  60 capsule  |  £17.30
    DT price = £23.80 (Hospital only)
    Acitretin 25 mg  Neotigason 25mg capsules  |  60 capsule  |  £43.00
    DT price = £55.24 (Hospital only)

Alitretinoin

● INDICATIONS AND DOSE
  Severe chronic hand eczema refractory to potent topical corticosteroids
  ▶ BY MOUTH
    Adult (prescribed by or under supervision of a consultant dermatologist): 30 mg once daily; reduced if not tolerated to 10 mg once daily for 12–24 weeks total duration of treatment, discontinue if no response after 12 weeks, course may be repeated in those who relapse

  Severe chronic hand eczema refractory to potent topical corticosteroids in patients with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease
  ▶ BY MOUTH
    Adult (prescribed by or under supervision of a consultant dermatologist): Initially 10 mg once daily, increased if necessary up to 30 mg once daily for 12–24 weeks total duration of treatment, discontinue if no response after 12 weeks, course may be repeated in those who relapse

DOSE ADJUSTMENTS DUE TO INTERACTIONS
  Manufacturer advises reduce dose to 10 mg once daily with concurrent use of potent inhibitors of CYP3A4, CYP2C8 and moderate inhibitors of CYP2C9.

● CONTRA-INDICATIONS
  Hypervitaminosis A  • uncontrolled hyperlipidaemia  • uncontrolled hypothyroidism

● CAUTIONS
  Avoid blood donation during treatment and for at least 1 month after stopping treatment  • dry eye syndrome  • history of depression

● INTERACTIONS
  ▶ Appendix 1: retinoids

● SIDE-EFFECTS
  ▶ Common or very common
    Alopecia  • anaemia  • arthralgia  • changes in thyroid function tests  • cheilitis  • conjunctivitis  • dry eyes  • dryness of lips  • dryness of skin  • erythema  • eye irritation  • flushing  • headache  • myalgia  • raised creatine kinase  • raised serum concentration of triglycerides and of cholesterol (risk of pancreatitis if triglycerides above 9 mmol/litre)
  ▶ Uncommon
    Ankylosing spondylitis  • osteoarthritic eczema  • blurred vision  • cataracts  • epistaxis  • hyperostosis  • pruritus
  ▶ Rare
    Benign intracranial hypertension  • vasculitis
  ▶ Frequency not known
    Decreased tolerance to contact lenses  • depression  • impaired night vision  • keratitis  • mood changes  • suicidal ideation

SIDE-EFFECTS, FURTHER INFORMATION
  ▶ Dry eyes  Dry eyes may respond to lubricating eye ointment or tear replacement therapy.
  ▶ Benign intracranial hypertension Discontinue treatment if severe headache, nausea, vomiting, papilloedema, or visual disturbances occur.

● CONCEPTION AND CONTRACEPTION
  Effective contraception must be used.
  Pregnancy prevention  In women of child-bearing potential, exclude pregnancy 1 month before treatment, up to 3 days before treatment, every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle.
  Women should practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods.
  Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

● PREGNANCY
  Avoid—teratogenic.

● BREAST FEEDING
  Manufacturer advises avoid.

● HEPATIC IMPAIRMENT
  Manufacturer advises avoid—no information available.

● RENAL IMPAIRMENT
  Manufacturer advises avoid in severe impairment—no information available.

● MONITORING REQUIREMENTS
  Monitor serum lipids (more frequently in those with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease)—discontinue if uncontrolled hyperlipidaemia.

● PRESCRIBING AND DISPENSING INFORMATION
  Prescribing for women of child-bearing potential Each prescription for alitretinoin should be limited to a supply of up to 30 days’ treatment and dispensed within 7 days of the date stated on the prescription.
  Alitretinoin is -teratogenic and must not be given to women of child-bearing potential unless they practise effective contraception and then only after detailed assessment and explanation by the physician.

● PATIENT AND CARER ADVICE
  A patient information leaflet should be provided.
  Patient advice required around conception and contraception Women of child-bearing potential must be counselled on pregnancy prevention.

● NATIONAL FUNDING/ACCESS DECISIONS

NIce technology appraisals (Tas)
  ▶ Alitretinoin for the treatment of severe chronic hand eczema in adults (August 2009) NIce TA177
  Alitretinoin is recommended for the treatment of severe chronic hand eczema that has not responded to potent topical corticosteroids. Treatment should be stopped as soon as an adequate response has been achieved (hands clear or almost clear), or if the eczema remains severe after...
12 weeks, or if an adequate response has not been achieved by 24 weeks.
www.nice.org.uk/TA177

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Capsule**
CAUTIONARY AND ADVISORY LABELS 10, 11, 21
- **Toctino** (Stiefel Laboratories (UK) Ltd)
  - Allretinoin 10 mg Toctino 10mg capsules | 30 capsule £411.43
  - Allretinoin 30 mg Toctino 30mg capsules | 30 capsule £411.43

**Tazarotene**

**INDICATIONS AND DOSE**
Mild to moderate plaque psoriasis affecting up to 10% of skin area
- **TO THE SKIN**
- Adult: Apply once daily usually for up to 12 weeks, apply in the evening

**CAUTIONS**
Avoid contact with eczematous skin - avoid contact with eyes - avoid contact with face - avoid contact with hair-covered scalp - avoid contact with inflamed skin - avoid contact with intertriginous areas

**SIDE-EFFECTS**
- Rare: Dry or painful skin - stinging and inflamed skin
- Frequency not known: Burning - contact dermatitis - desquamation - erythema - local irritation - non-specific rash - pruritus - worsening of psoriasis

**SIDE-EFFECTS, FURTHER INFORMATION**
Local irritation is more common with higher concentrations and may require discontinuation.

**CONCEPTION AND CONTRACEPTION**
Effective contraception required (oral progestogen-only contraceptives not considered effective).

**PREGNANCY**
Avoid.

**BREAST FEEDING**
Manufacturer advises avoid—present in milk in animal studies.

**PATIENT AND CARER ADVICE**
Avoid excessive exposure to UV light (including sunlight, sunlamps, PUVA or UVB treatment). Do not apply emollients or cosmetics within 1 hour of application. Wash hands immediately after use.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Gel**
EXCIPIENTS: May contain Benzyl alcohol, butylated hydroxyanisole, butylated hydroxytoluene, disodium edetate, polysorbates
- **Zorac** (Allergan Ltd)
  - Tazarotene 500 microgram per 1 gram Zorac 0.05% gel | 30 gram £14.93
  - Tazarotene 1 mg per 1 gram Zorac 0.1% gel | 30 gram £14.80

**SALICYLIC ACID AND DERIVATIVES**

**Salicylic acid with zinc oxide**

**INDICATIONS AND DOSE**
Hyperkeratotic skin disorders
- **TO THE SKIN**
- Adult: Apply twice daily

**CAUTIONS**
Avoid broken skin - avoid inflamed skin

**CAUTIONS, FURTHER INFORMATION**
- Salicylate toxicity: Salicylate toxicity may occur particularly if applied on large areas of skin or neonatal skin.

**SIDE-EFFECTS**
Excessive drying - irritation - sensitivity - systemic effects (after widespread use)

**PRESCRIBING AND DISPENSING INFORMATION**
Zinc and Salicylic Acid Paste BP is also referred to as Lassar’s Paste. When prepared extemporaneously, the BP states Zinc and Salicylic Acid Paste, BP (Lassar’s Paste) consists of zinc oxide 24%, salicylic acid 2%, starch 24%, white soft paraffin 50%.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: paste

**VITAMINS AND TRACE ELEMENTS**

**Calcipotriol**

**INDICATIONS AND DOSE**
Plaque psoriasis
- **TO THE SKIN USING OINTMENT**
- Adult: Apply 1–2 times a day, when preparations are used together maximum total calcipotriol 5 mg in any one week (e.g. scalp solution 60 mL with ointment 30 g or scalp solution 30 mL with ointment 60 g); maximum 100 g per week

**Scalp psoriasis**
- **TO THE SKIN USING SCALP LOTION**
- Adult: Apply twice daily, when preparations are used together maximum total calcipotriol 5 mg in any one week (e.g. scalp solution 60 mL with ointment 30 g or scalp solution 30 mL with ointment 60 g); maximum 60 mL per week

**CONTRA-INDICATIONS**
Calcium metabolism disorders

**CAUTIONS**
Avoid excessive exposure to sunlight and sunlamps - avoid use on face - erythrodemecic exfoliative psoriasis (enhanced risk of hypercalcaemia) - generalised pustular psoriasis (enhanced risk of hypercalcaemia)

**INTERACTIONS**
- **Appendix 1: vitamin D substances**

**SIDE-EFFECTS**
- Common or very common: Burning - dermatitis - erythema - itching - local skin reactions - paraesthesia
- Rare: Facial dermatitis - perioral dermatitis
- Frequency not known: Aggravation of psoriasis - dry skin - photosensitivity

**PREGNANCY**
Manufacturers advise avoid unless essential.

**BREAST FEEDING**
No information available.

**PATIENT AND CARER ADVICE**
Advice on application Patient information leaflet for Doxovex® ointment advises liberal application. However, patients should be advised of maximum recommended weekly dose.

Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

**Ointment**
EXCIPIENTS: May contain Disodium edetate, propylene glycol
- **Calcipotriol (Non-proprietary)**
  - Calcipotriol 50 microgram per 1 gram Calcipotriol 50 micromg/g ointment | 30 gram £7.57 DT price = £5.78 | 60 gram £11.56–£13.86 | 120 gram £23.12–£27.75

- **Calcipotriene**
  - Calcipotriene 0.005% ointment | 30 gram £5.39–£6.93 | 60 gram £10.78–£13.86

- **Calcipotriene**
  - Calcipotriene 0.005% ointment | 30 gram £5.39–£6.93 | 60 gram £10.78–£13.86

- **Intact**
  - Intact 500 g | 120 mg g £3.02
Calcitriol
(1,25-Dihydroxycholecalciferol)

**INDICATIONS AND DOSE**

- **Mild to moderate plaque psoriasis**
  - **TO THE SKIN**
  - **Adult:** Apply twice daily, not more than 35% of body surface to be treated daily; maximum 30 g per day

- **CONTRA-INDICATIONS** Do not apply under occlusion - patients with calcium metabolism disorders
- **CAUTIONS** Erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia) - generalised pustular psoriasis (enhanced risk of hypercalcaemia)
- **INTERACTIONS** → Appendix 1: vitamin D substances
- **SIDE-EFFECTS**
  - **Common or very common** Burning, dermatitis, erythema, itching, local skin reactions, paraesthesia
  - **Frequency not known** Aggravation of psoriasis
- **PREGNANCY** Manufacturer advises use in restricted amounts only if clearly necessary. Monitor urine- and serum-calcium concentration in pregnancy.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid — no information available.
- **RENAL IMPAIRMENT** Manufacturer advises avoid — no information available.
- **HANDLING AND STORAGE** Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **Ointment**
  - **Siliks** (Galderma (UK) Ltd)
    - **Calcitriol 3 microgram per 1 gram** Siliks ointment | 100 gram (POM) £18.06 DT price = £18.06

- **Calcitriol**

    - **Calcitriol (as Calcitriol hydrate) 50 microgram per 1 ml** Calcitriol 50 micrograms/ml scalp solution | 60 ml (POM) £66.94 DT price = £56.94 | 120 ml (POM) £113.88 DT price = £113.88

Combinations available: *Calcitriol with betamethasone*, p. 1141

---

**Hyperhidrosis**

**Overview**

Aluminium chloride hexahydrate p. 1160 is a potent antiperspirant used in the treatment of hyperhidrosis. Aluminium salts are also incorporated in preparations used for minor fungal skin infections associated with hyperhidrosis.

Limited evidence suggests that oxybutynin hydrochloride p. 733 [unlicensed indication] can be used to treat hyperhidrosis in patients whose symptoms are not adequately managed through lifestyle modifications and antiperspirants.

In more severe cases specialists use glycopyrronium bromide p. 1160 as a 0.05% solution in the iontophoretic treatment of hyperhidrosis of plantar and palmar areas. Botox® contains botulinum toxin type A complex p. 387 and is licensed for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihidrotic treatment.
5 Pruritus

Topical local antipruritics

Overview

Pruritus may be caused by systemic disease (such as obstructive jaundice, endocrine disease, chronic renal disease, iron deficiency, and certain malignant diseases), skin disease (e.g. psoriasis, eczema, urticaria, and scabies), drug hypersensitivity, or as a side-effect of opioid analgesics. Where possible, the underlying causes should be treated. An emollient may be of value where the pruritus is associated with dry skin. Pruritus that occurs in otherwise healthy elderly people can also be treated with an emollient.

Preparations containing crotamiton p. 1161 are sometimes used but are of uncertain value. Preparations containing calamine are often ineffective.

A topical preparation containing doxepin 5% p. 1161 is licensed for the relief of pruritus in eczema; it can cause drowsiness and there may be a risk of sensitisation.

Pruritus is common in biliary obstruction, especially in primary biliary cirrhosis and drug-induced cholestasis. Oral administration of colestyramine p. 191 is the treatment of choice.

Topical antihistamines and local anaesthetics are only marginally effective and occasionally cause hypersensitivity. For insect stings and insect bites, a short course of a topical corticosteroid is appropriate. Short-term treatment with a sedating antihistamine may help in insect stings and in intractable pruritus where sedation is desirable. Calamine preparations are of little value for the treatment of insect stings or bites.

Topical local anaesthetics are indicated for the relief of local pain. Preparations may be absorbed, especially through mucosal surfaces, therefore excessive application should be avoided and they should preferably not be used for more than 3 days; not generally suitable for young children and are less suitable for prescribing.

Topical antihistamines should be avoided in eczema and are not recommended for longer than 3 days. They are less suitable for prescribing.

Other drugs used for Pruritus

Alimemazine tartrate, p. 271 · Cetirizine hydrochloride, p. 268 · Chlorphenamine maleate, p. 272 · Hydroxyzine hydrochloride, p. 274 · Levocetirizine hydrochloride, p. 270
**Antipruritics**

**Calamine with zinc oxide**

31-Aug-2016

**Indications and dose**

- **Pruritus**
  - To the skin
  - Child: (consult product literature)
  - Adult: (consult product literature)

**Important safety information**

**Contra-indications** Avoid application of preparations containing zinc oxide prior to x-ray (zinc oxide may affect outcome of x-ray)

**Less suitable for prescribing** Less suitable for prescribing.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

- **Calamine with zinc oxide (Non-proprietary)**
  - Phenoxethanol 5% per 1 gram, Zinc oxide 30% per 1 gram, Calamine 40% per 1 gram, Cetomacrogol emulsifying wax 50% per 1 gram, Self-emulsifying glyceryl monostearate 50% per 1 gram, Liquid paraffin 200% per 1 gram Aqueous calamine cream | 100 gram | £1.38
  - **Cala Soothe** (Ennogen Healthcare Ltd)
    - Phenoxethanol 5% per 1 gram, Zinc oxide 30% per 1 gram, Calamine 40% per 1 gram, Cetomacrogol emulsifying wax 50% per 1 gram, Self-emulsifying glyceryl monostearate 50% per 1 gram, Liquid paraffin 200% per 1 gram Cala Soothe cream | 100 ml | £18.80

- **Liquid**
  - **Calamine with zinc oxide (Non-proprietary)**
    - Phenol liquefied 5% per 1 ml, Sodium citrate 5% per 1 ml, Bentonite 30% per 1 ml, Glycerol 50% per 1 ml, Zinc oxide 50% per 1 ml, Calamine 150% per 1 ml Calamine lotion | 200 ml | £0.74
    - **Cala Soothe** (Ennogen Healthcare Ltd)
      - Phenol liquefied 5% per 1 ml, Sodium citrate 5% per 1 ml, Bentonite 30% per 1 ml, Glycerol 50% per 1 ml, Zinc oxide 50% per 1 ml, Calamine 150% per 1 ml Cala Soothe lotion | 200 ml | £19.50

**Doxepin**

**Indications and dose**

- **Pruritus in eczema**
  - To the skin
  - Child 12–17 years: Apply up to 3 g 3–4 times a day, apply thinly; coverage should be less than 10% of body surface area; maximum 12 g per day
  - Adult: Apply up to 3 g 3–4 times a day, apply thinly; coverage should be less than 10% of body surface area; maximum 12 g per day

**Caution**

Avoid application to large areas · cardiac arrhythmias · mania · severe heart disease · susceptibility to angle-closure glaucoma · urinary retention

**Interactions** Appendix 1: tricyclic antidepressants

**Side-effects**

- Common or very common Dizziness · drowsiness
- Frequency not known Antimuscarinic effects · fever · gastro-intestinal disturbances · headache · irritation · local burning · rash · stinging · tingling

**Pregnancy**

Manufacturer advises use only if potential benefit outweighs risk.

**Breast feeding**

Manufacturer advises use only if potential benefit outweighs risk.

**Hepatic impairment**

Manufacturer advises caution in severe liver disease.

**Patient and carer advice**

A patient information leaflet should be provided.

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving).

Effects of alcohol enhanced.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

- **Xepin** (Cambridge Healthcare Supplies Ltd)
  - Doxepin hydrochloride 50% per 1 gram Xepin 5% cream | 30 gram | £11.70

**Levomenthol and derivatives**

**Levomenthol**

**Indications and dose**

- **Pruritus**
  - To the skin
  - Adult: Apply 1–2 times a day

**Caution**

Avoid use in buccal mucosa · avoid use near eyes · avoid use on broken skin · avoid use on very inflamed skin · use on doctor's advice for children under 5 years

**Pregnancy**

Manufacturer advises avoid, especially during the first trimester — no information available.

**Breast feeding**

No information available; avoid application to nipple area.
6 Rosacea and acne

Rosacea and Acne

Acne

Treatment of acne should be commenced early to prevent scarring. Patients should be counselled that an improvement may not be seen for at least a couple of months. The choice of treatment depends on whether the acne is predominantly inflammatory or comedonal and its severity.

Mild to moderate acne is generally treated with topical preparations. Systemic treatment with oral antibacterials is generally used for moderate to severe acne or where topical preparations are not tolerated or are ineffective or where application to the site is difficult. Another oral preparation used for acne is the hormone treatment co-cyproterone acetate (cyproterone acetate with ethinylestradiol) p. 1163; it is for women only.

Severe acne, acne unresponsive to prolonged courses of oral antibacterials, scarring, or acne associated with psychological problems calls for early referral to a consultant dermatologist who may prescribe isotretinoin p. 1166 for administration by mouth.

Topical preparations for acne

In mild to moderate acne, comedones and inflamed lesions respond well to benzoyl peroxide p. 1164 or to a topical retinoid. Alternatively, topical application of an antibacterial such as erythromycin p. 510 or clindamycin p. 1164 may be effective for inflammatory acne. If topical preparations prove inadequate, oral preparations may be needed.

Benzoyl peroxide and azelaic acid

Benzoyl peroxide is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with treatment continued at a reduced frequency of application. If the acne does not respond after 2 months then use of a topical antibacterial should be considered.

Azelaic acid p. 1165 has antimicrobial and anticomedonal properties. It may be an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face. Some patients prefer azelaic acid because it is less likely to cause local irritation than benzoyl peroxide.

Topical antibacterials for acne

For many patients with mild to moderate inflammatory acne, topical antibacterials may be no more effective than topical benzoyl peroxide or tretinoin p. 867. Topical antibacterials are probably best reserved for patients who wish to avoid oral antibacterials or who cannot tolerate them. Topical preparations of erythromycin and clindamycin are effective for inflammatory acne. Topical antibacterials can produce mild irritation of the skin, and on rare occasions cause sensitisation; gastro-intestinal disturbances have been reported with topical clindamycin.

Antibacterial resistance of Propionibacterium acnes is increasing; there is cross-resistance between erythromycin and clindamycin. To avoid development of resistance:

- when possible use non-antibiotic antimicrobials (such as benzoyl peroxide or azelaic acid);
- avoid concomitant treatment with different oral and topical antibacterials;
- if a particular antibacterial is effective, use it for repeat courses if needed (short intervening courses of benzoyl peroxide or azelaic acid may eliminate any resistant propionibacteria);
- do not continue treatment for longer than necessary (however, treatment with a topical preparation should be continued for at least 6 months).

Some manufacturers of topical antibacterial preparations for acne advise that preparations containing alcohol are not suitable for use with benzoyl peroxide.

Topical retinoids and related preparations for acne

Topical tretinoin, its isomer isotretinoin, and adapalene p. 1165 (a retinoid-like drug), are useful for treating comedones and inflammatory lesions in mild to moderate acne. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. Isotretinoin is given by mouth in severe acne.

Other topical preparations for acne

Preparations containing aluminium oxide p. 1168 are available for inflammatory acne.

A topical preparation of nicotinamide p. 1165 is not considered beneficial in acne.

Oral preparations for acne

Systemic antibacterial treatment is useful for inflammatory acne if topical treatment is not adequately effective or if it is inappropriate. Anticomendonal treatment (e.g. with topical benzoyl peroxide) may also be required.

Either oxytetracycline p. 536 or tetracycline p. 536 is usually given for acne. If there is no improvement after the first 3 months another oral antibacterial should be used. Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer.

Doxycycline p. 534 and lymecycline p. 535 are alternatives to tetracycline.

Although minocycline p. 535 is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation; it is given in a once or twice daily dose.

Erythromycin in a twice daily dose is an alternative for the management of acne but propionibacteria strains resistant to erythromycin are becoming widespread and this may explain poor response.
Triclosan 1.8 may be used for acne resistant to other antibacterials [unlicensed indication]. Prolonged treatment with triclosan may depress haematopoiesis; it should generally be initiated by specialists.

Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.

**Hormone treatment for acne**

Co-cyprindiol (cyproterone acetate with ethinyleradiol) contains an anti-androgen. It is licensed for use in women with moderate to severe acne that has not responded to topical therapy or oral antibiotics, and for moderately severe hirsutism. Although it is an effective hormonal contraceptive, it should not be used solely for contraception.

Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some women with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent.

**Oral retinoid for acne**

The retinoid isotretinoin reduces sebum secretion. It is used for the systemic treatment of nodulo-cystic and conglobate acne, severe acne, scarring, acne which has not responded to an adequate course of a systemic antibacterial, or acne which is associated with psychological problems. It is also useful in women who develop acne in the third or fourth decades of life, since late onset acne is frequently unresponsive to antibacterials.

Isotretinoin is a toxic drug that should be prescribed only by, or under the supervision of, a consultant dermatologist. It is given for at least 16 weeks; repeat courses are not normally required.

Side-effects of isotretinoin include severe dryness of the skin and mucous membranes, nose bleeds, and joint pains. The drug is teratogenic and must not be given to women of child-bearing age unless they practise effective contraception (oral progestogen-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. Women must also be registered with a pregnancy prevention programme.

Although a causal link between isotretinoin p. 1166 use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

**Rosacea**

Rosacea is not comedonal (but may exist with acne which may be comedonal). Brimonidine tartrate p. 1169 is licensed for the treatment of facial erythema in rosacea. The pustules and papules of rosacea respond to topical azelaic acid p. 1165, topical ivermectin p. 1169 or to topical metronidazole p. 1127. Alternatively oral administration of oxytetracycline p. 536 or tetracycline p. 536, or erythromycin p. 510, can be used; courses usually last 6–12 weeks and are repeated intermittently. Doxycycline p. 534 can be used [unlicensed indication] if oxytetracycline or tetracycline is inappropriate (e.g. in renal impairment). A modified-release preparation of doxycycline is licensed in low daily doses for the treatment of facial rosacea. Isotretinoin is occasionally given in refractory cases [unlicensed indication]. Camouflagers may be required for the redness.

**6.1 Acne**

### Anti-androgens

#### Co-cyprindiol

<table>
<thead>
<tr>
<th><strong>INDICATIONS AND DOSE</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Moderate to severe acne in females of child-bearing age refractory to topical therapy or oral antibacterials</td>

**Acne vulgaris**
- **TO THE SKIN**
- Child 12-17 years: Apply once daily, dose to be applied in the evening
- Adult: Apply once daily, dose to be applied in the evening

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

- **Gel**
  - **EXCIPIENTS:** May contain Disodium edetate
  - Clindamycin (as Clindamycin phosphate) 10 mg per 1 gram
  - Benzoyl peroxide 30 mg per 1 gram
    - Duac Once Daily gel (3% and 1%) | 30 gram [PoM] £13.14 DT price = £13.14 | 60 gram [PoM] £26.28
  - Clindamycin (as Clindamycin phosphate) 10 mg per 1 gram
  - Benzoyl peroxide 50 mg per 1 gram

### DERMATOLOGICAL DRUGS > ABRASIVE AGENTS

**Aluminium oxide**

### INDICATIONS AND DOSE

**Acne vulgaris**
- **TO THE SKIN**
- Adult: Apply 1–3 times a day, to be used instead of soap

**CONTRA-INDICATIONS**
Superficial venules • telangiectasia

**CAUTIONS**
Avoid contact with eyes

**SIDE-EFFECTS**
Skin irritation (discontinue use temporarily)

**PATIENT AND CARER ADVICE**
Patients should discontinue use temporarily if skin becomes irritated.

**LESS SUITABLE FOR PRESCRIBING**
Less suitable for prescribing (not considered beneficial).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

- **Paste**
  - **EXCIPIENTS:** May contain Fragrances, n-(3-chloroallyl)hexaminium chloride (quaternium 15)
  - Brasivol (GlaxoSmithKline Consumer Healthcare)
    - Aluminium oxide 380 mg per 1 gram
    - Brasivol Fine No. 1 38% paste | 75 gram [GSL] £2.76

### RETINOID AND RELATED DRUGS

**Adapalene**

### INDICATIONS AND DOSE

**Mild to moderate acne vulgaris**
- **TO THE SKIN**
- Child 12-17 years: Apply once daily, apply thinly in the evening
- Adult: Apply once daily, apply thinly in the evening

**CAUTIONS**
Avoid accumulation in angles of the nose • avoid contact with eyes, nostrils, mouth and mucous membranes

**SIDE-EFFECTS**
- Common or very common Local irritation (reduce frequency or discontinue temporarily)
- Uncommon Skin discoloration
- Frequency not known Worsening of asthma

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

- **Cream**
  - **EXCIPIENTS:** May contain Propylene glycol
  - Skinoren (Bayer Plc)
    - Azelaic acid 200 mg per 1 gram
    - Skinoren 20% cream | 30 gram [PoM] £3.74 DT price = £3.74
  - Gel
    - **EXCIPIENTS:** May contain Disodium edetate, polysorbates, propylene glycol
    - Finacea (Bayer Plc)
      - Azelaic acid 150 mg per 1 gram
      - Finacea 15% gel | 30 gram [PoM] £7.48 DT price = £7.48

### Papulopustular rosacea

- **TO THE SKIN**
- Adult: Apply twice daily, discontinue if no improvement after 2 months

**SKINOREN®**

- **Acne vulgaris**
  - **TO THE SKIN**
  - Child 12-17 years: Apply twice daily
  - Adult: Apply twice daily

- **Acne vulgaris in patients with sensitive skin**
  - **TO THE SKIN**
  - Child 12-17 years: Apply once daily for 1 week, then apply twice daily
  - Adult: Apply once daily for 1 week, then apply twice daily

**CONCEPTION AND CONTRACEPTION**
Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

**PREGNANCY**
Avoid.

**BREAST FEEDING**
Amount of drug in milk probably too small to be harmful; ensure infant does not come in contact with treated areas.

**PATIENT AND CARER ADVICE**
If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.
Adapalene with benzoyl peroxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, adapalene p. 1165, benzoyl peroxide p. 1164.

- **INDICATIONS AND DOSE**
  - **Acne vulgaris**
    - **TO THE SKIN**
    - Child 9–17 years: Apply once daily, to be applied thinly in the evening
    - Adult: Apply once daily, to be applied thinly in the evening

- **INTERACTIONS** → Appendix 1: retinoids
- **CONCEPTION AND CONTRACEPTION** Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).
- **PATIENT AND CARER ADVICE** Gel may bleach clothing and hair.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) Decisions**
    - The *Scottish Medicines Consortium* has advised (March 2014) that **Epiduo®** should be restricted for use in mild to moderate facial acne when monotherapy with benzoyl peroxide or adapalene is inappropriate.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - **CAUTIONARY AND ADVISORY LABELS**
    - **EXCIPIENTS:** May contain Disodium edetate, hydroxybenzoates (parabens)
    - **Adapalene (Non-proprietary)**
      - Adapalene 1 mg per 1 gram Adapalene 0.1% cream | 45 gram (POM) £19.73 DT price = £16.43
      - **Differin** (Galderma (UK) Ltd)
        - Adapalene 1 mg per 1 gram Differin 0.1% cream | 45 gram (POM) £16.43 DT price = £16.43
  - **Gel**
    - **CAUTIONARY AND ADVISORY LABELS**
    - **EXCIPIENTS:** May contain Disodium edetate, hydroxybenzoates (parabens), propylene glycol
    - **Adapalene (Non-proprietary)**
      - Adapalene 1 mg per 1 gram Adapalene 0.1% gel | 45 gram (POM) £19.73 DT price = £16.43
      - **Differin** (Galderma (UK) Ltd)
        - Adapalene 1 mg per 1 gram Differin 0.1% gel | 45 gram (POM) £16.43 DT price = £16.43

---

Isotretinoin

- **INDICATIONS AND DOSE**
  - **Topical treatment of mild to moderate acne**
    - **TO THE SKIN**
    - Adult: Apply 1–2 times a day, to be applied thinly
  - **Severe acne (under expert supervision)**
    - Acne which is associated with psychological problems (under expert supervision)
    - Acne which has not responded to an adequate course of a systemic antibacterial (under expert supervision)
    - Acne with scarring (under expert supervision)
  - **SYSTEMIC TREATMENT OF NODULO-CYSTIC AND CONGLOMBATE ACNE (UNDER EXPERT SUPERVISION)**
    - **BY MOUTH**
    - Adult: Initially 500 micrograms/kg daily in 1–2 divided doses, increased if necessary to 1 mg/kg daily for 16–24 weeks, repeat treatment course after a period of at least 8 weeks if relapse after first course; maximum 150 mg/kg per course

- **CONTRA-INDICATIONS**
  - With oral use Hyperlipidaemia · Hypervitaminosis A
  - With topical use Perioral dermatitis · Rosacea

- **CAUTIONS**
  - With oral use avoid blood donation during treatment and for at least 1 month after treatment · Diabetes · Dry eye syndrome (associated with risk of keratitis) · History of depression · Monitor for depression
  - With topical use allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid · Alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application) · Avoid accumulation in angles of the nose · Avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin · Avoid exposure to UV light (including sunlight, solariums) · Avoid in severe acne involving large areas · Avoid use of topical retinoids with abrasive cleaners, comedogenic or astringent cosmetics · Caution in sensitive areas such as the neck · Personal or familial history of non-melanoma skin cancer

- **INTERACTIONS** → Appendix 1: retinoids

- **SIDE-EFFECTS**
  - Common or very common
  - With oral use
    - Anaemia · Arthralgia · Dryness of eyes (with blepharitis and conjunctivitis) · Dryness of lips (sometimes cheilitis) · Dryness of nasal mucosa (with epistaxis) · Dryness of pharyngeal mucosa (with hoarseness) · Dryness of skin (with dermatitis, scaling, thinning, erythema, pruritus) · Epidermal fragility (trauma may cause blistering) · Haematuria · Headache · Myalgia · Proteinuria · Raised blood-glucose concentration · Raised plasma-triglyceride concentration · Raised serum-cholesterol concentration · Reduced high-density lipoprotein concentration · Raised serum-transaminase concentration · Thrombocytopenia · Thrombocytosis
  - Rare
    - With oral use Aggressive behaviour · Alopecia · Anxiety · Depression · Mood changes · Skin reactions
  - Very rare
    - With oral use
      - Acne fulminans · Allergic vasculitis · Arthritis · Benign intracranial hypertension · Blurred vision · Bone changes following long-term administration · Calcification of tendons and ligaments following long-term administration · Cataracts · Colour blindness · Convulsions · Corneal opacities · Decreased night vision · Decreased tolerance to contact lenses · Diabetes mellitus · Dizziness · Drowsiness · Early epiphysial closure following long-term administration · Exacerbation of acne · Gastrointestinal haemorrhage · Glomerulonephritis · Gram-positive infections of skin and mucous membranes · Granulomatous...
lesions • haemorrhagic diarrhoea • hepatitis • hirsutism • hyperuricaemia • impaired hearing • increased sweating • inflammatory bowel disease • keratitis • lymphadenopathy • malaise • nail dystrophy • nausea • papilloedema • paronychia • photophobia • photosensitivity • psychosis • raised serum–creatinine kinase concentration • reduced bone density following long-term administration • skeletal hyperostosis following long-term administration • skin hyperpigmentation • suicidal ideation • tendinitis • visual disturbances

- Frequency not known
- With oral use Stevens–Johnson syndrome • toxic epidermal necrolysis
- With topical use Blistering of skin • burning • crusting of skin • dry or peeling skin • erythema • eye irritation • increased sensitivity to UVB light or sunlight • oedema • pruritus • stinging

SIDE-EFFECTS, FURTHER INFORMATION
- Management of side-effects Risk of pancreatitis if triglycerides above 9 mmol/litre—discontinue if uncontrolled hypertriglyceridaemia or pancreatitis. Psychiatric side-effects require expert referral. Discontinue treatment if skin peeling severe or haemorrhagic diarrhoea develops. Visual disturbances require expert referral and possible withdrawal.

CONCEPTION AND CONTRACEPTION
- Pregnancy prevention
  - With oral use Effective contraception must be used. In women of child-bearing potential, exclude pregnancy up to 3 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Each prescription for isotretinoin should be limited to a supply of up to 30 days’ treatment and dispensed within 7 days of the date stated on the prescription; repeat prescriptions or fixed prescriptions are not acceptable. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.
  - With topical use Females of child-bearing age must use effective contraception (oral progestogen–only contraceptives not considered effective).

PREGNANCY Contra-indicated in pregnancy (teratogenic).

BREAST FEEDING Avoid.

HEPATIC IMPAIRMENT
- With oral use Avoid—further impairment may occur.

RENAL IMPAIRMENT
- With oral use In severe impairment, reduce initial dose (e.g. 10 mg daily) and increase gradually up to 1 mg/kg daily as tolerated.

MONITORING REQUIREMENTS
- With oral use Measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised).

PRESCRIBING AND DISPENSING INFORMATION Isotretinoin is an isomer of tretinoin.

- PATIENT AND CARER ADVICE
  - With oral use Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment.
  - Patients and carers should be told how to recognise signs and symptoms of psychiatric disorders such as depression, anxiety, and rarely suicidal thoughts.
  - With topical use Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

MEDICINAL FORMS

Isotretinoin with erythromycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, isotretinoin p. 1166, erythromycin p. 510.

INDICATIONS AND DOSE
- Topical treatment of mild to moderate acne
  - TO THE SKIN
  - Adult: (consult product literature)

INTERACTIONS Appendix 1: macrolides, retinoids

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gel

CAUTIONARY AND ADVISORY LABELS 11

EXCIPIENTS: May contain Butylated hydroxytoluene

- Isotrexin (Siefel Laboratories (UK) Ltd)
- Isotretinoin 500 microgram per 1 gram, Erythromycin 20 mg per 1 gram Isotrexin gel | 30 gram PBM £7.47 DT price + £7.47
Tretinoin with clindamycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, tretinoin p. 867, clindamycin p. 1164.

**INDICATIONS AND DOSE**

**Facial acne**
- **Child 12-17 years**: Apply daily, (to be applied thinly at bedtime)
- **Adult**: Apply daily, (to be applied thinly at bedtime)

**CONTRA-INDICATIONS** Perioral dermatitis - personal or familial history of non-melanoma skin cancer - rosacea

**CAUTIONS** Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid - alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application) - avoid accumulation in angles of the nose - avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin - avoid exposure to UV light (including sunlight, solariums) - avoid in severe acne involving large areas - avoid use of topical retinoids with abrasive cleaners, comedogenic or astringent cosmetics - caution in sensitive areas such as the neck

**INTERACTIONS** → Appendix 1: clindamycin, retinoids

**SIDE-EFFECTS** Blistering of skin - burning - crusting of skin - dry or peeling skin (discontinue if severe) - erythema - eye irritation - increased sensitivity to UVB light or sunlight - oedema - pruritus - stinging - temporary changes of skin pigmentation

**CONCEPTION AND CONTRACEPTION** Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

**PREGNANCY** Contra-indicated in pregnancy.

**BREAST FEEDING** Amount of drug in milk after topical application probably too small to be harmful; ensure infant does not come in contact with treated areas.

**PATIENT AND CARER ADVICE** If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

Patients and carers should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop.

SIDE-EFFECTS

- Common or very common: Burning sensation
- Uncommon: Dry skin, pruritus, skin irritation
- Frequency not known: Contact dermatitis, erythema

PREGNANCY

Manufacturer advises avoid—limited information but toxicity following oral use in animal studies.

BREAST FEEDING

Manufacturer advises avoid—limited information but present in milk following oral use.

HEPATIC IMPAIRMENT

Manufacturer advises use with caution in severe impairment—no information available.

DIRECTIONS FOR ADMINISTRATION

Manufacturer advises apply thinly to the face only, avoiding contact with eyes, lips and mucosa.

PATIENT AND CARER ADVICE

Wash hands immediately after use.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2015) that ivermectin (Soolantra®) is accepted for restricted use within NHS Scotland for the treatment of moderate-to-severe inflammatory lesions of rosacea (papulopustular) where a topical treatment is considered appropriate.

All Wales Medicines Strategy Group (AWMSG) Decisions

The All Wales Medicines Strategy Group has advised (April 2016) that ivermectin (Soolantra®) is recommended as an option for use within NHS Wales for the topical treatment of inflammatory lesions of rosacea (papulopustular) in adult patients.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, isopropyl palmitate, propylene glycol containing the same drug.

DRUG ACTION

Brimonidine, an alpha2-adrenoceptor agonist, is used to reduce erythema in rosacea by cutaneous vasoconstriction.

INDICATIONS AND DOSE

Facial erythema in rosacea

▶ TO THE SKIN

▶ Adult: Apply once daily until erythema subsides, apply thinly, divide dose over forehead, chin, nose, and cheeks, max. 1 g of gel per day

DOSE EQUIVALENCE AND CONVERSION

1 g of gel contains 5 mg of brimonidine tartrate (equivalent to 3.3 mg of brimonidine).

CONTRA-INDICATIONS

Neonates and children under 2 years (risk of severe systemic side-effects)

CAUTIONS

Cerebral insufficiency—coronary insufficiency—depression—postural hypotension—Raynaud’s syndrome—severe cardiovascular disease—thromboangiitis obliterans

INTERACTIONS

Appendix 1: brimonidine

SIDE-EFFECTS

- Common or very common: Burning sensation at application site—stinging at application site
- Uncommon: Dry mouth, dry skin, headache, paraesthesia, skin irritation

PREGNANCY

Manufacturer advises avoid—limited information available.

BREAST FEEDING

Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT

Manufacturer advises use with caution.

RENAL IMPAIRMENT

Manufacturer advises use with caution.

DIRECTIONS FOR ADMINISTRATION

Avoid contact with eyes, mouth, and mucous membranes; avoid use on irritated skin or open wounds; apply other topical preparations (including cosmetics) only after brimonidine gel has dried on skin.

PATIENT AND CARER ADVICE

Patients should be advised on administration of gel.

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving).

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2014) that brimonidine (Mirvaso®) is accepted for restricted use within NHS Scotland for the symptomatic treatment of inflammatory rosacea (papulopustular) in adult patients.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BRIMONIDINE GEL (MIRVASO®): RISK OF EXACERBATION OF ROSACEA (NOVEMBER 2016)

Symptom exacerbation has been reported very commonly in patients treated with brimonidine gel. Treatment should be initiated with a small amount of gel (less than the maximum dose) for at least 1 week, then increased gradually, based on tolerability and response. Patients should be counselled on the importance of not exceeding the maximum daily dose, and advised to stop treatment and seek medical advice if symptoms worsen during treatment.
treatment of moderate to severe persistent facial erythema associated with rosacea in adult patients.

7 Scalp and hair conditions

Scalp and hair conditions

Overview

Dandruff is considered to be a mild form of seborrhoeic dermatitis. Shampoos containing antimicrobial agents such as pyrithione zinc (which are widely available) and selenium sulﬁde shampoo as an antibacterial agent also may be used. A cream or an ointment containing coal tar with salicylic acid is very helpful in Psoriasis. Ketocnazole shampoo p. 1130 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1153 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in Psoriasis. Ketocnazole shampoo p. 1130 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1153 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in Psoriasis. Ketocnazole shampoo p. 1130 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1153 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in Psoriasis. Ketocnazole shampoo p. 1130 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1153 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in Psoriasis. Ketocnazole shampoo p. 1130 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1153 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in Psoriasis. Ketocnazole shampoo p. 1130 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1153 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in Psoriasis. Ketocnazole shampoo p. 1130 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1153 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in Psoriasis. Ketocnazole shampoo p. 1130 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1153 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in Psoriasis. Ketocnazole shampoo p. 1130 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1153 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in Psoriasis. Ketocnazole shampoo p. 1130 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1153 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in Psoriasis. Ketocnazole shampoo p. 1130 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1153 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in Psoriasis. Ketocnazole shampoo p. 1130 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1153 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in Psoriasis. Ketocnazole shampoo p. 1130 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1153 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in Psoriasis. Ketocnazole shampoo p. 1130 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1153 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in Psoriasis. Ketocnazole shampoo p. 1130 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.
7.1 Alopecia

Other drugs used for Alopecia

Finasteride, p. 742

Minoxidil

## INDICATIONS AND DOSE

**REGAINE® FOR MEN EXTRA STRENGTH FOAM**

Androgenetic alopecia

- **TO THE SKIN**
- Adult: Apply 0.5 capful twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 16 weeks

**REGAINE® FOR MEN EXTRA STRENGTH SOLUTION**

Androgenetic alopecia

- **TO THE SKIN**
- Adult: Apply 1 mL twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 1 year

**REGAINE® FOR WOMEN REGULAR STRENGTH**

Androgenetic alopecia

- **TO THE SKIN**
- Adult: Apply 1 mL twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 1 year

## CONTRA-INDICATIONS

Phaeochromocytoma

## CAUTIONS

- Avoid contact with broken, infected, shaved, or inflamed skin.
- Avoid contact with eyes.
- Avoid contact with mucous membranes.
- Avoid inhalation of spray mist.
- Avoid occlusive dressings.

## CAUTIONS, FURTHER INFORMATION

When used topically system effects unlikely; only about 1–2% absorbed (greater absorption may occur with use on inflamed skin).

## INTERACTIONS

Appendix 1: minoxidil

## SIDE-EFFECTS

- Common or very common: Headache, local irritation
- Uncommon: Changes in hair colour or texture (discontinue if increased hair loss persists for more than 2 weeks).
- Hypotension

## SIDE-EFFECTS, FURTHER INFORMATION

When used topically systemic effects unlikely; only about 1–2% absorbed (greater absorption may occur with use on inflamed skin).

## PREGNANCY

Avoid—possible toxicity including reduced placental perfusion. Neonatal hirsutism reported.

## BREAST FEEDING

Present in milk but not known to be harmful.

## PATIENT AND CARER ADVICE

Ensure hair and scalp dry before application. Patients and their carers should be advised to wash hands after application of liquid or foam.

7.2 Hirsutism

Other drugs used for Hirsutism

Co-cyprindiol, p. 1163

## ANTIPROTOZOALS

### Eflornithine

**DRUG ACTION**

An antiprotozoal drug that inhibits the enzyme ornithine decarboxylase in hair follicles.

### INDICATIONS AND DOSE

Adjunct to laser therapy for focal hirsutism in women

- **TO THE SKIN**
- Adult: Apply twice daily, to be applied thinly, discontinue use if no improvement after 4 months of treatment

### SIDE-EFFECTS

- Common or very common: Acne, burning at application site
- Uncommon: Abnormal hair growth, abnormal hair texture

### PREGNANCY

Toxicity in animal studies—manufacturer advises avoid.

### BREAST FEEDING

Manufacturer advises avoid—no information available.

### PATIENT AND CARER ADVICE

Medicines must be rubbed in thoroughly. Cosmetics may be applied over treated area 5 minutes after eflornithine, do not wash treated area for 4 hours after application.

### NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2005) that eflornithine for facial hirsutism is restricted for use in women in whom alternative drug treatment cannot be used.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens)

- Vaniqa (Almirall Ltd)
  - Eflornithine (as Eflornithine monohydrate chloride) 115 mg per 1 gram
    - Vaniqa 11.5% cream | 60 gram | £56.87
    - Vaniqa 11.5% foam | 50 gram | £39.13

### Liquid

EXCIPIENTS: May contain Propylene glycol

- Regaine (McNeil Products Ltd)
  - Minoxidil 20 mg per 1 mL
    - Regaine for Women Regular Strength 2% solution | 60 mL (GSL) | £14.16
    - Regaine for Men Extra Strength 5% solution | 180 mL (GSL) | £39.71

### Foam

EXCIPIENTS: May contain Butylated hydroxytoluene, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

- Regaine (McNeil Products Ltd)
  - Minoxidil 50 mg per 1 gram
    - Regaine for Men Extra Strength 5% scalp foam | 60 gram (GSL) | £21.84
    - Regaine for Men Extra Strength 5% scalp foam | 180 gram (GSL) | £46.33

### Other drugs used for Hirsutism

Co-cyprindiol, p. 1163

### VASODILATORS

#### Minoxidil

**REGAINE® FOR MEN EXTRA STRENGTH FOAM**

Androgenetic alopecia

- **TO THE SKIN**
- Adult: Apply 0.5 capful twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 16 weeks

**REGAINE® FOR MEN EXTRA STRENGTH SOLUTION**

Androgenetic alopecia

- **TO THE SKIN**
- Adult: Apply 1 mL twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 1 year

**REGAINE® FOR WOMEN REGULAR STRENGTH**

Androgenetic alopecia

- **TO THE SKIN**
- Adult: Apply 1 mL twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 1 year

**CONTRA-INDICATIONS**

Phaeochromocytoma

**CAUTIONS**

- Avoid contact with broken, infected, shaved, or inflamed skin.
- Avoid contact with eyes.
- Avoid contact with mucous membranes.
- Avoid inhalation of spray mist.
- Avoid occlusive dressings.

**CAUTIONS, FURTHER INFORMATION**

When used topically systemic effects unlikely; only about 1–2% absorbed (greater absorption may occur with use on inflamed skin).

**INTERACTIONS**

Appendix 1: minoxidil

**SIDE-EFFECTS**

- Common or very common: Headache, local irritation
- Uncommon: Changes in hair colour or texture (discontinue if increased hair loss persists for more than 2 weeks).
- Hypotension

**SIDE-EFFECTS, FURTHER INFORMATION**

When used topically systemic effects unlikely; only about 1–2% absorbed (greater absorption may occur with use on inflamed skin).

**PREGNANCY**

Avoid—possible toxicity including reduced placental perfusion. Neonatal hirsutism reported.

**BREAST FEEDING**

Present in milk but not known to be harmful.

**PATIENT AND CARER ADVICE**

Ensure hair and scalp dry before application. Patients and their carers should be advised to wash hands after application of liquid or foam.
8 Skin cleansers, antiseptics and desloughing agents

Skin cleansers, antiseptics and desloughing agents

Skin cleansers and antiseptics
Soap or detergent is used with water to cleanse intact skin; emollient preparations such as aqueous cream or emulsifying ointment can be used in place of soap or detergent for cleansing dry skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing chlorhexidine p. 1173 or povidone-iodine below, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics.

Antiseptics such as chlorhexidine or povidone-iodine are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing cetrimide can be used if a detergent effect is also required.

Hydrogen peroxide p. 1174, an oxidising agent, can be used in solutions of up to 6% for skin disinfection, such as cleansing and deodorising wounds and ulcers. Hydrogen peroxide is also available as a cream for superficial bacterial skin infections.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride 0.9% solution is used, but tap water is often appropriate.

Potassium permanganate below solution 1 in 10000, a mild antiseptic with astringent properties, can be used for exudative eczematous areas; treatment should be stopped when the skin becomes dry.

Desloughing agents
Alginate, hydrogel and hydrocolloid dressings are effective at wound debridement. Sterile larvae (maggots) (available from BioMonde) are also used for managing sloughing wounds and are prescribable on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised. Gravitational dermatitis may be complicated by absorbed and perilesional skin is easily sensitised.

VALENTINE AND CARER ADVICE Can stain clothing, skin and nails (especially with prolonged use).

ANTISEPTICS AND DISINFECTANTS

Potassium permanganate

- INDICATIONS AND DOSE
  - Cleansing and deodorising suppurating eczematous reactions and wounds
    - TO THE SKIN
    - Adult: For wet dressings or baths, use approximately 0.01% (1 in 10 000) solution

- CAUTIONS
  - Irritant to mucous membranes

- DIRECTIONS FOR ADMINISTRATION
  - Potassium permanganate 0.1% solution to be diluted 1 in 10 to provide a 0.01% (1 in 10 000) solution. With potassium permanganate tablets for solution, 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10 000) solution.

- PATIENT AND CARER ADVICE
  - Can stain clothing, skin and nails (especially with prolonged use).

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

    - Tablet for cutaneous solution
      - Potassium permanganate (Non-proprietary)

        - Potassium permanganate 400 mg Potassium permanganate 400mg tablets for cutaneous solution | 30 tablet no price available DT price = £17.50
      - Permitabs (Alliance Pharmaceuticals Ltd)

        - Potassium permanganate 400 mg Permitabs 400mg tablets for cutaneous solution | 30 tablet £17.50 DT price = £17.50

Alcohol

(Industrial methylated spirit)

- INDICATIONS AND DOSE
  - Skin preparation before injection
    - TO THE SKIN
    - Child: Apply as required
    - Adult: Apply as required

- CONTRA-INDICATIONS
  - Neonates

- CAUTIONS
  - Avoid broken skin • flammable • patients have suffered severe burns when diathermy has been preceded by application of alcoholic skin disinfectants

- SIDE-EFFECTS
  - Overdose
  - Features of acute alcohol intoxication include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis.

  - For details on the management of poisoning, see Alcohol, under Emergency treatment of poisoning p. 1249.

- PRESCRIBING AND DISPENSING INFORMATION
  - Industrial methylated spirits defined by the BP as a mixture of 19 volumes of ethyl alcohol of an appropriate strength with 1 volume of approved wood naphtha.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  - Liquid
    - Alcohol (Non-proprietary)
      - Industrial methylated spirit 70% | 600 ml £6.30
      - Wood naphtha 50 ml per 1 litre, Ethanol 950 ml per 1 litre Industrial methylated spirit 95% | 600 ml £5.04 | 1000 ml £4.46–£12.45

Povidone-iodine

- INDICATIONS AND DOSE
  - Skin disinfection
    - TO THE SKIN
    - Child: (consult product literature)
    - Adult: (consult product literature)

- BETADINE ® DRY POWDER SPRAY
  - Skin disinfection, particularly minor wounds and infections
    - TO THE SKIN
    - Adult: Not for use in serous cavities (consult product literature)

#### CONTRA-INDICATIONS  Avoid regular use in patients with thyroid disorders (in adults) • concomitant use of lithium • corrected gestational age under 32 weeks • infants body-weight under 1.5 kg • regular use in neonates

#### CAUTIONS  Broken skin • large open wounds

- Large open wounds: The application of povidone–iodine to large wounds or severe burns may produce systemic adverse effects such as metabolic acidosis, hypernatraemia and impairment of renal function.

#### SIDE-EFFECTS  Rare  Sensitivity

- **PREGNANCY**  Sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester.

- **BREAST FEEDING**  Avoid regular or excessive use.

- **RENAL IMPAIRMENT**  Avoid regular application to inflamed or broken skin or mucosa.

#### EFFECT ON LABORATORY TESTS  May interfere with thyroid function tests.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

- **Spray**
  - Betadine (Aspire Pharma Ltd)
    - Povidone-iodine 25 mg per 1 gram  Betadine 2.5% dry powder spray 100 ml [GEL] £9.95 DT price = £9.95

- **Liquid**
  - CAUTIONARY AND ADVISORY LABELS  15 (Only for use with alcoholic solutions)

      - Povidone-iodine 75 mg per 1 ml  Videne 7.5% surgical scrub solution 500 ml [GEL] £7.67
      - Povidone-iodine 100 mg per 1 ml  Videne 10% antiseptic solution 500 ml [GEL] £7.67

### Skin cleansers, antiseptics and desloughing agents 1173

**SAVLON ® DRY**

**Skin disinfection of minor wounds**
- TO THE SKIN
- Adult: (consult product literature)

**VIDENE ® SOLUTION**

**Skin disinfection**
- TO THE SKIN
- Child: Apply undiluted in pre-operative skin disinfection and general antisepsis
- Adult: Apply undiluted in pre-operative skin disinfection and general antisepsis

**VIDENE ® SURGICAL SCRUB ®**

**Skin disinfection**
- TO THE SKIN
- Child: Use as a pre-operative scrub for hand and skin disinfection
- Adult: Use as a pre-operative scrub for hand and skin disinfection

**VIDENE ® TINCTURE**

**Skin disinfection**
- TO THE SKIN
- Adult: Apply undiluted in pre-operative skin disinfection

- **CONTRA-INDICATIONS**  Avoid regular use in patients with thyroid disorders (in adults) • concomitant use of lithium • corrected gestational age under 32 weeks • infants body-weight under 1.5 kg • regular use in neonates

- **CAUTIONS**  Broken skin • large open wounds

- **SIDE-EFFECTS**  Rare  Sensitivity

- **PREGNANCY**  Sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester.

- **BREAST FEEDING**  Avoid regular or excessive use.

- **RENAL IMPAIRMENT**  Avoid regular application to inflamed or broken skin or mucosa.

- **EFFECT ON LABORATORY TESTS**  May interfere with thyroid function tests.
**Chlorhexidine with cetrimide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 1173.

### Indications and Dose

**Skin disinfection such as wound cleansing and obstetrics**
- **To the skin**
- **Child:** To be used undiluted
- **Adult:** To be used undiluted

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

**Cream**
- **Chlorhexidine with cetrimide (Non-proprietary)**
  - Chlorhexidine gluconate 1 mg per 1 gram, Cetrimide 5 mg per 1 gram
  - **Savlon antiseptic cream**
    - 15 gram [GSL] £1.19
    - 60 gram [GSL] £1.91
    - 100 gram [GSL] £2.78

**Irrigation solution**
- **Chlorhexidine with cetrimide (Non-proprietary)**
  - Chlorhexidine acetate 150 microgram per 1 ml, Cetrimide 1.5 mg per 1 ml
  - Chlorhexidine acetate 0.015% / Cetrimide 0.15% irrigation solution 3 litre bottles
  - 1 bottle [P] no price available

**Liquid**
- **Savlon disinfectant** (GlaxoSmithKline Consumer Healthcare)
  - Chlorhexidine gluconate 3 mg per 1 ml, Cetrimide 30 mg per 1 ml
  - **Savlon disinfectant liquid**
    - 500 ml £1.32

- **Sterets Tisept (Molnlycke Health Care Ltd)**
  - Chlorhexidine gluconate 150 microgram per 1 ml, Cetrimide 1.5 mg per 1 ml
  - **Sterets Tisept solution 25ml sachets**
    - 25 sachet [P] £5.33
  - **Sterets Tisept solution 100ml sachets**
    - 10 sachet [P] £6.85

---

**Diethyl phthalate with methyl salicylate**

### Indications and Dose

**Skin preparation before injection**
- **To the skin**
- **Adult:** Apply to the area to be disinfected

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

**Liquid**
- **Diethyl phthalate with methyl salicylate (Non-proprietary)**
  - **Methyl salicylate** 5 ml per 1 litre, **Diethyl phthalate** 20 ml per 1 litre
  - Castor oil 25 ml per 1 litre, **Industrial methylated spirit** 950 ml per 1 litre
  - **Surgical spirit**
    - 200 ml [GSL] £1.15 DT price = £1.15
    - 1000 ml [GSL] £3.62

---

**Hydrogen peroxide**

### Indications and Dose

**For skin disinfection, particularly cleansing and deodorising wounds and ulcers**
- **To the skin**
- **Adult:** Use 3% and 6% solutions (consult product literature)

### Drug Action

Hydrogen peroxide is an oxidising agent.

---

**Chlorhexidine gluconate with isopropyl alcohol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 1173.

### Indications and Dose

**Skin disinfection before invasive procedures**
- **To the skin**
- **Child:** 2 months-17 years: (consult product literature)
- **Adult:** (consult product literature)

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

**Liquid**
- **Chloraprep** (CareFusion U.K. Ltd)
  - Chlorhexidine gluconate 20 mg per 1 ml, Isopropyl alcohol
    - **700 ml per 1 litre** Chloraprep with Tint solution 10.5ml applicators

8.1 Minor cuts and abrasions

Minor cuts and abrasions

Management
Many preparations traditionally used to manage minor burns, and abrasions have fallen out of favour. Preparations containing camphor and sulfonamides should be avoided. Preparations such as magnesium sulfate paste are now rarely used to treat carbuncles and boils as these are best treated with antibiotics.

Cetrimide is used to treat minor cuts and abrasions and proflavine above may be used to treat infected wounds or burns, but its use has now been largely superseded by other antiseptics or suitable antibacterials. The effervescent effect of hydrogen peroxide p. 1174 is used to clean minor cuts and abrasions.

Flexible collodion (see castor oil with collodion and flexible collodion) may be used to seal minor cuts and wounds that have partially healed; skin tissue adhesives are used similarly, and also for additional suture support.
● DIRECTIONS FOR ADMINISTRATION  Paste should be stirred before use.

● MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  Paste
  ▶ Glycerol with magnesium sulfate and phenol (Non-proprietary)
    Phenol 5 mg per 1 gram, Magnesium sulfate dried 450 mg per 1 gram, Glycerol 550 mg per 1 gram  Magnesium sulfate paste  | 25 gram £1.24  | 50 gram £2.48  | NHS indicative price = £2.48

DERMATOLOGICAL DRUGS  COLLODIONS

Castor oil with collodion and colophony

● INDICATIONS AND DOSE
  Used to seal minor cuts and wounds that have partially healed
  ▶ TO THE SKIN
  ▶ Child: (consult product literature)
  ▶ Adult: (consult product literature)

● ALLERGY AND CROSS-SENSITIVITY
  Contra-indicated if patient has an allergy to colophony in elastic adhesive plasters and tape.

● MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  Liquid
  ▶ Castor oil with collodion and colophony (Non-proprietary)
    Castor oil 25 mg per 1 ml, Colophony 25 mg per 1 ml, Collodion methylated 950 micro litre per 1 ml Flexible collodion methylated | 100 ml £13.54  | 500 ml £27.79

Skin adhesives

● SKIN ADHESIVES
  DermaFlex skin adhesive (Chemence Ltd)  0.5 ml  |  NHS indicative price = £5.36  | Drug Tariff (Part IXa)
  Dermabond ProPen skin adhesive (Ethicon Ltd)  0.5 ml  |  NHS indicative price = £19.46  | Drug Tariff (Part IXa)
  Histoacryl L skin adhesive (B. Braun Medical Ltd)  0.5 ml  |  NHS indicative price = £6.72  | Drug Tariff (Part IXa)

  Indermil skin adhesive (Covidien (UK) Commercial Ltd)  5 gram  |  NHS indicative price = £6.50  | Drug Tariff (Part IXa)
  LiquiBand flow control tissue adhesive (MedLogic Global Ltd)  0.5 gram  |  NHS indicative price = £5.50  | Drug Tariff (Part IXa)
  LiquiBand tissue adhesive (MedLogic Global Ltd)  0.5 gram  |  NHS indicative price = £5.50  | Drug Tariff (Part IXa)

9  Skin disfigurement

Camouflagers

Overview
Disfigurement of the skin can be very distressing to patients and may have a marked psychological effect. Skilled hands, or with experience, camouflage cosmetics can be very effective in concealing scars and birchmarks. The depigmented patches in vitiligo are also very disfiguring and camouflage creams are of great cosmetic value. Opaque cover foundation or cream is used to mask skin pigment abnormalities; careful application using a combination of dark- and light-coloured cover creams set with powder helps to minimise the appearance of skin deformities.

Borderline substances
The preparations marked ‘ACBS’ can be prescribed on the NHS for postoperative scars and other deformities and as adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo.

Camouflages

● CAMOUFLAGES
  Covermark classic foundation (Derma UK Ltd)  15 ml (ACBS)  |  NHS indicative price = £11.86
  Covermark finishing powder (Derma UK Ltd)  25 gram (ACBS)  |  NHS indicative price = £11.86
  Covermark removing cream (Derma UK Ltd)  200 ml  |  No NHS indicative price available
  Dermablend Dermasmooth Corrective Foundation (Vichy)  30 ml  |  No NHS indicative price available
  Dermacolor Creme Effectiv (Kryolan UK Ltd)  50 ml  |  NHS indicative price = £5.73
  Dermacolor body camouflage (Kryolan UK Ltd)  50 ml  |  NHS indicative price = £8.94
  Dermacolor camouflage creme (Kryolan UK Ltd)  30 gram  |  NHS indicative price = £11.00
  Dermacolor cleansing cream (Kryolan UK Ltd)  75 gram  |  No NHS indicative price available
  Dermacolor fixing powder (Kryolan UK Ltd)  60 gram (ACBS)  |  NHS indicative price = £9.85
  Keromask finishing powder (Bellava Ltd)  20 gram (ACBS)  |  NHS indicative price = £5.80
  Keromask masking cream (Bellava Ltd)  15 ml (ACBS)  |  NHS indicative price = £5.90
  Veil cleansing cream (Thomas Blake Cosmetic Creams Ltd)  50 gram  |  NHS indicative price = £2.45  |  100 gram  |  NHS indicative price = £3.90
  Veil cover cream (Thomas Blake Cosmetic Creams Ltd)  19 gram (ACBS)  |  NHS indicative price = £22.42  |  44 gram (ACBS)  |  NHS indicative price = £33.35  |  70 gram (ACBS)  |  NHS indicative price = £42.10
  Veil finishing powder (Thomas Blake Cosmetic Creams Ltd)  35 gram (ACBS)  |  NHS indicative price = £24.58

10  Sun protection and photodamage

Photodamage

Overview
Patients should be advised to use a high-SPF sunscreen and to minimise exposure of the skin to direct sunlight or sun lamps.

Topical treatments can be used for actinic keratosis. An emollient may be sufficient for mild lesions. Diclofenac sodium gel p. 1177 is suitable for the treatment of superficial lesions in mild disease. Fluorouracil cream p. 1178 is effective against most types of non-hypertrophic actinic keratosis; a solution containing fluorouracil with salicylic acid p. 1178 is available for the treatment of low or moderately thick hyperkeratotic actinic keratoses. Imiquimod p. 1181 is used for lesions on the face and scalp when cryotherapy or other topical treatments cannot be used. Fluorouracil and imiquimod produce a more marked inflammatory reaction than diclofenac sodium but lesions resolve faster. A short course of ingenol mebutate p. 1178 is licensed for the treatment of non-hypertrophic actinic keratoses; response to treatment can usually be assessed 8 weeks after the course. Photodynamic therapy in
combination with methyl-5-aminolevulinate cream (Metvix®, available from Galderma) or 5-aminolevulinic acid gel (Ameluz®, available from Spirit Healthcare) is used in specialist centres for treating superficial and confluent, non-hypertrophic actinic keratosis when other treatments are inadequate or unsuitable; it is particularly suitable for multiple lesions, for periorbital lesions, or for lesions located at sites of poor healing.

Imiquimod or topical fluorouracil is used for treating superficial basal cell carcinomas. Photodynamic therapy in combination with methyl-5-aminolevulinate cream is used in specialist centres for treating superficial, nodular basal cell carcinomas when other treatments are unsuitable.

**Sunscreen**

**Sunscreen preparations**

Solar ultraviolet irradiation can be harmful to the skin. It is responsible for disorders such as polymorphic light eruption, solar urticaria, and it provokes the various cutaneous porphyrias. It also provokes (or at least aggravates) skin lesions of lupus erythematosus and may aggravate rosacea and some other dermatoses. Certain drugs, such as demeclocycline, phenothiazines, or amiodarone, can cause photosensitivity. All these conditions (as well as sunburn) may occur after relatively short periods of exposure to the sun. Solar ultraviolet radiation may provoke attacks of recurrent herpes labialis (but it is not known whether the effect of sunlight exposure is local or systemic).

The effects of exposure over longer periods include ageing changes and more importantly the initiation of skin cancer. Solar ultraviolet radiation is approximately 200–400 nm in wavelength. The medium wavelengths (290–320 nm, known as UVB) cause sunburn. The long wavelengths (320–400 nm, known as UVA) are responsible for many photosensitivity reactions and photodermatoses. Both UVA and UVB contribute to long-term photodamage and to the changes responsible for skin cancer and ageing.

Sunscreen preparations contain substances that protect the skin against UVA and UVB radiation, but they are no substitute for covering the skin and avoiding sunlight. The sun protection factor (SPF, usually indicated in the preparation title) provides guidance on the degree of protection offered against UVB; it indicates the multiples of protection provided against burning, compared with unprotected skin; for example, an SPF of 8 should enable a person to remain 8 times longer in the sun without burning. However, in practice, users do not apply sufficient sunscreen product and the protection is lower than that found in experimental studies.

Some manufacturers use a star rating system to indicate the protection against UVA relative to protection against UVB for sunscreen products. However, the usefulness of the star rating system remains controversial. The EU Commission (September 2006) has recommended that the UVA protection factor for a sunscreen should be at least one-third of the sun protection factor (SPF); products that achieve this requirement will be labelled with a UVA logo alongside the SPF classification. Preparations that also contain reflective substances, such as titanium dioxide, provide the most effective protection against UVA.

Sunscreen preparations may rarely cause allergic reactions.

For optimum photoprotection, sunscreen preparations should be applied thickly and frequently (approximately 2 hourly). In photodermatoses, they should be used from spring to autumn. As maximum protection from sunlight is desirable, preparations with the highest SPF should be prescribed.

The European Commission Cosmetic Products Regulation (EC) 1223/2009 requires the use of INCI (International Nomenclature of Cosmetic Ingredients) for cosmetics and sunscreens. This table includes the rINN and the INCI synonym for the active ingredients of sunscreen preparations in the BNF.

### Borderline substances

*Antheias®* XL SPF 50+ Melt-in cream; *Sunsense®* Ultra; *Uvistat®* Lipscreen SPF 50; and *Uvistat®* Suncream SPF 30 and 50 (see *Borderline substances*) are regarded as drugs when prescribed for skin protection against ultraviolet radiation in abnormal cutaneous photosensitivity resulting from genetic disorders or photodermatoses, including vitiligo and those resulting from radiotherapy; chronic or recurrent herpes simplex labialis. Preparations with SPF less than 30 should not normally be prescribed.

### ANALGESICS » NON-Steroidal ANTI-INFLAMMATORY DRUGS

#### Diclofenac sodium

- **INDICATIONS AND DOSE**

  **SOLARAZE®**

  **Actinic keratosis**

  ➤ TO THE SKIN

  ➤ Adult: Apply twice daily for 60–90 days, to be applied thinly; maximum 8 g per day

- **CAUTIONS** Avoid contact with eyes - avoid contact with inflamed or broken skin - avoid contact with mucous membranes - not for use with occlusive dressings - topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

- **INTERACTIONS** ➤ Appendix 1: NSAIDs

- **SIDE-EFFECTS** Paraesthesia - photosensitivity - rash (discontinue use if develops)

  ➤ **SIDE-EFFECTS, FURTHER INFORMATION** Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **PREGNANCY** Patient packs for topical preparations carry a warning to avoid during pregnancy.
Fluorouracil with salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluorouracil above, salicylic acid p. 1182.

**INDICATIONS AND DOSE**

**Low or moderately thick hyperkeratotic actinic keratosis**

- **TO THE SKIN**
  - Adult: Apply once daily for up to 12 weeks, reduced to 3 times a week if severe side effects occur and until side-effects improve, to be applied to the affected area, if treating area with thin epidermis, reduce frequency of application and monitor response more often; maximum area of skin treated at one time, 25 cm² (e.g. 5 cm × 5 cm)

**INTERACTIONS** → Appendix 1: fluorouracil

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Gel**

EXCIPIENTS: May contain Benzyl alcohol, fragrances, propylene glycol

- Solaraze (Almirall Ltd)
  - Diclofenac sodium 30 mg per 1 gram Solaraze 3% gel | 50 gram [POM] £38.30 DT price = £38.30 | 100 gram [POM] £76.60

**ANTINEOPLASTIC DRUGS** → ANTIMETABOLITES

**Fluorouracil**

**INDICATIONS AND DOSE**

Superficial malignant and pre-malignant skin lesions

- **TO THE SKIN USING CREAM**
  - Adult: Apply 1–2 times a day for 3–4 weeks (usual duration of initial therapy), apply thinly to the affected area, maximum area of skin 500 cm² (e.g. 23 cm × 23 cm) treated at one time, alternative regimens may be used in some settings

- **CAUTIONS** Avoid contact with eyes and mucous membranes • do not apply to bleeding lesions

- **INTERACTIONS** → Appendix 1: fluorouracil

- **SIDE-EFFECTS** Erythema multiforme • local irritation (use a topical corticosteroid for severe discomfort associated with inflammatory reactions) • photosensitivity

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- **PREGNANCY** Manufacturers advise avoid (teratogenic). 

- **BREAST FEEDING** Manufacturers advise avoid.

- **HANDLING AND STORAGE** Caution in handling—irritant to tissues.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates, propylene glycol

- Efudix (Meda Pharmaceuticals Ltd)
  - Fluorouracil 50 mg per 1 gram Efudix 5% cream | 40 gram [POM] £32.90 DT price = £32.90

**PROTEIN KINASE C ACTIVATORS**

**Ingenol mebutate**

**INDICATIONS AND DOSE**

Actinic keratosis on trunk and extremities

- **TO THE SKIN**
  - Adult: Apply once daily for 3 days, use the 150 microgram/g gel

Actinic keratosis on face and scalp

- **TO THE SKIN**
  - Adult: Apply once daily for 2 days, use the 500 microgram/g gel

- **CAUTIONS** Avoid contact with broken skin • avoid contact with eyes • avoid contact with inside of ears • avoid contact with with inside of nostrils • avoid contact with lips • avoid occlusive dressings on treated area

- **SIDE-EFFECTS**
  - **Common or very common** Blistering • local irritation • local oedema • pain • pruritus

- **Uncommon** Local ulceration • paraesthesia

- **PREGNANCY** Not absorbed from skin, but manufacturer advises avoid.

- **BREAST FEEDING** Not absorbed from skin; ensure infant does not come in contact with treated area for 6 hours after application.

**DIRECTIONS FOR ADMINISTRATION** One tube covers skin area of 25 cm². Allow gel to dry on treatment area for 15 minutes. Avoid washing or touching the treated area for 6 hours after application; after this time, area may be washed with mild soap and water. Avoid use immediately after shower or less than 2 hours before bedtime.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Gel**

EXCIPIENTS: May contain Benzyl alcohol

- Picato (LEO Pharma)
  - Ingenol mebutate 150 microgram per 1 gram Picato 150 micrograms/g gel | 1.41 gram [POM] £65.00
  - Ingenol mebutate 500 microgram per 1 gram Picato 500 micrograms/g gel | .94 gram [POM] £65.00
11 Superficial soft-tissue injuries and superficial thrombophlebitis

Topical circulatory preparations

Overview
These preparations are used to improve circulation in conditions such as bruising, superficial thrombophlebitis, chilblains and varicose veins but are of little value. Chilblains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective.

HEPARINOIDS

Heparinoid

- INDICATIONS AND DOSE
  - Superficial thrombophlebitis | Bruising | Haematoma
    - TO THE SKIN
    - Adult: Apply up to 4 times a day

- CONTRA-INDICATIONS
  - Should not be used on large areas of skin, broken or sensitive skin, or mucous membranes

- LESS SUITABLE FOR PRESCRIBING
  - Hirudoid is less suitable for prescribing.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Cream
    - EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens)
    - Hirudoid (Genus Pharmaceuticals Ltd)
      - Heparinoid 3 mg per 1 gram Hirudoid 0.3% cream | 50 gram P £3.99 DT price = £3.99
  - Gel
    - EXCIPIENTS: May contain Fragrances, propylene glycol
    - Hirudoid (Genus Pharmaceuticals Ltd)
      - Heparinoid 3 mg per 1 gram Hirudoid 0.3% gel | 50 gram P £3.99 DT price = £3.99

12 Warts and calluses

Warts and calluses

Overview
Warts (verrucas) are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region; treatment usually relies on local tissue destruction. Warts may regress on their own and treatment is required only if the warts are painful, unsightly, persistent, or cause distress.

Preparations of salicylic acid p. 1182, formaldehyde p. 1180, glutaraldehyde p. 1180 or silver nitrate p. 1181 are available for purchase by the public; they are suitable for the removal of warts on hands and feet. Salicylic acid is a useful keratolytic which may be considered first-line; it is also suitable for the removal of corns and calluses. Preparations of salicylic acid in a collodion basis are available but some patients may develop an allergy to colophony in the formulation; colloid should be avoided in children allergic to elastic adhesive plaster. Cryotherapy causes pain, swelling, and blistering, and may be no more effective than topical salicylic acid in the treatment of warts.

Anogenital warts
The treatment of anogenital warts (condylomata acuminata) should be accompanied by screening for other sexually transmitted infections. Podophyllotoxin p. 1180 (the major active ingredient of podophyll) may be used for soft, non-keratinised external anogenital warts. Patients with a limited number of external warts or keratinised lesions may be better treated with cryotherapy or other forms of physical ablation. Imiquimod cream p. 1181 is licensed for the treatment of external anogenital warts; it may be used for both keratinised and non-keratinised lesions. It is also licensed for the treatment of superficial basal cell carcinoma and actinic keratosis. Camellia sinensis below ointment is licensed for the treatment of external anogenital warts. Inosine pranobex p. 599 is licensed for adjunctive treatment of genital warts but it has been superseded by more effective drugs.

ANTINEOPLASTIC DRUGS > PLANT ALKALOIDS

Camellia sinensis

- DRUG ACTION
  - Camellia sinensis is an extract from green tea leaves. The exact mechanism of action is not known; non-clinical studies have shown inhibition of the growth of activated keratinocytes, and anti-oxidative effects at the site of application.

- INDICATIONS AND DOSE
  - Warts (external genital and perianal) in immunocompetent patients
  - TO THE LESION
  - Adult: Apply up to 250 mg 3 times a day until complete clearance of warts (maximum 16 weeks), do not exceed treatment period even if new warts develop; maximum 750 mg per day

- DOSE EQUIVALENCE AND CONVERSION
  - 250 mg is equivalent to 0.5 cm of ointment.

- CAUTIONS
  - Avoid broken skin · avoid contact with eyes · avoid contact with lips · avoid contact with mouth · avoid contact with nostrils · avoid inflamed skin · uncircumcised males (risk of phimosis) · vulvar region

- SIDE-EFFECTS
  - Common or very common · Local reactions · lymphadenopathy · phimosis
  - Uncommon · Balanitis · dyspareunia · dysuria · local infection · pollakisuria · rash · urinary urgency · vulvovaginitis

- CONCEPTION AND CONTRACEPTION
  - Manufacturer advises Catephen® may weaken condoms and vaginal diaphragms—alternative methods of contraception should be considered.

- PREGNANCY
  - Manufacturer advises avoid—toxicity in animal studies.

- BREAST FEEDING
  - Manufacturer advises risk to infant cannot be excluded—no information available.

- HEPATIC IMPAIRMENT
  - Manufacturer advises avoid in severe impairment—no information available.

- DIRECTIONS FOR ADMINISTRATION
  - Manufacturer advises apply to each wart, ensuring a thin layer is left on the wart. It is not necessary to wash off the ointment from the area before next application.

- PATIENT AND CARER ADVICE
  - Manufacturer advises the ointment should be washed off before sexual activity. Manufacturer advises female patients using tampons should insert tampon before applying the ointment.

- NATIONAL FUNDING/ACCESS DECISIONS
  - Scottish Medicines Consortium (SMC) Decisions
    - The Scottish Medicines Consortium has advised (April 2016) that camellia sinensis (green tea) leaf extract (Catephen®)
is accepted for restricted use within NHS Scotland for the treatment of external genital and perianal warts in patients not suitable for podophyllotoxin or who have not responded to treatment with podophyllotoxin.

**All Wales Medicines Strategy Group (AWMSG) Decisions**
The All Wales Medicines Strategy Group has advised (October 2016) that green tea leaf extract (camellia sinensis), (Catephen®), is recommended for restricted use within NHS Wales for the treatment of external genital and perianal warts in patients not suitable for podophyllotoxin or who have not responded to treatment with podophyllotoxin.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  - **Ointment**
    - Catephen (KoRa Healthcare)
    - Camellia sinensis extract 100 mg per 1 gram Catephen 10% ointment | 15 gram [POM] £39.00

**Podophyllotoxin**

- **INDICATIONS AND DOSE**
  **CONDYLINE®**
  Condylomata acuminata affecting the penis or the female external genitalia
  - TO THE LESION
  - Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of five 3-day treatment courses, direct medical supervision for lesions in the female and for lesions greater than 4 cm² in the male, maximum 50 single applications (‘loops’) per session (consult product literature)

**WARTICON® CREAM**
Condylomata acuminata affecting the penis or the female external genitalia
- TO THE LESION
- Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm²

**WARTICON® LIQUID**
Condylomata acuminata affecting the penis or the female external genitalia
- TO THE LESION
- Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm², maximum 50 single applications (‘loops’) per session (consult product literature)

- **CAUTIONS**
  - Avoid normal skin · avoid open wounds · keep away from face · very irritant to eyes
  - **SIDE-EFFECTS**
  - Local irritation
  - **PREGNANCY**
  - Avoid.
  - **BREAST FEEDING**
  - Avoid.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), sorbic acid
    - **Warticon** (Stiefel Laboratories (UK) Ltd)
      - Podophyllotoxin 1.5 mg per 1 gram Warticon 0.15% cream | 5 gram [POM] £17.83 DT price = £17.83

**Antiseptics and Disinfectants**

**Glutaraldehyde**

- **INDICATIONS AND DOSE**
  Warts, particularly plantar warts
  - TO THE LESION
  - Child: Apply twice daily
  - Adult: Apply twice daily

- **UNLICENSED USE**
  Licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS**
  Impaired peripheral circulation · not suitable for application to anogenital region · not suitable for application to face · not suitable for application to large areas · patients with diabetes at risk of neuropathic ulcers · protect surrounding skin and avoid broken skin · significant peripheral neuropathy

- **SIDE-EFFECTS**
  Skin irritation · skin ulceration (with high concentrations)

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid
  - **Gel**
    - Veracur (Typharm Ltd)
      - Formaldehyde 7.5 mg per 1 ml Veracur 0.75% gel | 15 gram [GEL] £2.41
  - **Liquid**
    - Formaldehyde (Non-proprietary)
      - Formaldehyde 40 mg per 1 ml Formaldehyde (Buffered) 4% solution | 1000 ml £3.90
      - Formaldehyde 350 mg per 1 gram Formaldehyde solution | 500 ml £5.90 DT price = £5.90 | 2000 ml £16.98

**Glutaraldehyde**

- **INDICATIONS AND DOSE**
  Warts, particularly plantar warts
  - TO THE LESION
  - Child: Apply twice daily
  - Adult: Apply twice daily

- **UNLICENSED USE**
  Licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS**
  Not for application to anogenital areas · not for application to face · not for application to mucosa · protect surrounding skin

- **SIDE-EFFECTS**
  Rashes · skin irritation (discontinue if severe) · stains skin brown

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  - **Paint**
    - Glutarol (Dermal Laboratories Ltd)
      - Glutaraldehyde 100 mg per 1 ml Glutarol 10% cutaneous solution | 10 ml [P] £2.07 DT price = £2.07
Silver nitrate

- **INDICATIONS AND DOSE**

  **Common warts**
  - **TO THE LESION**
  - Child: Apply every 24 hours for up to 3 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application.
  - Adult: Apply every 24 hours for up to 3 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application.

  **Verrucas**
  - **TO THE LESION**
  - Child: Apply every 24 hours for up to 6 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application.
  - Adult: Apply every 24 hours for up to 6 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application.

  **Umbilical granulomas**
  - **TO THE SKIN**
  - Child: Apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes, protect surrounding skin with soft paraffin.
  - Adult: Apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes, protect surrounding skin with soft paraffin.

- **UNLICENSED USE**
  - In children: No age range specified by manufacturer.

- **CAUTIONS**
  - Avoid broken skin: not suitable for application to large areas. Protect surrounding skin.

- **SIDE-EFFECTS**
  - Chemical burns on surrounding skin: Stains skin

- **PATIENT AND CARER ADVICE**
  - Patients should be advised that silver nitrate may stain fabric.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Stick**
  - **Silver nitrate (Non-proprietary)**
    - Silver nitrate 400 mg per 1 gram: Silver nitrate 40% caustic pencils (1 applicator, no price available).
    - Avoca (Bray Group Ltd): Silver nitrate 400 mg per 1 gram: Avoca 40% silver nitrate pencils (1 applicator, £1.03).
    - Silver nitrate 750 mg per 1 gram: Avoca 75% silver nitrate applicators (100 applicator, £44.48).
    - Avoca 75% silver nitrate applicators with thick handles (50 applicator, £43.41).
    - Silver nitrate 950 mg per 1 gram: Avoca 95% silver nitrate applicators (100 applicator, £44.52).
    - Avoca 95% silver nitrate pencils (1 applicator, £1.99 DT price = £2.44).
    - Avoca wart and verruca treatment set (1 applicator, £2.44 DT price = £2.44).

- **ANTIVIRALS › IMMUNE RESPONSE MODIFIERS**

  - **Imiquimod**
    - **INDICATIONS AND DOSE**
      - **ALDARA®**
        - **Warts (external genital and perianal)**
          - **TO THE LESION**
          - Adult: Apply 3 times a week until lesions resolve (maximum 16 weeks), to be applied thinly at night.

        - **Superficial basal cell carcinoma**
          - **TO THE LESION**
          - Adult: Apply daily for 5 nights of each week for 6 weeks, to be applied to lesion and 1 cm beyond it, assess response 12 weeks after completing treatment.

        - **Actinic keratosis**
          - **TO THE LESION**
          - Adult: Apply once daily for 2 weeks, to be applied at bedtime to lesion on face or balding scalp, repeat course after a 2-week treatment-free interval; repeat 4-week course if lesions persist, maximum 2 courses.

      - **ZYCLARA®**
        - **Actinic keratosis**
          - **TO THE SKIN**
          - Adult: Apply once daily for 2 weeks, to be applied at bedtime to lesion on face or balding scalp, repeat course after a 2-week treatment-free interval, assess response 8 weeks after second course; maximum 2 sachets per day.

    - **CAUTIONS**
      - Autoimmune disease: avoid broken skin.
      - Avoid contact with eyes.
      - Avoid contact with lips.
      - Avoid contact with nostrils.
      - Avoid open wounds.
      - Immunosuppressed patients: not suitable for internal genital warts.
      - Uncircumcised males (risk of phimosis or stricture of foreskin).

    - **SIDE-EFFECTS**

    - **Uncommon**
      - Alopecia: local ulceration.

    - **Rare**
      - Cutaneous lupus erythematosus-like effect: Stevens-Johnson syndrome.

    - **Very rare**
      - Dysuria.

    - **Frequency not known**
      - Permanent hyperpigmentation: permanent hypopigmentation.

    - **CONCEPTION AND CONTRACEPTION**
      - May damage latex condoms and diaphragms.

    - **PREGNANCY**
      - No evidence of teratogenicity or toxicity in animal studies; manufacturer advises caution.

    - **BREAST FEEDING**
      - No information available.

    - **DIRECTIONS FOR ADMINISTRATION**
      - ZYCLARA®
        - **Important**
          - Should be rubbed in and allowed to stay on the treated area for 8 hours, then washed off with mild soap and water.

      - ALDARA®
        - **Important**
          - Should be rubbed in and allowed to stay on the treated area for 6–10 hours for warts or for 8 hours for basal cell carcinoma and actinic keratosis, then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact.

      - **PATIENT AND CARER ADVICE**
        - A patient information leaflet should be provided.
**Skin**

---

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**CAUTIONARY AND ADVISORY LABELS**

- **UNLICENSED USE** Not licensed for use in children under 2 years.
- **CAUTIONS** Avoid broken skin - impaired peripheral circulation - not suitable for application to anogenital region - not suitable for application to face - not suitable for application to large areas - patients with diabetes at risk of neuropathic ulcer - significant peripheral neuropathy
- **SIDE-EFFECTS** Skin irritation - skin ulceration (with high concentrations)
- **PATIENT AND CARER ADVICE** Advise patient to apply carefully to wart and to protect surrounding skin (e.g. with soft paraffin or specially designed plaster); rub wart surface gently with file or pumice stone once weekly.

**SALICYLIC ACID AND DERIVATIVES**

### Salicylic acid

**INDICATIONS AND DOSE**

**OCCLUSAL**

- **Common and plantar warts**
  - **TO THE LESION**
  - Child: Apply daily, treatment may need to be continued for up to 3 months
  - Adult: Apply daily, treatment may need to be continued for up to 3 months

**VERRUGON**

- **For plantar warts**
  - **TO THE LESION**
  - Child: Apply daily, treatment may need to be continued for up to 3 months
  - Adult: Apply daily, treatment may need to be continued for up to 3 months

**SALICYLIC ACID WITH LACTIC ACID**

The properties listed below are those particular to the combination only. For the properties of the components please consider, salicylic acid above.

**INDICATIONS AND DOSE**

**CUPLEX**

- **Plantar and mosaic warts | Corns | Calluses**
  - **TO THE LESION**
  - Adult: Apply daily, treatment may need to be continued for up to 3 months

**DUOFILM**

- **Plantar and mosaic warts**
  - **TO THE LESION**
  - Adult: Apply daily, treatment may need to be continued for up to 3 months

**SALACTOL**

- **Warts, particularly plantar warts | Verrucas | Corns | Calluses**
  - **TO THE LESION**
  - Adult: Apply daily, treatment may need to be continued for up to 3 months

**PRESCRIBING AND DISPENSING INFORMATION**

Preparations of salicylic acid in a collodion basis (Cuplex and Salactol) are available but some patients may develop an allergy to colophony in the formulation.

---

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Paint**

- **Duofilm** (GlaxoSmithKline UK Ltd)
  - Lactic acid 150 mg per 1 gram, Salicylic acid 167 mg per 1 gram 15 ml £2.25

- **Salactol** (Dermal Laboratories Ltd)
  - Lactic acid 167 mg per 1 gram, Salicylic acid 167 mg per 1 gram 10 ml £1.71

**Gel**

- **Cuplex** (Crawford Healthcare Ltd)
  - Lactic acid 40 mg per 1 gram, Salicylic acid 110 mg per 1 gram 5 gram £2.88

- **Salatac** (Dermal Laboratories Ltd)
  - Lactic acid 40 mg per 1 gram, Salicylic acid 120 mg per 1 gram 8 gram £2.98

---

**SALICYLIC ACID IN COMBINATION WITH OTHER ACTIVES**

### Occlusal

- **Common and plantar warts**
  - **TO THE LESION**
  - Child: Apply daily, treatment may need to be continued for up to 3 months
  - Adult: Apply daily, treatment may need to be continued for up to 3 months

---

**EXCIPIENTS:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates

- Aldara (Meda Pharmaceuticals Ltd)
  - Imiquimod 50 mg per 1 gram Aldara 5% cream 250 mg sachets 12 sachets £48.60
  - Zyclara (Meda Pharmaceuticals Ltd)
  - Imiquimod 37.5 mg per 1 gram Zyclara 3.75% cream 250 mg sachets 28 sachets £113.00

---

**SALATAC**

- **Warts | Verrucas | Corns | Calluses**
  - **TO THE LESION**
  - Adult: Apply daily, treatment may need to be continued for up to 3 months

**SALICYLIC ACID AND LACTIC ACID COMBINATION**

- **TO THE LESION**
  - Child: Apply daily, treatment may need to be continued for up to 3 months
  - Adult: Apply daily, treatment may need to be continued for up to 3 months

---

**SALICYLIC ACID AND LACTIC ACID COMBINATION IN COMBINATION WITH OTHER ACTIVES**

- **TO THE LESION**
  - Child: Apply daily, treatment may need to be continued for up to 3 months
  - Adult: Apply daily, treatment may need to be continued for up to 3 months
Chapter 14

Vaccines

## 1 Immunoglobulin therapy

### IMMUNE SERA AND IMMUNOGLOBULINS

### IMMUNOGLOBULINS

**Immunoglobulins**

**Passive immunity**

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought. The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated. Antibodies of human origin are usually termed immunoglobulins. The term antiserum is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antisera, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

Two types of human immunoglobulin preparation are available, normal immunoglobulin p. 1186 and disease-specific immunoglobulins.

Human immunoglobulin is a sterile preparation of concentrated antibodies (immune globulins) recovered from pooled human plasma or serum obtained from outside the UK, tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK, for further information consult [www.ivig.nhs.uk](http://www.ivig.nhs.uk) and [Clinical Guidelines for Immunoglobulin Use, www.gov.uk/dh](http://www.gov.uk/dh).

Further information on the use of immunoglobulins is included in Public Health England’s [Immunoglobulin Handbook www.gov.uk/phe](http://www.gov.uk/phe), and in the Department of Health’s publication, [Immunisation against Infectious Disease, www.gov.uk/dh](http://www.gov.uk/dh).

**Availability**

Normal immunoglobulin for intramuscular administration is available from some regional Public Health laboratories for protection of contacts and the control of outbreaks of hepatitis A, measles, and rubella only. For other indications, subcutaneous or intravenous normal immunoglobulin should be purchased from the manufacturer.

Disease-specific immunoglobulins are available from some regional Public Health laboratories, with the exception of tetanus immunoglobulin p. 1188 which is available from BPL, hospital pharmacies, or blood transfusion departments. Rabies immunoglobulin p. 1188 is available from the Specialist and Reference Microbiology Division, Public Health England, Colindale. Hepatitis B immunoglobulin p. 1186 required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the [Scottish National Blood Transfusion Service (SNBTS)](http://www.scottishnhsbt.org.uk).

In Wales all immunoglobulins are available from the [Welsh Blood Service (WBS)](http://www.welshbloodservice.co.uk).

In Northern Ireland all immunoglobulins are available from the [Northern Ireland Blood Transfusion Service (NIBTS)](http://www.nibts.org.uk).

**Normal immunoglobulin**

Human normal immunoglobulin ('HNIG') is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

**Uses**

Normal immunoglobulin (containing 10%–18% protein) is administered by intramuscular injection for the protection of susceptible contacts against [hepatitis A](http://www.gov.uk/phe), measles, mumps, [rubella](http://www.gov.uk/phe), and, to a lesser extent, varicella. Injection of immunoglobulin produces immediate protection lasting several weeks.

Normal immunoglobulin (containing 3%–12% protein) for intravenous administration is used as replacement therapy for patients with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred. Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

**Hepatitis A**

Hepatitis A vaccine p. 1209 is preferred for individuals at risk of infection including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and New Zealand). In unimmunised individuals, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin is no longer recommended for routine prophylaxis in travellers, but it may be indicated for immunocompromised patients if their antibody response to the vaccine is unlikely to be adequate.
Intramuscular normal immunoglobulin is recommended for prevention of infection in close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age; normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts at risk of severe disease up to 28 days after exposure to the primary case. Hepatitis A vaccine can be given at the same time, but it should be given at a separate injection site.

**Measles**

Intravenous or subcutaneous normal immunoglobulin may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Patients with compromised immunity who have come into contact with measles should receive intravenous or subcutaneous normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days.

Subcutaneous or intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of measles or with a person associated with a local outbreak:

- non-immune pregnant women
- infants under 9 months

Further advice should be sought from the Centre for Infections, Public Health England (tel. (020) 8200 6868).

Individuals with normal immunity who are not in the above categories and who have not been fully immunised against measles, can be given measles, mumps and rubella vaccine, live p. 1213 for prophylaxis following exposure to measles.

**Rubella**

Intramuscular immunoglobulin after exposure to rubella does not prevent infection in non-immune contacts and is not recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intra-uterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against Rubella, see measles, mumps and rubella vaccine, live p. 1213.

**Disease-specific immunoglobulins**

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see Immunoglobulin Handbook (www.gov.uk/phe).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin p. 1186 is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor measles, mumps and rubella vaccine, live is effective as post-exposure prophylaxis.

**Hepatitis B immunoglobulin**

Disease-specific hepatitis B immunoglobulin p. 1186 (‘HBIG’) is available for use in association with hepatitis B vaccine p. 1210 for the prevention of infection in laboratory and other personnel who have been accidentally inoculated with hepatitis B virus, and in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers. Hepatitis B immunoglobulin will not inhibit the antibody response when given at the same time as hepatitis B vaccine but should be given at different sites.

An intravenous and subcutaneous preparation of hepatitis B immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

**Rabies immunoglobulin**

Following exposure of an unimmunised individual to an animal in or from a country where the risk of rabies is high the site of the bite should be washed with soapy water and specific rabies immunoglobulin p. 1188 of human origin administered. All of the dose should be injected around the site of the wound; if this is difficult or the wound has completely healed it can be given in the anterolateral thigh (remote from the site used for vaccination).

Rabies vaccine p. 1214 should also be given intramuscularly at a different site (for details see rabies vaccine). If there is delay in giving the rabies immunoglobulin, it should be given within 7 days of starting the course of rabies vaccine.

**Tetanus immunoglobulin**

For the management of tetanus-prone wounds, tetanus immunoglobulin p. 1188 should be used in addition to wound cleansing and, where appropriate, antibacterial prophylaxis and a tetanus-containing vaccine. Tetanus immunoglobulin, together with metronidazole p. 512 and wound cleansing, should also be used for the treatment of established cases of tetanus.

**Varicella-zoster immunoglobulin**

Varicella-zoster immunoglobulin p. 1189 (VZIG) is recommended for individuals who are at increased risk of severe varicella and who have no antibodies to varicella-zoster virus and who have significant exposure to chickenpox or herpes zoster. Those at increased risk include:

- neonates whose mothers develop chickenpox in the period 7 days before to 7 days after delivery;
- susceptible neonates exposed in the first 7 days of life;
- susceptible neonates or infants exposed whilst requiring intensive or prolonged special care nursing;
- susceptible women exposed at any stage of pregnancy (but when supplies of VZIG are short, may only be issued to those exposed in the first 20 weeks’ gestation or to those near term) providing VZIG is given within 10 days of contact;
- immunocompromised individuals including those who have received corticosteroids in the previous 3 months at the following dose equivalents of prednisolone; children 2 mg/kg daily for at least 1 week or 1 mg/kg daily for 1 month; adults about 40 mg daily for more than 1 week.

**Important:** for full details consult Immunisation against Infectious Disease. Varicella-zoster vaccine p. 1216 is available.

**Anti-D (Rh0) immunoglobulin**

Anti-D (Rh0) immunoglobulin p. 1185 is prepared from plasma taken from rhesus-negative donors who have been immunised against the anti-D-antigen. Anti-D (Rh0) immunoglobulin is used to prevent a rhesus-negative mother from forming antibodies to fetal rhesus-positive cells which may pass into the maternal circulation. The objective is to protect any subsequent child from the hazard of haemolytic disease of the newborn.

Anti-D (Rh0) immunoglobulin should be administered to the mother following any sensitising episode (e.g. abortion, miscarriage and birth); it should be injected within 72 hours of the episode but even if a longer period has elapsed it may still give protection and should be administered.

Anti-D (Rh0) immunoglobulin is also given when significant foetal-maternal haemorrhage occurs in rhesus-negative women during delivery. The dose of Anti-D (Rh0)
immunoglobulin is determined according to the level of exposure to rhesus-positive blood.

Use of routine antenatal anti-D prophylaxis should be given irrespective of previous anti-D prophylaxis for a sensitising event early in the same pregnancy. Similarly, postpartum anti-D prophylaxis should be given irrespective of previous routine antenatal anti-D prophylaxis or antenatal anti-D prophylaxis for a sensitising event in the same pregnancy.

Anti-D (Rh\textsubscript{D}) immunoglobulin is also given to women of child-bearing potential after the inadvertent transfusion of rhesus-incompatible blood components and is used for the treatment of idiopathic thrombocytopenia purpura.

**MMR vaccine**

Measles, mumps and rubella vaccine, live may be given in the postpartum period with Anti-D (Rh\textsubscript{D}) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

### Anti-D (Rh\textsubscript{D}) immunoglobulin

- **INDICATIONS AND DOSE**
  - **To rhesus-negative woman for prevention of Rh\textsubscript{D}(D) sensitisation, following birth of rhesus-positive infant**
    - BY DEEP INTRAMUSCULAR INJECTION
    - Females of childbearing potential: 500 units per episode, dose to be administered immediately or within 72 hours; for transplacental bleed of over 4 mL fetal red cells, extra 100–125 units per mL fetal red cells, subcutaneous route used for patients with bleeding disorders
  - **To rhesus-negative woman for prevention of Rh\textsubscript{D}(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) up to 20 weeks' gestation**
    - BY DEEP INTRAMUSCULAR INJECTION
    - Females of childbearing potential: 250 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders
  - **To rhesus-negative woman for prevention of Rh\textsubscript{D}(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) after 20 weeks' gestation**
    - BY DEEP INTRAMUSCULAR INJECTION
    - Females of childbearing potential: 500 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders
  - **To rhesus-negative woman for prevention of Rh\textsubscript{D}(D) sensitisation, antenatal prophylaxis**
    - BY DEEP INTRAMUSCULAR INJECTION
    - Females of childbearing potential: 500 units per episode, dose to be given at weeks 28 and 34 of pregnancy, if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, subcutaneous route used for patients with bleeding disorders
  - **To rhesus-negative woman for prevention of Rh\textsubscript{D}(D) sensitisation, antenatal prophylaxis (alternative NICE recommendation)**
    - BY DEEP INTRAMUSCULAR INJECTION
    - Females of childbearing potential: 1000–1650 units, dose to be given at weeks 28 and 34 of pregnancy, alternatively 1500 units for 1 dose, dose to be given between 28 and 30 weeks gestation
  - **To rhesus-negative woman for prevention of Rh\textsubscript{D}(D) sensitisation, following Rh\textsubscript{D}(D) incompatible blood transfusion**
    - BY DEEP INTRAMUSCULAR INJECTION
    - Females of childbearing potential: 100–125 units per mL of transfused rhesus-positive red cells, subcutaneous route used for patients with bleeding disorders
  - **RHOPHYLAC\textsuperscript{®}**
    - **To rhesus-negative woman for prevention of Rh\textsubscript{D}(D) sensitisation, following birth of rhesus-positive infant**
      - BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
      - Females of childbearing potential: 1000–1500 units, dose to be administered immediately or within 72 hours for large transplacental bleed, extra 100 units per mL fetal red cells (preferably by intravenous injection), intravenous route recommended for patients with bleeding disorders
    - **To rhesus-negative woman for prevention of Rh\textsubscript{D}(D) sensitisation, following any potentially sensitising episode (e.g. abortion, amniocentesis, chorionic villous sampling) up to 12 weeks' gestation**
      - BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
      - Females of childbearing potential: 1000 units per episode, dose to be administered immediately or within 72 hours, intravenous route recommended for patients with bleeding disorders, higher doses may be required after 12 weeks gestation
    - **To rhesus-negative woman for prevention of Rh\textsubscript{D}(D) sensitisation, antenatal prophylaxis**
      - BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
      - Females of childbearing potential: 1500 units, dose to be given between weeks 28–30 of pregnancy; if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, intravenous route recommended for patients with bleeding disorders
    - **To rhesus-negative woman for prevention of Rh\textsubscript{D}(D) sensitisation, following Rh\textsubscript{D}(D) incompatible blood transfusion**
      - BY INTRAVENOUS INJECTION
      - Females of childbearing potential: 50 units per mL of transfused rhesus-positive blood, alternatively 100 units per mL of erythrocyte concentrate, intravenous route recommended for patients with bleeding disorders

- **CONTRA-INDICATIONS**
  - Treatment of idiopathic thrombocytopenia purpura in rhesus negative patients.
  - Treatment of idiopathic thrombocytopenia purpura in splenectomised patients.

- **CAUTIONS**
  - Immunoglobulin A deficiency.
  - Possible interference with live virus vaccines.

- **CAUTIONS, FURTHER INFORMATION**
  - MMR vaccine may be given in the postpartum period with anti-D (Rh\textsubscript{D}) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Rare: Anaphylaxis, dyspnoea, hypotension, tachycardia, urticaria.
    - Frequency not known: Abdominal pain, arthralgia, asthenia, back pain, diarrhoea, dizziness, drowsiness, fever, headache, hypertension, hypotension, injection site pain.
Immunoglobulin therapy

1186

- malaise • myalgia • nausea • pruritus • rash • sweating • vomiting

**SPECIFIC SIDE-EFFECTS**
- With intravenous use: Abdominal distension • blood pressure fluctuations • deep vein thrombosis • haemolytic anaemia • injection site reactions • myocardial infarction • pulmonary embolism • stroke • thromboembolic events

**HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008) NICE TA156
  - Routine antenatal anti-D prophylaxis should be offered to all non-sensitised pregnant women who are rhesus negative.
  
  www.nice.org.uk/TA156

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **D-Gam (Bio Products Laboratory Ltd)**
  - **Anti-D (RH<sub>D</sub>) immunoglobulin 500 unit**
    - D-Gam Anti-D immunoglobulin 500 unit solution for injection vials 1 vial £33.75
  - **Anti-D (RH<sub>D</sub>) immunoglobulin 1500 unit**
    - D-Gam Anti-D immunoglobulin 1,500 unit solution for injection vials 1 vial £58.00
  - **Rhophylac (CSL Behring UK Ltd)**
    - **Anti-D (RH<sub>D</sub>) immunoglobulin 750 unit per 1 ml**
      - Rhophylac 1,500 units/ml solution for injection pre-filled syringes 1 pre-filled disposable injection £39.52

### Hepatitis B immunoglobulin

**INDICATIONS AND DOSE**

- **Prophylaxis against hepatitis B infection**
  - **BY INTRAMUSCULAR INJECTION**
    - Adult: 500 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure

- **Prophylaxis against hepatitis B infection, after exposure to hepatitis B virus-contaminated material**
  - **BY INTRAVENOUS INFUSION**
    - Adult: Dose to be administered as soon as possible after exposure, but no later than 72 hours (consult product literature)

- **Prevention of hepatitis B in haemodialysed patients**
  - **BY INTRAVENOUS INFUSION**
    - Adult: (consult product literature)

- **Prophylaxis against re-infection of transplanted liver**
  - **BY INTRAVENOUS INFUSION**
    - Adult: (consult product literature)

- **Prevention of hepatitis B re-infection more than 6 months after liver transplantation in stable HBV-DNA negative patients**
  - **BY SUBCUTANEOUS INJECTION**
    - Adult (body-weight up to 75 kg): 500 units once weekly, increased if necessary up to 1000 units once weekly, dose to be started 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin

**CAUTIONS**

- IgA deficiency • interference with live virus vaccines

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Injection site reactions
- **Uncommon** Abdominal pain • anaphylaxis • arthralgia • buccal ulceration • chest pain • dizziness • dysphonia • glossitis • headache • tremor

**SPECIFIC SIDE-EFFECTS**

- With intravenous use: Abdominal distension • blood pressure fluctuations • deep vein thrombosis • haemolytic anaemia • injection site reactions • myocardial infarction • pulmonary embolism • stroke • thromboembolic events

**PRESCRIBING AND DISPENSING INFORMATION**

- Vials containing 200 units or 500 units (for intramuscular injection), available from selected Public Health England and NHS laboratories (except for Transplant Centres), also available from BPL.

**HANDLING AND STORAGE**

Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Hepatitis B immunoglobulin (Non-proprietary)**
  - Hepatitis B immunoglobulin human 200 unit
  - Hepatitis B immunoglobulin human 200 unit solution for injection vials 1 vial £150.00
  - Hepatitis B immunoglobulin human 500 unit
  - Hepatitis B immunoglobulin human 500 unit solution for injection vials 1 vial £300.00

- **Zutectra (Biotest (UK) Ltd)**
  - Zutectra 500 units/ml solution for injection pre-filled syringes 5 syringe £1,275.00

**Solution for infusion**

- **Hepact CP (Biotest (UK) Ltd)**
  - Hepact B immunoglobulin human 50 unit per 1 ml
  - Hepact B immunoglobulin human 50 unit per 1 ml solution for infusion vials 1 vial £51.00
  - Hepact B immunoglobulin human 50 unit per 1 ml solution for infusion vials 1 vial £935.00
  - Hepact B immunoglobulin human 50 unit per 1 ml solution for infusion vials 1 vial £593.50
  - Hepact B immunoglobulin human 50 unit per 1 ml solution for infusion vials 1 vial £2,337.50

- **Omni-Hep-B (Imported (Israel))**
  - Hepatitis B immunoglobulin human 50 unit per 1 ml
  - Hepatitis B immunoglobulin human 50 unit per 1 ml solution for infusion vials 1 vial £175.00

**Normal immunoglobulin**

**INDICATIONS AND DOSE**

To control outbreaks of hepatitis A
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 500 mg

Rubella in pregnancy, prevention of clinical attack
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Females of childbearing potential: 750 mg
Contraindications

- Frequency not known

Restricted use

- Subgam® is not licensed for prophylactic use, but due to difficulty in obtaining suitable immunoglobulin products, the Public Health England recommends intramuscular use for prophylaxis against Hepatitis A or rubella.

Contra-indications

- Patients with selective IgA deficiency who have known antibody against IgA
- Hizentra® Hyperprolinaemia (contains -proline)
- Flebogamma® DIF Hereditary fructose intolerance (contains sorbitol)
- Privigen® Hyperprolinaemia (contains -proline)
- Gammaplex® Hereditary fructose intolerance (contains sorbitol)

Caution

- Agammaglobulinaemia with or without IgA deficiency - hypogammaglobulinaemia with or without IgA deficiency - interference with live virus vaccines

Caution, further information

- Interference with live virus vaccines Normal immunoglobulin may interfere with the immune response to live virus vaccines which should therefore only be given at least 3 weeks before or 3 months after an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).
- OCTAGAM® Falsely elevated results with blood glucose testing systems (contains maltose)

Side-effects

- Rare
  - Acute renal failure - anaphylaxis - aseptic meningitis - cutaneous skin reactions - hypotension
- Frequency not known
  - Arthralgia - chills - diarrhoea - dizziness - fever - headache - low back pain - muscle spasms - myalgia - nausea

Side-effects, further information

- Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

Monitoring requirements

- Monitor for acute renal failure; consider discontinuation if renal function deteriorates. Intravenous preparations with added sucrose have been associated with cases of renal dysfunction and acute renal failure.

Directions for administration

- Preparations for subcutaneous use May be administered by intramuscular injection if subcutaneous route not possible; intramuscular route not for patients with thrombocytopenia or other bleeding disorders.
- Gamunex® Use Glucose 5% intravenous infusion if dilution prior to infusion is required.
- Kiovig® Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

Prescribing and dispensing information

- Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are not interchangeable; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects.

With intramuscular use Available from the Centre for Infections and other regional Public Health England offices (for contacts and control of outbreaks only).

Handling and storage

- Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.
Vaccines

1188 Immunoglobulin therapy

Gammaplex 5g/100ml solution for infusion vials | 1 vial £205.00 (Hospital only)
Gammaplex 20g/400ml solution for infusion vials | 1 vial £836.00 (Hospital only)

- Gamunex (Grifols Ltd)
  Normal immunoglobulin human 100mg per 1ml Gamunex 10% 1g/10ml solution for infusion vials | 1 vial £42.50
  Gamunex 10% 10g/100ml solution for infusion vials | 1 vial £425.00
  Gamunex 10% 20g/200ml solution for infusion vials | 1 vial £850.00
  Gamunex 10% 5g/50ml solution for infusion vials | 1 vial £212.50
- Hizentra (CSL Behring UK Ltd)
  Normal immunoglobulin human 200mg per 1ml Hizentra 2g/10ml solution for infusion vials | 1 vial £91.80
  Hizentra 1g/5ml solution for infusion vials | 1 vial £45.90
  Hizentra 4g/20ml solution for infusion vials | 1 vial £183.60
- Intratect (Biostec UK Ltd)
  Normal immunoglobulin human 50mg per 1ml Intratect 5g/100ml solution for infusion vials | 1 vial £191.25
  Intratect 1g/20ml solution for infusion vials | 1 vial £38.25
  Intratect 2.5g/50ml solution for infusion vials | 1 vial £95.63
  Intratect 10g/200ml solution for infusion vials | 1 vial £382.50
- Octagam (Octapharma Ltd)
  Normal immunoglobulin human 50mg per 1ml Octagam 5g/100ml solution for infusion bottles | 1 bottle £408.00 (Hospital only)
  Octagam 5g/100ml solution for infusion bottles | 1 bottle £204.00 (Hospital only)
  Octagam 5g/100ml solution for infusion bottles | 1 bottle £102.00 (Hospital only)
- Privigen (CSL Behring Ltd)
  Normal immunoglobulin human 100mg per 1ml Privigen 5g/50ml solution for infusion vials | 1 vial £229.50
  Privigen 20g/200ml solution for infusion vials | 1 vial £918.00
  Privigen 10g/100ml solution for infusion vials | 1 vial £459.00
  Privigen 2.5g/25ml solution for infusion vials | 1 vial £114.75
- Vigm (Bio Products Laboratory Ltd)
  Normal immunoglobulin human 50mg per 1ml Vigm Liquid 5g/100ml solution for infusion vials | 1 vial £209.00
  Vigm Liquid 10g/200ml solution for infusion vials | 1 vial £415.00

Powder and solvent for solution for injection
- Gammagard S/D (Baxalta UK Ltd)
  Normal immunoglobulin human 5 gramm Gammagard S/D 5g powder and solvent for solution for injection bottles | 1 bottle no price available

- Kiovig (Baxalta UK Ltd)
  Normal immunoglobulin human 100mg per 1ml Kiovig 5g/50ml solution for infusion vials | 1 vial no price available
  Kiovig 10g/100ml solution for infusion vials | 1 vial no price available
  Kiovig 30g/300ml solution for infusion vials | 1 vial £1470.00
  Kiovig 2.5g/25ml solution for infusion vials | 1 vial no price available
  Kiovig 1g/10ml solution for infusion vials | 1 vial no price available
- Octagam (Octapharma Ltd)
  Normal immunoglobulin human 50mg per 1ml Octagam 5g/100ml solution for infusion bottles | 1 bottle £408.00 (Hospital only)
  Octagam 5g/100ml solution for infusion bottles | 1 bottle £204.00 (Hospital only)
  Octagam 5g/100ml solution for infusion bottles | 1 bottle £102.00 (Hospital only)
- Privigen (CSL Behring Ltd)
  Normal immunoglobulin human 100mg per 1ml Privigen 5g/50ml solution for infusion vials | 1 vial £229.50
  Privigen 20g/200ml solution for infusion vials | 1 vial £918.00
  Privigen 10g/100ml solution for infusion vials | 1 vial £459.00
  Privigen 2.5g/25ml solution for infusion vials | 1 vial £114.75

Tetanus immunoglobulin

- INDICATIONS AND DOSE

  Post-exposure prophylaxis against rabies infection
  - BY INTRAMUSCULAR INJECTION
    - Child: Initially 250 units, then increased to 500 units, dose is only increased if more than 24 hours have elapsed or there is risk of heavy contamination or following burns
    - Adult: Initially 250 units, then increased to 500 units, dose is only increased if more than 24 hours have elapsed or there is risk of heavy contamination or following burns

  Treatment of tetanus infection
  - BY INTRAMUSCULAR INJECTION
    - Child: 150 units/kg, dose may be given over multiple sites
    - Adult: 150 units/kg, dose may be given over multiple sites

- CAUTIONS
  - IgA deficiency - interference with live virus vaccines

- SIDE-EFFECTS
  - Rare Anaphylaxis - arthralgia - buccal ulceration - chest tightness - dizziness - dyspnoea - glossitis - tremor
  - Frequency not known Facial oedema - injection site pain - injection site swelling

- PRESCRIBING AND DISPENSING INFORMATION
  - The potency of individual batches of rabies immunoglobulin from the manufacturer may vary; potency may also be described differently by different manufacturers. It is therefore critical to know the potency of the batch to be used and the weight of the patient in order to calculate the specific volume required to provide the necessary dose.
  - Available from Specialist and Reference Microbiology Division, Public Health England (also from BPL).

- HANDLING AND STORAGE
  - Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze.
  - Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Rabies immunoglobulin (Non-proprietary)
  Rabies immunoglobulin human 500 unit Rabies immunoglobulin human 500 unit solution for injection vials | 1 vial £600.00
2 Post-exposure prophylaxis

IMMUNE SERA AND IMMUNOGLOBULINS

ANTITOXINS

Botulism antitoxin

DRUG ACTION A preparation containing the specific antitoxic globulins that have the power of neutralising the toxins formed by types A, B, and E of Clostridium botulinum.

INDICATIONS AND DOSE

Post exposure prophylaxis of botulism

- By intramuscular injection
- Adult: (consult product literature)

SIDE-EFFECTS

Hypersensitivity reactions

SIDE-EFFECTS, FURTHER INFORMATION

- Hypersensitivity reactions It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc.

PRE-TREATMENT SCREENING

All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

PRESCRIBING AND DISPENSING INFORMATION

Available from local designated centres, for details see TOXBASE (requires registration) www.toxbase.org. For supplies outside working hours apply to other designated centres or to the Public Health England Colindale duty doctor (Tel (020) 8200 6868). For major incidents, obtain supplies from the local blood bank.

The BP title Botulinum Antitoxin is not used because the preparation currently in use may have a different specification.

Varicella-zoster immunoglobulin

(Antivaricella-zoster Immunoglobulin)

INDICATIONS AND DOSE

Prophylaxis against varicella infection

- By deep intramuscular injection
- Adult: 1 g, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease

CAUTIONS

IgA deficiency · interference with live virus vaccines

SIDE-EFFECTS

- Rare Anaphylaxis
- Frequency not known Injection site pain · injection site swelling

DIRECTIONS FOR ADMINISTRATION

Normal immunoglobulin for intravenous use may be used in those unable to receive intramuscular injections.

PRESCRIBING AND DISPENSING INFORMATION

Available from selected Public Health England and NHS laboratories (also from BPL).

HANDLING AND STORAGE

Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

MEDICINAL FORMS

Available from Centre for Infections (Tel (020) 8200 6868) or in

Diphtheria antitoxin

(Dip/Ser)

INDICATIONS AND DOSE

Passive immunisation in suspected cases of diphtheria

- By intravenous infusion
- Adult: Dose should be given without waiting for bacteriological confirmation (consult product literature)

CAUTIONS

CAUTIONS, FURTHER INFORMATION

- Hypersensitivity Hypersensitivity is common after administration; resuscitation facilities should be available. Diphtheria antitoxin is no longer used for prophylaxis because of the risk of hypersensitivity; unimmunised contacts should be promptly investigated and given antibacterial prophylaxis and vaccine.

SIDE-EFFECTS

- Common or very common Hypersensitivity reactions

PRESCRIBING AND DISPENSING INFORMATION

Available from Centre for Infections (Tel (020) 8200 6868) or in
3 Tuberculosis diagnostic test

Tuberculin purified protein derivative (Tuberculin PPD)

**INDICATIONS AND DOSE**

Mantoux test
- **BY INTRADERMAL INJECTION**
  - Child: 2 units for one dose
  - Adult: 2 units for one dose

Mantoux test (if first test is negative and a further test is considered appropriate)
- **BY INTRADERMAL INJECTION**
  - Child: 10 units for 1 dose
  - Adult: 10 units for 1 dose

**DOSE EQUIVALENCE AND CONVERSION**
- 2 units is equivalent to 0.1 mL of 20 units/mL strength.
- 10 units is equivalent to 0.1 mL of 100 units/mL strength.

**CAUTIONS, FURTHER INFORMATION**

- Mantoux test: Response to tuberculin may be suppressed by viral infection, sarcoidosis, corticosteroid therapy, or immunosuppression due to disease or treatment and the MMR vaccine. If a tuberculin skin test has already been initiated, then the MMR should be delayed until the skin test has been read unless protection against measles is required urgently. If a child has had a recent MMR, and requires a tuberculin test, then a 4 week interval should be observed. Apart from tuberculin and MMR, all other live vaccines can be administered at any time before or after tuberculin.

**PRESCRIBING AND DISPENSING INFORMATION**

Available from ImmForm (SSI brand).

- The strength of tuberculin PPD in currently available products may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Tuberculin purified protein derivative (Non-proprietary)**
  - Tuberculin purified protein derivative 20 tuberculin unit per 1 mL Tuberculin PPD RT 23 SSI 20 tuberculin units/mL solution for injection 1.5 mL vials | 1 vial no price available
  - Tuberculin purified protein derivative 100 tuberculin unit per 1 mL Tuberculin PPD RT 23 SSI 100 tuberculin units/mL solution for injection 1.5 mL vials | 1 vial no price available

---

4 Vaccination

**Vaccines**

14-Jun-2017

**Active immunity**

Active immunity can be acquired by natural disease or by vaccination. **Vaccines** stimulate production of antibodies and other components of the immune mechanism; they consist of either:

- a live attenuated form of a virus (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. BCG vaccine), or
- inactivated preparations of the virus (e.g. influenza vaccine) or bacteria, or
- detoxified exotoxins produced by a micro-organism (e.g. tetanus vaccine), or
- extracts of a micro-organism, which may be derived from the organism (e.g. pneumococcal vaccine) or produced by recombinant DNA technology (e.g. hepatitis B vaccine).

**Live attenuated vaccines** usually produce a durable immunity, but not always as long-lasting as that resulting from natural infection.

**Inactive vaccines** may require a primary series of injections of vaccine to produce an adequate antibody response, and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

Advice reflects that in the handbook *Immunisation against Infectious Disease* (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI).

- The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates.

**Immunisation schedule**

Vaccines for the childhood immunisation schedule should be obtained from local health organisations or from ImmForm (www.immform.dh.gov.uk)—not to be prescribed on FP10 (HS21 in Northern Ireland; GP10 in Scotland; WP10 in Wales).

- For the most up to date immunisation schedule consult 'The complete routine immunisation schedule’, available at www.gov.uk.

**Preterm birth**

Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks gestational age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for 48–72 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring. Seroconversion may be unreliable in babies born earlier than 28 weeks’ gestation or in babies treated with corticosteroids for chronic lung disease; consideration should be given to testing for antibodies against *Haemophilus influenzae* type b, meningococcal C, and hepatitis B after primary immunisation.

**Vaccines and HIV infection**

HIV-positive individuals with or without symptoms can receive the following live vaccines:

- MMR (but avoid if immunity significantly impaired); use of normal immunoglobulin should be considered after...
### Routine immunisation schedule

<table>
<thead>
<tr>
<th>When to immunise</th>
<th>Vaccine given and dose schedule (for details of dose, see under individual vaccines)</th>
</tr>
</thead>
</table>
| **Neonates at risk only (see BCG vaccine and Hepatitis B vaccine, below)** | ✷ Bacillus Calmette-Guérin vaccine p. 1204  
    ✷ Hepatitis B vaccine p. 1210 |
| **2 months** | ✷ Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 1203 First dose  
    ✷ Meningococcal group B vaccine (rDNA, component, adsorbed) p. 1206 First dose  
    ✷ Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1207 First dose  
    ✷ Rotavirus vaccine p. 1215 First dose |
| **3 months** | ✷ Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 1203 Second dose  
    ✷ Rotavirus vaccine p. 1215 Second dose |
| **4 months** | ✷ Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 1203 Third dose  
    ✷ Meningococcal group B vaccine (rDNA, component, adsorbed) p. 1206 Second dose  
    ✷ Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1207 Second dose |
| **12-13 months** | ✷ Measles, mumps and rubella vaccine, live p. 1213 First dose  
    ✷ Meningococcal group B vaccine (rDNA, component, adsorbed) p. 1206 Single booster dose  
    ✷ Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1207 Single booster dose  
    ✷ Haemophilus influenzae type B with meningococcal group C vaccine p. 1205 Single booster dose |
| **2–8 years (including children in school years 1, 2, 3 and 4)** | ✷ Influenza vaccine p. 1212 Each year from September. **Note:** Flu nasal spray is recommended (Fluenz Tetra<sup>®</sup>). If contra-indicated and child is in clinical risk group, use inactivated flu vaccine |
| **Between 3 years and 4 months, and 5 years** | ✷ Diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 1203 Booster dose. **Note:** Preferably allow interval of at least 3 years after completing primary course  
    ✷ Measles, mumps and rubella vaccine, live p. 1213 Second dose |
| **11–14 years (females only). First dose of HPV vaccine will be offered to females aged 12–13 years of age in England, Wales, and Northern Ireland, and 11–13 years of age in Scotland.** | ✷ Human papillomavirus vaccines p. 1212 two doses; second dose 6–24 months after first dose. If a 3-dose course of HPV vaccine has been started under the 2013/2014 programme, where possible, the course should be completed (2 doses less than 6 months apart does not provide long-term protection). The two human papillomavirus vaccines are not interchangeable and, ideally, one vaccine product should be used for the entire course. However, since 2012, only Gardasil<sup>®</sup> is offered as part of the national immunisation programme; for those females who started the schedule with Cervarix<sup>®</sup> under the national immunisation programme, but did not complete the vaccination course, the course can be completed with Gardasil<sup>®</sup> |
| **13–15 years** | ✷ Meningococcal groups A with C and W135 and Y vaccine p. 1206 Single booster dose |
| **13–18 years** | ✷ Diphtheria with poliomyelitis and tetanus vaccine p. 1203 Single booster dose. **Note:** Can be given at the same time as the dose of meningococcal group A with C and W135 and Y vaccine at 13–15 years of age. |
| **During adult life, women of child-bearing age susceptible to rubella** | ✷ Measles, mumps and rubella vaccine, live p. 1213 Women of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—exclude pregnancy before immunisation. |
| **Pregnant women** | ✷ Acellular pertussis-containing vaccine administered as diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 1203 (Boostrix-IPV<sup>®</sup>) 1 dose from the 16th week of pregnancy, preferably after the foetal anomaly scan (weeks 18–20)  
    ✷ Influenza vaccine p. 1212 (inactivated), Single dose administered from September, regardless of the stage of pregnancy |
| **Under 25 years, those entering university who are at risk of meningococcal disease** | ✷ Meningococcal groups A with C and W135 and Y vaccine p. 1206 Single dose. **Note:** Should be offered to those aged under 25 years entering university who have not received the meningococcal groups A with C and W135 and Y vaccine over the age of 10 years |
| **During adult life, if not previously immunised** | ✷ Diphtheria with poliomyelitis and tetanus vaccine p. 1203 |
| **65 years** | ✷ Pneumococcal polysaccharide vaccine p. 1207 |
| **From 65 years** | ✷ Influenza vaccine p. 1212 Each year from September |
| **70 years** | ✷ Varicella-zoster vaccine p. 1216 Single dose |

### Additional Information

- Exposure to measles, varicella-zoster vaccine against chickenpox (but avoid if immunity significantly impaired—consult product literature; varicella-zoster immunoglobulin should be considered after exposure to chickenpox or herpes zoster), rotavirus; and the following inactivated vaccines:
  - anthrax, chola (oral), diphtheria, haemophilus influenzae type b, hepatitis A, hepatitis B, human papillomavirus, influenza (injection), meningococcal, pertussis, pneumococcal, poliomyelitis, rabies, tetanus, tick-borne encephalitis, typhoid (injection).
- HIV-positive individuals should **not** receive:
  - BCG, influenza nasal spray (unless stable HIV infection and receiving antiretroviral therapy), typhoid (oral), yellow fever (if yellow fever risk is unavoidable, specialist advice should be sought)
The above advice differs from that for other immunocompromised patients; *Immunisation Guidelines for HIV-infected Adults* issued by British HIV Association (BHIVA) are available at www.bhiva.org and, *Immunisation of HIV-infected Children* issued by Children’s HIV Association (CHIVA) are available at www.chiva.org.uk.

**Vaccines and asplenia**

The following vaccines are recommended for asplenic patients, those with splenic dysfunction or complement disorders, depending on the age at which their condition is diagnosed:

- Haemophilus influenzae type B with meningococcal group C vaccine p. 1205;
- Influenza vaccine p. 1212;
- Meningococcal groups A with C and W135 and Y vaccine p. 1206 and meningococcal group B vaccine (rDNA, component, adsorbed) p. 1206;
- Pneumococcal polysaccharide vaccine.

Children first diagnosed under 1 year of age should be vaccinated according to the Immunisation Schedule. Additionally, one dose of meningococcal groups A with C and W135 and Y vaccine should be given during infancy followed by a second dose at least one month apart. Two months following the routine 12 month booster vaccines, give a dose of meningococcal groups A with C and W135 and Y vaccine and an additional dose of 13-valent pneumococcal polysaccharide vaccine. An additional dose of haemophilus influenzae type B with meningococcal group C vaccine and 23-valent pneumococcal polysaccharide vaccine should be given after the second birthday. The influenza vaccine should be administered annually in children aged 6 months or older.

Children first diagnosed between 1 and 2 years of age should be vaccinated according to the Immunisation Schedule, including the 12 month boosters. Two months after the routine 12 month booster vaccines, give a dose of meningococcal groups A with C and W135 and Y vaccine and an additional dose of 13-valent pneumococcal polysaccharide vaccine. An additional dose of haemophilus influenzae type B with meningococcal group C vaccine and 23-valent pneumococcal polysaccharide vaccine should be given after the second birthday. The influenza vaccine should be administered annually.

Children first diagnosed over 2 years of age should be vaccinated according to the Immunisation schedule, including the 12 month boosters. The child should receive one additional booster dose of haemophilus influenzae type B with meningococcal group C vaccine along with the 23-valent pneumococcal polysaccharide vaccine, followed by one dose of meningococcal groups A with C and W135 and Y vaccine after 2 months. The influenza vaccine should be administered annually.

**Vaccines and antisera availability**

Anthrax vaccine p. 1204 and yellow fever vaccine, live p. 1217, botulism antitoxin p. 1189, diphtheria antitoxin p. 1189, and snake and spider venom antitoxins are available from local designated holding centres.

For antivenom, see Emergency treatment of poisoning p. 1249.

Enquiries for vaccines not available commercially can also be made to:

- Vaccines and Countermeasures Response Department
- Public Health England
- Wellington House
- 133–155 Waterloo Road
- London
- SE1 8UG
- vaccinesupply@phe.gov.uk

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health.

In Wales enquiries for vaccines not available commercially should be directed to:

- Welsh Medicines Information Centre
- University Hospital of Wales
- Cardiff
- CF14 4XW
- (029) 2074 2979

In Northern Ireland:

- Pharmacy and Medicines Management Centre
- Northern Health and Social Care Trust
- Beech House
- Antrim Hospital Site
- Bush Road
- Antrim
- BT41 2RL
- rphps.admin@northerntrust.hscni.net

For further details of availability, see under individual vaccines.

**Anthrax vaccine**

Anthrax vaccine is made from antigens from *B. anthracis*. Anthrax immunisation is indicated for individuals who handle infected animals, for those exposed to imported infected animal products, and for laboratory staff who work with *B. anthracis*. A 4-dose regimen is used for primary immunisation; booster doses should be given annually to workers at continued risk of exposure to anthrax.

In the event of possible contact with *B. anthracis*, post-exposure immunisation may be indicated, in addition to antimicrobial prophylaxis. Advice on the use of anthrax vaccine for post-exposure prophylaxis must be obtained from Public Health England Colindale (tel. 020 8200 4400).

**BCG vaccine**

Bacillus Calmette-Guérin vaccine p. 1204 should be given intradermally by operators skilled in the technique.

The expected reaction to successful Bacillus Calmette-Guérin vaccine is induration at the site of injection followed by a local lesion which starts as a papule 2 or more weeks after vaccination; the lesion may ulcerate then subside over several weeks or months, leaving a small, flat scar. A dry dressing may be used if the ulcer discharges, but air should not be excluded.

BCG is recommended for the following groups if BCG immunisation has not previously been carried out and they are negative for tuberculoprotein hypersensitivity:

- neonates with a family history of tuberculosis in the last 5 years;
- all neonates and infants (0–12 months) born in areas where the incidence of tuberculosis is greater than 40 per 100 000;
- all neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged under 16 years who were born in, or lived for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged 16–35 years from Sub-Saharan Africa or a country with an incidence of tuberculosis greater than 500 per 100 000;
- contacts aged under 36 years of those with active respiratory tuberculosis (for healthcare or laboratory workers who have had contact with clinical materials or patients with tuberculosis, age limit does not apply);
- healthcare workers and laboratory staff (irrespective of age) who are likely to have contact with patients, clinical materials, or derived isolates; other individuals under 35 years (there is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age based on the increased risk to them or their patients) at occupational risk including veterinary
and other staff who handle animal species susceptible to tuberculosis, and staff working directly with prisoners, in care homes for the elderly, or in hostels or facilities for the homeless or refugees;

- individuals under 16 years intending to live with local people for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000.

List of countries or primary care trusts where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at www.gov.uk/ phe.

Bladder instillations of BCG are licensed for the management of bladder carcinoma.

See also Tuberculosis p. 546 for advice on chemoprophylaxis; for the treatment of infection following vaccination, seek expert advice.

**Tuberculosis Diagnostic Agents**

The Mantoux test is recommended for tuberculin skin testing, but no licensed preparation is currently available. Guidance for healthcare professionals is available at www.dh.gov.uk/ immunisation.

In the Mantoux test, the diagnostic dose is administered by intradermal injection of tuberculin purified protein derivative (PPD) p. 1190.

The Huf test (involving the use of multiple—puncture apparatus) is no longer available.

Two interferon gamma release assay (IGRA) tests are also available as an aid in the diagnosis of tuberculosis infection: QuantIFERON® TB Gold and T-SPOT. Both tests measure T-cell mediated immune response to synthetic antigens. For further information on the use of interferon gamma release assay tests for tuberculosis, see www.gov.uk/ phe.

**Botulism antitoxin**

A polyvalent botulism antitoxin p. 1189 is available for the post—exposure prophylaxis of botulism and for the treatment of persons thought to be suffering from botulism. It specifically neutralises the toxins produced by *Clostridium botulinum* types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection.

**Cholera vaccine**

Cholera vaccine (oral) p. 1205 contains inactivated Inaba (including El-Tor type) and Ogawa strains of *Vibrio cholerae*, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of *V.cholerae*, serotype O1.

Oral cholera vaccine is licensed for travellers to endemic or epidemic areas on the basis of current recommendations. Immunisation should be completed at least 1 week before potential exposure. However, there is no requirement for cholera vaccination for international travel. Injectable cholera vaccine provides unreliable protection and is no longer available in the UK.

**Diphtheria vaccine**

Diphtheria—containing vaccines are prepared from the toxin of *Corynebacterium diphtheriae* and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antibody. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as 'high dose' or 'low dose'. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single—antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years vaccination is recommended usually in the form of 3 doses (separated by 1—month intervals) of *(242,462),(290,477) diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed)* (see Immunisation schedule). In unimmunised individuals aged over 10 years the primary course comprises of 3 doses of *adsorbed diphtheria* [low dose], *tetanus and poliomyelitis (inactivated) vaccine*.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive either *adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine* or *adsorbed diphtheria* [low dose], *tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine*. Individuals aged over 10 years should receive *adsorbed diphtheria* [low dose], *tetanus, and poliomyelitis (inactivated) vaccine*.

A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed).

**Diphtheria-containing vaccines for children over 10 years and adults**

A low dose of diphtheria toxoid is sufficient to recall immunity in individuals previously immunised against diphtheria but whose immunity may have diminished with time; it is insufficient to cause serious reactions in an individual who is already immune. Preparations containing low dose diphtheria should be used for adults and children over 10 years, for both primary immunisation and booster doses.

**Travel**

Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule. If more than 10 years have lapsed since completion of the UK schedule, a dose of *adsorbed diphtheria* [low dose], *tetanus and poliomyelitis (inactivated) vaccine* should be administered.

**Contacts**

Staff in contact with diphtheria patients or with potentially pathogenic clinical specimens or working directly with *C. diphtheriae* or *C. ulcerans* should receive a booster dose if fully immunised (with 5 doses of diphtheria—containing vaccine given at appropriate intervals); further doses should be given at 10—year intervals if risk persists. Individuals at risk who are not fully immunised should complete the primary course; a booster dose should be given after 5 years and then at 10—year intervals. *Adsorbed diphtheria* [low dose], *tetanus and poliomyelitis (inactivated) vaccine* is used for this purpose; immunity should be checked by antibody testing at least 3 months after completion of immunisation.

Advice on the management of cases, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected individuals and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. See advice on antibacterial treatment to prevent a secondary case of diphtheria in a non—immune individual.

**Haemophilus influenzae type b**

Haemophilus influenzae type b (Hib) vaccine is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. Haemophilus influenzae type b vaccine immunisation is given in combination with
Vaccines

Immunisation should be considered for:

- immunocompromised individuals.

A booster dose of Haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given annually at 12–13 months of age.

Children 1–10 years who have not been immunised against Haemophilus influenzae type b need to receive only 1 dose of Haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed, these children should be given 3 doses of diphtheria with Haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 1203. The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

Haemophilus influenzae type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive Haemophilus influenzae type b disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

**Invasive Haemophilus influenzae type b disease**

After recovery from infection, unimmunised and partially immunised index cases under 10 years of age should complete their age-specific course of immunisation. Previously vaccinated cases under 10 years of age should be given an additional dose of Haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if Hib antibody concentrations are low or if it is not possible to measure antibody concentrations. Index cases of any age with asplenia or splenic dysfunction should complete their immunisation according to the recommendations below; fully vaccinated cases with asplenia or splenic dysfunction should be given an additional dose of Haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if they received their previous dose over 1 year ago.

See also use of rifampicin p. 549 in the prevention of secondary cases of Haemophilus influenzae type b disease.

**Hepatitis A vaccine**

Hepatitis A vaccine p. 1209 is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells. Immunisation is recommended for:

- laboratory staff who work directly with the virus;
- staff and residents of homes for those with severe learning difficulties;
- workers at risk of exposure to untreated sewage;
- individuals who work with primates;
- patients with haemophilia or other conditions treated with plasma-derived clotting factors;
- patients with severe liver disease;
- travellers to high-risk areas;
- individuals who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:

- patients with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed or otherwise hepatitis A, within 14 days of exposure to the primary case (within 8 weeks of exposure to the primary case where there is more than 1 contact in the household).

A booster dose is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on re-immunisation of immunocompromised individuals.

For rapid protection against hepatitis A after exposure or during an outbreak, in adults a single dose of a monovalent vaccine is recommended; for children under 16 years, a single dose of the combined vaccine Ambirix® can also be used.

Intramuscular normal immunoglobulin p. 1186 is recommended for use in addition to hepatitis A vaccine for close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age.

Post-exposure prophylaxis is not required for healthy children under 1 year of age, so long as all those involved in nappy changing are vaccinated against hepatitis A. However, children 2–12 months of age can be given a dose of hepatitis A vaccine if it is not possible to vaccinate their carers, or if the child becomes a source of infection to others [unlicensed use]; in these cases, if the child goes on to require long-term protection against hepatitis A after the first birthday, the full course of 2 doses should be given.

**Hepatitis B vaccine**

Hepatitis B vaccine p. 1210 contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed onto aluminium hydroxide adjuvant. It is made biosynthetically using recombinant DNA technology. The vaccine is used in individuals at high risk of contracting hepatitis B.

In the UK, groups at high-risk of hepatitis B include:

- parenteral drug misusers, their sexual partners, and household contacts; other drug misusers who are likely to ‘progress’ to injecting;
- individuals who share sexual partners frequently;
- close family contacts of a case or individual with chronic hepatitis B infection;
- babies whose mothers have had acute hepatitis B during pregnancy or are positive for hepatitis B surface antigen (regardless of e-antigen markers); hepatitis B vaccination is started immediately on delivery and hepatitis B immunoglobulin given at the same time (but preferably at a different site). Babies whose mothers are positive for hepatitis B surface antigen and for e-antigen antibody should receive the vaccine only (but babies weighing 1.5 kg or less should also receive the immunoglobulin regardless of the mother’s e-antigen antibody status);
- individuals with haemophilia, those receiving regular blood transfusions or blood products, and carers responsible for the administration of such products;
- patients with chronic renal failure including those on haemodialysis. Haemodialysis patients should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
- individuals with chronic liver disease;
- healthcare personnel (including trainees) who have direct contact with blood or blood-stained body fluids or with patients’ tissues;
- laboratory staff who handle material that may contain the virus;
- other occupational risk groups such as morticians and embalmers;
- staff and patients of day-care or residential accommodation for those with severe learning difficulties;
- staff and inmates of custodial institutions;
- those travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods;
- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- foster carers and their families.

Different immunisation schedules for hepatitis B vaccine are recommended for specific circumstances. Generally, three or four doses are required for primary immunisation; an ‘accelerated schedule’ is recommended for pre-exposure...
prophylaxis in high-risk groups where rapid protection is required, and for post-exposure prophylaxis.

Immunisation may take up to 6 months to confer adequate protection; the duration of immunity is not known precisely, but a single booster 5 years after the primary course may be sufficient to maintain immunity for those who continue to be at risk.

Immunisation does not eliminate the need for commonsense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult Guidance for Clinical Health Care Workers: Protection against Infection with Blood-borne Viruses (available at www.dh.gov.uk). Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.

Following significant exposure to hepatitis B, an accelerated schedule, with the second dose given 1 month, and the third dose 2 months after the first dose, is recommended. For those at continued risk, a fourth dose should be given 12 months after the first dose. More detailed guidance is given in the handbook Immunisation against Infectious Disease. Specific hepatitis B immunoglobulin (HBIG) is available. Where appropriate, immunisation with human papillomavirus vaccine should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course. As the vaccines do not protect against all strains of human papillomavirus, routine cervical screening should continue.

**Influenza vaccine**

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccine p. 1212 in use contain the H and N components of the prevalent strain or strains as recommended each year by the World Health Organization.

Immunisation is recommended for persons at high risk, and to reduce transmission of infection. Annual immunisation is strongly recommended for individuals aged over 6 months with the following conditions:

- chronic respiratory disease (includes asthma treated with continuous or repeated use of inhaled or systemic corticosteroids or asthma with previous exacerbations requiring hospital admission);
- chronic heart disease;
- chronic liver disease;
- chronic renal disease at stage 3, 4 or 5;
- chronic neurological disease;
- complement disorders;
- diabetes mellitus;
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including prolonged systemic corticosteroid treatment [for over 1 month at dose equivalents of prednisolone: adult and child over 20 kg, 20 mg or more daily; child under 20 kg, 1 mg/kg or more daily] and chemotherapy);
- HIV infection (regardless of immune status);
- morbid obesity (BMI of 40 kg/m² and above).

Seasonal influenza vaccine (inactivated) is also recommended for all pregnant women, for all persons aged over 65 years, for residents of nursing or residential homes for the elderly and other long-stay facilities, and for carers of persons whose welfare may be at risk if the carer falls ill. Influenza immunisation should also be considered for household contacts of immunocompromised individuals.

As part of winter planning, NHS employers should offer vaccination to health and social care workers who are directly involved in patient care.

Unless contra-indicated, the live influenza vaccine, administered as a nasal spray (Fluenz Tetra®), is preferred in children aged 2–17 years because it provides a higher level of protection than the inactivated vaccine. In the 2017/2018 national influenza immunisation programme, seasonal influenza vaccine will also be offered to all children aged 2–8 years on 31 August 2017 (including those in school years 1, 2, 3 and 4) and to all primary school-aged children in former primary school pilot areas.

Information on pandemic influenza, avian influenza and swine influenza may be found at www.gov.uk/pandemic-flu and at www.gov.uk/phe.

**Japanese encephalitis vaccine**

Japanese encephalitis vaccine p. 1213 is indicated for travellers to areas in Asia and the Far East where infection is endemic and for laboratory staff at risk of exposure to the virus. The primary immunisation course of 2 doses should be completed at least one week before potential exposure to Japanese encephalitis virus.

---

**Human papillomavirus vaccine**

Human papillomavirus vaccine is available as a bivalent vaccine (Cervarix®) or a quadrivalent vaccine (Gardasil®). Since 2012, only Gardasil® is offered as part of the national immunisation programme. Cervarix® is licensed for use in females for the prevention of cervical cancer and other pre-cancerous lesions caused by human papillomavirus types 16 and 18. Gardasil® is licensed for use in females for the prevention of cervical and anal cancers, genital warts and pre-cancerous genital (cervical, vulvar, and vaginal) and anal lesions caused by human papillomavirus types 6, 11, 16, and 18. The vaccines may also provide limited protection against disease caused by other types of human papillomavirus. The two vaccines are not interchangeable and one vaccine product should be used for an entire course.

Human papillomavirus vaccine will be most effective if given before sexual activity starts. From September 2014, a 2-dose schedule is recommended, as long as the first dose is received before the age of 15 years. The first dose is given to females aged 11 to 14 years, and the second dose is given 6–24 months after the first dose (for the purpose of planning the national immunisation programme, it is appropriate to give the second dose 12 months after the first—see Immunisation schedule). If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

Females receiving their first dose aged 15 years or older require a 3-dose schedule (see Cervarix® and Gardasil®), with the second and third doses given 1 and 4–6 months after the first dose; all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

If a 3-dose course of vaccination had been started before September 2014 in a female aged under 15 years, then where possible this should be completed; the interrupted course should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

Under the national programme in England, females remain eligible to receive the human papillomavirus vaccine up to the age of 18 years if they did not receive the vaccine when scheduled. Where appropriate, immunisation with human papillomavirus vaccine should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course. As the vaccines do not protect against all strains of human papillomavirus, routine cervical screening should continue.
Up-to-date information on the risk of Japanese encephalitis in specific countries can be obtained from the National Travel Health Network and Centre (www.nathnac.org).

**Measles, Mumps and Rubella vaccine**

**Measles vaccine** has been replaced by a combined live measles, mumps and rubella vaccine, live p. 1213 (MMR vaccine).

Measles, mumps and rubella vaccine, live aims to eliminate measles, mumps, and rubella (German measles) and congential rubella syndrome. Every child should receive two doses of measles, mumps and rubella vaccine, live by entry to primary school, unless there is a valid contra-indication. Measles, mumps and rubella vaccine, live should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of measles, mumps and rubella vaccine, live is given to children aged 12–13 months. A second dose is given before starting school at 3 years and 4 months–5 years of age (see Immunisation Schedule).

Children presenting for pre-school booster who have not received the first dose of measles, mumps and rubella vaccine, live should be given a dose of measles, mumps and rubella vaccine, live followed 3 months later by a second dose.

At school-leaving age or at entry into further education, measles, mumps and rubella vaccine, live immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In those who have received only a single dose of measles, mumps and rubella vaccine, live in childhood, a second dose is recommended to achieve full protection. If 2 doses of measles, mumps and rubella vaccine, live are required, the second dose should be given one month after the initial dose. The decision on whether to vaccinate adults should take into consideration their vaccination history, the likelihood of the individual remaining susceptible, and the future risk of exposure and disease.

Measles, mumps and rubella vaccine, live p. 1213 should be used to protect against rubella in seronegative women of child-bearing age (see Immunisation Schedule); unimmunised healthcare workers who might put pregnant women and other vulnerable groups at risk of rubella or measles should be vaccinated. Measles, mumps and rubella vaccine, live may also be offered to previously unimmunised and seronegative post-partum women (see measles, mumps and rubella vaccine, live)–vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

**Contacts**

Measles, mumps and rubella vaccine, live may also be used in the control of outbreaks of measles and should be offered to susceptible children aged over 6 months who are contacts of a case, within 3 days of exposure to infection. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose may be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given. Children aged under 9 months for whom avoidance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin after exposure to measles; routine measles, mumps and rubella vaccine, live immunisation should then be given after at least 3 months at the appropriate age.

Measles, mumps and rubella vaccine, live is **not suitable** for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children and adults with impaired immune response should not receive live vaccines (see advice on HIV). If they have been exposed to measles infection they should be given normal immunoglobulin.

**Travel**

Unimmunised travellers, including children over 6 months, to areas where measles is endemic or epidemic should receive measles, mumps and rubella vaccine, live. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given.

**Meningococcal vaccines**

Almost all childhood meningococcal disease in the UK is caused by *Neisseria meningitidis* serogroups B and C.

**Meningococcal group C conjugate vaccine** protects only against infection by serogroup C and **Meningococcal group B vaccine** protects only against infection by serogroup B. The risk of meningococcal disease declines with age, immunisation is not generally recommended after the age of 25 years.

Tetravalent meningococcal vaccines that cover serogroups A, C, W135, and Y are available. Although the duration of protection has not been established, the **meningococcal groups A, C, W135, and Y conjugate vaccine** is likely to provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serogroup C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal [not currently available in the UK].

A **meningococcal group B vaccine**, Bexsero®, is licensed in the UK against infection caused by *Neisseria meningitidis* serogroup B and is recommended in the Immunisation Schedule. Bexsero® contains 3 recombinant *Neisseria meningitidis* serogroup B proteins and the outer membrane vesicles from the NZ 98/254 strain, in order to achieve broad protection against *Neisseria meningitidis* serogroup B; the proteins are adsorbed onto an aluminium compound to stimulate an enhanced immune response.

**Childhood immunisation**

**Meningococcal group C conjugate vaccine** provides long-term protection against infection by serogroup C of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 12 months of age (as the haemophilus influenzae type B with meningococcal group C vaccine p. 1205) and a second dose given at 13−15 years of age (as the meningococcal groups A with C and W135 and Y vaccine p. 1206) (see Immunisation Schedule).

**Meningococcal group B vaccine** provides protection against infection by serogroup B of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 2 months of age, a second dose at 4 months of age, and a booster dose at 12 months of age (see Immunisation Schedule above).

Unimmunised children aged under 12 months should be given 1 dose of meningococcal group B vaccine (rDNA, component, adsorbed) p. 1206 followed by a second dose of meningococcal group B vaccine (rDNA, component, adsorbed) two months later. They should then be vaccinated according to the Immunisation Schedule (ensuring at least a two month interval between doses of meningococcal group B vaccines). Unimmunised children aged 12–23 months should
be given 2 doses of meningococcal group B vaccine (rDNA, component, adsorbed) separated by an interval of two months if they have received less than 2 doses in the first year of life. Unimmunised children aged 2–9 years should be given a single dose of meningococcal group C vaccine (as the haemophilus influenzae type B with meningococcal group C vaccine) followed by a booster dose of meningococcal groups A with C and W135 and Y vaccine at 13–15 years of age.

From 2015, unimmunised individuals aged 10–25 years, including those aged under 25 years who are attending university for the first time, should be given a single dose of meningococcal groups A with C and W135 and Y vaccine; a booster dose is not required.

Patients under 25 years of age with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

Travel
Individuals travelling to countries of risk should be immunised with meningococcal groups A, C, W135, and Y conjugate vaccine, even if they have previously received meningococcal group C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administration of the tetravalent (meningococcal groups A, C, W135, and Y) vaccine.

Vaccination is particularly important for those living or working with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of meningococcal outbreaks and infection are reported. Country-by-country information is available from the National Travel Health Network and Centre (www.nathnac.org).

Proof of vaccination with the tetravalent meningococcal groups A with C and W135 and Y vaccine is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

Contacts
For advice on the immunisation of laboratory workers and close contacts of cases of meningococcal disease in the UK and on the role of the vaccine in the control of local outbreaks, consult Guidance for Public Health Management of Meningococcal Disease in the UK at www.gov.uk/phe. Also see for antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

The need for immunisation of laboratory staff who work directly with Neisseria meningitidis should be considered.

Pertussis vaccine
Pertussis vaccine is given as a combination preparation containing other vaccines. Acellular vaccines are derived from highly purified components of Bordetella pertussis. Primary immunisation against pertussis (whooping cough) requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule), given at intervals of 1 month from the age of 2 months.

All children up to the age of 10 years should receive primary immunisation with diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed).

A booster dose of an acellular pertussis-containing vaccine should ideally be given 3 years after the primary course, although, the interval can be reduced to 1 year if the primary course was delayed. Children aged 1–10 years who have not received a pertussis-containing vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not routinely recommended in individuals over 10 years of age.

Vaccination of pregnant women against pertussis
In response to the pertussis outbreak, the UK health departments introduced a temporary programme (October 2012) to vaccinate pregnant women against pertussis, and this programme will continue until further notice. The aim of the programme is to boost the levels of pertussis–specific antibodies that are transferred through the placenta, from the mother to the fetus, so that the newborn is protected before routine immunisation begins at 2 months of age.

Pregnant women should be offered a single dose of acellular pertussis-containing vaccine (as adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine; Boostrix-IPV®) between 16 and 32 weeks of pregnancy.

Public Health England has advised (2016) that the vaccine is probably best offered after the foetal anomaly scan at around 18–20 weeks. Pregnant women should be offered a single dose of acellular pertussis–containing vaccine up to the onset of labour if they missed the opportunity for vaccination at 16–32 weeks of pregnancy. A single dose of acellular pertussis–containing vaccine may also be offered to new mothers, who have never previously been vaccinated against pertussis, until the child receives the first vaccination.

While this programme is in place, women who become pregnant again should be offered vaccination during each pregnancy to maximise transplacental transfer of antibody.

Contacts
Vaccination against pertussis should be considered for close contacts of cases with pertussis who have been offered antibacterial prophylaxis. Unimmunised or partially immunised contacts under 10 years of age should complete their vaccination against pertussis. A booster dose of an acellular pertussis–containing vaccine is recommended for contacts aged over 10 years who have not received a pertussis–containing vaccine in the last 5 years and who have not received adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine in the last month.

Side-effects
Local reactions do not contra-indicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:

- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

Pneumococcal vaccine
Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1207 protects against infection with Streptococcus pneumoniae (pneumococcus); the vaccines contain polysaccharide from capsular pneumococci. Pneumococcal polysaccharide vaccine contains purified polysaccharide from 23 capsular types of pneumococci, whereas pneumococcal polysaccharide conjugate vaccine (adsorbed) is recommended for individuals at increased risk of pneumococcal infection as follows:

- age over 65 years;
Children under 2 years at increased risk of pneumococcal infection (see list) should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) at the recommended ages, followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday. Children at increased risk of pneumococcal infection presenting late for vaccination should receive 2 doses (separated by at least 1 month) of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) before the age of 12 months, and a third dose at 12–13 months. Children over 12 months and under 5 years (who have not been vaccinated or who have completed the primary course) should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) (2 doses separated by an interval of 2 months in the immunocompromised or those with asplenia or splenic dysfunction). All children under 5 years at increased risk of pneumococcal infection should receive a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday and at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children over 5 years and adults who are at increased risk of pneumococcal disease should receive a single dose of the 23-valent unconjugated pneumococcal polysaccharide vaccine.

Revaccination
In individuals with higher concentrations of antibodies to pneumococcal polysaccharides, revaccination with the 23-valent pneumococcal polysaccharide vaccine more commonly produces adverse reactions. Revaccination is therefore not recommended, except every 5 years in individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and nephrotic syndrome). If there is doubt, the need for revaccination should be discussed with a haematologist, immunologist, or microbiologist.

Poliomyelitis vaccine
Two types of poliomyelitis vaccines (containing strains of poliovirus types 1, 2, and 3) are available, inactivated poliomyelitis vaccine (for injection) and live (oral) poliomyelitis vaccine. Inactivated poliomyelitis vaccines, only available in combined preparation, is recommended for routine immunisation.

A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccines, starting at 2 months of age with intervals of 1 month between doses (see Immunisation schedule). A course of 3 doses should also be given to all unimmunised adults; no adult should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccines are recommended, the first before school entry and the second before leaving school (see Immunisation schedule). Further booster doses are only necessary for adults at special risk, such as travellers to endemic areas, or laboratory staff likely to be exposed to the viruses, or healthcare workers in possible contact with cases; booster doses should be given to such individuals every 10 years.

Live (oral) poliomyelitis vaccine is no longer available for routine use; its use may be considered during large outbreaks, but advice should be sought from Public Health England. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must not be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccines removes the risk of vaccine-associated paralytic polio altogether.

Travel
Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccines. Those who have not been vaccinated in the last 10 years should receive a booster dose of absorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine. Information about countries with a high incidence of poliomyelitis can be obtained from www.travax.nhs.uk or from the National Travel Health Network and Centre (www.nathnac.org).

Rabies vaccine
Rabies vaccine p. 1214 contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and post-exposure prophylaxis.

Pre-exposure prophylaxis
Immunisation should be offered to those at high risk of exposure to rabies—laboratory staff who handle the rabies virus, those working in quarantine stations, animal handlers, veterinary surgeons and field workers who are likely to be bitten by infected wild animals, certain port officials, and bat handlers. Transmission of rabies by humans has not been recorded but it is advised that those caring for patients with the disease should be vaccinated.

Immunisation against rabies is also recommended where there is limited access to prompt medical care for those living in areas where rabies is enzootic, for those travelling to such areas for longer than 1 month, and for those on shorter visits who may be exposed to unusual risk.
Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

Up-to-date country-by-country information on the incidence of rabies can be obtained from the National Travel Health Network and Centre (www.nathnacl.org) and, in Scotland, from Health Protection Scotland (www.hps.scot.nhs.uk).

Immunisation against rabies requires 3 doses of rabies vaccine, with further booster doses for those who remain at frequent risk. To ensure continued protection in persons at high risk (e.g. laboratory workers), the concentration of antirabies antibodies in plasma is used to determine the intervals between doses.

**Post-exposure management**

Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible after exposure. Disinfectant and a simple dressing can be applied, but suturing should be delayed because it may increase the risk of introducing rabies virus into the nerves.

Post-exposure prophylaxis against rabies depends on the level of risk in the country, the nature of exposure, and the individual’s immunity. In each case, expert risk assessment and advice on appropriate management should be obtained from the local Public Health England Centre or Public Health England’s Virus Reference Department, Colindale (tel. (020) 8200 4400) or the PHE Colindale Duty Doctor (tel. (020) 8200 6868), in Wales from the Public Health Wales local Health Protection Team or Public Health Wales Virus Reference Laboratory (tel. (029) 2074 7747), in Scotland from the local on-call infectious diseases consultant, and in Northern Ireland from the Public Health Agency Duty Room (tel (028) 9055 3997/(028) 9063 2662) or the Regional Virology Service (tel. (028) 9024 0503).

There are no specific contra-indications to the use of rabies vaccine for post-exposure prophylaxis and its use should be considered whenever a patient has been attacked by an animal in a country where rabies is enzootic, even if there is no direct evidence of rabies in the attacking animal. Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of **fully immunised** individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine are likely to be sufficient; the first dose is given on day 0 and the second dose is given between day 3–7. Rabies immunoglobulin p. 1188 is not necessary in such cases.

Post-exposure treatment for **unimmunised individuals** (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine given over 1 month (on days 0, 3, 7, 14, and the fifth dose is given between day 28–30); also, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin p. 1188 is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine p. 1214. The immunisation course can be discontinued if it is proved that the individual was not at risk.

**Rotavirus vaccine**

Rotavirus vaccine p. 1215 is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection. The recommended schedule consists of 2 doses, the first at 2 months of age, and the second at 3 months of age (see Immunisation schedule). The first dose of rotavirus vaccine must be given between 6–15 weeks of age and the second dose should be given after an interval of at least 4 weeks; the vaccine should not be started in children 15 weeks of age or older. Ideally, the full course should be completed before 16 weeks of age to provide protection before the main burden of disease, and to avoid a temporal association between vaccination and intussusception; the course must be completed before 24 weeks of age.

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with <span class="highlight">immunosuppressed</span> close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby’s nappies.

**Smallpox vaccine**

Limited supplies of smallpox vaccine are held at the Specialist and Reference Microbiology Division, Public Health England Colindale (Tel. (020) 8200 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, Guidelines for smallpox response and management in the post-eradication era should be consulted at www.gov.uk/phe.

**Tetanus vaccine**

Tetanus vaccine contains a cell-free purified toxin of Clostridium tetani adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine, with an interval of 1 month between doses. Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation schedule). The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total of 5 doses of tetanus vaccine is considered sufficient for long term protection.

For primary immunisation of adults and children over 10 years previously unimmunised against tetanus, 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine are given with an interval of 1 month between doses (see Diphtheria-containing Vaccines).

When an individual presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; patients awaiting elective surgery should be asked about tetanus immunisation and immunised if necessary. Parenteral drug abuse is also associated with tetanus; those abusing drugs by injection should be vaccinated if unimmunised—booster doses should be given if there is any doubt about their immunisation status.

All laboratory staff should be offered a primary course if unimmunised.

**Wounds**

Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment or at any interval after injury and are puncture-type (particularly if contaminated with soil or manure) or show much devitalised tissue or are septic or are compound fractures or contain foreign bodies. All wounds should receive thorough cleansing.

- For clean wounds: fully immunised individuals (those who have received a total of 5 doses of a tetanus-containing
Vaccines

Vaccines for travel

**Immunisation**

See advice on Malaria, treatment p. 580.

No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand, although all travellers should have immunity to tetanus and close contact with individuals at high risk of severe varicella infections. The Department of Health recommends these vaccines for seronegative healthcare workers who come into direct contact with patients. Those with a history of chickenpox or shingles can be considered immune, but healthcare workers with a negative or uncertain history should be tested.

Rarely, the varicella-zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy;
- Healthcare workers who develop a generalised popular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

**National shingles immunisation programme**

The aim of the national shingles immunisation programme is to lower the incidence and severity of shingles in older people using the high potency, live varicella-zoster vaccine, Zostavax®. It is recommended that vaccination is routinely offered to people aged 70 years. A catch-up programme has also been rolled out (since 2013) in those aged 70–79 years, as this age group is likely to have the greatest benefit from vaccination.

In the 2016–2017 immunisation programme, varicella-zoster vaccine is recommended in adults who were 70 or 78 years of age on 1st September 2016. Patients who were eligible for vaccination in the first 3 years of the programme but have not been vaccinated against herpes zoster remain eligible until their 80th birthday; this includes patients who were aged 71–73 or 79 on 1st September 2016. Patients who have reached 80 years are no longer eligible for vaccination. A single dose of Zostavax® is likely to give protection for at least 7 years, but the need for, or timing of, a booster dose has not been established. Although Zostavax® is not recommended for the treatment of shingles or post-herpetic neuralgia, it can be given to those with a previous history of shingles; ideally the vaccine should be delayed until systemic antiviral therapy has been completed.

Varicella-zoster immunoglobulin p. 1189 is used to protect susceptible individuals at increased risk of varicella infection.

**Yellow fever vaccine**

Yellow fever vaccine, live p. 1217 is indicated for those travelling or living in areas where infection is endemic and for laboratory staff who handle the virus or who handle clinical material from suspected cases. Infants under 6 months of age should not be vaccinated because there is a small risk of encephalitis; infants aged 6–9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (seek expert advice). The immunity which probably lasts for life is officially accepted for 10 years starting from 10 days after primary immunisation and for a further 10 years immediately after revaccination.

**Tick-borne encephalitis vaccine**

Tick-borne encephalitis vaccine, inactivated p. 1216 contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those working in, or visiting, high-risk areas (see International Travel). Those working, walking or camping in warm forested areas of Central and Eastern Europe, Scandinavia, Northern and Eastern China, and some parts of Japan, particularly from April to November when ticks are most prevalent, are at greatest risk of tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3–5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.

**Typhoid vaccine**

Typhoid vaccine p. 1208 is available as Vi capsular polysaccharide (from Salmonella typhi) vaccine for injection and as live attenuated Salmonella typhi for oral use.

Typhoid immunisation is advised for:

- travellers to areas where typhoid is endemic, especially if staying with or visiting local people;
- travellers to endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely;
- laboratory personnel who, in the course of their work, may be exposed to Salmonella typhi.

Typhoid vaccination is not a substitute for scrupulous personal hygiene.

Capsular polysaccharide typhoid vaccine is usually given by intramuscular injection. Children under 2 years may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). Revaccination is needed every 3 years on continued exposure.

Oral typhoid vaccine p. 1208 is a live attenuated vaccine contained in an enteric-coated capsule. One capsule taken on alternate days for a total of 3 doses, provides protection 7–10 days after the last dose. Protection may persist for up to 3 years in those constantly (or repeatedly) exposed to Salmonella typhi, but those who only occasionally travel to endemic areas require further courses at intervals of 1 year.

**Varicella-zoster vaccine**

The live varicella-zoster vaccine p. 1216, Varilrix® and Varivax®, are licensed for immunisation against varicella (chickenpox) in seronegative individuals. They are not recommended for routine use in children, but can be given to seronegative healthy children over 1 year who come into
poliomyelitis (and childhood immunisations should be up to date); Tick-borne encephalitis vaccine is recommended for immunisation of those working in, or visiting, high-risk areas. Certain special precautions are required in non-European areas surrounding the Mediterranean, in Africa, the Middle East, Asia, and South America.

Travellers to areas that have a high incidence of poliomyelitis or tuberculosis should be immunised with the appropriate vaccine; in the case of poliomyelitis, previously immunised travellers may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine. BCG immunisation is recommended for travellers aged under 16 years proposing to stay for longer than 3 months (or in close contact with the local population) in countries with an incidence of tuberculosis greater than 40 per 100 000 (list of countries where the incidence of tuberculosis is greater than 40 cases per 100 000 is available from www.gov.uk/phc); it should preferably be given 3 months or more before departure.

Yellow fever immunisation is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas; other countries require a certificate from all entering travellers (consult the Department of Health handbook, Health Information for Overseas Travel, www.dh.gov.uk).

Immunisation against meningococcal meningitis is recommended for a number of areas of the world. Protection against hepatitis A is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine is preferred and it is likely to be effective even if given shortly before departure; normal immunoglobulin is no longer given routinely but may be indicated in the immunocompromised. Special care must also be taken with food hygiene.

Hepatitis B vaccine is recommended for those travelling to areas of high or intermediate prevalence who intend to seek employment as healthcare workers or who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists or business travellers are not generally at increased risk of infection but may put themselves at risk by their sexual behaviour when abroad.

Prophylactic immunisation against rabies is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention.

Travellers who have not had a tetanus booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, even if they have received 5 doses of a tetanus-containing vaccine previously.

Typhoid vaccine is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions.

There is no requirement for cholera vaccination as a condition for entry into any country, but oral cholera vaccine should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene.

Advice on diphtheria, on Japanese encephalitis, and on tick-borne encephalitis is included in Health Information for Overseas Travel.

Food hygiene
In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers’ diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled or treated with sterilising tablets, should be used for drinking.

Information on health advice for travellers
Health professionals and travellers can find the latest information on immunisation requirements and precautions for avoiding disease while travelling from: www.nathnac.org. The handbook, Health Information for Overseas Travel (2010), which draws together essential information for healthcare professionals regarding health advice for travellers, can also be obtained from this website.

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country or from:

Vaccines

Vaccines

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (APRIL 2016)

Following reports of death in neonates who received a live attenuated vaccine after exposure to a tumor necrosis factor alpha (TNF-a) inhibitor in utero, the MHRA has issued the following advice:

**CONTRA-INDICATIONS**

- Impaired immune response 
  Severely immunosuppressed patients should not be given live vaccines (including those with severe primary immunodeficiency).

- **CAUTIONS** Acute illness - minor illnesses

### CAUTIONS, FURTHER INFORMATION

Vaccination may be postponed if the individual is suffering from an acute illness; however, it is not necessary to postpone immunisation in patients with minor illnesses without fever or systemic upset.

- Impaired immune response and drugs affecting immune response 
  Immune response to vaccines may be reduced in immunosuppressed patients and there is also a risk of generalised infection with live vaccines.

  Specialist advice should be sought for those being treated with high doses of corticosteroids (dose equivalents of prednisolone: **adults**, at least 40 mg daily for more than 1 week; **children**, 2 mg/kg (or more than 40 mg) daily for at least 1 week or 1 mg/kg daily for 1 month), or other immunosuppressive drugs, and those being treated for malignant conditions with chemotherapy or generalised radiotherapy. Live vaccines should be postponed until at least 3 months after stopping high-dose systemic corticosteroids and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressants following bone-marrow transplantation).

  The Royal College of Paediatrics and Child Health has produced a statement, *Immunisation of the Immunocompromised Child (2002)* (available at [www.rchp.ac.uk](http://www.rchp.ac.uk)).

- Predisposition to neurological problems
  When there is a personal or family history of febrile convulsions, there is an increased risk of these occurring during fever from any cause including immunisation, but this is not a contra-indication to immunisation. In children who have had a seizure associated with fever without neurological deterioration, immunisation is **recommended**; advice on the management of fever (see Post-immunisation Pyrexia in Infants) should be given before immunisation. When a child has had a convulsion not associated with fever, and the neurological condition is not deteriorating, immunisation is **recommended**.

  Children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and peri-natal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule.

  When there is a **still evolving neurological problem**, including poorly controlled epilepsy, immunisation should be deferred and the child referred to a specialist. Immunisation is **recommended** if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

### SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS

- **Common or very common** Fatigue - fever - gastro-intestinal disturbances - headache - irritability - loss of appetite - lymphangitis - malaise - myalgia

- **Very rare** Anaphylaxis (can be fatal) - angioedema (can be fatal) - bronchospasm (can be fatal) - hypersensitivity reactions (can be fatal) - urticaria (can be fatal)

- **Frequency not known** Arthralgia - asthenia - dizziness - drowsiness - influenza-like symptoms - lymphadenopathy - paraesthesia - rash

#### SPECIFIC SIDE-EFFECTS

- **Common or very common**
  - With intradermal use or intramuscular use or subcutaneous use
    - Induration may develop at the injection site - inflammation - local reactions - pain - redness - sterile abscess may develop at the injection site

### SIDE-EFFECTS, FURTHER INFORMATION

Occasionally serious adverse reactions can occur—these should always be reported to the CHM.

- Post-immunisation pyrexia in infants
  - The parent should be advised that if pyrexia develops after childhood immunisation, and the infant seems distressed, paracetamol can be given. Ibuprofen can be used if paracetamol is unsuitable. The parent should be warned to seek medical advice if the pyrexia persists.

#### ALLERGY AND CROSS-SENSITIVITY

Contra-indicated in patients with a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens or vaccine component (such as antibiotics in viral vaccines).

### PREGNANCY

- Live vaccines should not be administered routinely to pregnant women because of the theoretical risk of fetal infection but where there is a significant risk of exposure to disease, the need for vaccination usually outweighs any possible risk to the fetus. Termination of pregnancy following inadvertent immunisation is not recommended. There is no evidence of risk from vaccinating pregnant women with inactivated viral or bacterial vaccines or toxoids.

### BREAST FEEDING

- Although there is a theoretical risk of live vaccine being present in breast milk, vaccination is not contra-indicated for women who are breast-feeding when there is significant risk of exposure to disease. There is no evidence of risk from vaccinating women who are breast-feeding, with inactivated viral or bacterial vaccines or toxoids.

### DIRECTIONS FOR ADMINISTRATION

- If alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines.

  When 2 or more live vaccines are required (and are not available as a combined preparation), they can be administered at any time before or after each other at different sites, preferably in a different limb; if more than one injection is to be given in the same limb, they should be administered at least 2.5 cm apart. See also Bacillus Calmette-Guérin vaccine p. 1204.

  Vaccines should not be given intravenously. Most vaccines are given by the intramuscular route, although some are given by either the intradermal, deep subcutaneous, or oral route. The intramuscular route should not be used in patients with bleeding disorders such as haemophilia or thrombocytopenia, vaccines usually given by the intramuscular route should be given by deep subcutaneous injection instead.

  The Department of Health has advised against the use of jet guns for vaccination owing to the risk of transmitting blood borne infections, such as HIV.

  Particular attention must be paid to instructions on the use of diluents. Vaccines which are liquid suspensions or...
are reconstituted before use should be adequately mixed to ensure uniformity of the material to be injected.

**HANDLING AND STORAGE** Care must be taken to store all vaccines under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many vaccines need to be stored at 2–8°C and not allowed to freeze. Vaccines should be protected from light. Reconstituted vaccines and opened multidose vials must be used within the period recommended in the product literature. Unused vaccines should be disposed of by incineration at a registered disposal contractor.

**VACCINES › BACTERIAL AND VIRAL VACCINES, COMBINED**

### Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus

**INDICATIONS AND DOSE**

**Primary immunisation**
- **BY INTRAMUSCULAR INJECTION**
  - Child 2 months–10 years: 0.5 mL every month for 3 doses

**UNLICENSED USE** Infanrix-IPV + Hib® not licensed for use in children over 36 months; Pediacel® not licensed in children over 4 years. However, the Department of Health recommends that these be used for children up to 10 years.

**SIDE-EFFECTS** Atopic dermatitis • hypotonia • restlessness • sleep disturbances • unusual crying in infants

**SIDE-EFFECTS, FURTHER INFORMATION**
- Side effects of vaccines containing pertussis. The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used previously. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contra-indicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:
- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

**PREGNANCY** Contra-indicated in pregnant women with a history of encephalopathy of unknown origin within 7 days of previous immunisation with a pertussis-containing vaccine. Contra-indicated in pregnant women with a history of transient thrombocytopenia or neurological complications following previous immunisation against diphtheria or tetanus.

**PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood schedule from health organisations or ImmForm. Available for vaccination of pregnant women from ImmForm.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

#### Suspension for injection

**EXCIPIENTS:** May contain Neomycin, polymyxin b, streptomycin
- Boostrix-IPV (GlaxoSmithKline UK Ltd)
  - Boostrix-IPV suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [POM] £22.74
- Infanrix-IPV (GlaxoSmithKline UK Ltd)
  - Infanrix-IPV vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [POM] £17.56
- Repevax (sanofi pasteur MSD Ltd)
  - Repevax vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [POM] £20.00

### Diphtheria with poliomyelitis and tetanus vaccine

**INDICATIONS AND DOSE**

**Primary immunisation**
- **BY INTRAMUSCULAR INJECTION**
  - Child 10–17 years: 0.5 mL every month for 3 doses
  - Adult: 0.5 mL every month for 3 doses continued →

**SIDE-EFFECTS** Restlessness • sleep disturbances • unusual crying in infants

**SIDE-EFFECTS, FURTHER INFORMATION**
- Side effects of vaccines containing pertussis. The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used previously. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contra-indicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:
- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

**PREGNANCY** Contra-indicated in pregnant women with a history of encephalopathy of unknown origin within 7 days of previous immunisation with a pertussis-containing vaccine. Contra-indicated in pregnant women with a history of transient thrombocytopenia or neurological complications following previous immunisation against diphtheria or tetanus.

**PRESCRIBING AND DISPENSING INFORMATION**

- There can be variation in the licensing of different medicines containing the same drug.
- Available as part of childhood immunisation schedule from health organisations or ImmForm.
- Available for vaccination of pregnant women from ImmForm.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

#### Suspension for injection

**EXCIPIENTS:** May contain Neomycin, polymyxin b, streptomycin
- Boostrix-IPV (GlaxoSmithKline UK Ltd)
  - Boostrix-IPV suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [POM] £22.74
- Infanrix-IPV (GlaxoSmithKline UK Ltd)
  - Infanrix-IPV vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [POM] £17.56
- Repevax (sanofi pasteur MSD Ltd)
  - Repevax vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [POM] £20.00

---
**Booster doses**

- **BY INTRAMUSCULAR INJECTION**
  - Child 10-17 years: 0.5 mL for 1 dose, first booster dose—should be given 3 years after primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed), then 0.5 mL for 1 dose, second booster dose—should be given 10 years after first booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed), second booster dose may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine
  - Adult: 0.5 mL for 1 dose, first booster dose—should be given 3 years after primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed), then 0.5 mL for 1 dose, second booster dose—should be given 10 years after first booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed), second booster dose may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine

**SIDE-EFFECTS** Restlessness · sleep disturbances · unusual crying in infants

**PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood schedule from health organisations or ImmunForm.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Revaxis** (sanofi pasteur MSD Ltd)
  - Revaxis vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (£6.50)

**VACCINES**

** Anthrax vaccine**

**INDICATIONS AND DOSE**

- **Pre-exposure immunisation against anthrax** | **Post-exposure immunisation**
  - **BY INTRAMUSCULAR INJECTION**
  - **Adult:** Initially 1 dose every 3 weeks for 3 doses, followed by 1 dose after 6 months, to be administered in the deltoid region, 1 dose is equivalent to 0.5 mL

**Booster**

- **BY INTRAMUSCULAR INJECTION**
  - **Adult:** 1 dose every 12 months, to be administered in deltoid region, 1 dose is equivalent to 0.5 mL

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **EXCIPIENTS:** May contain Thiomersal
  - **Anthrax vaccine (Non-proprietary)**
    - Anthrax vaccine (alum precipitated sterile filtrate) suspension for injection 0.5ml ampoules | 5 ampoule (£5.50) no price available

**Bacillus Calmette-Guérin vaccine**

**(BCG Vaccine)**

**DRUG ACTION** BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from *Mycobacterium bovis* which stimulates the development of immunity to *M. tuberculosis*.

**INDICATIONS AND DOSE**

- **Immunisation against tuberculosis**
  - **BY INTRADERMAL INJECTION**
  - **Child 1-11 months:** 0.05 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be **avoided**
  - **Child 1-17 years:** 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be **avoided**
  - **Adult:** 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be **avoided**

**CONTRA-INDICATIONS** Generalised septic skin conditions

**CONTRA-INDICATIONS, FURTHER INFORMATION**

A lesion-free site should be used to administer BCG vaccine to patients with eczema.

**CAUTIONS**

**CAUTIONS, FURTHER INFORMATION**

BCG vaccine can be given simultaneously with another live vaccine, but if they are not given at the same time an interval of 4 weeks should normally be allowed. When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

**INTERACTIONS** → Appendix 1: live vaccines

**SIDE-EFFECTS**

- **Rare** Disseminated complications · osteitis · osteomyelitis
- **Frequency not known** Prolonged ulceration at the injection site · subcutaneous abscess at the injection site

**PRE-TREATMENT SCREENING**

Apart from children under 6 years, any person being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculoprotein (see tuberculin purified protein derivative p. 1190). A skin test is not necessary for a child under 6 years provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000, the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.

**DIRECTIONS FOR ADMINISTRATION**

**Intradermal injection technique**

Skin is stretched between thumb and forefinger and needle (size 25G or 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised blanched bleb showing tips of hair follicles is sign of correct injection; 7 mm bleb = 0.1 mL injection, 3 mm bleb = 0.05 mL injection; if considerable resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine.

**PRESCRIBING AND DISPENSING INFORMATION** Available from health organisations or direct from ImmunForm www.immform.dh.gov.uk (SSI brand, multidose vial with diluent).
Cholera vaccine

**INDICATIONS AND DOSE**

Immunisation against cholera (for travellers to endemic or epidemic areas on the basis of current recommendations)

- **BY MOUTH**
  - Child 2–5 years: 1 dose every 1–6 weeks for 3 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure.
  - Child 6–17 years: 1 dose every 1–6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure.
  - Adult: 1 dose every 1–6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure.

**Booster**

- **BY MOUTH**
  - Child 2–5 years: A single booster dose can be given within 6 months after primary course, if more than 6 months have elapsed since the last vaccination, the primary course should be repeated.
  - Child 6–17 years: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated.
  - Adult: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated.

**CONTRA-INDICATIONS**

Acute gastro-intestinal illness

**INTERACTIONS**

-Appendix 1: cholera vaccine

**SIDE-EFFECTS**

- Rare: Cough - respiratory symptoms - rhinitis
- Very rare: Insomnia - sore throat
- Frequency not known: Abdominal pain and cramps - diarrhoea - nausea - vomiting

**DIRECTIONS FOR ADMINISTRATION**

- In children: Dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). For children over 6 years, add vaccine suspension to make one dose. For child 2–5 years, discard half (approximately 75 mL) of the solution, then add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.
- In adults: Dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). Add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.

**PATIENT AND CARER ADVICE**

Counselling on administration advised. Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential.

Haemophilus influenzae type B with meningococcal group C vaccine

**INDICATIONS AND DOSE**

Booster dose (for infants who have received primary immunisation with a vaccine containing *Haemophilus influenzae type b* component) and primary immunisation against *Neisseria meningitidis*

- **BY INTRAMUSCULAR INJECTION**
  - Child 12-13 months: 0.5 mL for 1 dose

Immunisation against *Neisseria meningitidis* in an unimmunised patient

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-9 years: 0.5 mL for 1 dose

Booster dose (for children who have not been immunised against *Haemophilus influenzae type b*): Booster dose after recovery from *Haemophilus influenzae type b* disease (for index cases previously vaccinated, with low Hib antibody concentration or if it is not possible to measure antibody concentration)

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-9 years: 0.5 mL for 1 dose

Booster dose after recovery from *Haemophilus influenzae type b* disease (for fully vaccinated index cases with asplenia or splenic dysfunction, if previous dose received over 1 year ago)

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-9 years: 0.5 mL for 1 dose

Booster dose for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at under 2 years of age)

- **BY INTRAMUSCULAR INJECTION**
  - Child 2–17 years: 0.5 mL for 1 dose
  - Adult: 0.5 mL for 1 dose

Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at over 2 years of age)

- **BY INTRAMUSCULAR INJECTION**
  - Child 2–17 years: 0.5 mL for 1 dose

**SIDE-EFFECTS**

- Rare: Symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)
- Frequency not known: Atopic dermatitis - hypotonia

**UNLICENSED USE**

Not licensed for use in patients over 2 years.

**SIDE-EFFECTS**

- Rare: Symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)
- Frequency not known: Atopic dermatitis - hypotonia
**Meningococcal group B vaccine (rDNA, component, adsorbed)**

**INDICATIONS AND DOSE**
- **Immunoisation against Neisseria meningitidis, primary immunisation**
  - **By deep intramuscular injection**
    - Child 2 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see p. 422.
    - Child 4 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see p. 422.

**Immunoisation against Neisseria meningitidis, primary immunisation booster dose**
- **By deep intramuscular injection**
  - Child 12-23 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants)

**Immunoisation against Neisseria meningitidis, primary immunisation (in unimmunised patients)**
- **By deep intramuscular injection**
  - Child 6-11 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given between 1-2 years of age and at least 2 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
  - Child 12-23 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given 12-24 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
  - Child 2-10 years: 0.5 mL for 2 doses, separated by an interval of at least 2 months. Injected preferably into deltoid region (or anterolateral thigh in infants)
  - Child 11-17 years: 0.5 mL for 2 doses, separated by an interval of at least 1 month. Injected preferably into deltoid region
  - Adult: 0.5 mL for 2 doses, separated by an interval of at least 1 month. Injected preferably into deltoid region

**SIDE-EFFECTS**
- **Rare** Kawasaki disease (in children) - symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)
- **Frequency not known** Unusual crying (in children)

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
  - **Suspension for injection**
    - **EXCIPIENTS:** May contain Kanamycin
      - Bexsero (GlaxoSmithKline UK Ltd)
        - Bexsero vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection | £75.00
Immunisation against *Neisseria meningitidis* in an unimmunised patient

- **BY INTRAMUSCULAR INJECTION**
  - Child 10–17 years: 0.5 mL for 1 dose, booster dose is not required
  - Adult 18–24 years: 0.5 mL for 1 dose, booster dose is not required

Immunisation against *Neisseria meningitidis* in those at risk of exposure

- **BY INTRAMUSCULAR INJECTION**
  - Child 1–7 years: 0.5 mL for 1 dose, to be injected preferably into deltoid region (or anterolateral thigh in children 12–23 months), then 0.5 mL after 1 year if required for 1 dose, second dose should be considered in those who continue to be at risk of *Neisseria meningitidis* serogroup A infection
  - Adult: 0.5 mL for 1 dose, to be injected preferably into deltoid region, then 0.5 mL after 1 year if required for 1 dose, second dose should be considered in those who continue to be at risk of *Neisseria meningitidis* serogroup A infection

Patients attending university for the first time (who have not received the routine meningococcal A, C, W135, and Y conjugate vaccine over the age of 10 years)

- **BY INTRAMUSCULAR INJECTION**
  - Adult 18–24 years: 0.5 mL for 1 dose

**UNLICENSED USE** *Menveo*® is not licensed for use in children under 2 years.

**SIDE-EFFECTS**

- Rare: Symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- *Menveo* (GlaxoSmithKline UK Ltd)
  - Menveo vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial (£30.00)
- *Nimenrix* (Pfizer Ltd)
  - Nimenrix vaccine powder and solvent for solution for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (£30.00)

**Pneumococcal polysaccharide conjugate vaccine (adsorbed)**

**INDICATIONS AND DOSE**

**PREVENAR 13®**

**Primary immunisation against pneumococcal infection (first dose)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 2 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

**Primary immunisation against pneumococcal infection (second dose)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 4 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

**Primary immunisation against pneumococcal infection (booster dose)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 12–13 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

**Immunisation against pneumococcal infection (in patients who have not been vaccinated or not completed the primary course)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 12 months–4 years: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

**Immunisation against pneumococcal infection, in immunocompromised or asplenic patients or patients with splenic dysfunction (who have not been vaccinated or not completed the primary course)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 12 months–4 years: 0.5 mL every 2 months for 2 doses, deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

**SYNFLORIX®**

**Immunisation against pneumococcal infection**

- **BY INTRAMUSCULAR INJECTION**
  - Child 6 weeks–4 years: Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants (consult product literature)

**UNLICENSED USE**

**PREVENAR 13®** The dose in BNF publications may differ from that in product literature.

**CONTRA-INDICATIONS** Concomitant use of high potency varicella-zoster vaccine (*Zostavax®*) with pneumococcal polysaccharide vaccine (in adults)

**PRESCRIBING AND DISPENSING INFORMATION**

**PREVENAR 13®** Available as part of childhood immunisation schedule from ImmForm www.immform.dh.gov.uk.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Prevenar** (Pfizer Ltd)
  - Prevenar 13 vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (£39.10) | 10 pre-filled disposable injection (£491.00)
- **Synflorix** (GlaxoSmithKline UK Ltd)
  - Synflorix vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (£27.60)

**Pneumococcal polysaccharide vaccine**

**INDICATIONS AND DOSE**

**Immunisation against pneumococcal infection**

- **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Child 2–17 years: 0.5 mL for 1 dose
  - Adult: 0.5 mL for 1 dose

**Immunisation in patients at increased risk of pneumococcal disease**

- **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Child 2–4 years: 0.5 mL for 1 dose, dose should be administered after the second birthday or at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed)
  - Child 5–17 years: 0.5 mL for 1 dose
  - Adult: 0.5 mL for 1 dose
Typhoid vaccine

**INDICATIONS AND DOSE**

Immunisation against typhoid fever in children at high risk of typhoid fever

- **BY INTRAMUSCULAR INJECTION**
  - Child 12-23 months: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection, response may be suboptimal

Immunisation against typhoid fever

- **BY INTRAMUSCULAR INJECTION**
  - Child 2-17 years: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection
  - Adult: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection
  - **BY MOUTH**
  - Child 6-17 years: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5)
  - Adult: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5)

**UNLICENSED USE** Not licensed for use in children under 2 years.

**CONTRA-INDICATIONS**

- With oral use Acute gastro-intestinal illness

**INTERACTIONS** → Appendix 1: live vaccines

**SIDE-EFFECTS**

- With oral use Abdominal cramps - abdominal pain - diarrhoea - nausea - vomiting

**DIRECTIONS FOR ADMINISTRATION** Capsule should be taken one hour before a meal. Swallow as soon as possible after placing in mouth with a cold or lukewarm drink.

**HANDLING AND STORAGE**

- With oral use It is important to store capsules in a refrigerator.

**PATIENT AND CARER ADVICE**

- With oral use Patients or carers should be given advice on how to administer and store typhoid vaccine capsules.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Pneumococcal polysaccharide vaccine (Non-proprietary)**
  - Pneumococcal polysaccharide vaccine solution for injection 0.5ml vials | 1 vial (£0.32)

**Gastro-resistant capsule**

**CAUTIONARY AND ADVISORY LABELS** 25

- **Vivotif** (PaxVax Ltd)
  - Vivotif vaccine gastro-resistant capsules | 3 capsule (£14.77)

Combinations available: *Hepatitis A with typhoid vaccine*, p. 1209

**VACCINES** > **VIRAL VACCINES**

**Hepatitis A and B vaccine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 1209, hepatitis B vaccine p. 1210.

**INDICATIONS AND DOSE**

**AMBRIX®**

Immunisation against hepatitis A and hepatitis B infection (primary course)

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-15 years: Initially 1 mL for 1 dose, then 1 mL after 6-12 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**TWINRIX® ADULT**

Immunisation against hepatitis A and hepatitis B infection (primary course)

- **BY INTRAMUSCULAR INJECTION**
  - Child 16-17 years: Initially 1 mL every month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

Immunisation against hepatitis A and hepatitis B infection—accelerated schedule for travellers departing within 1 month

- **BY INTRAMUSCULAR INJECTION**
  - Child 16-17 years: Initially 1 mL for 1 dose, then 1 mL after 7 days for 1 dose, then 1 mL after 14 days for 1 dose, then 1 mL for 1 dose given 12 months after the first dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**TWINRIX® PAEDIATRIC**

Immunisation against hepatitis A and hepatitis B infection (primary course)

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-15 years: Initially 0.5 mL every month for 2 doses, then 0.5 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients...
with bleeding disorders (but immune response may be reduced)

**IMPORTANT SAFETY INFORMATION**

Ambririx® and Twinrix® are not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular, or mucous membrane exposure to hepatitis B virus.

**PRESCRIBING AND DISPENSING INFORMATION**

**TWINRIX® PAEDIATRIC** Primary course should be completed with Twinrix® (single component vaccines given at appropriate intervals may be used for booster dose).

**AMBRIRIX®** Primary course should be completed with Ambirix® (single component vaccines given at appropriate intervals may be used for booster dose).

**TWINRIX® ADULT** Primary course should be completed with Twinrix® (single component vaccines given at appropriate intervals may be used for booster dose).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

**EXCIPIENTS:** May contain Neomycin

- **Ambirix®** (GliaSmiThKlne UN Ltd) Ambirix vaccine suspension for injection 1ml pre-filled syringes | 1 pre-filled disposable injection (£31.18)
- **Twinrix®** (GliaSmiThKlne UN Ltd) Twinrix Paediatric vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (£20.79) Twinrix Adult vaccine suspension for injection 1ml pre-filled syringes | 1 pre-filled disposable injection (£33.31) | 10 pre-filled disposable syringes (£33.13)

**Hepatitis A vaccine**

**INDICATIONS AND DOSE**

**AVAXIM®**

**Immunisation against hepatitis A infection**

- **BY INTRAMUSCULAR INJECTION**
  - Child 16-17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders.
  - Adult: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders.

**HAVRIX MONODOSE®**

**Immunisation against hepatitis A infection**

- **BY INTRAMUSCULAR INJECTION**
  - Child 16-17 years: Initially 1 mL for 1 dose, then 1 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders.

**VAQTA® ADULT**

**Immunisation against hepatitis A infection**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 1 mL for 1 dose, then 1 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders.

**VAQTA® PAEDIATRIC**

**Immunisation against hepatitis A infection**

- **BY INTRAMUSCULAR INJECTION**
  - Child 1–17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–18 months, dose given as booster, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be delayed)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

**EXCIPIENTS:** May contain Neomycin

- **Avaxim** (sanofi pasteur MSD Ltd) Avaxim vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (£18.10) | 10 pre-filled disposable injection (£181.00)
- **Havrix®** (GliaSmiThKlne UN Ltd) Havrix Monodose vaccine suspension for injection 1ml pre-filled syringes | 1 pre-filled disposable injection (£22.14) | 10 pre-filled disposable injection (£211.43) Havrix Junior Monodose vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (£18.77) | 10 pre-filled disposable injection (£167.68) Havrix Junior Monodose vaccine suspension for injection 0.5ml vials | 1 vial (£16.77) Havrix Monodose vaccine suspension for injection 1ml vials | 1 vial (£22.14)
- **VAQTA** (Merck Sharp & Dohme Ltd) VAQTA Adult vaccine suspension for injection 1ml pre-filled syringes | 1 pre-filled disposable injection (£18.10) VAQTA Adult vaccine suspension for injection 1ml vials | 1 vial (£18.10) VAQTA Paediatric vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (£14.74)

**Hepatitis A with typhoid vaccine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine above, typhoid vaccine p. 1208.

**INDICATIONS AND DOSE**

**HEPATYRIX®**

**Immunisation against hepatitis A and typhoid infection**

- **BY INTRAMUSCULAR INJECTION**
  - Child 15-17 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be continued
Vaccines

1210 Vaccination

INTERACTIONS

VIATIM®

▶ Neonate: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttoc (vaccine efficacy reduced).

▶ Child 1-month-15 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttoc (vaccine efficacy reduced).

▶ Child 16-17 years: 20 micrograms every month for 3 doses, followed by 20 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttoc (vaccine efficacy reduced).

Immunisation against hepatitis B infection, alternative accelerated schedule

▶ By intramuscular injection

Adult: 20 micrograms for 1 dose, followed by 20 micrograms after 6 months, this schedule is not suitable if high risk of infection between doses or if compliance with second dose uncertain, deltoid muscle is preferred site of injection; not to be injected into the buttoc (vaccine efficacy reduced).

Immunisation against hepatitis B infection (accelerated schedule in exceptional cases, e.g. for travellers departing within 1 month)

▶ By intramuscular injection

Adult: 20 micrograms for 1 dose, then 20 micrograms after 7 days for 1 dose, followed by 20 micrograms after 14 days for 1 dose, followed by 20 micrograms for 1 dose, to be given 12 months after the first dose, deltoid muscle is preferred site of injection; not to be injected into the buttoc (vaccine efficacy reduced).

Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients)

▶ By intramuscular injection

Child 1-month-15 years: 10 micrograms every month for 2 doses, followed by 10 micrograms after 5 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttoc (vaccine efficacy reduced).

Child 16-17 years: 40 micrograms every month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttoc (vaccine efficacy reduced).

Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients (accelerated schedule))

▶ By intramuscular injection

Child 1-month-15 years: 10 micrograms every month for 2 doses, followed by 10 micrograms after 5 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttoc (vaccine efficacy reduced).

Child 16-17 years: 40 micrograms every month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttoc (vaccine efficacy reduced).

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

Excipients: May contain Neomycin

▶ Hepatryx (GlaucosSmithKline Ltd)

Hepatryx vaccine suspension for injection 1ml pre-filled syringes | 10 pre-filled disposable injection (Pud) £37.21 | 10 pre-filled disposable injection (Pud) £37.21

▶ VIATIM (Sanofi Pasteur MSD Ltd)

VIATIM vaccine suspension for injection 1ml pre-filled syringes | 1 pre-filled disposable injection (Pud) £29.80

Hepatitis B vaccine

Indications and dose

ENGEXIR B®

Immunisation against hepatitis B infection

▶ By intramuscular injection

Child 1 month-15 years: 10 micrograms for 1 dose, then 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttoc (vaccine efficacy reduced).

Child 16-17 years: 20 micrograms for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttoc (vaccine efficacy reduced).

Adult: 20 micrograms for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttoc (vaccine efficacy reduced).

Immunisation against hepatitis B infection (accelerated schedule)

▶ By intramuscular injection

Neonate: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttoc (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.
FENDRIX®
Immunisation against hepatitis B infection in renal insufficiency (including pre-haemodialysis and haemodialysis patients)
▶ BY INTRAMUSCULAR INJECTION
▶ Child 15-17 years: 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
▶ Child 1 month-15 years: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.
▶ Adult: 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

HBVAXPRO®
Immunisation against hepatitis B infection
▶ BY INTRAMUSCULAR INJECTION
▶ Neonate: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.
▶ Child 1 month-15 years: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
▶ Child 16-17 years: 10 micrograms for 1 dose, followed by 10 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in children; not to be injected into the buttock (vaccine efficacy reduced)
▶ Adult: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule)
▶ BY INTRAMUSCULAR INJECTION
▶ Neonate: 5 micrograms every month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.
▶ Child 1 month-15 years: 5 micrograms every month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in infants; not to be injected into the buttock (vaccine efficacy reduced)

Injection in older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
▶ Child 16-17 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in children; not to be injected into the buttock (vaccine efficacy reduced)
▶ Adult: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Neonate born to hepatitis B surface antigen-positive mother
▶ BY INTRAMUSCULAR INJECTION
▶ Neonate: 5 micrograms every month for 3 doses, first dose given at birth with hepatitis B immunoglobulin injection (separate site), followed by 5 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced).

Chronic haemodialysis patients
▶ BY INTRAMUSCULAR INJECTION
▶ Child 16-17 years: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection in children; not to be injected into the buttock (vaccine efficacy reduced)
▶ Adult: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Suspension for injection
EXCIPIENTS: May contain Thiomersal
▶ Engerix B (GlaxoSmithKline UK Ltd)
Hepatitis B virus surface antigen 20 microgram per 1 ml Engerix B 20micrograms/1ml vaccine suspension for injection vials | 1 vial £12.34 | 10 vial £123.41
Engerix B 10micrograms/0.5ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection £9.67
Engerix B 20micrograms/1ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection £12.99 | 10 pre-filled disposable injection £129.92

▶ HBVAXPRO (Merck Sharp & Dohme Ltd)
Hepatitis B virus surface antigen 40 microgram per 1 ml HBVAXPRO 20micrograms/0.5ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection £38.10

▶ HBVAXPRO 10micrograms/1ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection £12.20
HBVAXPRO 5micrograms/0.5ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection £8.95
Hepatitis B virus surface antigen 40 microgram per 1 ml HBVAXPRO 40micrograms/1ml vaccine suspension for injection vials | 1 vial £7.60
Human papillomavirus vaccines
02-Mar-2017

**INDICATIONS AND DOSE**

**CERVARIX ®**

Prevention of premalignant genital lesions and cervical cancer

- **BY INTRAMUSCULAR INJECTION**
  - Child 9–14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 5–7 months for 1 dose, if second dose administered earlier than 5 months after the first, a third dose should be administered, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.
  - Child 15–17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 1–2.5 months for 1 dose, then 0.5 mL after 5–12 months from the first dose for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.
  - Adult (female): 0.5 mL for 1 dose, followed by 0.5 mL after 1–2.5 months for 1 dose, then 0.5 mL after 5–12 months from the first dose for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

**GARDASIL ®**

Prevention of premalignant genital (cervical, vulvar and vaginal) and anal lesions, cervical and anal cancers, and genital warts

- **BY INTRAMUSCULAR INJECTION**
  - Child 9–14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.
  - Child 15–17 years (female): 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.
  - Adult (female): 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

Prevention of premalignant genital (cervical, vulvar, and vaginal) and anal lesions, cervical and anal cancers, and genital warts (alternative schedule)

- **BY INTRAMUSCULAR INJECTION**
  - Child 9–14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

**UNLICENSED USE**

- **GARDASIL ®** Two dose schedule not licensed for use in girls aged 14 years.
  - **PREGNANCY** Not known to be harmful, but vaccination should be postponed until completion of pregnancy.
  - **PRESCRIBING AND DISPENSING INFORMATION** To avoid confusion, prescribers should specify the brand to be dispensed.

**MEDI CINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Cervarix** (GlaxoSmithKline UK Ltd)
  - Cervarix vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection (PfP) £80.50
- **Gardasil** (Merck Sharp & Dohme Ltd)
  - Gardasil vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection (PfP) £86.50

**Influenza vaccine**

**INDICATIONS AND DOSE**

Annual immunisation against seasonal influenza

- **BY INTRAMUSCULAR INJECTION**
  - Child 6 months–17 years: 0.5 mL for 1 dose
  - Adult: 0.5 mL for 1 dose
  - **BY INTRADERMAL INJECTION**
  - Adult 18–59 years: 9 micrograms for 1 dose, dose to be injected into deltoid region
  - Adult 60 years and over: 15 micrograms for 1 dose, dose to be injected into deltoid region
  - **BY INTRANASAL ADMINISTRATION**
  - Child 2–17 years: 0.1 mL for 1 dose, dose to be administered into each nostril

**UNLICENSED USE** Some products containing inactivated influenza vaccine (surface antigen) are not licensed for use in children under 4 years—check product literature.

- **FLU VIN ®** Not licensed for use in children under 4 years.
- **FLUA RIX TETRA ®** Not licensed for use in children under 3 years of age.
- **OPTAFLU ®** Not licensed for use in children and adolescents under 18 years.

**CONTRA-INDICATIONS** Preparations marketed by Pfizer, or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions

- **FLUENZ TETRA ®** Active wheezing - concomitant use with antiviral therapy for influenza - severe asthma

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- Concomitant use with antivirals Avoid antivirals for at least 2 weeks after immunisation; avoid immunisation for at least 48 hours after stopping the antiviral.
- **ENZIRA ®** Child under 5 years—increased risk of febrile convulsions
- **CAUTIONS** Increased risk of fever in child 5–9 years with preparations marketed by Pfizer or CSL Biotherapies—use alternative influenza vaccine if available

**ENZIRA**® Child 5–9 years (increased risk of fever)—use alternative influenza vaccine if available

- **INTERACTIONS** → Appendix 1: live vaccines

- **SIDE-EFFECTS**
  
  **GENERAL SIDE-EFFECTS**
  
  - **Uncommon** Epistaxis
  
  - **Frequency not known** Febrile convulsions · transient thrombocytopenia · vasculitis (in adults)

  **SPECIFIC SIDE-EFFECTS**
  
  - With intranasal use Rhinorrhea

- **ALLERGY AND CROSS-SENSITIVITY** Individuals with a history of egg allergy can be immunised with either an egg free influenza vaccine, if available, or an influenza vaccine with an ovalbumin content less than 120 nanograms/mL. (facilities should be available to treat anaphylaxis). Vaccines with an ovalbumin content more than 120 nanograms/mL or where content is not stated should not be used in individuals with egg allergy. If an influenza vaccine containing ovalbumin is being considered in those with a history of anaphylaxis to egg or egg allergy with uncontrolled asthma, these individuals should be referred to a specialist in hospital.

- **PREGNANCY** Inactivated vaccines not known to be harmful.

**FLUENZ TETRA**® Avoid in pregnancy.

- **BREAST FEEDING** Inactivated vaccines not known to be harmful.

**FLUENZ TETRA**® Avoid in breast-feeding.

- **PRESCRIBING AND DISPENSING INFORMATION**

**FLUARIX TETRA**® Ovalbumin content less than 100 nanograms/mL.

- **PATIENT AND CARER ADVICE**

**FLUENZ TETRA**® Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

EXCIPIENTS: May contain Gelatin, gentamicin

- **FluMist Quadrivalent** (AstraZeneca UK Ltd)
  FluMist Quadrivalent vaccine nasal suspension 0.2ml unit dose | 10 unit dose **£180.00**

- **Fluenz Tetra** (AstraZeneca UK Ltd) ▼
  Fluenz Tetra vaccine nasal suspension 0.2ml unit dose | 10 unit dose **£180.00**

**Suspension for injection**

EXCIPIENTS: May contain Gentamicin, kanamycin, neomycin penicillins, polymyxin b, thiomersal.

- **Influenza vaccine (Non-proprietary)**
  Influenza vaccine (split virion, inactivated) suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection **£5.00–6.59** | 10 pre-filled disposable injection **£65.90**

- **Agripal** (Sepracor Ltd)
  Agripal vaccine suspension for injection 0.5ml pre-filled syringes | 10 pre-filled disposable injection **£58.50**

- **Enzira** (Pfizer Ltd)
  Enzira vaccine suspension for injection 0.5ml pre-filled syringes | 10 pre-filled disposable injection **£52.50**

- **Fluarix Tetra** (GlaxoSmithKline UK Ltd) ▼
  Fluarix Tetra vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection **£9.94** | 10 pre-filled disposable injection **£99.40**

- **Imuvac** (BGP Products Ltd)
  Imuvac vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection **£5.59** | 10 pre-filled disposable injection **£65.50**

- **Influvac Sub-unit** (BGP Products Ltd)
  Influvac Sub-unit vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection **£5.22** | 10 pre-filled disposable injection **£52.20**

- **Intanza** (sanofi pasteur MSD Ltd)
  Intanza 15microgram strain vaccine suspension for injection 0.1ml pre-filled syringes | 1 pre-filled disposable injection **£9.05** | 10 pre-filled disposable injection **£90.50**

**Japanese encephalitis vaccine**

- **INDICATIONS AND DOSE**

**Immunisation against Japanese encephalitis**

- **BY INTRAMUSCULAR INJECTION**
  - Child 2 months–2 years: 0.25 mL every 28 days for 2 doses, anterolateral thigh is preferred site of injection in infants, the subcutaneous route may be used for patients with bleeding disorders
  - Child 3–17 years: 0.5 mL every 28 days for 2 doses, deltoid muscle is preferred site in older children; anterolateral thigh is preferred in infants, the subcutaneous route may be used for patients with bleeding disorders
  - Adult: 0.5 mL every 28 days for 2 doses, deltoid muscle is preferred site of injection, the subcutaneous route may be used for patients with bleeding disorders

**Booster dose**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 0.5 mL after 1–2 years, deltoid muscle is preferred site of injection, the subcutaneous route may be used for patients with bleeding disorders, for those at continued risk, the booster dose should be given 1 year after completing the primary course

- **SIDE-EFFECTS**

  - **Uncommon** Cough (in children) · migrane (in adults) · vertigo (in adults)
  - **Rare** Dyspnœa (in adults) · neuritis (in adults) · palpitation (in adults) · tachycardia (in adults) · thrombocytopenia (in adults)

- **PREGNANCY** Although manufacturer advises avoid because of limited information, miscarriage has been associated with Japanese encephalitis virus infection acquired during the first 2 trimesters of pregnancy.

- **MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Ixiaro (Valneva UK Ltd)**
  Ixiaro vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection **£5.95**

**Measles, mumps and rubella vaccine, live**

- **INDICATIONS AND DOSE**

**Primary immunisation against measles, mumps, and rubella (first dose)**

- **BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION**
  - Child 12–13 months: 0.5 mL for 1 dose

**Primary immunisation against measles, mumps, and rubella (second dose)**

- **BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION**
  - Child 40 months–5 years: 0.5 mL for 1 dose

continued →
Rubella immunisation (in seronegative women, susceptible to rubella and in unimmunised, seronegative women, post-partum)
- By intramuscular injection, or by deep subcutaneous injection
- Females of childbearing potential: (consult product literature or local protocols)

Children presenting for pre-school booster, who have not received the primary immunisation (first dose) | Immunisation for patients at school-leaving age or at entry into further education, who have not completed the primary immunisation course | Control of measles outbreak | Immunisation for patients travelling to areas where measles is endemic or epidemic, who have not completed the primary immunisation
- By intramuscular injection, or by deep subcutaneous injection
- Child 6 months-17 years: (consult product literature or local protocols)
- Adult: (consult product literature or local protocols)

**SIDE-EFFECTS**

- Uncommon Parotid swelling (usually in the third week) · sleep disturbances · unusual crying in infants
- Rare Arthrophy (2 to 3 weeks after immunisation) · idiopathic thrombocytopenic purpura
- Frequency not known Optic neuritis · peripheral neuritis

**SIDE-EFFECTS, FURTHER INFORMATION**

Malaise, fever, or a rash can occur after the first dose of MMR vaccine—most commonly about a week after vaccination and lasting about 2 to 3 days. Leaflets are available for parents on advice for reducing fever (including the use of paracetamol).

Febrile seizures—occur rarely 6 to 11 days after MMR vaccination (the incidence is lower than that following measles infection)

Idiopathic thrombocytopenic purpura. Idiopathic thrombocytopenic purpura has occurred rarely following MMR vaccination, usually within 6 weeks of the first dose.

The risk of idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR should undergo serological testing before the second dose is due; if the results suggest incomplete immunity against measles, mumps or rubella then a second dose of MMR is recommended. The Specialist and Reference Microbiology Division, Health Protection Agency offers free serological testing for children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR.

- Aseptic meningitis Post-vaccination aseptic meningitis was reported (rarely and with complete recovery) following vaccination with MMR vaccine containing Ũrabe mumps vaccine, which has now been discontinued; no cases have been confirmed in association with the currently used Jeryl Lynn mumps vaccine. Children with post-vaccination symptoms are not infectious.
- Frequency of side effects Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first.

**ALLERGY AND CROSS-SENSITIVITY**

MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg. Dislike of eggs, refusal to eat egg, or confirmed anaphylactic reactions to egg-containing food is not a contra-indication to MMR vaccination. Children with a confirmed anaphylactic reaction to the MMR vaccine should be assessed by a specialist.

**CONCEPTION AND CONTRACEPTION**

Exclude pregnancy before immunisation. Avoid pregnancy for at least 1 month after vaccination.

**PRESCRIBING AND DISPENSING INFORMATION**

Available as part of childhood immunisation schedule from health organisations or ImmForm www.immform.dh.gov.uk.

**IMPORTANT SAFETY INFORMATION**

MMR VACCINATION AND BOWEL DISEASE OR AUTISM

Reviews undertaken on behalf of the CSM, the Medical Research Council, and the Cochrane Collaboration, have not found any evidence of a link between MMR vaccination and bowel disease or autism. The Chief Medical Officers have advised that the MMR vaccine is the safest and best way to protect children against measles, mumps, and rubella. Information (including fact sheets and a list of references) may be obtained from www.dh.gov.uk/immunisation.

**CAUTIONS**

Antibody response to measles component may be reduced after immunoglobulin administration or blood transfusion—leave an interval of at least 3 months before MMR immunisation.

**CAUTIONS, FURTHER INFORMATION**

- Administration with other vaccines. MMR vaccine should not be administered on the same day as yellow fever vaccine; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.

MMR and varicella-zoster vaccine can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

**INTERACTIONS**

- Appendix 1: live vaccines

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**

**EXCIPIENTS:** May contain Gelatin, neomycin
- **M-M-RVAXPRO** (Merck Sharp & Dohme Ltd)
  - M-M-RVAXPRO vaccine powder and solvent for suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (POE) £1.00
- **Powder and solvent for solution for injection**
  - **EXCIPIENTS:** May contain Neomycin
  - Priorix (GlaxoSmithKline UK Ltd)
  - Priorix vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial £0.64

**INDICATIONS AND DOSE**

**Pre-exposure prophylaxis**
- By intramuscular injection

**Child:** 1 ml for 2 doses (on days 0 and 7), followed by 1 ml for 1 dose (on day 28), to be administered in deltoid region or anterolateral thigh in infants, for those at continuous risk, measure plasma-concentration of antirabies antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/ml, final dose may be given from day 21, if insufficient time before travel

**Adult:** 1 ml for 2 doses (on days 0 and 7), followed by 1 ml for 1 dose (on day 28), to be administered in deltoid region, for those at continuous risk, measure plasma-concentration of antirabies antibodies every 6 months and give a booster dose if the titre is less than

**Rabies vaccine**
0.5 units/mL, final dose may be given from day 21, if insufficient time before travel

**Pre-exposure prophylaxis booster dose (for patients at frequent risk of exposure)**
- **BY INTRAMUSCULAR INJECTION**
  - Child: 1 mL after 1 year for 1 dose, to be given 1 year after primary course is completed, then 1 mL every 3–5 years, to be administered in deltoid region or anterolateral thigh in infants, the frequency of booster doses may alternatively be determined according to plasma-concentration of antirabies antibodies
  - Adult: 1 mL for 1 dose, to be given 1 year after primary course is completed, then 1 mL every 3–5 years, to be administered in deltoid region, the frequency of booster doses may alternatively be determined according to plasma-concentration of antirabies antibodies

**Pre-exposure prophylaxis booster dose (for patients at infrequent risk of exposure)**
- **BY INTRAMUSCULAR INJECTION**
  - Child: 1 mL for 1 dose, to be given 10 years after primary course is completed, administered in deltoid region or anterolateral thigh in infants
  - Adult: 1 mL for 1 dose, to be given 10 years after primary course is completed, administered in deltoid region

**Post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine)**
- **BY INTRAMUSCULAR INJECTION**
  - Child (administered on expert advice): 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered in deltoid region or anterolateral thigh in infants, rabies immunoglobulin is not necessary
  - Adult (administered on expert advice): 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered in deltoid region, rabies immunoglobulin is not necessary

**Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete)**
- **BY INTRAMUSCULAR INJECTION**
  - Child (administered on expert advice): 1 mL 5 times a month for 1 month, doses should be given on days 0, 3, 7, 14, and the fifth dose is given between day 28–30, to be administered in deltoid region or anterolateral thigh in infants, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine, the immunisation course can be discontinued if it is proved that the individual was not at risk
  - Adult (administered on expert advice): 1 mL 5 times a month for 1 month, doses should be given on days 0, 3, 7, 14, and the fifth dose is given between day 28–30, to be administered in deltoid region, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine, the immunisation course can be discontinued if it is proved that the individual was not at risk

**INTERACTIONS**
- Appendix 1: rabies vaccine

**SIDE-EFFECTS**
- Paralysis

**PREGNANCY**
- Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis. Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

**CONTRA-INDICATIONS**
- History of intussusception • predisposition to intussusception • severe combined immunosuppression

**CONTRA-INDICATIONS, FURTHER INFORMATION**
- Immunosuppression With the exception of severe combined immunodeficiency, rotavirus vaccine is not contra-indicated in immunosuppressed patients—benefit from vaccination is likely to outweigh the risk, if there is any doubt, seek specialist advice.

**CAUTIONS**
- Diarrhoea (postpone vaccination) • immunosuppressed close contacts • vomiting (postpone vaccination)

**CAUTIONS, FURTHER INFORMATION**
- The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus.

**INTERACTIONS**
- Appendix 1: live vaccines

**SIDE-EFFECTS**
- Abdominal cramps • abdominal pain • diarrhoea • nausea • vomiting

**PATIENT AND CARER ADVICE**
- The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby’s nappies.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**
- **EXCIPIENTS:** May contain Neomycin
  - Rabies vaccine (Non-proprietary)
    - Rabies vaccine powder and solvent for suspension for injection 1 mL vials | 1 vial (Pst) £60.34

**Powder and solvent for solution for injection**
- **EXCIPIENTS:** May contain Neomycin
  - Rabipur (GlaxoSmithKline UK Ltd)
    - Rabipur vaccine powder and solvent for solution for injection 1 mL vials | 1 vial (Pst) £34.56

---

**Rotavirus vaccine**

**DRUG ACTION**
- Rotavirus vaccine is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection.

**INDICATIONS AND DOSE**
- **Immunisation against gastro-enteritis caused by rotavirus**
  - **BY MOUTH**
    - Child 6–23 weeks: 1.5 mL for 2 doses separated by an interval of at least 4 weeks, first dose must be given between 6–14 weeks of age; course should be completed before 24 weeks of age (preferably before 16 weeks)

**CONTRA-INDICATIONS**
- History of intussusception • predisposition to intussusception • severe combined immunosuppression

**CONTRA-INDICATIONS, FURTHER INFORMATION**
- Immunosuppression With the exception of severe combined immunodeficiency, rotavirus vaccine is not contra-indicated in immunosuppressed patients—benefit from vaccination is likely to outweigh the risk, if there is any doubt, seek specialist advice.

**CAUTIONS**
- Diarrhoea (postpone vaccination) • immunosuppressed close contacts • vomiting (postpone vaccination)

**CAUTIONS, FURTHER INFORMATION**
- The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus.

**INTERACTIONS**
- Appendix 1: live vaccines

**SIDE-EFFECTS**
- Abdominal cramps • abdominal pain • diarrhoea • nausea • vomiting

**PATIENT AND CARER ADVICE**
- The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby’s nappies.

**Vaccines**
- Rotarix (GlaxoSmithKline UK Ltd)
  - Rotarix vaccine live oral suspension 1.5 mL pre-filled syringes | 1 unit dose (Pst) £34.76
Tick-borne encephalitis vaccine, inactivated

- **INDICATIONS AND DOSE**
  - Initial immunisation against tick-borne encephalitis
    - **BY INTRAMUSCULAR INJECTION**
    - Child 1-15 years: 0.25 mL for 1 dose, followed by 0.25 mL after 1–3 months for 1 dose, then 0.25 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region or anterolateral thigh in infants, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
    - Child 16–17 years: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
    - Adult: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
    - Elderly: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
  - Immunisation against tick-borne encephalitis, booster doses
    - **BY INTRAMUSCULAR INJECTION**
    - Child 1-17 years: First dose to be given within 3 years after initial course completed and then every 3–5 years, dose to be administered in deltoid region or anterolateral thigh in infants (consult product literature)
    - Adult: First dose to be given within 3 years after initial course completed and then every 3–5 years, dose to be administered in deltoid region (consult product literature)

- **ALLERGY AND CROSS-SENSITIVITY** Individuals with evidence of previous anaphylactic reaction to egg should not be given tick-borne encephalitis vaccine.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Suspension for injection**
    - **EXCIPiENTS:** May contain Gentamicin, neomycin
    - **TicoVac** (Masta Ltd)
      - TicoVac Junior vaccine suspension for injection 0.25mL pre-filled syringes | 1 pre-filled disposable injection [PoS] £28.00
      - TicoVac vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [PoS] £32.00

Varicella-zoster vaccine

- **INDICATIONS AND DOSE**
  - **VARILRIX®**
    - Prevention of varicella infection (chickenpox)
      - **BY SUBCUTANEOUS INJECTION**
      - Child 1-17 years: 0.5 mL every 4–6 weeks for 2 doses, to be administered into the deltoid region or anterolateral thigh
      - Adult: 0.5 mL every 4–6 weeks for 2 doses, to be administered into the deltoid region or anterolateral thigh
    - **VARIVAX®**
      - Prevention of varicella infection (chickenpox)
        - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
        - Child 1-12 years: 0.5 mL for 2 doses, interval of at least 4 weeks between each dose, to be administered into the deltoid region (or higher anterolateral thigh in young children)
        - Child 13–17 years: 0.5 mL every 4–8 weeks for 2 doses, to be administered preferably into the deltoid region
        - Adult: 0.5 mL every 4–8 weeks for 2 doses, to be administered preferably into the deltoid region
    - **Prevention of varicella infection (chickenpox) in children with asymptomatic HIV infection**
      - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
      - Child 1-12 years: 0.5 mL every 12 weeks for 2 doses, to be administered into the deltoid region (or higher anterolateral thigh in young children)
    - **ZOSTAVAX®**
      - Prevention of herpes zoster (shingles)
        - **BY SUBCUTANEOUS INJECTION**
        - Adult 70–79 years: 0.65 mL for 1 dose, to be administered preferably into the deltoid region

- **CAUTIONS** Post-vaccination close contact with susceptible individuals

- **CAUTIONS, FURTHER INFORMATION**
  - Rarely, the varicella–zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:
    - varicella-susceptible pregnant women;
    - individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.
  - Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.
  - Administration with MMR vaccine Varicella–zoster and MMR vaccines can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

- **INTERACTIONS** → Appendix 1: live vaccines
  - **SIDE-EFFECTS**
    - Rare: Thrombocytopenia
    - Frequency not known: Conjunctivitis, varicella-like rash
  - **CONCEPTION AND CONTRACEPTION** Avoid pregnancy for 3 months after vaccination.
PRESCRIBING AND DISPENSING INFORMATION

ZOSTAVAX ®. Advice in the BNF may differ from that in product literature.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

EXCIPIENTS: May contain Gelatin, neomycin

VARIVAX (Merck Sharp & Dohme Ltd)
Varivax vaccine powder and solvent for suspension for injection 0.5ml vials | 1 vial (PoS) £30.28

ZOSTAVAX (Merck Sharp & Dohme Ltd)
Zostavax vaccine powder and solvent for suspension for injection 0.65ml pre-filled syringes | 1 pre-filled disposable injection (PoS) £99.96

Powder and solvent for solution for injection

EXCIPIENTS: May contain Neomycin

VARILRIX (GlaxoSmithKline UK Ltd)
Varilrix vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial (PoS) £27.31

INDICATIONS AND DOSE

Immunisation against yellow fever

BY DEEP SUBCUTANEOUS INJECTION

Child 6–8 months (administered on expert advice): Infants under 9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (consult product literature or local protocols)

Child 9 months–17 years: 0.5 mL for 1 dose

Adult: 0.5 mL for 1 dose

CONTRA-INDICATIONS

Children under 6 months - history of thymus dysfunction

CAUTIONS

Individuals over 60 years—greater risk of vaccine-associated adverse effects (in adults)

CAUTIONS, FURTHER INFORMATION

Administration with MMR vaccine Yellow fever and MMR vaccines should not be administered on the same day; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.

INTERACTIONS

→ Appendix 1: live vaccines

SIDE-EFFECTS

Neurotropic disease - viscerotropic disease

SIDE-EFFECTS, FURTHER INFORMATION

Vaccine-associated adverse effects Very rare adverse effects, such as viscerotropic disease (yellow-fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cirrhosis, and multi-organ failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These very rare adverse effects usually occur after the first dose of yellow fever vaccine in those with no previous immunity.

ALLERGY AND CROSS-SENSITIVITY

Yellow fever vaccine should only be considered under the guidance of a specialist in individuals with evidence of previous anaphylactic reaction to egg.

PREGNANCY

Live yellow fever vaccine should not be given during pregnancy because there is a theoretical risk of fetal infection. Pregnant women should be advised not to travel to areas at high risk of yellow fever. If exposure cannot be avoided during pregnancy, then the vaccine should be given if the risk from disease in the mother outweighs the risk to the fetus from vaccination.

BREAST FEEDING

Avoid; seek specialist advice if exposure to virus cannot be avoided.
Chapter 15
Anaesthesia

General anaesthesia

Overview
Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation or with an intravenously administered drug; anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics, usually short-acting opioids, are also used. The use of neuromuscular blocking drugs necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local topical anaesthetic can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated patients and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

Intravenous anaesthetics
Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time. Extreme care is required in surgery of the mouth, pharynx, or larynx where the airway may be difficult to maintain (e.g. in the presence of a tumour in the pharynx or larynx).

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug or a short-acting opioid.

The doses of all intravenous anaesthetic drugs should be titrated to effect (except when using ‘rapid sequence induction’); lower doses may be required in premedicated patients.

Total intravenous anaesthesia
This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to predicted plasma–drug concentrations in ventilated adult patients.

Drugs used for intravenous anaesthesia
Propofol p. 1220, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in adults and children, but it is not commonly used in neonates. Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. Propofol can also be used for sedation during diagnostic procedures and sedation in adults in intensive care.

Thiopental p. 322 is a barbiturate that is used for induction of anaesthesia, but has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiovascular and respiratory depression can occur. Awakening from a moderate dose of thiopental sodium is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect and recovery is much slower.

Etomidate p. 1220 is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental sodium and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

Ketamine p. 1234 is used rarely. Ketamine causes less hypotension than thiopental sodium and propofol during induction. It is used mainly for paediatric anaesthesia, particularly when repeated administration is required (such as for serial burns dressings); recovery is relatively slow and there is a high incidence of extraneous muscle movements. The main disadvantage of ketamine is the high incidence of hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine such as diazepam p. 327 or midazolam p. 323.

Inhalational anaesthetics
Inhalational anaesthetics include gases and volatile liquids. Gaseous anaesthetics require suitable equipment for storage and administration. Volatile liquid anaesthetics are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide–oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide p. 1222 is being administered.
Volatile liquid anaesthetics
Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic.

Isoflurane p. 1222 is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise, particularly in younger patients. Systemic arterial pressure and cardiac output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isoflurane is the preferred inhalational anaesthetic for use in obstetrics.

Desflurane p. 1222 is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract.

Sevoflurane p. 1223 is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and is therefore often used for inhalational induction of anaesthesia; it has little effect on heart rhythm compared with other volatile liquid anaesthetics.

Nitrous oxide
Nitrous oxide is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For anaesthesia, nitrous oxide is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox®, Equanox®) is used. Self-administration using a demand valve is popular in obstetric practice, for changing painful dressings, as an aid to postoperative physiotherapy, and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

Malignant hyperthermia
Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Suxamethonium chloride p. 1226 has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium chloride should be avoided during anaesthesia in patients at high risk of malignant hyperthermia.

Dantrolene sodium p. 1236 is used in the treatment of malignant hyperthermia.

Sedation, anaesthesia, and resuscitation in dental practice
Overview
Sedation for dental procedures should be limited to conscious sedation. Diazepam p. 327 and temazepam p. 463 are effective anxiolytics for dental treatment in adults.

For details of sedation, anaesthesia, and resuscitation in dental practice see A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care; report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in Standards for Conscious Sedation in the Provision of Dental Care; report of an Intercollegiate Advisory Committee for Sedation in Dentistry, 2015 www.rcseng.ac.uk/library-and-publications/college-publications/docs/dental-sedation-report.

Surgery and long-term medication
Overview
The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about all drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate postoperative period.

Anaesthetists must therefore know whether a patient is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).

Other drugs that should normally not be stopped before surgery include antiepileptics, antiparkinsonian drugs, antipsychotics, anxiolytics, bronchodilators, cardiovascular drugs (but see potassium-sparing diuretics, angiotensin-converting enzyme inhibitors, and angiotensin–II receptor antagonists), glaucoma drugs, immunosuppressants, drugs of dependence, and thyroid or antithyroid drugs. Expert advice is required for patients receiving antivirals for HIV infection. See general advice on surgery in diabetic patients in Diabetes, surgery and medical illness p. 649.

Patients taking antiplatelet medication or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antiplatelet or the anticoagulant drug should be stopped or replaced with heparin (unfractionated) p. 128 or low molecular weight heparin therapy.

Drugs that should be stopped before surgery include combined oral contraceptives, see Contraceptives, hormonal p. 745; for advice on hormone replacement therapy, see Sex hormones p. 707. MAOIs can have important interactions with some drugs used during surgery, such as pethidine hydrochloride p. 445. Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Angiotensin–converting enzyme (ACE) inhibitors and angiotensin–II receptor antagonists can be associated with severe hypotension after induction of anaesthesia; these drugs may need to be discontinued.
24 hours before surgery. Herbal medicines may be associated with adverse effects when given with anaesthetic drugs and consideration should be given to stopping them before surgery.

ANAESTHETICS, GENERAL › INTRAVENOUS ANAESTHETICS

Etomidate

- INDICATIONS AND DOSE
  - Induction of anaesthesia
    - BY SLOW INTRAVENOUS INJECTION
      - Adult: 150–300 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous)
      - Elderly: 150–200 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous)

IMPORTANT SAFETY INFORMATION
Etomidate should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- CAUTIONS
  - Acute circulatory failure (shock)
  - Acute porphyrias
  - 969 (avoid)
  - Adrenal insufficiency
  - Cardiovascular disease
  - Elderly
  - Fixed cardiac output
  - Hypervolaemia

CAUTIONS, FURTHER INFORMATION
- Adrenal insufficiency
  - Etomidate suppresses adrenocortical function, particularly during continuous administration, and it should not be used for maintenance of anaesthesia. It should be used with caution in patients with underlying adrenal insufficiency, for example, those with sepsis.

- INTERACTIONS
  - Appendix 1: etomidate

- SIDE-EFFECTS
  - Common or very common
    - Apnoea
    - Hyperventilation
    - Hypotension
    - Nausea
    - Rash
    - Stridor
    - Vomiting
  - Uncommon
    - Arrhythmias
    - Cough
    - Hiccups
    - Hypersalivation
    - Hypertension
    - Phlebitis
  - Frequency not known
    - AV block
    - Cardiac arrest
    - Extraneous muscle movement (high incidence)
    - Pain on injection
    - Respiratory depression
    - Seizures
    - Shivering
    - Stevens-Johnson syndrome

SIDE-EFFECTS, FURTHER INFORMATION
- Pain on injection
  - Can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction.
- Extraneous muscle movement
  - Extraneous muscle movements can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.
- PREGNANCY
  - May depress neonatal respiration if used during delivery.

- BREAST FEEDING
  - Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

- HEPATIC IMPAIRMENT
  - Reduce dose in liver cirrhosis.

- DIRECTIONS FOR ADMINISTRATION
  - To be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous).

- PATIENT AND CARER ADVICE
  - Driving and skilled tasks
    - Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- EXCIPIENTS: May contain Propylene glycol
  - Hypnomidate (Janssen-Cilag Ltd)
    - Etomidate 2 mg per 1 ml
      - Hypnomidate 20mg/10ml solution for injection ampoules | 5 ampoule £0.60
  - Emulsion for injection
    - Etomidate-Lipuro (B.Braun Medical Ltd)
      - Etomidate 2 mg per 1 ml
        - Etomidate-Lipuro 20mg/10ml emulsion for injection ampoules | 10 ampoule £0.62

Propofol

- INDICATIONS AND DOSE
  - Induction of anaesthesia using 0.5% or 1% injection
    - BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
      - Adult 18–54 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response, for debilitated patients use dose for 55 years and over
      - Adult 55 years and over: Usual dose 1–1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response
  - Induction of anaesthesia using 2% injection
    - BY INTRAVENOUS INFUSION
      - Adult 18–54 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response. For debilitated patients use dose for 55 years and over
      - Adult 55 years and over: Usual dose 1–1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response
  - Maintenance of anaesthesia using 1% injection
    - INITIALLY BY INTRAVENOUS INFUSION
      - Adult: Usual dose 4–12 mg/kg/hour, alternatively (by slow intravenous injection) 25–50 mg, dose may be repeated according to response, for debilitated patients use dose for elderly
      - Elderly: Usual dose 3–6 mg/kg/hour, alternatively (by slow intravenous injection) 25–50 mg, dose may be repeated according to response
  - Maintenance of anaesthesia using 2% injection
    - BY INTRAVENOUS INFUSION
      - Adult: Usual dose 4–12 mg/kg/hour, for debilitated patients use dose for elderly
      - Elderly: Usual dose 3–6 mg/kg/hour
  - Sedation of ventilated patients in intensive care using 1% or 2% injection
    - BY CONTINUOUS INTRAVENOUS INFUSION
      - Adult: Usual dose 0.3–4 mg/kg/hour, adjusted according to response
  - Induction of sedation for surgical and diagnostic procedures using 0.5% or 1% injection
    - BY SLOW INTRAVENOUS INJECTION
      - Adult: Initially 0.5–1 mg/kg, to be administered over 1–5 minutes, dose and rate of administration adjusted according to desired level of sedation and response
  - Maintenance of sedation for surgical and diagnostic procedures using 0.5% injection
    - INITIALLY BY INTRAVENOUS INFUSION
      - Adult: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, (if rapid increase in
sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

**Maintenance of sedation for surgical and diagnostic procedures using 1% injection**

- **INITIALLY BY INTRAVENOUS INFUSION**
- **Adult:** Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

**Maintenance of sedation for surgical and diagnostic procedures using 2% injection**

- **INITIALLY BY INTRAVENOUS INFUSION**
- **Adult:** Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, using 0.5% or 1% injection (if rapid increase in sedation required), patients over 55 years or debilitated may require lower initial dose and rate of administration

**IMPORTANT SAFETY INFORMATION**

Propofol should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CAUTIONS**
  - Acute circulatory failure (shock)
  - Cardiac impairment
  - Cardiovascular disease
  - Elderly
  - Epilepsy
  - Fixed cardiac output
  - Hypotension
  - Hypovolaemia
  - Raised intracranial pressure
  - Respiratory impairment

- **INTERACTIONS** → Appendix 1: propofol

- **SIDE-EFFECTS**
  - **Common or very common**
    - Headache
    - Hypotension
    - Tachycardia
    - Transient apnoea
  - **Uncommon**
    - Phlebitis
    - Thrombosis
  - **Rare**
    - Anaphylaxis
    - Arrhythmia
    - Convulsions (onset can be delayed)
    - Delayed recovery from anaesthesia
    - Euphoria
    - Discoloration of urine
    - Pancreatitis
    - Pulmonary oedema
    - Sexual disinhibition
  - **Frequency not known**
    - Bradycardia
    - Pain on intravenous injection
    - Propofol infusion syndrome
    - Significant extraneous muscle movements

**SIDE-EFFECTS, FURTHER INFORMATION**

- Bradycardia
  - Bardycardia may be profound and may be treated with intravenous administration of an antimuscarinic drug.
- Extraneous muscle movement
  - Extraneous muscle movements can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.
- Pain on injection
  - Can be reduced by intravenous lidocaine.
- Propofol infusion syndrome
  - Prolonged infusion of propofol doses exceeding 4 mg/kg/hour may result in potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure.

- **PREGNANCY**
  - Max. dose for maintenance of anaesthesia
  - 6 mg/kg/hour. May depress neonatal respiration if used during delivery.

- **BREAST FEEDING**
  - Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

- **HEPATIC IMPAIRMENT**
  - Use with caution.

- **RENAL IMPAIRMENT**
  - Use with caution.

- **MONITORING REQUIREMENTS**
  - Monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days.

- **DIRECTIONS FOR ADMINISTRATION**
  - Shake before use; microbiological filter not recommended; may be administered via a Y-piece close to injection site co-administered with Glucose 5% or Sodium chloride 0.9%.
  - 0.5% emulsion for injection or intermittent infusion; may be administered undiluted, or diluted with Glucose 5% (Diprivan®) or (Propofol-Lipuro®) or Sodium chloride 0.9% (Propofol-Lipuro® only); dilute to a concentration not less than 1 mg/mL. 1% emulsion for injection or infusion; may be administered undiluted, or diluted with Glucose 5% (Diprivan®) or (Propofol-Lipuro®) or Sodium chloride 0.9% (Propofol-Lipuro® only); dilute to a concentration not less than 2 mg/mL; use within 6 hours of preparation. 2% emulsion for infusion; do not dilute.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
  - Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Emulsion for infusion**

- **Propofol-Lipuro®** (B.Braun Melsungen AG)
  - **Propofol 10 mg per 1 ml**
    - Propofol-Lipuro 1% emulsion for infusion 50ml ampoules £10.68 (Hospital only)
  - **Diprivan®**
    - (Aspen Pharma Trading Ltd)
  - **Propofol 10 mg per 1 ml**
    - Diprivan 1% emulsion for infusion 50ml pre-filled syringes £15.16
  - **Propofol 20 mg per 1 ml**
    - Diprivan 2% emulsion for infusion 50ml pre-filled syringes £15.16

**Emulsion for injection**

- **Diprivan®**
  - (Aspen Pharma Trading Ltd)
  - **Propofol 10 mg per 1 ml**
    - Diprivan 1% emulsion for injection 20ml ampoules £15.36 (Hospital only)
  - **Propofol-Lipuro®**
    - (B.Braun Melsungen AG)
  - **Propofol 5 mg per 1 ml**
    - Propofol-Lipuro 0.5% emulsion for injection 20ml ampoules £14.71

**ANAESTHETICS, GENERAL › VOLATILE LIQUID ANAESTHETICS**

Volatile halogenated anaesthetics

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS**
  - Susceptibility to malignant hyperthermia

- **CAUTIONS**
  - Can trigger malignant hyperthermia - raised intracranial pressure (can increase cerebrospinal pressure)

- **SIDE-EFFECTS**
  - **Common or very common**
    - Arrhythmias
    - Cardiorespiratory depression
    - Hypotension
  - **Frequency not known**
    - Convulsions

- **ALLERGY AND CROSS-SENSITIVITY**
  - Can cause hepatotoxicity in those sensitised to halogenated anaesthetics.

- **DIRECTIONS FOR ADMINISTRATION**
  - Volatile liquid anaesthetics are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide- oxygen mixtures as the
carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks
Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of driving or undertaking skilled tasks afterwards. For a short general anaesthetic, the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

### Desflurane

**INDICATIONS AND DOSE**

Induction of anaesthesia (but not recommended)
- **BY INHALATION**
  - Adult: 4–11%, to be inhaled through specifically calibrated vaporiser

Maintenance of anaesthesia (in nitrous oxide–oxygen)
- **BY INHALATION**
  - Adult: 2–6%, to be inhaled through a specifically calibrated vaporiser

Maintenance of anaesthesia (in oxygen or oxygen-enriched air)
- **BY INHALATION**
  - Adult: 2.5–8.5%, to be inhaled through a specifically calibrated vaporiser

**INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics

**SIDE-EFFECTS**
- Apnoea, breath-holding, cough, increased secretions, laryngospasm

**PREGNANCY**
- May depress neonatal respiration if used during delivery.

**BREAST FEEDING**
- Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Inhalation vapour**
- **Desflurane (Non-proprietary)**
  - Desflurane 1 ml per 1 ml | 240 ml
  - No price available (Hospital only)

**Nitrous oxide**

**INDICATIONS AND DOSE**

Maintenance of anaesthesia in conjunction with other anaesthetic agents
- **BY INHALATION**
  - Adult: 50–66%, to be administered using suitable anaesthetic apparatus in oxygen

Analgesia
- **BY INHALATION**
  - Adult: Up to 50%, to be administered using suitable anaesthetic apparatus in oxygen, adjusted according to the patient’s needs

**IMPORTANT SAFETY INFORMATION**

Nitrous oxide should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

**CAUTIONS**
- Entrapped air following recent underwater dive
- Pneumothorax
- Presence of intracranial air after head injury
- Recent intra–ocular gas injection

**FURTHER INFORMATION**
- Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra–ocular gas injection.

**INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics

**SIDE-EFFECTS**
- Depresssion of white cell formation
- Megaloblastic anaemia

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Inhalation vapour**
- **Isoflurane (Non-proprietary)**
  - Isoflurane 1 ml per 1 ml | 250 ml
  - Isoflurane volatile liquid | 250 ml
  - No price available (Hospital only)

**Isoflurane**

**INDICATIONS AND DOSE**

Induction of anaesthesia (in oxygen or nitrous oxide–oxygen)
- **BY INHALATION**
  - Adult: Initially 0.5%, increased to 3%, adjusted according to response, administered using specifically calibrated vaporiser

Maintenance of anaesthesia (in nitrous oxide–oxygen)
- **BY INHALATION**
  - Adult: 1–2.5%, to be administered using specifically calibrated vaporiser; an additional 0.5–1% may be required when given with oxygen alone

Maintenance of anaesthesia in caesarean section (in nitrous oxide–oxygen)
- **BY INHALATION**
  - Adult: 0.5–0.75%, to be administered using specifically calibrated vaporiser

**INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics

**SIDE-EFFECTS**
- Breath-holding, cough, irritate mucous membrane, laryngospasm

**PREGNANCY**
- May depress neonatal respiration if used during delivery.

**IMMEDIATE SAFETY INFORMATION**

Nitrous oxide may cause immediate apnoea in the presence of intracranial air following recent underwater dive, or recent intra–ocular gas injection.

**CAUTIONS**
- Entrained air following recent underwater dive
- Pneumothorax
- Presence of intracranial air after head injury
- Recent intra–ocular gas injection

**FURTHER INFORMATION**
- Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra–ocular gas injection.

**INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics

**SIDE-EFFECTS**
- Depresssion of white cell formation
- Megaloblastic anaemia
- Neurological toxic effects

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Inhalation vapour**
- **Isoflurane (Non-proprietary)**
  - Isoflurane 1 ml per 1 ml | 250 ml
  - Isoflurane volatile liquid | 250 ml
  - No price available (Hospital only)

**Anesthesia**

**MEDICINE FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Inhalation vapour**
- **Isoflurane (Non-proprietary)**
  - Isoflurane 1 ml per 1 ml | 250 ml
  - Isoflurane volatile liquid | 250 ml
  - No price available (Hospital only)

**Nitrous oxide**

**INDICATIONS AND DOSE**

Maintenance of anaesthesia in conjunction with other anaesthetic agents
- **BY INHALATION**
  - Adult: 50–66%, to be administered using suitable anaesthetic apparatus in oxygen

Analgesia
- **BY INHALATION**
  - Adult: Up to 50%, to be administered using suitable anaesthetic apparatus in oxygen, adjusted according to the patient’s needs

**IMPORTANT SAFETY INFORMATION**

Nitrous oxide should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

**CAUTIONS**
- Entrapped air following recent underwater dive
- Pneumothorax
- Presence of intracranial air after head injury
- Recent intra–ocular gas injection

**FURTHER INFORMATION**
- Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra–ocular gas injection.

**INTERACTIONS** → Appendix 1: volatile halogenated anaesthetics

**SIDE-EFFECTS**
- Depression of white cell formation
- Megaloblastic anaemia
- Neurological toxic effects
Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

**Monitoring requirements**
- Assessment of plasma-vitamin B₁₂ concentration should be considered in those at risk of deficiency, including the elderly, those who have a poor, vegetarian, or vegan diet, and those with a history of anaemia.
- Nitrous oxide should not be given continuously for longer than 24 hours or more frequently than every 4 days without close supervision and haemato logical monitoring.

**Directions for administration**
For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox®, Equanox®) is used.

**Handling and storage**
Exposure of theatre staff to nitrous oxide should be minimised (risk of serious side-effects).

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug.

**Inhalation gas**
- Nitrous oxide (Non-proprietary)
  - Nitrous oxide 1 ml per 1 ml Nitrous oxide cylinders size E (1800 litre) no price available
  - Medical Nitrous Oxide cylinders size D (900 litre) no price available
  - Medical Nitrous Oxide cylinders size G (9000 litre) no price available
  - Nitrous oxide cylinders size F (3600 litre) no price available
  - Nitrous oxide cylinders size J (18000 litre) no price available
  - Nitrous oxide cylinders size G (9000 litre) no price available
  - Medical Nitrous Oxide cylinders size G (9000 litre) no price available
  - Nitrous oxide cylinders size D (900 litre) no price available
  - Medical Nitrous Oxide cylinders size E (1800 litre) no price available

**Sevoflurane**

**Indications and dose**
- **Induction of anaesthesia (in oxygen or nitrous oxide-oxygen)**
  - **By inhalation**
    - Adult: Initially 0.5–1%, then increased to up to 8%, increased gradually, according to response, to be administered using specifically calibrated vaporiser
- **Maintenance of anaesthesia (in oxygen or nitrous oxide-oxygen)**
  - **By inhalation**
    - Adult: 0.5–3%, adjusted according to response, to be administered using specifically calibrated vaporiser

**Cautions**
- Susceptibility to QT-interval prolongation

**Interactions**
- Appendix 1: volatile halogenated anaesthetics

**Side-effects**
- Cardiac arrest • dystonia • leucopenia • torsade de pointes • urinary retention

**Pregnancy**
- May depress neonatal respiration if used during delivery.

**Breast-feeding**
- Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

**Renal impairment**
- Use with caution.

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug.

**Inhalation vapour**
- Sevoflurane (Non-proprietary)
  - Sevoflurane 1 ml per 1 ml Sevoflurane volatile liquid | 250 ml POM £123.00 (Hospital only)

---

**1 Anaesthesia adjuvants**

**Pre-medication and peri-operative drugs**

**Drugs that affect gastric pH**
Regurgitation and aspiration of gastric contents (Mendelson’s syndrome) can be an important complication of general anaesthesia, particularly in obstetrics and during emergency surgery, and requires prophylaxis against acid aspiration. Prophylaxis is also needed in those with gastro-oesophageal reflux disease and in circumstances where gastric emptying may be delayed.

A H₂-receptor antagonist can be used before surgery to increase the pH and reduce the volume of gastric fluid. It does not affect the pH of fluid already in the stomach and this limits its value in emergency procedures; an oral H₂-receptor antagonist can be given 1–2 hours before the procedure. Antacids are frequently used to neutralise the acidity of the fluid already in the stomach; ‘clear’ (non-particulate) antacids such as sodium citrate p. 743 are preferred.

**Antimuscarinic drugs**
Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics. They are also used before or with neostigmine p. 1024 to prevent bradycardia, excessive salivation, and other muscarinic actions of neostigmine. They also prevent bradycardia and hypotension associated with drugs such as propofol p. 1220 and suxamethonium chloride p. 1226.

Atropine sulphate p. 1224 is now rarely used for premedication but still has an emergency role in the treatment of vagotonic side-effects. Atropine sulphate may have a role in acute arrhythmias after myocardial infarction.

Hyoscyamine sulphate p. 417 reduces secretions and also provides a degree of amnesia, sedation, and anti-emesis. Unlike atropine sulphate it may produce bradycardia rather than tachycardia.

Oxymetazoline p. 1225 reduces salivary secretions. When given intravenously it produces less tachycardia than atropine sulphate. It is widely used with neostigmine for reversal of non-depolarising neuromuscular blocking drugs.

**Phenothiazines** do not effectively reduce secretions when used alone.

**Sedative drugs**
Fear and anxiety before a procedure (including the night before) can be minimised by using a sedative drug, usually a benzodiazepine. Premedication may also augment the action of anaesthetics and provide some degree of pre-operative amnesia. The choice of drug depends on the individual, the nature of the procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and availability of recovery facilities. The choice also varies between elective and emergency procedures.

Premedics can be given the night before major surgery; a further, smaller dose may be required before surgery. Alternatively, the first dose may be given on the day of the procedure.

**Benzodiazepines**
Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. Benzodiazepines are also used in...
intensive care units for sedation, particularly in those receiving assisted ventilation. Flumazenil p. 1258 is used to antagonise the effects of benzodiazepines.

Diazepam p. 327 is used to produce mild sedation with amnesia. It is a long-acting drug with active metabolites and a second period of drowsiness can occur several hours after its administration. Peri-operative use of diazepam in children is not recommended; its effect and timing of response are unreliable and paradoxical effects may occur.

Diazepam is relatively insoluble in water and preparations formulated in organic solvents are painful on intravenous injection and give rise to a high incidence of venous thrombosis (which may not be noticed for several days after the injection). Intramuscular injection of diazepam is painful and absorption is erratic. An emulsion formulated for intravenous injection is less irritant and reduces the risk of venous thrombosis; it is not suitable for intramuscular injection.

Temazepam p. 463 is given by mouth for premedication and has a shorter duration of action and a more rapid onset than oral diazepam; anxiolytic and sedative effects last about 90 minutes although there may be residual drowsiness.

Lorazepam p. 322 produces more prolonged sedation than temazepam and it has marked amnesic effects.

Midazolam p. 323 is a water-soluble benzodiazepine that is often used in preference to intravenous diazepam; recovery is faster than from diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing. Midazolam is associated with profound sedation when high doses are given intravenously or when it is used with certain other drugs.

Other drugs for sedation
Dexmedetomidine p. 1235 and clonidine hydrochloride p. 139 are alpha₂-adrenergic agonists with sedative properties. Dexmedetomidine is licensed for the sedation of patients receiving intensive care who need to remain responsive to verbal stimulation. Clonidine hydrochloride [unlicensed indication] can be used by mouth or by intravenous injection as a sedative agent when adequate sedation cannot be achieved with standard treatment.

Antagonists for central and respiratory depression
Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone hydrochloride p. 1259. Naloxone hydrochloride will immediately reverse opioid-induced respiratory depression but the dose may have to be repeated because of the short duration of action of naloxone hydrochloride; however, naloxone hydrochloride will also antagonise the analgesic effect.

Flumazenil is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam or midazolam so patients may become reasated.

Doxapram hydrochloride p. 286 is a central and respiratory stimulant but is of limited value in anaesthesia.

ANTIMUSCARINICS

Atropine sulfate

- INDICATIONS AND DOSE
  Bradydrysma due to acute massive overdosage of beta-blockers
  - BY INTRAVENOUS INJECTION
    - Child: 40 micrograms/kg (max. per dose 3 mg)
    - Adult: 3 mg

Treatment of poisoning by organophosphorus insecticide or nerve agent (in combination with pralidoxime chloride)
- BY INTRAVENOUS INJECTION
  - Child: 20 micrograms/kg every 5–10 minutes (max. per dose 2 mg) until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning
  - Adult: 2 mg every 5–10 minutes until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm
- BY MOUTH
  - Adult: 0.6–1.2 mg daily, dose to be taken at night

Premedication
- BY INTRAVENOUS INJECTION
  - Child 12–17 years: 300–600 micrograms, to be administered immediately before induction of anaesthesia
  - Adult: 300–600 micrograms, to be administered immediately before induction of anaesthesia

Intra-operative bradycardia
- BY INTRAVENOUS INJECTION
  - Child 12–17 years: 300–600 micrograms, larger doses may be used in emergencies
  - Adult: 300–600 micrograms, larger doses may be used in emergencies

Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block
- BY INTRAVENOUS INJECTION
  - Child 12–17 years: 0.6–1.2 mg
  - Adult: 0.6–1.2 mg

Excessive bradycardia associated with beta-blocker use
- BY INTRAVENOUS INJECTION
  - Adult: 0.6–2.4 mg in divided doses (max. per dose 600 micrograms)

Bradycardia following myocardial infarction (particularly if complicated by hypotension)
- BY INTRAVENOUS INJECTION
  - Adult: 500 micrograms every 3–5 minutes; maximum 3 mg per course

UNLICENSED USE Not licensed for use in children under 12 years for intra-operative bradycardia or by intravenous route for premedication.

IMPORTANT SAFETY INFORMATION
Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

- INTERACTIONS → Appendix 1: atropine
- PREGNANCY Not known to be harmful; manufacturer advises caution.
- BREAST FEEDING May suppress lactation; small amount present in milk—manufacturer advises caution.
- MONITORING REQUIREMENTS
  - Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block. Since atropine has a shorter duration of action than neostigmine, late unopposed...
bradycardia may result; close monitoring of the patient is necessary.

- **LESS SUITABLE FOR PRESCRIBING** Atropine tablets less suitable for prescribing. Any clinical benefit as a gastrointestinal antispasmodic is outweighed by atropinic side-effects.

- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection, solution for infusion

  **Tablet**
  - **Atropine sulfate (Non-proprietary)**
    - Atropine sulfate 600 microgram | Atropine 600microgram tablets | 28 tablet | £52.92 DT price = £49.53
  - **Solution for injection**
    - **Atropine sulfate (Non-proprietary)**
      - Atropine sulfate 100 microgram per 1 ml | Atropine 500micrograms/5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection | £7.40–£13.00 | 10 pre-filled disposable injection | £60.00–£130.00
      - Atropine sulfate 200 microgram per 1 ml | Atropine 1mg/5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection | £7.08–£13.00 | 10 pre-filled disposable injection | £130.00
      - Atropine sulfate 300 microgram per 1 ml | Atropine 3mg/10ml solution for injection pre-filled syringes | 1 pre-filled disposable injection | £130.00
      - Atropine sulfate 400 microgram per 1 ml | Atropine 400micrograms/1ml solution for injection ampoules | 10 ampoule | £80.48–£82.22 DT price = £75.11
      - Atropine sulfate 600 microgram per 1 ml | Atropine 600micrograms/1ml solution for injection ampoules | 10 ampoule | £11.71 DT price = £11.70
    - Atropine sulfate 1 mg per 1 ml | Atropine 1mg/1ml solution for injection ampoules | 10 ampoule | £74.29–£75.98 DT price = £73.03

### Glycopyrronium bromide

(Glycopyrronium)

#### 1.1 Neuromuscular blockade

**Neuromuscular blocking drugs**

Neuromuscular blocking drugs used in anaesthesia are also known as **muscle relaxants**. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in musculoskeletal disorders that act on the spinal cord or brain.

Patients who have received a neuromuscular blocking drug should **always** have their respiration assisted or controlled until the drug has been inactivated or antagonised. They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

**Non-depolarising neuromuscular blocking drugs** Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases such as neostigmine p. 1024. Non-depolarising neuromuscular blocking drugs can be divided into the **aminosteroid** group, comprising pancuronium bromide p. 1228, rocuronium bromide p. 1228, and vecuronium bromide p. 1229, and the **benzylisoquinolinium** group, comprising atracurium besilate p. 1227, cisatracurium p. 1227, and mivacurium p. 1228.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium chloride p. 1226. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–40 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as atracurium besilate and vecuronium bromide, are more

---

**IMPORTANT SAFETY INFORMATION**

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.
widely used than those with a longer duration of action, such as pancuronium bromide. 

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For patients receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium bromide, with a rapid onset of effect, may facilitate intubation. Atracurium besilate or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

Atracurium besilate, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in patients with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute.

Cisatracurium is a single isomer of atracurium besilate. It is more potent and has a slightly longer duration of action than atracurium besilate and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects.

Mivacurium, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection.

Pancuronium bromide, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in patients receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension.

Rocuronium bromide exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity.

Vecuronium bromide, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects.

**Depolarising neuromuscular blocking drugs**

Suxamethonium chloride has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required, e.g. with tracheal intubation. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium chloride should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. While tachycardia occurs with single use, bradycardia may occur with repeated doses in adults and with the first dose in children. Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium chloride use.

Prolonged paralysis may occur in **dual block**, which occurs with high or repeated doses of suxamethonium chloride and is caused by the development of a non-depolarising block following the initial depolarising block. Individuals with myasthenia gravis are resistant to suxamethonium chloride but can develop dual block resulting in delayed recovery.

Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.

**NEUROMUSCULAR BLOCKING DRUGS > DEPOLARISING**

### Suxamethonium chloride

*(Succinylcholine chloride)*

- **DRUG ACTION** Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade.

- **INDICATIONS AND DOSE**

  Neuromuscular blockade (short duration) during surgery and intubation

  → **BY INTRAVENOUS INJECTION**

  **Adult:** 1–1.5 mg/kg

- **UNLICENSED USE** Doses of suxamethonium in BNF may differ from those in product literature.

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CONTRA-INDICATIONS** Duchenne muscular dystrophy - family history of malignant hyperthermia - hyperkalaemia - low plasma-cholinesterase activity (including severe liver disease) - major trauma - neurological disease involving acute wasting of major muscle - personal or family history of congenital myotonic disease - prolonged immobilisation (risk of hyperkaemia) - severe burns

- **CAUTIONS** Cardiac disease - neuromuscular disease - raised intra-ocular pressure (avoid in penetrating eye injury) - respiratory disease - severe sepsis (risk of hyperkaemia)

- **INTERACTIONS** → Appendix 1: suxamethonium

- **SIDE-EFFECTS**

  → **Common or very common** Flushing - hyperkaemia - increased gastric pressure - increased intra-ocular pressure - myoglobinemia - myoglobinuria - postoperative muscle pain - rash

  → **Rare** Apnoea - arrhythmias - bronchospasm - cardiac arrest - limited jaw mobility - prolonged respiratory depression

  → **Very rare** Anaphylactic reactions - malignant hyperthermia

- **Frequency not known** Bradycardia (may occur with repeated doses) - hypertension - hypotension - rhabdomyolysis - tachycardia (occurs with single use)

**SIDE-EFFECTS, FURTHER INFORMATION**

Bradycardia - Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium use.

- **ALLERGY AND CROSS-SENSITIVITY** Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.

- **PREGNANCY** Mildly prolonged maternal neuromuscular blockade may occur.

- **BREAST FEEDING** Unlikely to be present in breast milk in significant amounts (ionised at physiological pH). Breast-feeding may be resumed once the mother recovered from neuromuscular block.

- **HEPATIC IMPAIRMENT** Prolonged apnoea may occur in severe liver disease because of reduced hepatic synthesis of pseudocholinesterase.
### Neuromuscular blocking drugs

#### Non-depolarising

**Importantly Safety Information**

Non-depolarising neuromuscular blocking drugs should only be administered by, or under direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

**Caution**

Burns (resistance can develop, increased doses may be required) - cardiovascular disease (reduce rate of administration) - electrolyte disturbances (response unpredictable) - fluid disturbances (response unpredictable) - hypothermia (activity prolonged, lower doses required) - myasthenia gravis (activity prolonged, lower doses required) - neuromuscular disorders (response unpredictable)

**Allergy and Cross-sensitivity**

Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.

**Pregnancy**

Non-depolarising neuromuscular blocking drugs are highly ionised at physiological pH and are therefore unlikely to cross the placenta in significant amounts.

**Breastfeeding**

Non-depolarising neuromuscular blocking drugs are ionised at physiological pH and are unlikely to be present in milk in significant amounts. Breast-feeding may be resumed once the mother has recovered from neuromuscular block.

### Atracurium besilate

(Atracurium besylate)

**Indications and Dose**

**Neuromuscular blockade (short to intermediate duration) for surgery and intubation**

- *Initially by intravenous injection*
  - Adult: Initially 300–600 micrograms/kg, then (by intravenous injection) 100–200 micrograms/kg as required, alternatively (by intravenous injection) initially 300–600 micrograms/kg, followed by (by intravenous infusion) 300–600 micrograms/kg/hour

**Neuromuscular blockade during intensive care**

- *Initially by intravenous injection*
  - Adult: Initially 300–600 micrograms/kg, initial dose is optional, then (by intravenous infusion) 270–1770 micrograms/kg/hour; (by intravenous infusion) usual dose 650–780 micrograms/kg/hour

**Doses at extremes of body-weight**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

### Interactions

- Appendix 1: neuromuscular blocking drugs, non-depolarising

### Side-effects

- **Very rare** Anaphylactoid reactions
- **Frequency not known** Acute myopathy (after prolonged use in intensive care) - bronchospasm - hypotension - seizures - skin flushing - tachycardia

### Directions for Administration

For intravenous infusion (Tracrium®; Atracurium besilate injection, Hospira; Atracurium injection/infusion, Genus), give continuously in Glucose 5% or Sodium Chloride 0.9%; stability varies with diluent; dilute requisite dose with infusion fluid to a concentration of 0.3–5 mg/mL.

### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Atracurium besilate (Non-proprietary)**
  - Atracurium besilate 10 mg per 1 ml Atracurium besilate 250mg/25ml solution for injection vials | 1 vial (POM) £16.50
  - Atracurium besilate 25mg/2.5ml solution for injection ampoules | 5 ampoule (POM) £9.25
  - Atracurium besilate 50mg/5ml solution for injection ampoules | 5 ampoule (POM) £17.50 | 10 ampoule (POM) £35.00
  - Tracrium (GlaxoSmithKline UK Ltd)
  - Atracurium besilate 10 mg per 1 ml Tracrium 250mg/25ml solution for injection vials | 2 vial (POM) £25.81
  - Tracrium 25mg/2.5ml solution for injection ampoules | 5 ampoule (POM) £8.28

### Cisatracurium

**Indications and Dose**

Neuromuscular blockade (intermediate duration) during surgery and intubation

- *Initially by intravenous injection*
  - Adult: Initially 150 micrograms/kg, then (by intravenous injection) maintenance 30 micrograms/kg every 20 minutes; alternatively (by intravenous infusion) initially 180 micrograms/kg/hour, then (by intravenous infusion) maintenance 60–120 micrograms/kg/hour, maintenance dose administered after stabilisation

Neuromuscular blockade (intermediate duration) during intensive care

- *Initially by intravenous injection*
  - Adult: Initially 150 micrograms/kg, initial dose is optional, then (by intravenous infusion) 180 micrograms/kg/hour, adjusted according to response; (by intravenous infusion) usual dose 30–600 micrograms/kg/hour

**Doses at extremes of body-weight**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**Interactions**

- Appendix 1: neuromuscular blocking drugs, non-depolarising

**Side-effects**

Acute myopathy (after prolonged use in intensive care) - bradycardia

**Directions for Administration**

For intravenous infusion (Nimbex®, Nimbex Forte®), give continuously in Glucose 5% or Sodium Chloride 0.9%; solutions of 2 mg/mL and 5 mg/mL may be infused undiluted; alternatively dilute with infusion fluid to a concentration of 0.1–2 mg/mL.
Pancuronium bromide

**INDICATIONS AND DOSE**

Neuromuscular blockade (long duration) during surgery and intubation
- BY INTRAVENOUS INJECTION
  - Adult: Initially 100 micrograms/kg, then 20 micrograms/kg as required

Neuromuscular blockade (long duration) during intensive care
- BY INTRAVENOUS INJECTION
  - Adult: Initially 100 micrograms/kg, initial dose is optional, then 60 micrograms/kg every 60–90 minutes

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

**INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising

**SIDE-EFFECTS**
- Acute myopathy (after prolonged use in intensive care)
- Hypertension · tachycardia

**SIDE-EFFECTS, FURTHER INFORMATION**

Pancuronium lacks histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension.

**HEPATIC IMPAIRMENT**
Possible slower onset, higher dose requirement, and prolonged recovery time.

**RENAL IMPAIRMENT**
Use with caution; prolonged duration of block.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Pancuronium bromide (Non-proprietary)
  - Pancuronium bromide 2 mg per 1 ml Pancuronium bromide 4mg/2ml solution for injection ampoules | 10 ampoule £50.00

**Mivacurium**

**INDICATIONS AND DOSE**

Neuromuscular blockade (short duration) during surgery and intubation
- INITIALLY BY INTRAVENOUS INJECTION

**SIDE-EFFECTS**
- Very rare Anaphylactoid reactions
- Frequency not known Bronchospasm · hypotension · skin flushing · tachycardia

**HEPATIC IMPAIRMENT**
Reduce dose in severe impairment.

**RENAL IMPAIRMENT**
Clinical effect prolonged in renal failure—reduce dose according to response.

**DIRECTIONS FOR ADMINISTRATION**
For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of 500 micrograms/mL; may also be given undiluted. Doses up to 150 micrograms/kg may be given over 5–15 seconds, higher doses should be given over 30 seconds. In asthma, cardiovascular disease or in those sensitive to reduced arterial blood pressure, give over 60 seconds.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Mivacron (GlaxoSmithKline UK Ltd)
  - Mivacurium (as Mivacurium chloride) 2 mg per 1 ml Mivacron 10mg/5ml solution for injection ampoules | 5 ampoule £13.95
  - Mivacurium 20mg/10ml solution for injection ampoules | 5 ampoule £22.57

**Rocuronium bromide**

**INDICATIONS AND DOSE**

Neuromuscular blockade (intermediate duration) during surgery and intubation
- INITIALLY BY INTRAVENOUS INJECTION

**SIDE-EFFECTS**
- Very rare Anaphylactoid reactions

**HEPATIC IMPAIRMENT**
Reduce dose in severe impairment.

**RENAL IMPAIRMENT**
Clinical effect prolonged in renal failure—reduce dose according to response.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of 500 micrograms/mL; may also be given undiluted. Doses up to 150 micrograms/kg may be given over 5–15 seconds, higher doses should be given over 30 seconds. In asthma, cardiovascular disease or in those sensitive to reduced arterial blood pressure, give over 60 seconds.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Rocuronium (as Rocuronium bromide) 2 mg per 1 ml Rocuronium bromide 2mg/2ml solution for injection ampoules | 10 ampoule £45.00
- Rocuronium (as Rocuronium bromide) 5 mg per 1 ml Rocuronium bromide 10mg/2ml solution for injection ampoules | 10 ampoule £90.00
- Rocuronium (as Rocuronium bromide) 15 mg per 1 ml Rocuronium bromide 15mg/5ml solution for injection ampoules | 10 ampoule £225.00

**DOSES AT EXTREMES OF BODY-WEIGHT**
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

**INTERACTIONS** → Appendix 1: neuromuscular blocking drugs, non-depolarising
1.2 Neuromuscular blockade reversal

Neuromuscular blockade reversal

Drugs for reversal of neuromuscular blockade

Anticholinesterases

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium bromide but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium chloride.

Neostigmine is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrronium bromide p. 1225 or alternatively atropine sulfate p. 1224, given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

Other drugs for reversal of neuromuscular blockade

Sugammadex p. 1230 is a modified gamma cyclodextrin that can be used for rapid reversal of neuromuscular blockade induced by rocuronium bromide or vecuronium bromide. In practice, sugammadex is used mainly for rapid reversal of neuromuscular blockade in an emergency.

ANTICHOLINESTERASES

Neostigmine with glycopyrronium bromide

The properties listed below are those particular to the combination only. For the properties of the components please consider, neostigmine p. 1024, glycopyrronium bromide p. 1225.

INDICATIONS AND DOSE

Reversal of non-depolarising neuromuscular blockade

BY INTRAVENOUS INJECTION

Adult: 1–2 mL, repeated if necessary, alternatively 0.02 mL/kilogram, repeated if necessary; maximum 2 mL per course

INTERACTIONS

Appendix 1: glycopyrronium, neostigmine

DIRECTIONS FOR ADMINISTRATION

For intravenous injection, give over 10–30 seconds.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Neostigmine with glycopyrronium bromide (Non-proprietary)

Glycopyrronium bromide 50 microgram per 1 mL, Neostigmine metilsulfate 2.5 mg per 1 mL

Neostigmine 2.5mg/1mL

Glycopyrronium bromide 500micrograms/mL solution for injection ampoules | 10 ampoule £11.50

downloaded from www.medicalbr.com
Antidotes and Chelators

Sugammadex

- **Indications and Dose**
  - Routine reversal of neuromuscular blockade induced by rocuronium or vecuronium
    - By intravenous injection
    - Adult: Initially 2–4 mg/kg, then 4 mg/kg if required, administered if recurrence of neuromuscular blockade occurs; consult product literature for further details
  - Immediate reversal of neuromuscular blockade induced by rocuronium
    - By intravenous injection
    - Adult: 16 mg/kg (consult product literature)

**Important Safety Information**

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **Caution**
  - Cardiovascular disease (recovery may be delayed)
  - Elderly (recovery may be delayed)
  - Pre-existing coagulation disorders
  - Recurrence of neuromuscular blockade—monitor respiratory function until fully recovered
  - Use of anticoagulants (unrelated to surgery)
  - Wait 24 hours before re-administering rocuronium
  - Wait 24 hours before re-administering vecuronium

- **Interactions**
  - Appendix 1: sugammadex

- **Side-effects**
  - Bradycardia
  - Bronchospasm
  - Cardiac arrest
  - Hypersensitivity reactions

- **Pregnancy**
  - Use with caution—no information available.

- **Renal Impairment**
  - Avoid if eGFR less than 30 mL/minute/1.73 m²

- **National Funding/Access Decisions**
  - Scottish Medicines Consortium (SMC) Decisions
    - The Scottish Medicines Consortium, has advised (February 2013) that sugammadex (Bridion®) is accepted for restricted use within NHS Scotland for the routine reversal of neuromuscular blockade in high-risk patients only, or where prompt reversal of neuromuscular block is required.

- **Medicinal Forms**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Solution for injection
  - Electrolytes: May contain sodium
    - Bridion: (Mercer Sharp & Dohme Ltd)
    - Sugammadex (as Sugammadex sodium) 100 mg per 1 ml
    - Bridion 500 mg/5 ml solution for injection vials | 10 vial | £1,491.00
      (Hospital only)
    - Bridion 200 mg/2 ml solution for injection vials | 10 vial | £596.40
      (Hospital only)

1.3 Peri-operative Analgesia

Peri-operative Analgesia

Non-opioid Analgesics

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastrointestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain. Acemetacin p. 1030, diclofenac sodium p. 1034, diclofenac potassium p. 1033, flurbiprofen p. 1040, ibuprofen p. 1041, ketoprofen p. 1044, paracetamol p. 422, parecoxib p. 1232, and ketorolac trometamol p. 1231 are licensed for postoperative use. Diclofenac and paracetamol can be given by injection as well as by mouth. Diclofenac sodium can be given by intravenous infusion for the treatment or prevention of postoperative pain. Intramuscular injections of diclofenac sodium and ketoprofen are rarely used; they are given deep into the gluteal muscle to minimise pain and tissue damage. Ketonolac trometamol is less irritant on intramuscular injection but pain has been reported; it can also be given by intravenous injection.

Suppositories of diclofenac sodium and ketoprofen may be effective alternatives to the parenteral use of these drugs.

Opioid Analgesics

Opioid Analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Pre-operative use of opioid analgesics is generally limited to those patients who require control of existing pain. See general notes on opioid analgesics and their use in postoperative pain.

See the management of opioid-induced respiratory depression in Pre-medications and peri-operative drugs p. 1223.

Intra-operative Analgesia

Opioid Analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

Alfentanil p. 1232, fentanyl p. 434, and remifentanil p. 1233 are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect. Repeated intra-operative doses of alfentanil or fentanyl should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive. Alfentanil, fentanyl, and remifentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by nonspecific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanil should not be given by intravenous injection intraoperatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

Anaesthetics, Local

Bupivacaine with fentanyl

The properties listed below are those particular to the combination only. For the properties of the components please consider, bupivacaine hydrochloride p. 1238, fentanyl p. 434.

- **Indications and Dose**
  - During labour (once epidural block established)
    - By continuous lumbar epidural infusion
    - Adult: 10–18.75 mg/hour, dose of bupivacaine to be administered, maximum 400 mg bupivacaine in 24 hours and 16–30 micrograms/hour, dose of fentanyl to be administered, maximum 720 micrograms fentanyl in 24 hours
  - Postoperative pain (once epidural block established)
    - By continuous epidural infusion
    - Adult: 4–18.75 mg/hour, dose of bupivacaine to be administered, maximum 400 mg bupivacaine in...
Ketorolac trometamol

**INDICATIONS AND DOSE**

Short-term management of moderate to severe acute postoperative pain only

- By intramuscular injection, or by intravenous injection
  - Adult (body-weight up to 50 kg): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day
  - Adult (body-weight 50 kg and above): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 90 mg per day
  - Elderly: Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day

- **CONTRA-INDICATIONS** Active or history of gastro-intestinal bleeding, active or history of gastro-intestinal ulceration, coagulation disorders, complete or partial syndrome of nasal polyps, confirmed or suspected cerebrovascular bleeding, dehydration, following operations with high risk of haemorrhage or incomplete haemostasis, haemorrhagic diathesis, history of gastro-intestinal perforation, hypovolaemia, severe heart failure

- **CAUTIONS** Allergic disorders, cardiac impairment (NSAIDs may impair renal function), cerebrovascular disease, coagulation defects, connective-tissue disorders, Crohn’s disease (may be exacerbated), elderly (risk of serious side-effects and fatalities), heart failure, ischaemic heart disease, peripheral arterial disease, risk factors for cardiovascular events, ulcerative colitis (may be exacerbated), uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

- **SIDE-EFFECTS**
  - Rare: Alveolitis, aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible), hepatic damage, interstitial fibrosis associated with NSAIDs can lead to renal failure, pancreatitis, papillary necrosis associated with NSAIDs can lead to renal failure, pulmonary eosinophilia, Stevens–Johnson syndrome, toxic epidermal necrolysis

- **Frequency not known** Abnormal dreams, angioedema, asthma, blood disorders, bradycardia, bronchospasm, chest pain, colitis (induction of or exacerbation of), confusion, convulsions, Crohn’s disease (induction of or exacerbation of), depression, diarrhoea, dizziness, drowsiness, dry mouth, dysphagia, euphoria, fluid retention (rarely precipitating congestive heart failure), flushing, gastro-intestinal bleeding, gastro-intestinal discomfort, gastro-intestinal disturbances, gastro-intestinal ulceration, haematuria, hallucinations, headache, hearing disturbances, hyperkalaemia, hyperkinesia, hypersensitivity reactions, hypertension, hynopatraemia, insomnia, malaise, myalgia, nausea, nervousness, optic neuritis, pain at injection site, pallor, palpitation, paraesthesia, photosensitivity, psychosis, purpura, raised blood pressure, rashes, renal failure (especially in patients with pre-existing renal impairment), sweating, taste disturbances, thirst, tinnitus, urinary frequency, vertigo, visual disturbances

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028.
  - **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
  - **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
  - **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
  - **BREAST FEEDING** Amount too small to be harmful.
  - **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
  - **RENAI IMPAIRMENT** Avoid if possible or use with caution. Avoid if serum creatinine greater than 160 micromol/litre. The lowest effective dose should be used for the shortest possible duration. Max. 60 mg daily by intramuscular injection or intravenous injection.

Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection, give over at least 15 seconds.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Ketorolac trometamol 30 mg per ml**
  - Ketorolac trometamol 30 mg/1 ml solution for injection ampoules | 5 ampoule (Fr) £5.47 (Hospital only) | 6 ampoule (Fr) £6.56
  - **Toraldo** (Atahns Pharma UK Ltd)
    - **Ketorolac trometamol 30 mg per ml**
      - Toraldo 30mg/1ml solution for injection ampoules | 5 ampoule (Fr) £5.36
**Parecoxib**

- **DRUG ACTION** Parecoxib is a selective inhibitor of cyclo-oxygenase-2.

- **INDICATIONS AND DOSE**
  - **Short-term management of acute postoperative pain**
    - **BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
      - Adult: Initially 40 mg, then 20–40 mg every 6–12 hours as required for up to 3 days; maximum 80 mg per day
      - Elderly (body-weight up to 50 kg): Initially 20 mg; maximum 40 mg per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding; active gastro-intestinal ulceration; cerebrovascular disease; inflammatory bowel disease; ischaemic heart disease; mild to severe heart failure; peripheral arterial disease

- **CAUTIONS** Allergic disorders; cardiac impairment (NSAIDs may impair renal function); coagulation defects; connective-tissue disorders; Crohn’s disease (may be exacerbated); dehydration; elderly (risk of serious side-effects and fatalities); following coronary artery bypass graft surgery; history of cardiac failure; hypertension; left ventricular dysfunction; oedema; risk factors for cardiovascular events; ulcerative colitis (may be exacerbated)

- **INTERACTIONS** → Appendix 1: NSAIDs

- **SIDE-EFFECTS**
  - **Common or very common**
    - Alveolar oestitis; flatulence; hypoaesthesia; hypokalaemia; hypotension; postoperative anaemia; sweating
  - **Uncommon**
    - Anorexia; arthralgia; bradycardia; cardiovascular events; ecchymosis; hyperglycaemia; malaise; pulmonary embolism
  - **Rare**
    - Alveolitis; aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible); hepatic damage; interstitial fibrosis associated with NSAIDs can lead to renal failure; pancreatitis; papillary necrosis associated with NSAIDs can lead to renal failure; pulmonary eosinophilia; Stevens-Johnson syndrome; toxic epidermal necrolysis; visual disturbances

- **Frequency not known**
  - Angioedema; blood disorders; blood pressure may be raised; bronchospasm; circulatory collapse; colitis (induction of or exacerbation of); Crohn’s disease (induction of or exacerbation of); depression; diarrhoea; dizziness; drowsiness; fluid retention (rarely precipitating congestive heart failure); gastro-intestinal bleeding; gastro-intestinal discomfort; gastro-intestinal disturbances; gastro-intestinal ulceration; haematuria; headache; hearing disturbances; hypersensitivity reactions; insomnia; nausea; nervousness; photosensitivity; rashes; renal failure (especially in patients with pre-existing renal impairment); tachycardia; tinnitus; vertigo

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID. Contra-indicated in patients with a history of allergic drug reactions including sulfonamide hypersensitivity.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Avoid—present in milk.

- **HEPATIC IMPAIRMENT** Halve dose in moderate impairment (max. 40 mg daily). Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) Decisions** The Scottish Medicines Consortium has advised (January 2003) that parecoxib is not recommended for use within NHS Scotland.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- **Dynastat** (Pfizer Ltd)
  - **Parecoxib (as Parecoxib sodium) 40 mg** Dynastat 40mg powder and solvent for solution for injection vials | 5 vial | £28.34

- **Powder for solution for injection**
  - **Dynastat** (Pfizer Ltd)
  - **Parecoxib (as Parecoxib sodium) 40 mg** Dynastat 40mg powder for solution for injection vials | 10 vial | £49.60

**Analgesics > Opioids**

**Alfentanil**

- **INDICATIONS AND DOSE**
  - **Spontaneous respiration: analgesia and enhancement of anaesthesia for short procedures**
    - **BY INTRAVENOUS INJECTION**
      - Adult: Initially up to 500 micrograms, dose to be administered over 30 seconds; supplemental doses 250 micrograms

- **Assisted ventilation: analgesia and enhancement of anaesthesia for short procedures**
  - **BY INTRAVENOUS INJECTION**
    - Adult: Initially 30–50 micrograms/kg, supplemental doses 15 micrograms/kg

- **Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia for longer procedures**
  - **BY INTRAVENOUS INFUSION**
    - Adult: Initially 50–100 micrograms/kg, dose to be administered over 10 minutes or as a bolus, followed by maintenance 30–60 micrograms/kg/hour

- **Assisted ventilation: analgesia and suppression of respiratory activity during intensive care for up to 4 days**
  - **BY INTRAVENOUS INFUSION**
    - Adult: Initially 2 mg/hour, adjusted according to response; usual dose 0.5–10 mg/hour, alternatively initially 5 mg in divided doses, to be administered over 10 minutes; dose used for more rapid initial control, reduce rate of administration if hypotension or bradycardia occur; additional doses of 0.5–1 mg may be
given by intravenous injection during short painful procedures

**DOSES AT EXTREMES OF BODY-WEIGHT**
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**CAUTIONS**

**CAUTIONS, FURTHER INFORMATION**
- Repeated intra-operative doses: Repeated intra-operative doses of alfentanil should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

**SIDE-EFFECTS**
- Common or very common: Hypertension, myoclonic movements
- Uncommon: Arrhythmias, hiccups, laryngospasm
- Rare: Epistaxis
- Frequency not known: Cardiac arrest, convulsions, cough, muscle rigidity, pyrexia

**SIDE-EFFECTS, FURTHER INFORMATION**
- Muscle rigidity: Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

**BREAST FEEDING**
Present in milk—withhold breast-feeding for 24 hours.

**RENAL IMPAIRMENT**
Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**DIRECTIONS FOR ADMINISTRATION**
5 mg/mL injection to be diluted before use. For continuous or intermittent intravenous infusion dilute in Glucose 5% or Sodium Chloride 0.9%.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**
- **Alfentanil (Non-proprietary)**
  - Alfentanil (as Alfentanil hydrochloride) 500 microgram per 1 ml: Alfentanil 1mg/2ml solution for injection ampoules | 10 amponge [PSM] £5.95 [CD]
  - Alfentanil 5mg/10ml solution for injection ampoules | 5 amponge [PSM] £13.90 [CD]
  - Alfentanil (as Alfentanil hydrochloride) 5 mg per 1 ml: Alfentanil 5mg/1ml solution for injection ampoules | 10 amponge [PSM] £21.95 [CD]
- **Rapifen (Janssen-Cilag Ltd)**
  - Alfentanil (as Alfentanil hydrochloride) 500 microgram per 1 ml: Rapifen 5mg/10ml solution for injection ampoules | 5 amponge [PSM] £14.50 [CD]
  - Rapifen 1mg/2ml solution for injection ampoules | 10 amponge [PSM] £6.34 [CD]
  - Alfentanil (as Alfentanil hydrochloride) 5 mg per 1 ml: Rapifen Intensive Care 5mg/1ml solution for injection ampoules | 10 amponge [PSM] £23.19 (Hospital only) [CD]

**INTERACTIONS**
- Appendix 1: opioids

**INDICATIONS AND DOSE**

**Premedication**
- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
  - Adult: 0.5–1 mL

**INTERACTIONS**
- Appendix 1: hyoscine, opioids

**LESS SUITABLE FOR PRESCRIBING**
Hyoscine hydrobromide with papaveretum is less suitable for prescribing.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

**Remifentanil**

**INDICATIONS AND DOSE**

**Analgesia and enhancement of anaesthesia at induction (initial bolus injection)**
- **BY INTRAVENOUS INJECTION**
  - Adult: Initially 0.25–1 microgram/kg, dose to be administered over at least 30 seconds, if patient is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary

**Analgesia and enhancement of anaesthesia at induction with or without initial bolus dose**
- **BY INTRAVENOUS INJECTION**
  - Adult: 30–60 micrograms/kg/hour, if patient is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary

**Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia (initial bolus injection)**
- **BY INTRAVENOUS INJECTION**
  - Adult: Initially 0.25–1 microgram/kg, dose to be administered over at least 30 seconds

**Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia with or without initial bolus dose**
- **BY INTRAVENOUS INJECTION**
  - Adult: 3–120 micrograms/kg/hour, dose to be administered according to anaesthetic technique and adjusted according to response, in light anaesthesia additional doses can be given by intravenous injection every 2–5 minutes during the intravenous infusion

**Spontaneous respiration: analgesia and enhancement of anaesthesia during maintenance of anaesthesia**
- **BY INTRAVENOUS INJECTION**
  - Adult: Initially 2.4 micrograms/kg/hour, adjusted according to response; usual dose 1.5–6 micrograms/kg/hour

**Assisted ventilation: analgesia and sedation in intensive-care patients (for max 3 days)**
- **BY INTRAVENOUS INJECTION**
  - Adult: Initially 6–9 micrograms/kg/hour, then adjusted in steps of 1.5 micrograms/kg/hour, allow at least 5 minutes between dose adjustments; usual dose 0.36–4.4 micrograms/kg/hour, if an infusion rate of 12 micrograms/kg/hour does not produce...
adequate sedation add another sedative (consult product literature for details).

Assisted ventilation: additional analgesia during stimulating or painful procedures in intensive-care patients

- **BY INTRAVENOUS INFUSION**
  - Adult: Usual dose 15–45 micrograms/kg/hour, maintain infusion rate of at least 6 micrograms/kg/hour for at least 5 minutes before procedure and adjust every 2–5 minutes according to requirements

Cardiac surgery

- Adult: (consult product literature)

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **UNLICENSED USE** Remifentanil doses in BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Analgesia in conscious patients
- **INTERACTIONS** \(\rightarrow\) Appendix 1: opioids
- **SIDE-EFFECTS**
  - Common or very common Hypoxia
  - Uncommon Hypoxia
  - Rare Asystole
  - Frequency not known AV block - convulsions

**SIDE-EFFECTS, FURTHER INFORMATION**

- Muscle rigidity Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.
- Respiratory depression In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by non-specific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression.
- **PREGNANCY** No information available.
- **BREAST FEEDING** Avoid breast-feeding for 24 hours after administration—present in milk in *animal* studies.
- **RENAI IMPAIRMENT** No dose adjustment necessary in renal impairment.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Ultiva*⁶), give continuously in Glucose 5% or Sodium Chloride 0.9% or Water for Injections; reconstitute with infusion fluid to a concentration of 1 mg/ml then dilute further to a concentration of 20–250 micrograms/ml (50 micrograms/ml recommended for general anaesthesia, 20–50 micrograms/ml recommended when used with target controlled infusion (TCI) device).

**PRESCRIBING AND DISPENSING INFORMATION**

Remifentanil should not be given by intravenous injection intra-operatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Remifentanil (Non-proprietary)**
  - Remifentanil (as Remifentanyl hydrochloride) 1 mg
  - Remifentanil 1 mg powder for concentrate for solution for injection vials \(\times\) 5 vial (£Pm £25.58–£25.60 (Hospital only) [CD]
  - Remifentanil (as Remifentanyl hydrochloride) 2 mg
  - Remifentanil 2 mg powder for concentrate for solution for injection vials \(\times\) 5 vial (£Pm £51.13–£51.15 (Hospital only) [CD]
  - Remifentanil (as Remifentanyl hydrochloride) 5 mg
  - Remifentanil 5 mg powder for concentrate for solution for injection vials \(\times\) 5 vial (£Pm £127.88–£127.90 (Hospital only) [CD]
  - *Ultiva* (GlaxoSmithKline UK Ltd)
  - Remifentanil (as Remifentanyl hydrochloride) 1 mg
  - Remifentanil 1 mg powder for solution for injection vials \(\times\) 5 vial (£Pm £25.58 (Hospital only) [CD]

**Remifentanil (as Remifentanyl hydrochloride) 2 mg** *Ultiva* 2 mg powder for solution for injection vials \(\times\) 5 vial (£Pm £51.15 (Hospital only) [CD]

**Remifentanil (as Remifentanyl hydrochloride) 5 mg** *Ultiva* 5 mg powder for solution for injection vials \(\times\) 5 vial (£Pm £127.88 (Hospital only) [CD]

### 1.4 Peri-operative sedation

**Conscious sedation for clinical procedures**

**Overview**

Sedation of patients during diagnostic and therapeutic procedures is used to reduce fear and anxiety, to control pain, and to minimise excessive movement. The choice of sedative drug will depend upon the intended procedure; some procedures are safer and more successful under anaesthesia. The patient should be monitored carefully; monitoring should begin as soon as the sedative is given or when the patient becomes drowsy, and should be continued until the patient wakes up.

**ANAESTHETICS, GENERAL > NMDA RECEPTOR ANTAGONISTS**

**Ketamine**

- **INDICATIONS AND DOSE**
  - **Induction and maintenance of anaesthesia for short procedures**
    - **BY INTRAMUSCULAR INJECTION**
      - Adult: Initially 6.5–13 mg/kg, adjusted according to response, a dose of 10 mg/kg usually produces 12–25 minutes of surgical anaesthesia
  - **BY INTRAVENOUS INJECTION**
    - Adult: Initially 1–4.5 mg/kg, adjusted according to response, to be administered over at least 60 seconds, a dose of 2 mg/kg usually produces 5–10 minutes of surgical anaesthesia
  - **Diagnostic manoeuvres and procedures not involving intense pain**
    - **BY INTRAMUSCULAR INJECTION**
      - Adult: Initially 4 mg/kg
  - **Induction and maintenance of anaesthesia for long procedures**
    - **BY INTRAVENOUS INJECTION**
      - Adult: Initially 0.5–2 mg/kg, using an infusion solution containing 1 mg/ml; maintenance 10–45 micrograms/kg/minute, adjusted according to response

**IMPORTANT SAFETY INFORMATION**

Ketamine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Acute porphyrias p. 969 • eclampsia • head trauma • hypertension • pre-eclampsia • raised intracranial pressure • severe cardiac disease • stroke
  - **CAUTIONS** Acute circulatory failure (shock) • cardiovascular disease • dehydration • elderly • fixed cardiac output • hallucinations • head injury • hypertension • hypovolaemia • increased cerebrospinal fluid pressure • intracranial mass lesions • nightmares • predisposition to
seizures • psychotic disorders • raised intra-ocular pressure • respiratory tract infection • thyroid dysfunction

**INTERACTIONS** ➔ Appendix 1: ketamine

**SIDE-EFFECTS**

- **Common or very common** Diplopia • hallucinations • hypertension • nausea • nightmares • nystagmus • rash • tachycardia • transient psychotic effects • vomiting
- **Uncommon** Arrhythmias • bradycardia • hypotension • laryngospasm • respiratory depression
- **Rare** Aponoea • cystitis • cystitis • haemorrhagic cystitis • hypersalivation • insomnia
- **Frequency not known** Raised intra-ocular pressure

**SIDE-EFFECTS, FURTHER INFORMATION**

- Transient psychotic effects Incidence of hallucinations, nightmares, and other transient psychotic effects can be reduced by a benzodiazepine such as diazepam or midazolam.

**PREGNANCY** May depress neonatal respiration if used during delivery.

**BREAST FEEDING** Avoid for at least 12 hours after last dose.

**HEPATIC IMPAIRMENT** Consider dose reduction.

**DIRECTIONS FOR ADMINISTRATION** For continuous intravenous infusion, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%; use microdrip infusion for maintenance of anaesthesia. For intravenous injection, dilute 100 mg/mL strength to a concentration of not more than 50 mg/mL with Glucose 5% or Sodium Chloride 0.9% or Water for Injections.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including ketamine, see Drugs and driving under Guidance on prescribing p. 1.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

- **Ketamine (Non-proprietary)**
  - Ketamine (as Ketamine hydrochloride) 50 mg per 1 mL
  - Ketalar (Pfizer Ltd)
  - Ketalar (as Ketamine hydrochloride) 10 mg per 1 mL
  - Ketalar 200mg/20ml solution for injection vials | 1 vial (£1.21)
  - Ketalar 500mg/10ml solution for injection vials | 1 vial (£0.92)

- **Dexmedetomidine**
  - **INDICATIONS AND DOSE**
    - Maintenance of sedation during intensive care
      - **BY INTRAVENOUS INFUSION**
      - Adult: 0.7 microgram/kg/hour, adjusted according to response; usual dose 0.2–1.4 micrograms/kg/hour

**IMPORTANT SAFETY INFORMATION**

Dexmedetomidine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management.

- **CONTRA-INDICATIONS** Acute cerebrovascular disorders • second- or third-degree AV block (unless pacemaker fitted) • uncontrolled hypotension
- **CAUTIONS** Abrupt withdrawal after prolonged use • bradycardia • ischaemic heart disease • malignant hyperthermia • severe cerebrovascular disease (especially at higher doses) • severe neurological disorders • spinal cord injury

- **INTERACTIONS** ➔ Appendix 1: dexmedetomidine

**SIDE-EFFECTS**

- **Common or very common** Agitation • blood pressure changes • bradycardia • changes in blood sugar • dry mouth • hyperthermia • myocardial infarction • myocardial ischaemia • nausea • tachycardia • vomiting
- **Uncommon** Abdominal distension • AV block • decreased cardiac output • dyspnoea • hallucination • hypoaalbuminaemia • metabolic acidosis • thirst
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Dose reduction may be required. Manufacturer advises caution.

**MONITORING REQUIREMENTS**

- Monitor cardiac function.
- Monitor respiratory function in non-intubated patients.

**DIRECTIONS FOR ADMINISTRATION** To be diluted before use. For intravenous infusion given continuously in Glucose 5% or Sodium chloride 0.9%, dilute to a concentration of 4 micrograms/mL.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Dexdor** (Orion Pharma (UK) Ltd)
  - Dexmedetomidine (as Dexmedetomidine hydrochloride) 100 microgram per 1 mL
    - Dexdor 1mg/10ml concentrate for solution for infusion vials | 4 vial (£3.13)
    - Dexdor 400micrograms/4ml concentrate for solution for infusion vials | 4 vial (£1.25)
    - Dexdor 200micrograms/2ml concentrate for solution for infusion ampoules | 5 ampoule (£0.78)
  - 25 ampoule (£3.90) (Hospital only)
2 Malignant hyperthermia

**MUSCLE RELAXANTS**

Dantrolene sodium

- **DRUG ACTION** Acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

- **INDICATIONS AND DOSE**
  - **Malignant hyperthermia**
    - **BY RAPID INTRAVENOUS INJECTION**
      - Adult: Initially 2–3 mg/kg, then 1 mg/kg, repeated if necessary; maximum 10 mg/kg per course
  - **Chronic severe spasticity of voluntary muscle**
    - **BY MOUTH**
      - Adult: Initially 25 mg daily, then increased to up to 100 mg 4 times a day; dose increased at weekly intervals; usual dose 75 mg 3 times a day

**SIDE-EFFECTS**

- **Common or very common**
  - Confusion
  - Constipation
  - Crystalluria
  - Depression
  - Dysphagia
  - Dyspnoea
  - Erratic blood pressure
  - Exacerbation of cardiac insufficiency
  - Haematuria
  - Increased sweating
  - Increased urinary frequency
  - Insomnia
  - Nervousness
  - Tachycardia
  - Urinary incontinence
  - Urinary retention

- **Uncommon**
  - Confusion
  - Constipation
  - Crystalluria
  - Depression
  - Dysphagia
  - Dyspnoea
  - Erratic blood pressure
  - Exacerbation of cardiac insufficiency
  - Haematuria
  - Increased sweating
  - Increased urinary frequency
  - Insomnia
  - Nervousness
  - Tachycardia
  - Urinary incontinence
  - Urinary retention

- **Frequency not known**
  - Confusion
  - Constipation
  - Crystalluria
  - Depression
  - Dysphagia
  - Dyspnoea
  - Erratic blood pressure
  - Exacerbation of cardiac insufficiency
  - Haematuria
  - Increased sweating
  - Increased urinary frequency
  - Insomnia
  - Nervousness
  - Tachycardia
  - Urinary incontinence
  - Urinary retention

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hepatotoxicity: Potentially life-threatening hepatotoxicity reported—discontinue if abnormal liver function tests or symptoms of liver disorder; re-introduce only if complete reversal of hepatotoxicity.

**PREGNANCY**

- **With intravenous use** Use only if potential benefit outweighs risk.

- **With oral use** Avoid use in chronic spasticity—embryotoxic in animal studies.

**IMPORTANT SAFETY INFORMATION**

- Should only be administered by, or under the direct supervision of, personnel experienced in the use of dantrolene when used for malignant hyperthermia.

**CONTRA-INDICATIONS**

- With oral use: Acute muscle spasm: avoid when spasticity is useful, for example, locomotion.

**CAUTIONS**

- With intravenous use: Avoid extravasation (risk of tissue necrosis).

**INTERACTIONS**

- With oral use: Females (hepatotoxicity): history of liver disorders (hepatotoxicity) - if doses greater than 400 mg daily (hepatotoxicity), impaired cardiac function, impaired pulmonary function; patients over 50 years (hepatotoxicity): therapeutic effect may take a few weeks to develop—discontinue if no response within 6–8 weeks.

**Medicinal forms**

- **Powder for solution for injection**
  - **Dantrolen** (Norgine Pharmaceuticals Ltd)
    - Dantrolene sodium 20 mg: Dantrolen Intravenous 20mg powder for solution for injection vials | 12 vial (Hospital only) | 36 vial (Hospital only) £1,836.00 (Hospital only)
  - **Capsule**
    - **Dantrium** (Norgine Pharmaceuticals Ltd)
      - Dantrolene sodium 25 mg: Dantrium capsules | 100 capsule (Hospital only) £16.87 DT price = £16.87
      - Dantrolene sodium 100 mg: Dantrium capsules | 100 capsule (Hospital only) £43.07 DT price = £43.07

Local anaesthesia

Local anaesthesia

**Local anaesthetic drugs**

The use of local anaesthetics by injection or by application to mucous membranes to produce local analgesia is discussed in this section.

Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier’s block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

Bupivacaine hydrochloride p. 1238 has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

Chloroprocaine hydrochloride p. 1240, a para-amino benzoic acid ester, is used for spinal anaesthesia in adults where the planned procedure should not exceed 40 minutes.

Levobupivacaine p. 1241, an isomer of bupivacaine, has anaesthetic and analgesic properties similar to bupivacaine hydrochloride, but is thought to have fewer adverse effects.
Lidocaine hydrochloride p. 1242 is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should not usually exceed 1% in strength. The duration of the block (with adrenaline/epinephrine p. 216) is about 90 minutes.

Prilocaine hydrochloride p. 1246 is a local anaesthetic of low toxicity which is similar to lidocaine hydrochloride. A hyperbaric solution of prilocaine hydrochloride (containing glucose) may be used for spinal anaesthesia.

Ropivacaine hydrochloride p. 1247 is an amide-type local anaesthetic agent similar to bupivacaine hydrochloride. It is less cardiotoxic than bupivacaine hydrochloride, but also less potent.

Tetracaine p. 1248, a para-aminobenzoic acid ester, is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. It is rapidly absorbed from mucous membranes and should never be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine hydrochloride is a safer alternative.

Administration by injection
The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The patient’s age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity.

NHS Improvement has advised (September 2016) that, prior to administration, all injectable medicines must be drawn directly from their original ampoule or container into a syringe and should never be decanted into gallipots or open containers. This is to avoid the risk of medicines being confused with other substances, e.g. skin disinfectants, and to reduce the risk of contamination.

Great care must be taken to avoid accidental intravascular injection; local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local anaesthesia around the oral cavity may impair swallowing and therefore increases the risk of aspiration.

Epidual anaesthesia is commonly used during surgery, often combined with general anaesthesia, because of its protective effect against the stress response of surgery. It is often used when good postoperative pain relief is essential.

Use of vasoconstrictors
Local anaesthetics cause dilatation of blood vessels. The addition of a vasoconstrictor such as adrenaline/epinephrine to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravenous administration of a preparation containing adrenaline/epinephrine, and it is not advisable to give adrenaline/epinephrine with a local anaesthetic injection in digits or appendages because of the risk of ischaemic necrosis.

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. Care must also be taken to calculate a safe maximum dose of local anaesthetic when using combination products.

In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline/epinephrine with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline/epinephrine should be used.

**Dental anaesthesia**
Lidocaine hydrochloride is widely used in dental procedures; it is most often used in combination with adrenaline/epinephrine. Lidocaine hydrochloride 2% combined with adrenaline/epinephrine 1 in 80 000 (12.5 micrograms/mL) is a safe and effective preparation; there is no justification for using higher concentrations of adrenaline/epinephrine.

The amide-type local anaesthetics articaine and mepivacaine hydrochloride p. 1245 are also used in dentistry; they are available in cartridges suitable for dental use. Mepivacaine hydrochloride is available with or without adrenaline/epinephrine and articaine is available with adrenaline.

In patients with severe hypertension or unstable cardiac rhythm, mepivacaine hydrochloride without adrenaline/epinephrine may be used. Alternatively, prilocaine hydrochloride with or without felypressin can be used but there is no evidence that it is any safer. Felypressin can cause coronary vasoconstriction when used at high doses; limit dose in patients with coronary artery disease.

**Toxicity**
For management of toxicity see Severe local anaesthetic-induced cardiovascular toxicity below.

**Severe local anaesthetic-induced cardiovascular toxicity**

**Overview**
After injection of a bolus of local anaesthetic, toxicity may develop at any time in the following hour. In the event of signs of toxicity during injection, the administration of the local anaesthetic must be stopped immediately.

Cardiovascular status must be assessed and cardiopulmonary resuscitation procedures must be followed.

In the event of local anaesthetic-induced cardiac arrest, standard cardiopulmonary resuscitation should be initiated immediately. Lidocaine must not be used as anti-arrhythmic therapy.

If the patient does not respond rapidly to standard procedures, 20% lipid emulsion such as Intralipid® [unlicensed indication] should be given intravenously at an initial bolus dose of 1.5 mL/kg over 1 minute, followed by an infusion of 15 mL/kg/hour. After 5 minutes, if cardiovascular stability has not been restored or circulation deteriorates, give a maximum of two further bolus doses of 1.5 mL/kg over 1 minute, 5 minutes apart, and increase the infusion rate to 30 mL/kg/hour. Continue infusion until cardiovascular stability and adequate circulation are restored or maximum cumulative dose of 12 mL/kg is given.

Standard cardiopulmonary resuscitation must be maintained throughout lipid emulsion treatment. Propofol is not a suitable alternative to lipid emulsion. Further advice on ongoing treatment should be obtained from the National Poisons Information Service.

Detailed treatment algorithms and accompanying notes are available at www.toxbase.org or can be found in the Association of Anaesthetists of Great Britain and Ireland safety guideline, Management of Severe Local Anaesthetic Toxicity and Management of Severe Local Anaesthetic Toxicity – Accompanying notes.
ANAESTHETICS, LOCAL

Adrenaline with articaine hydrochloride

(Carticaine hydrochloride with epinephrine)

- INDICATIONS AND DOSE
  - infiltration anaesthesia in dentistry
    - BY REGIONAL ADMINISTRATION
    - Adult: Consult expert dental sources
  - DOSES AT EXTREMES OF BODY-WEIGHT
    To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

CONTRA-INDICATIONS

Application to damaged skin - application to the middle ear (may cause ototoxicity) - complete heart block - injection into infected tissues - infection into inflamed tissues - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier's block)

CONTRA-INDICATIONS, FURTHER INFORMATION

- injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
- CAUTIONS
  - use of vasoconstrictors In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.
  - INTERACTIONS → Appendix 1: articaine, sympathomimetics, vasoconstrictor
  - SIDE-EFFECTS
    - Angina - angle-closure glaucoma - anorexia - anxiety - arrhythmias - blurred vision - cardiac arrest - cold extremities - confusion - convulsions - difficulty in micturition - dizziness - drowsiness - dry mouth - dyspnoea - feeling of inebriation - headache - hyperglycaemia - hypersalivation - hypertension (risk of cerebral haemorrhage) - hypokalaemia - insomnia - lightheadedness - metabolic acidosis - methaemoglobinemia - muscle twitching - mydriasis - myocardial depression (resulting in hypotension and bradycardia) - myocardial infarction - nausea - numbness of the tongue and perioral region - pallor - palpitation - paraesthesia (including sensations of hot and cold) - peripheral vasodilatation (resulting in hypotension and bradycardia) - psychosis - pulmonary oedema (on excessive dosage or extreme sensitivity) - restlessness - sweating - tachycardia - tinnitus - tissue necrosis at injection site and of extremities, bowel, liver and kidneys - transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) - tremor - urinary retention - vomiting - weakness

SIDE-EFFECTS, FURTHER INFORMATION

- Toxic effects
  - Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.
  - Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.
  - The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- ALLERGY AND CROSS-SENSITIVITY
  - Hypersensitivity and cross-sensitivity
  - Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- PREGNANCY
  - Use only if potential benefit outweighs risk—no information available.

- BREAST FEEDING
  - Avoid breast-feeding for 48 hours after administration.

- HEPATIC IMPAIRMENT
  - Use with caution; increased risk of side-effects in severe impairment.

- RENAL IMPAIRMENT
  - Manufacturers advise use with caution in severe impairment.

- MONITORING REQUIREMENTS
  - Consider monitoring blood pressure and ECG (advised with systemic adrenaline/epinephrine).

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Sulfites

- Septanest (Septodont Ltd)
  - Adrenaline (as Adrenaline acid tartrate) 10 microgram per 1 mL
  - Articaine hydrochloride 40 mg per 1 mL

Septanest 1 in 100,000 solution for injection cartridges | 50 cartridge no price available

Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 mL, Articaine hydrochloride 40 mg per 1 mL

Septanest 1 in 200,000 solution for injection cartridges | 50 cartridge no price available

Bupivacaine hydrochloride

- INDICATIONS AND DOSE
  - Surgical anaesthesia, lumbar epidural block
    - BY REGIONAL ADMINISTRATION
    - Adult: 75–150 mg, dose administered using a 5 mg/mL (0.5%) solution
Surgical anaesthesia, field block
- **BY REGIONAL ADMINISTRATION**
- Adult: Up to 150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, thoracic epidural block
- **BY THORACIC EPIDURAL**
- Adult: 12.5–50 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, caudal epidural block
- **BY REGIONAL ADMINISTRATION**
- Adult: 50–150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, major nerve block
- **BY REGIONAL ADMINISTRATION**
- Adult: 50–175 mg, dose administered using 5 mg/mL (0.5%) solution

Acute pain, intra-articular block
- **BY INTRA-ARTICULAR INJECTION**
- Adult: Up to 100 mg, dose administered using a 2.5 mg/mL (0.25%) solution; when co-administered with bupivacaine by another route, total max. 150 mg

Acute pain, thoracic epidural block
- **BY CONTINUOUS EPIDURAL INFUSION**
- Adult: 6.3–18.8 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

Acute pain, labour
- **BY CONTINUOUS EPIDURAL INFUSION**
- Adult: 6.25–12.5 mg/hour, dose administered using a 1.25 mg/mL (0.125%) solution; maximum 400 mg per day

Acute pain, lumbar epidural block
- **INITIALLY BY LUMBAR EPIDURAL**
- Adult: 15–37.5 mg, then (by lumbar epidural) 15–37.5 mg, repeated when required at intervals of at least 30 minutes, dose administered by intermittent injection using a 2.5 mg/mL (0.25%) solution, alternatively (by continuous epidural infusion) 12.5–18.8 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

Acute pain, field block
- **BY REGIONAL ADMINISTRATION**
- Adult: Up to 150 mg, dose administered using a 2.5 mg/mL (0.25%) solution

**MARCAIN HEAVY**

Intrathecal anaesthesia for surgery
- **BY INTRATHECAL INJECTION**
- Adult: 10–20 mg

**DOSES AT EXTREMES OF BODY-WEIGHT**
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**IMPORTANT SAFETY INFORMATION**
The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

**CONTRA-INDICATIONS** Application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - complete heart block - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) - should not be applied to damaged skin

**CONTRA-INDICATIONS, FURTHER INFORMATION**
- Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.
- **CAUTIONS** Cardiovascular disease - cerebral atheroma - debilitated patients (consider dose reduction) - elderly (consider dose reduction) - epilepsy - hypotension - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - myocardial depression may be more severe and more resistant to treatment - shock
- **INTERACTIONS** - Appendix 1: anaesthetics, local
- **SIDE-EFFECTS** Arhythmias - blurred vision - cardiac arrest - convulsions - dizziness - drowsiness - feeling of inebriation - headache - lightheadedness - muscle twitching - myocardial depression (resulting in hypotension and bradycardia) - nausea - numbness of the tongue and perioral region - paraesthesia (including sensations of hot and cold) - peripheral vasodilatation (resulting in hypotension and bradycardia) - restlessness - tinnitus - transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) - tremors - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
- Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

**ALLERGY AND CROSS-SENSITIVITY**
- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

**PREGNANCY** Use lower doses for intrathecal use during late pregnancy. Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block.

**BREAST FEEDING** Amount too small to be harmful.

**HEPATIC IMPAIRMENT** Use with caution in severe impairment.

**RENAL IMPAIRMENT** Use with caution in severe impairment.

**MEDIcular FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

**Solution for Injection**
- **Bupivacaine hydrochloride (Non-proprietary)**
  - Bupivacaine hydrochloride 2.5 mg per 1 ml Bupivacaine 0.25% solution for injection 10ml Sure-Amp ampoules | 20 ampoule PM £17.50
  - Bupivacaine hydrochloride 5 mg per 1 ml Bupivacaine 0.5% solution for injection 10ml Sure-Amp ampoules | 20 ampoule PM £18.30

Downloaded from www.medicalbr.com
Bupivacaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule (£3.8) no price available

- **Marcain** (Aspen Pharma Trading Ltd)
  - **Bupivacaine hydrochloride 2.5 mg per 1 ml** Marcain 0.25% solution for injection 10ml Polyanephar ampoules | 5 ampoule (£3.92)
  - **Bupivacaine hydrochloride 5 mg per 1 ml** Marcain 0.5% solution for injection 10ml Polyanephar ampoules | 5 ampoule (£3.25)
  - **Marcain Heavy** (Aspen Pharma Trading Ltd)
  - **Bupivacaine hydrochloride 5 mg per 1 ml** Marcain Heavy 0.5% solution for injection 4ml ampoules | 5 ampoule (£3.72)

**Infusion**
- **Bupivacaine hydrochloride (Non-proprietary)**
  - **Bupivacaine hydrochloride 1 mg per 1 ml** Bupivacaine 100mg/100ml (0.1%) infusion bags | 20 bag (£110) no price available
  - **Bupivacaine hydrochloride 250mg/250ml (0.1%)** infusion bags | 20 bag (£280) no price available
  - **Bupivacaine hydrochloride 1.25 mg per 1 ml** Bupivacaine 312.5mg/250ml (0.125%) infusion bags | 20 bag (£7.27) no price available

**Bupivacaine with adrenaline**
The properties listed below are those particular to the combination only. For the properties of the components please consider, bupivacaine hydrochloride p. 1238, adrenaline/epinephrine p. 216.

- **INDICATIONS AND DOSE**
  - **Surgical anaesthesia**
    - By lumbar epidural, or by local infiltration, or by caudal epidural
    - Adult: (consult product literature)
  - **Acute pain management**
    - By lumbar epidural, or by local infiltration
    - Adult: (consult product literature)

**IMPORTANT SAFETY INFORMATION**
Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

- **CAUTIONS**
  - **CAUTIONS, FURTHER INFORMATION**
  In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.
  - **INTERACTIONS** → Appendix 1: anaesthetics, local, sympathomimetics, vasoconstrictor

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - **Bupivacaine with adrenaline (Non-proprietary)**
      - **Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Bupivacaine hydrochloride 2.5 mg per 1 ml** Bupivacaine 25mg/10ml (0.25%) / Adrenaline (base) 50micrograms/10ml (1 in 200,000) solution for injection ampoules | 10 ampoule (£3.8) £40.00
      - **Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Bupivacaine hydrochloride 5 mg per 1 ml** Bupivacaine 50mg/10ml (0.5%) / Adrenaline (base) 50micrograms/10ml (1 in 200,000) solution for injection ampoules | 10 ampoule (£3.8) £45.00

**Chloroprocaine hydrochloride**
- **INDICATIONS AND DOSE**
  - Intrathecal anaesthesia for surgical procedures lasting up to 40 minutes
  - By slow intrathecal injection
  - Adult: 40–50 mg, dose depends on desired length of block

**DOSES AT EXTREMES OF BODY-WEIGHT**
To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.

**IMPORTANT SAFETY INFORMATION**
The licensed doses stated above may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS**
  - Application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - complete heart block - preparations containing preservatives should not be used for caudal, epidural, or spinal block, for intravenous regional anaesthesia (Bier’s block) - severe anaemia - should not be applied to damaged skin

**CONTRA-INDICATIONS, FURTHER INFORMATION**
- Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS**
  - Acute porphyrias p. 969 - cardiovascular disease - debilitated patients (consider dose reduction) - elderly (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - shock

- **INTERACTIONS** → Appendix 1: chloroprocaine

- **SIDE-EFFECTS**
  - Uncommon Hypertension

  - Frequency not known Arrhythmias - blurred vision - cardiac arrest - convulsions - dizziness - drowsiness - feeling of inebriation - headache - lightheadedness - muscle twitching - myocardial depression (resulting in hypotension and bradycardia) - nausea - numbness of the tongue and perioral region - paraesthesia (including sensations of hot and cold) - peripheral vasodilation (resulting in hypotension and bradycardia) - restlessness - tinnitus - transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) - tremors - vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

  - The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local
anaesthetics, such as tetracaine and chlorprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in severe impairment.

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Ampres (AMCo)
  - Chloroprocaine hydrochloride 10 mg per 1 ml Ampres 50mg/5ml solution for injection ampoules | 10 ampoule £87.50

### Levobupivacaine

#### INDICATIONS AND DOSE

**Acute postoperative pain**
- **BY CONTINUOUS EPIDURAL INFUSION**
  - Adult: 12.5–18.75 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

**Acute labour pain**
- **BY LUMBAR EPIDURAL**
  - Adult: 15–25 mg, repeated at intervals of at least 15 minutes, dose administered using a 2.5 mg/mL (0.25%) solution; maximum 400 mg per day
  - **BY CONTINUOUS EPIDURAL INFUSION**
  - Adult: 5–12.5 mg/hour, dose administered using a 1.25 mg/mL (0.125%) solution; maximum 400 mg per day

**Surgical anaesthesia, peripheral nerve block**
- **BY REGIONAL ADMINISTRATION**
  - Adult: 2.5–150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

**Surgical anaesthesia, peribulbar nerve block**
- **BY REGIONAL ADMINISTRATION**
  - Adult: 37.5–112.5 mg, dose administered using a 7.5 mg/mL (0.75%) solution

**Surgical anaesthesia for caesarean section**
- **BY LUMBAR EPIDURAL**
  - Adult: 75–150 mg, to be given over 15–20 minutes, dose administered using a 5 mg/mL (0.5%) solution

**Surgical anaesthesia**
- **BY LUMBAR EPIDURAL**
  - Adult: 50–150 mg, to be given over 5 minutes, dose administered using a 5 mg/mL (0.5%) or 7.5 mg/mL (0.75%) solution
  - **BY INTRATHecal INJECTION**
  - Adult: 15 mg, dose administered using a 5 mg/mL (0.5%) solution
  - **BY LOCAL INFILTRATION**
  - Adult: 2.5–150 mg, dose administered using a 2.5 mg/mL (0.25%) solution

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

### IMPORTANT SAFETY INFORMATION

The licensed doses stated may not be appropriate in some settings and expert advice should be sought.

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Application to the middle ear (can cause ototoxicity) • avoid injection into infected tissues • avoid injection into inflamed tissues • complete heart block • preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) • should not be applied to damaged skin

- **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS** Cardiovascular disease • debilitated patients (consider dose reduction) • elderly (consider dose reduction) • epilepsy • hypovolaemia • impaired cardiac conduction • impaired respiratory function • myasthenia gravis • shock

- **INTERACTIONS** → Appendix 1: anaesthetics, local

- **SIDE-EFFECTS** Anaemia • arrhythmias • blurred vision • cardiac arrest • convulsions • dizziness • drowsiness • feeling of inebriation • headache • lightheadedness • muscle twitching • myocardial depression (resulting in hypotension and bradycardia) • nausea • numbness of the tongue and perioral region • paraesthesia (including sensations of heat and cold) • peripheral vasodilatation (resulting in hypotension and bradycardia) • pyrexia • restlessness • sweating • tinnitus • transient excitement (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) • tremors • vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Toxic effects
    - Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.
    - Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.
    - The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Hypersensitivity and cross-sensitivity
    - Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chlorprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid if possible in the first trimester—toxicity in animal studies. May cause fetal distress syndrome. Do not use for paracervical block in obstetrics. Do not use 7.5 mg/mL strength in obstetrics.

- **BREAST FEEDING** Amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Use with caution.

- **DIRECTIONS FOR ADMINISTRATION** For 1.25 mg/mL concentration dilute standard solutions with sodium chloride 0.9%.
Lidocaine hydrochloride (Lignocaine hydrochloride)

**INDICATIONS AND DOSE**

**Infiltration anaesthesia**
- **BY LOCAL INFILTRATION**
  - Adult: Dose to be given according to patient’s weight and nature of procedure; max. 200 mg, maximum dose 500 mg if given in solutions containing adrenaline

**DOSES AT EXTREMES OF BODY-WEIGHT**
- When used by local infiltration To avoid excessive dosage in obese patients, weight-based doses for non-emergency indications may need to be calculated on the basis of ideal body-weight.

**Intravenous regional anaesthesia and nerve block**
- **BY REGIONAL ADMINISTRATION**
  - Adult: Seek expert advice

**Pain relief (in anal fissures, haemorrhoids, pruritus ani, pruritus vulvae, herpes zoster, or herpes labialis)**
- **TO THE SKIN USING OINTMENT**
  - Adult: Apply 1–2 mL as required, avoid long-term use

**Sore nipples from breast-feeding**
- **TO THE SKIN USING OINTMENT**
  - Adult: Apply using gauze and wash off immediately before next feed

**LMX 4**

**Anaesthesia before venous cannulation or venepuncture**
- **TO THE SKIN**
  - Child 1–2 months: Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 60 minutes, remove cream with gauze and perform procedure after approximately 5 minutes
  - Child 3–11 months: Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 4 hours, remove cream with gauze and perform procedure after approximately 5 minutes
  - Child 1–17 years: Apply 1–2.5 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes

**VERSATIS**
- **Postherpetic neuralgia**
  - **TO THE SKIN**
  - Adult: Apply once daily for up to 12 hours, followed by a 12-hour plaster-free period; discontinue if no response after 4 weeks, to be applied to intact, dry, non-hairy, non-irritated skin, up to 3 plasters may be used to cover large areas; plasters may be cut

**XYLOCAINE**
- **During delivery in obstetrics**
  - **TO THE SKIN**
  - Adult: Up to 20 doses

**IMPORTANT SAFETY INFORMATION**
- **When used by local infiltration**
  - The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

**CONTRA-INDICATIONS, FURTHER INFORMATION**
- **When used by regional administration All grades of atrioventricular block - application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) - severe myocardial depression - should not be applied to damaged skin - sino-atrial disorders**

**CONTRA-INDICATIONS, FURTHER INFORMATION**
- **When used by regional administration**
  - Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

**CAUTIONS**
- **When used by regional administration**
  - Acute porphyria (consider infusion with glucose for its anti-porphyrinogenic effects) - children (consider dose reduction) - congestive cardiac failure (consider lower dose) - debilitated patients (consider dose reduction) - elderly (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - post cardiac surgery (consider lower dose) - shock

**INTERACTIONS**
- Appendix 1: antiarrhythmics

**SIDE-EFFECTS**
- **Common or very common**
  - When used by regional administration Bradycardia (may lead to cardiac arrest) - confusion - convulsions - dizziness (particularly if injection too rapid) - drowsiness (particularly if injection too rapid) - hypotension (may lead to cardiac arrest) - paraesthesia (particularly if injection too rapid) - respiratory depression
  - Rare
  - When used by regional administration Anaphylaxis
Frequency not known
- When used by regional administration Transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) • arrhythmias • blurred vision • cardiac arrest • feeling of inebriation • headache • hypoglycaemia (following intrathecal or extradural administration) • methaemoglobinemia • muscle twitching • myocardial depression (resulting in hypotension and bradycardia) • nausea • numbness of the tongue and perioral region •ystagnus • peripheral vasodilatation (resulting in hypotension and bradycardia) • rash • restlessness • tinnitus • tremors • vomiting

SIDE-EFFECTS, FURTHER INFORMATION
- Topical application A single application of a topical lidocaine preparation does not generally cause systemic side-effects.
- Toxic effects
  - When used by regional administration Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.
  - Methaemoglobinemia
  - When used by regional administration Methaemoglobinemia can be treated with an intravenous injection of methylenithioninium chloride.

ALLERGY AND CROSS-SENSITIVITY
- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

PREGNANCY
- Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.

BREAST FEEDING
- Present in milk but amount too small to be harmful.

HEPATIC IMPAIRMENT
- Caution—increased risk of side-effects.

RENAL IMPAIRMENT
- Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

MONITORING REQUIREMENTS
- With systemic use Monitor ECG and have resuscitation facilities available.

PROFESSION SPECIFIC INFORMATION
- Dental practitioners’ formulary
  - Lidocaine ointment 5% may be prescribed. Spray may be prescribed as Lidocaine Spray 10%

NATIONAL FUNDING/ACCESS DECISIONS
- Versatis
  - Scottish Medicines Consortium (SMC) Decisions
    - The Scottish Medicines Consortium has advised (July 2008) that Versatis™ is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who are intolerant of first-line systemic therapies or when they have been ineffective.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, ointment

Solution for injection
- **Lidocaine hydrochloride (Non-proprietary)**
  - Lidocaine hydrochloride 5 mg per 1 ml
    - Lidocaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule (Pbm) | £7.00
  - Lidocaine hydrochloride 10 mg per 1 ml
    - Lidocaine 100mg/10ml (1%) solution for injection Mini-Plasco ampoules | 20 ampoule (Pbm) | £10.89
  - Lidocaine 100mg/10ml (1%) solution for injection ampoules | 10 ampoule (Pbm) | £4.40 DT price = £4.36
  - Lidocaine 100mg/10ml (1%) solution for injection Sure-Amp ampoules | 20 ampoule (Pbm) | £8.80
  - Lidocaine 200mg/20ml (1%) solution for injection vials | 10 vial (Pbm) | £19.00
  - Lidocaine 200mg/20ml (1%) solution for injection ampoules | 10 ampoule (Pbm) | £7.00–£9.63 DT price = £9.63
  - Lidocaine 50mg/5ml (1%) solution for injection ampoules | 10 ampoule (Pbm) | £2.57–£3.10 DT price = £2.57
  - Lidocaine 20mg/2ml (1%) solution for injection ampoules | 10 ampoule (Pbm) | £3.50 DT price = £2.18
  - Lidocaine 50mg/5ml (1%) solution for injection Sure-Amp ampoules | 20 ampoule (Pbm) | £6.00
  - Lidocaine hydrochloride 20 mg per 1 ml
    - Lidocaine 100mg/5ml (2%) solution for injection ampoules | 10 ampoule (Pbm) | £2.67–£3.80 DT price = £2.67
    - Lidocaine 400mg/20ml (2%) solution for injection vials | 10 vial (Pbm) | £19.50
    - Lidocaine 200mg/10ml (2%) solution for injection Mini-Plasco ampoules | 20 ampoule (Pbm) | £14.52
    - Lidocaine 400mg/20ml (2%) solution for injection ampoules | 10 ampoule (Pbm) | £4.00 DT price = £2.34
    - Lidocaine 100mg/5ml (2%) solution for injection Sure-Amp ampoules | 20 ampoule (Pbm) | £6.00
    - Lidocaine 400mg/20ml (2%) solution for injection ampoules | 10 ampoule (Pbm) | £8.00–£9.90 DT price = £9.90

Medicated plaster
- EXCIPIENTS: May contain Hydroxybenzoates (parabens), propylene glycol

  - Ointment
    - **Lidocaine hydrochloride (Non-proprietary)**
      - Lidocaine hydrochloride 50 mg per 1 gram Lidocaine 5% ointment | 15 gram (P) £6.50 DT price = £6.18
  - Spray
    - **Xylocaine** (Aspen Pharma Trading Ltd)
      - Lidocaine 10 mg per actuation Xylocaine 10mg/dose spray | 50 ml (P) £6.29

Lidocaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1242, adrenaline/epinephrine p. 216.

INDICATIONS AND DOSE
- **Local anaesthesia**
  - BY LOCAL INfiltrATION
    - Adult: Dosed according to the type of nerve block required (consult product literature)

IMPORTANT SAFETY INFORMATION
- Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a
Lidocaine with phenylephrine

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1242, phenylephrine hydrochloride p. 183.

INDICATIONS AND DOSE
Anaesthesia before nasal surgery, endoscopy, laryngoscopy, or removal of foreign bodies from the nose
  » BY INTRanasAL ADMINISTRATION
  » Adult: Up to 8 sprays

INTERACTIONS  Appendix 1: antiarrhythmics, sympathomimetics, vasoconstrictor

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection
Solution for injection
EXCipients: May contain Sulfites
  » Lignospan Special (Kent Pharmaceuticals Ltd)
  » Adrenaline (as Adrenaline acid tartrate) 12.5 microgram per 1 ml, Lidocaine hydrochloride 20 mg per 1 ml Lignospan Special 2% injection 2.0 ml cartridges
  » 50 cartridge (post) £19.95
  » Rexocaine (Henley Schein Ltd)
  » Adrenaline (as Adrenaline acid tartrate) 12.5 microgram per 1 ml, Lidocaine hydrochloride 20 mg per 1 ml Rexocan 2% injection 2.0 ml cartridges
  » 50 cartridge (post) no price available
  » Xylocaine with Adrenaline (Aspen Pharma Trading Ltd)
  » Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Lidocaine hydrochloride 10 mg per 1 ml Xylocaine 1% with Adrenaline 100 micrograms/20 ml (1 in 200,000) solution for injection vials
  » 5 vial (post) £9.66 OT price = £9.66
  » Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Lidocaine hydrochloride 20 mg per 1 ml Xylocaine 2% with Adrenaline 100 micrograms/20 ml (1 in 200,000) solution for injection vials
  » 5 vial (post) £8.85 OT price = £8.85

Lidocaine with prilocaine

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1242, prilocaine hydrochloride p. 1246.

INDICATIONS AND DOSE
Anaesthesia before minor skin procedures including venepuncture
  » TO THE SKIN
  » Child 1-2 months: Apply up to 1 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 1 dose per day
  » Child 3-11 months: Apply up to 2 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day
  » Child 1-11 years: Apply 1–5 hours before procedure, a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day
  » Child 12-17 years: Apply 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day
  » Adult: Apply 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing

Anaesthesia on genital skin before injection of local anaesthetics
  » TO THE SKIN
  » Adult: Apply under occlusive dressing for 15 minutes (males) or 60 minutes (females) before procedure

Anaesthesia before surgical treatment of lesions on genital mucosa
  » TO THE SKIN
  » Adult: Apply up to 10 g, to be applied 5–10 minutes before procedure

Anaesthesia before cervical curettage
  » TO THE SKIN
  » Adult: Apply 10 g in lateral vaginal fornices for 10 minutes

Anaesthesia before mechanical cleansing or debridement of leg ulcer
  » TO THE SKIN
  » Adult: Apply up to 10 g for 30–60 minutes, to be applied under occlusive dressing

CONTRAINDICATIONS
Use in child less than 37 weeks corrected gestational age
INTERACTIONS  Appendix 1: anaesthetics, local, antiarrhythmics

The properties listed above are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1242, prilocaine hydrochloride p. 1246.
Lidocaine with tetracaine

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 1242, tetracaine p. 1248.

- **INDICATIONS AND DOSE**
  
  **Anaesthesia before dermatological procedures and venepuncture**
  
  - TO THE SKIN
  - Adult: Apply 1 mm layer using a spatula 30 minutes before procedure, then peel off immediately before procedure; max. application area 400 cm², application time of 60 minutes indicated for certain procedures, such as laser-assisted tattoo removal and laser leg vein ablation

- **INTERACTIONS** → Appendix 1: anaesthetics, local, antiarrhythmics

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug.

  **Cream**
  
  EXCIPIENTS: May contain Hydroxybenzoates (parabens)

  - Pliaglis (Galderma (UK) Ltd)
  
  Lidocaine 70 mg, Tetracaine 70 mg
  
  Pliaglis 70mg/g / 70mg/g cream | 15 gram | £22.95

Mepivacaine hydrochloride

- **INDICATIONS AND DOSE**
  
  **Infiltration anaesthesia and nerve block in dentistry**
  
  - Child 3-17 years: Consult expert dental sources
  - Adult: Consult expert dental sources

  **DOSES AT EXTREMES OF BODY-WEIGHT**
  
  To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **IMPORTANT SAFETY INFORMATION**
  
  Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS**
  
  Application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) · should not be applied to damaged skin

  **CONTRA-INDICATIONS, FURTHER INFORMATION**
  
  - Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

  **CAUTIONS**
  
  Cardiovascular disease · children (consider dose reduction) · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock

  **INTERACTIONS** → Appendix 1: anaesthetics, local

  **SIDE-EFFECTS**
  
  Arrhythmias · blurred vision · cardiac arrest · convulsions · dizziness · drowsiness · feeling of inebriation · headache · lightheadedness · muscle twitching · myocardial depression (resulting in hypotension and bradycardia) · nausea · numbness of the tongue and perioral region · paraesthesia (including sensations of hot and cold) · peripheral vasodilatation (resulting in hypotension and bradycardia) · restlessness · tinnitus · transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) · tremors · vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  
  - Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.
  
  Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

  The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- **ALLERGY AND CROSS-SENSITIVITY**
  
  - Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY**
  
  Use with caution in early pregnancy.

- **BREAST FEEDING**
  
  Use with caution.

- **HEPATIC IMPAIRMENT**
  
  Use with caution; increased risk of side-effects in severe impairment.

- **RENAL IMPAIRMENT**
  
  Use with caution; increased risk of side-effects.

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  
  - Scandonest plain (Deproco UK Ltd)
  
  Mepivacaine hydrochloride 30 mg per 1 ml Scandonest plain 3% solution for injection 2.2ml cartridges | 50 cartridge no price available

Mepivacaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, mepivacaine hydrochloride above, adrenaline/epinephrine p. 216.

- **INDICATIONS AND DOSE**
  
  **Infiltration anaesthesia and nerve block in dentistry**
  
  - BY LOCAL INfiltrATION
  - Adult: (consult product literature)

- **IMPORTANT SAFETY INFORMATION**
  
  Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

- **INTERACTIONS** → Appendix 1: anaesthetics, local, sympathomimetics, vasoconstrictor
Prilocaine hydrochloride

**INDICATIONS AND DOSE**

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

CITANEST 1%®

**Infiltration anaesthesia | Nerve block**

- By regional administration
  - Adult: 100–200 mg/minute, alternatively may be given in incremental doses; dose adjusted according to site of administration and response, and in elderly and debilitated patients (smaller doses may be required); maximum 400 mg per course

PRILOTEKAL®

**Spinal anaesthesia**

- By intrathecal injection
  - Adult: Usual dose 40–60 mg (max. per dose 80 mg), dose may need to be reduced in elderly or debilitated patients, or in late pregnancy

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

**CONTRA-INDICATIONS**

Acquired methaemoglobinaemia - anaemia - application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - complete heart block - congenital methaemoglobinaemia - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) - should not be applied to damaged skin

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

**CAUTIONS**

Acute porphyrias p. 969 - cardiovascular disease - debilitated patients (consider dose reduction) - elderly (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - severe or untreated hypertension - shock

**INTERACTIONS**

- Appendix 1: anaesthetics, local

**SIDE-EFFECTS**

Arrhythmias - blurred vision - cardiac arrest - convulsions - dizziness - drowsiness - feeling of inebriation - headache - hypertension - lightheadedness - methaemoglobinaemia (with high doses) - muscle twitching - myocardial depression (resulting in hypotension and bradycardia) - nausea - numbness of the tongue and perioral region - paraesthesia (including sensations of hot and cold) - peripheral vasodilatation (resulting in hypotension and bradycardia) - restlessness - tinnitus - transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) - tremors - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

- Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

- The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- Methaemoglobinaemia Methaemoglobinaemia can be treated with an intravenous injection of methylthioninium chloride.

**ALLERGY AND CROSS-SENSITIVITY**

- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

**PREGNANCY**

Use lower doses for intrathecal use during late pregnancy. Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid paracervical or pudendal block in obstetrics (neonatal methaemoglobinaemia reported).

**BREAST FEEDING**

Present in milk but not known to be harmful.

**HEPATIC IMPAIRMENT**

Lower doses may be required for intrathecal anaesthesia. Use with caution.

**RENAL IMPAIRMENT**

Lower doses may be required for intrathecal anaesthesia. Use with caution.

**NATIONAL FUNDING/ACCESS DECISIONS**

**PRILOTEKAL®**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2010) that prilocaine 2% hyperbaric solution for injection (Prilotekal®) is accepted for restricted use within NHS Scotland for use in spinal anaesthesia in ambulatory surgery settings.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

- Citanest (Aspen Pharma Trading Ltd)
  - Prilocaine hydrochloride 10 mg per 1 ml Citanest 1% solution for injection 50ml vials | 1 vial [POM] £5.06

- Prilotekal (AMCo)
  - Prilocaine hydrochloride 20 mg per 1 ml Prilotekal 100mg/5ml hyperbaric solution for injection ampoules | 10 ampoule [POM] £7.75
**Prilocaine with felypressin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, prilocaine hydrochloride p. 1246.

### INDICATIONS AND DOSE

#### Dental anaesthesia
- **BY REGIONAL ADMINISTRATION**
- Adult: Consult expert dental sources for specific advice

#### INTERACTIONS
- Appendix 1: anaesthetics, local

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection
- **Citranest with Octapressin** (Dentsply Ltd)
  - Prilocaine hydrochloride 30 mg per 1 ml, Felypressin 0.3 unit per 1 ml
  - Citranest 3% with Octapressin Dental 0.054 units/1.8 ml solution for injection self-aspirating cartridges | 100 cartridge (PQM), no price available

Citranest 3% with Octapressin Dental 0.066 units/2.2 ml solution for injection self-aspirating cartridges | 100 cartridge (PQM) no price available

---

**Ropivacaine hydrochloride**

### INDICATIONS AND DOSE

#### Acute pain, peripheral nerve block
- **BY REGIONAL ADMINISTRATION**
- Adult: 10–20 mg/hour, dose administered as a continuous infusion or by intermittent injection using a 2 mg/mL (0.2%) solution

#### Acute pain, field block
- **BY REGIONAL ADMINISTRATION**
- Adult: 2–200 mg, dose administered using a 2 mg/mL (0.2%) solution

#### Acute pain, lumbar epidural block
- **BY LUMBAR EPIDURAL**
- Adult: 20–40 mg, followed by 20–30 mg at least every 30 minutes, dose administered using a 2 mg/mL (0.2%) solution

#### Acute labour pain
- **BY CONTINUOUS EPIDURAL INFUSION**
- Adult: 12–20 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

#### Acute postoperative pain
- **BY CONTINUOUS EPIDURAL INFUSION**
- Adult: Up to 28 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

#### Postoperative pain, thoracic epidural block
- **BY CONTINUOUS EPIDURAL INFUSION**
- Adult: 12–28 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

#### Surgical anaesthesia, field block
- **BY REGIONAL ADMINISTRATION**
- Adult: 7.5–225 mg, dose administered using a 7.5 mg/mL (0.75%) solution

#### Surgical anaesthesia, major nerve block (brachial plexus block)
- **BY REGIONAL ADMINISTRATION**
- Adult: 225–300 mg, dose administered using a 7.5 mg/mL (0.75%) solution

#### Surgical anaesthesia, thoracic epidural block (to establish block for postoperative pain)
- **BY THORACIC EPIDURAL**
- Adult: 38–113 mg, dose administered using a 7.5 mg/mL (0.75%) solution

---

**Surgical anaesthesia for caesarean section**

- **BY LUMBAR EPIDURAL**
- Adult: 113–150 mg, to be administered in incremental doses using a 7.5 mg/mL (0.75%) solution

**Surgical anaesthesia, lumbar epidural block**

- **BY LUMBAR EPIDURAL**
- Adult: 113–200 mg, dose administered using a 7.5 mg/mL (0.75%) or 10 mg/mL (1%) solution

### DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal bodyweight.

### IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

#### CONTRA-INDICATIONS
- Application to the middle ear (can cause ototoxicity)
- Avoid injection into infected tissues
- Avoid injection into inflamed tissues
- Complete heart block
- Preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block)
- Should not be applied to damaged skin

#### CONTRA-INDICATIONS, FURTHER INFORMATION
- Injection site
  - Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin.
  - Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

#### CAUTIONS
- Acute porphyrias p. 969
- Cardiovascular disease
- Debilitated patients (consider dose reduction)
- Elderly (consider dose reduction)
- Epilepsy
- Hypovolaemia
- Impaired cardiac conduction
- Impaired respiratory function
- Myasthenia gravis
- Shock

#### INTERACTIONS
- Appendix 1: anaesthetics, local

#### SIDE-EFFECTS

- **Common or very common**
  - Hypertension
  - Pyrexia

- **Uncommon**
  - Hypothermia
  - Syncope

- **Frequency not known**
  - Arrhythmias
  - Blurred vision
  - Cardiac arrest
  - Convulsions
  - Dizziness
  - Drowsiness
  - Feeling of inebriation
  - Headache
  - Lightheadedness
  - Muscle twitching
  - Myocardial depression (resulting in hypotension and bradycardia)
  - Nausea
  - Numness of the tongue and perioral region
  - Paralysis (including sensations of hot and cold)
  - Peripheral vasodilatation (resulting in hypotension and bradycardia)
  - Restlessness
  - Transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma)
  - Tremors
  - Vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION
- Toxic effects
  - Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.
  - Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.
  - The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

#### ALLERGY AND CROSS-SENSITIVITY
- Hypersensitivity
  - Hypersensitivity and cross-sensitivity
  - Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine;
reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Not known to be harmful. Do not use for paracervical block in obstetrics.
- **BREAST FEEDING** Not known to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.
- **RENAL IMPAIRMENT** Caution in severe impairment. Increased risk of systemic toxicity in chronic renal failure.

#### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**ELECTROLYTES:** May contain Sodium

- **Ropivacaine hydrochloride** (Non-proprietary)
  - Ropivacaine hydrochloride 2 mg per 1 ml Ropivacaine 20mg/10ml solution for injection ampoules | 10 amoule (PoM) £16.50 (Hospital only)
  - Ropivacaine hydrochloride 7.5 mg per 1 ml Ropivacaine 75mg/10ml solution for injection ampoules | 10 amoule (PoM) £25.00 (Hospital only)
  - Ropivacaine hydrochloride 10 mg per 1 ml Ropivacaine 100mg/10ml solution for injection ampoules | 10 amoule (PoM) £30.00 (Hospital only)

- **Naropin** (Aspen Pharma Trading Ltd)
  - Ropivacaine hydrochloride 2 mg per 1 ml Naropin 20mg/10ml solution for injection ampoules | 5 amoule (PoM) £12.79
  - Ropivacaine hydrochloride 7.5 mg per 1 ml Naropin 75mg/10ml solution for injection ampoules | 5 amoule (PoM) £15.90
  - Ropivacaine hydrochloride 10 mg per 1 ml Naropin 100mg/10ml solution for injection ampoules | 5 amoule (PoM) £19.22

**Infusion**

**ELECTROLYTES:** May contain Sodium

- **Ropivacaine hydrochloride** (Non-proprietary)
  - Ropivacaine hydrochloride 2 mg per 1 ml Ropivacaine 400mg/200ml infusion bags | 5 bag (PoM) £72.25 | 10 bag (PoM) £137.00 (Hospital only)
  - **Naropin** (AstraZeneca UK Ltd)
  - Ropivacaine hydrochloride 2 mg per 1 ml Naropin 400mg/200ml infusion Polybags | 5 bag (PoM) £86.70

#### SIDE-EFFECTS
Local skin reactions

**SIDE-EFFECTS, FURTHER INFORMATION**

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems; systemic side effects unlikely as minimal absorption following topical application.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **BREAST FEEDING** Not known to be harmful.

- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Tetracaine gel for local anaesthesia [www.medicinesforchildren.org.uk/tetracaine-gel-for-local-anaesthesia](http://www.medicinesforchildren.org.uk/tetracaine-gel-for-local-anaesthesia)

#### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Gel**

**EXCIPIENTS:** May contain Hydroxybenzoates (parabens)

- **Ametop** (Smith & Nephew Healthcare Ltd)
  - Tetracaine 40 mg per 1 gram Ametop 4% gel | 1.5 gram (PoM) £1.08 | 18 gram (PoM) no price available

### Tetracaine
(Amethocaine)

#### INDICATIONS AND DOSE

**Anaesthesia before venepuncture or venous cannulation**

- **TO THE SKIN**
  - Child 1 month–4 years: Apply contents of up to 1 tube (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation
  - Child 5-17 years: Apply contents of up to 5 tubes (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation
  - Adult: Apply contents of up to 5 tubes (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation

- **CONTRA-INDICATIONS** Should not be applied to damaged skin

- **INTERACTIONS** → Appendix 1: anaesthetics, local

Emergency treatment of poisoning

Overview
These notes provide only an overview of the treatment of poisoning, and it is strongly recommended that either TOXBASE or the UK National Poisons Information Service be consulted when there is doubt about the degree of risk or about management.

Hospital admission
Patients who have features of poisoning should generally be admitted to hospital. Patients who have taken poisons with delayed action should also be admitted, even if they appear well. Delayed-action poisons include aspirin p. 117, iron, paracetamol p. 422, tricyclic antidepressants, and co-phenotrope p. 64 (diphenoxylate with atropine, Lomotil®); the effects of modified-release preparations are also delayed. A note of all relevant information, including what treatment has been given, should accompany the patient to hospital.

Further information
TOXBASE, the primary clinical toxicology database of the National Poisons Information Service, is available on the internet to registered users at www.toxbase.org (a backup site is available at www.toxbasebackup.org if the main site cannot be accessed). It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Specialist information and advice on the treatment of poisoning is available day and night from the UK National Poisons Information Service on the following number: Tel: 0344 892 0111.

Advice on laboratory analytical services can be obtained from TOXBASE or from the National Poisons Information Service. Help with identifying capsules or tablets may be available from a regional medicines information centre or from the National Poisons Information Service (out of hours).

General care
It is often impossible to establish with certainty the identity of the poison and the size of the dose. This is not usually important because only a few poisons (such as opioids, paracetamol, and iron) have specific antidotes; few patients require active removal of the poison. In most patients, treatment is directed at managing symptoms as they arise. Nevertheless, knowledge of the type and timing of poisoning can help in anticipating the course of events. All relevant information should be sought from the poisoned individual and from carers or parents. However, such information should be interpreted with care because it may not be complete or entirely reliable. Sometimes symptoms arise from other illnesses and patients should be assessed carefully. Accidents may involve domestic and industrial products (the contents of which are not generally known). The National Poisons Information Service should be consulted when there is doubt about any aspect of suspected poisoning.

Respiration
Respiration is often impaired in unconscious patients. An obstructed airway requires immediate attention. In the absence of trauma, the airway should be opened with simple measures such as chin lift or jaw thrust. An oropharyngeal or nasopharyngeal airway may be useful in patients with reduced consciousness to prevent obstruction, provided ventilation is adequate. Intubation and ventilation should be considered in patients whose airway cannot be protected or who have respiratory acidosis because of inadequate ventilation; such patients should be monitored in a critical care area.

Most poisons that impair consciousness also depress respiration. Assisted ventilation (either mouth-to-mouth or using a bag-valve-mask device) may be needed. Oxygen is not a substitute for adequate ventilation, although it should be given in the highest concentration possible in poisoning with carbon monoxide and irritant gases.

Blood pressure
Hypotension is common in severe poisoning with central nervous system depressants. A systolic blood pressure of less than 70 mmHg may lead to irreversible brain damage or renal tubular necrosis. Hypotension should be corrected initially by raising the foot of the bed and administration of an infusion of either sodium chloride p. 953 or a colloid.

Vasoconstrictor sympathomimetics are rarely required and their use may be discussed with the National Poisons Information Service.

Fluid depletion without hypotension is common after prolonged coma and after aspirin poisoning due to vomiting, sweating, and hyperpnoea.

Hypertension, often transient, occurs less frequently than hypotension in poisoning; it may be associated with sympathomimetic drugs such as amphetamines, phencyclidine, and cocaine.

Heart
Cardiac conduction defects and arrhythmias can occur in acute poisoning, notably with tricyclic antidepressants, some antipsychotics, and some antihistamines. Arrhythmias often respond to correction of underlying hypoxia, acidosis,
or other biochemical abnormalities, but ventricular arrhythmias that cause serious hypotension require treatment. If the QT interval is prolonged, specialist advice should be sought because the use of some anti-arrhythmic drugs may be inappropriate. Supraventricular arrhythmias are seldom life-threatening and drug treatment is best withheld until the patient reaches hospital.

**Body temperature**

Hypothermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothiazines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by some other means. Hypothermia should be managed by prevention of further heat loss and appropriate re-warming as clinically indicated.

Hypothermia can develop in patients taking CNS stimulants; children and the elderly are also at risk when taking therapeutic doses of drugs with antimuscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with tepid water will promote evaporation. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome.

Both hypothermia and hyperthermia require urgent hospitalisation for assessment and supportive treatment.

**Convulsions**

Single short-lived convulsions (lasting less than 5 minutes) do not require treatment. If convulsions are protracted or recur frequently, lorazepam p. 322 or diazepam p. 327 (preferably as emulsion) should be given by slow intravenous injection into a large vein. Benzodiazepines should not be given by the intramuscular route for convulsions. If the patient has frequent convulsions, lorazepam p. 324 or midazolam injection into a large vein. Benzodiazepines should not be given by the intramuscular route for convulsions. If the patient has frequent convulsions, lorazepam p. 324 or midazolam should be given by the intramuscular route for convulsions.

**Methaemoglobinemia**

Drug- or chemical-induced methaemoglobinemia should be treated with methylthioninium chloride p. 1261 if the methaemoglobin concentration is 30% or higher, or if symptoms of tissue hypoxia are present despite oxygen therapy. Methylthioninium chloride reduces the ferric iron of methaemoglobin back to the ferrous iron of haemoglobin; in high doses, methylthioninium chloride can itself cause methaemoglobinemia.

**Removal and elimination**

**Prevention of absorption**

Given by mouth, charcoal, activated p. 1256 can bind many poisons in the gastro-intestinal system, thereby reducing their absorption. The sooner it is given the more effective it is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with antimuscarinic (anticholinergic) properties. It is particularly useful for the prevention of absorption of poisons that are toxic in small amounts, such as antidepressants.

**Active elimination techniques**

Repeated doses of charcoal, activated p. 1256 by mouth enhance the elimination of some drugs after they have been absorbed; repeated doses are given after overdosage with:

- Carbamazepine
- Dapsone
- Phenobarbital
- Quinine
- Theophylline

If vomiting occurs after dosing it should be treated (e.g. with an antiemetic drug) since it may reduce the efficacy of charcoal treatment. In cases of intolerance, the dose may be reduced and the frequency increased but this may compromise efficacy.

Charcoal, activated should not be used for poisoning with petroleum distillates, corrosive substances, alcohols, malathion, cyanides and metal salts including iron and lithium salts.

Other techniques intended to enhance the elimination of poisons after absorption are only practicable in hospital and are only suitable for a small number of severely poisoned patients. Moreover, they only apply to a limited number of poisons. Examples include:

- haemodialysis for ethylene glycol, lithium, methanol, phenobarbital, salicylates, and sodium valproate;
- alkalinisation of the urine for salicylates.

**Removal from the gastro-intestinal tract**

Gastric lavage is rarely required; for substances that cannot be removed effectively by other means (e.g. iron), it should be considered only if a life-threatening amount has been ingested within the previous hour. It should be carried out only if the airway can be protected adequately. Gastric lavage is contra-indicated if a corrosive substance or a petroleum distillate has been ingested, but it may occasionally be considered in patients who have ingested drugs that are not adsorbed by charcoal, such as iron or lithium. Induction of emesis (e.g. with ipecacuanha) is not recommended because there is no evidence that it affects absorption and it may increase the risk of aspiration.

**Whole bowel irrigation (by means of a bowel cleansing preparation)** has been used in poisoning with certain modified-release or enteric-coated formulations, in severe poisoning with iron and lithium salts, and if illicit drugs are carried in the gastro-intestinal tract (‘body-packing’). However, it is not clear that the procedure improves outcome and advice should be sought from the National Poisons Information Service.

**Alcohol**

Acute intoxication with alcohol (ethanol) is common in adults but also occurs in children. The features include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis. Aspiration of vomit is a special hazard and hypoglycaemia may occur in children and some adults. Patients are managed supportively, with particular attention to maintaining a clear airway and measures to reduce the risk of aspiration of gastric contents. The blood glucose is measured and glucose given if indicated.

**Aspirin**

The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. The associated acid-base disturbances are complex.

Treatment must be in hospital, where plasma salicylate, pH, and electrolytes can be measured; absorption of aspirin may be slow and the plasma-salicylate concentration may continue to rise for several hours, requiring repeated measurement. Plasma-salicylate concentration may not correlate with clinical severity in the young and the elderly, and clinical and biochemical assessment is necessary. Generally, the clinical severity of poisoning is less below a plasma-salicylate concentration of 500 mg/litre (3.6 mmol/litre), unless there is evidence of metabolic acidosis. Activated charcoal can be given within 1 hour of ingesting more than 125 mg/kg of aspirin. Fluid losses should be replaced and intravenous sodium bicarbonate may be given (ensuring plasma-potassium concentration is within the reference range) to enhance urinary salicylate excretion (optimum urinary pH 7.5–8.5).

**Hypothermia**

Hypothermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothiazines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by some other means. Hypothermia should be managed by prevention of further heat loss and appropriate re-warming as clinically indicated.

Hypothermia can develop in patients taking CNS stimulants; children and the elderly are also at risk when taking therapeutic doses of drugs with antimuscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with tepid water will promote evaporation. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome.

Both hypothermia and hyperthermia require urgent hospitalisation for assessment and supportive treatment.

**Convulsions**

Single short-lived convulsions (lasting less than 5 minutes) do not require treatment. If convulsions are protracted or recur frequently, lorazepam p. 322 or diazepam p. 327 (preferably as emulsion) should be given by slow intravenous injection into a large vein. Benzodiazepines should not be given by the intramuscular route for convulsions. If the intravenous route is not readily available, midazolam should be given by the intramuscular route for convulsions. If the pr...
Plasma-potassium concentration should be corrected before giving sodium bicarbonate as hypokalaemia may complicate alkalinisation of the urine.

Haemodialysis is the treatment of choice for severe salicylate poisoning and should be considered when the plasma-salicylate concentration exceeds 700 mg/litre (5.1 mmol/litre) or in the presence of severe metabolic acidosis.

Opioids
Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. The specific antidote naloxone hydrochloride p. 1259 is indicated if there is coma or bradypnoea. Since naloxone has a shorter duration of action than many opioids, close monitoring and repeated injections are necessary according to the respiratory rate and depth of coma. When repeated administration of naloxone is required, it can be given by continuous intravenous infusion instead and the rate of infusion adjusted according to vital signs. The effects of some opioids, such as buprenorphine, are only partially reversed by naloxone.

Dextropropoxyphene and methadone have very long durations of action; patients may need to be monitored for long periods following large overdoses.

Naloxone reverses the opioid effects of dextropropoxyphene. The long duration of action of dextropropoxyphene calls for prolonged monitoring and further doses of naloxone may be required.

Norpropoxyphene, a metabolite of dextropropoxyphene, also has cardiotoxic effects which may require treatment with sodium bicarbonate p. 950 or magnesium sulfate p. 963, or both. Arrhythmias may occur for up to 12 hours.

Paracetamol
In cases of intravenous paracetamol poisoning contact the National Poisons Information Service for advice on risk assessment and management.

Toxic doses of paracetamol p. 422 may cause severe hepatocellular necrosis and, much less frequently, renal tubular necrosis. Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis. Liver damage is maximal 3–4 days after paracetamol overdose and may lead to encephalopathy, haemorrhage, hypoglycaemia, cerebral oedema, and death. Therefore, despite a lack of significant early symptoms, patients who have taken an overdose of paracetamol should be transferred to hospital urgently.

To avoid underestimating the potentially toxic paracetamol dose ingested by obese patients who weigh more than 110 kg, use a body-weight of 110 kg (rather than their actual body-weight) when calculating the total dose of paracetamol ingested (in mg/kg).

Acetylcysteine p. 1260 protects the liver if infused up to, and possibly beyond, 24 hours of ingesting paracetamol. It is most effective if given within 8 hours of ingestion, after which effectiveness declines. Very rarely, giving acetylcysteine by mouth [unlicensed route] is an alternative if intravenous access is not possible—contact the National Poisons Information Service for advice on risk assessment and management.
Emergency treatment of poisoning

The prognostic accuracy of a plasma-paracetamol concentration, related to the time from ingestion, provided this time interval is not less than 4 hours; earlier samples may be misleading. The concentration is plotted on a paracetamol treatment graph, with a reference line (‘treatment line’) joining plots of 100 mg/litre (0.66 mmol/litre) at 4 hours and 3.13 mg/litre (0.02 mmol/litre) at 24 hours. Acetylcysteine treatment should commence immediately in patients:

- whose plasma-paracetamol concentration falls on or above the treatment line on the paracetamol treatment graph;
- who present 8–24 hours after taking an acute overdose of more than 150 mg/kg of paracetamol, even if the plasma-paracetamol concentration is not yet available; acetylcysteine can be discontinued if the plasma-paracetamol concentration is later reported to be below the treatment line on the paracetamol treatment graph, provided that the patient is asymptomatic and liver function tests, serum creatinine and INR are normal.

The prognostic accuracy of a plasma-paracetamol concentration taken after 15 hours is uncertain, but a concentration on or above the treatment line on the paracetamol treatment graph should be regarded as carrying a serious risk of liver damage. If more than 15 hours have elapsed since ingestion, or there is doubt about appropriate management, advice should be sought from the National Poisons Information Service.

**‘Staggered’ overdose, uncertain time of overdose, or therapeutic excess**

A ‘staggered’ overdose involves ingestion of a potentially toxic dose of paracetamol over more than one hour, with the possible intention of causing self-harm. Therapeutic excess is the inadvertent ingestion of a potentially toxic dose of paracetamol during its clinical use. The paracetamol treatment graph is unreliable if a ‘staggered’ overdose is taken, if there is uncertainty about the time of the overdose, or if there is therapeutic excess. In these cases, patients who have taken more than 150 mg/kg of paracetamol in any 24-hour period are at risk of toxicity and should be commenced on acetylcysteine immediately, unless it is more than 24 hours since the last ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal.

Rarely, toxicity can occur with paracetamol doses between 75–150 mg/kg in any 24-hour period; clinical judgement of the individual case is necessary to determine whether to treat those who have ingested this amount of paracetamol. For small adults, this may be within the licensed dose, but ingestion of a licensed dose of paracetamol is not considered an overdose.

Although there is some evidence suggesting that factors such as the use of liver enzyme-inducing drugs (e.g. carbamazepine p. 297, efavirenz p. 608, nevirapine p. 609, phenobarbital p. 318, phenytoin p. 308, primidone p. 319, rifabutin p. 543, rifampicin p. 549, St John’s wort), chronic alcoholism, and starvation may increase the risk of hepatotoxicity, the CHM has advised that these should no longer be used in the assessment of paracetamol toxicity.

Significant toxicity is unlikely if, 24 hours or longer after the last paracetamol ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal. Patients with clinical features of hepatic injury such as jaundice or hepatic tenderness should be treated urgently with acetylcysteine. If there is uncertainty about a patient’s risk of toxicity after paracetamol overdose, treatment with acetylcysteine should be commenced. Advice should be sought from the National Poisons Information Service whenever necessary.

**Acetylcysteine dose and administration**

For paracetamol overdosage, acetylcysteine is given in a total dose that is divided into 3 consecutive intravenous infusions over a total of 21 hours. The tables below include the dose of acetylcysteine, for adults and children of body-weight 40 kg and over, in terms of the volume of acetylcysteine Concentrate for Intravenous Infusion required for each of the 3 infusions. The requisite dose of acetylcysteine is added to glucose intravenous infusion 5% p. 955.

### First infusion

*Third infusion* (based on an acetylcysteine dose of approx. 100 mg/kg; start immediately after completion of second infusion)—add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 1 litre Glucose Intravenous Infusion 5%; infuse over 16 hours.

### Antidepressants

#### Tricyclic and related antidepressants

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations are common during recovery. Assessment in hospital is strongly advised in case of poisoning by tricyclic and related antidepressants but symptomatic treatment can be given before transfer. Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or intravenous diazepam (preferably in emulsion form) may be required to treat convulsions. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended QRS duration. Diazepam given by mouth is usually adequate to sedate delirious patients but large doses may be required.

#### Selective serotonin re-uptake inhibitors (SSRIs)

Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

Management of SSRI poisoning is supportive. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Convulsions can be treated with lorazepam, diazepam, or midazolam oromucosal solution [unlicensed use in adults and children under 3 months] (see *Convulsions*). Contact the National Poisons Information Service for the management of hyperthermia or the serotonin syndrome.

### Antimalarials

Overdosage with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

### Antipsychotics

#### Phenothiazines and related drugs

Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. Dystonic reactions can occur with therapeutic doses (particularly with prochlorperazine and trifluoperazine), and convulsions may occur in severe cases. Arrhythmias may respond to correction of hypoxia, acidosis, and other biochemical abnormalities, but specialist advice should be sought if arrhythmias result from a prolonged QT interval; the use of some anti-arrhythmic drugs can worsen such arrhythmias. Dystonic reactions are rapidly abolished by injection of drugs such as procyclidine hydrochloride p. 391 or diazepam p. 327 (emulsion preferred).

#### Second-generation antipsychotic drugs

Features of poisoning by second-generation antipsychotic drugs include drowsiness, convulsions, extrapyramidal symptoms, hypotension, and ECG abnormalities (including prolongation of the QT interval). Management is supportive. Charcoal, activated p. 1256 can be given within 1 hour of ingesting a significant quantity of a second-generation antipsychotic drug.

### Benzodiazepines

Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. Charcoal, activated can be given within 1 hour of ingesting a significant quantity of benzodiazepine, provided the patient is awake and the airway is protected. Benzodiazepines potentiate the effects of other central nervous system depressants taken concomitantly. Use of the benzodiazepine antagonist flumazenil p. 1258 [unlicensed indication] can be hazardous, particularly in mixed overdoses involving tricyclic antidepressants or in benzodiazepine-dependent patients. Flumazenil may prevent the need for ventilation, particularly in patients with severe respiratory disorders; it should be used on expert advice only and not as a diagnostic test in patients with a reduced level of consciousness.

### Beta blockers

Therapeutic overdoses with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. These complications are most likely in patients with conduction system disorders or impaired myocardial function. Bradycardia is the most common arrhythmia caused by beta-blockers, but sotalol may induce ventricular tachyarrhythmias (sometimes of the torsade de pointes type). The effects of massive overdose can vary from one beta-blocker to another; propranolol overdose in particular may cause coma and convulsions. **Acute massive overdose** must be managed in hospital and expert advice should be obtained. Maintenance of a clear airway and adequate ventilation is mandatory. An intravenous injection of atropine sulfate p. 1224 is required to treat bradycardia. Cardiogenic shock unresponsive to atropine sulfate is probably best treated with an intravenous injection of glucagon p. 681 [unlicensed] in glucose 5% (with precautions to protect the airway in case of vomiting) followed by an intravenous infusion. If glucagon is not available, intravenous isoprenaline (available from 'special-order' manufacturers or specialist importing companies) is an alternative. A cardiac pacemaker can be used to increase the heart rate.
Calcium-channel blockers

Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. Verapamil and diltiazem have a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole. The dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

Charcoal, activated should be considered if the patient presents within 1 hour of overdosage with a calcium-channel blocker; repeated doses of activated charcoal are considered if a modified-release preparation is involved. In patients with significant features of poisoning, calcium chloride p. 959 or calcium gluconate p. 959 is given by injection; atropine sulfate is given to correct symptomatic bradycardia. In severe cases, an insulin and glucose infusion may be required in the management of hypotension and myocardial failure. For the management of hypotension, the choice of inotropic sympathomimetic depends on whether hypotension is secondary to vasodilatation or to myocardial depression—advice should be sought from the National Poisons Information Service.

Iron salts

Iron poisoning in childhood is usually accidental. The symptoms are nausea, vomiting, abdominal pain, diarrhoea, haematemesis, and rectal bleeding. Hypotension and hepatocellular necrosis can occur later. Coma, shock, and metabolic acidosis indicate severe poisoning. Advice should be sought from the National Poisons Information Service if a significant quantity of iron has been ingested within the previous hour.

Mortality is reduced by intensive and specific therapy with desferrioxamine mesilate p. 941, which chelates iron. The serum-iron concentration is measured as an emergency and intravenous desferrioxamine mesilate given to chelate absorbed iron in excess of the expected iron binding capacity. In severe toxicity intravenous desferrioxamine mesilate should be given immediately without waiting for the result of the serum-iron measurement.

Lithium

Most cases of lithium intoxication occur as a complication of long-term therapy and are caused by reduced excretion of the drug because of a variety of factors including dehydration, deterioration of renal function, infections, and co-administration of diuretics or NSAIDs (or other drugs that interact). Acute deliberate overdoses may also occur with delayed onset of symptoms (12 hours or more) owing to slow entry of lithium into the tissues and continuing absorption from modified-release formulations.

The early clinical features are non-specific and may include apathy and restlessness which could be confused with mental changes arising from the patient’s depressive illness. Vomiting, diarrhoea, ataxia, weakness, dysarthria, muscle twitching, and tremor may follow. Severe poisoning is associated with convulsions, coma, renal failure, electrolyte imbalance, dehydration, and hypotension.

Therapeutic serum-lithium concentrations are within the range of 0.4–1 mmol/litre; concentrations in excess of 2 mmol/litre are usually associated with serious toxicity and such cases may need treatment with haemodialysis if neurological symptoms or renal failure are present. In acute overdosage much higher serum-lithium concentrations may be present without features of toxicity and all that is usually necessary is to take measures to increase urine output (e.g. by increasing fluid intake but avoiding diuretics). Otherwise, treatment is supportive with special regard to electrolyte balance, renal function, and control of convulsions. Gastric lavage may be considered if it can be performed within 1 hour of ingesting significant quantities of lithium. Whole-bowel irrigation should be considered for significant ingestion, but advice should be sought from the National Poisons Information Service.

Stimulants

Amphetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. The early stages can be controlled by diazepam p. 327 or lorazepam p. 322; advice should be sought from the National Poisons Information Service on the management of hypertension. Later, tepid sponging, anticonvulsants, and artificial respiration may be needed.

Cocaine

Cocaine stimulates the central nervous system, causing agitation, dilated pupils, tachycardia, hypertension, hallucinations, hyperthermia, hypertonia, and hyperreflexia; cardiac effects include chest pain, myocardial infarction, and arrhythmias.

Initial treatment of cocaine poisoning involves intravenous administration of diazepam to control agitation and cooling measures for hyperthermia (see Body temperature); hypertension and cardiac effects require specific treatment and expert advice should be sought.

Ecstasy

Ecstasy (methyleneoxymethamfetamine, MDMA) may cause severe reactions, even at doses that were previously tolerated. The most serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, hyperreflexia, hypotension and intracerebral haemorrhage; hypoponatraemia has also been associated with ecstasy use.

Treatment of methyleneoxymethamfetamine poisoning is supportive, with diazepam to control severe agitation or persistent convulsions and close monitoring including ECG. Self-induced water intoxication should be considered in patients with ecstasy poisoning.

‘Liquid ecstasy’ is a term used for sodium oxybate (gamma-hydroxybutyrate, GHB), which is a sedative.

Theophylline

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

Repeated doses of activated charcoal can be used to eliminate theophylline even if more than 1 hour has elapsed after ingestion and especially if a modified-release preparation has been taken (see also under Active Elimination Techniques). Ondansetron p. 414 may be effective for severe vomiting that is resistant to other antiemetics [unlicensed indication]. Hypokalaemia is corrected by intravenous infusion of potassium chloride p. 968 and may be so severe as to require 60 mmol/hour (high doses require ECG monitoring). Convulsions should be controlled by intravenous administration of lorazepam or diazepam (see Convulsions). Sedation with diazepam may be necessary in agitated patients.

Provided the patient does not suffer from asthma, a short-acting beta-blocker can be administered intravenously to reverse severe tachycardia, hypokalaemia, and hyperglycaemia.
Other poisons
Consult either the National Poisons Information Service day and night or TOXBASE, see under the National Poisons Information Service.

Cyanides
Oxygen should be administered to patients with cyanide poisoning. The choice of antidote depends on the severity of poisoning, certainty of diagnosis, and the cause. Dicobalt edetate p. 1257 is the antidote of choice when there is a strong clinical suspicion of severe cyanide poisoning, but it should not be used as a precautionary measure. Dicobalt edetate itself is toxic, associated with anaphylactoid reactions, and is potentially fatal if administered in the absence of cyanide poisoning. A regimen of sodium nitrite p. 1257 followed by sodium thiosulfate p. 1257 is an alternative if dicobalt edetate is not available.

Hydroxocobalamin p. 938 ('Cynamikit ®')—no other preparation of hydroxocobalamin is suitable—can be considered for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

Ethylene glycol and methanol
Fomepizole (available from 'special-order' manufacturers or specialist importing companies) is the treatment of choice for ethylene glycol and methanol (methyl alcohol) poisoning. If necessary, ethanolo (by mouth or by intravenous infusion) can be used, but with caution. Advice on the treatment of ethylene glycol and methanol poisoning should be obtained from the National Poisons Information Service. It is important to start antidote treatment promptly in cases of suspected poisoning with these agents.

Heavy metals
Heavy metal antidotes include succimer (DMSA) [unlicensed], unithiol (DMPS) [unlicensed], sodium calcium edetate [unlicensed], and dimercaprol. Dimercaprol in the management of heavy metal poisoning has been superseded by other chelating agents. In all cases of heavy metal poisoning, the advice of the National Poisons Information Service should be sought.

Noxious gases
Carbon monoxide
Carbon monoxide poisoning is usually due to inhalation of smoke, car exhaust, or fumes caused by blocked flues or incomplete combustion of fuel gases in confined spaces. Immediate treatment of carbon monoxide poisoning is essential. The person should be moved to fresh air, the airway cleared, and high-flow oxygen 100% administered through a tight-fitting mask with an inflated face seal. Artificial respiration should be given as necessary and continued until adequate spontaneous breathing starts, or stopped only after persistent and efficient treatment of cardiac arrest has failed. The patient should be admitted to hospital because complications may arise after a delay of hours or days. Cerebral oedema may occur in severe poisoning and is treated with an intravenous infusion of mannitol p. 222. Referral for hyperbaric oxygen treatment should be discussed with the National Poisons Information Service if the patient is pregnant or in cases of severe poisoning, such as if the patient is or has been unconscious, or has psychiatric or neurological features other than a headache, or has myocardial ischaemia or an arrhythmia, or has a blood carboxyhaemoglobin concentration of more than 20%.

Sulfur dioxide, chlorine, phosgene, ammonia
All of these gases can cause upper respiratory tract and conjunctival irritation. Pulmonary oedema, with severe breathlessness and cyanosis may develop suddenly up to 36 hours after exposure. Death may occur. Patients are kept under observation and those who develop pulmonary oedema are given oxygen. Assisted ventilation may be necessary in the most serious cases.

CS Spray
CS spray, which is used for riot control, irritates the eyes (hence ‘tear gas’) and the respiratory tract; symptoms normally settle spontaneously within 15 minutes. If symptoms persist, the patient should be removed to a well-ventilated area, and the exposed skin washed with soap and water after removal of contaminated clothing. Contact lenses should be removed and rigid ones washed (soft ones should be discarded). Eye symptoms should be treated by irrigating the eyes with physiological saline (or water if saline is not available) and advice sought from an ophthalmologist. Patients with features of severe poisoning, particularly respiratory complications, should be admitted to hospital for symptomatic treatment.

Nerve agents
Treatment of nerve agent poisoning is similar to organophosphorus insecticide poisoning, but advice must be sought from the National Poisons Information Service. The risk of cross-contamination is significant; adequate decontamination and protective clothing for healthcare personnel are essential. In emergencies involving the release of nerve agents, kits ('NAAS pods') containing pralidoxime chloride p. 1257 can be obtained through the Ambulance Service from the National Blood Service (or the Welsh Blood Service in South Wales or designated hospital pharmacies in Northern Ireland and Scotland—see TOXBASE for list of designated centres).

Pesticides
Organophosphorus insecticides
Organophosphorus insecticides are usually supplied as powders or dissolved in organic solvents. All are absorbed through the bronchi and intact skin as well as through the gut and inhibit cholinesterase activity, thereby prolonging and intensifying the effects of acetylcholine. Toxicity between different compounds varies considerably, and onset may be delayed after skin exposure. Anxiety, restlessness, dizziness, headache, miosis, nausea, hypersalivation, vomiting, abdominal colic, diarrhoea, bradycardia, and sweating are common features of organophosphorus poisoning. Muscle weakness and fasciculation may develop and progress to generalised flaccid paralysis, including the ocular and respiratory muscles. Convulsions, coma, pulmonary oedema with copious bronchial secretions, hypoxia, and arrhythmias occur in severe cases. Hyperglycaemia and glycosuria without ketonuria may also be present.

Further absorption of the organophosphorus insecticide should be prevented by moving the patient to fresh air, removing soiled clothing, and washing contaminated skin. In severe poisoning it is vital to ensure a clear airway, frequent removal of bronchial secretions, and adequate ventilation and oxygenation; gastric lavage may be considered provided that the airway is protected. Atropine sulfate p. 1224 will reverse the muscarinic effects of acetylcholine and is given by intravenous injection until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished.

Pralidoxime chloride, a cholinesterase reactivator, is used as an adjunct to atropine sulfate in moderate or severe poisoning. It improves muscle tone within 30 minutes of administration. Pralidoxime chloride is continued until the patient has not required atropine sulfate for 12 hours. Pralidoxime chloride can be obtained from designated centres, the names of which are held by the National Poisons Information Service.
Snakes and animal stings

Snake bites

Envenoming from snake bite is uncommon in the UK. Many exotic snakes are kept, some illegally, but the only indigenous venomous snake is theadder (Vipera berus). The bite may cause local and systemic effects. Local effects include pain, swelling, bruising, and tendon enlargement of regional lymph nodes. Systemic effects include early anaphylactic reactions (transient hypotension with syncope, angioedema, urticaria, abdominal colic, diarrhoea, and vomiting), with later persistent or recurrent hypotension, ECG abnormalities, spontaneous systemic bleeding, coagulopathy, adult respiratory distress syndrome, and acute renal failure. Fatal envenoming is rare but the potential for severe envenoming must not be underestimated.

Early anaphylactic symptoms should be treated with adrenaline/epinephrine p. 216. Indications for European viper snake venom antiserum p. 1261. Treatment includes systemic envenoming, especially hypotension, ECG abnormalities, vomiting, haemostatic abnormalities, and marked local envenoming such that after bites on the hand or foot, swelling extends beyond the wrist or ankle within 4 hours of the bite. For those patients who present with clinical features of severe envenoming (e.g. shock, ECG abnormalities, or local swelling that has advanced from the foot to above the knee or from the hand to above the elbow within 2 hours of the bite), a higher initial dose of the European viper snake venom antiserum is recommended; if symptoms of systemic envenoming persist contact the National Poisons Information Service.

Adrenaline/epinephrine injection must be immediately to hand for treatment of anaphylactic reactions to the European viper snake venom antiserum.

European viper snake venom antiserum is available for bites by certain foreign snakes and spiders, stings by scorpions and fish. For information on identification, management, and for supply in an emergency, telephone the National Poisons Information Service. Whenever possible the TOXBASE entry should be read, and relevant information collected, before telephoning the National Poisons Information Service.

Insect stings

Stings from ants, wasps, hornets, and bees cause local pain and swelling but seldom cause severe direct toxicity unless many stings are inflicted at the same time. If the sting is in the mouth or on the tongue local swelling may threaten the upper airway. The stings from these insects are usually treated by cleaning the area with a topical antiseptic. Bee stings should be removed as quickly as possible. Anaphylactic reactions require immediate treatment with intramuscular adrenaline/epinephrine; self-administered intramuscular adrenaline/epinephrine (e.g. EpiPen®) is the best first-aid treatment for patients with severe hypersensitivity. An inhaled bronchodilator should be used for asthmatic reactions, see also the management of anaphylaxis. A short course of an oral antihistamine or a topical corticosteroid may help to reduce inflammation and relieve itching. A vaccine containing extracts of bee and wasp venom can be used to reduce the risk of anaphylaxis and systemic reactions in patients with systemic hypersensitivity to bee or wasp stings.

Marine stings

The severe pain of weeverfish (Trachinus draco) and Portuguese man-o’-war stings can be relieved by immersing the sting area immediately in uncomfortably hot, but not scalding, water (not more than 45°C). People stung by jellyfish and Portuguese man-o’-war around the UK coast should be removed from the sea as soon as possible. Adherent tentacles should be lifted off carefully (wearing gloves or using tweezers) or washed off with seawater. Alcoholic solutions, including suntan lotions, should not be applied because they can cause further discharge of stinging hairs. Ice packs can be used to reduce pain.

Other poisons

Consult either the National Poisons Information Service or TOXBASE.

1  Active elimination from the gastro-intestinal tract

ANTIDOTES AND CHELATORS > INTESTINAL ADSORBENTS

Charcoal, activated

- INDICATIONS AND DOSE

Reduction of absorption of poisons in the gastro-intestinal system

- BY MOUTH

  > Child 1 month–11 years: 1 g/kg (max. per dose 50 g)
  > Child 12–17 years: 50 g
  > Adult: 50 g

Active elimination of poisons

- BY MOUTH

  > Child 1 month–11 years: 1 g/kg every 4 hours (max. per dose 50 g), dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy
  > Child 12–17 years: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, reduced dose may compromise efficacy
  > Adult: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, reduced dose may compromise efficacy

Accelerated elimination of teriflunomide

- BY MOUTH USING GRANULES

  > Adult: 50 g every 12 hours for 11 days

Accelerated elimination of leflunomide (washout procedure)

- BY MOUTH USING GRANULES

  > Adult: 50 g 4 times a day for 11 days

- UNLICENSED USE  Activated charcoal doses in BNF may differ from those in product literature.

- CAUTIONS  Comatose patient (risk of aspiration—ensure airway is protected) · drowsy patient (risk of aspiration—ensure airway protected) · reduced gastrointestinal motility (risk of obstruction)

- SIDE-EFFECTS  Black stools

- DIRECTIONS FOR ADMINISTRATION  Suspension or reconstituted powder may be mixed with soft drinks (e.g. caffeine-free diet cola) or fruit juices to mask the taste.

- MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug

Oral suspension

- Actidose-Aqua Advance (Alliance Pharmaceuticals Ltd)
  Activated charcoal 208 mg per 1 ml Actidose-Aqua Advance 1.04g/5ml oral suspension 1 240 ml £12.89
- Charcordote (Teva UK Ltd)
  Activated charcoal 200 mg per 1 ml Charcordote 200mg/ml oral suspension sugar-free 1 250 ml £11.89

Granules

- Carbomix (Beacon Pharmaceuticals Ltd)
  Activated charcoal 813 mg per 1 gram Carbomix 81.3% granules sugar-free 1 50 gram £11.90
2 Chemical toxicity

2.1 Cyanide toxicity

ANTIDOTES AND CHELATORS

Dicobalt edetate

**INDICATIONS AND DOSE**

**Severe poisoning with cyanides**

- **BY INTRAVENOUS INJECTION**
  - Child: Consult the National Poisons Information Service
  - Adult: 300 mg, to be given over 1 minute (or 5 minutes if condition less serious), dose to be followed immediately by 50 mL of glucose intravenous infusion 50%; if response inadequate a second dose of both may be given, but risk of cobalt toxicity

**CAUTIONS** Owing to toxicity to be used only for definite cyanide poisoning when patient tending to lose, or has lost, consciousness

**SIDE-EFFECTS** Anaphylactoid reactions • cardiac abnormalities • facial oedema • hypotension • laryngeal oedema • tachycardia • vomiting

**EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for injection ampoules • 6 ampoule [Pst] £11.72

Sodium nitrate

**INDICATIONS AND DOSE**

Poisoning with cyanides (used in conjunction with sodium thiosulfate)

- **BY INTRAVENOUS INJECTION**
  - Child: 4–10 mg/kg (max. per dose 300 mg), to be given over 5–20 minutes followed by sodium thiosulphate injection
  - Adult: 300 mg, to be given over 5–20 minutes (as sodium nitrite injection 30 mg/mL)

**DOSE EQUIVALENCE AND CONVERSION**

- 4–10 mg/kg equates to 0.13–0.33 mL/kg of a 3% solution.
- Dose max. of 300 mg equates to 10 mL of a 3% solution.

**SIDE-EFFECTS** Flushing (due to vasodilatation) • headache (due to vasodilatation)

**EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Sodium thiosulfate

**INDICATIONS AND DOSE**

Poisoning with cyanides (used in conjunction with sodium nitrite)

- **BY INTRAVENOUS INJECTION**
  - Child: 400 mg/kg (max. per dose 12.5 g), to be given over 10 minutes, dose may be repeated in severe cyanide poisoning if dicobalt edetate not available
  - Adult: 12.5 g, to be given over 10 minutes (as sodium thiosulfate injection 500 mg/mL), dose may be repeated in severe cyanide poisoning if dicobalt edetate not available

**DOSE EQUIVALENCE AND CONVERSION**

- 400 mg/kg equates to 0.8 mL/kg of a 50% solution.
- 12.5 g equates to 25 mL of a 50% solution.

**EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for injection ampoules • 6 ampoule [Pst] £11.72

2.2 Other drugs used for Organophosphorus toxicity

**Antidotes and chelators**

Pralidoxime chloride

**INDICATIONS AND DOSE**

Adjunct to atropine in the treatment of poisoning by organophosphorus insecticide or nerve agent

- **BY INTRAVENOUS INFUSION**
  - Child: Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day
  - Adult: Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day

**UNLICENSED USE** Pralidoxime chloride doses may differ from those in product literature. Licensed for use in children (age range not specified by manufacturer).

**CONTRA-INDICATIONS** Poisoning with carbamates • poisoning with organophosphorus compounds without anticholinesterase activity

**CAUTIONS** Myasthenia gravis

**SIDE-EFFECTS** Disturbances of vision • dizziness • drowsiness • headache • hyperventilation • muscular weakness • nausea • tachycardia

**RENAL IMPAIRMENT** Use with caution.

**DIRECTIONS FOR ADMINISTRATION** The loading dose may be administered by intravenous injection (diluted to a concentration of 50 mg/mL with water for injections) over at least 5 minutes if pulmonary oedema is present or if it is not practical to administer an intravenous infusion.

**IN CHILDREN** For intravenous infusion, reconstitute each vial with 20 mL Water for Injections, then dilute to a concentration of 10–20 mg/mL with Sodium Chloride 0.9%.

**PRESCRIBING AND DISPENSING INFORMATION** Available from designated centres for organophosphorus insecticide poisoning or from the National Blood Service (or Welsh
3 Drug toxicity

3.1 Benzodiazepine toxicity

ANTIDOTES AND CHELATORS

BENZODIAZEPINE ANTAGONISTS

Flumazenil

- **INDICATIONS AND DOSE**
  - Reversal of sedative effects of benzodiazepines in anaesthesia and clinical procedures
    - **BY INTRAVENOUS INJECTION**
    - Adult: 200 micrograms, dose to be administered over 15 seconds, then 100 micrograms every 1 minute if required; usual dose 300–600 micrograms; maximum 1 mg per course
  - Reversal of sedative effects of benzodiazepines in intensive care
    - **BY INTRAVENOUS INJECTION**
    - Adult: 300 micrograms, dose to be administered over 15 seconds, then 100 micrograms every 1 minute if required; maximum 2 mg per course
  - Reversal of sedative effects of benzodiazepines in intensive care (if drowsiness recurs after injection)
    - **INITIALLY BY INTRAVENOUS INFUSION**
    - Adult: 100–400 micrograms/hour, adjusted according to response, alternatively (by intravenous injection) 300 micrograms, adjusted according to response

**IMPORTANT SAFETY INFORMATION**

Flumazenil should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CONTRA-INDICATIONS**
  - Life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines
- **CAUTIONS**
  - Avoid rapid injection following major surgery; avoid rapid injection in high-risk or anxious patients; benzodiazepine dependence (may precipitate withdrawal symptoms) - elderly - ensure neuromuscular blockade cleared before giving - head injury (rapid reversal of benzodiazepine sedation may cause convulsions) - history of panic disorders (risk of recurrence) - prolonged benzodiazepine therapy for epilepsy (risk of convulsions) - short-acting (repeat doses may be necessary - benzodiazepine effects may persist for at least 24 hours)
- **SIDE-EFFECTS**
  - Common or very common: Nausea, vomiting
  - Uncommon: Anxiety, fear, palpitation
  - Frequency not known: Agitation, chills, convulsions
  - Pregnancy: Not known to be harmful.

- **BREAST FEEDING**
  - Avoid breast-feeding for 24 hours.
- **HEPATIC IMPAIRMENT**
  - Carefully titrate dose.
- **DIRECTIONS FOR ADMINISTRATION**
  - For continuous intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - Flumazenil (Non-proprietary)
      - Flumazenil 100 microgram per 1 ml
      - Flumazenil 500 micrograms/5 ml solution for injection ampoules | 5 ampoul
      - £65.50–£72.46

3.2 Digoxin toxicity

ANTIDOTES AND CHELATORS

DIGOXIN-SPECIFIC ANTIBODIES

Digoxin-specific antibody

- **INDICATIONS AND DOSE**
  - Treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradyarrhythmias unresponsive to atropine and when measures beyond the withdrawal of digoxin and correction of any electrolyte abnormalities are considered necessary
  - **BY INTRAVENOUS INFUSION**
    - Child: Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)
    - Adult: Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)

- **DIRECTIONS FOR ADMINISTRATION**
  - In adults
    - For intravenous infusion (DigiFab®), given intermittently in Sodium chloride 0.9%. Reconstitute with water for injections (4 ml/vial), then dilute with infusion fluid and give over 30 minutes.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder for solution for infusion**
    - DigiFab (BTG International Ltd)
      - Digoxin-specific antibody fragments 40 mg
      - DigiFab 40 mg powder for solution for infusion vials | 1 vial
      - £750.00 (Hospital only)

3.3 Heparin toxicity

ANTIDOTES AND CHELATORS

Protamine sulfate

- **INDICATIONS AND DOSE**
  - Overdose with intravenous injection of unfractionated heparin
    - **BY INTRAVENOUS INJECTION**
      - Adult: Dose to be administered at a rate not exceeding 5 mg/min, 1 mg neutralises 80–100 units heparin when given within 15 minutes; if longer than 15 minute since heparin, less protamine required (consult product literature for details) as heparin rapidly excreted; maximum 50 mg
3.4 Opioid toxicity

**OPIOID RECEPTOR ANTAGONISTS**

**Naloxone hydrochloride**

- **INDICATIONS AND DOSE**
  - **Overdose with opioids**
    - By intravenous injection, or by subcutaneous injection, or by intramuscular injection
    - Child 1 month–11 years: Initially 100 micrograms/kg, if no response, repeat at intervals of 1 minute to a total max. 2 mg, then review diagnosis; further doses may be required if respiratory function deteriorates

**Overdosage with intravenous infusion of unfractionated heparin**
- By intravenous injection
- Adult: 25–50 mg, to be administered once heparin infusion stopped at a rate not exceeding 5 mg/minute

**Overdosage with subcutaneous injection of unfractionated heparin**
- Initially by intravenous injection
- Adult: Initially 25–50 mg, to be administered at a rate not exceeding 5 mg/minute, 1 mg neutralises 100 units heparin, then (by intravenous infusion), any remaining dose to be administered over 8–16 hours; maximum 50 mg per course

**Overdosage with subcutaneous injection of low molecular weight heparin**
- By intravenous injection, or by continuous intravenous infusion
- Adult: Dose to be administered by intermittent intravenous injection at a rate not exceeding 5 mg/minute, 1 mg neutralises approx. 100 units low molecular weight heparin (consult product literature of low molecular weight heparin for details); maximum 50 mg

- **CAUTIONS** Excessive doses can have an anticoagulant effect
- **SIDE-EFFECTS** Anaphylaxis · angioedema · back pain · bradycardia · dyspnoea · flushing · hypersensitivity reactions · hypertension · hypotension · lassitude · nausea · pulmonary oedema · rebound bleeding · vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Caution if increased risk of allergic reaction to protamine (includes previous treatment with protamine or protamine insulin, allergy to fish, men who are infertile or who have had a vasectomy and who may have antibodies to protamine).
- **MONITORING REQUIREMENTS** Monitor activated partial thromboplastin time or other appropriate blood clotting parameters.
- **PRESCRIBING AND DISPENSING INFORMATION** The long half-life of low molecular weight heparins should be taken into consideration when determining the dose of protamine sulfate; the effects of low molecular weight heparins can persist for up to 24 hours after administration.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Protamine sulfate (Non-proprietary)**
  - Protamine sulfate 10 mg per 1 ml Protamine sulfate 100 mg/10 ml solution for injection ampoules  | 5 ampoule [Pass] no price available Protamine sulfate 50 mg/5 ml solution for injection ampoules  | 10 ampoule [Pass] £49.55

**Overdosage with opioids in a non-medical setting**
- By intramuscular injection
- Adult: 400 micrograms every 2–3 minutes, each dose given in subsequent resuscitation cycles if patient not breathing normally, continue until consciousness regained, breathing normally, medical assistance available, or contents of syringe used up; to be injected into deltoid region or anterolateral thigh

**Reversal of postoperative respiratory depression**
- Initially by intravenous injection
- Child 1 month–11 years: 1 microgram/kg, repeated every 2–3 minutes if required
- Child 12–17 years: Initially 100–200 micrograms, alternatively (by intravenous injection) initially 1.5–3 micrograms/kg, if response inadequate, give subsequent doses, (by intravenous injection) 100 micrograms every 2 minutes, alternatively (by intramuscular injection) 100 micrograms every 1–2 hours
- Adult: Initially 100–200 micrograms, alternatively (by intravenous injection) initially 1.5–3 micrograms/kg, if response inadequate, give subsequent doses, (by intravenous injection) 100 micrograms every 2 minutes, alternatively (by intramuscular injection) 100 micrograms every 1–2 hours

**PHARMACOKINETICS**
Naloxone has a short duration of action; repeated doses or infusion may be necessary to reverse effects of opioids with longer duration of action.

**IMPORTANT SAFETY INFORMATION**

**SAFE PRACTICE**
Doses used in acute opioid overdose may not be appropriate for the management of opioid-induced respiratory depression and sedation in those receiving palliative care and in chronic opioid use.

- **CAUTIONS** Cardiovascular disease or those receiving cardiotoxic drugs (serious adverse cardiovascular effects

**UNLICENSED USE** Naloxone doses in BNF may differ from those in product literature.
3.5 Paracetamol toxicity

ANTIDOTES AND CHELATORS

Acetylcysteine

- **INDICATIONS AND DOSE**
  - **Paracetamol overdose**
    - **BY INTRAVENOUS INFUSION**
      - **Child (body-weight up to 20 kg):** Initially 150 mg/kg over 1 hour, dose to be administered in 3 mL/kg glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 7 mL/kg glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 14 mL/kg glucose 5%.
      - **Child (body-weight 20–39 kg):** Initially 150 mg/kg over 1 hour, dose to be administered in 100 mL glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 250 mL glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 500 mL glucose 5%.
      - **Child (body-weight 40 kg and above):** 150 mg/kg over 1 hour, dose to be administered in 200 mL glucose Intravenous Infusion 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL glucose Intravenous Infusion 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre glucose Intravenous Infusion 5%.
      - **Adult (body-weight 40 kg and above):** 150 mg/kg over 1 hour, dose to be administered in 200 mL glucose Intravenous Infusion 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL glucose Intravenous Infusion 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre glucose Intravenous Infusion 5%.

**DOSES AT EXTREMES OF BODY-WEIGHT**
To avoid excessive dosage in obese patients, a ceiling weight of 110 kg should be used when calculating the dose for paracetamol overdose.

**IMPORTANT SAFETY INFORMATION**
**MHRA/CHM ADVICE:** INTRAVENOUS ACETYLCYSTEINE FOR PARACETAMOL OVERDOSE: REMINDER OF AUTHORISED DOSE REGIMEN; POSSIBLE NEED FOR CONTINUED TREATMENT (JANUARY 2017)
The authorised dose regimen for acetylcysteine in paracetamol overdose is 3 consecutive intravenous infusions given over a total of 21 hours.
Continued treatment (given at the dose and rate as used in the third infusion) may be necessary depending on the clinical evaluation of the individual patient.

- **CAUTIONS** Asthma (see Side-effects for management of asthma but do not delay acetylcysteine treatment) - atopy - may slightly increase INR - may slightly increase prothrombin time
- **SIDE-EFFECTS** Hypersensitivity-like reactions - rash - slight increase in INR and prothrombin time

**SIDE-EFFECTS, FURTHER INFORMATION**
Hypersensitivity-like reactions: Hypersensitivity-like reactions managed by reducing infusion rate or suspending until reaction settled (rash also managed by giving antihistamine; acute asthma managed by giving nebulised short-acting beta agonist) — contact the National Poisons Information Service if reaction severe.

- **DIRECTIONS FOR ADMINISTRATION**
  - **In children** Glucose 5% is preferred fluid; Sodium Chloride 0.9% is an alternative if Glucose 5% is unsuitable.
  - **In adults** *For intravenous infusion (Parvolex)*, give continuously in Glucose 5% or Sodium chloride 0.9%. Glucose Intravenous Infusion 5% is the preferred fluid; Sodium Chloride Intravenous Infusion 0.9% is an alternative if Glucose Intravenous Infusion 5% is unsuitable.
4 Methaemoglobinaemia

**Methylothioninium chloride**
**(Methylene blue)**

- **INDICATIONS AND DOSE**
  - **Drug- or chemical-induced methaemoglobinaemia**
    - **By slow intravenous injection**
      - Child: 3 months–17 years: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course
      - Adult: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course
  - **Aniline- or dapsone-induced methaemoglobinaemia**
    - **By slow intravenous injection**
      - Child: 3 months–17 years: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg per course
      - Adult: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg per course

- **CAUTIONS**
  - Children under 3 months (more susceptible to methaemoglobinaemia from high doses of methylothioninium) - chlorate poisoning (reduces efficacy of methylothioninium). G6PD deficiency (seek advice from National Poisons Information Service).
  - Methaemoglobinaemia due to treatment of cyanide poisoning with sodium nitrite (seek advice from National Poisons Information Service).
  - Pulse oximetry may give false estimation of oxygen saturation.

- **INTERACTIONS**
  - Appendix 1: methylothioninium chloride

- **SIDE-EFFECTS**
  - Abdominal pain, agitation, anxiety, arrhythmia, blue-green discoloration of faeces, blue-green discoloration of skin, blue-green discoloration of urine, chest pain, confusion, dizziness, dysphoea, fever, haemolytic anaemia, headache, hyperbilirubinaemia (in infants), hypotension, hypertension, methaemoglobinemia, mydriasis, nausea, sweating, tachypnoea, tremor, vomiting.

- **PREGNANCY**
  - No information available, but risk to fetus of untreated methaemoglobinaemia likely to be significantly higher than risk of treatment.

- **BREAST FEEDING**
  - Manufacturer advises avoid breastfeeding for up to 6 days after administration—no information available.

**RENAL IMPAIRMENT**
Use with caution in severe impairment; dose reduction may be required.

**DIRECTIONS FOR ADMINISTRATION**
- In children For intravenous injection, may be diluted with Glucose 5% to minimise injection-site pain; not compatible with Sodium Chloride 0.9%.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection.

- **Solution for injection**
  - **Methylothioninium chloride (Non-proprietary)**
    - Methylothioninium chloride 5 mg per 1 ml
  - **Solution for injection ampoules**
    - Parvolex 200 mg (Phoenix Labs Ltd)
    - Parvolex 200 mg per 1 ml
  - **Solution for infusion**
    - Parvolex 2 g/10 ml concentrate for solution for infusion ampoules 10 ampoule £22.50

5 Snake bites

**IMMUNE SERA AND IMMUNOGLOBULINS**

**European viper snake venom antiserum**

- **INDICATIONS AND DOSE**
  - **Systemic envenoming from snake bites | Marked local envenoming**
    - **By intravenous injection, or by intravenous infusion**
      - Child: Initially 10 mL for 1 dose, then 10 mL after 1–2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service
      - Adult: Initially 10 mL for 1 dose, then 10 mL after 1–2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service
  - **Severe systemic envenoming from snake bites in patients presenting with clinical features**
    - **By intravenous injection, or by intravenous infusion**
      - Child: Initially 20 mL for 1 dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service
      - Adult: Initially 20 mL for 1 dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

- **DIRECTIONS FOR ADMINISTRATION**
  - By intravenous injection given over 10–15 minutes or by intravenous infusion over 30 minutes after diluting in sodium chloride 0.9% (use 5 mL diluent/kg body-weight).

- **PRESCRIBING AND DISPENSING INFORMATION**
  - To order, email immform@dhh.gsi.gov.uk.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - **European viper snake venom antiserum (Non-proprietary)**
      - European viper snake venom antiserum 100 mg per 1 ml
      - Viper venom antiserum, European (equine) 1 g/10 ml solution for injection vials 1 vial £0.0 no price available
Appendix 1
Interactions

Changes have been made to Appendix 1. For more information, see www.bnf.org.

Two or more drugs given at the same time can exert their effects independently or they can interact. Interactions may be beneficial and exploited therapeutically; this type of interaction is not within the scope of this appendix. Many interactions are harmless, and even those that are potentially harmful can often be managed, allowing the drugs to be used safely together. Nevertheless, adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse Reactions to Drugs, p. 12), as for other adverse drug reactions.

Potentially harmful drug interactions may occur in only a small number of patients, but the true incidence is often hard to establish. Furthermore the severity of a harmful interaction is likely to vary from one patient to another. Patients at increased risk from drug interactions include the elderly and those with impaired renal or hepatic function.

Interactions can result in the potentiation or antagonism of one drug by another, or result in another effect, such as renal impairment. Drug interactions may develop either through pharmacokinetic or pharmacodynamic mechanisms.

Pharmacodynamic interactions
These are interactions between drugs that have similar or antagonistic pharmacological effects or side-effects. They might be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs.

Pharmacokinetic interactions
These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or decreasing the amount of drug available to produce its pharmacological effects. Pharmacokinetic interactions occurring with one drug do not necessarily occur uniformly across a group of related drugs.

Affecting absorption
The rate of absorption and the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless a rapid effect is required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, can result in ineffective therapy.

Affecting distribution
Due to changes in protein binding
To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing the proportion free to diffuse from the plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces more than transient potentiation because this increased concentration of free drug will usually be eliminated.

Displacement from protein binding does play a part in the potentiation of warfarin by sulfonamides but these interactions become clinically relevant mainly because warfarin metabolism is also inhibited.

Induction or inhibition of drug transporter proteins
Drug transporter proteins, such as P-glycoprotein, actively transport drugs across biological membranes. Transporters can be induced or inhibited, resulting in changes in the concentrations of drugs that are substrates for the transporter. For example, rifampicin induces P-glycoprotein, particularly in the gut wall, resulting in decreased plasma concentrations of digoxin, a P-glycoprotein substrate.

Affecting metabolism
Many drugs are metabolised in the liver. Drugs are either metabolised by phase I reactions (oxidation, reduction, or hydrolysis) or by phase II reactions (e.g. glucuronidation).

Phase I reactions are mainly carried out by the cytochrome P450 family of isoenzymes, of which CYP3A4 is the most important isoenzyme involved in the metabolism of drugs. Induction of cytochrome P450 isoenzymes by one drug can increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducing drug, plasma concentrations increase and toxicity can occur.

Conversely when one drug inhibits cytochrome P450 isoenzymes, it can decrease the metabolism of another, leading to higher plasma concentrations, resulting in an increased effect with a risk of toxicity.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. With knowledge of which isoenzymes are involved in a drug’s metabolism, it is possible to predict whether certain pharmacokinetic interactions will occur. For example, carbamazepine is a potent inducer, ketoconazole is a potent inhibitor, and midazolam is a substrate of CYP3A4. Carbamazepine increases midazolam concentrations, and it is therefore likely that other drugs that are potent inducers of CYP3A4 will interact similarly with midazolam. Ketoconazole, however, increases midazolam concentrations, and it can be predicted that other drugs that are potent inhibitors of CYP3A4 will interact similarly.

Less is known about the enzymes involved in phase II reactions. These include UDP-glucuronosyltransferases which, for example, might be induced by rifampicin, resulting in decreased metabolism of mycophenolate (a substrate for this enzyme) to its active form, mycophenolic acid.

Affecting renal excretion
Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible. Changes in urinary pH can also affect the reabsorption of a small number of drugs, including methenamine.
Relative importance of interactions

Severity of interactions

Most interactions have been assigned a severity; this describes the likely effect of an unmanaged interaction on the patient.

- **Severe** – the result may be a life-threatening event or have a permanent detrimental effect.
- **Moderate** – the result could cause considerable distress or partially incapacitate a patient; they are unlikely to be life-threatening or result in long-term effects.
- **Mild** – the result is unlikely to cause concern or incapacitate the majority of patients.
- **Unknown** – used for those interactions that are predicted, but there is insufficient evidence to hazard a guess at the outcome.

Appendix 1 structure

1. **Drugs**

Drugs are listed alphabetically. If a drug is a member of a drug class, all interactions for that drug will be listed under the drug class entry; in this case the drug entry provides direction to the relevant drug class where its interactions can be found.

Within a drug or drug class entry, interactions are listed alphabetically by the interacting drug or drug class. The interactions describe the effect that occurs, and the action to be taken, either based on manufacturer’s advice from the relevant Summary of Product Characteristics or advice from a relevant authority (e.g. MHRA). An action message is only included where the combination is to be avoided, where a dose adjustment is required, or where specific administration requirements (e.g. timing of doses) are recommended. If two drugs have a pharmacodynamic effect in addition to a pharmacokinetic interaction, a cross-reference to the relevant pharmacodynamic effect table is included at the end of the pharmacokinetic message.

2. **Drug classes**

The drugs that are members of a drug class are listed underneath the drug class entry in a blue box. Interactions for the class are then listed alphabetically by the interacting drug or drug class. If the interaction only applies to certain drugs in the class, these drugs will be shown in brackets after the drug class name.

3. **Supplementary information**

If a drug has additional important information to be considered, this is shown in a blue box underneath the drug or drug class entry. This information might be food and lifestyle advice (including smoking and alcohol consumption), relate to the pharmacology of the drug or applicability of interactions to certain routes of administration, or it might be advice about separating administration times.

Evidence for interactions

Most interactions have been assigned a rating to indicate the weight of evidence behind the interaction.

- **Study** – for interactions where the information is based on formal study including those for other drugs with the same mechanism (e.g. known inducers, inhibitors, or substrates of cytochrome P450 isoenzymes or P-glycoprotein).
- **Anecdotal** – interactions based on either a single case report or a limited number of case reports.
- **Theoretical** – interactions that are predicted based on sound theoretical considerations. The information may have been derived from *in vitro* studies or based on the way other members in the same class act.

### Table 1

### Table 2

**Drug entry**

- Details of interaction between drug entry and another drug or drug class. Action statement. [Severity] Evidence
- Details of interaction between drug entry and another drug or drug class. Action statement. [Severity] Evidence

### Table 3

**Drug class entry**

- Details of interaction between drug class entry and another drug or drug class. Action statement. [Severity] Evidence

### Table 4

**Drug entry or Drug class entry**

- Also see TABLE 1

**Drug entry or Drug class entry**

- see TABLE 1

### Table 5

**Pharmacodynamic effects**

Tables at the beginning of Appendix 1 cover pharmacodynamic effects. If a drug is included in one or more of these tables, this will be indicated at the top of the list of interactions for the drug or drug class. In addition to the list of interactions for a drug or drug class, these tables should always be consulted.

Each table describes the relevant pharmacodynamic effect and lists those drugs that are commonly associated with the effect. Concurrent use of two or more drugs from the same table is expected to increase the risk of the pharmacodynamic effect occurring. Please note these tables are not exhaustive.

Other than for QT interval prolongation, actions for pharmacodynamic effects are not included in the BNF, as these will depend on individual patient circumstances.
## TABLE 1
### Drugs that cause hepatotoxicity

The following is a list of some drugs that cause hepatotoxicity (note that this list is not exhaustive). Concurrent use of two or more drugs from the list might increase this risk.

### TABLE 9
**Drugs that prolong the QT interval**

The following is a list of some drugs that prolong the QT-interval (note that this list is not exhaustive). In general, manufacturers advise that the use of two or more drugs that are associated with QT prolongation should be avoided. Increasing age, female sex, cardiac disease, and some metabolic disturbances (notably hypokalaemia) predispose to QT prolongation—concurrent use of drugs that reduce serum potassium might further increase this risk (see table of drugs that reduce serum potassium). Drugs that are not known to prolong the QT interval but are predicted (by the manufacturer) to increase the risk of QT prolongation include: domperidone, erythromycin, fingolimod, granisetron, ivabradine, mepfoline, mizolastine, palonosetron, and pentamidine.

Most manufacturers advise avoiding concurrent use with drugs that prolong the QT interval.

### TABLE 16  
**Drugs that increase serum potassium**

The following is a list of some drugs that increase serum potassium concentrations (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of hyperkalaemia. Hyperkalaemia is particularly notable when ACE inhibitors or angiotensin-II receptor antagonists are given with spironolactone or eplerenone.

<table>

### TABLE 17  
**Drugs that reduce serum potassium**

The following is a list of some drugs that reduce serum potassium concentrations (note that this list is not exhaustive). Concurrent use of two or more drugs from this list might increase the risk of hypokalaemia. Hypokalaemia can increase the risk of torsade de pointes, which might be additive with the effects of drugs that prolong the QT interval.

List of drug interactions

The following is an alphabetical list of drugs and their interactions; to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts.

**Abacavir**
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to abacavir. [Moderate] Theoretical
- **Enalaprilat** is predicted to decrease the exposure to abacavir. [Moderate] Theoretical
- HIV-protease inhibitors (tipranavir) slightly decrease the exposure to abacavir. Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to abacavir. [Moderate] Theoretical

**Abatacept**
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with abatacept. Public Health England advises avoid. [Severe] Theoretical

**Abciximab** → see TABLE 4. p. 1264 (antiplatelet effects)

**Abiraterone**
- **General Information** Caution with concurrent chemotherapy—safety and efficacy not established.
- **Abiraterone** is predicted to increase the exposure to antiarrhythmics (flcainide). [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to abiraterone. Avoid. [Severe] Theoretical
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to abiraterone. [Severe] Theoretical
- **Acarbose** is predicted to increase the exposure to abiraterone. [Severe] Theoretical
- **Enalaprilat** is predicted to decrease the exposure to abiraterone. [Severe] Theoretical
- **Lisinopril** is predicted to increase the exposure to abiraterone. [Severe] Theoretical
- **Mexiletine** is predicted to increase the exposure to abiraterone. [Severe] Theoretical
- **Perindopril** is predicted to increase the exposure to abiraterone. [Severe] Theoretical
- **Ranolazine** is predicted to increase the exposure to abiraterone. [Severe] Theoretical
- **Captopril** is predicted to decrease the exposure to abiraterone. Use with caution and adjust dose. [Moderate] Study
- **Rifampicin** is predicted to increase the exposure to abiraterone. Avoid. [Severe] Theoretical
- **Abiraterone** is predicted to decrease the exposure to pilosulinate. Use with caution and adjust dose. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to abiraterone. Avoid. [Severe] Theoretical
- **Abiraterone** potentially increases the exposure to venlafaxine. [Severe] Theoretical
- **Acarbose** → see TABLE 14. p. 1267 (antidiabetic drugs)
- **Acarbose** decreases the concentration of digoxin. [Moderate] Study
- **Pancreatin** is predicted to decrease the effects of acarbose. [Avoid. [Moderate] Theoretical
- **ACE inhibitors** → see TABLE 7. p. 1265 (first-dose hypotension), TABLE 8 p. 1265 (hypotension), TABLE 16 p. 1268 (increased serum potassium)
- Captopril,enalapril,fosinopril,imidapril,lisinopril,moexipril,perindopril,quinapril,ramipril,trandolapril
- **ACE inhibitors** increase the risk of renal impairment when given with aliskiren. Use with caution or avoid aliskiren in selected patients, p. 175. [Severe] Study → Also see TABLE 8 p. 1265 → Also see TABLE 16 p. 1268
- **ACE inhibitors** are predicted to increase the risk of hypersensitivity and haematological reactions when given with allopurinol. [Severe] Anecdotal
- **ACE inhibitors** are predicted to increase the risk of anaemia and/or leucopenia when given with azathioprine. [Severe] Anecdotal
- **ACE inhibitors** increase the risk of hypersensitivity when given with bee venom extract. Avoid. [Severe] Study
- **ACE inhibitors** are predicted to decrease the efficacy of icatibant and icatibant is predicted to decrease the efficacy of ACE inhibitors. Avoid. [Moderate] Theoretical
- **ACE inhibitors** are predicted to increase the concentration of lithium. Monitor and adjust dose. [Severe] Anecdotal
- **ACE inhibitors** are predicted to increase the risk of hypersensitivity when given with sodium aurothiomalate. [Severe] Anecdotal
- **Quinapril** (tablet) decreases the absorption of oral tetracyclines (tetracycline). Avoid. [Moderate] Study
- **ACE inhibitors** increase the risk of hypersensitivity when given with wasp venom extract. Avoid. [Severe] Study
- **Acenocoumarol** → see coumarins
- **Acetazolamide**
  - **Acetazolamide** potentially increases the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. [Severe] Theoretical
  - **Acetazolamide** increases the risk of severe toxic reaction when given with aspirin (high-dose). [Severe] Study
  - **Acetazolamide** alters the concentration of lithium. [Severe] Anecdotal
  - **Acetazolamide** is predicted to decrease the efficacy of methotrexate. [Moderate] Study
  - **Acetazolamide** increases the urinary excretion of methotrexate. [Moderate] Study

**Aciclovir** → see TABLE 2. p. 1264 (nephrotoxicity)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.
- **Aciclovir** increases the exposure to aminophylline. Monitor theophylline concentration and adjust dose. [Severe] Anecdotal
- **Myophenolate** is predicted to increase the risk of haematological toxicity when given with aciclovir. [Moderate] Theoretical
- **Aciclovir** is predicted to increase the exposure to theophylline. Monitor theophylline concentration and adjust dose. [Severe] Theoretical
- **Aciclovir** → see retinoids
- **Aclidium** → see TABLE 10. p. 1266 (antimuscarnicins)
- **Aciclovir** → see sympathomimetics, vasoconstrictor
- **Aciclovir** → see antihistamines, non-sedating
- **Adalimumab** → see monoclonal antibodies
- **Adapalene** → see retinoids
- **Adefovir**
  - **Ataluren** increases the exposure to adefovir. [Moderate] Study
- **Adenosine** → see antihypertensives
- **Adrenaline/epinephrine** → see sympathomimetics, vasoconstrictor
- **Afinitor** → see TABLE 15. p. 1267 (myelosuppression)
  - **Anticholinergics (amiodarone, dronedarone)** are predicted to increase the exposure to aitinib. Separate administration by 12 hours. [Moderate] Study
  - **Antiepileptics (carbamazepine)** are predicted to decrease the exposure to aitinib. [Moderate] Study
  - **Antifungals, azoles (itraconazole, ketoconazole)** are predicted to increase the exposure to aitinib. Separate administration by 12 hours. [Moderate] Study
  - **Calcium channel blockers (verapamil)** are predicted to increase the exposure to aitinib. Separate administration by 12 hours. [Moderate] Study
  - **Ciclosporin** is predicted to increase the exposure to aitinib. Separate administration by 12 hours. [Moderate] Study
  - **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to increase the exposure to aitinib. Separate administration by 12 hours. [Moderate] Study
  - **Lapatinib** is predicted to increase the exposure to aitinib. Separate administration by 12 hours. [Moderate] Study
  - **Macrolides** are predicted to increase the exposure to aitinib. Separate administration by 12 hours. [Moderate] Study

---

A1

Interactions | Appendix 1
Afatinib (continued)
- **Ranolazine** is predicted to increase the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to afatinib. [Moderate] Study
- **St John's Wort** is predicted to decrease the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study
- **Vemurafenib** is predicted to increase the exposure to afatinib. [Moderate] Study

**Afflithercept → see TABLE 15 p. 1267 (myelosuppression)**

**Agalsidase**
- **Aminoglycosides** are predicted to decrease the effects of agalsidase. Avoid. [Moderate] Theoretical
- **Antiarrhythmics (amiodarone)** are predicted to decrease the effects of agalsidase. Avoid. [Moderate] Theoretical
- **Antimalarial (chloroquine)** are predicted to decrease the effects of agalsidase. Avoid. [Moderate] Theoretical
- **Hydroxychloroquine** is predicted to decrease the effects of agalsidase. [Moderate] Theoretical

**Agomelatine → see TABLE 11 p. 1266 (CNS depressant effects)**
- Dose adjustment might be necessary if smoking started or stopped during treatment.
- Caution with concomitant use of drugs associated with hepatic injury.
- **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- **Combined hormonal contraceptives** are predicted to increase the exposure to agomelatine. [Moderate] Study
- **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to agomelatine. [Moderate] Study
- **Quinolones (ciprofloxacin)** are predicted to increase the exposure to agomelatine. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- **SSRIs (fluvoxamine)** very markedly increase the exposure to agomelatine. Avoid. [Severe] Study

**Albendazole**
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the concentration of albendazole. [Moderate] Study
- **H$_2$ receptor antagonists (cimetidine)** decrease the clearance of albendazole. [Moderate] Study
- **HIV-protease inhibitors (ritonavir)** decrease the exposure to albendazole. [Moderate] Study
- Albendazole slightly decreases the exposure to levasimole and levasimole moderately decreases the exposure to albendazole. [Moderate] Study

**Albiglutide → see TABLE 14 p. 1267 (antidiabetic drugs)**

**Alcohol (beverage)** → see TABLE 1 p. 1264 (hepatotoxicity), TABLE 8 p. 1265 (hypotension), TABLE 11 p. 1266 (CNS depressant effects)

**Aldosterone antagonists → see TABLE 18 p. 1268 (hypotension), TABLE 8 p. 1268 (hypotension), TABLE 16 p. 1268 (increased serum potassium)**

**Eplerenone - spironolactone**
- **Antiarrhythmics (amiodarone)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 185. [Severe] Theoretical
- **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 185. [Severe] Study
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to eplerenone. Avoid. [Moderate] Study
- **Antifungals, azoles (fluconazole, itraconazole, posaconazole)** are predicted to markedly increase the exposure to eplerenone. Adjust eplerenone dose, p. 185. [Severe] Study
- **Aprepitant** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 185. [Severe] Study
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 185. [Severe] Study → Also see TABLE 8 p. 1265
- **Cobicistat** is predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **Crizotinib** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 185. [Severe] Study
- **Eplerenone very slightly increases the exposure to digoxin.** [Mild] Study
- **Spirinolactone increases the concentration of digoxin.** Monitor and adjust dose. [Moderate] Study
- **Enalaprilamide** is predicted to decrease the exposure to eplerenone. Avoid. [Moderate] Theoretical
- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 185. [Severe] Study
- **Idelalisib** is predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **Imatinib** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 185. [Severe] Study
- **Eplerenone is predicted to increase the concentration of lithium.** Avoid. [Moderate] Theoretical
- **Spirinolactone potentially increases the concentration of lithium.** [Moderate] Study
- **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to eplerenone. Avoid. [Severe] Study
- **Macrolides (erythromycin)** are predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 185. [Severe] Study
- **Spirinolactone is predicted to decrease the effects of mitotane.** Avoid. [Severe] Anecdotal
- **Netupitant** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 185. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to eplerenone. Adjust eplerenone dose, p. 185. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to eplerenone. Avoid. [Moderate] Theoretical
- **St John's Wort** is predicted to slightly decrease the exposure to eplerenone. Avoid. [Moderate] Study
- **Alemtezumab → see monoclonal antibodies**
- **Alendronic acid** → see bisphosphonates
- **Alfacalcidol → see vitamin D substances**
- **Alfentanil → see opioids**
- **Alfuzosin → see alpha blockers**
- **Aliiminemazone → see antihistamines, sedating**
- **Alirocumab → see monoclonal antibodies**
- **Aliskiren → see TABLE 8 p. 1265 (hypotension), TABLE 16 p. 1268 (increased serum potassium)**

**Food and lifestyle** Avoid apple juice and orange juice as they greatly decrease aliskiren concentrations and plasma renin activity.
Ciclosporin markedly increases the exposure to aliskiren. Avoid. [Severe] Study → Also see TABLE 16 p. 1268

Grapefruit juice moderately decreases the exposure to aliskiren. Avoid. [Severe] Study

HIV-protease inhibitors (ritonavir, saquinavir) are predicted to increase the exposure to aliskiren. [Moderate] Theoretical

Lapatinib is predicted to increase the exposure to aliskiren. [Moderate] Theoretical

Aliskiren slightly decreases the exposure to loop diuretics (furosemide). [Moderate] Study → Also see TABLE 8 p. 1265

Lumacaftor is predicted to affect the exposure to aliskiren. [Moderate] Theoretical

Macrolides (azithromycin) are predicted to increase the exposure to aliskiren. [Moderate] Theoretical

Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to aliskiren. [Moderate] Study

Mirabegron is predicted to increase the exposure to aliskiren. [Mild] Study

Aliskiren increases the exposure to rifampicin. [Mild] Study

St John’s Wort decreases the exposure to aliskiren. [Moderate] Study

Statin (atorvastatin) slightly to moderately increase the exposure to aliskiren. [Moderate] Study

Velpatasvir is predicted to increase the exposure to aliskiren. [Severe] Theoretical

Venlafaxine is predicted to increase the exposure to aliskiren. Use with caution and adjust dose. [Moderate] Theoretical

Alitretinoin → see retinoids

Alkylating agents → see TABLE 15 p. 1267 (myelosuppression), TABLE 2 p. 1264 (nephrotoxicity), TABLE 5 p. 1264 (thromboembolism)

Bendamustine • busulfan • carmustine • chlorambucil • cyclophosphamide • dacarbazine • estramustine • ifosfamide • lomustine • melphalan • temozolomide • thiopeta • treosulfan

Antacids are predicted to decrease the absorption of estramustine. Avoid. [Moderate] Study

Antifungals, azoles (itraconazole) increase the risk of busulfan toxicity when given with busulfan. Monitor and adjust dose. [Moderate] Study

Antifungals, azoles (miconazole) are predicted to increase the concentration of busulfan. Use with caution and adjust dose. [Moderate] Theoretical

Oral calcium salts decrease the absorption of estramustine. [Severe] Study

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with alkylating agents. Public Health England advises avoid. [Severe] Theoretical

Metronidazole increases the risk of toxicity when given with busulfan. [Severe] Study

Paracetamol is predicted to decrease the clearance of busulfan. [Moderate] Theoretical

Cyclophosphamide (high-dose) increases the risk of toxicity when given with pentostatin. Avoid. [Severe] Anecdotal → Also see TABLE 15 p. 1267 → Also see TABLE 5 p. 1264

Cyclophosphamide increases the risk of prolonged neuromuscular blockade when given with suxamethonium. [Moderate] Study

Allopurinol

ACE inhibitors are predicted to increase the risk of hypersensitivity and haematological reactions when given with allopurinol. [Severe] Anecdotal

Allopurinol potentially increases the risk of haematological toxicity when given with azathioprine. Adjust azathioprine dose, p. 787. [Severe] Study

Allopurinol is predicted to decrease the effects of capetabine. Avoid. [Severe] Study

Allopurinol moderately increases the exposure to didanosine. Avoid. [Severe] Study

Allopurinol potentially increases the risk of haematological toxicity when given with mercaptopurine. Adjust mercaptopurine dose, p. 844. [Severe] Study

Allopurinol increases the risk of skin rash when given with penicillins (amoxicillin, ampicillin). [Moderate] Study

Allopurinol is predicted to increase the risk of hyperuricaemia when given with pyrazinamide. [Moderate] Theoretical

Thiazide diuretics are predicted to increase the risk of hypersensitivity reactions when given with allopurinol. [Severe] Theoretical

Almotriptan → see TABLE 13 p. 1267 (serotonin syndrome)

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the exposure to almotriptan. [Mild] Study

Cobicistat increases the exposure to almotriptan. [Mild] Study

Almotriptan is predicted to increase the risk of vasocostriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after almotriptan. [Severe] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) increase the exposure to almotriptan. [Mild] Study

Idealisib increases the exposure to almotriptan. [Mild] Study

Macrolides (clarithromycin) increase the exposure to almotriptan. [Mild] Study

Alogliptin → see TABLE 14 p. 1267 (antidiabetic drugs)

Alpha blockers → see TABLE 7 p. 1265 (first-dose hypotension), TABLE 8 p. 1265 (hypotension)

alfuzosin • doxazosin • indoramin • prazosin • tamsulosin • terazosin

Antiarrhythmics (dronedarone) are predicted to increase the exposure to tamsulosin. [Moderate] Theoretical

Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to tamsulosin. [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to doxazosin. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study

Aprepitant is predicted to increase the exposure to tamsulosin. [Moderate] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tamsulosin. [Moderate] Theoretical → Also see TABLE 8 p. 1265

Cobicistat is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study

Cobicistat is predicted to increase the exposure to doxazosin. [Moderate] Study

Crizotinib is predicted to increase the exposure to tamsulosin. [Moderate] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to doxazosin. [Moderate] Study

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to tamsulosin. [Moderate] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study

Idealisib is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study

Idealisib is predicted to increase the exposure to doxazosin. [Moderate] Study

Imatinib is predicted to increase the exposure to tamsulosin. [Moderate] Theoretical

Macrolides (clarithromycin) are predicted to increase the exposure to tamsulosin. [Moderate] Study

Macrolides (erythromycin) are predicted to increase the exposure to tamsulosin. [Moderate] Theoretical

Monamine-oxidase A and B inhibitors, irreversible are predicted to increase the effects of indoramin. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 1265

Netupitant is predicted to increase the exposure to tamsulosin. [Moderate] Theoretical
Alpha blockers (continued)

- **Nilotinib** is predicted to increase the exposure to tamsulosin.
  
- **Alpha blockers** cause significant hypotensive effects when given with **phosphodiesterase type-5 inhibitors**. Patient should be stabilised on first drug then second drug should be added at the lowest recommended dose. **(Severe) Study**  
  Also see TABLE 8 p. 1265

**Alpha tocopherol** → see vitamin E substances

**Alpha tocopheryl acetate** → see vitamin E substances

**Alprazolam**  
- **Antidepressants** (dronedarone) are predicted to increase the exposure to alprazolam. **(Severe) Study**
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to alprazolam. Adjust alprazolam dose. **(Moderate) Theoretical**  
  Also see TABLE 11 p. 1266
- **Antifungals, azoles** (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to alprazolam. **(Severe) Study**
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) moderately increase the exposure to alprazolam. Avoid. **(Moderate) Study**
- **Crizotinib** is predicted to increase the exposure to alprazolam. **(Severe) Study**
- **Enalaprilat** is predicted to decrease the exposure to alprazolam. Adjust alprazolam dose. **(Moderate) Theoretical**
- **HIV- protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) moderately increase the exposure to alprazolam. Avoid. **(Moderate) Study**
- **Hydralazine** is predicted to increase the exposure to alprazolam. **(Severe) Study**
- **Ipratropium bromide** is predicted to increase the exposure to alprazolam. **(Severe) Study**
- **Lidocaine** is predicted to increase the exposure to alprazolam. **(Severe) Study**
- **Nicardipine** is predicted to increase the exposure to alprazolam. **(Severe) Study**
- **Nitroglycerin** is predicted to increase the exposure to alprazolam. **(Severe) Study**
- **Nitroprusside** is predicted to increase the exposure to alprazolam. **(Severe) Study**
- **Rifampicin** is predicted to decrease the exposure to alprazolam. Adjust alprazolam dose. **(Moderate) Theoretical**
- **SSRIs** (fluvoxamine) moderately increase the exposure to alprazolam. **(Moderate) Study**
- **St John’s Wort** moderately decreases the exposure to alprazolam. **(Moderate) Study**
- **Alprazolam**  
  Separate administration by 12 hours. **(Moderate) Theoretical**
  - **Macrolides** (clarithromycin) moderately increase the exposure to alprazolam. Avoid. **(Moderate) Study**
  - **Macrolides** (erythromycin) are predicted to increase the exposure to alprazolam. **(Severe) Study**
  - **Nitritopenton** is predicted to increase the exposure to alprazolam. **(Severe) Study**

**Amfetamines** → see TABLE 13 p. 1267 (serotonin syndrome)
- **Dexamfetamine** • **Lisdexamfetamine**
- **Amfetamines** are predicted to decrease the risk of side-effects when given with **atomoxetine**. **(Severe) Theoretical**
- **Dexamfetamine** decreases the effects of **guanethidine**. **(Severe) Study**
- **HIV-protease inhibitors** (ritonavir, tipranavir) are predicted to increase the exposure to amfetamines. **(Severe) Theoretical**
  Also see TABLE 13 p. 1267
- **Moclobemide** is predicted to increase the risk of a hypertensive crisis when given with **dexamfetamine**. Avoid. **(Severe) Theoretical**  
  Also see TABLE 13 p. 1267
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of a hypertensive crisis when given with amfetamines. Avoid and for 14 days after stopping the MAOI. **(Severe) Anecdotal**  
  Also see TABLE 13 p. 1267
- **Monoamine-oxidase B inhibitors** (rasagiline, selegiline) are predicted to increase the risk of severe hypertension when given with amfetamines. Avoid. **(Severe) Theoretical**  
  Also see TABLE 13 p. 1267
- **Aminoglycosides** (rifampicin, ethambutol, isoniazid) are predicted to decrease the effects of amfetamines. **(Severe) Study**
- **Amfetamines** are predicted to decrease the effects of phenothiazines (chlorpromazine). **(Moderate) Study**
- **SSRIs** (fluoxetine, paroxetine) are predicted to increase the exposure to amfetamines. **(Severe) Theoretical**  
  Also see TABLE 13 p. 1267
- **Amifampridine** → see TABLE 9 p. 1266 (QT-interval prolongation)
- **Amikacin** → see aminoglycosides
- **Amiloride** → see potassium-sparing diuretics

**Aminoglycosides** → see TABLE 2 p. 1264 (nephrotoxicity), TABLE 19 p. 1268 (ototoxicity), TABLE 20 p. 1268 (neuromuscular blocking effects)
- **Amikacin** • **Gentamicin** • **Streptomycin** • **Tobramycin**
- **Aminoglycosides** are predicted to decrease the effects of **agalasidase**. Avoid. **(Moderate) Theoretical**
- **Antifungals, azoles** (itraconazole) potentially decrease the exposure to tobramycin. **(Moderate) Anecdotal**
- **Talutaren** is predicted to increase the risk of nephrotoxicity when given with intravenous **aminoglycosides**. Avoid. **(Severe) Study**
- **Aminoglycosides** increase the risk of hypocalcaemia when given with **bisphosphonates**. **(Moderate) Anecdotal**  
  Also see TABLE 2 p. 1264
- **Aminoglycosides** potentially increase the concentration of digoxin. Monitor and adjust dose. **(Mild) Study**
- **Loop diuretics** increase the risk of nephrotoxicity and ototoxicity when given with **aminoglycosides**. Avoid. **(Moderate) Study**  
  Also see TABLE 19 p. 1268
- **Aminoglycosides** are predicted to decrease the effects of **neostigmine**. **(Moderate) Theoretical**  
  Also see TABLE 20 p. 1268
- **Aminoglycosides** are predicted to increase the risk of prolonged neuromuscular blockade when given with **neuromuscular blocking drugs, non-depolarising**. **(Severe) Theoretical**  
  Also see TABLE 20 p. 1268
- **Aminoglycosides** are predicted to decrease the effects of **pyridostigmine**. **(Moderate) Theoretical**  
  Also see TABLE 20 p. 1268
- **Aminoglycosides** are predicted to increase the risk of prolonged neuromuscular blockade when given with **suxamethonium**. **(Severe) Theoretical**  
  Also see TABLE 20 p. 1268
- **Telavancin** is predicted to increase the risk of ototoxicity when given with **aminoglycosides**. **(Moderate) Theoretical**  
  Also see TABLE 20 p. 1268
- **Vancomycin** increases the risk of nephrotoxicity when given with **aminoglycosides**. Avoid. **(Moderate) Study**  
  Also see TABLE 20 p. 1264  
  Also see TABLE 19 p. 1268

**Aminophylline** → see TABLE 17 p. 1268 (reduced serum potassium)

**F O O D A N D L I F E S T Y L E**  
- Smoking can increase aminophylline clearance and increased doses of aminophylline are therefore
Aminosalicylic acid is predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine. Use with caution or avoid. Avoid. [Severe] Theoretical

Amiodarone  → see antiarrhythmics
Amisulpride  → see TABLE 9 p. 1266 (QT-interval prolongation), TABLE 11 p. 1266 (CNS depressant effects)
→ Amisulpride is predicted to decrease the effects of dopamine receptor antagonists. Avoid. [Moderate] Theoretical  → Also see TABLE 9 p. 1266
→ Amisulpride is predicted to decrease the effects of levodopa. Avoid. [Severe] Theoretical

Amniotriptyline  → see tricyclic antidepressants
Amlodipine  → see calcium channel blockers
Amoxicillin  → see penicillins
Anacin  → see TABLE 15 p. 1267 (myelosuppression)
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with amsacrine. Public Health England advises avoid. [Severe] Theoretical

Aminosalicylic acid is predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine. Use with caution or avoid. Avoid. [Severe] Theoretical

Antidepressants, local  → see TABLE 9 p. 1266 (CNS depressant effects)
bupivacaine - levobupivacaine - mepivacaine - oxybuprocaine - prilocaine - proxymetacaine - ropivacaine - tetracaine

Aminosalicylic acid is predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine. Use with caution or avoid. Avoid. [Severe] Theoretical

Antitussives  → see TABLE 10 p. 1250 (bronchodilator effects)
Antihistamines  → see TABLE 10 p. 1250 (antihistaminic effects)

Amiodarone  → see antiarrhythmics
Amisulpride  → see TABLE 9 p. 1266 (QT-interval prolongation), TABLE 11 p. 1266 (CNS depressant effects)
→ Amisulpride is predicted to decrease the effects of dopamine receptor antagonists. Avoid. [Moderate] Theoretical  → Also see TABLE 9 p. 1266
→ Amisulpride is predicted to decrease the effects of levodopa. Avoid. [Severe] Theoretical

Amniotriptyline  → see tricyclic antidepressants
Amlodipine  → see calcium channel blockers
Amoxicillin  → see penicillins
Anacin  → see TABLE 15 p. 1267 (myelosuppression)
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with amsacrine. Public Health England advises avoid. [Severe] Theoretical

Aminosalicylic acid is predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine. Use with caution or avoid. Avoid. [Severe] Theoretical

Antidepressants, local  → see TABLE 9 p. 1266 (CNS depressant effects)
bupivacaine - levobupivacaine - mepivacaine - oxybuprocaine - prilocaine - proxymetacaine - ropivacaine - tetracaine

Aminosalicylic acid is predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine. Use with caution or avoid. Avoid. [Severe] Theoretical

Antitussives  → see TABLE 10 p. 1250 (bronchodilator effects)
Antihistamines  → see TABLE 10 p. 1250 (antihistaminic effects)

Amiodarone  → see antiarrhythmics
Amisulpride  → see TABLE 9 p. 1266 (QT-interval prolongation), TABLE 11 p. 1266 (CNS depressant effects)
→ Amisulpride is predicted to decrease the effects of dopamine receptor antagonists. Avoid. [Moderate] Theoretical  → Also see TABLE 9 p. 1266
→ Amisulpride is predicted to decrease the effects of levodopa. Avoid. [Severe] Theoretical

Amniotriptyline  → see tricyclic antidepressants
Amlodipine  → see calcium channel blockers
Amoxicillin  → see penicillins
Anacin  → see TABLE 15 p. 1267 (myelosuppression)
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with amsacrine. Public Health England advises avoid. [Severe] Theoretical

Aminosalicylic acid is predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine. Use with caution or avoid. Avoid. [Severe] Theoretical

Antidepressants, local  → see TABLE 9 p. 1266 (CNS depressant effects)
bupivacaine - levobupivacaine - mepivacaine - oxybuprocaine - prilocaine - proxymetacaine - ropivacaine - tetracaine

Aminosalicylic acid is predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine. Use with caution or avoid. Avoid. [Severe] Theoretical

Antitussives  → see TABLE 10 p. 1250 (bronchodilator effects)
Antihistamines  → see TABLE 10 p. 1250 (antihistaminic effects)

Amiodarone  → see antiarrhythmics
Amisulpride  → see TABLE 9 p. 1266 (QT-interval prolongation), TABLE 11 p. 1266 (CNS depressant effects)
→ Amisulpride is predicted to decrease the effects of dopamine receptor antagonists. Avoid. [Moderate] Theoretical  → Also see TABLE 9 p. 1266
→ Amisulpride is predicted to decrease the effects of levodopa. Avoid. [Severe] Theoretical

Amniotriptyline  → see tricyclic antidepressants
Amlodipine  → see calcium channel blockers
Amoxicillin  → see penicillins
Anacin  → see TABLE 15 p. 1267 (myelosuppression)
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with amsacrine. Public Health England advises avoid. [Severe] Theoretical

Aminosalicylic acid is predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine. Use with caution or avoid. Avoid. [Severe] Theoretical

Antidepressants, local  → see TABLE 9 p. 1266 (CNS depressant effects)
bupivacaine - levobupivacaine - mepivacaine - oxybuprocaine - prilocaine - proxymetacaine - ropivacaine - tetracaine

Aminosalicylic acid is predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine. Use with caution or avoid. Avoid. [Severe] Theoretical

Antitussives  → see TABLE 10 p. 1250 (bronchodilator effects)
Antihistamines  → see TABLE 10 p. 1250 (antihistaminic effects)

Amiodarone  → see antiarrhythmics
Amisulpride  → see TABLE 9 p. 1266 (QT-interval prolongation), TABLE 11 p. 1266 (CNS depressant effects)
→ Amisulpride is predicted to decrease the effects of dopamine receptor antagonists. Avoid. [Moderate] Theoretical  → Also see TABLE 9 p. 1266
→ Amisulpride is predicted to decrease the effects of levodopa. Avoid. [Severe] Theoretical

Amniotriptyline  → see tricyclic antidepressants
Amlodipine  → see calcium channel blockers
Amoxicillin  → see penicillins
Anacin  → see TABLE 15 p. 1267 (myelosuppression)
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with amsacrine. Public Health England advises avoid. [Severe] Theoretical

Aminosalicylic acid is predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine. Use with caution or avoid. Avoid. [Severe] Theoretical

Antidepressants, local  → see TABLE 9 p. 1266 (CNS depressant effects)
bupivacaine - levobupivacaine - mepivacaine - oxybuprocaine - prilocaine - proxymetacaine - ropivacaine - tetracaine

Aminosalicylic acid is predicted to increase the risk of methaemoglobinaemia when given with topical prilocaine. Use with caution or avoid. Avoid. [Severe] Theoretical

Antitussives  → see TABLE 10 p. 1250 (bronchodilator effects)
Antihistamines  → see TABLE 10 p. 1250 (antihistaminic effects)
Anakinra (continued)

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with anakinra. Public Health England advises avoid. [Severe] Theoretical

Angiotensin-II receptor antagonists  
> see TABLE 7 p. 1265 (first-dose hypotension), TABLE 8 p. 1265 (hypotension), TABLE 16 p. 1268 (increased serum potassium)

Azilsartan | candesartan | eprosartan | irbesartan | losartan | olmesartan | telmisartan | valsartan

Angiotensin-II receptor antagonists increase the risk of renal impairment when given with aliskiren. Use with caution or avoid aliskiren in selected patients. p. 17. [Severe] Study  
Also see TABLE 8 p. 1265  
Also see TABLE 16 p. 1268

Angiotensin-II receptor antagonists potentially increase the concentration of lithium. Monitor concentration and adjust dose. [Severe] Anecdotal

Antacids
aluminium hydroxide · magnesium carbonate · magnesium trisilicate

Separation of administration  
Antacids should preferably not be taken at the same time as other drugs since they might impair absorption. Antacids might damage enteric coatings designed to prevent dissolution in the stomach.

Antacids are predicted to decrease the absorption of alkylation agents (etramustine). Avoid. [Moderate] Study

Antacids decrease the absorption of antiemetics (gabapentin). Gabapentin should be taken 2 hours after antacids. [Moderate] Study

Antacids decrease the absorption of antiinflammatory agents (azelaic acid, aspirin (acetylsalicylic acid), ibuprofen, naproxen, ketoprofen). Separate administration by at least 2 hours. [Moderate] Study

Antacids decrease the absorption of antivirals (protease inhibitors, nucleoside reverse transcriptase inhibitors, nucleotide reverse transcriptase inhibitors). Separate administration by at least 4 hours. [Moderate] Study

Antacids are predicted to decrease the absorption of antimalarials (chloroquine). Separate administration by at least 2 hours. [Moderate] Study

Antacids decrease the absorption of aspirin (high-dose). [Moderate] Study

Antacids decrease the absorption of biphosphonates (alendronic acid, risedronate). Separate administration by at least 6 hours before or 1 hour after biphosphonate. [Moderate] Theoretical

Antacids decrease the absorption of biphosphonates (salicylate). Avoid antacids for at least 6 hours before or 1 hour after biphosphonate. [Moderate] Theoretical

Antacids decrease the absorption of biphosphonates (sodium clodronate). Avoid antacids for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study

Antacids are predicted to decrease the absorption of bosutinib. Bosutinib should be taken at least 12 hours before antacids. [Moderate] Theoretical

Antacids are predicted to decrease the absorption of ceritinib. Separate administration by 2 hours. [Moderate] Theoretical

Antacids are predicted to decrease the absorption of chenodeoxycholic acid. Separate administration by 5 hours. [Mild] Theoretical

Antacids are predicted to decrease the absorption of probenecid. Separate administration by 2 hours. [Moderate] Theoretical

Antacids decrease the absorption of corticosteroids (deflazacort). Separate administration by 2 hours. [Moderate] Theoretical

Antacids decrease the absorption of corticosteroids (dexamethasone). [Moderate] Study

Antacids are predicted to decrease the absorption of dabrafenib. Avoid. [Severe] Theoretical

Antacids decrease the absorption of dasatinib. Separate administration by at least 2 hours. [Moderate] Study

Aluminium hydroxide is predicted to decrease the absorption of deferiprone. Avoid. [Moderate] Theoretical

Antacids decrease the absorption of digoxin. Separate administration by 2 hours. [Mild] Study

Antacids are predicted to decrease the absorption of dipyridamole (immediate release tablets). [Moderate] Theoretical

Antacids moderately decrease the exposure to dolutegravir. Dolutegravir should be taken 2 hours before or 6 hours after antacids. [Moderate] Study

Antacids decrease the absorption of eltorbopag. Eltorbopag should be taken 2 hours before or 4 hours after antacids. [Severe] Study

Antacids moderately decrease the exposure to elvitegravir. Separate administration by at least 4 hours. [Moderate] Study

Antacins increase the risk of blocked enteral or nasogastric tubes when given with enteral feeds. [Moderate] Study

Antacids are predicted to decrease the absorption of erlotinib. Antacids should be taken 4 hours before or 2 hours after erlotinib. [Moderate] Theoretical

Antacids slightly to moderately decrease the exposure to fribates (gemfibrozil). [Mild] Study

Antacids are predicted to slightly decrease the exposure to gefitinib. [Moderate] Theoretical

Antacids are predicted to decrease the absorption of HIV-protease inhibitors (atazanavir). Atazanavir should be taken 2 hours before or 1 hour after antacids. [Severe] Theoretical

Antacids are predicted to decrease the absorption of HIV-protease inhibitors (tipranavir). Separate administration by 2 hours. [Moderate] Study

Antacids decrease the absorption of hydroxychloroquine. Separate administration by at least 4 hours. [Moderate] Study

Antacids decrease the absorption of iron (oral). Iron (oral) should be taken 1 hour before or 2 hours after antacids. [Moderate] Study

Aluminium hydroxide is predicted to decrease the exposure to iron chelators (deferasirox). Avoid. [Moderate] Theoretical

Antacids are predicted to decrease the absorption of lapatinib. Avoid. [Moderate] Theoretical

Antacids are predicted to decrease the exposure to ledipasvir. Separate administration by 4 hours. [Mild] Theoretical

Antacids are predicted to decrease the absorption of levothyroxine. Separate administration by at least 4 hours. [Mild] Anecdotal

Antacids decrease the exposure to mycophenolate. [Mild] Study

Antacids are predicted to decrease the absorption of nilotinib. Separate administration by at least 2 hours. [Mild] Theoretical

Magnesium trisilicate decreases the absorption of nitrofurantoin. [Mild] Study

Antacids are predicted to decrease the absorption of pazopanib. Pazopanib should be taken 1 hour before or 2 hours after antacids. [Mild] Theoretical

Antacids decrease the absorption of penicillamine. Separate administration by 2 hours. [Mild] Study

Antacids decrease the absorption of phenothiazines. [Mild] Anecdotal

Antacids increase the risk of metabolic alkalosis when given with polystyrene sulfonate. [Severe] Anecdotal

Antacids decrease the absorption of quinolones. Quinolones should be taken 2 hours before or 4 hours after antacids. [Mild] Study

Antacids slightly decrease the exposure to raltegravir. Avoid. [Mild] Study

Antacids decrease the absorption of rifampicin. Rifampicin should be taken 1 hour before antacids. [Mild] Study

Antacids are predicted to decrease the exposure to sunitinib. Sunitinib should be taken 2 hours before or 4 hours after sunitinib. [Severe] Theoretical

Antacids slightly decrease the exposure to riociguat. Antacids should be taken 2 hours before or 1 hour after riociguat. [Mild] Study

Downloaded from www.medicalbr.com
Antacids moderately decrease the absorption of statins (rosuvastatin). Separate administration by 2 hours. [Moderate] Study

Antacids decrease the absorption of strontium ranelate. Separate administration by 2 hours. [Moderate] Study

Antacids increase the absorption of tetracyclines. Separate administration by 2 to 3 hours. [Moderate] Study

Antacids are predicted to decrease the absorption of ursodeoxycholic acid. Separate administration by 2 hours. [Moderate] Theoretical

Antacids are predicted to decrease the concentration of velpatasvir. Separate administration by 4 hours. [Moderate] Theoretical

Anthracyclines → see TABLE 15 p. 1267 (myelosuppression), TABLE 5 p. 1264 (thromboembolism)

daunorubicin · doxorubicin · epirubicin · idarubicin · mitoxantrone · paxitane

GENERAL INFORMATION Caution is necessary with concurrent use of cardiototoxic drugs, or drugs that reduce cardiac contractility.

Calcium channel blockers (verapamil) moderately increase the exposure to doxorubicin. [Moderate] Study

Ciclosporin increases the concentration of anthracyclines (daunorubicin, doxorubicin, epirubicin, idarubicin, mitoxantrone). [Severe] Study

H₂ receptor antagonists (cimetidine) slightly increase the exposure to epirubicin. Avoid. [Moderate] Study

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with anthracyclines. Public Health England advises avoid. [Severe] Theoretical

Anthracyclines are predicted to increase the risk of cardiotoxicity when given with monoclonal antibodies (trastuzumab, trastuzumab emtansine). Avoid. [Severe] Theoretical

Anthracyclines are predicted to increase the risk of cardiotoxicity when given with aldosterone antagonists (trastuzumab, trastuzumab emtansine). Avoid. [Severe] Theoretical

Adenosine · amiodarone · disopyramide · dronedarone · flecainide · lidocaine · propafenone

Amiodarone has a long half-life; there is potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped.

Since systemic absorption can follow topical application of lidocaine, the possibility of interactions should be borne in mind.

Abiraterone is predicted to increase the exposure to flecainide. [Severe] Theoretical

Antiarhythmics (amiodarone, dronedarone) are predicted to increase the exposure to abiraterone. Separate administration by 12 hours. [Moderate] Study

Amiodarone is predicted to decrease the effects of agalsidase. Avoid. [Moderate] Theoretical

Amiodarone is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 185. [Severe] Theoretical

Dronedarone is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 185. [Severe] Study

Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to aliskiren. [Severe] Study

Dronedarone is predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical

Dronedarone is predicted to increase the exposure to alprazolam. [Severe] Study

Aminophylline is predicted to decrease the efficacy of adenosine. Separate administration by 24 hours. [Mild] Theoretical

Anaesthetics, local are predicted to increase the risk of cardiodepression when given with antiarrhythmics. [Severe] Theoretical → Also see TABLE 11 p. 1266

Antiarrhythmics (propafenone) are predicted to increase the risk of cardiodepression when given with antiarrhythmics (amiodarone). Monitor and adjust dose. [Severe] Theoretical

Antiarrhythmics (amiodarone) increase the concentration of antiarrhythmics (flecainide). Adjust flecainide dose and monitor side effects. [Severe] Study → Also see TABLE 6 p. 1265 → Also see TABLE 9 p. 1266

Antiarrhythmics (propafenone) are predicted to increase the exposure to antiarrhythmics (flecainide). [Severe] Theoretical

Antiarrhythmics (propafenone) are predicted to increase the risk of cardiodepression when given with antiarrhythmics (lidocaine). [Moderate] Study

Antiarrhythmics (dronedarone) are predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. [Moderate] Study

Amiodarone increases the risk of bradycardia when given with anticholinesterases, centrally acting. [Moderate] Anecdotal → Also see TABLE 6 p. 1265

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the efficacy of propafenone. [Moderate] Study

Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to lidocaine. [Severe] Anecdotal

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. [Severe] Study

Amiodarone is predicted to slightly increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. [Severe] Study → Also see TABLE 12 p. 1267

Antifungals, azoles (fluconazole) are predicted to increase the exposure to disopyramide. Monitor and adjust dose. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to disopyramide. Avoid. [Severe] Study → Also see TABLE 9 p. 1266

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) very markedly increase the exposure to disopyramide. Avoid. [Severe] Study → Also see TABLE 9 p. 1266

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to propafenone. Monitor and adjust dose. [Moderate] Study

Antifungals, azoles (miconazole) are predicted to increase the exposure to disopyramide. Use with caution and adjust dose. [Severe] Theoretical

Antifungals, azoles (posaconazole) are predicted to increase the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. [Severe] Theoretical

Dronedarone is predicted to increase the exposure to antifungals, azoles (isavuconazole). [Severe] Theoretical

Dronedarone is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine, mizolastine). [Severe] Theoretical

Dronedarone is predicted to increase the concentration of antimalarials (piperazine). [Severe] Theoretical

Dronedarone is predicted to increase the exposure to apixaban. [Moderate] Theoretical

Aprepitant increases the exposure to dronedarone. [Severe] Theoretical

Aprepitant is predicted to increase the exposure to propafenone. Monitor and adjust dose. [Moderate] Study

Dronedarone is predicted to increase the exposure to apixaban. [Moderate] Theoretical

Dronedarone is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 1266

Antiarrhythmics (amiodarone, disopyramide, dronedarone, flecainide, lidocaine) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, non-selective. Use with caution or avoid. [Severe] Study → Also see TABLE 6 p. 1265 → Also see TABLE 9 p. 1266

Propafenone is predicted to increase the risk of cardiovascular
Antiarrhythmics (continued) side-effects when given with beta blockers, non-selective (carotolol, labetalol, levobunolol, nadolol, oxprenolol, pindolol, sotalol). Use with caution or avoid. [Severe] Study

- **Propafenone** is predicted to increase the exposure to beta blockers, non-selective (carvedilol). [Moderate] Theoretical
- **Propafenone** is predicted to increase the exposure to beta blockers, selective (metoprolol). [Moderate] Theoretical
- **Propafenone** is predicted to increase the exposure to beta blockers, selective (nebivolol) and beta blockers, selective (nebivolol) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, selective. Use with caution or avoid. [Severe] Study

- **Propafenone** is predicted to increase the exposure to beta blockers, non-selective (timolol) and beta blockers, non-selective (timolol) are predicted to increase the risk of cardiodepression when given with propafenone. [Severe] Anecdotal
- **Antiarrhythmics** (amiodarone, disopyramide, dronedarone, flecainide, lidocaine) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, selective. Use with caution or avoid. [Severe] Study

- **Propafenone** is predicted to increase the exposure to beta blockers, non-selective (timolol) and beta blockers, non-selective (timolol) are predicted to increase the risk of cardiodepression when given with propafenone. [Severe] Study

- **Propafenone** is predicted to increase the exposure to beta blockers, selective (metoprolol). [Moderate] Theoretical
- **Propafenone** is predicted to increase the exposure to beta blockers, selective (nebivolol) and beta blockers, selective (nebivolol) are predicted to increase the risk of cardiodepression when given with propafenone. Avoid. [Severe] Theoretical
  - **Bosantan** is predicted to decrease the exposure to dronedarone. [Severe] Theoretical
- **Dronedarone** is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical
- **Bupropion** is predicted to increase the exposure to flecainide. [Severe] Theoretical
- **Bupropion** is predicted to increase the exposure to propafenone. Monitor and adjust dose. [Moderate] Study
- **Dronedarone** is predicted to increase the exposure to bupropione. Use with caution and adjust dose. [Moderate] Study
- **Dronedarone** is predicted to increase the exposure to cabozantinib. [Moderate] Theoretical
- **Caffeine citrate** decreases the efficacy of adenosine. Separate administration by 24 hours. [Mild] Study
- **Calcium channel blockers (diltiazem, verapamil)** increase the exposure to dronedarone and dronedarone increases the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Study
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to propafenone. Monitor and adjust dose. [Moderate] Study
- **Calcium channel blockers (verapamil)** increase the risk of cardiodepression when given with flecainide. [Severe] Anecdotal
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to propafenone. [Moderate] Study
- **Dronedarone** is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- **Amiodarone** is predicted to increase the risk of cardiodepression when given with calcium channel blockers (verapamil). [Severe] Theoretical
- **Disopyramide** is predicted to increase the risk of cardiodepression when given with calcium channel blockers (verapamil). [Severe] Theoretical
- **Antiarrhythmics** (amiodarone, dronedarone) are predicted to increase the exposure to ceritinib. [Moderate] Theoretical
- **Amiodarone** increases the concentration of cilosporin. Monitor cilosporin concentration and adjust dose. [Severe] Study
- **Dronedarone** increases the concentration of cilosporin. [Severe] Study
- **Ciclosporin** increases the exposure to dronedarone. Avoid. [Severe] Theoretical
  - **Ciclosporin** is predicted to increase the exposure to flecainide. [Severe] Theoretical
  - **Ciclosporin** is predicted to increase the exposure to propafenone. Monitor and adjust dose. [Moderate] Study
  - **Cobicistat** very markedly increases the exposure to dronedarone. Avoid. [Severe] Study
  - **Cobicistat** is predicted to increase the exposure to propafenone. Monitor and adjust dose. [Severe] Study
  - **Dronedarone** is predicted to increase the exposure to cobimetinib. [Severe] Theoretical
  - **Dronedarone** is predicted to increase the exposure to colchicine. Adjust colchicine dose, p. 1020. [Severe] Study
  - **Dronedarone** is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. [Moderate] Study
  - **Amiodarone** increases the antiocoagulant effect of coumarins. Monitor INR and adjust dose. [Moderate] Study
  - **Dronedarone** is predicted to slightly increase the exposure to darifenacin. [Moderate] Study
  - **Darifenacin** is predicted to increase the concentration of flecainide. [Moderate] Theoretical
  - **Dronedarone** is predicted to increase the exposure to dasatinib. [Severe] Study
  - **Antiarrhythmics** (amiodarone, dronedarone) are predicted to moderately increase the exposure to digoxin. Monitor and adjust digoxin dose p. 106. [Severe] Study
  - **Propafenone** increases the concentration of digoxin. Monitor and adjust dose. [Severe] Study
  - **Daclatasvir** is predicted to increase the risk of severe bradycardia or heart block when given with amiodarone. Refer to specialist literature. [Severe] Anecdotal
  - **Dronedarone** is predicted to slightly increase the exposure to darifenacin. [Moderate] Study
  - **Darifenacin** is predicted to increase the concentration of flecainide. [Moderate] Theoretical
  - **Dronedarone** is predicted to increase the exposure to dabigatran. Adjust dabigatran dose, p. 131. [Moderate] Study
  - **Dronedarone** slightly increases the exposure to dabigatran. Avoid. [Severe] Study
  - **Dapagliflozin** increases the exposure to adenosine. Avoid. [Moderate] Study
  - **Dronedarone** increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
  - **Dronedarone** is predicted to increase the exposure to dopamine receptor agonists ( bromocriptine, cabergoline). [Severe] Theoretical
  - **Duloxetine** is predicted to increase the exposure to flecainide. [Severe] Theoretical
  - **Dronedarone** is predicted to moderately increase the exposure to dutasteride. [Mild] Study
  - **Amiodarone** slightly increases the exposure to edoxaban. [Severe] Study
  - **Dronedarone** slightly increases the exposure to edoxaban. Adjust edoxaban dose, p. 122. [Severe] Study
  - **Efavirenz** is predicted to decrease the exposure to dronedarone. [Severe] Theoretical
  - **Enalaprilat** is predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. [Severe] Study
  - **Enalaprilat** is predicted to decrease the efficacy of propafenone. [Moderate] Study
  - **Dronedarone** is predicted to increase the exposure to ergometrine. [Severe] Theoretical
  - **Dronedarone** is predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical
  - **Antiarrhythmics** (amiodarone, dronedarone) are predicted to increase the exposure to ergotamine. [Severe] Theoretical
  - **Antiarrhythmics** (amiodarone, dronedarone) are predicted to increase the exposure to everolimus. Avoid or adjust dose. [Moderate] Study
  - **Dronedarone** is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment, p. 732. [Mild] Study
  - **Antiarrhythmics** (amiodarone, dronedarone) are predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study
HIV-protease inhibitors are predicted to increase the exposure to idelalisib. {Moderate} Theoretical

Grapefruit juice increases the exposure to amiodarone. Avoid. {Moderate} Study

Grapefruit juice moderately increases the exposure to dronedarone. Avoid. {Severe} Study

Grapefruit juice increases the exposure to propafenone. Monitor and adjust dose. {Moderate} Study

Dronedarone is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 335. {Moderate} Theoretical

H₂ receptor antagonists (cimetidine) increase the exposure to amiodarone. {Moderate} Study

H₂ receptor antagonists (cimetidine) slightly increase the exposure to flecainide. Monitor and adjust dose. {Severe} Study

H₂ receptor antagonists (cimetidine) increase the exposure to lidocaine. Monitor and adjust dose. {Moderate} Study

H₂ receptor antagonists (cimetidine) are predicted to increase the exposure to propafenone. Monitor and adjust dose. {Moderate} Theoretical

HIV-protease inhibitors are predicted to increase the exposure to amiodarone. Avoid. {Severe} Theoretical

HIV-protease inhibitors are predicted to increase the exposure to disopyramide. {Severe} Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) very markedly increase the exposure to dronedarone. Avoid. {Severe} Study

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to propafenone. Monitor and adjust dose. {Moderate} Study

HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to flecainide. {Severe} Theoretical

Dronedarone is predicted to increase the exposure to ibritunib. Avoid or adjust ibritunib dose, p. 902. {Severe} Theoretical

Idelalisib very markedly increases the exposure to dronedarone. Avoid. {Severe} Study

Idelalisib is predicted to increase the exposure to propafenone. Monitor and adjust dose. {Severe} Study

Idelalisib is predicted to increase the exposure to dronedarone. {Severe} Theoretical

Idelalisib is predicted to increase the exposure to propafenone. {Severe} Study

Dronedarone is predicted to increase the exposure to propafenone. Monitor and adjust dose. {Moderate} Study

Dronedarone is predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 205. {Severe} Theoretical

Dronedarone is predicted to increase the exposure to ivacaftor. Adjust ivacaftor dose, p. 281. {Severe} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Dronedarone is predicted to increase the exposure to lapatinib. {Moderate} Study

Macrolides (clarithromycin) are predicted to increase the exposure to propafenone. Monitor and adjust dose. {Severe} Study

Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to lidocaine. {Moderate} Theoretical

Macrolides (erythromycin) are predicted to moderately increase the exposure to dronedarone. Avoid. {Severe} Theoretical

Macrolides (erythromycin) are predicted to increase the exposure to propafenone. Monitor and adjust dose. {Moderate} Study

Dronedarone is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. {Severe} Study

Mirabegron is predicted to increase the exposure to flecainide. {Severe} Theoretical

Dronedarone increases the risk of neutropenia when given with monoclonal antibodies (brentuximab vedotin). Monitor and adjust dose. {Severe} Theoretical

Dronedarone is predicted to increase the exposure to nabixegol. Adjust nabixegol dose and monitor side effects, p. 63. {Moderate} Study

Netupitant is predicted to increase the exposure to propafenone. Monitor and adjust dose. {Moderate} Study

Nevirapine is predicted to decrease the exposure to dronedarone. {Severe} Theoretical

Dronedarone is predicted to increase the exposure to nilotinib. {Moderate} Theoretical

Nilotinib is predicted to increase the exposure to propafenone. Monitor and adjust dose. {Moderate} Study

Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to nintedanib. {Moderate} Study

NSAIDs, (celecoxib) are predicted to increase the exposure to antiarrhythmics (flecainide, propafenone). Monitor and adjust dose. {Moderate} Theoretical

Dronedarone is predicted to increase the exposure to oloparib. Avoid or adjust oloparib dose, p. 919. {Moderate} Theoretical

Dronedarone is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. {Moderate} Study

Propafenone is predicted to decrease the efficacy of opioids (tramadol). {Moderate} Study

Dronedarone is predicted to increase the exposure to oxybutynin. {Mild} Theoretical

Dronedarone is predicted to increase the exposure to pazopanib. {Moderate} Theoretical

Propafenone is predicted to increase the anticoagulant effect of phenindione. Monitor and adjust dose. {Moderate} Theoretical

Dronedarone is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 765. {Moderate} Theoretical

Dronedarone is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor and adjust sildenafil dose, p. 766. {Moderate} Study

Dronedarone is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). {Severe} Theoretical

Dronedarone is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. {Severe} Theoretical

Dronedarone is predicted to increase the exposure to pimozide. Avoid. {Severe} Theoretical

Propafenone is predicted to increase the exposure to pitolisant. Use with caution and adjust dose. {Moderate} Study

Dronedarone is predicted to increase the exposure to quetiapine. Avoid. {Moderate} Study

Quinolones (ciprofloxacin) slightly increase the exposure to lidocaine. {Mild} Study

Dronedarone is predicted to increase the exposure to ranolazine. {Severe} Study

Table 9...
Antiarrhythmics (continued)

- **Amiodarone** is predicted to increase the exposure to retinoids (all-transretinoin). Adjust all-transretinoin dose, p. 1157. [Moderate] Theoretical
- **Rifampicin** is predicted to decrease the exposure to antiarrhythmics (disopyramide, dronedarone). Avoid. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the efficacy of propafenone. [Moderate] Study
- **Dronedarone** is predicted to increase the exposure to rivaroxaban. Avoid. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to rufoxitinib. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to saxagliptin. [Mild] Study
- **Simeprevir** is predicted to increase the concentration of amiodarone. Refer to specialist literature. [Severe] Anecdotal
- **Dronedarone** is predicted to increase the concentration of simeprevir. Avoid. [Severe] Study
- **Amiodarone** is predicted to increase the concentration of sirolimus. [Severe] Anecdotal
- **Dronedarone** increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- **Sofosbuvir** is predicted to increase the risk of severe bradycardia or heart block when given with amiodarone. Refer to specialist literature. [Severe] Anecdotal
- **SSRIs:** fluoxetine, fluvoxamine, paroxetine) are predicted to increase the exposure to propafenone. Monitor and adjust dose. [Moderate] Study
- **SSRIs:** fluoxetine, paroxetine) are predicted to increase the exposure to flecainide. [Severe] Theoretical
- **Dronedarone** is predicted to increase the exposure to SSRIs (dapofoxetine). Adjust dapofoxetine dose, p. 773. [Moderate] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to flecainide. Avoid. [Severe] Theoretical
- **Amiodarone** is predicted to increase the risk of rhabdomyolysis when given with statins (atorvastatin). Monitor and adjust dose. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. [Severe] Theoretical
- **Amiodarone** is predicted to increase the exposure to statins (fluvastatin). [Severe] Theoretical
- **Dronedarone** slightly increases the exposure to statins (rosuvastatin). Adjust dose. [Severe] Study
- **Amiodarone** increases the risk of rhabdomyolysis when given with statins (simvastatin). Adjust simvastatin dose, p. 198. [Severe] Study
- **Dronedarone** is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 196. [Severe] Study
- **Amiodarone** is predicted to increase the exposure to sulfonylureas. Use with caution and adjust dose. [Moderate] Study
- **Dronedarone** is predicted to increase the exposure to sunitinib. [Moderate] Theoretical → Also see TABLE 9 p. 1266
- **Lidocaine** is predicted to increase the effects of suxamethonium. [Moderate] Study
- **Amiodarone** is predicted to increase the concentration of tacrolimus. [Severe] Anecdotal
- **Dronedarone** is predicted to increase the concentration of tacrolimus. [Severe] Study
- **Dronedarone** is predicted to increase the exposure to taxanes (cabazitaxel). [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to taxanes (paclitaxel). [Severe] Theoretical
- **Dronedarone** is predicted to increase the concentration of temsirolimus. [Mild] Study
- **Terbinafine** is predicted to increase the exposure to flecainide. [Severe] Theoretical
- **Terbinafine** is predicted to increase the exposure to propafenone. Monitor and adjust dose. [Moderate] Study
- **Theophylline** decreases the efficacy of adenosine. Separate administration by 24 hours. [Mild] Study
- **Amiodarone** is predicted to increase the exposure to ticagrelor. Use with caution or avoid. [Severe] Study
- **Dronedarone** is predicted to increase the exposure to tofroterodine. [Mild] Theoretical → Also see TABLE 9 p. 1266
- **Dronedarone** is predicted to increase the exposure to tolvaptan. Adjust dose. [Moderate] Theoretical
- **Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to topotecan. [Severe] Study
- **Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the concentration of trametinib. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the exposure to trazodone. [Moderate] Theoretical
- **Dronedarone** is predicted to increase the risk of torsade de pointes when given with tricyclic antidepressants. Avoid. [Severe] Theoretical → Also see TABLE 9 p. 1266
- **Propafenone** is predicted to increase the concentration of tricyclic antidepressants. [Moderate] Theoretical → Also see TABLE 10 p. 1266
- **Dronedarone** is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study
- **Amiodarone** is predicted to increase the concentration of velpatasvir. Avoid or monitor. [Moderate] Theoretical
- **Amiodarone** is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. [Severe] Theoretical
- **Dronedarone** is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose, p. 919. [Severe] Study
- **Dronedarone** is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical → Also see TABLE 9 p. 1266
- **Dronedarone** is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study

### Anticholinesterases, centrally acting → Also see TABLE 6 p. 1265

- DONEPEZIL - GALANTAMINE - RIVASTIGMINE

- **Antiarrhythmics (amiodarone)** increase the risk of bradycardia when given with anticholinesterases, centrally acting. [Moderate] Anecdotal → Also see TABLE 6 p. 1265
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to donepezil. [Mild] Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- **Anticholinesterases, centrally acting** are predicted to increase the risk of bradycardia when given with beta blockers, non-selective. [Moderate] Anecdotal → Also see TABLE 6 p. 1265
- **Anticholinesterases, centrally acting** are predicted to increase the risk of bradycardia when given with beta blockers, selective. [Moderate] Anecdotal → Also see TABLE 6 p. 1265
- **Bupropion** is predicted to increase the exposure to donepezil. [Moderate] Theoretical
- **Bupropion** is predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- **Calcium channel blockers (diltiazem, verapamil)** increase the risk of bradycardia when given with anticholinesterases, centrally acting. [Moderate] Anecdotal → Also see TABLE 6 p. 1265
- **Ciclosporin** is predicted to increase the exposure to donepezil. [Moderate] Theoretical
- **Ciclosporin** is predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- **Enalaprilat** is predicted to decrease the exposure to donepezil. [Mild] Study
- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- **Idelalisib** is predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study
- **Macrolides (clarithromycin)** are predicted to increase the exposure to galantamine. Monitor and adjust dose. [Moderate] Study

Anticholinesterases, centrally acting – Antiepileptics

Acetazolamide

▶ Antiepileptics

Rifampicin is predicted to decrease the exposure to donepezil.

(Mild) Study

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to donepezil.

(Theoretical) Study

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to galantamine. Monitor and adjust dose.

(Moderate) Study

Anticholinesterases, centrally acting increase the effects of suxamethonium.

(Moderate) Theoretical

Terbinafine is predicted to increase the exposure to donepezil.

(Theoretical) Study

Terbinafine is predicted to increase the exposure to galantamine. Monitor and adjust dose.

(Moderate) Study

Antiepileptics → see TABLE 1 p. 1264 (hepatotoxicity), TABLE 18 p. 1268 (hyponatraemia), TABLE 15 p. 1267 (myelosuppression), TABLE 12 p. 1267 (peripheral neuropathy), TABLE 11 p. 1266 (CNS depressant effects)

brivaracetam • carbamazepine • eslicarbazepine a • ethosuximide • fosphenytoin • gabapentin • lacosamide • lamotrigine • levetiracetam • oxcarbazepine • paraldehyde • perampanel • phenytoin • pregabalin • primidone • retigabine • rufinamide • stiripentol • tiagabine • topiramate • valproate • vigabatrin • zonisamide

FOOD AND LIFESTYLE

Increased risk of blurred vision when retigabine taken with alcohol.

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to abacavir.

(Moderate) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to abiraterone. Avoid.

(Severe) Theoretical

Acetazolamide potentially increases the risk of overheating and dehydration when given with zonisamide. Avoid in children.

(Severe) Theoretical

Carbamazepine is predicted to decrease the exposure to aminophylline.

(Moderate) Study

Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to agomelatine.

(Moderate) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of albendazole.

(Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to aldosterone antagonists (eplerenone). Avoid.

(Moderate) Theoretical → Also see TABLE 18 p. 1268

Carbamazepine decreases the exposure to aliskiren.

(Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to alprazolam. Adjust alprazolam dose.

(Moderate) Theoretical → Also see TABLE 11 p. 1266

Fosphenytoin is predicted to decrease the exposure to aminophylline. Adjust dose.

(Moderate) Study

Phenobarbital is predicted to decrease the exposure to aminophylline. Adjust dose.

(Moderate) Theoretical

Phenytoin decreases the exposure to aminophylline. Adjust dose.

(Moderate) Study

Primidone is predicted to increase the clearance of aminophylline. Adjust dose.

(Moderate) Theoretical

Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of methaemoglobinaemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid.

(Severe) Theoretical → Also see TABLE 11 p. 1266

Antacids decrease the absorption of gabapentin. Gabapentin should be taken 2 hours after antacids.

(Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antihypertensives (disopyramide, droxidopa). Avoid.

(Severe) Study

Antihypertensives (amiodarone) are predicted to slightly increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose.

(Severe) Study → Also see TABLE 12 p. 1267

Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to antihypertensives (lidocaine). Severe

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the efficacy of antihypertensives (propafenone). Moderate Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to anticholinesterases, centrally acting (donepezil).

(Mild) Study

Antiepileptics (carbamazepine) decrease the concentration of antiepileptics (brivaracetam).

(Moderate) Study

Antiepileptics (fosphenytoin, phenytoin) decrease the concentration of antiepileptics (brivaracetam).

(Moderate) Study

Antiepileptics (lamotrigine) potentially increase the concentration of antiepileptics (carbamazepine) and antiepileptics (carbamazepine) decrease the concentration of antiepileptics (lamotrigine). Adjust lamotrigine dose and monitor carbamazepine concentration, p. 303.

(Moderate) Study

Antiepileptics (phenobarbital) affect the concentration of antiepileptics (carbamazepine) and antiepileptics (carbamazepine) increase the concentration of antiepileptics (phenobarbital). Adjust dose.

(Moderate) Study

Antiepileptics (stiripentol) increase the concentration of antiepileptics (carbamazepine).

(Severe) Study

Antiepileptics (topiramate) increase the risk of carbamazepine toxicity when given with antiepileptics (carbamazepine).

(Moderate) Study

Antiepileptics (carbamazepine) slightly decrease the exposure to antiepileptics (eslicarbazepine, oxcarbazepine).

(Monitor and adjust dose.

(Moderate) Study

Antiepileptics (oxcarbazepine) are predicted to increase the concentration of antiepileptics (fosphenytoin). Monitor concentration and adjust dose.

(Moderate) Study

Antiepileptics (carbamazepine) affect the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) decrease the concentration of antiepileptics (carbamazepine). Monitor and adjust dose.

(Severe) Study

Antiepileptics (eslicarbazepine) increase the exposure to antiepileptics (fosphenytoin, phenytoin) and antiepileptics (carbamazepine) decrease the exposure to antiepileptics (eslicarbazepine).

(Monitor and adjust dose.

(Moderate) Study

Antiepileptics (stiripentol) are predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin).

(Severe) Study

Antiepileptics (valproate) affect the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (carbamazepine) decrease the concentration of antiepileptics (valproate).

(Severe) Study

Antiepileptics (vagabatrin) decrease the concentration of antiepileptics (fosphenytoin, phenytoin).

(Mild) Study

Antiepileptics (fosphenytoin) decrease the concentration of antiepileptics (lamotrigine). Monitor and adjust lamotrigine dose, p. 303.

(Moderate) Study

Antiepileptics (phenobarbital, phenytoin, primidone) decrease the concentration of antiepileptics (lamotrigine). Monitor and adjust lamotrigine dose, p. 303.

(Moderate) Study → Also see TABLE 11 p. 1266

Antiepileptics (valproate) increase the exposure to antiepileptics (lamotrigine). Adjust lamotrigine dose and monitor rash, p. 303.

(Severe) Study

Antiepileptics (lamotrigine) are predicted to increase the concentration of antiepileptics (oxcarbazepine) and antiepileptics (oxcarbazepine) are predicted to decrease the concentration of antiepileptics (lamotrigine). Monitor side effects and adjust dose.

(Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin) are predicted to decrease the exposure to antiepileptics (perampanel). Monitor and adjust dose.

(Moderate) Study

Antiepileptics (oxcarbazepine) decrease the concentration of antiepileptics (perampanel) and antiepileptics (perampanel)
Antiepileptics (continued)

increase the concentration of antiepileptics (oxcarbazepine). Monitor and adjust dose. [Moderate] Study

- Antiepileptics (phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antiepileptics (perampanel). Monitor and adjust dose. [Moderate] Study  Also see TABLE 11 p. 1266

- Antiepileptics (phenytoin) increase the concentration of antiepileptics (phenobarbital) and antiepileptics (phenobarbital) affect the concentration of antiepileptics (phenytoin). [Moderate] Study

- Antiepileptics (fosphenytoin) increase the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) affect the concentration of antiepileptics (phenytoin). [Moderate] Study

- Antiepileptics (triamterene) are predicted to increase the concentration of antiepileptics (phenobarbital, primidone). [Severe] Theoretical

- Antiepileptics (oxcarbazepine) are predicted to increase the concentration of antiepileptics (phenytoin). Monitor concentration and adjust dose. [Moderate] Study

- Antiepileptics (carbamazepine) potentially decrease the concentration of antiepileptics (primidone) and antiepileptics (primidone) potentially decrease the concentration of antiepileptics (carbamazepine). Adjust dose. [Moderate] Anecdotal

- Antiepileptics (phenytoin) increase the concentration of antiepileptics (primidone) and antiepileptics (primidone) affect the concentration of antiepileptics (phenytoin). [Moderate] Study

- Antiepileptics (valproate) affect the concentration of antiepileptics (primidone). Monitor and adjust dose. [Severe] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenytoin) decrease the exposure to antiepileptics (retigabine). [Moderate] Study

- Antiepileptics (valproate) increase the exposure to antiepileptics (rufinamide). Adjust rufinamide dose, p. 311. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenytoin, phenobarbital, primidone) decrease the exposure to antiepileptics (tiagabine). Monitor and adjust tiagabine dose, p. 314. [Moderate] Study

- Antiepileptics (fosphenytoin, phenytoin) decrease the concentration of antiepileptics (topiramate) and antiepileptics (topiramate) increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. [Moderate] Study

- Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of antiepileptics (topiramate). [Mild] Study

- Antiepileptics (phenobarbital) decrease the concentration of antiepileptics (valproate) and antiepileptics (valproate) increase the concentration of antiepileptics (phenobarbital). Monitor and adjust dose. [Moderate] Study

- Antiepileptics (topiramate) increase the risk of toxicity when given with antiepileptics (valproate). [Severe] Study

- Antiepileptics (carbamazepine) slightly to moderately decrease the concentration of antiepileptics (zonisamide) and antiepileptics (zonisamide) affect the concentration of antiepileptics (carbamazepine). Monitor and adjust dose. [Moderate] Study

- Antiepileptics (fosphenytoin, phenytoin) slightly to moderately decrease the concentration of antiepileptics (zonisamide). Monitor and adjust dose. [Moderate] Study

- Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of antiepileptics (zonisamide). Monitor and adjust dose. [Moderate] Study

- Antiepileptics (topiramate) potentially increase the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. [Severe] Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to perampanel. [Mild] Study

- Antifungals, azoles (miconazole) increase the risk of carbamazepine toxicity when given with carbamazepine. Monitor and adjust dose. [Severe] Anecdotal

- Antifungals, azoles (miconazole) increase the risk of phenytoin toxicity when given with fosphenytoin. Monitor and adjust dose. [Severe] Anecdotal

- Antifungals, azoles (miconazole) increase the risk of phenytoin toxicity when given with phenytoin. Monitor and adjust dose. [Severe] Anecdotal

- Carbamazepine is predicted to decrease the efficacy of antifungals, azoles (flucytosine) and antifungals, azoles (fluconazole) increase the concentration of carbamazepine. Avoid or monitor carbamazepine concentration and adjust dose accordingly. [Severe] Theoretical  Also see TABLE 1 p. 1264

- Antifungals, azoles (flucytosine) increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Moderate] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. [Severe] Study

- Fosphenytoin very markedly decreases the exposure to antifungals, azoles (itraconazole). Avoid. Fosphenytoin for 14 days before and during treatment with itraconazole. [Moderate] Study

- Phenobarbital decreases the concentration of antifungals, azoles (itraconazole). Avoid phenobarbital for 14 days before and during treatment with itraconazole. [Moderate] Study

- Phenytoin very markedly decreases the exposure to antifungals, azoles (itraconazole). Avoid phenytoin for 14 days before and during treatment with itraconazole. [Moderate] Study

- Primidone is predicted to decrease the concentration of antifungals, azoles (itraconazole). [Moderate] Theoretical

- Carbamazepine is predicted to decrease the efficacy of antifungals, azoles (itraconazole, voriconazole) and antifungals, azoles (itraconazole, voriconazole) increase the concentration of carbamazepine. Avoid or adjust dose. [Moderate] Theoretical  Also see TABLE 1 p. 1264

- Carbamazepine is predicted to decrease the efficacy of antifungals, azoles (ketocconazole) and antifungals, azoles (ketocconazole) slightly increase the concentration of carbamazepine. Avoid or monitor carbamazepine concentration and adjust dose accordingly. [Moderate] Study

- Phenobarbital is predicted to decrease the concentration of antifungals, azoles (ketocconazole). Avoid. [Moderate] Study

- Antiepileptics (fosphenytoin, phenytoin) decrease the exposure to antifungals, azoles (ketocconazole). Avoid. [Moderate] Study

- Primidone is predicted to decrease the concentration of antifungals, azoles (ketocconazole, posaconazole). Avoid. [Moderate] Study

- Carbamazepine is predicted to decrease the efficacy of antifungals, azoles (posaconazole) and antifungals, azoles (posaconazole) increase the concentration of carbamazepine. Avoid. [Mild] Study

- Phenobarbital is predicted to decrease the concentration of antifungals, azoles (posaconazole). Avoid. [Mild] Study

- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to antifungals, azoles (posaconazole). Avoid. [Mild] Study

- Fosphenytoin decreases the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) increase the exposure to fosphenytoin. Avoid or adjust voriconazole dose and monitor phenytoin concentration, p. 566. [Moderate] Study

- Phenytoin decreases the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) increase the exposure to phenytoin. Avoid or adjust voriconazole dose and monitor phentoin concentration, p. 566. [Moderate] Study

- Antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of antifungals, azoles (voriconazole). Avoid. [Mild] Study

- Antifungals, sedating antihistamines (hydroxyzine) potentially increase the risk of overheating and dehydration when given with zonisamide. Avoid in children. [Severe] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antimalarials (artemether) (with lumefantrine). Avoid. [Severe] Study

- Antihistamines, sedating (hydroxyzine) potentially increase the risk of overheating and dehydration when given with zonisamide. Avoid in children. [Severe] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to antimalarials (artemether) (with lumefantrine). Avoid. [Severe] Study

- Antihistamines, sedating (hydroxyzine) potentially increase the risk of overheating and dehydration when given with zonisamide. Avoid in children. [Severe] Theoretical
Antiepileptics (pyrimethamine) increase the risk of haematological toxicity when given with antiepileptics (fosphenytoin, phenytoin). (Severe) Study

Antimalarials (pyrimethamine) are predicted to increase the risk of haematological toxicity when given with antiepileptics (phenobarbital, primidone). (Severe) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of antimalarials (piperaquine). Avoid. (Moderate) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 376. (Moderate) Study. Also see Table 11 p. 1266

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to apremilast. Avoid. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to aprepitant. Avoid. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to azithromycin. Avoid. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to bazedoxifene. (Moderate) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to bedaquiline. Avoid. (Severe) Study

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, non-selective (carvedilol, labetalol). (Moderate) Theoretical

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, non-selective (propranolol). (Moderate) Study

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, selective (acebutolol, bisoprolol, metoprolol, nebivolol). (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) slightly decrease the exposure to bortezomib. Avoid. (Severe) Study. Also see Table 12 p. 1267

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) affect the exposure to bosentan. Avoid. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to very markedly decrease the exposure to bupropion. (Severe) Study

Valproate increases the exposure to bupropion. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to buspirone. Use with caution and adjust dose. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to cabozantinib. Avoid. (Moderate) Study

Antiepileptics (fosphenytoin, phenytoin) are predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. (Moderate) Study

Calcium channel blockers (diltiazem, verapamil) increase the concentration of carbamazepine. (Severe) Anecdotal

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to calcium channel blockers (amiodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to calcium channel blockers (diltiazem). (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to calcium channel blockers (irtraconazole). Avoid. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to calcium channel blockers (verapamil). (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cannabis extract. Avoid. (Severe) Theoretical. Also see Table 11 p. 1266

Capcetibaine increases the concentration of antiepileptics (fosphenytoin, phenytoin). (Severe) Anecdotal

Carbogenem decreases the concentration of valproate. Avoid. (Severe) Anecdotal

Antiepileptics (carbamazepine, fosphenytoin, phenytoin) are predicted to decrease the concentration of caspofungin. Adjust caspofungin dose, p. 560. (Moderate) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ceritinib. Avoid. (Severe) Study

Antiepileptics (phenobarbital, primidone) decrease the concentration of chloramphenicol. (Moderate) Study

Intravenous chloramphenicol increases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) affect the concentration of intravenous chloramphenicol. Monitor concentration and adjust dose. (Severe) Study

Chlorbidipoxide affects the concentration of antiepileptics (fosphenytoin, phenytoin). (Severe) Study

Phenobarbital decreases the effects of cholic acid. Avoid. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of ciclosporin. (Severe) Anecdotal

Oxcarbazepine decreases the concentration of ciclosporin. (Severe) Anecdotal

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to alter the effects of cisatrazol. (Moderate) Theoretical

Clozam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). (Severe) Anecdotal

Stiripentol increases the concentration of clozam. (Severe) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to clomethiazole. Monitor and adjust dose. (Moderate) Study. Also see Table 11 p. 1266

Clonazepam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). (Severe) Anecdotal

Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to clozaopine. (Moderate) Anecdotal

Antiepileptics (phenobarbital, primidone) decrease the exposure to clozapine. (Moderate) Anecdotal. Also see Table 11 p. 1266

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cobicistat. Avoid. (Severe) Theoretical

Oxcarbazepine is predicted to decrease the concentration of cobicistat. (Severe) Theoretical

Cobicistat is predicted to slightly increase the exposure to perampanel. (Moder) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cobicistat. Avoid. (Severe) Theoretical

Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of combined hormonal contraceptives. For FHSG guidance, see Contraceptives, interactions p. 747. (Severe) Study

Combined hormonal contraceptives alter the exposure to lamotrigine. Adjust lamotrigine dose, p. 303. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to corticosteroids (budesonide, dexamethasone, methylprednisolone, prednisolone). Monitor and adjust dose. (Moderate) Study
Antiepileptics (continued)

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to corticosteroids (fluticasone). [Unknown] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to corticosteroids (prednisone). [BNF]
- Antiepileptics (fosphenytoin, phenytoin) are predicted to alter the anticoagulant effect of coumarins. [Moderate] Anecdotal
- Antiepileptics (phenobarbital, primidone) decrease the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Moderate] Study
- Carbamazepine decreases the effects of coumarins. Monitor and adjust dose. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to crizotinib. Avoid. [Severe] Study
- Carbamazepine is predicted to decrease the exposure to dabigatran. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to daclatasvir. Avoid. [Severe] Study
- Oxcarbazepine is predicted to decrease the exposure to daclatasvir. Avoid. [Severe] Theoretical
- Danazol moderately increases the concentration of carbamazepine. Monitor carbamazepine concentration and adjust dose. [Severe] Study
- Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of methaemoglobinemia when given with dapsone. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to darifenacin. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to dasatinib. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to slightly decrease the exposure to delamanid. Avoid. [Moderate] Study
- Lamotrigine is predicted to increase the risk of hynopatraemia when given with desmopressin. [Severe] Theoretical
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of desogestrel. For FSH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- Desogestrel is predicted to increase the exposure to lamotrigine. [Moderate] Study
- Diazepam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study
- Diazoxide decreases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the effects of diazoxide. Monitor concentration and adjust dose. [Moderate] Anecdotal
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the concentration of digoxin. [Moderate] Anecdotal
- Disulfiram increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study → Also see TABLE 12 p. 1267
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to dolutegravir. Adjust dose. [Severe] Study
- Oxcarbazepine is predicted to decrease the exposure to dolutegravir. Adjust dose. [Severe] Theoretical
- Carbamazepine is predicted to decrease the exposure to edoxaban. [Moderate] Study
- Antiepileptics (fosphenytoin, phenytoin) slightly decrease the exposure to efavirenz and efavirenz affects the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Theoretical
- Carbamazepine slightly decreases the exposure to efavirenz and efavirenz slightly decreases the exposure to carbamazepine. [Severe] Study
- Phenobarbital is predicted to decrease the exposure to efavirenz and efavirenz affects the concentration of phenobarbital. [Severe] Theoretical
- Efavirenz is predicted to affect the efficacy of primidone and primidone is predicted to slightly decrease the exposure to efavirenz. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to elbasvir. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical
- Enteral feeds decreases the absorption of phenytoin. [Severe] Study
- Enzalutamide is predicted to slightly decrease the exposure to brivaracetam. [Moderate] Theoretical
- Enzalutamide is predicted to decrease the exposure to perampanel. Monitor and adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, dasabuvir, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the effects of ergotamine. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ergotamine. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to etoricoxib. Avoid or adjust etoricoxib dose. [Severe] Study
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of estradiol. For FSH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the efficacy of etoposide. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to etravirine. Avoid. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of everolimus. Avoid or adjust everolimus dose. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to exemestane. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fesoterodine. Avoid. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fingolimod. [Moderate] Study
- Fluoroouracil increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Anecdotal
- Folic acid (folate) decreases the concentration of antiepileptics (fosphenytoin, phenobarbital, phenobarbital, phenytoin, primidone). Monitor concentration and adjust dose. [Severe] Study
- Folic acid (folinic acid) are predicted to decrease the concentration of antiepileptics (fosphenytoin, phenobarbital, phenobarbital, phenytoin, primidone). [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study
- Grapefruit juice slightly increases the exposure to carbamazepine. Monitor carbamazepine concentration and adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study
Antiepileptics (phenobarbital, primidone) decrease the effects of griseofulvin. [Moderate] Study
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Study → Also see TABLE 11, p. 1266
Oxcarbazepine is predicted to decrease the concentration of guanfacine. Monitor and adjust guanfacine dose, p. 335. [Moderate] Theoretical
Guanfacine increases the concentration of valproate. Monitor and adjust dose. [Moderate] Study
H₂ receptor antagonists (cimetidine) transiently increase the concentration of carbamazepine. [Moderate] Study
H₂ receptor antagonists (cimetidine) increase the concentration of fosphenytoin. Monitor phenytoin concentration and adjust dose. [Severe] Theoretical
H₂ receptor antagonists (cimetidine) increase the concentration of phenytoin. Monitor phenytoin concentration and adjust dose. [Severe] Study
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of haloperidol. Adjust dose. [Moderate] Study → Also see TABLE 11, p. 1266
Haloperidol potentially increases the risk of overheating and dehydration when given with zonisamide. Avoid in children. [Severe] Theoretical
HIV-protease inhibitors (ritonavir) are predicted to decrease the concentration of valproate. [Severe] Anecdotal
HIV-protease inhibitors are predicted to affect the exposure to antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) decrease the concentration of HIV-protease inhibitors. [Severe] Theoretical
HIV-protease inhibitors are predicted to affect the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of HIV-protease inhibitors. [Severe] Theoretical
HIV-protease inhibitors are predicted to increase the exposure to carbamazepine and carbamazepine is predicted to decrease the exposure to HIV-protease inhibitors. Monitor and adjust dose. [Severe] Theoretical
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to significantly increase the exposure to perampanel. [Mild] Study
HIV-protease inhibitors (ritonavir) slightly decrease the exposure to lamotrigine. [Severe] Study
Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the effects of hormone replacement therapy. [Moderate] Anecdotal
Hormone replacement therapy is predicted to alter the exposure to lamotrigine. [Moderate] Theoretical
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ibritinib. Avoid. [Severe] Study
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to idealisib. Avoid. [Severe] Study
Idealisib is predicted to slightly increase the exposure to perampanel. [Mild] Study
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to imatinib. Avoid. [Moderate] Study
Oxcarbazepine decreases the exposure to imatinib. Avoid. [Moderate] Study
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to iron chelators (deferasirox). Monitor serum ferritin and adjust dose. [Moderate] Theoretical
Isoniazid increases the concentration of antiepileptics (fosphenytoin, phenytoin). [Moderate] Study → Also see TABLE 12, p. 1267
Isoniazid increases the concentration of carbamazepine and carbamazepine increases the risk of hepatotoxicity when given with isoniazid. Monitor carbamazepine concentration and adjust dose. [Severe] Study → Also see TABLE 1, p. 1264
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ivabradine. Adjust dose. [Moderate] Theoretical
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) markedly decrease the exposure to ivacaftor. Avoid. [Severe] Study
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lopinavir. Avoid. [Severe] Study
Carbamazepine is predicted to decrease the exposure to lipiodol. Avoid. [Severe] Theoretical
Antiepileptics (fosphenytoin, phenytoin) decrease the effects of levodopa. [Moderate] Study
Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
Antiepileptics (fosphenytoin, phenytoin) increase the risk of hypothyroidism when given with levothyroxine. [Moderate] Study
Antiepileptics (phenobarbital, primidone) are predicted to decrease the effects of levothyrione. [Moderate] Theoretical
Carbamazepine increases the risk of hypothyroidism when given with levothyrione. Monitor and adjust dose. [Moderate] Study
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to linagliptin. [Moderate] Study
Antiepileptics (fosphenytoin, phenytoin) are predicted to increase the risk of hypothyroidism when given with liothyronine. [Moderate] Theoretical
Antiepileptics (phenobarbital, primidone) are predicted to decrease the effects of liothyronine. [Moderate] Theoretical
Carbamazepine increases the risk of neurotoxicity when given with lithium. [Severe] Anecdotal
Oxcarbazepine is predicted to increase the risk of neurotoxicity when given with lithium. [Severe] Theoretical
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lomitapide. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 1, p. 1264
Antiepileptics (fosphenytoin, phenytoin) decrease the effects of loop diuretics (furosemide). [Moderate] Study
Lumacaftor is predicted to decrease the exposure to antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone). Avoid. [Severe] Theoretical
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to luridone. Avoid. [Moderate] Study → Also see TABLE 11, p. 1266
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to macitentan. Avoid. [Severe] Study
Macrolides (clarithromycin) slightly increase the concentration of carbamazepine. Monitor carbamazepine concentration and adjust dose. [Severe] Study
Macrolides (clarithromycin) are predicted to slightly increase the exposure to perampanel. [Mild] Study
Macrolides (erythromycin) markedly increase the concentration of carbamazepine. Monitor carbamazepine concentration and adjust dose. [Severe] Study
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to maraviroc. Adjust dose. [Severe] Study
Levetiracetam decreases the clearance of methotrexate. [Severe] Anecdotal
Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to metronidazole. [Moderate] Study
Antiepileptics — Antiepileptics

Antiepileptics (continued)

- Antiepileptics (fosphenytoin, phenobarbital, phenytoin primidone) decrease the effects of metyrapone. Avoid. [Moderate] Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to mianserin. [Moderate] Study → Also see TABLE 11 p. 1266

» Carbamazepine markedly decreases the exposure to mianserin. Adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to midazolam. Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 1266

» Carbamazepine markedly decreases the exposure to mianserin. Adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to mirtazapine. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 1266

» Carbamazepine (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to modafinil. [Mild] Theoretical
- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to modafinil and modafinil is predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Moderate] Theoretical
- Antiepileptics (phenobarbital, primidone) are predicted to increase the effects of monoamine-oxidase A and B inhibitors, irreversible. [Severe] Theoretical

» Carbamazepine is predicted to decrease the effects of monoclonal antibodies (brentuximab vedotin). [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to monoclonal antibodies (trastuzumab emtansine). [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to montelukast. [Mild] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to naloxegol. Avoid. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to slightly decrease the exposure to netupitant. Avoid. [Moderate] Study
- Antiepileptics (fosphenytoin, phenytoin) decrease the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium, vecuronium). [Moderate] Study

» Carbamazepine is predicted to decrease the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium, vecuronium). [Moderate] Study

» Nevirapine is predicted to decrease the concentration of antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) and antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of nevirapine. [Severe] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to nilotinib. Avoid. [Severe] Study

» Carbamazepine is predicted to decrease the exposure to nintedanib. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to nitisine. Adjust nitisine dose. [Moderate] Theoretical
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of noxurex. FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal

» Carbamazepine potentially decreases the exposure to olanzapine. Monitor and adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to olaparib. Avoid. [Moderate] Theoretical

» Carbamazepine is predicted to decrease the exposure to omibasvir. Avoid. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ondansetron. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to opioids (alfentanil, fentanyl). [Moderate] Study → Also see TABLE 11 p. 1266

» Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to opioids (buprenorphine). Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 11 p. 1266

» Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to opioids (methadone). Monitor and adjust dose. [Severe] Study → Also see TABLE 11 p. 1266

» Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to opioids (oxycodeine). Monitor and adjust dose. [Moderate] Study → Also see TABLE 11 p. 1266

» Carbamazepine decreases the concentration of opioids (tramadol). Adjust dose. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to osimertinib. Avoid. [Moderate] Study

» Oxbutynin potentially increases the risk of overheating and dehydration when given with zonisamide. Avoid in children. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to palbociclib. Avoid. [Severe] Study

» Carbamazepine decreases the concentration of paliperidone. Adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to paracetamol. [Moderate] Study → Also see TABLE 1 p. 1264

» Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to pazopanib. Avoid. [Severe] Theoretical

» Phenothiazines (chlorpromazine) decrease the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) decrease the concentration of phenothiazines (chlorpromazine). [Moderate] Study → Also see TABLE 11 p. 1266

» Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, tadalafil). Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafil). Avoid. [Moderate] Theoretical

» Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to pirfenidone. Avoid. [Moderate] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to pinitol. Avoid. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to praziquantel. Avoid. [Moderate] Study
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of hypersensitivity reactions when given with procarbazine. 
Severe Anecdotal

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to quetiapine. Moderate Study  Also see Table 11 p. 1266

Quinolones (ciprofloxacin) affect the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. Severe Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ranolazine. Avoid. Severe Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to rifampicin. Moderate Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to reboxetine. Moderate Anecdotal

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to regorafenib. Avoid. Moderate Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. Moderate Study

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to rifampicin and rifampicin is predicted to decrease the exposure to antiepileptics (phenobarbital, primidone). Use with caution and adjust dose. Moderate Study

Rifampicin decreases the concentration of antiepileptics (fosphenytoin, phenytoin). Use with caution and adjust dose. Moderate Study

Rifampicin slightly decreases the exposure to brivaracetam. Adjust dose. Moderate Study

Rifampicin markedly increases the clearance of lamotrigine. Adjust lamotrigine dose. p. 303. Moderate Study

Rifampicin is predicted to decrease the exposure to perampanel. Monitor and adjust dose. Moderate Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) markedly decrease the exposure to rilpivirine. Avoid. Severe Study

Oxcarbazepine is predicted to decrease the concentration of rilpivirine. Avoid. Severe Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to risperidone. Adjust risperidone dose. Moderate Study  Also see Table 11 p. 1266

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. Severe Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. Moderate Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to saxaglitin. Moderate Study

Valproate is predicted to increase the exposure to selexipag. Unknown Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to simeprevir. Avoid. Severe Study

Oxcarbazepine is predicted to decrease the exposure to simeprevir. Avoid. Severe Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of sirolimus. Avoid. Severe Study

Valproate increases the exposure to sodium oxybate. Adjust sodium oxybate dose. p. 466. Moderate Study

Valproate potentially decreases the effects of sodium phenylbutyrate. Moderate Anecdotal

Antiepileptics (carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sofosbuvir. Avoid. Severe Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to solifenacín. Moderate Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sorafenib. Moderate Theoretical

SSRIs (fluoxetine, fluvoxamine) are predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. Severe Anecdotal

SSRIs (sertaline) potentially increase the risk of toxicity when given with antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. Severe Anecdotal

Antiepileptics (fosphenytoin, phenytoin) decrease the concentration of SSRIs (paroxetine). Moderate Study

St John’s Wort is predicted to decrease the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone). Avoid. Severe Theoretical

St John’s Wort is predicted to decrease the exposure to brivaracetam. Moderate Theoretical

St John’s Wort is predicted to decrease the concentration of carbamazepine. Monitor and adjust dose. Moderate Theoretical

St John’s Wort is predicted to decrease the exposure to perampanel. Monitor and adjust dose. Moderate Theoretical

Antiepileptics (carbamazepine, eslicarbazepine) are predicted to decrease the exposure to stavudine (atazanavir, simvastatin). Monitor and adjust dose. Moderate Theoretical

Carbamazepine moderately decreases the exposure to statins (simvastatin). Monitor and adjust dose. Severe Study  Also see Table 1 p. 1264

Elisacarbazepine moderately decreases the exposure to statins (simvastatin). Monitor and adjust dose. Moderate Study

Sulfipyrazone increases the concentration of antiepileptics (fosphenytoin, phenytoin). Moderate Study

Sulfonamides (sulfadiazine) are predicted to increase the concentration of fosphenytoin. Monitor and adjust dose. Moderate Study

Sulfonamides (sulfadiazine) increase the concentration of phenytoin. Monitor and adjust dose. Moderate Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose. p. 914. Moderate Study

Antiepileptics (fosphenytoin, phenytoin) increase the effects of suxamethonium. Moderate Study

Carbamazepine increases the risk of prolongued neuromuscular blockade when given with suxamethonium. Moderate Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of tacrolimus. Monitor and adjust dose. Severe Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. Severe Study  Also see Table 12 p. 1267

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to taxanes (docetaxel). Severe Theoretical  Also see Table 12 p. 1267

toga fumar potentially increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. Severe Anecdotal

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of temsirolimus. Avoid. Severe Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to tacrolimus (doycylcine). Monitor and adjust dose. Moderate Study  Also see Table 1 p. 1264

Antiepileptics (phenobarbital, primidone) are predicted to increase the clearance of theophylline. Adjust dose. Moderate Theoretical

Downloaded from www.medicalbr.com
Antiepileptics (continued)

- Carbamazepine potentially increases the clearance of theophylline and theophylline decreases the exposure to carbamazepine. Adjust dose. [Moderate] Anecdotal
- Phenytoin is predicted to increase the clearance of theophylline. Adjust dose. [Moderate] Study
- Phenytoin is predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to ticagrelor. Avoid. [Severe] Study
- Antiepileptics (fosphenytoin, phenytoin) moderately decrease the exposure to tizanidine. [Mild] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tolvaptan. Avoid. [Severe] Study
- Antiepileptics (fosphenytoin, phenytoin) increase the clearance of topotecan. [Moderate] Study
- Carbamazepine decreases the exposure to tricyclic antidepressants. Adjust dose. [Moderate] Study
- Tricyclic antidepressants (clomipramine, imipramine) potentially increase the risk of overheating and dehydration when given with zonisamide. Avoid in children. [Severe] Theoretical
- Trimethoprim increases the concentration of antiepileptics (fosphenytoin, phenytoin). [Moderate] Study
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the exposure to toremifene. Avoid. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to trimethoprim. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vandetanib. Avoid. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to velpatasvir. Avoid. [Severe] Study
- Oxcarbazepine is predicted to decrease the exposure to velpatasvir. Avoid. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vemurafenib. Avoid. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to venetoclax. Avoid. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindesine). [Severe] Theoretical → Also see TABLE 1 p. 1264 → Also see TABLE 12 p. 1267
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vinca alkaloids (vinflunine). Avoid. [Severe] Theoretical → Also see TABLE 12 p. 1267
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vinorelbine. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 12 p. 1267
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vismodegib. Avoid. [Moderate] Theoretical
- Antiepileptics (fosphenytoin, phenytoin) decrease the effects of vitamin D substances. [Moderate] Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the effects of vitamin D substances. [Moderate] Theoretical
- Carbamazepine is predicted to decrease the effects of vitamin D substances. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study
- Valproate slightly increases the exposure to zidovudine. [Moderate] Study
- Carbamazepine moderately decreases the exposure to zolpidem. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to zopiclone. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 1266

Antifungals, azoles → see TABLE 1 p. 1264 (hepatotoxicity), TABLE 9 p. 1266 (QT-interval prolongation)

clotrimazole - fluconazole - isavuconazole - itraconazole - ketoconazole - miconazole - posaconazole - voriconazole

- In general, fluconazole interactions relate to multiple-dose treatment.
- The use of carbonated drinks, such as cola, improves itraconazole, ketoconazole, and posaconazole bioavailability.
- Disulfiram-like reaction might occur with ketoconazole on consumption of alcohol.
- Since systemic absorption can follow topical application, the possibility of interactions with topical ketoconazole should be borne in mind.
- Interactions of miconazole apply to the oral gel formulation, as a sufficient quantity can be absorbed to cause systemic effects. Systemic absorption from intravaginal and topical formulations might also occur.
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to abiraterone. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to alfalbine. Separate administration by 1.2 hours. [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 185. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to aldosterone antagonists (eplerenone). Avoid. [Severe] Study
- Itraconazole markedly increases the exposure to aliskiren. Avoid. [Severe] Study
- Ketoconazole moderately increases the exposure to aliskiren. [Moderate] Study
- Itraconazole increases the risk of busulfan toxicity when given with alkylating agents (busulfan). Monitor and adjust dose. [Moderate] Study
- Miconazole is predicted to increase the concentration of alkylating agents (busulfan). Use with caution and adjust dose. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the exposure to almotriptan. [Mild] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to alpha blockers (doxazosin). [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to alprazolam. [Severe] Study
Antifungals, azoles — Antifungals, azoles

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) moderately increase the exposure to alprazolam. Avoid. (Moderate) Study
- Miconazole is predicted to increase the exposure to alprazolam. Use with caution and adjust dose. (Moderate) Theoretical
- Miconazole potentially decreases the exposure to aminoglycosides (tobramycin). (Moderate) Anecdotal
- Antacids decrease the absorption of itraconazole. Antacids should be taken 1 hour before or 2 hours after itraconazole. (Moderate) Study
- Antacids decrease the absorption of ketoconazole. Separate administration by at least 2 hours. (Moderate) Study
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to ketoconazole. (Severe) Theoretical
- Miconazole is predicted to increase the exposure to antiarrhythmics (disopyramide). Use with caution and adjust dose. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antifungals, azoles (itraconazole, ketoconazole, voriconazole). Avoid. (Severe) Theoretical
- Fluconazole is predicted to increase the exposure to antifungals, azoles (itraconazole, ketoconazole, voriconazole). Avoid. (Severe) Study → Also see TABLE 9 p. 1266
- Posaconazole is predicted to increase the exposure to antifungals, azoles (itraconazole, ketoconazole, voriconazole). Avoid. (Severe) Theoretical
- Antiepileptics (Carbamazepine) are predicted to decrease the efficacy of fluconazole and fluconazole increases the concentration of antiepileptics (carbamazepine). Avoid or monitor carbamazepine concentration and adjust dose accordingly. (Severe) Theoretical → Also see TABLE 1 p. 1264
- Antiepileptics (Carbamazepine) are predicted to decrease the efficacy of ketoconazole and ketoconazole slightly increases the concentration of antiepileptics (carbamazepine). Avoid or monitor carbamazepine concentration and adjust dose accordingly. (Moderate) Study
- Antiepileptics (Carbamazepine) are predicted to decrease the efficacy of posaconazole and posaconazole increases the concentration of antiepileptics (carbamazepine). Avoid. (Moderate) Theoretical
- Antiepileptics (Carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to isavuconazole. Avoid. (Severe) Study
- Antiepileptics (Fosphenytoin) very markedly decrease the exposure to phenobarbital. Avoid for 14 days before and during treatment with itraconazole. (Moderate) Study
- Antiepileptics (Phenobarbital) decrease the concentration of itraconazole. Avoid phenobarbital for 14 days before and during treatment with itraconazole. (Moderate) Study
- Antiepileptics (Phenobarbital) are predicted to decrease the concentration of ketoconazole. Avoid. (Moderate) Study
- Antiepileptics (Phenobarbital) are predicted to decrease the concentration of posaconazole. Avoid. (Moderate) Study
- Antiepileptics (Phenobarbital, primidone) are predicted to decrease the concentration of voriconazole. Avoid. (Moderate) Theoretical
- Antiepileptics (Phenytoin) very markedly decrease the exposure to itraconazole. Avoid phenytoin for 14 days before and during treatment with itraconazole. (Moderate) Study
- Antiepileptics (Phenytoin) decrease the exposure to voriconazole and voriconazole increases the exposure to antiepileptics (phenytoin). Avoid or adjust voriconazole dose and monitor phenytoin concentration, p. 566. (Moderate) Study
- Antiepileptics (Primidone) are predicted to decrease the concentration of itraconazole. (Moderate) Theoretical
- Miconazole increases the risk of carbamazepine toxicity when given with antiepileptics (carbamazepine). Monitor and adjust dose. (Severe) Anecdotal
- Miconazole increases the risk of phenytoin toxicity when given with antiepileptics (fosphenytoin). Monitor and adjust dose. (Severe) Anecdotal
- Fluconazole increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. (Moderate) Study
- Antiepileptics (Carbamazepine) are predicted to decrease the concentration of antiepileptics (itraconazole, voriconazole) and antifungals, azoles (itraconazole, voriconazole) and antifungals, azoles (itraconazole, voriconazole) increase the concentration of antiepileptics (carbamazepine). Avoid or adjust dose. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to antiepileptics (perampanel). (Mid) Study
- Miconazole increases the risk of phenytoin toxicity when given with antiepileptics (phenytoin). Monitor and adjust dose. (Severe) Anecdotal
- Antifungals, azoles (fluconazole) are predicted to increase the exposure to antifungals, azoles (itraconazole, voriconazole). Avoid. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antifungals, azoles (itraconazole, ketoconazole, voriconazole). Avoid or monitor side effects. (Severe) Study
- Antifungals, azoles (posaconazole) are predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid. (Moderate) Theoretical
- Miconazole is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. (Moderate) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to antimalarials (artemether) (with lumefantrine). (Moderate) Study → Also see TABLE 9 p. 1266
- Ketoconazole increases the exposure to antimalarials (mefloquine). (Moderate) Study
- Antifungals, azoles (fluconazole, itraconazole, posaconazole, voriconazole) are predicted to increase the exposure to antimalarials (mefloquine). (Moderate) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the concentration of antimalarials (piperaquine). (Severe) Theoretical
- Itraconazole is predicted to increase the exposure to apixaban. Avoid. (Severe) Theoretical
- Ketoconazole slightly to moderately increases the exposure to apixaban. Avoid. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to aprepitant. (Moderate) Study
- Aprepitant is predicted to increase the exposure to isavuconazole. (Moderate) Theoretical
Antifungals, azoles (continued)

- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to *aripiprazole*. Adjust aripiprazole dose, p. 376. [Moderate Study]
- **Antifungals, azoles** (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to *axitinib*. [Moderate] *Theoretical*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to *axitinib*. Avoid or adjust dose. [Moderate Study]
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to *bedaquiline*. Avoid prolonged use. [Mild] *Theoretical*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to *bedaquiline*. Avoid prolonged use. [Mild] *Study* → Also see TABLE 9 p. 1266
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to *beta blockers*, non-selective (nadolol). [Moderate] *Study*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to *beta, agonists (salmeterol)*. Avoid. [Severe] *Study*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to *bosentan*. Avoid. [Severe] *Study*
- **Itraconazole** is predicted to decrease the exposure to *isavuconazole*. Avoid. [Severe] *Theoretical*
- **Itraconazole** is predicted to increase the exposure to *bosentan*. [Moderate] *Theoretical*
- **Ketoconazole** moderately increases the exposure to *bosentan*. [Moderate] *Study*
- **Voriconazole** is predicted to increase the exposure to *bosentan*. Avoid. [Severe] *Theoretical*
- **Fluconazole** is predicted to increase the exposure to *bosutinib*. Avoid or adjust bosutinib dose. [Severe] *Theoretical*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to *bosutinib*. Avoid or adjust bosutinib dose. [Severe] *Study* → Also see TABLE 9 p. 1266
- **Antifungals, azoles** (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to *buspirone*. Use with caution and adjust dose. [Moderate] *Study*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to *buspirone*. Adjust buspirone dose, p. 325. [Severe] *Study*
- **Miconazole** is predicted to increase the concentration of *buspirone*. Use with caution and adjust dose. [Moderate] *Theoretical*
- **Antifungals, azoles** (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to *cabozantinib*. [Moderate] *Theoretical*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to *cabozantinib*. [Moderate] *Study* → Also see TABLE 9 p. 1266
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to *isavuconazole*. [Moderate] *Theoretical*
- **Miconazole** is predicted to increase the exposure to *calcium channel blockers* (amlodipine, clevidipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Use with caution and adjust dose. [Moderate] *Theoretical*
- **Antifungals, azoles** (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to *calcium channel blockers* (amlodipine, felodipine, isradipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] *Study*
- **Fluconazole** (high-dose) is predicted to increase the exposure to *calcium channel blockers* (diltiazem, verapamil). [Moderate] *Theoretical*
- **Posaconazole** is predicted to increase the exposure to *calcium channel blockers* (diltiazem, verapamil). [Moderate] *Theoretical*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to *calcium channel blockers* (diltiazem, verapamil). [Moderate] *Theoretical*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to *calcium channel blockers* (amlodipine, verapamil). [Severe] *Study*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to *cannabin extract*. Use with caution and adjust dose. [Moderate] *Theoretical*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to *ciclosporin*. [Severe] *Study*
- **Miconazole** increases the concentration of *ciclosporin*. Monitor and adjust dose. [Severe] *Anecdotal*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to *ciclosporin*. Adjust *ciclosporin* dose, p. 226. [Moderate] *Study*
- **Fluconazole** is predicted to increase the exposure to *ciclosporin*. Adjust *ciclosporin* dose, p. 226. [Moderate] *Theoretical*
- **Miconazole** is predicted to increase the exposure to *ciclosporin*. Use with caution and adjust dose. [Moderate] *Theoretical*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to *ciclosporin*. Adjust dose. [Moderate] *Study*
- **Fluconazole** is predicted to decrease the efficacy of *clopidogrel*. Avoid. [Severe] *Theoretical*
- **Voriconazole** is predicted to decrease the efficacy of *clopidogrel*. Avoid. [Severe] *Study*
- **Cobicistat** is predicted to increase the exposure to antifungals, azoles (fluconazole, posaconazole). [Moderate] *Theoretical*
- **Cobicistat** is predicted to increase the exposure to *isavuconazole*. Avoid or monitor side effects. [Severe] *Study*
- **Cobicistat** is predicted to increase the exposure to *itraconazole*. Adjust *itraconazole* dose, p. 564. [Moderate] *Theoretical*
- **Cobicistat** is predicted to increase the exposure to *ketonazole*. Adjust *ketonazole* dose, p. 641. [Moderate] *Theoretical*
- **Cobicistat** is predicted to affect the exposure to *voriconazole*. Avoid. [Moderate] *Theoretical*
- **Antifungals, azoles** (fluconazole, isavuconazole, miconazole, posaconazole) are predicted to increase the exposure to *cimetidine*. [Severe] *Theoretical*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to *cimetidine*. Avoid or monitor for toxicity. [Severe] *Study*
- **Antifungals, azoles** (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to *colchicine*. Adjust *colchicine* dose, p. 1020. [Severe] *Study*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to *colchicine*. Avoid or adjust *colchicine* dose, p. 1020. [Severe] *Study*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (budesonide). Avoid. [Severe] *Study*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (budesonide). Avoid. [Severe] *Study*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (budesonide). Avoid. [Severe] *Study*
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (budesonide). Avoid. [Severe] *Study*
- **Miconazole** is predicted to increase the concentration of *corticosteroids* (methylprednisolone). Monitor and adjust dose. [Moderate] *Theoretical*
Antifungals, azoles

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to corticosteroids (mometasone). (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of side-effects when given with corticosteroids (triamcinolone). (Severe) Theoretical
- Fluconazole increases the anticoagulant effect of coumarins. Monitor INR and adjust dose. (Severe) Study
- Itraconazole potentially increases the anticoagulant effect of coumarins. (Severe) Anecdotal
- Ketoconazole potentially increases the anticoagulant effect of coumarins (warfarin). Monitor INR and adjust dose. (Severe) Anecdotal
- Miconazole greatly increases the anticoagulant effect of coumarins. (Severe) Study
- Voriconazole increases the anticoagulant effect of coumarins. Monitor INR and adjust dose. (Moderate) Study
- Antifungals, azoles (fluconazole, posaconazole) are predicted to increase the exposure to crizotinib. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to crizotinib. Avoid. (Moderate) Study
- Crizotinib is predicted to increase the exposure to isavuconazole. (Moderate) Theoretical
- Antifungals, azoles, (itraconazole, ketoconazole) are predicted to increase the exposure to dabigatran. Avoid. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dabrafenib. Use with caution or avoid. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to dacatasvir. Adjust dacetasvir dose, p. 591. (Moderate) Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to slightly increase the exposure to darifenacin. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly very markedly increase the exposure to darifenacin. Avoid. (Severe) Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to dasatinib. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to dasatinib. Avoid. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) very slightly increase the exposure to delamanid. (Severe) Study
- Antifungals, azoles (fluconazole, voriconazole) moderately increase the exposure to diazepam. Monitor and adjust dose. (Moderate) Study
- Didanosine (buffered) decreases the exposure to antifungals, azoles (itraconazole, ketoconazole). Separate administration by 2 hours. (Severe) Study
- Itraconazole markedly increases the concentration of digoxin. Monitor and adjust dose. (Severe) Study
- Ketoconazole is predicted to markedly increase the concentration of digoxin. (Severe) Theoretical
- Posaconazole is predicted to increase the concentration of digoxin. (Severe) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) increase the risk of QT-prolongation when given with domperidone. Avoid. (Severe) Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). (Severe) Study
- Ketoconazole moderately increases the exposure to drospirenone. (Severe) Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to moderately increase the exposure to dutasteride. (Mild) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. (Moderate) Theoretical
- Itraconazole is predicted to slightly increase the exposure to edoxaban. (Theoretical)
- Ketoconazole slightly increases the exposure to edoxaban. Adjust edoxaban dose, p. 122. (Severe) Study
- Efavirenz is predicted to decrease the exposure to isavuconazole. Avoid. (Severe) Theoretical
- Efavirenz slightly decreases the exposure to itraconazole. Avoid efavirenz for 14 days before and during treatment with itraconazole. (Moderate) Study
- Efavirenz moderately decreases the exposure to ketoconazole. (Severe) Study
- Efavirenz slightly decreases the exposure to posaconazole. Avoid. (Moderate) Study
- Efavirenz moderately decreases the exposure to voriconazole and voriconazole slightly increases the exposure to efavirenz. Adjust dose. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) slightly to moderately increase the exposure to elbasvir. Avoid. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to eleriptan. Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to isavuconazole. Avoid. (Severe) Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the risk of ergotism when given with ergometrine. (Severe) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergotamine. Avoid. (Severe) Theoretical
- Miconazole is predicted to increase the exposure to ergotamine. Avoid. (Moderate) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the risk of ergotism when given with ergotamine. Avoid. (Theoretical)
- Miconazole is predicted to increase the exposure to ergotamine. Avoid. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to erlotinib. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. (Moderate) Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of everolimus. Avoid. (Severe) Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to fosfoterodine. Adjust fosfoterodine dose in hepatic and renal impairment, p. 732. (Mild) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to fosfoterodine. Adjust fosfoterodine dose; avoid in hepatic and renal impairment, p. 732. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to fosaprepitant. (Moderate) Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to gefitinib. (Moderate) Theoretical
Antifungals, azoles (continued)

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to gefitinib. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately to markedly increase the exposure to grapefruit juice. Avoid. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the absorption of itraconazole. Administer itraconazole capsules with an acidic beverage. [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the absorption of ketoconazole. Administer ketoconazole with an acidic beverage. [Moderate] Study
- H₂ receptor antagonists are predicted to slightly decrease the exposure to posaconazole. Avoid use of posaconazole oral suspension. [Moderate] Study
- Itraconazole increases the concentration of haloperidol. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to isavuconazole. Avoid or monitor side effects. [Severe] Study
- Fluconazole slightly increases the exposure to HIV-protease inhibitors (tipranavir). Avoid or adjust dose. [Moderate] Study
- HIV-protease inhibitors are predicted to increase the exposure to itraconazole. Use with caution and adjust dose. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to ketoconazole. Use with caution and adjust dose. [Moderate] Study
- Miconazole is predicted to increase the concentration of HIV-protease inhibitors. Use with caution and adjust dose. [Moderate] Theoretical
- Posaconazole is predicted to increase the exposure to HIV-protease inhibitors. [Moderate] Study
- HIV-protease inhibitors are predicted to affect the exposure to voriconazole and voriconazole potentially affects the exposure to HIV-protease inhibitors. [Severe] Study → Also see TABLE 9 p. 1266
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ibritinib. Avoid or adjust ibritinib dose, p. 902. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to very markedly increase the exposure to ibritinib. Avoid or adjust ibritinib dose, p. 902. [Severe] Study
- Idelalisib is predicted to increase the exposure to isavuconazole. Avoid or monitor side effects. [Severe] Study
- Antifungals, azoles (fluconazole, posaconazole) are predicted to increase the exposure to imatinib. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to imatinib. [Moderate] Study
- Imatinib is predicted to decrease the exposure to isavuconazole. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 205. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ivabradine. Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ivacaftor. Adjust ivacaftor dose, p. 281. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ivacaftor. Adjust ivacaftor or lumacaftor with ivacaftor dose, p. 281. [Severe] Study
- Lanthanum is predicted to decrease the absorption of ketoconazole. Separate administration by at least 2 hours. [Moderate] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to lapatinib. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to lapatinib. Avoid. [Moderate] Study → Also see TABLE 9 p. 1266
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to lomitapide. Avoid. [Severe] Study → Also see TABLE 1 p. 1264
- Clotrimazole is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Lumacaftor is predicted to decrease the exposure to antifungals, azoles (itraconazole, ketoconazole, voriconazole). [Moderate] Theoretical
- Lumacaftor is predicted to decrease the exposure to fluconazole. Adjust dose. [Mild] Theoretical
- Lumacaftor is predicted to decrease the exposure to posaconazole. Avoid. [Moderate] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to luridascine. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to luridascine. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to maraviroc. Adjust dose. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to midazolam. Avoid or adjust midazolam dose. [Severe] Study
- Miconazole is predicted to increase the exposure to intravenous midazolam. Use with caution and adjust dose. [Moderate] Theoretical
- Miconazole is predicted to increase the exposure to oral midazolam. Avoid. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 736. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mirtazapine. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to modafinil. [Mild] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) increase the risk of neutropenia when given with monoclonal antibodies (brentuximab vedotin). Monitor and adjust dose. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. [Severe] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 63. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to naloxegol. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to netupitant. [Mild] Study
Antifungals, azoles – Antifungals, azoles 1291

- **Netupitant** is predicted to decrease the exposure to isavuconazole. [Moderate] Theoretical
- **Fluconazole** slightly to moderately increases the exposure to **nivinavirine**. [Moderate] Study
- **Nevirapine** is predicted to decrease the exposure to **isavuconazole**. Avoid. [Severe] Theoretical
- **Nevirapine** moderately decreases the exposure to **itraconazole**. Avoid nevirapine for 14 days before and during treatment with itraconazole. [Moderate] Study
- **Nevirapine** moderately decreases the exposure to ketoconazole. Avoid. [Severe] Study
- **Nevirapine** is predicted to decrease the exposure to voriconazole and **voriconazole** increases the exposure to **nevirapine**. Monitor and adjust dose. [Severe] Theoretical
- Antifungals, azoles (fluconazole, posaconazole) are predicted to increase the exposure to nitinolin. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to nitinolin. Avoid. [Severe] Study → Also see TABLE 9 p. 1266
- **Nilotinib** is predicted to increase the exposure to isavuconazole. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to nintedanib. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to nitinol. Adjust nitinol dose. [Moderate] Theoretical
- Fluconazole moderately increases the exposure to **NSAID** (ciclofenac). Adjust ciclofenac dose, p. 1031. [Moderate] Study
- Voriconazole slightly increases the exposure to **NSAID** (diclofenac). Monitor and adjust dose. [Moderate] Study
- Voriconazole moderately increases the exposure to **NSAID** (ibuprofen). Adjust dose. [Moderate] Study
- Fluconazole increases the exposure to **NSAID** (paraxoxib). Monitor and adjust dose. [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Study
- **Miconazole** is predicted to increase the exposure to opioids (afentanil). Use with caution and adjust dose. [Moderate] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to opioids (afentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to opioids (afentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to opioids (methadone). [Moderate] Theoretical → Also see TABLE 9 p. 1266
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to oxobutynin. [Mild] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to oxobutynin. [Mild] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to paflobicil. Avoid or adjust paflobicil dose, p. 909. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 864. [Moderate] Study → Also see TABLE 9 p. 1266
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to partiprevir (with ritonavir and omibitasir). Avoid. [Severe] Theoretical
- **Posaconazole** is predicted to increase the exposure to paritaprevir (with ritonavir and omibitasir) and paritaprevir (with ritonavir and omibitasir) is predicted to increase the exposure to posaconazole. Avoid. [Severe] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to pazopanib. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose, p. 909. [Moderate] Study → Also see TABLE 9 p. 1266
- **Miconazole** greatly increases the anticoagulant effect of **phenindione**. [Severe] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 765. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study → Also see TABLE 9 p. 1266
- **Miconazole** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Use with caution and adjust dose. [Severe] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor and adjust sildenafil dose, p. 766. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid or adjust sildenafil dose, p. 766. [Severe] Study → Also see TABLE 9 p. 1266
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Adjust dose. [Severe] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to pimozide. Avoid. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to pimozide. Avoid. [Severe] Study → Also see TABLE 9 p. 1266
- **Miconazole** is predicted to increase the exposure to pimozide. Avoid. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to **ponatinib**. Monitor and adjust ponatinib dose, p. 911. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to **praziquantel**. [Mild] Study
- Fluconazole is predicted to increase the exposure to **proton pump inhibitors**. [Mild] Study
- **Proton pump inhibitors** decrease the absorption of itraconazole. Administer itraconazole capsules with an acidic beverage. [Moderate] Study
- **Proton pump inhibitors** decrease the absorption of ketoconazole. Administer ketoconazole with an acidic beverage. [Moderate] Study
- **Proton pump inhibitors** decrease the absorption of posaconazole (oral suspension). Avoid. [Moderate] Study
- Voriconazole increases the exposure to proton pump inhibitors (esomeprazole, omeprazole). Adjust dose. [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study
- Voriconazole increases the exposure to proton pump inhibitors (esomeprazole, omeprazole). Adjust dose. [Moderate] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to quetiapine. Avoid. [Severe] Study
- **Posaconazole** increases the exposure to proton pump inhibitors (esomeprazole, omeprazole). Adjust dose. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ranolazine. [Severe] Study

Interactions | Appendix 1

Downloaded from www.medicalbr.com
Antifungals, azoles (continued)

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ranolazine. Avoid. (Severe) Study → Also see TABLE 9 p. 1266

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to reboxetine. Avoid. (Moderate) Study

- Miconazole is predicted to increase the concentration of reboxetine. Use with caution and adjust dose. (Moderate) Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to regorafenib. Avoid. (Moderate) Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to repaglinide. (Moderate) Study

- Antifungals, azoles (fluconazole, itraconazole, ketoconazole, miconazole, voriconazole, posaconazole) are predicted to increase the exposure to retinoids (altretinoin). Adjust altretinoin dose, p. 1157. (Moderate) Theoretical

- Antifungals, azoles (fluconazole, ketoconazole, voriconazole) are predicted to increase the risk of tretinoin toxicity when given with retinoids (tretinoin). (Moderate) Study

- Antifungals, azoles (itraconazole, posaconazole) increase the concentration of rifabutin and rifabutin decreases the concentration of antifungals, azoles (itraconazole, posaconazole). Avoid. (Severe) Study

- Fluconazole increases the risk of uveitis when given with rifabutin. Adjust dose. (Severe) Study

- Rifabutin is predicted to decrease the exposure to isavuconazole. Avoid. (Severe) Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to decrease the concentration of ketoconazole. Avoid, (Severe) Theoretical

- Fluconazole increases the concentration of voriconazole and voriconazole increases the concentration of ketoconazole. Avoid or adjust voriconazole dose, p. 566. (Severe) Study

- Rifampicin slightly decreases the exposure to fluconazole. Adjust dose. (Moderate) Study

- Rifampicin is predicted to decrease the exposure to isavuconazole. Avoid. (Severe) Study

- Rifampicin markedly decreases the exposure to itraconazole. Avoid rifampicin for 14 days before and during treatment with itraconazole. (Moderate) Study

- Rifampicin markedly decreases the exposure to ketoconazole and ketoconazole potentially decreases the exposure to rifampicin. Avoid. (Moderate) Study

- Rifampicin is predicted to decrease the exposure to posaconazole. Avoid. (Moderate) Anecdotal

- Rifampicin very markedly decreases the exposure to voriconazole. Avoid. (Moderate) Study

- Itraconazole is predicted to increase the exposure to riociguat. Avoid. (Moderate) Study

- Ketoconazole moderately increases the exposure to riociguat. Avoid. (Moderate) Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study → Also see TABLE 9 p. 1266

- Antifungals, azoles (itraconazole, ketoconazole) increase the exposure to rivaroxaban. Avoid. (Severe) Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to rivaroxaban. Avoid. (Moderate) Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ruxolitinib. (Moderate) Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to saxagliptin. (Mild) Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to saxagliptin. (Moderate) Study

- Fluconazole is predicted to increase the exposure to selexipag. (Unknown) Theoretical

- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to simprevir. Avoid. (Severe) Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) increase the concentration of sirolimus. Monitor and adjust dose. (Moderate) Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of sirolimus. Avoid. (Severe) Study

- Miconazole is predicted to increase the concentration of sirolimus. Monitor and adjust dose. (Moderate) Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of sirolimus. (Moderate) Anecdotal

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to SSRIs (citalopram). (Severe) Theoretical → Also see TABLE 9 p. 1266

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to SSRIs (dapoxetine). Adjust dapoxetine dose, p. 773. (Moderate) Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to SSRIs (dapsone). Avoid, or adjust dapoxetine dose, p. 773. (Severe) Study

- St John’s Wort is predicted to decrease the exposure to isavuconazole. Avoid. (Severe) Theoretical

- St John’s Wort moderately decreases the exposure to voriconazole. Avoid. (Moderate) Study

- Miconazole potentially increases the exposure to statins (atorvastatin). (Severe) Anecdotal

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. (Severe) Theoretical → Also see TABLE 1 p. 1264

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. (Severe) Study → Also see TABLE 1 p. 1264

- Antifungals, azoles (fluconazole, miconazole) are predicted to increase the exposure to statins (fluvastatin). Avoid. (Severe) Study → Also see TABLE 1 p. 1264

- Miconazole is predicted to increase the exposure to statins (simvastatin). Avoid. (Severe) Theoretical

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 198. (Severe) Study → Also see TABLE 1 p. 1264

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to statins (simvastatin). Avoid. (Severe) Study → Also see TABLE 1 p. 1264

- Antifungals, azoles (fluconazole, miconazole, voriconazole) are predicted to increase the exposure to sulfonyleurases. Use with caution and adjust dose. (Moderate) Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to sunitinib. (Moderate) Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 914. (Moderate) Study → Also see TABLE 9 p. 1266

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of tacrolimus. (Severe) Study

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study

- Miconazole is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. (Severe) Theoretical

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to tasaden (cabazitaxel). (Moderate) Theoretical
Antifungals, azoles

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to taxanes (cabazitaxel). Avoid. (Severe) Study

Miconazole is predicted to increase the concentration of taxanes (docetaxel). Use with caution and adjust dose. (Moderate) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to taxanes (docetaxel). Avoid or adjust dose. (Severe) Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to taxanes (paclitaxel). (Severe) Theoretical

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of temsirolimus. (Moderate) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of temsirolimus. Avoid. (Severe) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to ticagrelor. Avoid. (Severe) Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to tolvaptan. Adjust dose. (Moderate) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tolvaptan. Avoid. (Severe) Study → Also see TABLE 9 p. 1266

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to topotecan. (Severe) Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to toremifene. (Moderate) Theoretical → Also see TABLE 9 p. 1266

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to trabectedin. Avoid or adjust dose. (Severe) Theoretical → Also see TABLE 1 p. 1264

Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the concentration of tramepralin. (Moderate) Theoretical

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to trazodone. (Moderate) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. (Moderate) Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to uliprastal. Avoid if used for uterine fibroids. (Moderate) Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Severe) Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to vemurafenib. (Severe) Theoretical → Also see TABLE 9 p. 1266

Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose, p. 919. (Severe) Study → Also see TABLE 9 p. 1266

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to venlafaxine. (Moderate) Theoretical

Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to vinca alkaloids. (Severe) Theoretical → Also see TABLE 1 p. 1264 → Also see TABLE 9 p. 1266

Miconazole is predicted to increase the concentration of vinca alkaloids. Use with caution and adjust dose. (Moderate) Theoretical

Antifungals, azoles (clotrimazole, ketoconazole) are predicted to decrease the exposure to vitamin D substances (colecalciferol). (Moderate) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to vitamin D substances (paricalcitol). (Moderate) Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to zopiclone. Adjust dose. (Moderate) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to zopiclone. Adjust dose. (Moderate) Theoretical

Antihistamines, non-sedating → see TABLE 9 p. 1266 (QT-interval prolongation)

Acrivastine · Azelastine · Bilastine · Citizine · Desloratadine · Fexofenadine · Levocetirizine · Loratadine · Mizolastine

**Food and Lifestyle**

Apple juice and orange juice decrease the exposure to fexofenadine.

**Antacids** decrease the absorption of fexofenadine. Separate administration by 2 hours. (Mild) Study

Antiarrhythmics (dronedarone) are predicted to increase the exposure to antihistamines, non-sedating (fexofenadine, mizolastine). (Severe) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mizolastine. Avoid. (Severe) Study

Antifungals, azoles (miconazole) are predicted to increase the exposure to mizolastine. Avoid. (Moderate) Theoretical

Aprepitant is predicted to increase the exposure to mizolastine. (Severe) Theoretical

Antihistamines, non-sedating are predicted to decrease the effects of betahistine. (Moderate) Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to mizolastine. (Severe) Theoretical

Ceritinib is predicted to increase the exposure to fexofenadine. (Moderate) Theoretical

Cobicistat is predicted to increase the exposure to mizolastine. Avoid. (Severe) Study

Crizotinib is predicted to increase the exposure to mizolastine. (Severe) Theoretical

Grapefruit juice slightly decreases the exposure to bilastine. Bilastine should be taken 1 hour before or 2 hours after grapefruit juice. (Moderate) Study

Antihistamines, non-sedating are predicted to decrease the effects of histamine. Avoid. (Severe) Theoretical

HIV- protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to mizolastine. Avoid. (Severe) Study

HIV- protease inhibitors (indinavir) are predicted to increase the exposure to mizolastine. (Severe) Theoretical

Idealisib is predicted to increase the exposure to mizolastine. Avoid. (Severe) Study

Imatinib is predicted to increase the exposure to mizolastine. (Severe) Theoretical

Lapatinib is predicted to increase the exposure to fexofenadine. (Moderate) Theoretical

Lumacaftor is predicted to affect the exposure to fexofenadine. Monitor and adjust dose. (Moderate) Theoretical

Macrolides (clarithromycin) are predicted to increase the exposure to mizolastine. Avoid. (Severe) Study

Macrolides (erythromycin) are predicted to increase the exposure to mizolastine. (Severe) Theoretical

Mirabegron is predicted to increase the exposure to fexofenadine. (Mild) Theoretical

Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of antimuscarinic side-effects when given with antihistamines, non-sedating. Avoid. (Severe) Theoretical

Netupitant is predicted to increase the exposure to mizolastine. (Severe) Theoretical

Nilotinib is predicted to increase the exposure to mizolastine. (Severe) Theoretical

Rifampicin is predicted to decrease the exposure to bilastine. (Moderate) Theoretical
Antihistamines, non-sedating — Antimalarials

Antimalarials

- **Rifampicin** increases the clearance of **fexofenadine**. [Moderate Study]
- **Velpatasvir** is predicted to increase the exposure to **fexofenadine**. [Severe Theoretical]

**Antimalarials** (procaine) → see TABLE 9 p. 1266 (QT-interval prolongation), TABLE 11 p. 1266 (CNS depressant effects), TABLE 10 p. 1266 (antimuscarnics)

**ROUTE-SPECIFIC INFORMATION** Since systemic absorption can follow topical application of **ketotifen**, the possibility of interactions should be borne in mind.

- **Hydroxyzine** potentially increases the risk of overheating and dehydration when given with **antiplatelets** (**zonisamide**). Avoid in children. [Severe Theoretical]
- **Antihistamines**, **sedating** are predicted to decrease the effects of **betahistine**. [Moderate Theoretical]
- **Antihistamines, sedating** are predicted to decrease the effects of **histamine**. Avoid. [Severe Theoretical]
- **Cyproheptadine** decreases the effects of **metyrapone**. Avoid. [Moderate Study]
- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of antimuscarnic side-effects when given with **antihistamines**, **sedating**. Avoid. [Severe Theoretical]
- **Antihistamines, sedating** are predicted to decrease the efficacy of **pitolisant**. [Unknown] Theoretical
- **Cyproheptadine** potentially decreases the effects of **SSRIs**. [Anecdotal] Theoretical

Antimalarials → see TABLE 15 p. 1267 (myelosuppression), TABLE 9 p. 1266 (QT-interval prolongation)

**PHARMACOLOGY** Piperaquine has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped.

- **Chloroquine** is predicted to decrease the effects of **agalsidase**. Avoid. [Moderate Theoretical]
- **Antimalarials** (**chloroquine**, **primaquine**) are predicted to increase the risk of methaemoglobinemia when given with topical **anesthetics**, local (**prilocaine**). Use with caution or avoid. [Severe Theoretical]
- **Antacids** decrease the absorption of **chloroquine**. Separate administration by at least 4 hours. [Moderate Study]
- **Antacids** are predicted to decrease the absorption of **proguanil**. Separate administration by at least 2 hours. [Moderate Study]
- **Antiarrhythmics** (**dronedarone**) are predicted to increase the concentration of **piperaquine**. [Severe Theoretical]
- **Antiplatelets** (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the exposure to **artemether** (with lumafantrine). Avoid. [Severe Study]
- **Antiplatelets** (**carbamazepine**, **fosphenytoin**, **phenobarbital**, **phenytoin**, **primidone**) are predicted to decrease the concentration of **piperaquine**. Avoid. [Moderate Theoretical]
- **Pyrimethamine** increases the risk of haematological toxicity when given with **antiplatelets** (**fosphenytoin**, **phenytoin**). [Severe Study]
- **Pyrimethamine** is predicted to increase the risk of haematological toxicity when given with **antiplatelets** (**phenobarbital**, **primidone**). [Severe Theoretical]
- **Antifungals, azoles** (**fluconazole**, **itraconazole**, **mefloquine**, **itraconazole**), **pyrimethamine**, **posaconazole**, **voriconazole**) are predicted to increase the concentration of **piperaquine**. [Severe Theoretical]
- **Antifungals, azoles** (**itraconazole**, **ketocanozone**, **voriconazole**) are predicted to increase the exposure to **mefloquine**. [Moderate Theoretical]
- **Antifungals, azoles** (**itraconazole**, **ketocanozone**, **voriconazole**) are predicted to increase the exposure to **artemether** (with lumafantrine). [Moderate Study] 

**HIV**

- **Antifungals, azoles** (**ketocanozone**) increase the exposure to **mefloquine**. [Moderate Study]
- **Antimalarials** (**proguanil**) are predicted to increase the risk of side-effects when given with **antimalarials** (**pyrimethamine**). [Severe Theoretical]
- **Aprepitant** is predicted to increase the concentration of **piperaquine**. [Severe Theoretical]
- **Mefloquine** is predicted to increase the risk of bradycardia when given with **beta blockers, non-selective**. [Severe Theoretical]
- **Mefloquine** is predicted to increase the risk of bradycardia when given with **calcium channel blockers**. [Severe Theoretical]
- **Calcium channel blockers** (**diltiazem**, **verapamil**) are predicted to increase the concentration of **piperaquine**. [Severe Theoretical]
- **Calcium salts** (**calcium carbonate**) decrease the absorption of **chloroquine**. Separate administration by at least 4 hours. [Moderate Study]
- **Calcium salts** (**calcium carbonate**) are predicted to decrease the absorption of **proguanil**. Separate administration by at least 2 hours. [Moderate Study]
- **Chloroquine** decreases the efficacy of **oral cholera vaccine**. [Moderate Study]
- **Cobicistat** is predicted to increase the exposure to **artemether** (with **lumafantrine**). [Moderate Study]
- **Cobicistat** is predicted to increase the concentration of **piperaquine**. [Severe Theoretical]
- **Clobimetazol** is predicted to increase the concentration of **piperaquine**. [Severe Theoretical]
- **Antimalarials** (**chloroquine**, **primaquine**) are predicted to increase the risk of methaemoglobinemia when given with **dapsone**. [Severe Theoretical]
- **Mefloquine** is predicted to increase the risk of bradycardia when given with **digoxin**. [Severe Theoretical]
- **Quinine** increases the concentration of **digoxin**. Monitor and adjust **digoxin** dose. [Severe] Anecdotal
- **Efavirenz** decreases the concentration of **artemether**. [Severe Study]
- **Efavirenz** moderately decreases the exposure to **atovaquone**. Avoid. [Moderate Study]
- **Efavirenz** affects the exposure to **proguanil**. Avoid. [Moderate Study]
- **Enzalutamide** is predicted to decrease the exposure to **artemether** (with lumafantrine). Avoid. [Severe Study]
- **Enzalutamide** is predicted to decrease the concentration of **piperaquine**. Avoid. [Moderate Theoretical]
- **Etravirine** decreases the exposure to **artemether**. [Moderate Study]
- **Grapefruit juice** increases the exposure to **artemether**. [Unknown] Study
- **Grapefruit juice** is predicted to increase the concentration of **piperaquine**. Avoid. [Severe Study]
- **H₂ receptor antagonists** (**cimetidine**) decrease the clearance of **chloroquine**. [Moderate Study]
- **H₂ receptor antagonists** (**cimetidine**) slightly increase the exposure to **quinine**. [Moderate Study]
- **Antimalarials** (**artemether**, **atovaquone**, **chloroquine**, **mefloquine**, **primaquine**, **proguanil**, **pyrimethamine**, **quinine**) are predicted to affect the exposure to **histamine**. Avoid. [Severe Theoretical]
- **HIV-protease inhibitors** (**atazanavir**, **darunavir**, **fosamprenavir**, **lopinavir**, **ritonavir**, **saquinavir**, **tipranavir**) are predicted to increase the exposure to **artemether** (with lumafantrine). [Moderate Study] → Also see TABLE 9 p. 1266
- **HIV-protease inhibitors** decrease the exposure to **atovaquone**. Avoid if boosted with ritonavir. [Moderate Study]
- **HIV-protease inhibitors** are predicted to increase the concentration of **piperaquine**. [Severe Theoretical]
- **HIV-protease inhibitors** are predicted to decrease the exposure to **proguanil**. Avoid. [Moderate Study]
- **HIV-protease inhibitors** are predicted to affect the exposure to **quinine**. [Severe] Study → Also see TABLE 9 p. 1266
- **Idelalisib** is predicted to increase the exposure to **artemether** (with lumafantrine). [Moderate Study]
- **Idelalisib** is predicted to increase the concentration of **piperaquine**. [Severe Theoretical]
**Imatinib** is predicted to increase the concentration of piperazine. **Severe** Theoretical

**Lanthanum** is predicted to decrease the absorption of chloroquine. Separate administration by at least 2 hours. **Moderate** Theoretical

**Chloroquine** is predicted to decrease the exposure to laronidase. Avoid simultaneous administration. **Severe** Theoretical

**Macrolides (clarithromycin)** are predicted to increase the exposure to pyrimethamin. **Severe** Theoretical

**Aprepitant** is predicted to increase the exposure to apixaban. Avoid. **Severe** Theoretical

**Macrolides (erythromycin)** are predicted to increase the exposure to apixaban. **Moderate** Theoretical

**Rifampicin** is predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. **Severe** Study

**St John’s Wort** is predicted to decrease the exposure to apixaban. Use with caution or avoid. **Moderate** Theoretical

**Apomorphine** → see dopamine receptor agonists

**Apremilast** is predicted to increase the exposure to apixaban. Avoid. **Severe** Theoretical

**Theoretical**

**Pyrimethamine** is predicted to increase the risk of side-effects when given with *methotrexate*. **Severe** Theoretical → Also see TABLE 15 p. 1267

**Metoclopramide** decreases the concentration of atovaquone. Avoid. **Moderate** Study

**Netupitant** is predicted to increase the concentration of piperazine. **Severe** Theoretical

**Nilotinib** is predicted to increase the concentration of piperazine. **Severe** Theoretical

**Pyrimethamine** is predicted to increase the risk of side-effects when given with *pemetrexed*. **Severe** Theoretical → Also see TABLE 15 p. 1267

**Chloroquine** is predicted to increase the risk of haematological toxicity when given with *penicillamine*. Avoid. **Severe** Theoretical

**Chloroquine** moderately decreases the exposure to praziquantel. Use with caution and adjust dose. **Moderate** Study

**Chloroquine** decreases the efficacy of *rabies vaccine*. Avoid. **Moderate** Study

**Rifaximin** slightly decreases the exposure to atovaquone. Avoid. **Moderate** Study

**Rifaximin** is predicted to decrease the exposure to artemether (with lumafantrine). Avoid. **Severe** Study

**Rifaximin** moderately decreases the exposure to atovaquone and atovaquone slightly increases the exposure to rifampicin. Avoid. **Moderate** Study

**Rifaximin** moderately decreases the exposure to *mefloquine*. **Severe** Study

**Rifaximin** is predicted to decrease the concentration of piperazine. Avoid. **Moderate** Theoretical

**Rifaximin** decreases the exposure to quinine. **Severe** Study

**St John’s Wort** is predicted to decrease the concentration of piperazine. Avoid. **Moderate** Theoretical

**Pyrimethamine** increases the risk of side-effects when given with *sulfonamides*. **Severe** Study → Also see TABLE 15 p. 1267

**Tetracyclines (tetracycline)** decrease the concentration of atovaquone. **Moderate** Study

**Pyrimethamine** increases the risk of side-effects when given with *trimethoprim*. **Severe** Study

**Pyrimethamine** is predicted to increase the risk of side-effects when given with *zidovudine*. **Severe** Theoretical → Also see TABLE 15 p. 1267

**Apixaban** → see TABLE 3 p. 1264 (anticoagulant effects)

**Antiarrhythmics (dronedarone)** are predicted to increase the exposure to apixaban. **Moderate** Theoretical

**Antiarrhythmics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. **Severe** Study

**Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly decrease the exposure to aprepiant. Avoid. **Moderate** Study

**Antifungals, azoles (isavuconazole)** are predicted to markedly decrease the exposure to aprepiant. **Moderate** Study

**Apixaban** is predicted to increase the exposure to aldoosterone antagonists (eplerenone). Adjust eplerenone dose, p. 185. **Severe** Study

**Apixaban** is predicted to increase the exposure to alpha blockers (tamsulosin). **Moderate** Theoretical

**Apixaban** is predicted to increase the exposure to alprazolam. **Severe** Study

**Apixaban** increases the exposure to antiarrhythmics (dronedarone). **Severe** Theoretical

**Apixaban** is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. **Moderate** Study

**Apixaban** is predicted to increase the exposure to antidepressants (amitriptyline, desipramine, imipramine). **Severe** Theoretical

**Apixaban** is predicted to increase the concentration of antimalarials (piperazine). **Severe** Theoretical

**Apixaban** is predicted to increase the exposure to axitinib. **Moderate** Theoretical

**Apixaban** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. **Mild** Theoretical

**Apixaban** is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. **Severe** Theoretical

**Apixaban** is predicted to increase the exposure to buspirone. Use with caution and adjust dose. **Moderate** Study

**Apixaban** is predicted to increase the exposure to cabozantinib. **Moderate** Theoretical

**Calcium channel blockers** are predicted to increase the exposure to aprepiant and aprepiant increases the exposure to calcium channel blockers. **Moderate** Study

**Calcium channel blockers (verapamil)** are predicted to increase the exposure to aprepiant and aprepiant is predicted to increase the exposure to calcium channel blockers. **Moderate** Theoretical

**Aprepitant** is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. **Moderate** Study
Aprepitant (continued)
▶ Aprepitant is predicted to increase the exposure to ceritinib. Moderate Theoretical
▶ Aprepitant increases the concentration of ciclosporin. Severe Study
▶ Cobimetinib is predicted to markedly increase the exposure to cobimetinib. Severe Theoretical
▶ Aprepitant is predicted to increase the exposure to colchicine. Adjust colchicine dose, p. 1020. Severe Study
▶ Aprepitant is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 747. Severe Study
▶ Aprepitant moderately increases the exposure to corticosteroids (dexamethasone). Monitor and adjust dose. Moderate Study
▶ Aprepitant is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. Moderate Study
▶ Aprepitant decreases the anticoagulant effect of coumarins. Moderate Study
▶ Aprepitant is predicted to increase the exposure to crizotinib. Moderate Theoretical
▶ Aprepitant is predicted to slightly increase the exposure to darifenacin. Moderate Study
▶ Aprepitant is predicted to increase the exposure to dasatinib. Severe Study
▶ Aprepitant is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. Severe Theoretical
▶ Aprepitant increases the risk of QT-prolongation when given with domperidone. Avoid. Severe Study
▶ Aprepitant is predicted to increase the exposure to dopamine receptor agonists (溴隐亭, cabergoline). Severe Theoretical
▶ Aprepitant is predicted to moderately increase the exposure to dutasteride. Mild Study
▶ Enzalutamide is predicted to markedly decrease the exposure to aprepitant. Avoid. Moderate Study
▶ Aprepitant is predicted to increase the risk of ergotism when given with ergometrine. Severe Theoretical
▶ Aprepitant is predicted to increase the risk of ergotism when given with ergotamine. Severe Theoretical
▶ Aprepitant is predicted to increase the exposure to erlotinib. Moderate Theoretical
▶ Aprepitant is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. Severe Theoretical
▶ Aprepitant is predicted to increase the concentration of everolimus. Avoid or adjust dose. Moderate Study
▶ Aprepitant is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment, p. 732. Mild Study
▶ Aprepitant is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 335. Moderate Theoretical
▶ HIV- protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to aprepitant. Moderate Study
▶ Aprepitant is predicted to decrease the effects of Hormone replacement therapy. Moderate Anecdotal
▶ Aprepitant is predicted to increase the exposure to irbutinib. Avoid or adjust irbutinib dose, p. 902. Severe Theoretical
▶ Idelalisib is predicted to markedly increase the exposure to aprepitant. Moderate Study
▶ Aprepitant is predicted to increase the exposure to imatinib. Moderate Theoretical
▶ Aprepitant is predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 205. Severe Theoretical
▶ Aprepitant is predicted to increase the exposure to ivacaftor. Adjust ivacaftor dose, p. 281. Severe Study
▶ Aprepitant is predicted to increase the exposure to lapiatinib. Moderate Study
▶ Aprepitant is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 747. Severe Theoretical
▶ Aprepitant is predicted to increase the exposure to lomitapide. Avoid. Moderate Theoretical
▶ Aprepitant is predicted to increase the exposure to lurusidone. Moderate Study
▶ Aprepitant is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. Severe Study
▶ Aprepitant is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 63. Moderate Study
▶ Aprepitant is predicted to increase the exposure to nilotinib. Moderate Theoretical
▶ Aprepitant is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 747. Severe Anecdotal
▶ Aprepitant is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. Moderate Theoretical
▶ Aprepitant is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. Moderate Study
▶ Aprepitant is predicted to increase the exposure to opioids (methadone, sufentanil). Moderate Theoretical
▶ Aprepitant is predicted to increase the exposure to oxabutolin. Mild Theoretical
▶ Aprepitant is predicted to increase the exposure to pazopanib. Moderate Theoretical
▶ Aprepitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 765. Moderate Theoretical
▶ Aprepitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor and adjust sildenafil dose, p. 766. Moderate Study
▶ Aprepitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Severe Theoretical
▶ Aprepitant is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. Severe Theoretical
▶ Aprepitant is predicted to increase the exposure to pimozide. Avoid. Moderate Theoretical
▶ Aprepitant is predicted to increase the exposure to quetiapine. Avoid. Moderate Study
▶ Aprepitant is predicted to increase the exposure to ranolazine. Severe Study
▶ Aprepitant is predicted to markedly decrease the exposure to aprepitant. Avoid. Moderate Study
▶ Aprepitant is predicted to increase the exposure to ruxolitinib. Moderate Theoretical
▶ Aprepitant is predicted to increase the exposure to saxagliptin. Mild Study
▶ Aprepitant is predicted to increase the exposure to simeprevir. Avoid. Severe Study
▶ Aprepitant increases the concentration of sirolimus. Monitor and adjust dose. Moderate Study
▶ Aprepitant is predicted to increase the exposure to SSRIs. (dapoxetine). Adjust dapoxetine dose, p. 773. Moderate Theoretical
▶ St John’s Wort is predicted to decrease the exposure to aprepitant. Avoid. Moderate Theoretical
▶ Aprepitant is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. Severe Theoretical
▶ Aprepitant is predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 198. Severe Study
▶ Aprepitant is predicted to increase the exposure to sunifatinib. Moderate Theoretical
▶ Aprepitant is predicted to increase the concentration of tacrolimus. Severe Study
▶ Aprepitant is predicted to increase the exposure to taxanes (cabazitaxel). Moderate Theoretical
▶ Aprepitant is predicted to increase the concentration of temsirolimus. Moderate Theoretical
Aprepitant – Atomoxetine 1297

- Aprepitant is predicted to increase the exposure to tolterodine. [Mild] Theoretical
- Aprepitant is predicted to increase the exposure to tolvaptan. Adjust dose. [Moderate] Theoretical
- Aprepitant is predicted to increase the exposure to trazodone. [Moderate] Theoretical
- Aprepitant decreases the efficacy of ulipristal. For FSHR guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- Aprepitant is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose, p. 919. [Severe] Study
- Aprepitant is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical
- Aprepitant is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- Argatroban → see TABLE 3 p. 1264 (anticoagulant effects)
- Ranibizumab is predicted to increase the risk of bleeding events when given with argatroban. [Severe] Theoretical
- Arripiiprazole → see TABLE 8 p. 1265 (hypotension), TABLE 11 p. 1266 (CNS depressant effects)
- Antiepileptics (Carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to arripiiprazole. Adjust arripiiprazole dose, p. 376. [Moderate] Study → Also see TABLE 11 p. 1266
- Antifungals (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to arripiiprazole. Adjust arripiiprazole dose, p. 376. [Moderate] Study
- Bupropion is predicted to moderately increase the exposure to arripiiprazole. Adjust arripiiprazole dose, p. 376. [Moderate] Study
- Cinacalcet is predicted to moderately increase the exposure to arripiiprazole. Adjust arripiiprazole dose, p. 376. [Moderate] Study
- Ciclosporin is predicted to slightly increase the exposure to arripiiprazole. Adjust arripiiprazole dose, p. 376. [Moderate] Study
- Arripiiprazole is predicted to decrease the effects of dopamine receptor agonists. [Moderate] Theoretical → Also see TABLE 8 p. 1265
- Enzalutamide is predicted to moderately decrease the exposure to arripiiprazole. Adjust arripiiprazole dose, p. 376. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to slightly increase the exposure to arripiiprazole. Adjust arripiiprazole dose, p. 376. [Moderate] Study
- Rifampicin is predicted to moderately decrease the exposure to arripiiprazole. Adjust arripiiprazole dose, p. 376. [Moderate] Study
- Arripiiprazole is predicted to decrease the effects of levodopa. [Severe] Theoretical → Also see TABLE 8 p. 1265
- Macrolides (clarithromycin) are predicted to slightly increase the exposure to arripiiprazole. Adjust arripiiprazole dose, p. 376. [Moderate] Study
- Terbinafine is predicted to moderately increase the exposure to arripiiprazole. Adjust arripiiprazole dose, p. 376. [Moderate] Study
- Arsenic trioxide → see TABLE 15 p. 1267 (myelosuppression), TABLE 9 p. 1266 (QT-interval prolongation)
- Artemether → see antimalarials
- Arteminol → see antimalarials
- Articaine → see TABLE 11 p. 1266 (CNS depressant effects)
- Ascorbic acid is predicted to increase the risk of cardiovascular side-effects when given with deferiprone. [Severe] Theoretical
- Ascorbic acid is predicted to increase the risk of cardiovascular side-effects when given with iron chelators (desferrioxamine). [Severe] Theoretical
- Asenapine → see TABLE 8 p. 1265 (hypotension), TABLE 11 p. 1266 (CNS depressant effects)
- Asenapine is predicted to decrease the effects of dopamine receptor agonists. Adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 1265
- Asenapine is predicted to decrease the effects of levodopa. Adjust dose. [Severe] Theoretical → Also see TABLE 8 p. 1265
- SSRIs (fluvoxamine) increase the exposure to asenapine. [Moderate] Study
- SSRIs (paroxetine) moderately increase the exposure to asenapine. [Moderate] Study
- Asparaginase → see TABLE 1 p. 1264 (hepatotoxicity), TABLE 15 p. 1267 (myelosuppression)
- Asparaginase is predicted to increase the risk of hepatotoxicity when given with imatinib. [Severe] Theoretical → Also see TABLE 15 p. 1267
- Asparaginase affects the efficacy of methotrexate. [Severe] Anecdotal → Also see TABLE 1 p. 1264 → Also see TABLE 15 p. 1267
- Asparaginase potentially increases the risk of neurotoxicity when given with vinca alkaloids (vincristine). Vincristine should be taken 3 to 24 hours before asparaginase. [Severe] Anecdotal → Also see TABLE 1 p. 1264 → Also see TABLE 15 p. 1267
- Aspirin → see TABLE 4 p. 1264 (antiplatelet effects)
- Acetazolamide increases the risk of severe toxic reaction when given with aspirin (high-dose). [Severe] Study
- Antacids decrease the absorption of aspirin (high-dose). [Moderate] Study
- Aspirin (high-dose) is predicted to increase the risk of gastrointestinal irritation when given with bisphosphonates (alendronic acid, ibandronic acid). [Moderate] Study
- Aspirin (high-dose) is predicted to increase the risk of renal impairment when given with bisphosphonates (sodium clodronate). [Severe] Theoretical
- Corticosteroids are predicted to decrease the concentration of aspirin (high-dose) and aspirin (high-dose) increases the risk of gastrointestinal bleeding when given with corticosteroids. [Moderate] Study
- Aspirin (high-dose) is predicted to increase the risk of gastrointestinal bleeds when given with iron chelators (deferasirox). [Severe] Theoretical
- Aspirin (high-dose) is predicted to increase the risk of toxicity when given with methotrexate. [Severe] Theoretical
- Aspirin is predicted to increase the risk of gastrointestinal perforation when given with aspirin (high-dose). [Severe] Theoretical
- Aspirin (high-dose) potentially increases the risk of seizures when given with quinolones. [Severe] Theoretical
- Aspirin decreases the effects of sulfipyrazone. [Moderate] Study → Also see TABLE 4 p. 1264
- Aspirin (high-dose) increases the risk of acute renal failure when given with thiazide diuretics. [Severe] Theoretical
- Zidovudine increases the risk of haematological toxicity when given with aspirin (high-dose). [Severe] Study
- Ataluren
- Ataluren increases the exposure to adeovir. [Moderate] Study
- Ataluren is predicted to increase the risk of nephrotoxicity when given with intravenous aminoglycosides. Avoid. [Severe] Study
- Rifampicin decreases the exposure to ataluren. [Moderate] Study
- Atenolol → see beta blockers, selective
- Atomoxetine
- Amfetamines are predicted to increase the risk of side-effects when given with atomoxetine. [Severe] Theoretical
- Atomoxetine is predicted to increase the risk of cardiovascular side-effects when given with beta2 agonists (high-dose). [Moderate] Study
- Bupropion is predicted to markedly increase the exposure to atomoxetine. Adjust dose. [Severe] Study
- Cinacalcet is predicted to markedly increase the exposure to atomoxetine. Adjust dose. [Severe] Study
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of side-effects when given with atomoxetine. Avoid and for 2 weeks after stopping the MAOI. [Severe] Theoretical
1298 Atomoxetine — Bedaquiline
Atomoxetine (continued)
▶ Panobinostat is predicted to increase the exposure to
atomoxetine. Monitor and adjust dose. r Theoretical
▶ SSRIs (fluoxetine, paroxetine) are predicted to markedly
increase the exposure to atomoxetine. Adjust dose. r

BNF 74

▶

Anecdotal
▶

Study

Terbinafine is predicted to markedly increase the exposure to
atomoxetine. Adjust dose. r Study
Atorvastatin → see statins
Atovaquone → see antimalarials
Atracurium → see neuromuscular blocking drugs, non-depolarising
Atropine → see TABLE 10 p. 1266 (antimuscarinics)
▶ Atropine increases the risk of severe hypertension when given
with sympathomimetics, vasoconstrictor (phenylephrine). r
▶

Study

Interactions | Appendix 1

A1

Avanafil → see phosphodiesterase type-5 inhibitors
Axitinib → see TABLE 15 p. 1267 (myelosuppression)
▶ Antiarrhythmics (dronedarone) are predicted to increase the
exposure to axitinib. o Theoretical
▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure
to axitinib. Avoid or adjust dose. o Study
▶ Antifungals, azoles (fluconazole, isavuconazole, posaconazole)
are predicted to increase the exposure to axitinib. o
Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are
predicted to increase the exposure to axitinib. Avoid or adjust
dose. o Study
▶ Aprepitant is predicted to increase the exposure to axitinib.
▶

o Theoretical
▶

Bosentan is predicted to decrease the exposure to axitinib.

▶

Calcium channel blockers (diltiazem, verapamil) are predicted to
increase the exposure to axitinib. o Theoretical
Cobicistat is predicted to increase the exposure to axitinib.
Avoid or adjust dose. o Study
Axitinib is predicted to increase the risk of bleeding events
when given with coumarins. r Theoretical
Crizotinib is predicted to increase the exposure to axitinib.
o Theoretical → Also see TABLE 15 p. 1267
Efavirenz is predicted to decrease the exposure to axitinib.

o Theoretical

▶
▶
▶
▶

o Theoretical

Enzalutamide is predicted to decrease the exposure to axitinib.
Avoid or adjust dose. o Study
▶ Grapefruit juice is predicted to increase the exposure to
axitinib. o Theoretical
▶ HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir,
lopinavir, ritonavir, saquinavir, tipranavir) are predicted to
increase the exposure to axitinib. Avoid or adjust dose.
▶

o Study
▶
▶
▶
▶
▶
▶

HIV-protease inhibitors (indinavir) are predicted to increase the
exposure to axitinib. o Theoretical
Idelalisib is predicted to increase the exposure to axitinib.
Avoid or adjust dose. o Study → Also see TABLE 15 p. 1267
Imatinib is predicted to increase the exposure to axitinib.
o Theoretical → Also see TABLE 15 p. 1267
Macrolides (clarithromycin) are predicted to increase the
exposure to axitinib. Avoid or adjust dose. o Study
Macrolides (erythromycin) are predicted to increase the
exposure to axitinib. o Theoretical
Netupitant is predicted to increase the exposure to axitinib.
o Theoretical

Azacitidine → see TABLE 15 p. 1267 (myelosuppression)
Azathioprine → see TABLE 15 p. 1267 (myelosuppression)

Febuxostat is predicted to increase the exposure to
azathioprine. Avoid. r Theoretical
Live vaccines are predicted to increase the risk of generalised
infection (possibly life-threatening) when given with
azathioprine. Public Health England advises avoid. r

Azelastine → see antihistamines, non-sedating
Azilsartan → see angiotensin-II receptor antagonists
Azithromycin → see macrolides
Bacillus Calmette-Guérin vaccine → see live vaccines
Bacitracin → see TABLE 2 p. 1264 (nephrotoxicity)
Baclofen → see TABLE 8 p. 1265 (hypotension), TABLE 11 p. 1266 (CNS
depressant effects), TABLE 10 p. 1266 (antimuscarinics)
▶ Baclofen is predicted to increase the risk of side-effects when
given with levodopa. r Anecdotal → Also see TABLE 8 p. 1265
Balsalazide → see TABLE 15 p. 1267 (myelosuppression)
▶ Balsalazide is predicted to decrease the concentration of
digoxin. o Theoretical
Bambuterol → see beta2 agonists
Basiliximab → see monoclonal antibodies
Bazedoxifene
▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure
to bazedoxifene. o Theoretical
▶ Rifampicin is predicted to decrease the exposure to
bazedoxifene. o Theoretical
Beclometasone → see corticosteroids
Bedaquiline → see TABLE 9 p. 1266 (QT-interval prolongation)
▶ Antiarrhythmics (dronedarone) are predicted to increase the
exposure to bedaquiline. Avoid prolonged use. n
Theoretical → Also see TABLE 9 p. 1266
▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) decrease the exposure to bedaquiline.
Avoid. r Study
▶ Antifungals, azoles (fluconazole, isavuconazole, posaconazole)
are predicted to increase the exposure to bedaquiline. Avoid
prolonged use. n Theoretical
▶ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are
predicted to increase the exposure to bedaquiline. Avoid
prolonged use. n Study → Also see TABLE 9 p. 1266
▶ Aprepitant is predicted to increase the exposure to
bedaquiline. Avoid prolonged use. n Theoretical
▶ Bosentan is predicted to decrease the exposure to bedaquiline.
Avoid. r Study
▶ Calcium channel blockers (diltiazem, verapamil) are predicted to
increase the exposure to bedaquiline. Avoid prolonged use.

Nevirapine is predicted to decrease the exposure to axitinib.
Nilotinib is predicted to increase the exposure to axitinib.
o Theoretical → Also see TABLE 15 p. 1267
Axitinib is predicted to increase the risk of bleeding events
when given with phenindione. r Theoretical
Rifampicin is predicted to decrease the exposure to axitinib.
Avoid or adjust dose. o Study
St John’s Wort is predicted to decrease the exposure to axitinib.

Allopurinol potentially increases the risk of haematological
toxicity when given with azathioprine. Adjust azathioprine
dose, p. 787. r Study
Azathioprine decreases the anticoagulant effect of coumarins.
o Study

▶

▶

Imatinib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical

Macrolides (clarithromycin) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study

Also see TABLE 9 p. 1266

Macrolides (erythromycin) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical

Netupitant is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical

Nevirapine is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study

Nilotinib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical

St John’s Wort is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study

Bee venom extract

General information Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).

• ACE inhibitors increase the risk of hypersensitivity when given with bee venom extract. Avoid. [Severe] Study

Belatacept

• Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with belatacept. Public Health England advises avoid. [Severe] Theoretical

Betamethasone → see monoclonal antibodies

Betaxolol → see alkylation agents

Bendroflumethiazide → see thiazide diuretics

Benperidol → see TABLE 8 p. 1265 (hypotension), TABLE 11 p. 1266 (CNS depressant effects)

Benperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1265

Benperidol is predicted to decrease the effects of guanethidine. [Moderate] Theoretical → Also see TABLE 8 p. 1265

Benperidol is predicted to decrease the effects of levodopa. [Severe] Study → Also see TABLE 8 p. 1265

Benzylamine → see NSAIDs

Benzylpenicillin → see penicillins

Beta blockers, non-selective → see TABLE 6 p. 1265 (bradycardia), TABLE 8 p. 1265 (hypotension), TABLE 9 p. 1266 (QT-interval prolongation)

carteolol · carvedilol · labetalol · levobunolol · nadolol · oxprenolol · pindolol · propranolol · sotalol · timolol

Route-specific information Since systemic absorption can follow topical application of carteolol, levobunolol, and timolol, the possibility of interactions should be borne in mind.

Abrisnate is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). [Moderate] Theoretical

Beta blockers, non-selective are predicted to increase the risk of bronchospasm when given with aminophylline. Avoid. [Severe] Theoretical

Antiarrhythmics (amiodarone, disopyramide, droterenone, flecainide, lidocaine) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, non-selective. Use with caution or avoid. [Severe] Study → Also see TABLE 6 p. 1265 → Also see TABLE 9 p. 1266

Antiarrhythmics (propafenone) are predicted to increase the exposure to carvedilol. [Moderate] Theoretical

Antiarrhythmics (propafenone) increase the risk of cardiovascular side-effects when given with propranolol. Use with caution or avoid. [Severe] Study

Antiarrhythmics (propafenone) are predicted to increase the exposure to timolol and timolol is predicted to increase the risk of cardiodepression when given with antiarrhythmics (propafenone). [Severe] Anecdotal

Antiarrhythmics (propafenone) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, non-selective (carteolol, labetalol, levobunolol, nadolol, oxprenolol, pindolol, sotalol). Use with caution or avoid. [Severe] Study

Anticholinesterases, centrally acting are predicted to increase the risk of bradycardia when given with beta blockers, non-selective. [Moderate] Anecdotal → Also see TABLE 6 p. 1265

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to propranolol. [Moderate] Study

Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, non-selective (carvedilol, labetalol). [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to nadolol. [Moderate] Study

Antimalarials (methloquine) are predicted to increase the risk of bradycardia when given with beta blockers, non-selective. [Severe] Theoretical

Bupropion is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). [Moderate] Study

Calcium channel blockers (diltiazem) are predicted to increase the risk of cardiodepression when given with beta blockers, non-selective. [Severe] Study → Also see TABLE 6 p. 1265 → Also see TABLE 8 p. 1265

Intravenous calcium channel blockers (verapamil) increase the risk of cardiovascular side-effects when given with beta blockers, non-selective. Avoid. [Severe] Study → Also see TABLE 6 p. 1265 → Also see TABLE 8 p. 1265

Oral calcium channel blockers (verapamil) increase the risk of cardiovascular side-effects when given with beta blockers, non-selective. [Severe] Study → Also see TABLE 6 p. 1265 → Also see TABLE 8 p. 1265

Ciclosporin is predicted to increase the exposure to nadolol. [Moderate] Study

Cinacalcet is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). [Moderate] Study

Duloxetine is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). [Moderate] Theoretical

Beta blockers, non-selective are predicted to increase the risk of peripheral vasoconstriction when given with ergometrine. [Severe] Theoretical

Beta blockers, non-selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. [Severe] Study

HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to nadolol. [Moderate] Study

HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to carvedilol. [Moderate] Theoretical

HIV-protease inhibitors (ritonavir) (high-dose) are predicted to increase the exposure to timolol. [Moderate] Theoretical

Beta blockers, non-selective are predicted to increase the risk of bradycardia when given with lanreotide. [Moderate] Theoretical

Lapatinib is predicted to increase the exposure to nadolol. [Moderate] Study

Macrolides are predicted to increase the exposure to nadolol. [Moderate] Study

Mirabegron is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). [Moderate] Theoretical

Ranolazine is predicted to increase the exposure to nadolol. [Moderate] Study

Rifampicin moderately decreases the exposure to carvedilol. [Moderate] Study

Rifampicin decreases the exposure to propranolol. Monitor and adjust propranolol dose. [Moderate] Study

Propranolol slightly to moderately increases the exposure to ritaziptan. Adjust ritaziptan dose and separate administration by at least 2 hours. [Moderate] Study

SSRIs (fluvoxamine) moderately increase the concentration of propranolol. [Moderate] Study

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). [Moderate] Study

Beta blockers, non-selective are predicted to increase the risk of hypertension and bradycardia when given with sympotomimetics, inotropes (dobutamine). [Severe] Theoretical

Beta blockers, non-selective are predicted to increase the risk of hypertension and bradycardia when given with...
Beta blockers, non-selective (continued)

sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). Severe Study

- Terbinafine is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). Moderate Study
- Beta blockers, non-selective are predicted to increase the risk of bronchospasm when given with theophylline. Avoid. Severe Theoretical
- Vemurafenib is predicted to increase the exposure to nadolol. Moderate Study

Beta blockers, selective → see TABLE 6 p. 1265 (bradycardia), TABLE 8 p. 1265 (hypotension)

- acetylbutol · atenolol · betaxolol · bisoprolol · celiprolol · esmolol · metoprolol · nebivolol

Since systemic absorption can follow topical application of betaxolol, the possibility of interactions should be borne in mind.
- Orange juice greatly decreases the exposure to celiprolol.

- Abratherone is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). Moderate Study
- Beta blockers, selective are predicted to increase the risk of bronchospasm when given with aminophylline. Avoid. Severe Theoretical
- Antiarrhythmics (amiodarone, disopyramid, dronedarone, flecainide, lidocaine) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, selective. Use with caution or avoid. Severe Study → Also see TABLE 6 p. 1265
- Antiarrhythmics (propafenone) are predicted to increase the exposure to metoprolol. Moderate Study
- Antiarrhythmics (propafenone) are predicted to increase the exposure to nebivolol and nebivolol is predicted to increase the risk of cardiodepression when given with antiarrhythmics (propafenone). Avoid. Severe Theoretical
- Antiarrhythmics (propafenone) are predicted to increase the risk of cardiovascular side-effects when given with beta blockers, selective (acebutolol, atenolol, betaxolol, bisoprolol, celiprolol, esmolol). Use with caution or avoid. Severe Study
- Anticholinesterases, centrally acting are predicted to increase the risk of bradycardia when given with beta blockers, selective. Moderate Anecdotal → Also see TABLE 6 p. 1265
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to beta blockers, selective (acebutolol, bisoprolol, metoprolol, nebivolol). Moderate Study
- Antimarialis (mefloquine) are predicted to increase the risk of bradycardia when given with beta blockers, selective. Moderate Study
- Bupropion is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). Moderate Study
- Calcium channel blockers (diltiazem) are predicted to increase the risk of cardiodepression when given with beta blockers, selective. Severe Study → Also see TABLE 6 p. 1265 → Also see TABLE 8 p. 1265
- Intravenous calcium channel blockers (verapamil) increase the risk of cardiovascular side-effects when given with beta blockers, selective. Avoid. Severe Study → Also see TABLE 6 p. 1265 → Also see TABLE 8 p. 1265
- Oral calcium channel blockers (verapamil) increase the risk of cardiovascular side-effects when given with beta blockers, selective. Severe Study → Also see TABLE 6 p. 1265 → Also see TABLE 8 p. 1265
- Cinacalcet is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). Moderate Study
- Duloxetine is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). Moderate Study
- Beta blockers, selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. Severe Theoretical
- Beta blockers, selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. Severe Study
- Grapefruit juice greatly decreases the exposure to celiprolol. Moderate Study
- HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). Moderate Study
- Beta blockers, selective are predicted to increase the risk of bradycardia when given with lanreotide. Moderate Theoretical
- Mirabegron is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). Moderate Study
- Panobinostat is predicted to increase the exposure to metoprolol. Monitor and adjust dose. Moderate Theoretical
- Rifampicin slightly decreases the exposure to beta blockers, selective (bisoprolol, metoprolol). Mild Study
- Rifampicin moderately decreases the exposure to celpiropl. Moderate Study
- SSRI, (fluoxetine, paroxetine) are predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). Moderate Study
- Beta blockers, selective increase the risk of hypertension and bradycardia when given with sympathomimetics, inotropic (dobutamine). Severe Theoretical
- Beta blockers, selective are predicted to increase the risk of hypertenison and bradycardia when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). Severe Study
- Terbinafine is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). Moderate Study
- Beta blockers, selective are predicted to increase the risk of bronchospasm when given with theophylline. Avoid. Severe Theoretical

Beta, agonists → see TABLE 17 p. 1268 (reduced serum potassium) bumbetol · formoterol · indacaterol · olodaterol · salbutamol · salmeterol · terbutaline · vilanterol

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to salmeterol. Avoid. Severe Study
- Atomoxetine is predicted to increase the risk of cardiovascular side-effects when given with beta, agonists (high-dose). Moderate Study
- Cobicistat is predicted to increase the exposure to salmeterol. Avoid. Severe Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to salmeterol. Avoid. Severe Study
- Idealisib is predicted to increase the exposure to salmeterol. Avoid. Severe Study
- Beta, agonists are predicted to increase the risk of glaucoma when given with irtrapatropium. Moderate Anecdotal
- Beta, agonists are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. Severe Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to salmeterol. Avoid. Severe Study
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of cardiovascular side-effects when given with beta, agonists. Moderate Anecdotal
- Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of severe hypertension when given with beta, agonists. Avoid. Severe Theoretical
- Monoamine-oxidase B inhibitors (safinamide) are predicted to increase the risk of severe hypertension when given with beta2 agonists. Severe Theoretical

Betahistine
- Antihistamines, non-sedating are predicted to decrease the effects of betahistine. Moderate Theoretical
- Antihistamines, sedating are predicted to decrease the effects of betahistine. Moderate Theoretical
- Betamethasone → see corticosteroids
- Betaxolol → see beta blockers, selective
- Bevacizumab → see monoclonal antibodies
- Bexarotene → see retinoids
- Beaflazate → see fibrates
- Bicalutamide
- Bilastine → see antihistamines, non-sedating
Biphasic insulin aspart → see insulins
Biphasic insulin lispro → see insulins
Biphasic isophane insulin → see insulins
Bisacodyl → see TABLE 17 p. 1268 (reduced serum potassium)
Bisoprolol → see beta blockers, selective
Bisphosphonates → see TABLE 2 p. 1264 (nephrotoxicity)

Aminoglycosides increase the risk of hypocalcaemia when given with bisphosphonates. [Moderate] Anecdotal → Also see TABLE 2 p. 1264

Antacids decrease the absorption of alendronic acid. Alendronic acid should be taken at least 30 minutes before antacids. [Moderate] Study

Antacids are predicted to decrease the absorption of ibandronic acid. Avoid antacids for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical

Antacids decrease the absorption of risedronate. Separate administration by at least 2 hours. [Moderate] Study

Antacids decrease the absorption of sodium clodronate. Avoid antacids for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study

Aspirin (high-dose) is predicted to increase the risk of gastrointestinal irritation when given with bisphosphonates (alendronic acid, ibandronic acid). [Moderate] Study

Aspirin (high-dose) is predicted to increase the risk of renal impairment when given with sodium clodronate. [Severe] Theoretical

Oral calcium salts decrease the absorption of alendronic acid. Alendronic acid should be taken at least 30 minutes before calcium salts. [Moderate] Study

Oral calcium salts are predicted to decrease the absorption of oral ibandronic acid. Avoid calcium salts for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical

Oral calcium salts decrease the absorption of risedronate. Separate administration by at least 2 hours. [Moderate] Study

Oral calcium salts decrease the absorption of sodium clodronate. Avoid calcium salts for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study

Iron (oral) is predicted to decrease the absorption of oral ibandronic acid. Avoid iron (oral) for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical

Iron (oral) decreases the absorption of risedronate. Separate administration by at least 2 hours. [Moderate] Study

Iron (oral) decreases the absorption of sodium clodronate. Avoid iron (oral) for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study

Bisphosphonates are predicted to increase the risk of gastrointestinal bleeding when given with iron chelators (deferasirox). [Severe] Theoretical

Oral magnesium decreases the absorption of alendronic acid. Alendronic acid should be taken at least 30 minutes before magnesium. [Moderate] Study

Oral magnesium is predicted to decrease the absorption of oral ibandronic acid. Avoid magnesium for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical

Oral magnesium decreases the absorption of risedronate. Separate administration by at least 2 hours. [Moderate] Study

Oral magnesium decreases the absorption of sodium clodronate. Avoid magnesium for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study

NSAIDs are predicted to increase the risk of gastrointestinal irritation when given with bisphosphonates (alendronic acid, ibandronic acid). [Moderate] Study

NSAIDs are predicted to increase the risk of renal impairment when given with sodium clodronate. [Severe] Theoretical

Oral zinc decreases the absorption of oral alendronic acid. Zinc should be taken at least 30 minutes before alendronic acid. [Moderate] Study

Oral zinc is predicted to decrease the absorption of oral ibandronic acid. Avoid zinc for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical

Oral zinc decreases the absorption of oral risedronate. Separate administration by at least 2 hours. [Moderate] Study

Oral zinc decreases the absorption of oral sodium clodronate. Avoid zinc for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study

Bivalirudin → see TABLE 3 p. 1264 (anticoagulant effects)

Ranibizumab is predicted to increase the risk of bleeding events when given with bivalirudin. [Moderate] Theoretical

Bleomycin → see TABLE 15 p. 1267 (myelosuppression), TABLE 5 p. 1264 (thromboembolism)

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with bleomycin. Public Health England advises avoid. [Severe] Theoretical

Monoclonal antibodies (brentuximab vedotin) increase the risk of pulmonary toxicity when given with bleomycin. Avoid. [Severe] → Also see TABLE 15 p. 1267

Platinum compounds (cisplatin) increase the risk of pulmonary toxicity when given with bleomycin. [Severe] Study → Also see TABLE 15 p. 1267

Blinatumomab → see monoclonal antibodies

Bortezomib → see TABLE 8 p. 1265 (hypotension), TABLE 15 p. 1267 (myelosuppression), TABLE 12 p. 1267 (peripheral neuropathy)

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) slightly decrease the exposure to bortezomib. Avoid. [Severe] Study → Also see TABLE 12 p. 1267

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) slightly increase the exposure to bortezomib. [Moderate] Study

Cobicistat slightly decreases the exposure to bortezomib. [Moderate] Study

Enzalutamide slightly decreases the exposure to bortezomib. Avoid. [Severe] Study

HIV- protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) slightly increase the exposure to bortezomib. [Moderate] Study

Idealis slightly increases the exposure to bortezomib. [Moderate] Study → Also see TABLE 15 p. 1267

Macrolides (clarithromycin) slightly increase the exposure to bortezomib. [Moderate] Study

Rifampicin slightly decreases the exposure to bortezomib. Avoid. [Severe] Study

Bosentan

Bosentan is predicted to decrease the exposure to antiarrhythmics (dronedarone). [Severe] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) affect the exposure to bosentan. Avoid. [Severe] Study

Antifungals, azoles (fluconazole) are predicted to increase the exposure to bosentan. Avoid. [Severe] Study

Antifungals, azoles (itraconazole) are predicted to increase the exposure to bosentan. [Moderate] Theoretical

Antifungals, azoles (ketoconazole) moderately increase the exposure to bosentan. [Moderate] Study

Antifungals, azoles (voriconazole) are predicted to increase the exposure to bosentan. Avoid. [Severe] Theoretical

Bosentan is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. [Severe] Theoretical

Bosentan is predicted to decrease the exposure to axitinib. [Moderate] Theoretical

Bosentan is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study

Bosentan is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical

Bosentan is predicted to decrease the exposure to cabozantinib. [Moderate] Theoretical

Bosentan is predicted to decrease the exposure to calcium channel blockers (amilodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical

Bosentan is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical

Cephalosporins (ceftobiprole) are predicted to increase the exposure to bosentan. [Moderate] Theoretical

Bosentan moderately decreases the exposure to ciclosporin and ciclosporin moderately increases the exposure to bosentan. Avoid. [Severe] Study
Bosentan (continued)

▶ Bosentan is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical

▶ Bosentan is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical

▶ Bosentan is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Study

▶ Bosentan decreases the anticoagulant effect of coumarins. [Moderate] Study

▶ Bosentan is predicted to decrease the exposure to crizotinib. Avoid. [Severe] Theoretical

▶ Bosentan is predicted to decrease the exposure to dabrafenib. [Moderate] Theoretical

▶ Bosentan is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical

▶ Bosentan decreases the exposure to duloxetine. Adjust dose. [Severe] Study

▶ Bosentan is predicted to moderately decrease the exposure to elbasvir. Avoid. [Severe] Study

▶ Bosentan is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical

▶ Enzalutamide affects the exposure to bosentan. Avoid. [Severe] Study

▶ Bosentan is predicted to decrease the effects of ergotamine. [Moderate] Theoretical

▶ Bosentan is predicted to decrease the exposure to erlotinib. Avoid. [Severe] Theoretical

▶ Bosentan is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical

▶ Bosentan is predicted to decrease the exposure to etravirine. Avoid. [Severe] Study

▶ Bosentan is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study

▶ Bosentan is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical

▶ Bosentan is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study

▶ Bosentan is predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical

▶ HIV-protease inhibitors are predicted to increase the exposure to bosentan. [Severe] Study

▶ Bosentan is predicted to decrease the effects of Hormone replacement therapy. [Moderate] Anecdotal

▶ Bosentan is predicted to decrease the exposure to imatinib. Avoid. [Moderate] Study

▶ Bosentan is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study

▶ Bosentan is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical

▶ Bosentan is predicted to decrease the exposure to lurapidone. Monitor and adjust dose. [Moderate] Theoretical

▶ Macrolides (clarithromycin) are predicted to increase the exposure to bosentan. [Moderate] Theoretical

▶ Bosentan is predicted to decrease the exposure to maraviroc. Avoid. [Moderate] Theoretical

▶ Bosentan is predicted to decrease the concentration of midazolam. Monitor and adjust dose. [Moderate] Theoretical

▶ Bosentan is predicted to decrease the exposure to nilotinib. Avoid. [Severe] Theoretical

▶ Bosentan is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal

▶ Bosentan is predicted to decrease the exposure to olaparib. Avoid. [Moderate] Theoretical

▶ Bosentan decreases the exposure to opioids (methadone). Monitor and adjust dose. [Severe] Study

▶ Bosentan is predicted to decrease the exposure to osimertinib. [Moderate] Theoretical

▶ Bosentan is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study

▶ Bosentan decreases the exposure to phosphodiesterase type-5 inhibitors. [Moderate] Study

▶ Rifampicin affects the exposure to bosentan. Avoid. [Severe] Study

▶ Bosentan is predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Theoretical

▶ Bosentan is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Theoretical

▶ Bosentan is predicted to decrease the concentration of sirolimus and sirolimus potentially increases the concentration of bosentan. Avoid. [Severe] Theoretical

▶ St John’s Wort is predicted to decrease the exposure to bosentan. Avoid. [Moderate] Theoretical

▶ Bosentan slightly decreases the exposure to statins (atorvastatin). [Mild] Study

▶ Bosentan moderately decreases the exposure to statins (simvastatin). [Moderate] Study

▶ Bosentan increases the risk of hepatotoxicity when given with sulfonyleureas (glibenclamide). Avoid. [Severe] Study

▶ Bosentan is predicted to decrease the concentration of tariquidar. Avoid. [Severe] Theoretical

▶ Bosentan decreases the concentration of temsirolimus. Avoid. [Severe] Theoretical

▶ Bosentan is predicted to decrease the concentration of ticagrelor. [Moderate] Theoretical

▶ Bosentan is predicted to decrease the exposure to tolvaptan. [Moderate] Theoretical

▶ Bosentan decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal

▶ Bosentan is predicted to decrease the exposure to velpatasvir. Avoid. [Moderate] Theoretical

Bosutinib → see TABLE 15 p. 1267 (myelosuppression), TABLE 9 p. 1266 (QT-interval prolongation)

▶ Antacids are predicted to decrease the absorption of bosutinib. Bosutinib should be taken at least 12 hours before antacids. [Moderate] Theoretical

▶ Antirhythmic drugs (dronedarone) are predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical → Also see TABLE 9 p. 1266

▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to very markedly decrease the exposure to bosutinib. Avoid. [Severe] Study

▶ Antifungals, azoles (itraconazole, isavuconazole, posaconazole) are predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical

▶ Antifungals, azoles (fluconazole, itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical

▶ Aprepitant is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical

▶ Bosentan is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical

▶ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical

▶ Cobicistat is predicted to markedly increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Study

▶ Bosutinib is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical

▶ Crizotinib is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical → Also see TABLE 15 p. 1267 → Also see TABLE 9 p. 1266

▶ Efavirenz is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical

▶ Enzalutamide is predicted to very markedly decrease the exposure to bosutinib. Avoid. [Severe] Study
Bosutinib – Bupropion 1303

- Etravirine is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical
- Fosaprepitant is predicted to increase the exposure to bosutinib. [Severe] Theoretical
- Grapefruit juice is predicted to increase the exposure to bosutinib. Avoid. [Moderate] Theoretical
- H₂ receptor antagonists are predicted to decrease the absorption of bosutinib. [Moderate] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Study → Also see TABLE 9 p. 1266
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical
- Idelalisib is predicted to markedly increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Study → Also see TABLE 15 p. 1267
- Imatinib is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical → Also see TABLE 15 p. 1267
- Macrolides (clarithromycin) are predicted to markedly increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Study → Also see TABLE 9 p. 1266
- Macrolides (erythromycin) are predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical
- Modafinil is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical
- Netupitant is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical
- Nevirapine is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical
- Nilotinib is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical → Also see TABLE 15 p. 1267 → Also see TABLE 9 p. 1266
- Bosutinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Pitolisant is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical
- Proton pump inhibitors are predicted to decrease the absorption of bosutinib. [Moderate] Study
- Rifampicin is predicted to very markedly decrease the exposure to bosutinib. Avoid. [Severe] Study → Also see TABLE 13 p. 1267
- St John’s Wort is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical

Botulinum toxin type A → see TABLE 20 p. 1268 (neuromuscular blocking effects)

Botulinum toxin type B → see TABLE 20 p. 1268 (neuromuscular blocking effects)

Bowel cleansing preparations

ROUTE-SPECIFIC INFORMATION Other oral drugs should not be taken 1 hour before, or after, administration of bowel cleansing preparations because absorption may be impaired. Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given.

Brentuximab vedotin → see monoclonal antibodies
Brimonidine → see TABLE 6 p. 1265 (bradycardia), TABLE B p. 1265 (hypotension), TABLE 11 p. 1266 (CNS depressant effects)
Brinzolamide

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Brimonidine → see antiepileptics
Bupropion → see table 13 p. 1267 (serotonin syndrome)
Bupropion is predicted to increase the exposure to antihistamines (flecainide). [Severe] Theoretical
Bupropion is predicted to increase the exposure to antihistamines (propafenone). Monitor and adjust dose. [Moderate] Study
Bupropion is predicted to increase the exposure to anticholinesterases, centrally acting (donepezil). Moderate Theoretical
Bupropion is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Moderate Study
Bupropion is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). [Moderate] Study
Bupropion is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). [Moderate] Study
Bupropion is predicted to slightly increase the exposure to darifenacin. [Mild] Study
Bupropion increases the risk of side-effects when given with dopamine receptor agonists (amantadine). Moderate Study
Efavirenz moderately decreases the exposure to bupropion. Moderate Study
Enzalutamide is predicted to markedly decrease the exposure to bupropion. [Severe] Theoretical
HIV-protease inhibitors (ritonavir) slightly to moderately decrease the exposure to bupropion. Moderate Study
Bupropion increases the risk of side-effects when given with levodopa. [Moderate] Study
Bupropion increases the risk of intraoperative hypertension when given with linezolid. [Severe] Anecdotal → Also see TABLE 13 p. 1267
Lumacaftor is predicted to decrease the exposure to bupropion. Adjust dose. [Moderate] Theoretical
Mefloquine is predicted to decrease the efficacy of bupropion. Avoid. [Severe] Theoretical
Methyldopa decreases the exposure to bupropion. Avoid. [Severe] Theoretical 
Methylxanthines are predicted to increase the risk of severe hypertension when given with bupropion. [Severe] Theoretical → Also see TABLE 13 p. 1267
Moclobemide is predicted to increase the risk of severe hypertension when given with bupropion. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1267
Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of severe hypertension when given with bupropion. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 1267
Monoamine-oxidase B inhibitors are predicted to increase the risk of severe hypertension when given with bupropion. Avoid. [Moderate] Theoretical → Also see TABLE 13 p. 1267
Bupropion is predicted to increase the efficacy of opioids (codeine). [Moderate] Theoretical
Bupropion is predicted to decrease the efficacy of opioids (tramadol). [Severe] Study → Also see TABLE 13 p. 1267
Bupropion is predicted to moderately increase the exposure to pitolisant. Use with caution and adjust dose. [Moderate] Study
Rifampicin is predicted to markedly decrease the exposure to bupropion. [Severe] Study
Bupropion is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
Bupropion is predicted to increase the exposure to SSRIs (dapoxetine). [Moderate] Theoretical → Also see TABLE 13 p. 1267
Bupropion is predicted to decrease the efficacy of tamoxifen. Avoid. [Severe] Study
Bupropion is predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. [Severe] Study → Also see TABLE 13 p. 1267
Bupropion is predicted to increase the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study → Also see TABLE 13 p. 1267
1304 Buspirone — Calcium channel blockers
Buspirone → see TABLE 13 p. 1267 (serotonin syndrome)
▶ Antiarrhythmics (dronedarone) are predicted to increase the
exposure to buspirone. Use with caution and adjust dose.

BNF 74

Antifungals, azoles (itraconazole, ketoconazole, voriconazole)
slightly increase the exposure to cabozantinib. o
Study → Also see TABLE 9 p. 1266

HIV-protease inhibitors (indinavir) are predicted to increase the
exposure to cabozantinib. o Theoretical
Idelalisib slightly increases the exposure to cabozantinib.
o Study → Also see TABLE 15 p. 1267
Imatinib is predicted to increase the exposure to cabozantinib.
o Theoretical → Also see TABLE 15 p. 1267
Macrolides (clarithromycin) slightly increase the exposure to
cabozantinib. o Study → Also see TABLE 9 p. 1266
Macrolides (erythromycin) are predicted to increase the
exposure to cabozantinib. o Theoretical
Netupitant is predicted to increase the exposure to
cabozantinib. o Theoretical
Nevirapine is predicted to decrease the exposure to
cabozantinib. o Theoretical
Nilotinib is predicted to increase the exposure to cabozantinib.
o Theoretical → Also see TABLE 15 p. 1267 → Also see TABLE 9
p. 1266

Cabozantinib is predicted to increase the risk of bleeding
events when given with phenindione. r Theoretical
Rifampicin moderately decreases the exposure to cabozantinib.
Avoid. o Study
▶ St John’s Wort is predicted to decrease the exposure to
cabozantinib. o Theoretical
Caffeine citrate
▶ Caffeine citrate decreases the efﬁcacy of antiarrhythmics
(adenosine). Separate administration by 24 hours. n Study
▶ Antiepileptics (fosphenytoin, phenytoin) are predicted to
moderately increase the clearance of caffeine citrate. Monitor
and adjust dose. o Study
▶ HIV-protease inhibitors (ritonavir) are predicted to moderately
increase the clearance of caffeine citrate. Monitor and adjust
dose. o Study
▶ Rifampicin is predicted to moderately increase the clearance of
caffeine citrate. Monitor and adjust dose. o Study
▶ SSRIs (fluvoxamine) markedly decrease the clearance of
caffeine citrate. Monitor and adjust dose. r Study
▶ Caffeine citrate decreases the clearance of theophylline.

Cabozantinib is predicted to increase the risk of bleeding
events when given with coumarins. r Theoretical
Crizotinib is predicted to increase the exposure to
cabozantinib. o Theoretical → Also see TABLE 15 p. 1267
→ Also see TABLE 9 p. 1266
Efavirenz is predicted to decrease the exposure to
cabozantinib. o Theoretical
Enzalutamide moderately decreases the exposure to
cabozantinib. Avoid. o Study
Grapefruit juice is predicted to increase the exposure to
cabozantinib. o Theoretical
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir,
lopinavir, ritonavir, saquinavir, tipranavir) slightly increase the
exposure to cabozantinib. o Study → Also see TABLE 9
p. 1266

▶

▶

Idelalisib is predicted to increase the exposure to buspirone.
Adjust buspirone dose, p. 325. r Study
▶ Imatinib is predicted to increase the exposure to buspirone.
Use with caution and adjust dose. o Study
▶ Buspirone is predicted to increase the risk of elevated blood
pressure when given with linezolid. Avoid. r Theoretical
→ Also see TABLE 13 p. 1267
▶ Macrolides (clarithromycin) are predicted to increase the
exposure to buspirone. Adjust buspirone dose, p. 325. r

Aprepitant is predicted to increase the exposure to
cabozantinib. o Theoretical
Bosentan is predicted to decrease the exposure to
cabozantinib. o Theoretical
Calcium channel blockers (diltiazem, verapamil) are predicted to
increase the exposure to cabozantinib. o Theoretical
Cobicistat slightly increases the exposure to cabozantinib.

▶

Verapamil is predicted to increase the exposure to afatinib.
Separate administration by 12 hours. o Study

Calcium channel blockers

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose. [Severe] Study → Also see TABLE 8 p. 1265

Verapamil moderately increases the exposure to atorvastatin. [Moderate] Study → Also see TABLE 8 p. 1265

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical → Also see TABLE 8 p. 1265

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to aliskiren. [Moderate] Study → Also see TABLE 8 p. 1265

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to alprazolam. [Severe] Study

Verapamil moderately increases the exposure to anthracyclines (doxorubicin). [Moderate] Study

Antiarrhythmics (disopyramide) are predicted to increase the risk of cardiodepression when given with verapamil. [Severe] Theoretical

Antiarrhythmics (dronedarone) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study

Antifungals (amidodarone) are predicted to increase the risk of cardiodepression when given with calcium channel blockers (diltiazem, verapamil). Avoid. [Severe] Theoretical → Also see TABLE 6 p. 1265

Calcium channel blockers (diltiazem, verapamil) increase the exposure to antiarrhythmics (dronedarone) and antiarrhythmics (amidodarone) increase the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Study

Verapamil increases the risk of cardiodepression when given with antiarrhythmics (flexicainide). [Severe] Anecdotal → Also see TABLE 6 p. 1265

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. [Moderate] Study

Calcium channel blockers (diltiazem, verapamil) increase the risk of bradycardia when given with anticholinesterases, centrally acting. [Moderate] Anecdotal → Also see TABLE 6 p. 1265

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to diltiazem. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to isradipine. Avoid. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to verapamil. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of antiepileptics (carbamazepine). [Severe] Anecdotal

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to lercanidipine. Avoid. [Severe] Study

Antifungals, azoles (miconazole) are predicted to increase the exposure to calcium channel blockers (amlodipine, clevidipine, felodipine, isradipine, lercanidipine, nicardipine, nifedipine, nimodipine). Use with caution and adjust dose. [Moderate] Theoretical

Antifungals, azoles (fluconazole, itraconazole, ketoconazole, posaconazole, voriconazole) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study

Antifungals, azoles (fluconazole) (high-dose) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study

Antifungals, azoles (posaconazole) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to antifungals, azoles (isavuconazole). [Moderate] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to antihistamines, non-sedating (mizolastine). [Severe] Theoretical

Antiarrhythmics (mefloquine) are predicted to increase the risk of bradyarrhythmia when given with calcium channel blockers. [Severe] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of antiarrhythmics (piperacaine). [Moderate] Theoretical

Verapamil is predicted to increase the exposure to apixaban. [Moderate] Theoretical

Aprepitant is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, laccadipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study

Diltiazem increases the exposure to aprepitant and aprepitant increases the exposure to diltiazem. [Moderate] Study

Verapamil is predicted to increase the exposure to aprepitant and aprepitant is predicted to increase the exposure to verapamil. [Moderate] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to axitinib. [Moderate] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical

Diltiazem is predicted to increase the risk of cardiodepression when given with beta blockers, non-selective. [Severe] Study → Also see TABLE 6 p. 1265 → Also see TABLE 8 p. 1265

Intravenous verapamil increases the risk of cardiovascular side-effects when given with beta blockers, non-selective. Avoid. [Severe] Study → Also see TABLE 6 p. 1265 → Also see TABLE 8 p. 1265

Oral verapamil increases the risk of cardiovascular side-effects when given with beta blockers, non-selective. [Severe] Study → Also see TABLE 6 p. 1265 → Also see TABLE 8 p. 1265

Diltiazem is predicted to increase the risk of cardiodepression when given with beta blockers, selective. [Severe] Study → Also see TABLE 6 p. 1265 → Also see TABLE 8 p. 1265

Intravenous verapamil increases the risk of cardiovascular side-effects when given with beta blockers, selective. Avoid. [Severe] Study → Also see TABLE 6 p. 1265 → Also see TABLE 8 p. 1265

Oral verapamil increases the risk of cardiovascular side-effects when given with beta blockers, selective. Avoid. [Severe] Study → Also see TABLE 6 p. 1265 → Also see TABLE 8 p. 1265

Bosentan is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical

Bosentan is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to cabozantinib. [Moderate] Theoretical

Calcium channel blockers (diltiazem) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study → Also see TABLE 8 p. 1265

Calcium channel blockers (verapamil) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study → Also see TABLE 8 p. 1265

Calcium channel blockers (diltiazem) are predicted to increase the exposure to calcium channel blockers (felodipine, isradipine, lercanidipine, nicardipine, nifedipine, nimodipine).
Calcium channel blockers (continued)

Monitor and adjust dose. [Moderate] Study → Also see TABLE 8 p. 1265

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to certitinib. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, nicardipine, verapamil) increase the concentration of ciclosporin. [Severe] Study
- Ciclosporin moderately increases the exposure to lercanidipine. Use with caution or avoid. [Severe] Study
- Cobicistat is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Cobicistat is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Theoretical
- Cobicistat is predicted to markedly increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to cobimetinib. [Severe] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to colchicine. Adjust colchicine dose, p. 1020. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to crizotinib. [Moderate] Theoretical → Also see TABLE 6 p. 1265
- Crizotinib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Verapamil increases the exposure to dabigatran. Adjust dabigatran dose, p. 131. [Severe] Study
- Intravenous dantrolene potentially increases the risk of acute hyperkalaemia and cardiovascular collapse when given with calcium channel blockers (diltiazem, verapamil). Avoid. [Severe] Anecdotal
- Calcium channel blockers (diltiazem, verapamil) are predicted to slightly increase the exposure to darifenacin. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dasatinib. [Severe] Study
- Intravenous dantrolene potentially increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
→ Also see TABLE 6 p. 1265
- Calcium channel blockers (diltiazem, verapamil) increase the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) increase the concentration of digoxin. Monitor and adjust dose. [Severe] Study → Also see TABLE 8 p. 1265
- Calcium channel blockers (diltiazem, verapamil) increase the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical → Also see TABLE 8 p. 1265
- Calcium channel blockers (diltiazem, verapamil) are predicted to moderately increase the exposure to dutasteride. [Moderate] Study
- Verapamil is predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical
- Efavirenz is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical
- Efavirenz is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical
- Enalaprilat is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Enalaprilat decreases the exposure to diltiazem. [Severe] Study
- Enalaprilat decreases the exposure to isradipine. Avoid. [Moderate] Study
- Enalaprilat is predicted to decrease the exposure to verapamil. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to everolimus. Avoid or adjust dose. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment, p. 732. [Mild] Study
- Verapamil is predicted to increase the exposure to fidaxomicin. Avoid. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to fingolimod. Avoid. [Moderate] Theoretical → Also see TABLE 6 p. 1265
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to gefitinib. [Moderate] Theoretical
- Grapefruit juice very slightly increases the exposure to amiodipine. Avoid. [Mild] Study
- Grapefruit juice increases the exposure to calcium channel blockers (nifedipine, verapamil). Avoid. [Mild] Study
- Grapefruit juice increases the exposure to felodipine. Avoid. [Mild] Study
- Grapefruit juice is predicted to increase the exposure to lercanidipine. Avoid. [Moderate] Theoretical
- Grapefruit juice increases the exposure to nicardipine. [Mild] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Theoretical → Also see TABLE 8 p. 1265
- H1 receptor antagonists (cimetidine) (high-dose) are predicted to increase the exposure to lercanidipine. [Moderate] Theoretical
- H1 receptor antagonists (cimetidine) moderately increase the exposure to nifedipine. Monitor and adjust dose. [Severe] Study
- H1 receptor antagonists (cimetidine) increase the exposure to verapamil. [Moderate] Study
- H1 receptor antagonists (cimetidine) slightly increase the exposure to calcium channel blockers (diltiazem, isradipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to lercanidipine. Avoid. [Severe] Study
- HIV-protease inhibitors are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ibrutinib. Avoid or adjust ibrutinib dose, p. 902. [Severe] Theoretical
- Idelalisib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Idelalisib is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study
- Idelalisib is predicted to markedly increase the exposure to lercanidipine. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to imatinib. [Moderate] Theoretical
- Imatinib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Imatinib is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ibavrafidine. Avoid. [Moderate] Study
→ Also see TABLE 6 p. 1265
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ivaacaftor. Adjust ivaacaftor dose, p. 281. [Severe] Study
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lapatinib. [Moderate] Study
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of neurotoxicity when given with lithium. [Severe] Anecdotal
Calcium channel blockers (amlodipine, lacidipine) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lomitapide. Avoid. [Moderate] Theoretical
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to lurasidone. [Moderate] Study → Also see TABLE 8 p. 1265
Macrolides (clarithromycin) are predicted to markedly increase the exposure to verapamil. Avoid. [Severe] Study
Macrolides (erythromycin) are predicted to increase the exposure to diltiazem. [Severe] Theoretical
Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
Macrolides (clarithromycin) are predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study
Calcium channel blockers (amlodipine, clevidipine, felodipine, isradipine, lacidipine, lercanidipine, nifedipine, nimodipine, verapamil) in pregnant women. [Severe] Anecdotal
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 63. [Moderate] Study
Netupitant is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
Nevirapine is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical
Nevirapine is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to nilotinib. [Moderate] Theoretical
Nilotinib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
Verapamil is predicted to increase the exposure to nintedanib. [Moderate] Study
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Theoretical
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to alfentanil, buprenorphone, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study → Also see TABLE 6 p. 1265
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical → Also see TABLE 6 p. 1265
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to oxybutynin. [Mild] Theoretical
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to oxycodone. [Mild] Theoretical
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 765. [Moderate] Theoretical → Also see TABLE 8 p. 1265
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor and adjust sildenafil dose, p. 766. [Moderate] Study → Also see TABLE 8 p. 1265
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). [Severe] Theoretical → Also see TABLE 8 p. 1265
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. [Severe] Theoretical → Also see TABLE 8 p. 1265
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to pimozide. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 1265
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study → Also see TABLE 8 p. 1265
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ranolazine. [Severe] Study
Rifampicin is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nimodipine). Monitor and adjust dose. [Moderate] Study
Rifampicin decreases the exposure to diltiazem. [Severe] Study
Rifampicin decreases the exposure to isradipine. Avoid. [Moderate] Study
Rifampicin moderately decreases the exposure to nifedipine. Avoid. [Severe] Study
Rifampicin is predicted to decrease the exposure to verapamil. [Severe] Study
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to saxagliptin. [Mild] Study
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to simiprevir. Avoid. [Severe] Study
Calcium channel blockers (diltiazem, verapamil) increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to SSRI (dapoxetine). Adjust dapoxetine dose, p. 773. [Moderate] Theoretical
St John’s Wort is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical
St John’s Wort is predicted to decrease the exposure to statins (atorvastatin). Monitor and adjust dose. [Severe] Theoretical
Amlodipine slightly increases the exposure to statins (simvastatin). Adjust simvastatin dose, p. 198. [Mild] Study
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 198. [Severe] Study
Sulfipyrazone decreases the exposure to verapamil. [Moderate] Study
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to sunitinib. [Moderate] Theoretical
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of tacrolimus. [Severe] Study
Nicardipine potentially increases the concentration of tacrolimus. Monitor concentration and adjust dose. [Severe] Anecdotal
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to taxanes (cabazitaxel. [Moderate] Theoretical
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of temsirolimus. [Moderate] Theoretical
Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tolterodine. [Mild] Theoretical
Calcium channel blockers (continued)
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tolvaptan. Adjust dose. [Moderate] Theoretical
- Verapamil is predicted to increase the exposure to topotecan. [Severe] Study
- Verapamil is predicted to increase the concentration of trametinib. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to trazodone. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose. p. 919. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study

Calcium chloride → see calcium salts
Calcium gluconate → see calcium salts
Calcium lactate → see calcium salts
Calcium phosphate → see calcium salts
Calcium salts

calcium acetate • calcium carbonate • calcium chloride • calcium gluconate • calcium lactate • calcium phosphate

Separation of administration Calcium carbonate-containing antacids should preferably not be taken at the same time as other drugs since they might impair absorption. Antacids might damage enteric coatings designed to prevent dissolution in the stomach.

- Oral calcium salts decrease the absorption of alkylating agents (estramustine). [Severe] Study
- Calcium carbonate decreases the absorption of antimalarials (chloroquine). Separate administration by at least 4 hours. [Moderate] Study
- Calcium carbonate is predicted to decrease the absorption of antimalarials (proguanil). Separate administration by at least 2 hours. [Moderate] Study
- Oral calcium salts decrease the absorption of biphosphonates (alendronic acid). Alendronic acid should be taken at least 30 minutes before calcium salts. [Moderate] Study
- Oral calcium salts are predicted to decrease the absorption of oral biphosphonates (ibandronic acid). Avoid calcium salts for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical
- Oral calcium carbonate is predicted to decrease the absorption of biphosphonates (risedronate). Separate administration by at least 2 hours. [Moderate] Study
- Oral calcium salts decrease the absorption of biphosphonates (sodium clodronate). Avoid calcium salts for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study
- Cephalosporins (ceftriaxone) increase the risk of cardio-respiratory arrest when given with calcium chloride. Avoid. [Severe] Anecdotal
- Cephalosporins (ceftriaxone) increase the risk of cardio-respiratory arrest when given with intravenous calcium gluconate. Avoid. [Severe] Anecdotal
- Intravenous calcium salts increase the concentration of digoxin. Avoid. [Moderate] Anecdotal
- Oral calcium salts decrease the absorption of dolasetron. Dolasetron should be taken 2 hours before or 6 hours after calcium salts. [Moderate] Study
- Oral calcium salts decrease the absorption of etoricoxib. Etoricoxib should be taken 2 hours before or 4 hours after calcium salts. [Severe] Study
- Calcium carbonate decreases the absorption of hydroxychloroquine. Separate administration by at least 4 hours. [Moderate] Study
- Calcium carbonate decreases the absorption of iron (oral). Calcium carbonate should be taken 1 hour before or 2 hours after iron (oral). [Moderate] Study
- Calcium carbonate is predicted to decrease the exposure to ledipasvir. Separate administration by 4 hours. [Moderate] Theoretical
- Oral calcium salts are predicted to decrease the absorption of levothyroxine. Separate administration by at least 4 hours. [Moderate] Anecdotal
- Calcium carbonate decreases the absorption of quinolones (ciprofloxacin, nalidixic acid). Separate administration by 2 hours. [Moderate] Study
- Calcium carbonate decreases the absorption of quinolones (norfloxacin). Norfloxacin should be taken 2 hours before or 4 hours after calcium carbonate. [Moderate] Study
- Calcium carbonate is predicted to slightly decrease the exposure to rifampirine. Calcium carbonate should be taken 2 hours before or 4 hours after rifampirine. [Severe] Theoretical
- Oral calcium salts decrease the absorption of strontium ranelate. Separate administration by 2 hours. [Moderate] Study
- Calcium carbonate is predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours. [Moderate] Theoretical
- Thiadiazide diuretics increase the risk of hypercalcaemia when given with calcium salts. [Severe] Anecdotal
- Oral calcium carbonate decreases the concentration of velpatasvir. Separate administration by 4 hours. [Moderate] Anecdotal
- Oral calcium salts decrease the absorption of zinc. [Moderate] Study

Canagliflozin → see TABLE 14 p. 1267 (antidiabetic drugs), TABLE 8 p. 1265 (hypotension)
- Rifampicin moderately decreases the exposure to canagliflozin. Adjust canagliflozin dose, p. 661. [Moderate] Study
Canakinumab → see monoclonal antibodies
Candesartan → see angiotensin-II receptor antagonists
Cangrelor → see TABLE 4 p. 1264 (platelet effects)
Cannabis extract → see TABLE 11 p. 1266 (CNS depressant effects)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cannabis extract. Avoid. [Severe] Theoretical Also see TABLE 11 p. 1266
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. [Moderate] Theoretical
- Enalapril is predicted to decrease the exposure to cannabis extract. Avoid. [Severe] Theoretical
- Theoretical study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. [Moderate] Theoretical
- Idelalisib is predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. [Moderate] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. [Moderate] Theoretical
- Rifampicin is predicted to decrease the exposure to cannabis extract. Avoid. [Severe] Theoretical

Calcitabine → see TABLE 15 p. 1267 (myelosuppression)
- Allopurinol is predicted to decrease the effects of capcitabine. Avoid. [Severe] Study
- Capcitabine increases the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Anecdotal
- Capcitabine increases the effects of coumarins. Monitor INR and adjust dose. [Moderate] Anecdotal
- Folates (folic acid) are predicted to increase the risk of toxicity when given with capcitabine. [Severe] Anecdotal
- Folates (folic acid) increase the risk of toxicity when given with capcitabine. [Severe] Study
- H2 receptor antagonists (cimetidine) are predicted to slightly increase the exposure to capcitabine. [Severe] Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with capcitabine. Public Health England advises avoid. [Severe] Theoretical
**Ceftobiprole** is predicted to increase the concentration of statins. [Moderate] Theoretical

**Ceftobiprole** is predicted to increase the concentration of sulfonamide [glibenclamide]. [Moderate] Theoretical

**Ceftobiprole** is predicted to increase the concentration of sulfonamide [glibenclamide]. [Moderate] Theoretical

**Carbamazepine** is predicted to increase the exposure to aliskiren. [Moderate] Theoretical

**Antacids** are predicted to decrease the absorption of ceritinib. Separate administration by 2 hours. [Moderate] Theoretical

**Antifungals (amiodarone, dronedarone)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**Antifungals (amiodarone, dronedarone)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**Antifungals (amiodarone, dronedarone)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the dose of ceritinib. [Moderate] Theoretical

**Cobicistat** is predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**Cobicistat** is predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**Cobicistat** is predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**Cobicistat** is predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**Coumarins** (warfarin) are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**H₂ receptor antagonists** are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose, p. 895. [Severe] Study

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ceritinib. [Moderate] Theoretical
Chloral hydrate is predicted to increase the concentration of tacrolimus. Avoid. (Severe) Study

Chloramphenicol

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- Antiepileptics (phenobarbital, primidone) decrease the concentration of chloramphenicol. (Moderate) Study
- Intravenous chlormphenicol increases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) affect the concentration of intravenous chlormphenicol. Monitor concentration and adjust dose. (Severe) Study
- Chloramphenicol potentially increases the anticoagulant effect of coumarins. (Moderate) Anecdotal
- Chloramphenicol decreases the efficacy of intravenous iron (injectable). (Moderate) Anecdotal
- Chloramphenicol decreases the efficacy of oral iron (oral). (Moderate) Theoretical
- Rifampicin decreases the concentration of chloramphenicol. (Moderate) Study
- Chloramphenicol is predicted to increase the exposure to sulfonylureas. (Severe) Study
- Chloramphenicol increases the concentration of tacroliumus. (Severe) Study

Chloridiazepoxide → see TABLE 11 p. 1266 (CNS depressant effects)
- Chloridiazepoxide affects the concentration of antiepileptics (fosphenytoin, phenytoin). (Severe) Study
- Rifampicin is predicted to decrease the exposure to chloridiazepoxide. (Moderate) Theoretical
- Chloroproprazine → see TABLE 11 p. 1266 (CNS depressant effects)
- Chloroquine → see antimalarials
- Chlorphenamine → see antihistamines, sedating
- Chlorpromazine → see phenothiazines
- Chlortaldione → see thiazide diuretics

Chlorine salicylate
- Corticosteroids are predicted to decrease the concentration of chlorine salicylate. (Moderate) Study

Ciclesonide → see corticosteroids

Ciclosporin → see TABLE 2 p. 1264 (nephrotoxicity), TABLE 16 p. 1268 (increased serum potassium)
- Pomelo juice is predicted to increase ciclosporin exposure, and purple grape juice is predicted to decrease ciclosporin exposure.
- Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- Ciclosporin is predicted to increase the exposure to afatinib. Separate administration by 12 hours. (Moderate) Study
- Ciclosporin markedly increases the exposure to aliskiren. Avoid. (Severe) Study → Also see TABLE 16 p. 1268
- Ciclosporin moderately increases the exposure to bosentan. Adjust ambrisantan dose, p. 179. (Moderate) Study
- Ciclosporin increases the concentration of anthracyclines (daunorubicin, doxorubicin, epirubicin, idarubicin, mitoxantrone). (Severe) Study
- Antiarhythmics (amiodarone) increase the concentration of ciclosporin. Monitor ciclosporin concentration and adjust dose. (Severe) Study
- Antiarhythmics (dronedarone) increase the concentration of ciclosporin. (Severe) Study
- Ciclosporin increases the exposure to antiarhythmics (dronedarone). Avoid. (Severe) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of ciclosporin. (Severe) Study
- Antiepileptics (oxcarbazepine) decrease the concentration of ciclosporin. (Severe) Anecdotal
- Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole) increase the concentration of ciclosporin. (Severe) Study
- Antifungals, azoles (miconazole) increase the concentration of ciclosporin. Monitor and adjust dose. (Severe) Anecdotal
- Aprepitant increases the concentration of ciclosporin. (Severe) Study
- Ciclosporin is predicted to increase the exposure to beta blockers, non-selective (nadodol). (Moderate) Study
- Bosentan moderately decreases the exposure to ciclosporin and ciclosporin moderately increases the exposure to bosentan. Avoid. (Severe) Study
- Calcium channel blockers (diltiazem, nicardipine, verapamil) increase the concentration of ciclosporin. (Severe) Study
- Ciclosporin moderately increases the exposure to calcium channel blockers (verapamil). Use with caution or avoid. (Severe) Study
- Ciclosporin slightly increases the exposure to caspofungin. (Severe) Study
- Ciclosporin is predicted to increase the exposure to ceritinib. Avoid. (Severe) Theoretical
- Ciclosporin affects the concentration of cholic acid. Avoid. (Moderate) Study
- Ciclosporin increases the exposure to colchicine. Avoid or adjust colchicine dose, p. 1020. (Severe) Study
- Crizotinib increases the concentration of ciclosporin. (Severe) Study

Chlorinerale (chloroquine) decrease the efficacy of oral chlorera vaccine. (Moderate) Study
- Hydroxychloroquine is predicted to decrease the efficacy of oral choleravaccine. (Moderate) Theoretical

Cholic acid
- Antacids are predicted to decrease the absorption of cholic acid. Separate administration by 5 hours. (Mild) Theoretical
- Antiepileptics (phenobarbital) decrease the effects of cholic acid. Avoid. (Moderate) Study
- Ciclosporin affects the concentration of cholic acid. Avoid. (Moderate) Study

Appendix 1

Chloramphenicol
- Cetirizine increases the concentration of chloramphenicol. Avoid. (Severe) Study
- Cetirizine is predicted to increase the exposure to sirolimus. Avoid. (Severe) Theoretical
- Clotrimazole povidon gel → see monocalonal antibodies
- Cetirizine → see antihistamines, non-sedating
- Cetuximab → see monoclonal antibodies

Choleoeoxycholic acid
- Antacids are predicted to decrease the absorption of choleoeoxycholic acid. (Mild) Theoretical

Chloral hydrate → see TABLE 11 p. 1266 (CNS depressant effects)
- Intravenous loop diuretics (furosemide) potentially increase the risk of sweating, variable blood pressure, and tachycardia when given after chloral hydrate. (Moderate) Anecdotal

Chlorambucil → see alkylating agents

Chlorphenamcin

Table 2

1310 Ceritinib — Ciclosporin
**Ciclosporin** is predicted to increase the exposure to **dabigatran**. Avoid. [Severe] Theoretical

**Danazo** increases the concentration of **ciclosporin**. [Severe] Study

**Ciclosporin** is predicted to increase the risk of rhabdomyolysis when given with **daptomycin**. [Severe] Theoretical

**Ciclosporin** is predicted to increase the exposure to **darifenacin**. Avoid. [Moderate] Theoretical

**Ciclosporin** increases the concentration of **digoxin**. Monitor and adjust dose. [Severe] Theoretical

**Ciclosporin** slightly increases the exposure to **edoxyaban**. Adjust edoxyaban dose, p. 122. [Severe] Study

**Efavirenz** decreases the concentration of **ciclosporin**. Monitor **ciclosporin** concentration and adjust dose. [Moderate] Study

**Enzalutamide** decreases the concentration of **ciclosporin**. [Severe] Study

**Ciclosporin** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical

**Ciclosporin** increases the exposure to **etoposide**. Monitor and adjust dose. [Severe] Study

**Ciclosporin** moderately increases the exposure to **everolimus**. Avoid or adjust dose. [Severe] Study

**Ciclosporin** moderately increases the exposure to **ezetimibe** and **ezetimibe** slightly increases the exposure to **ciclosporin**. [Moderate] Study

**Fibrates** (bezafibrate) are predicted to increase the risk of nephrotoxicity when given with **ciclosporin**. [Severe] Theoretical

**Fibrates** (fenofibrate) increase the risk of nephrotoxicity when given with **ciclosporin**. [Severe] Study

**Ciclosporin** is predicted to increase the exposure to **fidaxomicin**. Avoid. [Moderate] Study

**Grapefruit Juice** increases the concentration of **ciclosporin**. Avoid. [Severe] Study

**Ciclosporin** greatly increases the exposure to **grazoprevir**. Avoid. [Severe] Study

**H₂ receptor antagonists** (cimetidine) increase the concentration of **ciclosporin**. [Moderate] Study

**HIV-protease inhibitors** increase the concentration of **ciclosporin**. [Severe] Study

**Idelalisib** increases the concentration of **ciclosporin**. [Severe] Study

**Imatinib** increases the concentration of **ciclosporin**. [Severe] Study

**Lansoprazole** is predicted to decrease the absorption of oral **ciclosporin**. Adjust dose. [Severe] Theoretical

**Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **ciclosporin**. Public Health England advises avoid. [Severe] Theoretical

**Ciclosporin** is predicted to increase the exposure to **lomitapide**. Separate administration by 12 hours. [Moderate] Theoretical

**Lumacaftor** is predicted to decrease the exposure to **ciclosporin**. Avoid. [Severe] Theoretical

**Macrolides** (clarithromycin, erythromycin) increase the concentration of **ciclosporin**. [Severe] Study

**Ciclosporin** is predicted to decrease the efficacy of **mifamurtide**. Avoid. [Severe] Theoretical

**Monoclonal antibodies** (blinatumomab) are predicted to transiently increase the exposure to **ciclosporin**. Monitor and adjust dose. [Moderate] Theoretical

**Netupitant** increases the concentration of **ciclosporin**. [Severe] Study

**Nevirapine** is predicted to decrease the concentration of **ciclosporin**. [Moderate] Study

**Nilotinib** increases the concentration of **ciclosporin**. [Severe] Study

**Ciclosporin** is predicted to increase the exposure to **nintedanib**. [Moderate] Study

**Ciclosporin** increases the concentration of **NSAID** (diclofenac). [Severe] Study

**Enzalutamide** increases the concentration of **ciclosporin**. [Severe] Study

**Octreotide** decreases the absorption of oral **ciclosporin**. Adjust ciclosporin dose, p. 788. [Severe] Anecdotal

**Palbociclib** is predicted to increase the exposure to **ciclosporin**. Adjust dose. [Moderate] Theoretical

**Pasireotide** is predicted to decrease the absorption of oral **ciclosporin**. Adjust dose. [Severe] Theoretical

**Pitolisant** is predicted to decrease the exposure to **ciclosporin**. Avoid. [Severe] Theoretical

**Ciclosporin** is predicted to increase the concentration of **ranolazine** and **ranolazine** is predicted to increase the concentration of **ciclosporin**. [Moderate] Theoretical

**Ciclosporin** moderately increases the exposure to **repaglinide**. [Moderate] Study

**Rifampicin** decreases the concentration of **ciclosporin**. [Severe] Study

**Ciclosporin** very markedly increases the exposure to **rifaximin**. [Severe] Study

**Ciclosporin** is predicted to increase the exposure to **riociguat**. [Moderate] Theoretical

**Ciclosporin** is predicted to increase the exposure to **sacubitril**. [Moderate] Theoretical

**Ciclosporin** moderately increases the exposure to **sirolimus**. Separate administration by 4 hours. [Severe] Study

**St John's Wort** decreases the concentration of **ciclosporin**. Avoid. [Moderate] Study

**Ciclosporin** very markedly increases the exposure to **statins** (atorvastatin). Avoid or adjust **atorvastatin** dose, p. 196. [Severe] Study

**Ciclosporin** moderately increases the exposure to **statins** (fluvastatin). [Severe] Study

**Ciclosporin** markedly very markedly increases the exposure to **statins** (pravastatin). Adjust **pravastatin** dose. [Severe] Study

**Ciclosporin** markedly increases the exposure to **statins** (rosuvastatin, simvastatin). Avoid. [Severe] Study

**Sulfipyrazone** decreases the concentration of **ciclosporin**. [Severe] Study

**Ciclosporin** increases the concentration of **tacrolimus**. Avoid. [Severe] Study

→ Also see TABLE 2 p. 1264 → Also see TABLE 16 p. 1268

**Ciclosporin** is predicted to increase the exposure to **ticagrelor**. Use with caution or avoid. [Severe] Study

**Ciclosporin** is predicted to increase the exposure to **topotecan**. [Severe] Study

**Ciclosporin** is predicted to increase the concentration of **trametinib**. [Moderate] Theoretical

**Ursodeoxycholic acid** affects the concentration of **ciclosporin**. Use with caution and adjust dose. [Severe] Anecdotal

**Ciclosporin** is predicted to increase the exposure to **venetoclax**. Avoid or monitor for toxicity. [Severe] Theoretical

**Vitamin E substances** affect the exposure to **ciclosporin**. [Moderate] Study

**Cilostazol** → see TABLE 4 p. 1264 (antiplatelet effects)

### GENERAL INFORMATION

Concurrent use with 2 or more antiplatelets or anticoagulants is contra-indicated.

1312 Cilostazol — Clopidogrel
Cilostazol (continued)
▶ Macrolides (clarithromycin) are predicted to moderately
increase the exposure to cilostazol. Adjust cilostazol dose,
p. 226. o Study

o Study

Rifampicin is predicted to alter the effects of cilostazol.
o Theoretical

▶

▶

SSRIs (fluvoxamine) are predicted to increase the exposure to
cilostazol. Adjust cilostazol dose, p. 226. o Theoretical
→ Also see TABLE 4 p. 1264
St John’s Wort is predicted to alter the effects of cilostazol.
o Theoretical

A1

Cimetidine → see H2 receptor antagonists
Cinacalcet
FOOD AND LIFESTYLE Dose adjustment might be necessary if
smoking started or stopped during treatment.

Interactions | Appendix 1

▶
▶

Cinacalcet is predicted to increase the exposure to
antiarrhythmics (flecainide). r Theoretical
Cinacalcet is predicted to increase the exposure to
antiarrhythmics (propafenone). Monitor and adjust dose.
o Study

▶

Cinacalcet is predicted to increase the exposure to
anticholinesterases, centrally acting (donepezil). o

▶

Cinacalcet is predicted to increase the exposure to
anticholinesterases, centrally acting (galantamine). Monitor and
adjust dose. o Study
Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are
predicted to moderately increase the exposure to cinacalcet.
Adjust dose. o Study
Cinacalcet is predicted to moderately increase the exposure to
aripiprazole. Adjust aripiprazole dose, p. 376. o Study
Cinacalcet is predicted to markedly increase the exposure to
atomoxetine. Adjust dose. r Study
Cinacalcet is predicted to increase the exposure to beta
blockers, non-selective (carvedilol, timolol). o Study
Cinacalcet is predicted to increase the exposure to beta
blockers, selective (metoprolol, nebivolol). o Study
Cobicistat is predicted to moderately increase the exposure to
cinacalcet. Adjust dose. o Study
Cinacalcet is predicted to slightly increase the exposure to
darifenacin. n Study
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir,
lopinavir, ritonavir, saquinavir, tipranavir) are predicted to
moderately increase the exposure to cinacalcet. Adjust dose.

BNF 74

Cinacalcet is predicted to decrease the efﬁcacy of opioids
(codeine). o Theoretical
Cinacalcet is predicted to decrease the efﬁcacy of opioids
(tramadol). r Study
Cinacalcet is predicted to moderately increase the exposure to
pitolisant. Use with caution and adjust dose. o Study
Cinacalcet is predicted to increase the exposure to risperidone.
Adjust dose. o Study
SSRIs (fluvoxamine) are predicted to increase the exposure to
cinacalcet. Adjust dose. o Theoretical
Cinacalcet is predicted to increase the exposure to SSRIs
(dapoxetine). o Theoretical
Cinacalcet is predicted to decrease the efﬁcacy of tamoxifen.
Avoid. r Study

Theoretical

Clarithromycin → see macrolides
Clemastine → see antihistamines, sedating
Clevidipine → see calcium channel blockers
Clindamycin
ROUTE-SPECIFIC INFORMATION Since systemic absorption can
follow topical application, the possibility of interactions
should be borne in mind.
▶
▶

Clindamycin increases the effects of neuromuscular blocking
drugs, non-depolarising. r Anecdotal
Clindamycin increases the effects of suxamethonium. r
Anecdotal

Clobazam
▶ Antiepileptics (stiripentol) increase the concentration of
clobazam. r Study
▶ Clobazam potentially affects the concentration of antiepileptics
(fosphenytoin, phenytoin). r Anecdotal
Clofarabine → see TABLE 15 p. 1267 (myelosuppression)
▶ Live vaccines are predicted to increase the risk of generalised
infection (possibly life-threatening) when given with
clofarabine. Public Health England advises avoid. r
Theoretical

Clofazimine
▶ Clofazimine potentially increases the risk of QT-prolongation
when given with bedaquiline. r Study
Clomethiazole → see TABLE 11 p. 1266 (CNS depressant effects)
FOOD AND LIFESTYLE Alcohol consumption can cause serious,
potentially fatal, CNS depression with clomethiazole.
▶

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) decrease the exposure to clomethiazole.
Monitor and adjust dose. o Study → Also see TABLE 11
p. 1266

Enzalutamide decreases the exposure to clomethiazole.
Monitor and adjust dose. o Study
▶ Rifampicin decreases the exposure to clomethiazole. Monitor
and adjust dose. o Study
Clomipramine → see tricyclic antidepressants
Clonazepam → see TABLE 11 p. 1266 (CNS depressant effects)
▶ Clonazepam potentially affects the concentration of
antiepileptics (fosphenytoin, phenytoin). r Anecdotal
Clonidine → see TABLE 6 p. 1265 (bradycardia), TABLE 8 p. 1265
(hypotension), TABLE 11 p. 1266 (CNS depressant effects)
▶ Clonidine is predicted to decrease the effects of histamine.
Avoid. r Theoretical → Also see TABLE 8 p. 1265
▶ Tricyclic antidepressants decrease the antihypertensive effects
of clonidine. Monitor and adjust dose. o Anecdotal
→ Also see TABLE 8 p. 1265
Clopamide → see thiazide diuretics
Clopidogrel → see TABLE 4 p. 1264 (antiplatelet effects)
▶ Antifungals, azoles (fluconazole) are predicted to decrease the
efﬁcacy of clopidogrel. Avoid. r Theoretical
▶ Antifungals, azoles (voriconazole) are predicted to decrease the
efﬁcacy of clopidogrel. Avoid. o Study
▶ Grapefruit juice markedly decreases the exposure to
clopidogrel. r Study
▶ Clopidogrel is predicted to increase the exposure to
loperamide. r Theoretical
▶ Moclobemide is predicted to decrease the efﬁcacy of
clopidogrel. Avoid. o Study
▶

Clobidogrel is predicted to increase the exposure to pioglitazone. **Severe** Theoretical

Proton pump inhibitors (esomeprazole, omeprazole) are predicted to decrease the efficacy of clobidogrel. **Avoid.** **Moderate** Study

Cobicistat increases the exposure to repaglinide. **Severe** Study

SSRIs (fluvoxamine) are predicted to decrease the efficacy of clobidogrel. **Avoid.** **Severe** Theoretical → Also see TABLE 4 p. 1264

Clobidogrel increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 197. **Moderate** Study

Cobicistat → see antifungals, azoles

Clobidogrel → see antifungals, azoles

Clobidogrel is predicted to decrease the effects of dopamine receptor agonists. **Moderate** Theoretical → Also see TABLE 8 p. 1265 → Also see TABLE 10 p. 1266

Clobidogrel is predicted to decrease the effects of levodopa. **Severe** Theoretical → Also see TABLE 8 p. 1265

Quinolones (ciprofloxacin) increase the concentration of clozapine. Monitor side effects and adjust dose. **Severe** Study

Rifampicin decreases the exposure to clozapine. **Severe** Anecdotal

55Rs (fluvoxamine) increase the concentration of clozapine. Monitor side effects and adjust dose. **Severe** Study

Co-trimoxazolae → see sulphonamides

Cobicistat

Cobicistat is predicted to increase the exposure to abiraterone. **Severe** Theoretical

Cobicistat is predicted to markedly increase the exposure to aldosterone antagonists (spironolactone). **Avoid.** **Severe** Study

Cobicistat increases the exposure to almotriptan. **Mild** Study

Cobicistat is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. **Moderate** Study

Cobicistat is predicted to increase the exposure to alpha blockers (doxazosin). **Moderate** Study

Cobicistat moderately increases the exposure to alprazolam. **Avoid.** **Moderate** Study

Cobicistat very markedly increases the exposure to antiarrhythmics (dronedarone). **Avoid.** **Severe** Study

Cobicistat is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. **Severe** Study

Cobicistat is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. **Moderate** Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cobicistat. Avoid. **Severe** Theoretical

Antiepileptics (oxcarbazepine) are predicted to decrease the concentration of cobicistat. **Severe** Theoretical

Cobicistat is predicted to slightly increase the exposure to antiepileptics (perampanel). **Mild** Study

Cobicistat is predicted to increase the exposure to antifungals, azoles (fluconazolae, posaconazolae). **Moderate** Theoretical

Cobicistat is predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or monitor side effects. **Severe** Study

Cobicistat is predicted to increase the exposure to antifungals, azoles (itraconazole). Adjust itraconazole dose, p. 564. **Moderate** Study

Cobicistat is predicted to increase the exposure to antifungals, azoles (ketokonazole). Adjust ketokonazole dose, p. 641. **Moderate** Theoretical

Cobicistat is predicted to affect the exposure to antifungals, azoles (voriconazole). **Avoid.** **Moderate** Theoretical

Cobicistat is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). **Avoid.** **Severe** Study

Cobicistat is predicted to increase the exposure to antimalarials (artemether) (with lumefantrine). **Moderate** Study

Cobicistat is predicted to increase the concentration of antimalarials (piperazine). **Severe** Theoretical

Cobicistat is predicted to markedly increase the exposure to aripiprazole. **Severe** Study

Cobicistat is predicted to increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 376. **Moderate** Study

Cobicistat is predicted to increase the exposure to axitinib. Avoid or adjust dose. **Moderate** Study

Cobicistat is predicted to increase the exposure to bedaquiline. Avoid prolonged use. **Moderate** Study

Cobicistat is predicted to increase the exposure to beta agonists (salmeterol). **Avoid.** **Severe** Study

Cobicistat slightly increases the exposure to bortezomib. **Moderate** Study

Bosentan is predicted to decrease the exposure to cobicistat. **Avoid.** **Severe** Theoretical

Cobicistat is predicted to markedly increase the exposure to bosutinib. **Avoid or adjust bosutinib dose.** **Severe** Study

Cobicistat is predicted to increase the exposure to bupirone. Adjust busiprone dose, p. 325. **Severe** Study

Cobicistat slightly increases the exposure to cabozantinib. **Moderate** Study

Cobicistat is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. **Moderate** Study

Cobicistat is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). **Severe** Study

Cobicistat is predicted to markedly increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, nicardipine, nifedipine, nimodipine). **Avoid.** **Severe** Study

Cobicistat is predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. **Moderate** Theoretical

Cobicistat is predicted to increase the exposure to ceritinib. Avoid or adjust ceritinib dose, p. 895. **Severe** Study

Cobicistat increases the concentration of ciclosporin. **Severe** Study

Cobicistat is predicted to moderately increase the exposure to clobazolae. Adjust clobazolae dose, p. 226. **Moderate** Study

Cobicistat is predicted to moderately increase the exposure to cinacalcet. Adjust dose, **Moderate** Study

Cobicistat is predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. **Severe** Study

Cobicistat is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose, p. 1020. **Severe** Study

Cobicistat is predicted to decrease the efficacy of combined hormonal contraceptives. **Avoid.** **Severe** Study

Cobicistat is predicted to increase the concentration of corticosteroids (beclometasone) (risk with beclometasone is likely to be lower than with other corticosteroids). MHRA advises avoid or monitor for beclometasone side effects. **Moderate** Theoretical

Cobicistat is predicted to increase the concentration of corticosteroids (betamethasone). MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. **Severe** Theoretical

Cobicistat is predicted to increase the concentration of corticosteroids (budesonide). MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. **Severe** Theoretical
Cobicistat — Cobicistat

Cobicistat (continued)

- **Corticosteroids (ciclesonide)**. Avoid. [Moderate] Theoretical

- **Cobicistat** is predicted to increase the concentration of corticosteroids (dexamethasone). MHRAs advises avoid or monitor side effects and consider beclomethasone as an alternative. [Severe] Theoretical

- **Cobicistat** is predicted to increase the concentration of corticosteroids (hydrocortisone). MHRAs advises avoid or monitor side effects and consider beclomethasone as an alternative. [Severe] Theoretical

- **Cobicistat** is predicted to increase the concentration of corticosteroids (mometasone). MHRAs advises avoid or monitor side effects and consider beclomethasone as an alternative. [Severe] Theoretical

- **Cobicistat** is predicted to increase the concentration of corticosteroids (prednisolone). MHRAs advises avoid or monitor side effects and consider beclomethasone as an alternative. [Severe] Theoretical

- **Cobicistat** is predicted to moderately increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study

- **Cobicistat** is predicted to moderately increase the exposure to daclatasvir. Adjust daclatasvir dose, p. 591. [Moderate] Study

- **Cobicistat** is predicted to markedly increase the exposure to dabatinib. Avoid. [Severe] Study

- **Cobicistat** very slightly increases the exposure to delamanid. [Severe] Study

- **Cobicistat** increases the risk of QT-prolongation when given with doperidone. Avoid. [Severe] Study

- **Cobicistat** increases the exposure to dopamine receptor antagonists (bromocriptine, cabergoline). [Severe] Study

- **Cobicistat** is predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. [Moderate] Theoretical

- **Eflavirenz** is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical

- **Cobicistat** slightly to moderately increases the exposure to elbasvir. Avoid. [Moderate] Study

- **Cobicistat** is predicted to markedly increase the exposure to eleriptan. Avoid. [Severe] Study

- **Enzalutamide** is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical

- **Cobicistat** is predicted to increase the risk of ergotism when given with ergometrine. Avoid. [Severe] Theoretical

- **Cobicistat** is predicted to increase the risk of ergotism when given with ergotamine. Avoid. [Severe] Theoretical

- **Cobicistat** is predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. [Moderate] Study

- **Cobicistat** is predicted to increase the concentration of everolimus. Avoid. [Severe] Study

- **Cobicistat** is predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose; avoid in hepatic and renal impairment, p. 732. [Severe] Study

- **Cobicistat** is predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical

- **Cobicistat** is predicted to increase the exposure to gefitinib. [Moderate] Study

- **Cobicistat** is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study

- **Cobicistat** is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Study

- **Cobicistat** is predicted to very markedly increase the exposure to ibrutinib. Avoid or adjust ibrutinib dose, p. 902. [Severe] Study

- **Cobicistat** is predicted to increase the exposure to imatinib. [Moderate] Study

- **Cobicistat** is predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study

- **Cobicistat** is predicted to increase the exposure to ivabradine. Avoid. [Severe] Study

- **Cobicistat** is predicted to increase the exposure to ivacaftor. Adjust ivacaftor or lumacaftor with ivacaftor dose, p. 281. [Severe] Study

- **Cobicistat** is predicted to increase the exposure to lapatinib. Avoid. [Moderate] Study

- **Cobicistat** is predicted to markedly increase the exposure to lenalidomide. Avoid. [Severe] Study

- **Cobicistat** is predicted to increase the exposure to lurasidone. Avoid. [Severe] Study

- **Cobicistat** is predicted to increase the exposure to macitentan. Moderate Study

- **Cobicistat** markedly increases the exposure to maraviroc. Refer to specialist literature. [Severe] Study

- **Cobicistat** is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust midazolam dose. [Severe] Study

- **Cobicistat** is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 736. [Moderate] Study

- **Cobicistat** is predicted to increase the exposure to mirtazapine. [Moderate] Study

- **Cobicistat** is predicted to increase the exposure to modafinil. [Mild] Theoretical

- **Cobicistat** is predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. [Severe] Theoretical

- **Cobicistat** is predicted to markedly increase the exposure to naloxegol. Avoid. [Severe] Study

- **Cobicistat** is predicted to increase the exposure to netupitant. [Mild] Study

- **Nevirapine** is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical

- **Cobicistat** is predicted to moderately increase the exposure to nilotinib. Avoid. [Severe] Study

- **Cobicistat** is predicted to increase the exposure to nitisineone. Adjust nitisinolone dose. [Moderate] Theoretical

- **Cobicistat** is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Study

- **Cobicistat** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. [Severe] Study

- **Cobicistat** is predicted to increase the exposure to opioids (methadone). [Moderate] Theoretical

- **Cobicistat** is predicted to increase the exposure to oxabutynin. [Mild] Study

- **Cobicistat** is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose, p. 909. [Severe] Study

- **Cobicistat** is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 864. [Moderate] Study

- **Cobicistat** is predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Theoretical

- **Cobicistat** is predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose, p. 909. [Moderate] Study

- **Cobicistat** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study

- **Cobicistat** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid or adjust sildenafil dose, p. 766. [Severe] Study

- **Cobicistat** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. [Severe] Study

- **Cobicistat** is predicted to increase the exposure to pimozide. Avoid. [Severe] Study

- **Cobicistat** is predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose, p. 911. [Moderate] Study
Cobicistat – Colchicine

- Cobicistat is predicted to moderately increase the exposure to praziquantel. [Mild] Study
- Cobicistat is predicted to increase the exposure to quetiapine. Avoid. [Severe] Study
- Cobicistat is predicted to increase the exposure to ranolazine. Avoid. [Severe] Study
- Cobicistat is predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study
- Cobicistat is predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study
- Cobicistat is predicted to increase the exposure to rapaglinide. [Moderate] Study
- Cobicistat is predicted to increase the exposure to retinoids (alitretinoin). Adjust altiretinoin dose, p. 1157. [Moderate] Theoretical
- Rifabutin decreases the concentration of cobicistat and cobicistat increases the exposure to rifabutin. Avoid or adjust dose. [Severe] Study
- Rifampicin is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical
- Cobicistat is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- Cobicistat is predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study
- Cobicistat is predicted to moderately increase the exposure to SSRIs (dapoxetine). Avoid or adjust dapoxetine dose, p. 772. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical
- Cobicistat is predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
- Cobicistat is predicted to increase the exposure to statins (simvastatin). Avoid. [Severe] Study
- Cobicistat is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 914. [Moderate] Study
- Cobicistat is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study
- Cobicistat is predicted to increase the exposure to taxanes (cabazitaxel). Avoid. [Severe] Study
- Cobicistat is predicted to moderately increase the exposure to taxanes (docetaxel). Avoid or adjust dose. [Severe] Study
- Cobicistat is predicted to increase the exposure to taxanes (paclitaxel). [Severe] Theoretical
- Cobicistat is predicted to increase the concentration of temsirilimus. Avoid. [Severe] Theoretical
- Cobicistat is predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study
- Cobicistat is predicted to increase the exposure to tolterodine. Avoid. [Severe] Study
- Cobicistat is predicted to increase the exposure to tolvaptan. [Moderate] Theoretical
- Cobicistat is predicted to increase the exposure to toremifene. Avoid or adjust dose. [Severe] Study
- Cobicistat is predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical
- Cobicistat is predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. [Moderate] Study
- Cobicistat is predicted to slightly increase the exposure to tricyclic antidepressants. [Mild] Study
- Cobicistat is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Severe] Study
- Cobicistat is predicted to increase the exposure to vemurafenib. [Severe] Theoretical
- Cobicistat is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose, p. 919. [Severe] Study
- Cobicistat is predicted to increase the exposure to venlafaxine. Moderate] Study
- Cobicistat is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical
- Cobicistat is predicted to increase the exposure to vitamin D substances (paricalcitol). Moderate] Study
- Cobicistat is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Theoretical

Cobimetinib
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to cobimetinib. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, miconazole, posaconazole) are predicted to increase the exposure to cobimetinib. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. [Severe] Study
- Aprepitant is predicted to increase the exposure to cobimetinib. [Severe] Theoretical
- Bosentan is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to cobimetinib. [Severe] Theoretical
- Cobimetinib is predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. [Severe] Study
- Crizotinib is predicted to increase the exposure to cobimetinib. [Severe] Theoretical
- Elafirenz is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical
- Enzalutamide is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical
- Grapefruit juice is predicted to increase the exposure to cobimetinib. Avoid. [Severe] Theoretical
- HIV-protase inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. [Severe] Study
- HIV-protase inhibitors (indinavir) are predicted to increase the exposure to cobimetinib. [Severe] Theoretical
- Idelalisib is predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. [Severe] Study
- Imatinib is predicted to increase the exposure to cobimetinib. [Severe] Theoretical
- Macrolides (clarithromycin) are predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. [Severe] Study
- Macrolides (erythromycin) are predicted to increase the exposure to cobimetinib. [Severe] Theoretical
- Netupitant is predicted to increase the exposure to cobimetinib. [Severe] Theoretical
- Nevirapine is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical
- Nilotinib is predicted to increase the exposure to cobimetinib. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical
- Colchicine
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to colchicine. Adjust colchicine dose, p. 1020. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, miconazole, posaconazole) are predicted to increase the exposure to colchicine. Adjust colchicine dose, p. 1020. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to colchicine. Adjust colchicine dose, p. 1020. [Severe] Study
- Aprepitant is predicted to increase the exposure to colchicine. Adjust colchicine dose, p. 1020. [Severe] Study

Codeine – see opioids
Colchicine (continued)

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to colchicine. Adjust colchicine dose, p. 1020. [Severe] Study
- Ceritinib is predicted to increase the exposure to colchicine. [Moderate] Theoretical
- Ciclosporin increases the exposure to colchicine. Avoid or adjust colchicine dose, p. 1020. [Severe] Study
- Cobicistat is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose, p. 1020. [Severe] Study
- Crizotinib is predicted to increase the exposure to colchicine. Adjust colchicine dose, p. 1020. [Severe] Study
- Colchicine increases the risk of rhabdomyolysis when given with fibrates. [Severe] Anecdotal
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose, p. 1020. [Severe] Study
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to colchicine. Adjust colchicine dose, p. 1020. [Severe] Study
- Idelalisib is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose, p. 1020. [Severe] Study
- Imatinib is predicted to increase the exposure to colchicine. Adjust colchicine dose, p. 1020. [Severe] Study
- Lapatinib is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose, p. 1020. [Moderate] Theoretical
- Lumacaftor is predicted to affect the exposure to colchicine. [Moderate] Theoretical
- Macrolides (azithromycin) are predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose, p. 1020. [Severe] Study
- Macrolides (clarithromycin) are predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose, p. 1020. [Severe] Study
- Macrolides (erythromycin) are predicted to increase the exposure to colchicine. Adjust colchicine dose, p. 1020. [Severe] Study
- Mirabegron is predicted to increase the exposure to colchicine. [Mild] Theoretical
- Netupitant is predicted to increase the exposure to colchicine. Adjust colchicine dose, p. 1020. [Severe] Study
- Nilotinib is predicted to increase the exposure to colchicine. Adjust colchicine dose, p. 1020. [Severe] Study
- Ranolazine is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose, p. 1020. [Theoretical]
- Colchicine increases the risk of rhabdomyolysis when given with statins. [Severe] Anecdotal
- Vemurafenib is predicted to increase the exposure to colchicine. [Severe] Theoretical
- Vemurafenib is predicted to increase the exposure to colchicine. [Moderate] Theoretical
- Colecalciferol → see vitamin D substances

Colestipol

**SEPARATION OF ADMINISTRATION** Manufacturer advises take 4 hours before, or after, other drugs.

Colestyramine

**SEPARATION OF ADMINISTRATION** Manufacturer advises take other drugs at least 1 hour before, or 4–6 hours after, colestipol.

Colistimethate → see TABLE 2 p. 1264 (nephrotoxicity), TABLE 20 p. 1268 (neuromuscular blocking effects)

- Colistimethate increases the effects of neuromuscular blocking drugs, non-depolarising. Monitor and adjust dose. [Moderate] Study → Also see TABLE 20 p. 1268
- Colistimethate increases the effects of suxamethonium. Monitor and adjust dose. [Moderate] Study → Also see TABLE 20 p. 1268

Combined hormonal contraceptives

- Combined hormonal contraceptives are predicted to increase the exposure to agomelatine. [Moderate] Study
- Combined hormonal contraceptives are predicted to increase the exposure to aminophylline. [Moderate] Theoretical
- Combined hormonal contraceptives are predicted to increase the exposure to anagrelide. [Moderate] Theoretical
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Study
- Combined hormonal contraceptives alter the exposure to antiepileptics (lamotrigine). Adjust lamotrigine dose. [Moderate] Study
- Aprepitant is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Study
- Bosentan is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Study
- Combined hormonal contraceptives increases the concentration of clozapine. Monitor side effects and adjust dose. [Severe] Study
- Cobicistat is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. [Severe] Study
- Combined hormonal contraceptives increase the risk of raised liver function tests when given with dasabuvir. Avoid. [Severe] Study
- Combined hormonal contraceptives are predicted to increase the exposure to dopamine receptor agonists (ropinirol). Adjust dose. [Moderate] Study
- Efavirenz is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Study
- Combined hormonal contraceptives slightly increases the exposure to erlotinib. Monitor side effects and adjust dose. [Moderate] Study
- Combined hormonal contraceptives are predicted to increase the exposure to dopamine receptor agonists (ropinirol). Adjust dose. [Moderate] Study
- Efavirenz is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Study
- Combined hormonal contraceptives are predicted to decrease the effect of venous thromboembolism when given with lenalidomide. Avoid. [Severe] Theoretical
- Oral combined hormonal contraceptives slightly increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Combined hormonal contraceptives are predicted to increase the exposure to loxapine. Avoid. [Unknown] Theoretical
- Lumacaftor is predicted to decrease the efficacy of combined hormonal contraceptives. Use additional contraceptive precautions. [Severe] Theoretical
- Combined hormonal contraceptives are predicted to increase the exposure to melatonin. [Moderate] Theoretical
- Combined hormonal contraceptives decrease the effects of metyrapone. Avoid. [Moderate] Theoretical
- Modafinil is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Study
- Combined hormonal contraceptives slightly increase the exposure to monoamine-oxidase B inhibitors (rasagiline). [Moderate] Study
- Combined hormonal contraceptives increase the exposure to monoamine-oxidase B inhibitors (selegiline). Avoid. [Severe] Study
Combined hormonal contraceptives — Corticosteroids

- **Nevirapine** is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 747. **Severe** Study
- **NSAID. (etoricoxib)** slightly increase the exposure to combined hormonal contraceptives. **Moderate** Study
- **Paritaprevir (with ritonavir and omibitasvir)** increases the risk of raised liver function tests when given with combined hormonal contraceptives. Avoid. **Severe** Study
- **Combined hormonal contraceptives** are predicted to increase the exposure to **pirfenidone**. Use with caution and adjust dose. **Moderate** Study
- **Pitolisant** is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. **Severe** Theoretical
- **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with **gemildamide**. Avoid. **Severe** Theoretical
- **Rifabutin** is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 747. **Severe** Study
- **Rifampicin** is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 747. **Severe** Study
- **Combined hormonal contraceptives** are predicted to increase the exposure to **roflumilast**. **Moderate** Theoretical
- **St John's Wort** decreases the efficacy of combined hormonal contraceptives. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 747. **Severe** Anecdotal
- **Sugammadex** is predicted to decrease the exposure to oral combined hormonal contraceptives. Refer to patient information leaflet for missed pill advice. **Severe** Theoretical
- **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with **thalidomide**. Avoid. **Severe** Study
- **Combined hormonal contraceptives** are predicted to increase the exposure to **theophylline**. Monitor and adjust dose. **Moderate** Theoretical
- **Combined hormonal contraceptives** increase the exposure to **tizanidine**. Avoid. **Moderate** Study
- **Ulipristal** is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. **Severe** Theoretical
- **Combined hormonal contraceptives** are predicted to increase the exposure to **zolmitriptan**. Adjust **zolmitriptan** dose, p. 456. **Moderate** Theoretical

**Corticosteroids** → see TABLE 17 p. 1268 (reduced serum potassium)

- **Betamethasone** • **Betamethasone** • **Budesonide** • **Ciclesonide** • **Deflazacort** • **Dexamethasone** • **Fluticasone** • **Hydrocortisone** • **Methylprednisolone** • **Mometasone** • **Prednisolone** • **Prednisone** • **Triamcinolone**

- Interactions do not generally apply to corticosteroids used for topical action (including inhalation) unless specified.
- With intravital use of **dexamethasone**: caution with concurrent administration of anticoagulant or antiplatelet drugs—increased risk of haemorrhagic events.

- **Antacids** are predicted to decrease the absorption of **deflazacort**. Separate administration by 2 hours. **Moderate** Theoretical
- **Antacids** decrease the absorption of **dexamethasone**. **Moderate** Study
- **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to **methylprednisolone**. Monitor and adjust dose. **Moderate** Study
- **Antiepileptics (Carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **deflazacort** (unknown) Theoretical
- **Antiepileptics (Carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **prednisone**. **MDM** Study
- **Antiepileptics (Carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to corticosteroids (Budesonide, Dexamethasone, Methylprednisolone, Prednisolone). Monitor and adjust dose. **Moderate** Study
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. **Moderate** Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to budesonide. Avoid. **Severe** Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to ciclesonide. Avoid. **Moderate** Theoretical
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to inhaled fluticasone. **Severe** Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to mometasone. **Moderate** Theoretical
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the risk of side-effects when given with triamcinolone. **Severe** Theoretical
- **Antifungals, azoles (miconazole)** are predicted to increase the concentration of methylprednisolone. Monitor and adjust dose. **Moderate** Theoretical
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to corticosteroids (Dexamethasone, Methylprednisolone). Monitor and adjust dose. **Moderate** Study
- **Aprepitant** moderately increases the exposure to dexamethasone. Monitor and adjust dose. **Moderate** Study
- **Aprepitant** is predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. **Moderate** Study
- **Corticosteroids** are predicted to decrease the concentration of **dexamethasone**. **Moderate** Study
- **Cobicistat** is predicted to increase the concentration of **betamethasone**. MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. **Severe** Theoretical
- **Cobicistat** is predicted to increase the concentration of **dexamethasone**. MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. **Severe** Theoretical
- **Cobicistat** is predicted to increase the concentration of **beclometasone**. MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. **Severe** Theoretical
- **Cobicistat** is predicted to increase the concentration of **beclometasone**. MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. **Severe** Theoretical
- **Cobicistat** is predicted to increase the concentration of **beclometasone**. MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. **Severe** Theoretical
- **Cobicistat** is predicted to increase the concentration of **beclometasone**. MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. **Severe** Theoretical
- **Cobicistat** is predicted to increase the concentration of **beclometasone**. MHRA advises avoid or monitor side effects and consider beclometasone as an alternative. **Severe** Theoretical

**BNF 74**

**Interactions | Appendix 1**
Corticosteroids

- **Cobicistat** is predicted to increase the concentration of prednisolone. MHRA advises avoid or monitor side effects and consider beclomethasone as an alternative. (Severe) Theoretical
- **Cobicistat** is predicted to increase the concentration of prednisone. MHRA advises avoid or monitor side effects and consider beclomethasone as an alternative. (Severe) Theoretical
- **Cobicistat** is predicted to increase the concentration of triamcinolone. MHRA advises avoid or monitor side effects and consider beclomethasone as an alternative. (Severe) Theoretical

**Corticosteroids** are predicted to increase the effects of
- **Counarins**. (Moderate) Study
- **Crizotinib** is predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. (Moderate) Study
- **Enzalutamide** is predicted to decrease the exposure to corticosteroids (budesonide, dexamethasone, methylprednisolone, prednisolone). Monitor and adjust dose. (Moderate) Study
- **Enzalutamide** is predicted to decrease the exposure to fluticasone. (Unknown) Theoretical
- **Enzalutamide** is predicted to decrease the exposure to methylprednisolone. (HiLo) Study
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to ciclesonide. Avoid. (Moderate) Theoretical
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to inhaled fluticasone. (Severe) Study
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. (Moderate) Theoretical
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the risk of side-effects when given with triamcinolone. (Severe) Theoretical

**Corticosteroids** are predicted to increase the risk of gastrointestinal bleeding when given with iron chelators (deferasirox). (Severe) Theoretical

- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with corticosteroids (high-dose). Public Health England advises avoid. (Severe) Theoretical
- **Lumacaftor** is predicted to decrease the exposure to corticosteroids (methylprednisolone, prednisolone). Adjust dose. (Severe) Theoretical
- **Macrolides** (clarithromycin) are predicted to increase the exposure to budesonide. Avoid. (Severe) Study
- **Macrolides** (clarithromycin) are predicted to increase the exposure to ciclesonide. Avoid. (Moderate) Theoretical
- **Macrolides** (clarithromycin) are predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. (Moderate) Study
- **Corticosteroids** are predicted to decrease the efficacy of mifamurtide. Avoid. (Severe) Theoretical
- **Mifepristone** is predicted to decrease the efficacy of corticosteroids. Use with caution and adjust dose. (Moderate) Theoretical
- **Netupitant** increases the exposure to dexamethasone. Adjust dose. (Moderate) Study
- **Netupitant** is predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. (Moderate) Study
- **Corticosteroids** are predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. (Severe) Anecdotal
- **Corticosteroids** increase the risk of gastrointestinal perforation when given with nicorandil. (Severe) Anecdotal
- **Nilotinib** is predicted to increase the exposure to methylprednisolone. Monitor and adjust dose. (Moderate) Study
- **NSAIDs** increase the risk of gastrointestinal bleeding when given with corticosteroids. (Severe) Study
- **Corticosteroids** are predicted to increase the effects of phenindione. (Moderate) Anecdotal
- **Dexamethasone** decreases the exposure to praziquantel. (Moderate) Study
- **Rifampicin** is predicted to decrease the exposure to corticosteroids (budesonide, dexamethasone, methylprednisolone, prednisolone). Monitor and adjust dose. (Moderate) Study
- **Rifampicin** is predicted to decrease the exposure to trilostane. (Unknown) Theoretical
- **Rifampicin** is predicted to decrease the exposure to fluticasone. (Unknown) Theoretical
- **Carbamazepine** is predicted to decrease the exposure to methylprednisolone. (HiLo) Study
- **Corticosteroids** potentially decrease the effects of sodium phenylbutyrate. (Moderate) Anecdotal
- **Corticosteroids** are predicted to decrease the effects of somatropin. (Moderate) Theoretical
- **Corticosteroids** are predicted to decrease the effects of suxamethonium. (Severe) Anecdotal

**Counarins** → see TABLE 3 p. 1264 (anticoagulant effects)

acencoumarol - warfarin

**FOOD AND LIFESTYLE** The effects of counarins can be reduced or abolished by vitamin K, including that found in health
foods, food supplements, enteral feeds, or large amounts of some green vegetables or green tea. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption can affect anticoagulant control. Pomegranate increases the INR in response to warfarin and is predicted to increase the INR in response to acenocoumarol.

- **Antiarrhythmics (amiodarone)** increase the anticoagulant effect of coumarins. *Severe* Study
- **Antiarrhythmics (propafenone)** increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. *Moderate* Study
- **Antiepileptics (carbamazepine)** decrease the effects of coumarins. Monitor and adjust dose. *Severe* Study
- **Antiepileptics (fosphenytoin, phenytoin)** are predicted to alter the anticoagulant effect of coumarins. *Moderate* Anecdotal
- **Antiepileptics (phenobarbital, primidone)** decrease the anticoagulant effect of coumarins. Monitor INR and adjust dose. *Moderate* Study
- **Antifungals, azoles (fluconazole)** increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. *Severe* Study
- **Antifungals, azoles (itraconazole)** potentially increase the anticoagulant effect of coumarins. *Severe* Anecdotal
- **Antifungals, azoles (ketocconazole)** potentially increase the anticoagulant effect of warfarin. Monitor INR and adjust dose. *Severe* Anecdotal
- **Antifungals, azoles (miconazole)** greatly increase the anticoagulant effect of coumarins. *Severe* Study
- **Antifungals, azoles (vorkonazole)** increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. *Moderate* Study
- **Aprepitant** decreases the anticoagulant effect of coumarins. *Moderate* Study
- **Axitinib** is predicted to increase the risk of bleeding events when given with coumarins. *Severe* Theoretical
- **Azathioprine** decreases the anticoagulant effect of coumarins. *Moderate* Study
- **Bosentan** decreases the anticoagulant effect of coumarins. *Moderate* Study
- **Bosutinib** is predicted to increase the risk of bleeding events when given with coumarins. *Severe* Theoretical
- **Cabozantinib** is predicted to increase the risk of bleeding events when given with coumarins. *Severe* Theoretical
- **Capecitabine** increases the effects of coumarins. Monitor INR and adjust dose. *Moderate* Anecdotal
- **Cephalosporins (ceftriaxone)** potentially increase the risk of bleeding events when given with coumarins. *Severe* Anecdotal
- **Ceritinib** is predicted to increase the exposure to warfarin. Avoid. *Severe* Theoretical
- **Chloramphenicol** potentially increases the anticoagulant effect of coumarins. *Moderate* Anecdotal
- **Corticosteroids** are predicted to increase the effects of coumarins. *Moderate* Study
- **Cranberry juice** potentially increases the anticoagulant effect of warfarin. Avoid. *Severe* Anecdotal
- **Crizotinib** is predicted to increase the risk of bleeding events when given with coumarins. *Severe* Theoretical
- **Dabrafenib** is predicted to decrease the anticoagulant effect of coumarins. *Severe* Theoretical
- **Danazol** potentially increases the anticoagulant effect of coumarins. *Severe* Anecdotal
- **Dasatinib** is predicted to increase the risk of bleeding events when given with coumarins. *Severe* Theoretical
- **Disulfiram** increases the anticoagulant effect of coumarins. *Moderate* Study
- **Efavirenz** is predicted to affect the concentration of coumarins. Adjust dose. *Moderate* Theoretical
- **Elvitegravir** is predicted to decrease the anticoagulant effect of coumarins. *Moderate* Theoretical
- **Enteral feeds** (vitamin-K containing) potentially decrease the anticoagulant effect of coumarins. *Severe* Anecdotal
- **Enzalutamide** potentially decreases the exposure to coumarins. Avoid or adjust dose and monitor INR. *Severe* Study
- **Erlotinib** increases the anticoagulant effect of coumarins. *Severe* Anecdotal
- **Etravirine** increases the anticoagulant effect of coumarins. *Moderate* Theoretical
- **Fibrates** are predicted to increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. *Severe* Study
- **Fluorouracil** increases the anticoagulant effect of coumarins. *Moderate* Anecdotal
- **Fosaprepitant** is predicted to decrease the anticoagulant effect of coumarins. *Moderate* Study
- **Gefitinib** is predicted to increase the anticoagulant effect of coumarins. *Moderate* Theoretical
- **Glucagon** increases the anticoagulant effect of warfarin. *Severe* Study
- **Glucosamine** increases the anticoagulant effect of warfarin. *Moderate* Anecdotal
- **Griseofulvin** potentially decreases the anticoagulant effect of coumarins. *Moderate* Anecdotal
- **H₃ receptor antagonists (cimetidine)** increase the anticoagulant effect of coumarins. *Severe* Study
- **HIV-protease inhibitors** are predicted to affect the anticoagulant effect of coumarins. *Moderate* Study
- **Imatinib** is predicted to increase the risk of bleeding events when given with coumarins. *Severe* Theoretical
- **Ivacafarin** is predicted to increase the anticoagulant effect of warfarin. *Severe* Theoretical
- **Ivermectin** potentially increases the anticoagulant effect of coumarins. *Severe* Anecdotal
- **Lapatinib** is predicted to increase the risk of bleeding events when given with coumarins. *Severe* Theoretical
- **Leflunomide** increases the anticoagulant effect of coumarins. *Severe* Anecdotal
- **Live vaccines (influenza vaccine)** potentially increase the risk of bleeding events when given with coumarins. *Severe* Anecdotal
- **Lomitapide** increases the exposure to warfarin. Monitor INR and adjust warfarin dose. *Moderate* Study
- **Lumacaftor** is predicted to affect the exposure to warfarin. *Severe* Theoretical
- **Macrolides (clarithromycin, erythromycin)** increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. *Severe* Anecdotal
- **Mercaptopurine** decreases the anticoagulant effect of coumarins. *Moderate* Anecdotal
- **Metronidazole** increases the anticoagulant effect of coumarins. Monitor INR and adjust dose. *Severe* Study
- **Monoclonal antibodies (blinatumomab)** are predicted to transiently increase the exposure to warfarin. Monitor and adjust dose. *Moderate* Theoretical
- **Nandrolone** is predicted to increase the anticoagulant effect of coumarins. Monitor and adjust dose. *Severe* Theoretical
- **Nevirapine** potentially alters the anticoagulant effect of coumarins. *Severe* Anecdotal
- **Nilotinib** is predicted to increase the risk of bleeding events when given with coumarins. *Severe* Theoretical
- **Oxymetholone** increases the anticoagulant effect of coumarins. *Severe* Anecdotal
- **Paracetamol** increases the anticoagulant effect of coumarins. *Moderate* Anecdotal
- **Penicillins** potentially alter the anticoagulant effect of coumarins. Monitor INR and adjust dose. *Moderate* Theoretical
- **Pazopanib** is predicted to increase the risk of bleeding events when given with coumarins. *Severe* Theoretical
- **Pemetrexed** potentially decreases the anticoagulant effect of coumarins. *Moderate* Study
- **Ponatinib** is predicted to decrease the exposure to warfarin. *Unknown* Theoretical
- **Ponatinib** is predicted to increase the risk of bleeding events when given with coumarins. *Severe* Theoretical
- **Quinolones** increase the anticoagulant effect of coumarins. *Severe* Anecdotal
- **Ranibizumab** increases the risk of bleeding events when given with coumarins. *Severe* Theoretical
- **Regorafenib** is predicted to increase the risk of bleeding events when given with coumarins. *Severe* Study
- **Rifampicin** decreases the anticoagulant effect of coumarins. *Severe* Study
- **Ruxolitinib** is predicted to increase the risk of bleeding events when given with coumarins. *Severe* Theoretical
Interactions

Appendix 1

Crizotinib

- **Sorafenib** increases the anticoagulant effect of coumarins. [Severe] Anecdotal
- **St John's Wort** decreases the anticoagulant effect of coumarins. Avoid. [Severe] Anecdotal
- Statins (fluvastatin, rosuvastatin) increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Study
- **Sucralfate** potentially decreases the effects of warfarin. Separate administration by 2 hours. [Moderate] Anecdotal
- **Sulfamethoxazole** increases the anticoagulant effect of coumarins. [Severe] Study
- **Bosentan** decreases the anticoagulant effect of coumarins. [Severe] Theoretical
- **Tamoxifen** increases the anticoagulant effect of coumarins. [Moderate] Study
- **Grapefruit juice** increases the anticoagulant effect of coumarins. [Severe] Study
- **Cranberry juice** increases the anticoagulant effect of coumarins. [Moderate] Anecdotal
- **Teriflunomide** affects the anticoagulant effect of coumarins. [Severe] Study
- **Tetracyclines** increase the risk of bleeding events when given with coumarins. [Moderate] Anecdotal
- **Tiludronate** is predicted to increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Theoretical
- **Toremifene** is predicted to increase the anticoagulant effect of coumarins. [Severe] Theoretical
- **Trimethoprim** is predicted to increase the anticoagulant effect of coumarins. [Severe] Study
- **Vandetanib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- **Venetoclax** slightly increases the exposure to warfarin. [Moderate] Study

**Cranberry juice** potentially increases the anticoagulant effect of coumarins (warfarin). Avoid. [Severe] Anecdotal

**Crisantaspase** → see TABLE 1 p. 1264 (hepatotoxicity), TABLE 15 p. 1267 (myelosuppression)

**Crisantaspase** is predicted to increase the risk of hepatotoxicity when given with imatinib. [Severe] Theoretical → Also see TABLE 15 p. 1267

**Crisantaspase** affecls the efficacy of methotrexate. [Severe] Anecdotal → Also see TABLE 1 p. 1264 → Also see TABLE 15 p. 1267

**Crisantaspase** potentially increases the risk of neurotoxicity when given with vinca alkaloids (vincristine). [Severe] Anecdotal → Also see TABLE 1 p. 1264 → Also see TABLE 15 p. 1267

**Crizotinib** → see TABLE 6 p. 1265 (bradycardia), TABLE 15 p. 1267 (myelosuppression), TABLE 9 p. 1266 (QT-interval prolongation)

**Crizotinib** is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 185. [Severe] Study

**Crizotinib** is predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical

**Crizotinib** is predicted to increase the exposure to alprazolam. [Severe] Study

**Antiarrhythmics (dronedarone)** are predicted to increase the exposure to crizotinib. [Moderate] Theoretical → Also see TABLE 9 p. 1266

**Crizotinib** is predicted to increase the exposure to antianginal drugs (propafenone). Monitor and adjust dose. [Moderate] Study

**Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to crizotinib. Avoid. [Severe] Study

**Antifungals, azoles (fluconazole, posaconazole)** are predicted to increase the exposure to crizotinib. Avoid. [Moderate] Study

**Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to moderately increase the exposure to crizotinib. Avoid. [Moderate] Study → Also see TABLE 9 p. 1266

- **Crizotinib** is predicted to increase the exposure to antifungals, azoles (isavuconazole). [Moderate] Theoretical
- **Crizotinib** is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). [Severe] Theoretical
- **Crizotinib** is predicted to increase the concentration of antimailarials (piperazaine). [Severe] Theoretical
- **Aprepitant** is predicted to increase the exposure to crizotinib. [Moderate] Theoretical
- **Crizotinib** is predicted to increase the exposure to axitinib. [Moderate] Theoretical → Also see TABLE 15 p. 1267
- **Crizotinib** is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mid] Theoretical → Also see TABLE 9 p. 1266
- **Bosentan** is predicted to decrease the exposure to crizotinib. Avoid. [Severe] Theoretical
- **Crizotinib** is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical → Also see TABLE 15 p. 1267 → Also see TABLE 9 p. 1266
- **Crizotinib** is predicted to increase the exposure to buspirone. Use with caution and adjust dose. [Moderate] Study
- **Crizotinib** is predicted to increase the exposure to cabozantinib. [Moderate] Theoretical → Also see TABLE 15 p. 1267 → Also see TABLE 9 p. 1266
- **Calcium channel blockers** (diltiazem, verapamil) are predicted to increase the exposure to crizotinib. [Moderate] Theoretical → Also see TABLE 6 p. 1267
- **Crizotinib** is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- **Crizotinib** is predicted to increase the exposure to ceritinib. [Moderate] Theoretical → Also see TABLE 15 p. 1267 → Also see TABLE 9 p. 1266
- **Crizotinib** increases the concentration of ciclosporin. [Severe] Study
- **Cobicistat** is predicted to moderately increase the exposure to crizotinib. Avoid. [Moderate] Study
- **Crizotinib** is predicted to increase the exposure to cobimetinib. [Severe] Theoretical
- **Crizotinib** is predicted to increase the exposure to colchicine. Adjust colchicine dose, p. 1020. [Severe] Study
- **Crizotinib** is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. [Moderate] Study
- **Crizotinib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- **Crizotinib** is predicted to slightly increase the exposure to darifenacin. [Moderate] Study
- **Crizotinib** is predicted to increase the exposure to dasatinib. [Severe] Study → Also see TABLE 15 p. 1267 → Also see TABLE 9 p. 1266
- **Crizotinib** increases the risk of QT-prolongation when given with dorperidone. Avoid. [Severe] Study
- **Crizotinib** is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
- **Crizotinib** is predicted to moderately increase the exposure to dutasteride. [Mid] Study
- **Efavirenz** is predicted to decrease the exposure to crizotinib. Avoid. [Severe] Theoretical
- **Enalapril** is predicted to markedly decrease the exposure to crizotinib. Avoid. [Severe] Study
- **Crizotinib** is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical
- **Crizotinib** is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical
- **Crizotinib** is predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- **Crizotinib** is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 1267
- **Crizotinib** is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment, p. 732. [Mid] Study
- **Crizotinib** is predicted to increase the exposure to gefitinib. [Moderate] Theoretical → Also see TABLE 15 p. 1267
- **Grapefruit juice** is predicted to increase the exposure to crizotinib. Avoid. [Moderate] Theoretical
Crizotinib is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Theoretical

▶ HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to crizotinib. Avoid. [Moderate] Study ▶ Also see TABLE 9 p. 1266

▶ HIV-protease inhibitors (indinavir) are predicted to increase the exposure to crizotinib. [Moderate] Theoretical

Crizotinib is predicted to increase the exposure to ibritinib. Avoid or adjust ibritinib dose, p. 902. [Severe] Theoretical ▶ Also see TABLE 15 p. 1267

Idelalisib is predicted to moderately increase the exposure to crizotinib. Avoid. [Moderate] Study ▶ Also see TABLE 15 p. 1267

Crizotinib is predicted to increase the exposure to irabradine. Adjust irabradine dose, p. 205. [Severe] Theoretical ▶ Also see TABLE 6 p. 1265

Crizotinib is predicted to increase the exposure to ivacaftor. Adjust ivacaftor dose, p. 281. [Severe] Study

Crizotinib is predicted to increase the exposure to lopatinib. [Moderate] Study ▶ Also see TABLE 9 p. 1266

Crizotinib is predicted to increase the exposure to lomitapide. Avoid. [Moderate] Theoretical

▶ Macrolides (clarithromycin) are predicted to moderately increase the exposure to crizotinib. Avoid. [Moderate] Study ▶ Also see TABLE 9 p. 1266

▶ Macrolides (erythromycin) are predicted to increase the exposure to crizotinib. [Moderate] Theoretical

Crizotinib is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study

Crizotinib is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 63. [Moderate] Study

Netupitant is predicted to increase the exposure to crizotinib. [Severe] Theoretical

▶ Nevirapine is predicted to decrease the exposure to crizotinib. Avoid. [Severe] Theoretical

▶ Crizotinib is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Theoretical ▶ Also see TABLE 15 p. 1267

Crizotinib is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study ▶ Also see TABLE 6 p. 1266

Crizotinib is predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical ▶ Also see TABLE 6 p. 1265 ▶ Also see TABLE 9 p. 1266

▶ Crizotinib is predicted to increase the exposure to oxycodone. [Mild] Theoretical

Crizotinib is predicted to increase the exposure to oxycodone. [Mild] Theoretical ▶ Also see TABLE 15 p. 1267 ▶ Also see TABLE 9 p. 1266

Crizotinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical

Crizotinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 765. [Moderate] Theoretical

Crizotinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor and adjust sildenafil dose, p. 766. [Moderate] Study ▶ Also see TABLE 9 p. 1266

Crizotinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). [Severe] Theoretical

Crizotinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. [Severe] Theoretical ▶ Also see TABLE 9 p. 1266

Crizotinib is predicted to increase the exposure to pimozone. Avoid. [Severe] Theoretical ▶ Also see TABLE 9 p. 1266

Pitolisant is predicted to decrease the exposure to crizotinib. [Severe] Theoretical

Crizotinib is predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study

Crizotinib is predicted to increase the exposure to ranolazine. [Severe] Study ▶ Also see TABLE 9 p. 1266

▶ Rifampicin is predicted to markedly decrease the exposure to crizotinib. Avoid. [Severe] Study

Crizotinib is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical ▶ Also see TABLE 15 p. 1267

Crizotinib is predicted to increase the exposure to saxagliptin. [Moderate] Theoretical

Crizotinib is predicted to increase the exposure to simprevir. Avoid. [Severe] Study

Crizotinib increases the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study

Crizotinib is predicted to increase the exposure to SSRIs (dapoxetine). Adjust dapoxetine dose, p. 773. [Moderate] Theoretical

▶ St John’s Wort is predicted to decrease the exposure to crizotinib. Avoid. [Severe] Theoretical

Crizotinib is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. [Severe] Theoretical

Crizotinib is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 198. [Severe] Study

Crizotinib is predicted to increase the exposure to sunifatinib. [Moderate] Theoretical ▶ Also see TABLE 15 p. 1267 ▶ Also see TABLE 9 p. 1266

Crizotinib is predicted to increase the concentration of tacrolimus. [Severe] Study

Crizotinib is predicted to increase the exposure to temsirolimus. [Mild] Theoretical ▶ Also see TABLE 9 p. 1266

Crizotinib is predicted to increase the exposure to tocotrienol. [Mild] Theoretical

Crizotinib is predicted to increase the exposure to trazodone. [Mild] Theoretical

Crizotinib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study

Crizotinib is predicted to increase the exposure to venoctalax. Avoid or adjust venoctalax dose, p. 919. [Severe] Study

Crizotinib is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical ▶ Also see TABLE 9 p. 1266 ▶ Also see TABLE 15 p. 1267

Crizotinib is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study

Cyclizine ▶ see antihistamines, sedating

Cyclopenthiazide ▶ see thiazide diuretics

Cyclophosphamide ▶ see alkylating agents

Cycloserine ▶ Cycloserine increases the risk of CNS toxicity when given with isoniazid. Monitor and adjust dose. [Moderate] Study

Cyproheptadine ▶ see antihistamines, sedating

Cytarabine ▶ see TABLE 15 p. 1267 (myelosuppression)

Cytarabine decreases the concentration of flucytosine. Avoid. [Severe] Study

▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with cytarabine. Public Health England advises avoid. [Severe] Theoretical

Dabigatran ▶ see TABLE 3 p. 1264 (anticoagulant effects)

▶ Antiarrhythmics (amiodarone) increase the exposure to dabigatran. Adjust dabigatran dose, p. 131. [Moderate] Study

▶ Antiarrhythmics (dronedarone) slightly increase the exposure to dabigatran. Avoid. [Severe] Study

▶ Antiepileptics (carbamazepine) are predicted to decrease the exposure to dabigatran. Avoid. [Severe] Study

▶ Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to dabigatran. Avoid. [Severe] Study

▶ Calcium channel blockers (verapamil) increase the exposure to dabigatran. Adjust dabigatran dose, p. 131. [Severe] Study

Certitinib is predicted to increase the exposure to dabigatran. [Moderate] Theoretical

Ciclosporin is predicted to increase the exposure to dabigatran. Avoid. [Severe] Theoretical

Elbasvir is predicted to increase the concentration of dabigatran. [Moderate] Theoretical
Dabrafenib (continued)

- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to dabrafenib. Avoid. [Severe] Theoretical
- Lapatinib is predicted to increase the exposure to dabrafenib. [Severe] Theoretical
- Lumacaftor is predicted to affect the exposure to dabrafenib. Monitor and adjust dose. [Moderate] Theoretical
- Macrolides (azithromycin, clarithromycin, erythromycin) are predicted to increase the exposure to dabrafenib. [Moderate] Theoretical
- Mirabegron is predicted to increase the exposure to dabrafenib. [Severe] Theoretical
- Pilotisant is predicted to decrease the exposure to dabrafenib. [Uncommon]
- Ranolazine is predicted to increase the exposure to dabrafenib. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to dabrafenib. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to dabrafenib. Avoid. [Severe] Study
- Velpatasvir is predicted to increase the exposure to dabrafenib. Avoid. [Severe] Study
- Vemurafenib increases the exposure to dabrafenib. Use with caution and adjust dose. [Severe] Theoretical

Dabrafenib → see TABLE 15 p. 1267 (myelosupression)

- Antacids are predicted to decrease the absorption of dabrafenib. Avoid. [Severe] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study
- Cobicistat is predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study
- Dabrafenib is predicted to decrease the anticoagulant effect of coumarins. [Severe] Theoretical
- Enzalutamide is predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical
- Fibres (gemfibrozil) are predicted to increase the exposure to dabrafenib. [Moderate] Theoretical
- H₂ receptor antagonists are predicted to decrease the exposure to dabrafenib. Avoid. [Severe] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study
- Idelalisib is predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study
- Dabrafenib is predicted to decrease the exposure to midazolam. Monitor and adjust dose. [Moderate] Study
- Proton pump inhibitors are predicted to decrease the exposure to dabrafenib. Avoid. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical
- Dacarbazine → see alkylating agents

Dacitasvir
- Dacitasvir is predicted to increase the risk of severe bradycardia or heart block when given with antiarrhythmics (amiodarone). Refer to specialist literature. [Severe] Anecdotal
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to dacitasvir. Avoid. [Severe] study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to dacitasvir. Adjust dacitasvir dose, p. 591. [Moderate] Study
- Bosentan is predicted to decrease the exposure to dacitasvir. Adjust dacitasvir dose, p. 591. [Moderate] Theoretical
- Cobicistat is predicted to moderately increase the exposure to dacitasvir. Adjust dacitasvir dose, p. 591. [Moderate] Study
- Dacitasvir slightly increases the concentration of digoxin. [Severe] Study
- Efavirenz is predicted to decrease the exposure to dacitasvir. Adjust dose. [Severe] Study
- Enzalutamide is predicted to moderately decrease the exposure to dacitasvir. Avoid. [Severe] Study
- Etravirine is predicted to decrease the exposure to dacitasvir. Avoid. [Severe] Study
- Macrolides (clarithromycin) are predicted to moderately increase the exposure to dacitasvir. Adjust dacitasvir dose, p. 591. [Moderate] Study
- Dabrafenib is predicted to increase the exposure to dacitasvir. Avoid. [Moderate] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to dacitasvir. Adjust dacitasvir dose, p. 591. [Moderate] Study
- Idelalisib is predicted to moderately increase the exposure to dacitasvir. Adjust dacitasvir dose, p. 591. [Moderate] Study
- Dacelizumab → see monoclonal antibodies

Dactinomycin → see TABLE 1 p. 1264 (hepatotoxicity), TABLE 15 p. 1267 (myelosuppression)

- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with dactinomycin. Public Health England advises avoid. [Severe] Theoretical

Dairy products
- Dairy products are predicted to decreases the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after dairy products. [Severe] Theoretical
- Dairy products decrease the exposure to tetracyclines (demeclocycline, oxytetracycline, tetracycline). Avoid. [Moderate] Study

Dalteparin → see low molecular-weight heparins

Danaparoid → see TABLE 3 p. 1264 (anticoagulant effects)

- Ranibizumab is predicted to increase the risk of bleeding events when given with danaparoid. [Severe] Theoretical

Danazol
- Danazol moderately increases the concentration of antiepileptics (carbamazepine). Monitor carbamazepine concentration and adjust dose. [Severe] Study
- Danazol increases the concentration of ciclosporin. [Severe] Study
- Danazol potentially increases the anticoagulant effect of coumarins. [Severe] Anecdotal
- Danazol is predicted to increase the risk of rhabdomyolysis when given with statins (atorvastatin). [Severe] Theoretical
- Danazol increases the risk of rhabdomyolysis when given with statins (simvastatin). Avoid. [Severe] Anecdotal
- Danazol potentially increases the concentration of tacrolimus. [Severe] Anecdotal

Dantronolene → see TABLE 1 p. 1264 (hepatotoxicity)

- Intravenous dantronolene potentially increases the risk of acute hyperkalaemia and cardiovascular collapse when given with calcium channel blockers (diltiazem, verapamil). Avoid. [Severe] Anecdotal

Dantron → see TABLE 17 p. 1268 (reduced serum potassium)

Dapagliflozin → see TABLE 14 p. 1267 (antidiabetic drugs), TABLE 8 p. 1265 (hypotension)

Dapoxetine → see SSRIs

Dapsone
- Aminosalicylic acid is predicted to increase the risk of methaemoglobinemia when given with dapsone. [Severe] Theoretical
- Dapsone is predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. [Severe] Theoretical
- Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to increase the risk of...
Grapefruit juice is predicted to decrease the exposure to darifenacin. [Severe] Theoretical

Antimalarials (chloroquine, primaquine) are predicted to increase the risk of methaemoglobinemia when given with darifenacin. [Severe] Theoretical

Nitrates are predicted to increase the risk of methaemoglobinemia when given with darifenacin. [Severe] Theoretical

Nitrofurantoin is predicted to increase the risk of methaemoglobinemia when given with darifenacin. [Severe] Theoretical

Paracetamol is predicted to increase the risk of methaemoglobinemia when given with darifenacin. [Severe] Theoretical

Rifabutin increases the clearance of darifenacin. [Moderate] Study

rifampicin moderately decreases the exposure to darifenacin. [Moderate] Study

Sodium nitroprusside is predicted to increase the risk of methaemoglobinemia when given with darifenacin. [Severe] Theoretical

Sulfonamides are predicted to increase the risk of methaemoglobinemia when given with darifenacin. [Severe] Theoretical

Dapson increases the exposure to trimethoprim and trimethoprim increases the exposure to dapson. [Severe] Study

Daptomycin

Aspirin (high-dose) increases the risk of renal impairment when given with daptomycin. [Moderate] Theoretical

Ciclosporin is predicted to increase the risk of rhabdomyolysis when given with daptomycin. [Severe] Theoretical

Fibrates are predicted to increase the risk of rhabdomyolysis when given with daptomycin. [Severe] Theoretical

NSAIDs increase the risk of renal impairment when given with daptomycin. [Moderate] Theoretical

Statins are predicted to increase the risk of rhabdomyolysis when given with daptomycin. [Severe] Theoretical

Daratumumab ➔ see monoclonal antibodies

Darbepoetin alfa ➔ see TABLE 5 p. 1264 (thromboembolism), TABLE 16 p. 1266 (increased serum potassium)

Darifenacin ➔ see TABLE 10 p. 1266 (antimuscarinics)

Antiarrhythmics (dronedarone) are predicted to slightly increase the exposure to darifenacin. [Moderate] Study

Darifenacin is predicted to increase the concentration of antiarrhythmics (flecainide). [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to darifenacin. [Moderate] Theoretical

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to slightly increase the exposure to darifenacin. [Moderate] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study

Aprepitant is predicted to slightly increase the exposure to darifenacin. [Moderate] Study

Bupropion is predicted to slightly increase the exposure to darifenacin. [Mild] Study

Calcium channel blockers (diltiazem, verapamil) are predicted to slightly increase the exposure to darifenacin. [Moderate] Study

Ciclosporin is predicted to increase the exposure to darifenacin. Avoid. [Moderate] Theoretical

Cincalcet is predicted to slightly increase the exposure to darifenacin. [Mild] Study

Cobicistat is predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study

Crizotinib is predicted to slightly increase the exposure to darifenacin. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to darifenacin. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to darifenacin. [Moderate] Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study

HIV-protease inhibitors (indinavir) are predicted to slightly increase the exposure to darifenacin. [Moderate] Study

Idelalisib is predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study

Imatinib is predicted to slightly increase the exposure to darifenacin. [Moderate] Study

Macrolides (clarithromycin) are predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study

Macrolides (erythromycin) are predicted to slightly increase the exposure to darifenacin. [Moderate] Study

Netupitant is predicted to slightly increase the exposure to darifenacin. [Moderate] Study

Nilotinib is predicted to slightly increase the exposure to darifenacin. [Moderate] Study

rifampicin is predicted to decrease the exposure to darifenacin. [Moderate] Theoretical

SSRIs (fluoxetine, paroxetine) are predicted to slightly increase the exposure to darifenacin. [Mild] Study

St John’s Wort is predicted to decrease the exposure to darifenacin. [Moderate] Theoretical

Terbinafine is predicted to slightly increase the exposure to darifenacin. [Mild] Study

Darifenacin is predicted to increase the exposure to tricyclic antidepressants. [Moderate] Theoretical ➔ also see TABLE 10 p. 1266

Darunavir ➔ see HIV-protease inhibitors

Dasabuvir

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical

Combined hormonal contraceptives increase the risk of raised liver function tests when given with dasabuvir. Avoid. [Severe] Study

Enzalutamide is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical

Fibrates (gemfibrozil) very markedly increase the exposure to dasabuvir. Avoid. [Severe] Study

Dasabuvir (with ombitasvir, paritaprevir and ritonavir) increases the concentration of loop diuretics (furosemide). Adjust dose. [Moderate] Study

rifampicin is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical

St John’s Wort is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical

Dasabuvir increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 197. [Moderate] Study

Dasatinib ➔ see TABLE 15 p. 1267 (myelosuppression), TABLE 9 p. 1266 (QT-interval prolongation), TABLE 4 p. 1264 (antiplatelet effects)

Antacids decrease the absorption of dasatinib. Separate administration by at least 2 hours. [Moderate] Study

Antiarrhythmics (dronedarone) are predicted to increase the exposure to dasatinib. [Severe] Study ➔ also see TABLE 9 p. 1266

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to dasatinib. Avoid. [Severe] Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to dasatinib. [Severe] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly to very markedly increase the exposure to dasatinib. Avoid. [Severe] Study

Aprepitant is predicted to increase the exposure to dasatinib. [Severe] Study

Bosentan is predicted to decrease the exposure to dasatinib. [Severe] Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dasatinib. [Severe] Study

Cobicistat is predicted to markedly increase the exposure to dasatinib. [Severe] Study

Crizotinib is predicted to increase the exposure to dasatinib. [Severe] Study ➔ also see TABLE 15 p. 1267 ➔ also see TABLE 9 p. 1266

Efavirenz is predicted to decrease the exposure to dasatinib. [Severe] Study
Dasatinib (continued)

- **Enzalutamide** is predicted to markedly decrease the exposure to dasatinib. Avoid. **Severe** Study
- **Grapefruit juice** is predicted to increase the exposure to dasatinib. Avoid. **Moderate** Theoretical
- H2 receptor antagonists are predicted to decrease the exposure to dasatinib. Avoid. **Moderate** Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to dasatinib. Avoid. **Severe** Study → Also see TABLE 9 p. 1266
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to dasatinib. **Severe** Study
- **Idelalisib** is predicted to markedly increase the exposure to dasatinib. Avoid. **Severe** Study → Also see TABLE 15 p. 1267
- **Imatinib** is predicted to increase the exposure to dasatinib. **Severe** Study → Also see TABLE 15 p. 1267
- **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to dasatinib. Avoid. **Severe** Study → Also see TABLE 9 p. 1266
- **Macrolides (erythromycin)** are predicted to increase the exposure to dasatinib. **Severe** Study
- **Netupitant** is predicted to increase the exposure to dasatinib. **Severe** Study
- **Nevirapine** is predicted to decrease the exposure to dasatinib. **Severe** Study
- **Nilotinib** is predicted to increase the exposure to dasatinib. **Severe** Study → Also see TABLE 15 p. 1267 → Also see TABLE 9 p. 1266
- Dasatinib is predicted to increase the risk of bleeding events when given with **phenindione. **Severe** Theoretical
- **Pitolisant** is predicted to decrease the exposure to dasatinib. Avoid. **Severe** Theoretical
- **Proton pump inhibitors** are predicted to slightly to moderately decrease the exposure to dasatinib. Avoid. **Severe** Study
- **Rifampicin** is predicted to markedly decrease the exposure to dasatinib. Avoid. **Severe** Study
- **St John’s Wort** is predicted to decrease the exposure to dasatinib. **Severe** Study
- Dasatinib is predicted to increase the exposure to **statins (simvastatin). **Moderate** Theoretical
- Daunorubicin → see anthracyclines
- **Decitabine** → see TABLE 15 p. 1267 (myelosuppression)
- **Deferasirox** → see iron chelators
- **Deferriprone** → see TABLE 15 p. 1267 (myelosuppression)
- Antacids (aluminium hydroxide) are predicted to decrease the absorption of deferriprone. Avoid. **Moderate** Theoretical
- **Ascorbic acid** is predicted to increase the risk of cardiovascular side-effects when given with deferriprone. **Severe** Theoretical
- **Deflazacort** → see corticosteroids
- **Delamanid** → see TABLE 9 p. 1266 (QT-interval prolongation)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of **desogestrel.** For FSRH guidance, see Contraceptives, interactions p. 747. **Severe** Theoretical
- **Desogestrel** is predicted to decrease the exposure to antiepileptics (lamotrigine). **Moderate** Study
- **Aprepitant** is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. **Severe** Theoretical
- **Bosentan** is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. **Severe** Theoretical
- **Davirenz** is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. **Severe** Theoretical
- **Fosaprepitant** is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. **Severe** Theoretical
- **Grisofulvin** potentially decreases the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. **Severe** Theoretical
- **Modafinil** is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. **Severe** Theoretical
- **Nevirapine** is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. **Severe** Theoretical
- **Rifabutin** is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. **Severe** Theoretical
- **Rifampicin** is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. **Severe** Theoretical
- **St John’s Wort** is predicted to decrease the efficacy of desogestrel. **Severe** Theoretical
- **Ulipristal** is predicted to decrease the efficacy of desogestrel. Avoid. **Severe** Theoretical
- Dexamethasone → see corticosteroids
- **Dexamfetamine** → see amphetamines
- **Dexibuprofen** → see NSAIDs
- **Dexketoprofen** → see NSAIDs
- **Dexmedetomidine** → see TABLE 11 p. 1266 (CNS depressant effects)
- **Dexrazoxane** → see iron chelators
- Diamorphine → see opioids
- **Diazepam** → see TABLE 11 p. 1266 (CNS depressant effects)
- Diazepam potentially affects the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. **Severe** Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) very slightly increase the exposure to delamanid. **Moderate** Study
- **Cobicistat** very slightly increases the exposure to delamanid. **Severe** Study → Also see TABLE 9 p. 1266
- **Enzalutamide** is predicted to slightly decrease the exposure to delamanid. Avoid. **Moderate** Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) very slightly increase the exposure to delamanid. **Severe** Study → Also see TABLE 9 p. 1266
- **Idelalisib** very slightly increases the exposure to delamanid. **Severe** Study
- **Macrolides (clarithromycin)** very slightly increase the exposure to delamanid. **Severe** Study → Also see TABLE 9 p. 1266
- **Rifampicin** is predicted to slightly decrease the exposure to delamanid. Avoid. **Moderate** Study
- **Demeclomycin** → see tetracyclines
- **Denosumab** → see monoclonal antibodies
- **Desferrioxamine** → see iron chelators
- Desflurane → see volatile halogenated anaesthetics
- Desloratadine → see antihistamines, non-sedating

Desmopressin → see TABLE 18 p. 1268 (hyponatraemia)
- Antiepileptics (lamotrigine) are predicted to increase the risk of hyponatraemia when given with desmopressin. **Severe** Theoretical
- **Loperamide** greatly increases the absorption of oral desmopressin (and possibly sublingual). **Moderate** Study
- Phenothiazines (chlorpromazine) are predicted to increase the risk of hyponatraemia when given with desmopressin. **Severe** Theoretical

Desogestrel
- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. **Severe** Theoretical
- **Desogestrel** is predicted to increase the exposure to antiepileptics (lamotrigine). **Moderate** Study
- **Aprepitant** is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. **Severe** Theoretical
Diazoxide ➔ see TABLE 8 p. 1265 (hypotension)

- Diazoxide decreases the concentration of antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the effects of diazoxide. Monitor concentration and adjust dose. [Moderate] Anecdotal
- Diazoxide increases the risk of severe hypotension when given with hydralazine. [Severe] Study ➔ Also see TABLE 8 p. 1265

Diclofenac ➔ see NSAIDs

Dicyclomine ➔ see TABLE 10 p. 1266 (anantispasmodics)

Didanosine ➔ see TABLE 1 p. 1264 (hepatotoxicity), TABLE 12 p. 1267 (peripheral neuropathy)

ROUTE-SPECIFIC INFORMATION  Antacids in tablet formulation might affect absorption of other drugs—give at least 2 hours apart.

- Allopurinol moderately increases the exposure to didanosine. Avoid. [Severe] Study
- Didanosine (buffered) decreases the exposure to antifungals, azoles (itraconazole, ketoconazole). Separate administration by 2 hours. [Severe] Study ➔ Also see TABLE 1 p. 1264
- Febuxostat is predicted to increase the exposure to didanosine. [Severe] Theoretical
- Ganciclovir is predicted to increase the exposure to didanosine. [Moderate] Study

- HIV-protease inhibitors (tipranavir) decrease the exposure to didanosine. Separate administration by 2 hours. [Moderate] Study
- Didanosine (buffered) decreases the exposure to HIV-protease inhibitors (atazanavir). Didanosine should be taken 2 hours after atazanavir. [Severe] Study
- Didanosine (buffered) is predicted to decrease the exposure to HIV-protease inhibitors (darunavir) boosted with ritonavir. Didanosine should be taken 1 hour before or 2 hours after darunavir. [Moderate] Theoretical
- Didanosine (buffered) decreases the exposure to HIV-protease inhibitors (indinavir). Separate administration by 1 hour. [Severe] Study
- Hydroxycarbamide increases the risk of toxicity when given with didanosine. Avoid. [Severe] Study
- Isoniazid is predicted to increase the risk of peripheral neuropathy when given with didanosine. [Severe] Theoretical ➔ Also see TABLE 1 p. 1264 ➔ Also see TABLE 12 p. 1267
- Didanosine is predicted to increase the risk of pancreatitis when given with pentamidine. Avoid. [Severe] Study
- Didanosine (buffered) is predicted to greatly decrease the exposure to oral quinolones. Didanosine should be taken 2 hours after quinolones. [Moderate] Study
- Ribavirin is predicted to increase the exposure to didanosine. Avoid. [Severe] Study
- Didanosine increases the risk of toxicity when given with stavudine. Avoid. [Severe] Study ➔ Also see TABLE 12 p. 1267
- Tenofovir increases the risk of toxicity when given with didanosine. Avoid. [Severe] Study
- Valganciclovir is predicted to increase the exposure to didanosine. [Moderate] Study

Digoxin ➔ see TABLE 6 p. 1265 (bradycardia)

GENERAL INFORMATION  Drugs that reduce serum potassium are predicted to increase the risk of digoxin toxicity, see TABLE 17 p. 1268.

- Acarbose decreases the concentration of digoxin. [Moderate] Study
- Aldosterone antagonists (eplerenone) very slightly increase the exposure to digoxin. [Minor] Study
- Aldosterone antagonists (spironolactone) increase the concentration of digoxin. Monitor and adjust dose. [Moderate] Study
- Aminoglycosides potentially increase the concentration of digoxin. Monitor and adjust dose. [Minor] Study
- Antacids decrease the absorption of digoxin. Separate administration by 2 hours. [Minor] Study
- Antiarrhythmics (amiodarone, dronedarone) are predicted to moderately increase the exposure to digoxin. Monitor and adjust digoxin dose, p. 106. [Severe] Study ➔ Also see TABLE 6 p. 1265
- Antiarrhythmics (propafenone) increase the concentration of digoxin. Monitor and adjust dose. [Severe] Study

- Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the concentration of digoxin. [Moderate] Anecdotal
- Antifungals, azoles (itraconazole) markedly increase the concentration of digoxin. Monitor and adjust dose. [Severe] Study
- Antifungals, azoles (ketoconazole) are predicted to markedly increase the concentration of digoxin. [Severe] Theoretical
- Antifungals, azoles (posaconazole) are predicted to increase the concentration of digoxin. [Severe] Theoretical
- Antimalarial agents (mefloquine) are predicted to increase the risk of bradycardia when given with digoxin. [Severe] Theoretical
- Antimalarial agents (quinine) increase the concentration of digoxin. Monitor and adjust digoxin dose, p. 106. [Severe] Anecdotal
- Balsalazide is predicted to increase the concentration of digoxin. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) increase the concentration of digoxin. Monitor and adjust dose. [Severe] Study ➔ Also see TABLE 6 p. 1265
- Intravenous calcium salts increase the concentration of digoxin. Avoid. [Moderate] Anecdotal
- Carbimazole affects the concentration of digoxin. Monitor and adjust dose. [Moderate] Theoretical
- Certitinib is predicted to increase the risk of bradycardia when given with digoxin. Avoid. [Severe] Theoretical
- Ciclosporin increases the concentration of digoxin. Monitor and adjust dose. [Severe] Theoretical
- Daclatasvir slightly increases the concentration of digoxin. [Severe] Study
- HIV-protease inhibitors (ritonavir) increase the concentration of digoxin. Adjust dose and monitor concentration. [Severe] Study
- Lapatinib is predicted to increase the exposure to digoxin. [Moderate] Theoretical
- Levothyroxine is predicted to affect the concentration of digoxin. Monitor and adjust dose. [Moderate] Theoretical
- Liothyronine is predicted to affect the concentration of digoxin. Monitor and adjust dose. [Moderate] Theoretical
- Lumacaftor is predicted to affect the exposure to digoxin. Monitor and adjust dose. [Moderate] Theoretical
- Macrolides increase the concentration of digoxin. [Severe] Anecdotal
- Mirabegron slightly increases the exposure to digoxin. Monitor digoxin concentration and adjust dose. [Severe] Study
- Neomycin decreases the absorption of digoxin. [Moderate] Study
- Neuromuscular blocking drugs, non-depolarising (pancuronium) are predicted to increase the risk of cardiovascular side-effects when given with digoxin. [Severe] Anecdotal
- NSAIDs (indomethacin) increase the concentration of digoxin. [Severe] Study
- Penicillamine potentially decreases the concentration of digoxin. Separate administration by 2 hours. [Severe] Anecdotal
- Pitolisant is predicted to decrease the exposure to digoxin. [Unknown] Theoretical
- Ranolazine increases the concentration of digoxin. [Moderate] Study
- Rifampicin decreases the concentration of digoxin. [Moderate] Study
- St John’s Wort decreases the concentration of digoxin. Avoid. [Severe] Anecdotal
- Sucrafate decreases the absorption of digoxin. Separate administration by 2 hours. [Severe] Anecdotal
- Sulfasalazine decreases the concentration of digoxin. [Moderate] Study
- Suxamethonium is predicted to increase the risk of cardiovascular side-effects when given with digoxin. [Severe] Anecdotal
- Ticagrelor increases the concentration of digoxin. [Moderate] Study
- Tolvaptan increases the concentration of digoxin. [Minor] Study
- Trimethoprim increases the concentration of digoxin. [Moderate] Study
- Vandetanib slightly increases the exposure to digoxin. Monitor ECG and adjust dose. [Moderate] Study
- Velpatasvir is predicted to increase the exposure to digoxin. [Severe] Study

Downloaded from www.medicalbr.com
Digoxin (continued)
- Vitamin D substances are predicted to increase the risk of toxicity when given with digoxin. [Severe] Theoretical
Dihydrocodeine → see opioids
Dihydrotachysterol → see vitamin D substances
Diltiazem → see calcium channel blockers
Dimenhydrinate → see TABLE 10 p. 1266 (antimuscarinics)
Dimethyl fumarate
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with dimethyl fumarate. Public Health England advises avoid. [Severe] Theoretical
Dimethyl sulfoxide
- Topical dimethyl sulfoxide potentially increases the risk of peripheral neuropathy when given with NSAI Ds. [sulindac]. Avoid. [Severe] Anecdotal
Diphenoxylate → see opioids
Dipryramide → see TABLE 8 p. 1265 (hypotension), TABLE 4 p. 1264 (antiplatelet effects)
- Anticids are predicted to decrease the absorption of dipryramide (immediate release tablets). [Moderate] Theoretical
Dipyridamole → see TABLE 11 p. 1265 (hypotension), TABLE 4 p. 1264
- Anticids are predicted to decrease the absorption of dipyridamole (immediate exposure to antihypertensive (adenosine). Avoid or adjust dose. [Severe] Study
- H2 Receptor antagonists are predicted to decrease the absorption of dipyridamole (immediate release tablets). [Moderate] Theoretical
- Proton pump inhibitors are predicted to decrease the absorption of dipyridamole (immediate release tablets). [Moderate] Theoretical
Disopryamide → see antihistamines
Disulfiram → see TABLE 12 p. 1267 (peripheral neuropathy)

FOOD AND LIFESTYLE
Disulfiram gives rise to an extremely unpleasant systemic reaction after the ingestion of even a small amount of alcohol. Ensure that alcohol is not consumed for at least 24 hours before initiating treatment and should be avoided for at least 1 week after stopping treatment.
- Disulfiram increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Study → Also see TABLE 12 p. 1267
- Disulfiram increases the anticoagulant effect of coumarins. Monitor and adjust dose. [Severe] Study
- Disulfiram increases the risk of acute psychoses when given with metronidazole. [Severe] Study → Also see TABLE 12 p. 1267
- Disulfiram is predicted to increase the anticoagulant effect of phenindione. [Severe] Theoretical
Dobutamine → see sympathomimetics, inotropic
Docetaxel → see taxanes
Doxycycline sodium → see TABLE 17 p. 1268 (reduced serum potassium)
Dolutegravir
- Antacids moderately decrease the exposure to dolutegravir. Dolutegravir should be taken 2 hours before or 6 hours after antacids. [Moderate] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to dolutegravir. Adjust dose. [Severe] Study
- Antiepileptics (oxcarbazepine) are predicted to decrease the exposure to dolutegravir. Adjust dose. [Severe] Theoretical
- Bosentan decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- Oral calcium salts decrease the absorption of dolutegravir. Dolutegravir should be taken 2 hours before or 6 hours after calcium salts. [Moderate] Study
- Efavirenz decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- Enzalutamide decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- Estravir moderately decreases the exposure to dolutegravir. Avoid unless given with atazanavir, darunavir, or lopinavir (all boosted with ritonavir). [Severe] Study
- HIV-1 protease inhibitors (fosamprenavir) boosted with ritonavir slightly decrease the exposure to dolutegravir. Avoid if resistant to HIV-integrase inhibitors. [Severe] Study
- HIV-2 protease inhibitors (tipranavir) moderately decrease the exposure to dolutegravir. Refer to specialist literature. [Severe] Study
- Iron (oral) decreases the absorption of dolutegravir. Iron (oral) should be taken 2 hours before or 6 hours after dolutegravir. [Moderate] Study
- Dolutegravir slightly to moderately increases the exposure to metformin. Use with caution and adjust dose. [Severe] Study
- Nevirapine decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- Rifampicin decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- St John’s Wort decreases the exposure to dolutegravir. Adjust dose. [Severe] Study
- Sucralfate decreases the absorption of dolutegravir. [Moderate] Anecdotal

Domperidone
- See TABLE 9 p. 1266 (QT-interval prolongation)
- Antiarhythmics (dronedarone) increase the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Antifungals, azoles (fluconazole, itraconazole, ketoconazole, posaconazole, voriconazole) increase the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Dolutegravir is predicted to increase the anticoagulant effect of dopamine receptor agonists (bromocriptine, cabergoline). [Moderate] Theoretical
- HIV-1 protease inhibitors increase the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Aprepitant increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) increase the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Ciclosporin increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Crizotinib increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Domperidone is predicted to decrease the prolactin-lowering effect of dopamine receptor agonists (bromocriptine, cabergoline). [Moderate] Theoretical
- HIV-1 protease inhibitors increase the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Idelalisib increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Imatinib increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Macrolides (clarithromycin, erythromycin) increase the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Netupitant increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Nilotinib increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Donepezil → see anticholinesterases, centrally acting
- Dopamine → see sympathomimetics, inotropic
- Dopamine receptor agonists → see TABLE 8 p. 1265 (hypotension), TABLE 9 p. 1266 (QT-interval prolongation), TABLE 10 p. 1266 (antimuscarinics)
- Antimicrobials (itraconazole, ketoconazole, posaconazole) are predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
- Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
- Aripiprazole is predicted to decrease the effects of dopamine receptor agonists. [Moderate] Theoretical → Also see TABLE 8 p. 1265

1326 Digoxin – Dopamine receptor agonists BNF 74

A1
Dopamine receptor agonists — Droperidol 1327

- Asenapine is predicted to decrease the effects of dopamine receptor agonists. Adjust dose. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265
- Benperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265
- Bupropion increases the risk of side-effects when given with amantadine. [Moderate] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
- Clozapine is predicted to decrease the effects of dopamine receptor agonists. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265
- Cobicistat increases the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Study
- Combined hormonal contraceptives are predicted to increase the exposure to ropinirole. Adjust dose. [Moderate] Study
- Crixotinib is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
- Dopamine receptor agonists (bromocriptine) are predicted to increase the risk of ergotism when given with dopamine receptor agonists (bromocriptine, cabergoline). Avoid. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265
- Dopamine receptor agonists (cabergoline) are predicted to increase the risk of ergotism when given with dopamine receptor agonists (bromocriptine, pergolide). Avoid. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265
- Dopamine receptor agonists (bromocriptine) are predicted to increase the risk of ergotism when given with dopamine receptor agonists (bromocriptine, cabergoline). Avoid. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265
- Dopamine receptor agonists (amantadine) are predicted to increase the exposure to dopamine receptor agonists (pramipexole). Adjust pramipexole dose. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265
- Droperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265 \(\rightarrow\) Also see TABLE 9 p. 1266
- Ergometrine is predicted to increase the risk of ergotism when given with dopamine receptor agonists (cabergoline, pergolide). Avoid. [Moderate] Theoretical
- Ergotamine is predicted to increase the risk of ergotism when given with dopamine receptor agonists (bromocriptine, cabergoline). Avoid. [Moderate] Theoretical
- Ergotamine is predicted to increase the risk of ergotism when given with pergolide. [Moderate] Theoretical
- Flupentixol is predicted to decrease side effects dopamine receptor agonists. Avoid. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265
- Apomorphine is predicted to increase the risk of severe hypotension when given with granisetron. [Severe] Theoretical
- H₂ receptor antagonists (cimetidine) slightly increase the exposure to pramipexole. Adjust dose. [Moderate] Study
- Haloperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265 \(\rightarrow\) Also see TABLE 9 p. 1266 \(\rightarrow\) Also see TABLE 10 p. 1266
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Study
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
- Hormone replacement therapy decreases the clearance of ropinirole. Monitor and adjust dose. [Moderate] Study
- Idealalisib increases the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Study
- Imatinib is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
- Loxapine is predicted to decrease the effects of dopamine receptor agonists. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265 \(\rightarrow\) Also see TABLE 10 p. 1266
- Macrolides (clarithromycin) are predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
- Macrolides (erythromycin) are predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
- Amantadine increases the risk of CNS toxicity when given with memantine. Use with caution or avoid. [Severe] Theoretical
- Memantine is predicted to increase the effects of dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pergolide, pramipexole, quinagolide, ropinirole, rotigotine). Avoid. [Moderate] Study
- Metoclopramide is predicted to decrease the effects of dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pergolide, pramipexole, quinagolide, ropinirole, rotigotine). Avoid. [Moderate] Study
- Nefopam is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
- Nitroprusside is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
- Olanzapine is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265
- Apomorphine increases the risk of severe hypotension when given with ondansetron. Avoid. [Severe] Study \(\rightarrow\) Also see TABLE 9 p. 1266
- Paliperidone is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265 \(\rightarrow\) Also see TABLE 9 p. 1266
- Amantadine increases the risk of ergotism when given with pergolide. Avoid. [Moderate] Study \(\rightarrow\) Also see TABLE 10 p. 1266
- Pramipexole increases the risk of severe hypotension when given with palonosetron. [Severe] Theoretical
- Phenothiazines are predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265 \(\rightarrow\) Also see TABLE 9 p. 1266 \(\rightarrow\) Also see TABLE 10 p. 1266
- Pinelidone is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265 \(\rightarrow\) Also see TABLE 9 p. 1266 \(\rightarrow\) Also see TABLE 10 p. 1266
- Quetiapine is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265 \(\rightarrow\) Also see TABLE 9 p. 1266 \(\rightarrow\) Also see TABLE 10 p. 1266
- Quinolones (ciprofloxacin) are predicted to increase the exposure to ropinirole. Adjust dose. [Moderate] Study
- Risperidone is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265 \(\rightarrow\) Also see TABLE 9 p. 1266 \(\rightarrow\) Also see TABLE 10 p. 1266
- Sulfpride is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265 \(\rightarrow\) Also see TABLE 9 p. 1266
- Zuclopenthixol is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical \(\rightarrow\) Also see TABLE 8 p. 1265 \(\rightarrow\) Also see TABLE 9 p. 1266
- Dopexamine → sympathomimetics, inotropic

Dorzolamide

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Doxsuleno → see tricyclic antidepressants

Doxapram

- Aminophylline increases the risk of agitation when given with doxapram. [Moderate] Study
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the effects of doxapram. [Moderate] Theoretical
- Theophylline increases the risk of agitation when given with doxapram. [Moderate] Study
- Doxazosin → see alpha blockers
- Doxepin → see tricyclic antidepressants
- Dorzolamide → see sympathomimetics, inotropic

Dorzolamide
Aprepitant
▶ Duloxetin
▶ Imatinib
▶ Calcium channel blockers
▶ Macrolides
▶ HIV-protease inhibitors
▶ SSRI
▶ Eculizumab
▶ Dutasteride

Exposure to antiarhythmics is predicted to moderately increase the exposure to drospirenone. Use with caution and adjust dose. [Moderate] Theoretical

Duloxetin is predicted to increase the exposure to antiarhythmics (flecainide). [Severe] Theoretical

Duloxetin is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). [Moderate] Theoretical

Duloxetin is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). [Moderate] Study

Duloxetin is predicted to increase the efficacy of opioids (tramadol). [Moderate] Study → Also see Table 13 p. 1267

Duloxetin is predicted to increase the exposure to pitolisant. Use with caution and adjust dose. [Moderate] Study

Quinolones (ciprofloxacin) are predicted to increase the exposure to duloxetine. Avoid. [Moderate] Theoretical

SSRI (fluoxetine) markedly increases the exposure to duloxetine. Avoid. [Severe] Study → Also see Table 18 p. 1268 → Also see Table 4 p. 1264

Dutasteride
▶ Antiarrhythmics (droxidone) are predicted to moderately increase the exposure to dutasteride. [Mild] Study

Antiarrhythmics (dronectone, isavuconazole, posaconazole) are predicted to moderately increase the exposure to dutasteride. [Mild] Study

Antiarrhythmics (itraconazole) are predicted to moderately increase the exposure to dutasteride. [Mild] Study

Cobicistat is predicted to increase the exposure to dutasteride. [Mild] Study

Cobicistat is predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. [Moderate] Theoretical

Cobicistat is predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. [Mild] Study

Calcium channel blockers (verapamil) are predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical

Calcium channel blockers (verapamil) are predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical

Ceritinib is predicted to increase the exposure to edoxaban. [Moderate] Theoretical

Ciclosporin slightly increases the exposure to edoxaban. Adjust edoxaban dose, p. 122. [Severe] Study

HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical

Lapatinib is predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical

Lumacafor is predicted to affect the exposure to edoxaban. [Moderate] Theoretical

Macrolides (azithromycin, clarithromycin) are predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical

Macrolides (erythromycin) slightly increase the exposure to edoxaban. Adjust edoxaban dose, p. 122. [Severe] Study

Mirabegron is predicted to increase the exposure to edoxaban. [Mild] Theoretical

Ranolazine is predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical

Rifampicin is predicted to decrease the exposure to edoxaban. [Moderate] Study

St John's Wort is predicted to decrease the exposure to edoxaban. [Moderate] Study

Velpatasvir is predicted to increase the exposure to edoxaban. [Severe] Theoretical

Vemurafenib is predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical

Efavirenz
▶ Efavirenz is predicted to increase the exposure to antiarhythms (dronedaron). [Severe] Theoretical

Antiepileptics (carbamazepine) slightly decrease the exposure to efavirenz and efavirenz decreases the exposure to antiepileptics (carbamazepine). [Severe] Study

Antiepileptics (fosphenytoin, phenytoin) slightly decrease the exposure to efavirenz and efavirenz affects the concentration of antiepileptics (fosphenytoin, phenytoin). [Severe] Theoretical

Antiepileptics (phenobarbital) are predicted to decrease the exposure to efavirenz and efavirenz affects the concentration of antiepileptics (phenobarbital). [Severe] Theoretical

Efavirenz is predicted to affect the efficacy of antiepileptics (primidon) and antiepileptics (primidon) are predicted to slightly decrease the exposure to efavirenz. [Severe] Theoretical

Efavirenz is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. [Severe] Theoretical

Efavirenz slightly decreases the exposure to antifungals, azoles (itraconazole). Avoid efavirenz for 14 days before and during treatment with itraconazole. [Mild] Theoretical

Efavirenz moderately decreases the exposure to antifungals, azoles (ketoconazole). [Severe] Study

Efavirenz moderately decreases the exposure to antifungals, azoles (posaconazole). Avoid. [Moderate] Study

Efavirenz moderately decreases the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) slightly increase the exposure to efavirenz. Adjust dose. [Severe] Study

Efavirenz decreases the concentration of antimalarials (artemether). [Severe] Study

Efavirenz moderately decreases the exposure to antimalarials (atovaquone). Avoid. [Moderate] Study

Efavirenz affects the exposure to antimalarials (proguanil). Avoid. [Moderate] Study

Efavirenz is predicted to decrease the exposure to axitinib. [Moderate] Theoretical

Efavirenz is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study

Efavirenz is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical

Efavirenz moderately decreases the exposure to buproprion. [Moderate] Study

Efavirenz is predicted to decrease the exposure to cabozantinib. [Moderate] Theoretical

Efavirenz is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, pimozide, prazosin, nitrendipine, nifedipine).
Efavirenz is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). (Moderate) Theoretical

Efavirenz is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 747. (Severe) Study

Efavirenz increases the concentration of ciclosporin. Monitor ciclosporin concentration and adjust dose. (Moderate) Study

Efavirenz is predicted to decrease the exposure to cobicistat. Avoid. (Severe) Theoretical

Efavirenz is predicted to decrease the efficacy of efavirenz. (Moderate) Study

Efavirenz is predicted to decrease the exposure to etravirine. (Severe) Study

Efavirenz is predicted to decrease the concentration of elbasvir. Avoid. (Severe) Study

Efavirenz is predicted to decrease the concentration of elbasvir. Avoid. (Severe) Theoretical

Efavirenz is predicted to decrease the exposure to dasatinib. Adjust dose. (Severe) Study

Efavirenz is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. (Severe) Study

Efavirenz decreases the exposure to dolutegravir. Adjust dose. (Severe) Study

Efavirenz is predicted to moderately decrease the exposure to elbasvir. Avoid. (Severe) Study

Efavirenz is predicted to decrease the concentration of everolimus. Avoid or adjust dose. (Severe) Study

Efavirenz is predicted to decrease the exposure to gefitinib. Avoid. (Severe) Study

Efavirenz is predicted to markedly decrease the exposure to grazoprevir. Avoid. (Severe) Study

Efavirenz is predicted to decrease the concentration of guanfacine. Adjust dose. (Moderate) Theoretical

Efavirenz decreases the exposure to HIV-protease inhibitors. Refer to specialist literature. (Severe) Study

Efavirenz is predicted to decrease the effects of hormone replacement therapy. (Moderate) Anecdotal

Efavirenz is predicted to decrease the exposure to imatinib. Avoid. (Moderate) Study

Efavirenz is predicted to decrease the exposure to lopatinib. Avoid. (Severe) Study

Efavirenz is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 747. (Severe) Theoretical

Efavirenz is predicted to decrease the exposure to lurasidone. Monitor and adjust dose. (Moderate) Theoretical

Efavirenz decreases the exposure to macrolides (clarithromycin). (Moderate) Study

Efavirenz decreases the exposure to maraviroc. Refer to specialist literature. (Severe) Theoretical

Efavirenz is predicted to alter the effects of midazolam. Avoid. (Moderate) Theoretical

Efavirenz decreases the concentration of efavirenz. Avoid. (Severe) Study

Efavirenz is predicted to decrease the exposure to niotilinib. Avoid. (Severe) Theoretical

Efavirenz is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 747. (Severe) Anecdotal

Efavirenz is predicted to decrease the exposure to olaparib. Avoid. (Moderate) Theoretical

Efavirenz decreases the exposure to opioids (methadone). Monitor and adjust dose. (Severe) Study

Efavirenz is predicted to decrease the exposure to osimertinib. (Moderate) Theoretical

Efavirenz is predicted to decrease the exposure to paritaprevir with ritonavir and omibitasvir. Avoid. (Severe) Study

Efavirenz is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors. (Moderate) Theoretical

Efavirenz is predicted to decrease the exposure to efavirenz. (Unknown) Theoretical

Efavirenz slightly decreases the exposure to rifabutin. Adjust dose. (Severe) Study

Rifampicin slightly decreases the exposure to efavirenz. Adjust dose. (Severe) Study

Efavirenz is predicted to decrease the exposure to rifampicin. Avoid. (Severe) Theoretical

Efavirenz is predicted to decrease the exposure to rilpivirine. Avoid. (Severe) Theoretical

Efavirenz is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. (Moderate) Theoretical

Efavirenz is predicted to decrease the exposure to simeprevir. (Severe) Study

Efavirenz is predicted to decrease the concentration of sirolimus. Monitor and adjust dose. (Moderate) Theoretical

St John’s Wort is predicted to decrease the concentration of efavirenz. Avoid. (Severe) Theoretical

Efavirenz slightly decreases the exposure to statins (atorvastatin). (Mild) Study

Efavirenz moderately decreases the exposure to statins (simvastatin). (Moderate) Study

Efavirenz is predicted to decrease the concentration of tacrolimus. Monitor and adjust dose. (Moderate) Theoretical

Efavirenz is predicted to decrease the concentration of temsirolimus. Avoid. (Severe) Theoretical

Efavirenz is predicted to decrease the exposure to ticagrelor. (Moderate) Theoretical

Efavirenz is predicted to decrease the exposure to tolvaptan. (Moderate) Theoretical

Efavirenz decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 747. (Severe) Anecdotal

Efavirenz is predicted to decrease the exposure to velpatasvir. Avoid. (Moderate) Theoretical

Elbasvir

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to elbasvir. Avoid. (Severe) Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) slightly to moderately increase the exposure to elbasvir. Avoid. (Moderate) Study

Bosentan is predicted to moderately decrease the exposure to elbasvir. Avoid. (Severe) Study

Cobicistat slightly to moderately increases the exposure to elbasvir. Avoid. (Moderate) Study

Elbasvir is predicted to increase the concentration of dabigatran. (Moderate) Theoretical

Efavirenz is predicted to moderately decrease the exposure to elbasvir. Avoid. (Severe) Study

Enzalutamide is predicted to decrease the exposure to elbasvir. Avoid. (Severe) Study

Etravirine is predicted to decrease the exposure to elbasvir. Avoid. (Unknown) Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lapinavir, ritonavir, saquinavir, tipranavir) slightly to moderately increase the exposure to elbasvir. Avoid. (Moderate) Study

Idelalisib slightly to moderately increases the exposure to elbasvir. Avoid. (Moderate) Study

Macrolides (clarithromycin) slightly to moderately increase the exposure to elbasvir. Avoid. (Moderate) Study
Elbasvir (continued)

- **Modafnil** is predicted to decrease the exposure to elbasvir. Avoid. [Unknown] Theoretical
- **Nevirapine** is predicted to moderately decrease the exposure to elbasvir. Avoid. [Severe] Study
- **Rifampin** is predicted to decrease the exposure to elbasvir. Avoid. [Severe] Study
- **St John’s Wort** is predicted to moderately decrease the exposure to elbasvir. Avoid. [Severe] Study
- Elbasvir potentially increases the exposure to **statins** (atorvastatin). Adjust atorvastatin dose, p. 196. [Moderate] Study
- Elbasvir is predicted to increase the exposure to **statins** (fluvastatin). Adjust fluvastatin dose, p. 196. [Unknown] Theoretical
- Elbasvir increases the exposure to **statins** (rosuvastatin). Adjust rosuvastatin dose, p. 197. [Moderate] Study
- Elbasvir is predicted to increase the exposure to **statins** (simvastatin). Adjust simvastatin dose, p. 198. [Unknown] Theoretical

**Eletroptan** → see TABLE 13 p. 1267 (serotonin syndrome)
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to eletroptan. Avoid. [Severe] Study
- **Cobicistat** is predicted to markedly increase the exposure to eletroptan. Avoid. [Severe] Study
- Eletroptan increases the risk of vasoconstriction when given with **ergotamine**. Separate administration by 24 hours. [Severe] Study
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to eletroptan. Avoid. [Severe] Study
- **Idelalisib** is predicted to markedly increase the exposure to eletroptan. Avoid. [Severe] Study
- Macrolides (clarithromycin) are predicted to markedly increase the exposure to eletroptan. Avoid. [Severe] Study
- Macrolides (erythromycin) moderately increase the exposure to eletroptan. Avoid. [Moderate] Study

**Eltumuzumab** → see monoclonal antibodies

**Eltrombopag**
- **Antacids** decrease the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after antacids. [Severe] Study
- **Dairy products** are predicted to decrease the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after dairy products. [Severe] Theoretical
- **Iron (oral)** is predicted to decrease the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after iron (oral). [Severe] Theoretical
- **Selenium** is predicted to decrease the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after selenium. [Severe] Theoretical
- **Eltrombopag** is predicted to increase the exposure to **statins**. Monitor and adjust dose. [Moderate] Study
- **Zinc** is predicted to decrease the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after zinc (zinc acetate, zinc sulfate). [Severe] Theoretical

**Elvitegravir**
- **Antacids** moderately decrease the exposure to elvitegravir. Separate administration by at least 5 hours. [Moderate] Study
- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical
- **Bosentan** is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical
- **Elvitegravir** is predicted to decrease the anticoagulant effect of **coumarins**. [Moderate] Theoretical
- **Efavirenz** is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical
- Elvitegravir is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical
- **HIV-protease inhibitors** (atazanavir, lopinavir) boosted with ritonavir increase the concentration of elvitegravir. Refer to specialist literature. [Moderate] Study
- **Nevirapine** is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical
- **Rifampin** is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical
- **St John’s Wort** is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical

Empagliflozin → see TABLE 1 p. 1267 (antidiabetic drugs), TABLE 8 p. 1265 (hypotension)
- **Enalapril** → see ACE inhibitors
- **Enoxaparin** → see low molecular-weight heparins

**Entacapone**
- **Iron (oral)** is predicted to decrease the absorption of entacapone. Separate administration by at least 2 hours. [Moderate] Theoretical
- **Entacapone** is predicted to increase the exposure to **levodopa**. Monitor side effects and adjust dose. [Moderate] Study
- **Entacapone** is predicted to increase the exposure to **methylodopa**. [Moderate] Theoretical
- **Entacapone** is predicted to increase the risk of elevated blood pressure when given with **monoamine-oxidase A and B inhibitors**, irreversibly. Avoid. [Severe] Theoretical
- **Entacapone** is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, inotropic (doxbutamine, dopamine). [Moderate] Theoretical
- **Entacapone** is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). [Moderate] Study

**Enteral feeds**
- **Antacids** (aluminium hydroxide) increase the risk of blocked enteral or nasogastric tubes when given with **enteral feeds**. [Moderate] Study
- **Enteral feeds** decrease the absorption of antiepileptics (phenytoin). [Severe] Study
- **Enteral feeds** (vitamin-K containing) potentially decrease the anticoagulant effect of coumarins. [Severe] Anecdotal
- **Enteral feeds** (vitamin-K containing) potentially decrease the effects of phenindione. [Severe] Theoretical
- **Enteral feeds** decrease the exposure to quinolones (ciprofloxacin). [Moderate] Study
- **Sucralfate** increases the risk of blocked enteral or nasogastric tubes when given with **enteral feeds**. Separate administration by 1 hour. [Moderate] Study
- **Enteral feeds** decrease the exposure to **theophylline**. [Moderate] Study

**Enzalutamide**

**GENERAL INFORMATION** Caution with concurrent chemotherapy—safety and efficacy not established.
- **Enzalutamide** is predicted to decrease the exposure to **abacavir**. [Moderate] Theoretical
- **Enzalutamide** is predicted to decrease the exposure to **abiraterone**. Avoid. [Severe] Theoretical
- **Enzalutamide** is predicted to decrease the exposure to aldosterone antagonists (spironolactone). Avoid. [Moderate] Theoretical
- **Enzalutamide** is predicted to decrease the exposure to **alprazolam**. Adjust alprazolam dose. [Moderate] Theoretical
- **Enzalutamide** is predicted to decrease the exposure to antihyrrhysis (disopyramide, dronedarone). Avoid. [Severe] Study
- **Enzalutamide** is predicted to decrease the efficacy of antihyrrhysis (propafenone). [Moderate] Study
- **Enzalutamide** is predicted to decrease the exposure to anticholinesterases, centrally acting (donepezil). [Mild] Study
- **Enzalutamide** is predicted to slightly decrease the exposure to antiepileptics (brivaracetam). [Moderate] Theoretical
- **Enzalutamide** is predicted to decrease the exposure to antiepileptics (perampanel). Monitor and adjust dose. [Moderate] Study
- **Enzalutamide** is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. [Severe] Study
Enzalutamide is predicted to decrease the exposure to antimalarials (artemether) with lumefantrine. Avoid. 

Enzalutamide is predicted to decrease the concentration of antimalarials (piperaquine). Avoid. 

Enzalutamide is predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. 

Enzalutamide moderately decreases the exposure to apremilast. Avoid. 

Enzalutamide is predicted to markedly decrease the exposure to aprepitant. Avoid. 

Enzalutamide is predicted to moderately decrease the exposure to aripiprazole. Adjust aripiprazole dose, p. 376. 

Enzalutamide is predicted to decrease the exposure to axitinib. Avoid or adjust dose. 

Enzalutamide decreases the exposure to bedaquiline. Avoid. 

Enzalutamide slightly decreases the exposure to bortezomib. Avoid. 

Enzalutamide affects the exposure to bosantan. Avoid. 

Enzalutamide is predicted to very markedly decrease the exposure to bosutinib. Avoid. 

Enzalutamide is predicted to markedly decrease the exposure to bupropion. 

Enzalutamide is predicted to decrease the exposure to buspirone. Use with caution and adjust dose. 

Enzalutamide moderately decreases the exposure to cabozantinib. Avoid. 

Enzalutamide is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. 

Enzalutamide decreases the exposure to calcium channel blockers (diltiazem). 

Enzalutamide decreases the exposure to calcium channel blockers (isradipine). Avoid. 

Enzalutamide is predicted to decrease the exposure to calcium channel blockers (verapamil). 

Enzalutamide is predicted to decrease the exposure to cannabis extract. Avoid. 

Enzalutamide is predicted to decrease the exposure to ceritinib. Avoid. 

Enzalutamide decreases the concentration of ciclosporin. 

Enzalutamide is predicted to alter the effects of cilostazol. 

Enzalutamide decreases the exposure to clomethiazole. Monitor and adjust dose. 

Enzalutamide is predicted to decrease the exposure to cobimetinib. Avoid. 

Enzalutamide is predicted to decrease the exposure to corticosteroids (budesonide, dexmethasone, methylprednisolone, prednisolone). Monitor and adjust dose. 

Enzalutamide is predicted to decrease the exposure to corticosteroids (fluticasone). 

Enzalutamide is predicted to decrease the exposure to corticosteroids (prednisone). 

Enzalutamide potentially decreases the exposure to coumarins. Avoid or adjust dose and monitor INR. 

Enzalutamide is predicted to markedly decrease the exposure to crizotinib. Avoid. 

Enzalutamide is predicted to decrease the exposure to dabrafenib. Avoid. 

Enzalutamide is predicted to moderately decrease the exposure to dacarbazine. Avoid. 

Enzalutamide is predicted to decrease the exposure to darifenacin. 

Enzalutamide is predicted to decrease the exposure to dasabuvir. Avoid. 

Enzalutamide is predicted to markedly decrease the exposure to dasatinib. Avoid. 

Enzalutamide is predicted to slightly decrease the exposure to delamanid. Avoid. 

Enzalutamide decreases the exposure to dolutegravir. Adjust dose. 

Enzalutamide is predicted to decrease the exposure to elbasvir. Avoid. 

Enzalutamide is predicted to decrease the concentration of elvitegravir. Avoid. 

Enzalutamide is predicted to decrease the effects of ergotamine. 

Enzalutamide is predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose, p. 899. 

Enzalutamide is predicted to decrease the exposure to etravirine. Avoid. 

Enzalutamide is predicted to decrease the concentration of everolimus. Avoid or adjust dose. 

Enzalutamide moderately decreases the exposure to exemestane. 

Enzalutamide is predicted to decrease the exposure to fesoterodine. Avoid. 

Fibrates (gemfibrozil) moderately increase the exposure to enzalutamide. Avoid or adjust enzalutamide dose, p. 874. 

Enzalutamide is predicted to decrease the exposure to fingolimod. 

Enzalutamide is predicted to decrease the exposure to fosaprepitant. Avoid. 

Enzalutamide is predicted to decrease the exposure to gefitinib. Avoid. 

Enzalutamide is predicted to decrease the exposure to grazoprevir. Avoid. 

Enzalutamide is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 335. 

Enzalutamide decreases the concentration of haloperidol. Adjust dose. 

Enzalutamide is predicted to decrease the exposure to ibrutinib. Avoid. 

Enzalutamide is predicted to decrease the exposure to idelalisib. Avoid. 

Enzalutamide is predicted to decrease the exposure to imatinib. Avoid. 

Enzalutamide is predicted to decrease the exposure to irinotecan. Avoid. 

Enzalutamide is predicted to decrease the exposure to ivabradine. Adjust dose. 

Enzalutamide markedly decreases the exposure to ivacaftor. Avoid. 

Enzalutamide is predicted to decrease the exposure to ixazomib. Avoid. 

Enzalutamide is predicted to decrease the exposure to lapatinib. Avoid. 

Enzalutamide is predicted to decrease the exposure to linagliptin. 

Enzalutamide is predicted to decrease the exposure to lomitapide. Monitor and adjust dose. 

Enzalutamide is predicted to decrease the exposure to luracidine. Avoid. 

Enzalutamide is predicted to decrease the exposure to macitentan. Avoid. 

Enzalutamide is predicted to decrease the exposure to maraviroc. Adjust dose. 

Enzalutamide is predicted to decrease the exposure to midazolam. Monitor and adjust dose. 

Enzalutamide is predicted to decrease the exposure to mirtazapine. Adjust dose. 

Enzalutamide is predicted to decrease the exposure to monoclonal antibodies (trastuzumab emtansine). 

Enzalutamide is predicted to decrease the exposure to montelukast. 

Enzalutamide is predicted to markedly decrease the exposure to nalorexogol. Avoid. 

Downloaded from www.medicalbr.com
Enzalutamide is predicted to slightly decrease the exposure to nateglinide. [Mild] Study

Enzalutamide is predicted to decrease the exposure to netupitant. Avoid. [Moderate] Study

Enzalutamide is predicted to moderately decrease the exposure to nilotinib. Avoid. [Severe] Study

Enzalutamide is predicted to decrease the exposure to nitisinone. Adjust nitisinone dose. [Moderate] Theoretical

Enzalutamide is predicted to decrease the exposure to olaparib. Avoid. [Moderate] Theoretical

Enzalutamide is predicted to decrease the exposure to ondansetron. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to opioids (alfentanil, fentanyl). [Moderate] Study

Enzalutamide is predicted to decrease the exposure to opioids (buprenorphine). Monitor and adjust dose. [Moderate] Theoretical

Enzalutamide decreases the exposure to opioids (methadone). Monitor and adjust dose. [Severe] Study

Enzalutamide is predicted to decrease the exposure to opioids (oxycodone). Monitor and adjust dose. [Moderate] Study

Enzalutamide is predicted to moderately decrease the exposure to osimertinib. Avoid. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to paclitaxel. Avoid. [Severe] Study

Enzalutamide is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, tadalfafil). Avoid. [Severe] Study

Enzalutamide is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardafenafil). [Moderate] Theoretical

Enzalutamide is predicted to moderately decrease the exposure to pioglitazone. [Mild] Study

Enzalutamide is predicted to decrease the exposure to pizotifen. [Moderate] Study

Enzalutamide is predicted to markedly decrease the exposure to praziquantel. Avoid. [Moderate] Study

Enzalutamide is predicted to moderately decrease the exposure to proton pump inhibitors (omeprazole). [Moderate] Study

Enzalutamide is predicted to decrease the exposure to quetiapine. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to ranolazine. Avoid. [Severe] Study

Enzalutamide is predicted to decrease the exposure to reboxetine. [Moderate] Aneodal

Enzalutamide is predicted to decrease the exposure to regorafenib. Avoid. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. [Moderate] Study

Enzalutamide markedly decreases the exposure to ripirvirine. Avoid. [Severe] Study

Enzalutamide is predicted to decrease the exposure to risperidone. Adjust risperidone dose. [Moderate] Study

Enzalutamide is predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study

Enzalutamide is predicted to decrease the exposure to roflumilast. Avoid. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Study

Enzalutamide is predicted to moderate decrease the exposure to saxagliptin. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to simeprevir. Avoid. [Severe] Study

Enzalutamide is predicted to decrease the concentration of sirolimus. Avoid. [Severe] Study

Enzalutamide is predicted to decrease the exposure to solifenacin. [Moderate] Theoretical

Enzalutamide is predicted to decrease the exposure to sorafenib. [Moderate] Theoretical

Enzalutamide is predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 914. [Moderate] Study

Enzalutamide decreases the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study

Enzalutamide is predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. [Severe] Study

Enzalutamide is predicted to decrease the exposure to taxanes (docetaxel). [Severe] Theoretical

Enzalutamide is predicted to decrease the concentration of temsirolimus. Avoid. [Severe] Study

Enzalutamide decreases the exposure to tetracyclines (doxycycline). Monitor and adjust dose. [Moderate] Study

Enzalutamide is predicted to markedly decrease the exposure to ticagrelor. Avoid. [Severe] Study

Enzalutamide is predicted to decrease the exposure to tolvaptan. Avoid. [Severe] Study

Enzalutamide is predicted to decrease the exposure to toremifene. Adjust dose. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to trametinib. Avoid. [Severe] Study

Enzalutamide is predicted to markedly decrease the exposure to ulipristal. Avoid and for 4 weeks after stopping ulipristal. [Severe] Theoretical

Enzalutamide is predicted to decrease the exposure to vandetanib. Avoid. [Moderate] Study

Enzalutamide is predicted to moderately decrease the exposure to velpatasvir. Avoid. [Severe] Study

Enzalutamide is predicted to decrease the exposure to vemurafenib. Avoid. [Severe] Theoretical

Enzalutamide is predicted to decrease the exposure to venetoclax. Avoid. [Severe] Study

Enzalutamide is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindesine). [Severe] Theoretical

Enzalutamide is predicted to decrease the exposure to vinflunine. Avoid. [Severe] Theoretical

Enzalutamide is predicted to decrease the exposure to vinorelbine. Use with caution or avoid. [Severe] Theoretical

Enzalutamide is predicted to decrease the exposure to vismodegib. Avoid. [Moderate] Theoretical

Enzalutamide is predicted to decrease the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study

Enzalutamide is predicted to decrease the exposure to zopiclone. Adjust dose. [Moderate] Study

Epidermide — see sympathomimetics, vasoconstrictor

Ephedrine — see sympathomimetics

Ephedrine — see adrenergic antagonists

Epoetin alfa — see TABLE 5 p. 1264 (thromboembolism), TABLE 16 p. 1268 (increased serum potassium)

Epoetin beta — see TABLE 5 p. 1264 (thromboembolism), TABLE 16 p. 1268 (increased serum potassium)

Epoprostenol — see TABLE 4 p. 1264 (ant platelet effects)

Eprosartan — see angiotensin-II receptor antagonists

Eptifibatide — see TABLE 4 p. 1264 (ant platelet effects)

Ergocalciferol — see vitamin D substances

Ergometrine

Antiarrhythmics (dronedaron) are predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical

Antifungals, azoles (fluconazole, itraconazole, posaconazole) are predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of ergotism when given with ergometrine. Avoid. [Severe] theoretical

Antifungals, azoles (miconazole) are predicted to increase the exposure to ergometrine. Avoid. [Moderate] Theoretical

Aprepitant is predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical
Beta blockers, non-selective are predicted to increase the risk of peripheral vasoconstriction when given with ergometrine. 
Avoid. [Severe] Theoretical

Beta blockers, selective are predicted to increase the risk of peripheral vasoconstriction when given with ergometrine. 
Avoid. [Severe] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of ergotism when given with ergometrine. 
Avoid. [Severe] Theoretical

Cobicistat is predicted to increase the risk of ergotism when given with ergometrine. Avoid. [Severe] Theoretical

Crizotinib is predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical

Ergometrine is predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical

Favipiravir is predicted to decrease the effects of ergotamine. [Moderate] Theoretical

Eletriptan increases the risk of vasoconstriction when given with ergotamine. Separate administration by 24 hours. [Severe] Study

Enzalutamide is predicted to decrease the effects of ergotamine. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to ergotamine. Avoid. [Severe] Theoretical

Cobicistat is predicted to increase the risk of ergotism when given with ergotamine. Avoid. [Severe] Theoretical

Crizotinib is predicted to increase the risk of ergotism when given with ergotamine. Avoid. [Severe] Theoretical

Ergometrine is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical

Efavirenz is predicted to decrease the effects of ergotamine. [Moderate] Theoretical

Eletriptan increases the risk of vasoconstriction when given with ergotamine. Separate administration by 24 hours. [Severe] Study

Enzalutamide is predicted to decrease the effects of ergotamine. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to ergotamine. Avoid. [Severe] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the risk of ergotism when given with ergometrine. 
Avoid. [Severe] Theoretical

HIV-protease inhibitors (indinavir) are predicted to increase the risk of ergotism when given with ergometrine. 
Avoid. [Severe] Theoretical

Idealisib is predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical

Imatinib is predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical

Macrolides (clarithromycin) are predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical

Macrolides (erythromycin) are predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical

Netupitant is predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical

Nilotinib is predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical

Ergometrine potentially increases the risk of peripheral vasoconstriction when given with sympathomimetics, inotropic (dopamine). 
Avoid. [Severe] Anecdotal

Ergometrine is predicted to increase the risk of peripheral vasoconstriction when given with sympathomimetics, vasoconstrictor (noradrenaline/norepinephrine). 
[Severe] Anecdotal

Ergotamine

Almotriptan is predicted to increase the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after almotriptan. [Severe] Theoretical

Antiarrhythmics (dronedarone) are predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical

Antiarrhythmics (sotalol) are predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical

Aprepitant is predicted to increase the risk of ergotism when given with ergotamine. [Moderate] Theoretical

Beta blockers, non-selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. 
[Severe] Study

Beta blockers, selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. 
[Severe] Study

Beta blockers, selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. 
[Moderate] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of ergotism when given with ergotamine. 
[Severe] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the risk of ergotism when given with ergotamine. 
[Severe] Theoretical

Ceritinib is predicted to increase the exposure to ergotamine. 
Avoid. [Severe] Theoretical

Efavirenz is predicted to decrease the effects of ergotamine. [Moderate] Theoretical

Eletriptan increases the risk of vasoconstriction when given with ergotamine. Separate administration by 24 hours. [Severe] Study

Erlotinib

Food and lifestyle: Dose adjustment may be necessary if smoking started or stopped during treatment.

Antacids are predicted to decrease the absorption of erlotinib. Antacids should be taken 4 hours before or 2 hours after erlotinib. [Moderate] Theoretical

Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to erlotinib [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose, p. 899. [Severe] Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the risk of ergotism when given with ergotamine. 
[Severe] Theoretical

Beta blockers, selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. 
[Severe] Study

Beta blockers, selective are predicted to increase the risk of peripheral vasoconstriction when given with ergotamine. 
[Severe] Study

Ceritinib is predicted to increase the exposure to ergotamine. Avoid. [Severe] Theoretical

Erlotinib increases the risk of vasoconstriction when given with ergotamine. 
[Severe] Theoretical

Erlotinib increases the risk of ergotism when given with dopamine receptor agonists (bromocriptine, cabergoline). 
Avoid. [Moderate] Theoretical

Erlotinib increases the risk of ergotism when given with dopamine receptor agonists (bromocriptine, cabergoline). Avoid. [Moderate] Theoretical

Erlotinib increases the risk of vasoconstriction when given with ergotamine. 
[Severe] Study

Enzalutamide is predicted to decrease the effects of ergotamine. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to ergotamine. Avoid. [Severe] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the risk of ergotism when given with ergotamine. 
Avoid. [Severe] Theoretical

HIV-protease inhibitors (indinavir) are predicted to increase the risk of ergotism when given with ergotamine. 
Avoid. [Severe] Theoretical

Idealisib is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical

Imatinib is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical

Macrolides (clarithromycin) are predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical

Macrolides (erythromycin) are predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical

Nilotinib is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical

Nilotinib is predicted to increase the exposure to ergotamine. 
[Severe] Theoretical

Palbociclib is predicted to increase the exposure to ergotamine. Adjust dose. [Moderate] Theoretical

Rifaximin is predicted to decrease the effects of ergotamine. [Moderate] Theoretical

Rizatriptan is predicted to increase the risk of vasoconstriction when given with ergotamine. 
[Severe] Study

St. John's Wort is predicted to decrease the effects of ergotamine. [Moderate] Theoretical

Sumatriptan increases the risk of vasoconstriction when given with ergotamine. 
[Severe] Study

Erlotinib
Erlotinib (continued)

- Anti-infectives, zoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. [Moderate] Study
- Aprepitant is predicted to increase the exposure to erlotinib. [Theoretical] Study
- Erlotinib is predicted to increase the risk of gastrointestinal perforation when given with aspirin (high-dose). [Severe] Theoretical
- Bosantan is predicted to decrease the exposure to erlotinib. [Severe] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- Ciclosporin is predicted to increase the exposure to erlotinib. [Theoretical] Study
- Cobichstat is predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. [Moderate] Study
- Combined hormonal contraceptives slightly increase the exposure to erlotinib. Monitor side effects and adjust dose. [Moderate] Study
- Corticosteroids increase the risk of gastrointestinal perforation when given with erlotinib. [Severe] Theoretical
- Erlotinib increases the anticoagulant effect of coumarins. [Severe] Anecdotal
- Crizotinib is predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- Efavirenz is predicted to decrease the exposure to erlotinib. [Severe] Theoretical
- Enzalutamide is predicted to decrease the exposure to erlotinib. Avoid or adjust erlotinib dose, p. 899. [Severe] Study
- Grapefruit juice is predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- H₂ receptor antagonists are predicted to decrease the exposure to erlotinib. Erlotinib should be taken 2 hours before or 10 hours after H₂ receptor antagonists. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. [Moderate] Study
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- Idelalisib is predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- Ixazomib is predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- Laptalimib is predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- Macrolides (clarithromycin) are predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. [Moderate] Study
- Netupitant is predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- Nevirapine is predicted to decrease the exposure to erlotinib. [Severe] Theoretical
- Nitotinib is predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- Erlotinib is predicted to increase the risk of gastrointestinal perforation when given with NSAIDs. [Severe] Theoretical
- Erlotinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Proton pump inhibitors are predicted to slightly decrease the exposure to erlotinib. Avoid. [Moderate] Study
- Quinolones (ciprofloxacin) slightly increase the exposure to erlotinib. Monitor side effects and adjust dose. [Moderate] Study
- Ranolazine is predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- Rifapentina is predicted to decrease the exposure to erlotinib. [Theoretical]
- St John’s Wort is predicted to decrease the exposure to erlotinib. [Severe] Theoretical
- Vemurafenib is predicted to increase the exposure to erlotinib. [Moderate] Theoretical
- Ertapenem → see carbapenems
- Erythromycin → see macrolides
- Escitalopram → see SSRIs
- Escitalopram → see antiepileptics
- Esomolol → see beta blockers, selective
- Esomeprazole → see proton pump inhibitors
- Estramustine → see alkylating agents
- Etanercept
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with etanercept. Public Health England advises avoid. [Severe] Theoretical
- Ethambutol
- Isoniazid increases the risk of optic neuropathy when given with ethambutol. [Severe] Anecdotal
- Ethosuximide → see antiepileptics
- Etodolac → see NSAIDs
- Etopimide → see TABLE 8 p. 1265 (hypotension), TABLE 11 p. 1266 (CNS depressant effects)

Etonogestrel

- Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- Aprepitant is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- Bosantan is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- Enzalutamide is predicted to slightly increase the exposure to etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- Efavirenz is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- Bosantan is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- Estrophan is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- Glinemide decreases the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- Griseofulvin decreases the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- Modafinil is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- Nevirapine is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- Rifabutin is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- Rifampicin is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- St John’s Wort is predicted to decrease the efficacy of etonogestrel. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- Suguayminadex is predicted to decrease the efficacy of etonogestrel. Use additional contraceptive precautions. [Severe] Theoretical
- Ulipristal is predicted to decrease the efficacy of etonogestrel. Avoid. [Severe] Theoretical
- Etoposide → see TABLE 15 p. 1267 (myelosuppression)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the efficacy of etoposide. [Moderate] Study
- Ciclosporin increases the exposure to etoposide. Monitor and adjust dose. [Severe] Study
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with etoposide. Public Health England advises avoid. [Severe] Theoretical
Etiravirine

- Etravirine (Carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to etravirine. Avoid. (Severe) Theoretical
- Etravirine decreases the exposure to antimalarials (artemether). (Moderate) Study
- Etravirine is predicted to decrease the exposure to bedaquiline. Avoid. (Severe) Theoretical
- Etravirine is predicted to decrease the exposure to etravirine. Avoid. (Severe) Study
- Etravirine is predicted to decrease the exposure to bosutinib. Avoid. (Severe) Theoretical
- Etravirine increases the anticoagulant effect of coumarins. (Moderate) Theoretical
- Etravirine is predicted to decrease the exposure to daclatasvir. Avoid. (Moderate) Theoretical
- Etravirine moderately decreases the exposure to dolutegravir. Avoid unless given with atazanavir, darunavir, or lopinavir (all boosted with ritonavir). (Severe) Study
- Efavirenz is predicted to decrease the exposure to etravirine. Avoid. (Severe) Study
- Etravirine is predicted to decrease the exposure to elbasvir. Avoid. (Unknown) Theoretical
- Enzalutamide is predicted to decrease the exposure to etravirine. Avoid. (Severe) Theoretical
- Etravirine is predicted to decrease the exposure to grazoprevir. Avoid. (Mild) Theoretical
- HIV-protease inhibitors (tipranavir) decrease the exposure to etravirine. Avoid. (Severe) Study
- Etravirine increases the exposure to HIV-protease inhibitors (fosamprenavir) boosted with ritonavir. Refer to specialist literature. (Moderate) Study
- Etravirine is predicted to decrease the exposure to HIV-protease inhibitors (indinavir). Avoid. (Severe) Theoretical
- Etravirine decreases the exposure to macrolides (clarithromycin). (Severe) Study
- Etravirine (with a boosted protease inhibitor) increases the exposure to maraviroc. Avoid or adjust dose. (Moderate) Study
- Nevirapine is predicted to decrease the exposure to etravirine. Avoid. (Severe) Study
- Etravirine moderately decreases the exposure to phosphodiesterase type-5 inhibitors. Adjust dose. (Moderate) Study
- Rifabutin decreases the exposure to etravirine. (Moderate) Study
- Rifampicin is predicted to decrease the exposure to etravirine. Avoid. (Severe) Theoretical
- Etravirine is predicted to decrease the exposure to rifapentine. Avoid. (Severe) Theoretical
- Etravirine is predicted to decrease the exposure to simprevir. Avoid. (Moderate) Study
- St John’s Wort is predicted to decrease the exposure to etravirine. Avoid. (Severe) Study
- Everolimus is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Antiarhythmics (dronedarone) are predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of everolimus. Avoid or adjust dose. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Aprepitant is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Bosentan is predicted to decrease the concentration of everolimus. Avoid or adjust dose. (Severe) Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Ceritinib is predicted to increase the exposure to everolimus. (Moderate) Theoretical
- Cobicistat is predicted to increase the concentration of everolimus. Avoid. (Severe) Study
- Crizotinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Grapefruit juice is predicted to increase the exposure to everolimus. Avoid. (Severe) Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the concentration of everolimus. Avoid. (Severe) Study
- HIV-protease inhibitors (indinavir) are predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study

Avoid or adjust dose. (Severe) Study
- Idelalisib is predicted to increase the concentration of everolimus. Avoid. (Severe) Study
- Imatinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Lapatinib is predicted to increase the exposure to everolimus. (Moderate) Theoretical
- Mirabegron is predicted to increase the exposure to everolimus. (Mild) Theoretical
- Netupitant is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Nevirapine is predicted to decrease the concentration of everolimus. Avoid or adjust dose. (Severe) Study
- Nilotinib is predicted to increase the concentration of everolimus. Avoid or adjust dose. (Moderate) Study
- Palbociclib is predicted to increase the exposure to everolimus. Adjust dose. (Moderate) Theoretical
- Pitolisant is predicted to decrease the exposure to everolimus. Avoid. (Severe) Theoretical
- Rifampicin is predicted to decrease the concentration of everolimus. Avoid or adjust dose. (Severe) Study
- St John’s Wort is predicted to decrease the concentration of everolimus. Avoid or adjust dose. (Severe) Study
- Velpatasvir is predicted to increase the exposure to everolimus. (Severe) Theoretical

Evolocumab → see monoclonal antibodies

Exemestane

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) moderately decrease the exposure to exemestane. (Moderate) Study
- Enzalutamide moderately decreases the exposure to exemestane. (Moderate) Study
- Rifampicin moderately decreases the exposure to exemestane. (Moderate) Study
- St John’s Wort is predicted to decrease the exposure to exemestane. (Moderate) Theoretical

Exenatide → see Table 14 p. 1267 (antidiabetic drugs)

SEPARATION OF ADMINISTRATION With standard-release exenatide: some orally administered drugs should be taken at least 1 hour before, or 4 hours after, exenatide injection.
Ezetimibe

- Ciclosporin moderately increases the exposure to ezetimibe and ezetimibe slightly increases the exposure to ciclosporin. [Moderate Study]
- Fibrates are predicted to slightly increase the risk of gallstones when given with ezetimibe. [Severe] Theoretical
- Ezetimibe potentially increases the risk of rhabdomyolysis when given with statins. [Severe] Anecdotal

Fampridine

- H₂ receptor antagonists (cimetidine) increase the concentration of fampridine. Avoid. [Severe] Theoretical

Febuxostat

- Febuxostat is predicted to increase the exposure to azaithioprine. [Severe] Theoretical
- Febuxostat is predicted to increase the exposure to didanosine. [Severe] Theoretical
- Febuxostat is predicted to increase the exposure to mercaptopurine. Avoid. [Severe] Theoretical

Felbakin → see NSAIDs
Felodipine → see calcium channel blockers
Fenofibrate → see fibrates
Fenoprofen → see NSAIDs
Fentanyl → see opioids
Ferric carboxymaltose → see iron (injectable)
Ferric maltol → see iron (oral)
Ferroas fumarate → see iron (oral)
Ferroas gluconate → see iron (oral)
Ferroas sulfate → see iron (oral)

Fesoterodine → see Table 10 p. 1266 (antimuscarinics)
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment, p. 732. [Mild] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fesoterodine. Avoid. [Moderate] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment, p. 732. [Mild] Study
- Aprepitant is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment, p. 732. [Mild] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment, p. 732. [Mild] Study
- Cobicistat is predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose; avoid in hepatic and renal impairment, p. 732. [Severe] Study
- Crizotinib is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment, p. 732. [Mild] Study
- Enzalutamide is predicted to decrease the exposure to fesoterodine. Avoid. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose; avoid in hepatic and renal impairment, p. 732. [Severe] Study
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment, p. 732. [Mild] Study
- Idelalisib is predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose; avoid in hepatic and renal impairment, p. 732. [Severe] Study
- Imatinib is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment, p. 732. [Mild] Study
- Macrolides (clarithromycin) are predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose; avoid in hepatic and renal impairment, p. 732. [Severe] Study
- Macrolides (erythromycin) are predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment, p. 732. [Mild] Study
- Netupitant is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment, p. 732. [Mild] Study
- Nilotinib is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment, p. 732. [Mild] Study
- Rifampicin is predicted to decrease the exposure to fesoterodine. Avoid. [Moderate] Study
- St John’s Wort is predicted to decrease the exposure to fesoterodine. Avoid. [Severe] Theoretical
- Fexofenadine → see antihistamines, non-sedating

Fibrates

bezafibrate - cipofibrate - fenofibrate - gemfibrozil
- Antacids slightly to moderately decrease the exposure to gemfibrozil. [Moderate] Study
- Bezafibrate is predicted to increase the risk of nephrotoxicity when given with ciclosporin. [Severe] Theoretical
- Fenofobrate increases the risk of nephrotoxicity when given with ciclosporin. [Severe] Study
- Colchicine increases the risk of rhabdomyolysis when given with fibrates. [Severe] Anecdotal
- Fibrates are predicted to increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Study
- Gemfibrozil is predicted to increase the exposure to dabrafenib. [Moderate] Theoretical
- Fibrates are predicted to increase the risk of rhabdomyolysis when given with dapometin. [Severe] Theoretical
- Gemfibrozil very markedly increases the exposure to dasabuvir. Avoid. [Severe] Study
- Gemfibrozil moderately increases the exposure to enzalutamide. Avoid or adjust enzalutamide dose, p. 874. [Severe] Study
- Fibrates are predicted to increase the risk of gallstones when given with ezetimibe. [Severe] Theoretical
- Fibrates are predicted to increase the risk of hypoglycaemia when given with insulin. [Moderate] Theoretical
- Gemfibrozil is predicted to moderately increase the exposure to montelukast. [Moderate] Study
- Fibrates are predicted to increase the anticoagulant effect of phenindione. Monitor INR and adjust dose. [Severe] Study
- Gemfibrozil markedly increases the exposure to pioglitazone. Monitor blood glucose and adjust dose. [Severe] Study
- Gemfibrozil markedly increases the exposure to repaglinide. Avoid. [Severe] Study
- Gemfibrozil is predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose, p. 1157. [Moderate] Theoretical
- Gemfibrozil increases the concentration of retinoids (bexarotene). Avoid. [Severe] Study
- Gemfibrozil is predicted to increase the exposure to selexipag. Avoid. [Severe] Theoretical
- Cipofibrate increases the risk of rhabdomyolysis when given with statins (atorvastatin). Avoid or adjust dose. [Severe] Study
- Bezaabifibrate increases the risk of rhabdomyolysis when given with statins (atorvastatin, fluvastatin). [Severe] Study
- Fenofibrate increases the risk of rhabdomyolysis when given with statins (atorvastatin, simvastatin). Adjust fenofibrate dose, p. 193. [Severe] Anecdotal
- Cipofibrate increases the risk of rhabdomyolysis when given with statins (fluvastatin). [Severe] Study
- Fenofibrate is predicted to increase the risk of rhabdomyolysis when given with statins (fluvastatin). Adjust fenofibrate dose, p. 193. [Severe] Theoretical
- Fenofibrate is predicted to increase the risk of rhabdomyolysis when given with statins (pravastatin). Avoid. [Severe] Theoretical
- Fibrates (bezaabifibrate, cipofibrate) increase the risk of rhabdomyolysis when given with statins (pravastatin). Avoid. [Severe] Study
Fenofibrate increases the risk of rhabdomyolysis when given with statins (rosuvastatin). Adjust fenofibrate and rosuvastatin doses, p. 193, p. 197. (Severe) Anecdotal

Fibrates (bezafibrate, clofibrate) increase the risk of rhabdomyolysis when given with statins (rosuvastatin). Adjust rosuvastatin dose, p. 197. (Severe) Study

Fibrates (bezafibrate, clofibrate) increase the risk of rhabdomyolysis when given with statins (simvastatin). Adjust simvastatin dose, p. 198. (Severe) Study

Gemfibrozil increases the risk of rhabdomyolysis when given with statins. Avoid. (Severe) Anecdotal

Fibrates are predicted to increase the risk of hypoglycaemia when given with sulfonylureas. (Moderate) Theoretical

Fibrates are predicted to decrease the efficacy of ursodeoxycholic acid. Avoid. (Severe) Theoretical

Fidaxomicin

Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study

Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study

Calcium channel blockers (verapamil) are predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study

Ciclosporin is predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study

HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study

Fingerblind is predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study

Macrolides are predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study

Ranolazine is predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study

Vemurafenib is predicted to increase the exposure to fidaxomicin. Avoid. (Moderate) Study

Fingolimod → see TABLE 6 p. 1265 (bradycardia), TABLE 9 p. 1266 (QT-interval prolongation)

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fingolimod. (Moderate) Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to fingolimod. Avoid. (Moderate) Study

Enzalutamide is predicted to decrease the exposure to fingolimod. (Moderate) Study

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fingolimod. Public Health England advises avoid. (Severe) Theoretical

Rifampicin is predicted to decrease the exposure to fingolimod. (Moderate) Study

St John’s Wort is predicted to decrease the exposure to fingolimod. Avoid. (Moderate) Theoretical

Flavoxate → see TABLE 10 p. 1266 (antimuscarinics)

Flecainide → see antiarrhythmics

Fluoxacillin → see penicillins

Flucytosine → see antifungals, azoles

Flucytosine is predicted to increase the risk of toxicity when given with levofolinic acid. (Severe) Theoretical

Folinic acid is predicted to decrease the concentration of fluocytosine. Avoid. (Severe) Study

Fludarabine → see TABLE 15 p. 1267 (myelosuppression)

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with fludarabine. Public Health England advises avoid. (Severe) Theoretical

Fludarabine increases the risk of pulmonary toxicity when given with pentostatin. Avoid. (Severe) Study → Also see TABLE 15 p. 1267

Fludrocortisone → see TABLE 17 p. 1268 (reduced serum potassium)

Fluocinolone

ROUTE-SPECIFIC INFORMATION With intravitreal use in adults: caution with concurrent administration of antiocoagulant or antiplatelet drugs (higher incidence of conjunctival haemorrhage).

Fluorouracil → see TABLE 15 p. 1267 (myelosuppression), TABLE 5 p. 1264 (thromboembolism)

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Fluorouracil increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. (Severe) Anecdotal

Fluorouracil increases the antiocoagulant effect of coumarins. (Severe) Anecdotal

Fluridone (folic acid) are predicted to increase the risk of toxicity when given with fluorouracil. Avoid. (Severe) Theoretical

Flurbiprofen is predicted to increase the risk of toxicity when given with fluorouracil. (Severe) Study

Fluvastatin → see statins

Fluvonoxime → see SSRIss

Folic acid - folinic acid - levofolinic acid

Folic acid decreases the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone). Monitor concentration and adjust dose. (Severe) Study

Folinic acid is predicted to decrease the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone). (Severe) Theoretical

Folic acid is predicted to increase the risk of toxicity when given with capecitabine. (Severe) Anecdotal

Folic acid increases the risk of toxicity when given with capecitabine. (Severe) Study

Folic acid is predicted to increase the risk of toxicity when given with fluorouracil. Avoid. (Severe) Theoretical

Folic acid is predicted to increase the risk of toxicity when given with fluorouracil. (Severe) Theoretical

Folic acid is predicted to alter the effects of raltitrexed. Avoid. (Moderate) Theoretical

Folic acid alters the effects of raltitrexed. Avoid. (Moderate) Study

Sulfasalazine decreases the absorption of folic acid. (Moderate) Study

Sulfasalazine is predicted to decrease the absorption of folinic acid. (Moderate) Theoretical

Folic acid is predicted to increase the risk of tegafur toxicity when given with tegafur. (Severe) Theoretical

Folic acid is predicted to increase the risk of toxicity when given with tegafur. (Severe) Theoretical

Folic acid → see folates

Fondaparinux → see TABLE 3 p. 1264 (antiocoagulant effects)

Formoterol → see beta, agonists
Fosaprepitant  
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to fosaprepitant. Avoid. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical
- Fusidic acid is predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical
- Gabapentin is predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical

Fusidic acid  
- Fusidic acid increases the risk of rhabdomyolysis when given with statins. Avoid. [Severe] Anecdotal

Gabapentin  
- see antiepileptics

Galantamine  
- see anticholinesterases, centrally acting

Ganciclovir  
- see TABLE 15 p. 1267 (myelosuppression), TABLE 2 p. 1264 (nephrotoxicity)

ROUTE-SPECIFIC INFORMATION  
Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Ganciclovir is predicted to increase the risk of seizures when given with carbapenems (imipenem). Avoid. [Severe] Anecdotal

Ganciclovir is predicted to increase the exposure to didanosine. [Moderate] Study

Mycopl熟悉 alate is predicted to increase the risk of haematological toxicity when given with ganciclovir. [Moderate] Theoretical

Also see TABLE 15 p. 1267

Gefitinib  
- see TABLE 15 p. 1267 (myelosuppression)

Antacids are predicted to slightly decrease the exposure to gefitinib. [Moderate] Theoretical

Antirhythmic (dronedarone) are predicted to increase the exposure to gefitinib. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to gefitinib. [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to gefitinib. [Moderate] Study

Aprepitant is predicted to increase the exposure to gefitinib. [Moderate] Theoretical

Bosentan is predicted to increase the exposure to gefitinib. Avoid. [Severe] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to gefitinib. [Moderate] Theoretical

Cobicistat is predicted to increase the exposure to gefitinib. [Moderate] Study

Gefitinib is predicted to increase the anticoagulant effect of coumarins. [Severe] Anecdotal

Crizotinib is predicted to increase the exposure to gefitinib. [Moderate] Theoretical

Elavirex is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical

Elacridar is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical

H2 receptor antagonists are predicted to slightly to moderately decrease the exposure to gefitinib. [Moderate] Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to gefitinib. [Moderate] Theoretical

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to gefitinib. [Moderate] Theoretical

Indinavir is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study

Irinotecan is predicted to increase the exposure to gefitinib. [Moderate] Theoretical

Irinotecan is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical

Metronidazole is predicted to increase the exposure to gefitinib. [Moderate] Theoretical

Netupitant is predicted to increase the exposure to gefitinib. [Moderate] Theoretical

Nevirapine is predicted to increase the exposure to gefitinib. Avoid. [Severe] Theoretical

Nilotinib is predicted to increase the exposure to gefitinib. [Moderate] Theoretical

Nilotinib is predicted to decrease the exposure to gefitinib. [Moderate] Theoretical

Pimozide is predicted to increase the exposure to gefitinib. Avoid. [Severe] Study

St John’s Wort is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study

TABLE 15 p. 1267

Imatinib is predicted to increase the exposure to gefitinib. [Moderate] Study

Imatinib is predicted to increase the exposure to gefitinib. [Moderate] Study

Macrolides (clarithromycin) are predicted to increase the exposure to gefitinib. [Moderate] Study

Macrolides (eriythromycin) are predicted to increase the exposure to gefitinib. [Moderate] Theoretical

Methotrexate is predicted to increase the exposure to gefitinib. [Moderate] Theoretical

Nefopam is predicted to increase the exposure to gefitinib. Avoid. [Severe] Theoretical

Nelfinavir is predicted to increase the exposure to gefitinib. Avoid. [Severe] Study

St John’s Wort is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical

TABLE 15 p. 1267

Gefitinib is predicted to increase the risk of bleeding events when given with phenidone. [Severe] Theoretical

Proton pump inhibitors are predicted to decrease the exposure to gefitinib. [Severe] Theoretical

Rifampicin is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Study

St John’s Wort is predicted to decrease the exposure to gefitinib. Avoid. [Severe] Theoretical

TABLE 5

Ganciclovir  
- see TABLE 15 p. 1267 (myelosuppression)

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to gefitinib. [Moderate] Theoretical
Grapefruit juice

▶ Glucosamine increases the anticoagulant effect of coumarins (warfarin). [Severe] Study

Glucosamine

Glucose ▶ see TABLE 3 p. 1264 (anticoagulant effects)

Glycerol ▶ see TABLE 17 p. 1268 (reduced serum potassium)

Glycercyl trinitrate ▶ see nitrates

Glycopyrronium ▶ see sulfonylureas

Glomimubab ▶ see monoclonal antibodies

Granisetron ▶ see TABLE 13 p. 1267 (serotonin syndrome), TABLE 9 p. 1266 (QT-interval prolongation)

Dopamine receptor agonists (apomorphine) are predicted to increase the risk of severe hypotension when given with granisetron. [Severe] Theoretical

Grapefruit juice
▶ Grapefruit juice moderately decreases the exposure to aliskiren. [Avoid. Severe] Study

Grapefruit juice increases the exposure to antiarrhythmics (amiodarone). [Avoid. Moderate] Study

Grapefruit juice moderately increases the exposure to antiarrhythmics (dronedaron). [Avoid. Severe] Study

Grapefruit juice increases the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. [Moderate] Study

Grapefruit juice slightly increases the exposure to antiepileptics (carbamazepine). Monitor carbamazepine concentration and adjust dose. [Moderate] Study

Grapefruit juice slightly decreases the exposure to antihistamines, non-sedating (biliastine). Biliastine should be taken 1 hour before or 2 hours after grapefruit juice. [Moderate] Study

Grapefruit juice increases the exposure to antimalarials (atremether). [Unknown] Study

Grapefruit juice is predicted to increase the concentration of antimalarials (piperaquine). [Avoid. Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to axitinib. [Moderate] Theoretical

Grapefruit juice greatly decreases the exposure to beta blockers, selective (celiprolol). [Moderate] Study

Grapefruit juice is predicted to increase the exposure to bosutinib. [Avoid. Moderate] Theoretical

Grapefruit juice increases the exposure to buspirone. [Avoid. Mild] Study

Grapefruit juice is predicted to increase the exposure to cabozantinib. [Moderate] Theoretical

Grapefruit juice very slightly increases the exposure to calcium channel blockers (amlodipine). [Avoid. Mild] Study

Grapefruit juice increases the exposure to calcium channel blockers (felodipine). [Avoid. Moderate] Study

Grapefruit juice is predicted to increase the exposure to calcium channel blockers (lercanidipine). [Avoid. Moderate] Theoretical

Grapefruit juice increases the exposure to calcium channel blockers (nicardipine). [Mild] Study

Grapefruit juice increases the exposure to calcium channel blockers (nifedipine, verapamil). [Avoid. Mild] Study

Grapefruit juice is predicted to increase the exposure to ceritinib. [Avoid. Severe] Theoretical

Grapefruit juice increases the concentration of cyclosporin. [Avoid. Severe] Study

Grapefruit juice markedly decreases the exposure to clopidogrel. [Severe] Study

Grapefruit juice is predicted to increase the exposure to cobicetinib. [Avoid. Severe] Theoretical

Grapefruit juice moderately increases the exposure to oral corticosteroids (budesonide). [Avoid. Moderate] Study

Grapefruit juice is predicted to increase the exposure to crizotinib. [Avoid. Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to darifenacin. [Moderate] Study

Grapefruit juice is predicted to increase the exposure to dasatinib. [Avoid. Moderate] Theoretical

Grapefruit juice is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to ergotamine. [Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to erlotinib. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to everolimus. [Avoid. Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to ibritinib. [Avoid. Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to imatinib. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to ivabradine. [Avoid. Moderate] Study

Grapefruit juice is predicted to increase the exposure to ivacaftor. [Avoid. Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to lapatinib. [Avoid. Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to luridosione. [Avoid. Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to naloxegol. [Avoid. Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to nilotinib. [Avoid. Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to olaparib. [Avoid. Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to palbociclib. [Avoid. Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to pazopanib. [Avoid. Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to phosphodiesterase type-5 inhibitors. Use with caution or avoid. [Moderate] Study

Grapefruit juice increases the exposure to pimozide. [Avoid. Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to ponatinib. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to praziquantel. [Moderate] Study

Grapefruit juice is predicted to increase the exposure to quetiapine. [Avoid. Severe] Theoretical

Grapefruit juice is predicted to increase the concentration of ranolazine. [Avoid. Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to regorafenib. [Avoid. Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to ruxolitinib. [Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to saxagliptin. [Mild] Theoretical

Grapefruit juice increases the concentration of sirolimus. [Avoid. Moderate] Study

Grapefruit juice moderately increases the exposure to SSRIs (sertraline). [Avoid. Moderate] Study

Grapefruit juice increases the exposure to statins (atorvastatin). [Mild] Study

Grapefruit juice increases the exposure to statins (simvastatin). [Avoid. Severe] Study

Grapefruit juice is predicted to increase the exposure to sunitinib. [Avoid. Moderate] Theoretical

Grapefruit juice increases the concentration of tacrolimus. [Avoid. Severe] Study

Grapefruit juice is predicted to increase the concentration of temsirolimus. Use with caution or avoid. [Moderate] Theoretical

Grapefruit juice moderately increases the exposure to ticagrelor. [Moderate] Study

Grapefruit juice is predicted to increase the exposure to crizotinib. [Avoid. Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to darifenacin. [Moderate] Study

Grapefruit juice is predicted to increase the exposure to dasatinib. [Avoid. Moderate] Theoretical

Grapefruit juice is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to ergotamine. [Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to erlotinib. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to everolimus. [Avoid. Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to ibritinib. [Avoid. Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to imatinib. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to ivabradine. [Avoid. Moderate] Study

Grapefruit juice is predicted to increase the exposure to ivacaftor. [Avoid. Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to lapatinib. [Avoid. Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to luridosione. [Avoid. Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to naloxegol. [Avoid. Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to nilotinib. [Avoid. Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to olaparib. [Avoid. Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to palbociclib. [Avoid. Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to pazopanib. [Avoid. Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to phosphodiesterase type-5 inhibitors. Use with caution or avoid. [Moderate] Study

Grapefruit juice increases the exposure to pimozide. [Avoid. Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to ponatinib. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to praziquantel. [Moderate] Study

Grapefruit juice is predicted to increase the exposure to quetiapine. [Avoid. Severe] Theoretical

Grapefruit juice is predicted to increase the concentration of ranolazine. [Avoid. Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to regorafenib. [Avoid. Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to ruxolitinib. [Severe] Theoretical

Grapefruit juice is predicted to increase the exposure to saxagliptin. [Mild] Theoretical

Grapefruit juice increases the concentration of sirolimus. [Avoid. Moderate] Study

Grapefruit juice moderately increases the exposure to SSRIs (sertraline). [Avoid. Moderate] Study

Grapefruit juice increases the exposure to statins (atorvastatin). [Mild] Study

Grapefruit juice increases the exposure to statins (simvastatin). [Avoid. Severe] Study

Grapefruit juice is predicted to increase the exposure to sunitinib. [Avoid. Moderate] Theoretical

Grapefruit juice increases the concentration of tacrolimus. [Avoid. Severe] Study

Grapefruit juice is predicted to increase the concentration of temsirolimus. Use with caution or avoid. [Moderate] Theoretical

Grapefruit juice moderately increases the exposure to ticagrelor. [Moderate] Study
Grapefruit juice — Guanfacine

Grapefruit juice (continued)

- Grapefruit juice increases the exposure to tolvaptan. Avoid.
  [Moderate] Study
- Grapefruit juice is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Theoretical
- Grapefruit juice is predicted to increase the exposure to venetoclax. Avoid. [Severe] Theoretical

Grass pollen extract

GENERAL INFORMATION Desensitising vaccines should be avoided in patients taking beta-blockers (adenaline might be ineffective in case of a hypersensitivity reaction) or ACE inhibitors (risk of severe anaphylactoid reactions).

Grazoprevir

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study
- Bosentan is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study
- Ciclosporin greatly increases the exposure to grazoprevir. Avoid. [Severe] Study
- Cobicitat is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study
- Efavirenz is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study
- Efavirenz is predicted to decrease the exposure to grazoprevir. Avoid. [Mild] Theoretical
- HIV- protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study
- Idelalisib is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study
- Modafinil is predicted to decrease the exposure to grazoprevir. Avoid. [Unknown] Theoretical
- Nevirapine is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to grazoprevir. Avoid. [Severe] Study
- St John’s Wort is predicted to markedly decrease the exposure to grazoprevir. Avoid. [Severe] Study
- Grazoprevir increases the exposure to statins (atorvastatin). Adjust atorvastatin dose, p. 196. [Moderate] Study
- Grazoprevir is predicted to increase the exposure to statins (fluvastatin). Adjust fluvastatin dose, p. 196. [Unknown] Theoretical
- Grazoprevir increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 197. [Moderate] Study
- Grazoprevir is predicted to increase the exposure to statins (simvastatin). Adjust simvastatin dose, p. 198. [Unknown] Theoretical
- Grazoprevir increases the exposure to tacrolimus. [Moderate] Study

Griselofulvin

FOOD AND LIFESTYLE Disulfram-like reaction might occur on consumption of alcohol.

- Antiepileptics (phenobarbital, primidone) decrease the effects of griselofulvin. [Moderate] Study
- Griselofulvin potentially decreases the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- Griselofulvin potentially decreases the anticoagulant effect of coumarins. [Moderate] Anecdotal
- Griselofulvin potentially decreases the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- Griselofulvin decreases the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Moderate] Anecdotal
- Griselofulvin potentially decreases the efficacy of oral levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- Griselofulvin potentially decreases the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- Griselofulvin potentially decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- Guanfacine → see TABLE 8 p. 1265 (hypotension)
- Benperidol is predicted to decrease the efficacy of guanethidine. [Moderate] Theoretical → Also see TABLE 8 p. 1265
- Droperidol is predicted to decrease the efficacy of guanethidine. Monitor and adjust dose. [Moderate] Theoretical → Also see TABLE 8 p. 1265
- Haloperidol is predicted to decrease the antihypertensive effects of guanethidine. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 8 p. 1265
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to decrease the antihypertensive effects of guanethidine. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 8 p. 1265
- Monamine- oxidase A and B inhibitors, reversible are predicted to decrease the antihypertensive effects of guanethidine. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 8 p. 1266
- Guanethidine increases the concentration of sympathomimetics, inotropic (dopamine). [Severe] Theoretical
- Guanethidine is predicted to increase the effects of sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). [Moderate] Study
- Guanethidine increases the effects of sympathomimetics, vasoconstrictor (phenylephrine). [Severe] Study
- Guanethidine increases the effects of sympathomimetics, vasoconstrictor (metaraminol). [Severe] Anecdotal
- Guanethidine increases the effects of sympathomimetics, vasoconstrictor (metaraminol). [Severe] Study → Also see TABLE 8 p. 1265
- Guanethidine → see TABLE 8 p. 1265 (hypotension), TABLE 11 p. 1266 (CNS depressant effects)
- Antiarrhythmics (dronedaron) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Theoretical
- Antiepileptics (oxcarbazepine) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Study
- Aprepitant is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Theoretical
- Bosentan is predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Theoretical → Also see TABLE 8 p. 1265
- Ciclosporin is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Study
- Crizotinib is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Theoretical
- Efavirenz is predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical
Guanfacine — H₂ receptor antagonists

- **Enzalutamide** is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Study
- **Fosaprepitant** is predicted to increase the concentration of guanfacine. [Moderate] Theoretical
- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Study
- **HIV-protease inhibitors (indinavir)** are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Theoretical
- **Idelalisib** is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Study
- **Imatinib** is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Theoretical
- **Macrolides (clarithromycin)** are predicted to decrease the exposure to guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Study
- **Macrolides (erythromycin)** are predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Theoretical
- **Netupitant** is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Theoretical
- **Nevirapine** is predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical
- **Nilotinib** is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Theoretical
- **Rifampicin** is predicted to decrease the concentration of guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Study
- **St John's Wort** is predicted to decrease the concentration of guanfacine. Adjust dose. [Moderate] Theoretical

**H₂ receptor antagonists**

- Cimetidine decreases the clearance of albendazole. [Moderate] Study
- Cimetidine decreases the concentration of aminophylline. Adjust dose. [Severe] Study
- Cimetidine slightly increases the exposure to anthracyclines (epirubicin). Avoid. [Moderate] Study
- Cimetidine increases the exposure to antihistamines (aminadorene). [Moderate] Study
- Cimetidine slightly increases the exposure to antihistamines (flecainide). Monitor and adjust dose. [Mild] Study
- Cimetidine increases the exposure to antihistamines (lidocaine). Monitor and adjust dose. [Moderate] Study
- Cimetidine is predicted to increase the exposure to antihistamines (propafenone). Monitor and adjust dose. [Moderate] Theoretical
- Cimetidine transiently increases the concentration of antiepileptics (carbamazepine). [Moderate] Study
- Cimetidine increases the concentration of antiepileptics (fosphenytoin). Monitor phenytoin concentration and adjust dose. [Severe] Study
- Cimetidine increases the concentration of antiepileptics (phenytoin). Monitor phenytoin concentration and adjust dose. [Severe] Study
- H₂ receptor antagonists are predicted to decrease the absorption of antifungals, azoles (itraconazole). Administer itraconazole capsules with an acidic beverage. [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the absorption of antifungals, azoles (ketoconazole). Administer ketoconazole with an acidic beverage. [Moderate] Study
- H₂ receptor antagonists are predicted to slightly decrease the exposure to antifungals, azoles (posaconazole). Avoid use of posaconazole oral suspension. [Moderate] Study
- Cimetidine decreases the clearance of antimalarials (chloroquine). [Moderate] Study
- Cimetidine slightly increases the exposure to antimalarials (quinine). [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the absorption of bosutinib. [Moderate] Theoretical
- Cimetidine slightly increases the exposure to calcium channel blockers (diltiazem, isradipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Cimetidine (high-dose) is predicted to increase the exposure to calcium channel blockers (lercanidipine). [Moderate] Theoretical
- Cimetidine moderately increases the exposure to calcium channel blockers (nifedipine). Monitor and adjust dose. [Severe] Study
- Cimetidine increases the exposure to calcium channel blockers (verapamil). [Moderate] Study
- Cimetidine is predicted to slightly increase the exposure to capcetibine. [Severe] Theoretical
- H₂ receptor antagonists are predicted to decrease the absorption of ceritinib. [Moderate] Theoretical
- Cimetidine increases the concentration of ciclosporin. [Mild] Study
- Cimetidine increases the anticoagulant effect of coumarins. [Severe] Study
- H₂ receptor antagonists are predicted to decrease the exposure to dabrafenib. Avoid. [Severe] Theoretical
- H₂ receptor antagonists are predicted to decrease the exposure to dasatinib. Avoid. [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the absorption of dipridamole (immediate release tablets). [Moderate] Theoretical
- Cimetidine slightly increases the exposure to dopamine receptor antagonists (pramipexole). Adjust dose. [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical
- H₂ receptor antagonists decrease the exposure to HIV-protease inhibitors (atazanavir). Monitor and adjust dose. [Moderate] Study
- Cimetidine is predicted to decrease the clearance of hydroxychloroquine. [Moderate] Theoretical
- H₂ receptor antagonists are predicted to decrease the absorption of lapatinib. Avoid. [Moderate] Theoretical
- H₂ receptor antagonists are predicted to decrease the exposure to ledipasvir. Adjust dose, see sofosbuvir with ledipasvir p. 596. [Moderate] Study
- H₂ receptor antagonists (cimetidine, ranitidine) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Lumacaftor is predicted to affect the exposure to ranitidine. Monitor and adjust dose. [Moderate] Theoretical
- Cimetidine slightly increases the exposure to macrolides (erythromycin). [Moderate] Study
- Cimetidine increases the concentration of mebendazole. [Moderate] Study
- Cimetidine slightly increases the exposure to metformin. Monitor and adjust dose. [Moderate] Study
- Cimetidine slightly increases the exposure to mirtazapine. Use with caution and adjust dose. [Moderate] Theoretical
- Cimetidine increases the exposure to moclubebide. Adjust moclubebide dose, p. 346. [Mild] Study
- H₂ receptor antagonists are predicted to decrease the absorption of nilotinib. H₂ receptor antagonists should be taken 10 hours before or 2 hours after nilotinib. [Mild] Theoretical
- Cimetidine increases the concentration of opioids (alfentanil). Use with caution and adjust dose. [Severe] Study
- Cimetidine increases the exposure to opioids (fentanyl). [Moderate] Study
- H₂ receptor antagonists are predicted to decrease the exposure to pazopanib. H₂ receptor antagonists should be taken 10 hours before or 2 hours after pazopanib. [Moderate] Theoretical
- Cimetidine increases the exposure to phenindione. [Severe] Anecdotal
- Cimetidine moderately increases the exposure to praziquantel. [Moderate] Study
H₂ receptor antagonists (continued)

- H₂ receptor antagonists are predicted to decrease the exposure to rifampirin. H₂ receptor antagonists should be taken 12 hours before or 4 hours after rifampirin. [Severe] Study
- Cimetidine slightly increases the exposure to rofumilast. [Moderate] Study
- H₂ receptor antagonists potentially decrease the exposure to sofosbuvir. Adjust dose, see sofosbuvir with ledipasvir and sofosbuvir with velpatasvir p. 596. [Moderate] Study
- Cimetidine slightly increases the exposure to SSRI (citalopram, escitalopram). Adjust dose. [Moderate] Study
- Cimetidine slightly increases the exposure to SSRI (paroxetine, sertraline). [Moderate] Study
- Cimetidine is predicted to increase the risk of toxicity when given with abacavir. [Severe] Theoretical
- Cimetidine increases the concentration of theophylline. Adjust dose. [Severe] Study
- Cimetidine increases the exposure to tricyclic antidepressants. [Moderate] Study
- Haloperidol are predicted to decrease the concentration of velpatasvir. Adjust dose, see sofosbuvir with velpatasvir p. 596. [Moderate] Study
- Cimetidine slightly increases the exposure to venlafaxine. [Mild] Study
- Cimetidine slightly increases the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 456. [Mild] Study

**Haloperidol** → see TABLE 8 p. 1265 (hypotension), TABLE 9 p. 1266 (QT interval prolongation), TABLE 10 p. 1266 (CNS depressant effects), TABLE 10 p. 1266 (antimuscarinics)

**FOOD AND LIFESTYLE** Dose adjustment might be necessary if smoking started or stopped during treatment.

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of haloperidol. Adjust dose. [Moderate] Study → also see TABLE 11 p. 1266
- Haloperidol potentially increases the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. [Severe] Theoretical
- Antifungals, azoles (itraconazole) increase the concentration of haloperidol. [Moderate] Study
- Haloperidol is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → also see TABLE 8 p. 1265 → also see TABLE 9 p. 1266 → also see TABLE 10 p. 1266
- Enzalutamide decreases the concentration of haloperidol. Adjust dose. [Moderate] Study
- Haloperidol is predicted to decrease the antihypertensive effects of guanethidine. Monitor and adjust dose. [Moderate] Theoretical → also see TABLE 8 p. 1265
- HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to haloperidol. [Severe] Theoretical
- Haloperidol decreases the effects of levodopa. [Severe] Study → also see TABLE 8 p. 1265
- Rifampicin decreases the concentration of haloperidol. Adjust dose. [Moderate] Study
- Haloperidol is predicted to decrease the antihypertensive effects of sodium phenytoibutyrate. [Moderate] Anecdotal
- SSRIs (fluoxetine) increase the concentration of haloperidol. Adjust dose. [Moderate] Anecdotal
- SSRIs (fluvoxamine) increase the concentration of haloperidol. Adjust dose. [Moderate] Study
- Venlafaxine slightly increases the exposure to haloperidol. [Severe] Study → also see TABLE 9 p. 1266 → also see TABLE 11 p. 1266

**Heparin (unfractionated)** → see TABLE 16 p. 1268 (increased serum potassium), TABLE 3 p. 1264 (anticoagulant effects)
- Ranibizumab increases the risk of bleeding events when given with heparin (unfractionated). [Severe] Theoretical

**Histamine** → see TABLE 8 p. 1265 (hypotension)

- Antihistamines, non-sedating are predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical
- Antihistamines, sedating are predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical
- Antimalarials (artemether, atovaquone, chloroquine, mefloquine, primaquine, proguaoin, pyrimethamine, quinine) are predicted to affect the exposure to histamine. Avoid. [Severe] Theoretical
- Clonidine is predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → also see TABLE 8 p. 1265
- Clozapine is predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → also see TABLE 8 p. 1265
- Corticosteroids are predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical
- H₂ receptor antagonists are predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to affect the exposure to histamine. Avoid. [Severe] Theoretical → also see TABLE 8 p. 1265
- Olanzapine is predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → also see TABLE 8 p. 1265
- Phenothiazines are predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → also see TABLE 8 p. 1265
- Quetiapine is predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → also see TABLE 8 p. 1265
- Risperidone is predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → also see TABLE 8 p. 1265
- Tricyclic antidepressants are predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → also see TABLE 8 p. 1265
- Zuclopenthixol is predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → also see TABLE 8 p. 1265

**HIV-protease inhibitors** → see TABLE 9 p. 1266 (QT-interval prolongation)

- atazanavir - darunavir - fosamprenavir - indinavir - lopinavir - ritonavir - saquinavir - tipranavir

- Caution on concurrent use of atazanavir, lopinavir with ritonavir, or ritonavir with drugs that prolong the PR interval.
- Concurrent use of saquinavir with drugs that prolong the PR interval is contra-indicated.
- Caution with concurrent use of tipranavir with drugs that increase risk of bleeding.

- Tipranavir slightly decreases the exposure to abacavir. Avoid. [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to abiraterone. [Severe] Theoretical
- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to amlodipine. Separate administration by 12 hours. [Moderate] Study
- Ritonavir is predicted to decrease the exposure to agomelatine. [Moderate] Theoretical
- Ritonavir decreases the exposure to albendazole. [Moderate] Study
- Indinavir is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 185. [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to aldosterone antagonists (eplerenone). Avoid. [Severe] Study
- HIV-protease inhibitors (ritonavir, saquinavir) are predicted to increase the exposure to aliskiren. [Moderate] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) increase the exposure to almitrine. [Mild] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to alpha blockers (doxazosin). [Moderate] Study
- Indinavir is predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to alprazolam. Avoid. [Moderate] Study
- Indinavir is predicted to increase the exposure to alprazolam. [Severe] Study
HIV-protease inhibitors (ritonavir, tipranavir) are predicted to increase the exposure to amfetamines. **Severe** Theoretical

- **Ritonavir** decreases the exposure to aminophylline. Adjust dose. **Moderate** Study

- **Antacids** are predicted to decrease the absorption of atazanavir. **Severe** Theoretical

- **HIV-protease inhibitors** are predicted to increase the exposure to antifungals (azoles, fluconazole). Use with caution and adjust dose. **Moderate** Study

- **Indinavir** is predicted to increase the exposure to antifungals (valproate). **Severe** Anecdotal

- Antifungals, azoles (fluconazole) slightly increase the exposure to tipranavir. Avoid or adjust dose. **Moderate** Study

- **HIV-protease inhibitors** are predicted to increase the concentration of HIV-protease inhibitors. **Severe** Theoretical

- **Ritonavir** is predicted to decrease the absorption of tipranavir. **Severely** Theoretical

- **HIV-protease inhibitors** are predicted to increase the exposure to antifungals (azoles, ketoconazole). Use with caution and adjust dose. **Moderate** Study

- **HIV-protease inhibitors** are predicted to increase the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (itraconazole) potentially affect the exposure to HIV-protease inhibitors. **Severe** Study → Also see **TABLE 9** p. 1266

- **Indinavir** is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). **Severe** Theoretical

- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to antimalarials (mefloquine) with lumefantrine. **Moderate** Study → Also see **TABLE 9** p. 1266

- **HIV-protease inhibitors** decrease the exposure to antimalarials (atovaquone). Avoid if boosted with ritonavir. **Moderate** Study

- **HIV-protease inhibitors** are predicted to increase the concentration of antimalarials (piperaquine). **Severe** Theoretical

- **HIV-protease inhibitors** are predicted to decrease the exposure to antimalarials (proguanil). **Avoid**. **Moderate** Study

- **HIV-protease inhibitors** are predicted to affect the exposure to antimalarials (quinine). **Severe** Study → Also see **TABLE 9** p. 1266

- **Ritonavir** is predicted to increase the exposure to apixaban. **Avoid**. **Severe** Theoretical

- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to affect the exposure to antiepileptics (carbamazepine) and antiepileptics (carbamazepine) are predicted to decrease the exposure to HIV-protease inhibitors. **Moderate** Theoretical

- **HIV-protease inhibitors** are predicted to affect the exposure to antiepileptics (fosphenytoin, phenytoin) and antiepileptics (fosphenytoin, phenytoin) decrease the concentration of HIV-protease inhibitors. **Severe** Theoretical

- **Ritonavir** slightly decreases the exposure to antiepileptics (lamotrigine). **Severe** Study

- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to slightly increase the exposure to antiepileptics (perampanel). **Mild** Study

- **HIV-protease inhibitors** are predicted to affect the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) are predicted to decrease the concentration of HIV-protease inhibitors. **Severe** Theoretical

- **Ritonavir** is predicted to decrease the concentration of antiepileptics (valproate). **Severe** Anecdotal

- **Antifungals, azoles (fluconazole)** slightly increase the exposure to tipranavir. Avoid or adjust dose. **Moderate** Study

- **Antifungals, azoles (miconazole)** are predicted to increase the concentration of HIV-protease inhibitors. Use with caution and adjust dose. **Moderate** Theoretical

- **Antifungals, azoles (posaconazole)** are predicted to increase the exposure to HIV-protease inhibitors. **Moderate** Study

- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or monitor side effects. **Severe** Study

- **HIV-protease inhibitors** are predicted to increase the exposure to antifungals, azoles (itraconazole). Use with caution and adjust dose. **Moderate** Study

- **HIV-protease inhibitors** are predicted to increase the exposure to antifungals, azoles (ketoconazole). Use with caution and adjust dose. **Moderate** Study

- **HIV-protease inhibitors** are predicted to increase the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (itraconazole) are predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or monitor side effects. **Severe** Study
HIV-protease inhibitors (continued)

- Indinavir is predicted to increase the exposure to cobicistat.  [Moderate] Study
- Ritonavir is predicted to moderately increase the clearance of cobicistat. Monitor and adjust dose.  [Moderate] Study
- HIV-protease inhibitors are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose.  [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to calcium channel blockers (eriocandine). Avoid.  [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to calcium channel blockers (eriocandine). Avoid.  [Severe] Study

Modular protease inhibitors increase the concentration of ciclosporin.  [Severe] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to ciclosporin. Adjust ciclosporin dose, p. 1020.  [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to ciclosporin. Adjust ciclosporin dose.  [Moderate] Study
- Indinavir is predicted to increase the exposure to ciclosporin. Avoid.  [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to ciclosporin. Avoid or monitor for toxicity.  [Severe] Study
- Indinavir is predicted to increase the exposure to cobicistat. Avoid.  [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to cobicistat. Avoid or monitor for toxicity.  [Severe] Study
- Indinavir is predicted to increase the exposure to cobicistat. Avoid.  [Severe] Study
- Atazanavir (unboosted) increases the exposure to combined hormonal contraceptives. Adjust dose.  [Severe] Study
- Ritonavir is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 747.  [Severe] Study
- Ritonavir is predicted to increase the concentration of corticosteroids (beclometasone) (risk with beclometasone is likely to be lower than with other corticosteroids). MHRA advises avoid or monitor for beclometasone side effects.  [Moderate] Study
- Ritonavir is predicted to increase the concentration of corticosteroids (betamethasone, budesonide, deflazacort, dexamethasone, hydrocortisone, methylprednisolone, prednisolone, prednisone, triamcinolone). MHRA advises avoid or monitor for beclometasone side effects.  [Moderate] Study
- Ritonavir is predicted to increase the concentration of corticosteroids (budesonide). MHRA advises avoid or monitor side effects and consider beclometasone as an alternative.  [Severe] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) are predicted to increase the exposure to corticosteroids (budesonide). Avoid.  [Severe] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to corticosteroids (budesonide). Avoid.  [Severe] Study
- Indinavir is predicted to increase the exposure to corticosteroids (ciclesonide). Avoid.  [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) are predicted to increase the exposure to corticosteroids (dexamethasone, methylprednisolone). Monitor and adjust dose.  [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to corticosteroids (fluticasone).  [Severe] Study
- Indinavir is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose.  [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to corticosteroids (mometasone).  [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) are predicted to increase the risk of side-effects when given with corticosteroids (triamcinolone).  [Severe] Study
- HIV-protease inhibitors are predicted to affect the anticoagulant effect of coumarins.  [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to dabrafenib. Use with caution or avoid.  [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to dabrafenib. Adjust dabrafenib dose, p. 591.  [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to dabrafenib. Adjust dabrafenib dose, p. 591.  [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to dabrafenib. Adjust dabrafenib dose.  [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to dabrafenib. Adjust dabrafenib dose.  [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to dabrafenib. Adjust dabrafenib dose.  [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) very slightly increase the exposure to delamanid.  [Severe] Study
- Ritonavir is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 747.  [Severe] Study
- Ritonavir is predicted to increase the exposure to diazepam. Avoid.  [Moderate] Study
- Didanosine (buffered) decreases the exposure to atazanavir. Didanosine should be taken 2 hours after atazanavir.  [Severe] Study
- Didanosine (buffered) is predicted to decrease the exposure to darunavir (boosted with ritonavir). Didanosine should be taken 1 hour before or 2 hours after darunavir.  [Moderate] Study
- Didanosine (buffered) decreases the exposure to indinavir. Separate administration by 1 hour.  [Severe] Study
- Tipranavir decreases the exposure to didanosine. Separate administration by 2 hours.  [Moderate] Study
- Ritonavir increases the concentration of digoxin. Adjust dose and monitor concentration.  [Severe] Study

HIV-protease inhibitors — HIV-protease inhibitors

BNF 74

A1
HIV-protease inhibitors — HIV-protease inhibitors

- **Fosamprenavir** (boosted with ritonavir) slightly decreases the exposure to **dolutegravir**. Avoid if resistant to HIV-integrase inhibitors. [Severe] Study

- **Tipranavir** moderately decreases the exposure to **dolutegravir**. Refer to specialist literature. [Severe] Study

- HIV-protease inhibitors increase the risk of QT-prolongation when given with **dopemidine**. Avoid. [Severe] Study

- **Indinavir** is predicted to increase the exposure to dopamine receptor agonists **(bromocriptine, cabergoline)**. [Severe] Theoretical

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** increase the exposure to dopamine receptor agonists **(bromocriptine, cabergoline)**. [Severe] Study

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to **elbasvir**. Avoid. [Moderate] Study

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to markedly increase the exposure to **elvitegravir**. Avoid. [Severe] Study

- **Atazanavir** increases the concentration of **elvitegravir**. Refer to specialist literature. [Moderate] Study

- **Lopinavir** increases the concentration of **elvitegravir**. Refer to specialist literature. [Moderate] Study

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Study

- **Indinavir** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical

- **Indinavir** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Theoretical

- **Indinavir** is predicted to increase the risk of ergotism when given with **ergotamine**. [Severe] Theoretical

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the risk of ergotism when given with **ergotamine**. Avoid. [Severe] Study

- **Indinavir** is predicted to increase the exposure to **erlotinib**. [Moderate] Theoretical

- **Ritonavir** is predicted to decrease the efficacy of **etanercept**. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Study

- **Etravirine** increases the exposure to **fosamprenavir** (boosted with ritonavir). Refer to specialist literature. [Moderate] Study

- **Etravirine** is predicted to decrease the exposure to **indinavir**. [Moderate] Study

- **Tipranavir** decreases the exposure to **etravirine**. Avoid. [Severe] Study

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the concentration of **everolimus**. Avoid. [Severe] Study

- **Indinavir** is predicted to increase the concentration of **everolimus**. Avoid or adjust dose. [Moderate] Study

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to moderately increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose; avoid in hepatic and renal impairment, p. 732. [Severe] Study

- **Indinavir** is predicted to increase the exposure to **fesoterodine**. Adjust **fesoterodine** dose in hepatic and renal impairment, p. 732. [Mild] Study

- HIV-protease inhibitors **(lopinavir, ritonavir, saquinavir)** are predicted to increase the exposure to **fidaxomycin**. Avoid. [Severe] Study

- **Ritonavir** is predicted to increase the exposure to **flurazepam**. Avoid. [Moderate] Theoretical

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to **fosaprepitant**. [Moderate] Theoretical

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to **gefitinib**. [Moderate] Study

- **Indinavir** is predicted to increase the exposure to **gefitinib**. [Moderate] Theoretical

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to moderately to markedly increase the exposure to **grazoprevir**. Avoid. [Severe] Study

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to **guanfacine**. Adjust **guanfacine** dose, p. 335. [Moderate] Study

- **Indinavir** is predicted to increase the concentration of **guanfacine**. Adjust **guanfacine** dose, p. 335. [Moderate] Theoretical

- **H₂ receptor antagonists** decrease the exposure to **atazanavir**. Monitor and adjust dose. [Moderate] Study

- **Ritonavir** is predicted to increase the exposure to **haloperidol**. [Severe] Theoretical

- **Ritonavir** is predicted to decrease the effects of **Hormone replacement therapy**. [Moderate] Anecdotal

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to very markedly increase the exposure to **ibrutinib**. Avoid or adjust **ibrutinib** dose, p. 902. [Severe] Study

- **Indinavir** is predicted to increase the exposure to **ibrutinib**. Avoid or adjust **ibrutinib** dose, p. 902. [Severe] Theoretical

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to **imatinib**. [Moderate] Study

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the risk of toxicity when given with **irinotecan**. Avoid. [Moderate] Study

- **Ritonavir** is predicted to decrease the exposure to **iron chelators** (deferasirox). Monitor serum ferritin and adjust dose. [Moderate] Theoretical

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** or lumacaftor with ivacaftor dose, p. 281. [Severe] Study

- **Indinavir** is predicted to increase the exposure to **ivacaftor**. Adjust **ivacaftor** dose, p. 281. [Severe] Study

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to **ivabradine**. Avoid. [Severe] Study

- **Indinavir** increases the exposure to **ivabradine**. Adjust dose. [Severe] Theoretical

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to **ivacaftror** or lumacaftor with ivacaftor dose. Also see TABLE 9 p. 1266

- **Indinavir** is predicted to increase the exposure to **lapiatinib**. [Moderate] Study

- **Ritonavir** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to **lapiatinib**. Avoid. [Moderate] Study

- **Indinavir** is predicted to increase the exposure to **lapiatinib**. Avoid. [Moderate] Theoretical

- **Ritonavir** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical

- HIV-protease inhibitors **(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to moderately increase the exposure to **lomitapide**. Avoid. [Severe] Study

- **Indinavir** is predicted to increase the exposure to **lomitapide**. Avoid. [Moderate] Theoretical

Downloaded from www.medicalbr.com on 2023-11-25.
HIV-protease inhibitors (continued)

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to lurasidone. Avoid. [Severe] Study

- Indinavir is predicted to increase the exposure to lurasidone. [Moderate] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to macitentan. [Moderate] Study

- Macrolides (clarithromycin) increase the exposure to saquinavir and saquinavir increases the exposure to macrolides (clarithromycin). Avoid. [Severe] Study → Also see TABLE 9 p. 1266

- Macrolides (erythromycin) are predicted to increase the exposure to saquinavir. Avoid. [Severe] Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir) increase the exposure to maraviroc. Refer to specialist literature. [Severe] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to midazolam. Avoid or adjust midazolam dose. [Severe] Study

- Indinavir is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 736. [Moderate] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to mirtazapine. [Moderate] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to modafinil. [Mild] Theoretical

- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the risk of neutropenia when given with monoclonal antibodies (brentuximab vedotin). Monitor and adjust dose. [Severe] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. [Severe] Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to naxolegol. Avoid. [Severe] Study

- Indinavir is predicted to increase the exposure to naxolegol. Adjust naxolegol dose and monitor side effects, p. 63. [Mild] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to netupitant. [Mild] Study

- Nevirapine decreases the exposure to HIV-protease inhibitors. Refer to specialist literature. [Moderate] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to nilotinib. Avoid. [Severe] Study → Also see TABLE 9 p. 1266

- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to nintedanib. [Moderate] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to nitisine. Adjust nitisine dose. [Moderate] Theoretical

- Ritonavir is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal

- Ritonavir moderately decreases the exposure to olanzapine. [Moderate] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Study

- Indinavir is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Theoretical

- Indinavir is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. [Severe] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to opioids (methadone). [Mild] Study

- Indinavir is predicted to increase the exposure to opioids (morphine). [Moderate] Theoretical

- Ritonavir is predicted to decrease the concentration of opioids (morphine). [Moderate] Theoretical

- Ritonavir increases the risk of CNS toxicity when given with opioids (pethidine). Avoid. [Severe] Study

- Ritonavir is predicted to decrease the efficacy of opioids (tramadol). [Moderate] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to oxycodyn. [Mild] Study

- Indinavir is predicted to increase the exposure to oxycodyn. [Mild] Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose, p. 909. [Severe] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 864. [Moderate] Study → Also see TABLE 9 p. 1266

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to paritaprevir with ritonavir and ombitasvir. Avoid. [Severe] Theoretical

- Indinavir potentially increases the exposure to paritaprevir. Avoid. [Severe] Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose, p. 909. [Moderate] Study → Also see TABLE 9 p. 1266

- Indinavir is predicted to increase the exposure to pazopanib. [Moderate] Theoretical

- Indinavir is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 785. [Moderate] Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study → Also see TABLE 9 p. 1266

- Indinavir is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor and adjust sildenafil dose, p. 766. [Moderate] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid or adjust sildenafil dose, p. 766. [Severe] Study → Also see TABLE 9 p. 1266

- Indinavir is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). [Severe] Theoretical
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. (Severe) Study

Indinavir is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. (Severe) Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to pimozide. Avoid. (Severe) Study  Also see TABLE 9 p. 1266

Indinavir is predicted to increase the exposure to pimozide. Avoid. (Severe) Theoretical

Ritonavir is predicted to decrease the exposure to pirfenidone. Avoid. (Moderate) Theoretical

Ritonavir is predicted to increase the exposure to pitolisant. Use with caution and adjust dose. (Moderate) Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose. (Moderate) Study

Ritonavir is predicted to increase the exposure to raltegravir. (Moderate) Study

Fosamprenavir (boosted with ritonavir) decreases the exposure to raltegravir and raltegravir decreases the exposure to fosamprenavir (boosted with ritonavir). Avoid. (Severe) Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to quetiapine. Avoid. (Severe) Study

Indinavir is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study

Darunavir increases the risk of rash when given with raltegravir. (Moderate) Study

Fosamprenavir (boosted with ritonavir) decreases the exposure to raltegravir and raltegravir decreases the exposure to fosamprenavir (boosted with ritonavir). Avoid. (Severe) Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to ranolazine. Avoid. (Severe) Study  Also see TABLE 9 p. 1266

Indinavir is predicted to increase the exposure to ranolazine. (Severe) Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to reboxetine. Avoid. (Moderate) Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to regorafenib. Avoid. (Moderate) Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to repaglinide. (Moderate) Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to retinooids (alitretinoin). Adjust alitretinoin dose, p. 1557. (Moderate) Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) increase the exposure to rifabutin. Monitor and adjust dose. (Severe) Study

Indinavir increases the exposure to rifabutin and rifabutin decreases the exposure to indinavir. Avoid. (Severe) Study

Ritonavir markedly increases the exposure to rifabutin. Avoid or adjust dose. (Severe) Study

Rifampicin is predicted to moderately to markedly decrease the exposure to HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir). Avoid. (Severe) Study

Rifampicin slightly decreases the exposure to ritonavir. Avoid. (Moderate) Theoretical

Ritonavir is predicted to increase the exposure to riociguat. Avoid. (Severe) Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to risperidone. Adjust dose. (Moderate) Study  Also see TABLE 9 p. 1266

Ritonavir moderately increases the exposure to rivaroxaban. Avoid. (Severe) Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. (Moderate) Study

Indinavir is predicted to increase the exposure to ruxolitinib. (Moderate) Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to simeprevir. Avoid. (Severe) Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the concentration of sirolimus. Avoid. (Severe) Study

Indinavir increases the concentration of sirolimus. Monitor and adjust dose. (Moderate) Study

Tipranavir is predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment, p. 734, p. 740. (Severe) Study

Indinavir is predicted to increase the exposure to SSI Rs. (dapoxetine). Adjust dapoxetine dose, p. 773. (Moderate) Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to SSI Rs. (dopoxetine). Avoid, or adjust dapoxetine dose, p. 773. (Severe) Study

St John’s Wort is predicted to decrease the exposure to HIV-protease inhibitors. Avoid. (Severe) Study

Indinavir is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. (Severe) Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. (Severe) Study

HIV-protease inhibitors slightly to moderately increase the exposure to statins (rosuvastatin). Avoid or adjust dose. (Severe) Study

Indinavir is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 198. (Severe) Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to statins (simvastatin). Avoid or adjust dose and monitor rhabdomyolysis. (Severe) Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to statins (simvastatin). Avoid. (Severe) Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 914. (Moderate) Study  Also see TABLE 9 p. 1266

Indinavir is predicted to increase the exposure to sunitinib. (Moderate) Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. (Severe) Study

Indinavir is predicted to increase the concentration of tacrolimus. (Severe) Study

Indinavir is predicted to increase the exposure to taxanes (cabazitaxel). (Moderate) Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to taxanes (cabazitaxel). Avoid. (Severe) Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to
HIV-protease inhibitors (continued) moderately increase the exposure to taxanes (docetaxel). Avoid or adjust dose. (Severe) Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to taxanes (paclitaxel). (Severe) Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the concentration of temsirolimus. Avoid. (Severe) Theoretical

- Indinavir is predicted to increase the concentration of temsirolimus. (Moderate) Theoretical

- Ritonavir is predicted to decrease the exposure to theophylline. Adjust dose. (Moderate) Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to ticagrelor. Avoid. (Severe) Study

- Ritonavir moderately decreases the exposure to tizanidine. (Mild) Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to tolterodine. Avoid. (Severe) Study Also see TABLE 9 p. 1266

- Indinavir is predicted to increase the exposure to tolterodine. Adjust dose. (Mild) Study

- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to troleifene. (Moderate) Theoretical Also see TABLE 9 p. 1266

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to trabectedin. Avoid or adjust dose. (Severe) Study

- HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the concentration of trametinib. (Moderate) Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. (Moderate) Study

- Indinavir is predicted to increase the exposure to trazodone. (Moderate) Theoretical

- HIV-protease inhibitors (ritonavir, tipranavir) are predicted to increase the exposure to trycyclic antidepressants. (Moderate) Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Severe) Study

- Indinavir is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. (Moderate) Study

- Ritonavir decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 747. (Severe) Aneodctal

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to vemurafenib. (Severe) Theoretical Also see TABLE 9 p. 1266

- HIV-protease inhibitors are predicted to increase the exposure to venoconax. Avoid or adjust venoconax dose, p. 919. (Severe) Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to venlafaxine. (Moderate) Study Also see TABLE 9 p. 1266

- HIV-protease inhibitors are predicted to increase the exposure to vinca alkaloids. (Severe) Theoretical Also see TABLE 9 p. 1266

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to vitamin D substances (paricalcitol). (Moderate) Study

- Tipranavir slightly decreases the exposure to zidovudine. Avoid. (Moderate) Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to zopiclone. Adjust dose. (Moderate) Theoretical

- Indinavir is predicted to increase the exposure to zopiclone. Adjust dose. (Moderate) Study

Hormone replacement therapy

- Antiepileptics (carbamazepine, felbamate, lamotrigine, fosphenytoin, oxcarbazepine, perampanel, pheonobarbital, phenytoin, primidone, rufinamide, topiramate) are predicted to decrease the effects of Hormone replacement therapy. (Moderate) Aneodctal

- Hormone replacement therapy is predicted to alter the exposure to antiepileptics (lamotrigine). (Moderate) Theoretical

- Aprepitant is predicted to decrease the effects of Hormone replacement therapy. (Moderate) Aneodctal

- Bosentan is predicted to decrease the effects of Hormone replacement therapy. (Moderate) Aneodctal

- Hormone replacement therapy decreases the clearance of dopamine receptor agonists (ropinirole). Monitor and adjust dose. (Moderate) Study

- Efavirenz is predicted to decrease the effects of Hormone replacement therapy. (Moderate) Aneodctal

- Fosaprepitant is predicted to decrease the effects of Hormone replacement therapy. (Moderate) Aneodctal

- HIV-protease inhibitors (ritonavir) are predicted to decrease the effects of Hormone replacement therapy. (Moderate) Aneodctal

- Hormone replacement therapy is predicted to increase the risk of venous thromboembolism when given with lenalidomide. (Severe) Theoretical

- Oral Hormone replacement therapy is predicted to decrease the effects of levothyroxine. (Moderate) Theoretical

- Oral Hormone replacement therapy is predicted to decrease the effects of lithium. (Moderate) Theoretical

- Modafinil is predicted to decrease the effects of Hormone replacement therapy. (Moderate) Aneodctal

- Hormone replacement therapy is predicted to increase the risk of venous thromboembolism when given with pomalidomide. (Severe) Theoretical

- Rifabutin is predicted to decrease the effects of Hormone replacement therapy. (Moderate) Aneodctal

- Rifampicin is predicted to decrease the effects of Hormone replacement therapy. (Moderate) Aneodctal

- St John's Wort is predicted to decrease the efficacy of Hormone replacement therapy. (Moderate) Theoretical

- Hormone replacement therapy is predicted to increase the risk of venous thromboembolism when given with thalidomide. (Severe) Theoretical

- Hydralazine → see TABLE 8 p. 1265 (hypotension)

- Diazoxide increases the risk of severe hypotension when given with hydralazine. (Severe) Study Also see TABLE 8 p. 1265

- Hydrochlorothiazide → see thiazide diuretics

- Hydrocortisone → see corticosteroids

- Hydroflumethiazide → see thiazide diuretics

- Hydromorphone → see opioids

- Hydroxybenzoic acid (e.g. hydroxydecanoic acid) increases the risk of toxicity when given with didanosine. Avoid. (Severe) Study

- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with hydroxyurea. Public Health England advises avoid. (Severe) Theoretical
Hydroxycarbamide — Idelalisib 1349

BNF 74

Theoretical
▶

Hydroxychloroquine is predicted to increase the risk of
haematological toxicity when given with penicillamine. Avoid.
r Theoretical

Hydroxychloroquine is predicted to decrease efﬁcacy rabies
vaccine. o Theoretical
Hydroxyzine → see antihistamines, sedating
Hyoscine → see TABLE 10 p. 1266 (antimuscarinics)
Ibandronic acid → see bisphosphonates
Ibrutinib → see TABLE 15 p. 1267 (myelosuppression), TABLE 4 p. 1264
▶

Macrolides (clarithromycin) are predicted to very markedly
increase the exposure to ibrutinib. Avoid or adjust ibrutinib
dose, p. 902. r Study
▶ Macrolides (erythromycin) are predicted to increase the
exposure to ibrutinib. Avoid or adjust ibrutinib dose, p. 902.
▶

r Theoretical
▶
▶

see TABLE 15 p. 1267
▶

(Seville) oranges as they are predicted to increase the
exposure to ibrutinib.
▶

Antiarrhythmics (dronedarone) are predicted to increase the
exposure to ibrutinib. Avoid or adjust ibrutinib dose, p. 902.
r Theoretical

▶

▶
▶

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital,
phenytoin, primidone) are predicted to decrease the exposure
to ibrutinib. Avoid. r Study
Antifungals, azoles (fluconazole, isavuconazole, posaconazole)
are predicted to increase the exposure to ibrutinib. Avoid or
adjust ibrutinib dose, p. 902. r Theoretical
Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are
predicted to very markedly increase the exposure to ibrutinib.
Avoid or adjust ibrutinib dose, p. 902. r Study
Aprepitant is predicted to increase the exposure to ibrutinib.
Avoid or adjust ibrutinib dose, p. 902. r Theoretical
Calcium channel blockers (diltiazem, verapamil) are predicted to
increase the exposure to ibrutinib. Avoid or adjust ibrutinib
dose, p. 902. r Theoretical
Cobicistat is predicted to very markedly increase the exposure
to ibrutinib. Avoid or adjust ibrutinib dose, p. 902. r Study
Crizotinib is predicted to increase the exposure to ibrutinib.
Avoid or adjust ibrutinib dose, p. 902. r Theoretical → Also
see TABLE 15 p. 1267

▶
▶
▶
▶

▶

Enzalutamide is predicted to decrease the exposure to
ibrutinib. Avoid. r Study
Fosaprepitant is predicted to slightly increase the exposure to
ibrutinib. o Theoretical
Grapefruit juice is predicted to increase the exposure to
ibrutinib. Avoid. o Theoretical
HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir,
lopinavir, ritonavir, saquinavir, tipranavir) are predicted to very
markedly increase the exposure to ibrutinib. Avoid or adjust
ibrutinib dose, p. 902. r Study
HIV-protease inhibitors (indinavir) are predicted to increase the
exposure to ibrutinib. Avoid or adjust ibrutinib dose, p. 902.
r Theoretical

▶

▶

Idelalisib is predicted to very markedly increase the exposure
to ibrutinib. Avoid or adjust ibrutinib dose, p. 902. r
Study → Also see TABLE 15 p. 1267
Imatinib is predicted to increase the exposure to ibrutinib.
Avoid or adjust ibrutinib dose, p. 902. r Theoretical → Also
see TABLE 15 p. 1267

Quinolones (ciprofloxacin) are predicted to increase the
exposure to ibrutinib. Avoid or adjust ibrutinib dose, p. 902.
r Theoretical

Rifampicin is predicted to decrease the exposure to ibrutinib.
Avoid. r Study
▶ St John’s Wort is predicted to decrease the exposure to
ibrutinib. Avoid. r Theoretical
Ibuprofen → see NSAIDs
Icatibant
▶ ACE inhibitors are predicted to decrease the efﬁcacy of
icatibant and icatibant is predicted to decrease the efﬁcacy of
ACE inhibitors. Avoid. o Theoretical
Idarubicin → see anthracyclines
Idarucizumab → see monoclonal antibodies
Idelalisib → see TABLE 15 p. 1267 (myelosuppression)
▶ Idelalisib is predicted to increase the exposure to abiraterone.
▶

r Theoretical
▶

(antiplatelet effects)
FOOD AND LIFESTYLE Avoid food or drink containing bitter

Netupitant is predicted to increase the exposure to ibrutinib.
Avoid or adjust ibrutinib dose, p. 902. r Theoretical
Nilotinib is predicted to increase the exposure to ibrutinib.
Avoid or adjust ibrutinib dose, p. 902. r Theoretical → Also

Idelalisib is predicted to increase the exposure to
antihistamines, non-sedating (mizolastine). Avoid. r Study
Idelalisib is predicted to increase the exposure to antimalarials
(artemether) with lumafantrine. o Study
Idelalisib is predicted to increase the concentration of
antimalarials (piperaquine). r Theoretical
Idelalisib is predicted to markedly increase the exposure to
aprepitant. o Study
Idelalisib is predicted to slightly increase the exposure to
aripiprazole. Adjust aripiprazole dose, p. 376. o Study
Idelalisib is predicted to increase the exposure to axitinib.
Avoid or adjust dose. o Study → Also see TABLE 15 p. 1267
Idelalisib is predicted to increase the exposure to bedaquiline.
Avoid prolonged use. n Study
Idelalisib is predicted to increase the exposure to beta2 agonists
(salmeterol). Avoid. r Study
Idelalisib slightly increases the exposure to bortezomib.
o Study → Also see TABLE 15 p. 1267
Idelalisib is predicted to markedly increase the exposure to
bosutinib. Avoid or adjust bosutinib dose. r Study → Also
see TABLE 15 p. 1267

Idelalisib (continued)

- Idelalisib is predicted to increase the exposure to buspirone. Adjust buspirone dose, p. 325. [Severe] Study
- Idelalisib slightly increases the exposure to cabozantinib. [Moderate] Study → Also see TABLE 15 p. 1267
- Idelalisib is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study
- Idelalisib is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study
- Idelalisib is predicted to markedly increase the exposure to calcium channel blockers (tercanipide). Avoid. [Severe] Study
- Idelalisib is predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. [Moderate] Theoretical
- Idelalisib is predicted to increase the exposure to corticosteroids (dexamethasone, methylprednisolone). Monitor and adjust dose. [Moderate] Study
- Idelalisib is predicted to increase the exposure to corticosteroids (budesonide). Avoid. [Severe] Study
- Idelalisib is predicted to increase the exposure to corticosteroids (ciclesonide). Avoid. [Severe] Study
- Idelalisib is predicted to increase the exposure to inhaled corticosteroids (fluticasone). [Severe] Study
- Idelalisib is predicted to increase the exposure to corticosteroids (mometasone). [Moderate] Theoretical
- Idelalisib is predicted to increase the exposure to corticosteroids (ciclesonide). Avoid. [Moderate] Theoretical
- Idelalisib is predicted to increase the exposure to corticosteroids (dexamethasone, methylprednisolone). Monitor and adjust dose. [Moderate] Study
- Idelalisib is predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study → Also see TABLE 15 p. 1267
- Idelalisib is predicted to moderately increase the exposure to daclatasvir. Adjust daclatasvir dose, p. 591. [Moderate] Study
- Idelalisib is predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study
- Idelalisib is predicted to markedly increase the exposure to dasatinib. Avoid. [Severe] Study → Also see TABLE 15 p. 1267
- Idelalisib very slightly increases the exposure to delamanid. [Severe] Study
- Idelalisib increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study
- Idelalisib increases the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Study
- Idelalisib is predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. [Moderate] Theoretical
- Idelalisib slightly to moderately increases the exposure to elbasvir. Avoid. [Moderate] Study
- Idelalisib is predicted to markedly increase the exposure to elotriptan. Avoid. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to idelalisib. Avoid. [Severe] Study
- Idelalisib is predicted to increase the risk of ergotism when given with ergometrine. Avoid. [Severe] Theoretical
- Idelalisib is predicted to increase the risk of ergotism when given with ergonovine. Avoid. [Severe] Theoretical
- Idelalisib is predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. [Moderate] Study
- Idelalisib is predicted to increase the concentration of everolimus. Avoid. [Severe] Study → Also see TABLE 15 p. 1267

- Idelalisib is predicted to moderately increase the exposure to fesoterodine. Adjust fesoterodine dose; avoid in hepatic and renal impairment, p. 732. [Severe] Study
- Idelalisib is predicted to increase the exposure to fosaprepitant. [Moderate] Theoretical
- Idelalisib is predicted to increase the exposure to gefitinib. [Moderate] Study → Also see TABLE 15 p. 1267
- Idelalisib is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. [Severe] Study
- Idelalisib is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Study
- Idelalisib is predicted to increase the exposure to ivacaftor. Adjust ivacaftor or lumacaftor with ivacaftor dose, p. 281. [Severe] Study
- Idelalisib is predicted to increase the exposure to lapatinib. Avoid. [Moderate] Study
- Idelalisib is predicted to markedly increase the exposure to lomitapide. Avoid. [Severe] Study
- Idelalisib is predicted to increase the exposure to lurasidone. Avoid. [Severe] Study
- Idelalisib is predicted to increase the exposure to macitentan. [Moderate] Study
- Idelalisib markedly increases the exposure to maraviroc. Adjust dose. [Severe] Theoretical
- Idelalisib is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust midazolam dose. [Severe] Study
- Idelalisib is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 736. [Moderate] Study
- Idelalisib is predicted to increase the exposure to mirtazapine. [Moderate] Study
- Idelalisib is predicted to increase the exposure to modafinil. [Mild] Theoretical
- Idelalisib is predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. [Severe] Theoretical → Also see TABLE 15 p. 1267
- Idelalisib is predicted to markedly increase the exposure to naloxegol. Avoid. [Severe] Study
- Idelalisib is predicted to increase the exposure to netupitant. [Mild] Study
- Idelalisib is predicted to markedly increase the exposure to nilotinib. Avoid. [Severe] Study → Also see TABLE 15 p. 1267
- Idelalisib is predicted to increase the exposure to nitisine. Adjust nitisine dose. [Moderate] Theoretical
- Idelalisib is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Study → Also see TABLE 15 p. 1267
- Idelalisib is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. [Severe] Study
- Idelalisib is predicted to increase the exposure to opioids (methadone). [Moderate] Theoretical
- Idelalisib is predicted to increase the exposure to oxbutynin. [Mild] Study
- Idelalisib is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose, p. 909. [Severe] Study
- Idelalisib is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 864. [Moderate] Study → Also see TABLE 15 p. 1267
- Idelalisib is predicted to increase the exposure to pariparibrevir with ritonavir and ombravir. Adjust. [Severe] Theoretical
Idelalisib is predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose, p. 909. [Moderate] Study → Also see TABLE 15 p. 1267

Idelalisib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid or adjust sildenafil dose, p. 766. [Severe] Study

Idelalisib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to pimozone. Avoid. [Severe] Study

Idelalisib is predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose, p. 911. [Moderate] Study

Idelalisib is predicted to moderately increase the exposure to praziquantel. [Mild] Study

Idelalisib is predicted to increase the exposure to quetiapine. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to ranolazine. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study → Also see TABLE 15 p. 1267

Idelalisib is predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study → Also see TABLE 15 p. 1267

Idelalisib is predicted to increase the exposure to repaglinide. [Moderate] Study

Idelalisib is predicted to increase the exposure to retinoids (all-transretinoin). Adjust all-transretinoin dose, p. 1157. [Moderate] Theoretical

Rifaximin is predicted to decrease the exposure to idelalisib. [Mild] Study

Idelalisib is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study

Idelalisib is predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study → Also see TABLE 15 p. 1267

Idelalisib is predicted to increase the exposure to saxagliptin. [Moderate] Study

Idelalisib is predicted to increase the exposure to simprevir. Avoid. [Severe] Study

Idelalisib is predicted to increase the concentration of sirolimus. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment, p. 734, p. 740. [Severe] Study

Idelalisib is predicted to moderately increase the exposure to SSRI (dapoxetine). Avoid, or adjust dapoxetine dose, 773. [Severe] Study

St John’s Wort is predicted to decrease the exposure to idelalisib. Avoid. [Severe] Theoretical

Idelalisib is predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study

Idelalisib is predicted to increase the exposure to statins (simvastatin). Avoid. [Severe] Study

Idelalisib is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 914. [Moderate] Study → Also see TABLE 15 p. 1267

Idelalisib is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study

Idelalisib is predicted to increase the exposure to taxanes (cabazitaxel). Avoid. [Severe] Study → Also see TABLE 15 p. 1267

Idelalisib is predicted to moderately increase the exposure to taxanes (docetaxel). Avoid or adjust dose. [Severe] Study → Also see TABLE 15 p. 1267

Idelalisib is predicted to increase the exposure to taxanes (paclitaxel). [Severe] Theoretical → Also see TABLE 15 p. 1267

Idelalisib is predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 1267

Idelalisib is predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to tolterodine. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to tolvaptan. Adjust dose. [Severe] Study

Idelalisib is predicted to increase the exposure to toremifene. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 15 p. 1267

Idelalisib is predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. [Moderate] Study

Idelalisib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Severe] Study

Idelalisib is predicted to increase the exposure to vemurafenib. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose, p. 919. [Severe] Study

Idelalisib is predicted to increase the exposure to venlafaxine. [Moderate] Study

Idelalisib is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical → Also see TABLE 15 p. 1267

Idelalisib is predicted to increase the exposure to vitamin D substances (paricalcitol). [Moderate] Study

Idelalisib is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Theoretical

Ifosfamide is predicted to increase the exposure to alitretinoin. Avoid. [Severe] Study

Iloprost is predicted to increase the exposure to amiodarone. Avoid or adjust dose. [Severe] Study

Idelalisib is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid or adjust dose. [Severe] Study

Idelalisib is predicted to increase the exposure to antihistamines, non-sedating (cetirizine). Avoid or adjust dose. [Severe] Study

Idelalisib is predicted to increase the exposure to antihistamines, non-sedating (loratadine). Avoid or adjust dose. [Severe] Study

Idelalisib is predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study

Idelalisib is predicted to increase the exposure to statins (simvastatin). Avoid. [Severe] Study

Idelalisib is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 914. [Moderate] Study → Also see TABLE 15 p. 1267

Idelalisib is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study

Idelalisib is predicted to increase the exposure to taxanes (docetaxel). Avoid or adjust dose. [Severe] Study → Also see TABLE 15 p. 1267

Idelalisib is predicted to increase the exposure to taxanes (paclitaxel). [Severe] Theoretical → Also see TABLE 15 p. 1267

Idelalisib is predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 1267

Idelalisib is predicted to markedly increase the exposure to ticagrelor. Avoid. [Severe] Study

Idelalisib is predicted to increase the exposure to tolvaptan. Adjust dose. [Severe] Study

Idelalisib is predicted to increase the exposure to toremifene. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical → Also see TABLE 15 p. 1267

Idelalisib is predicted to moderately increase the exposure to trazodone. Avoid or adjust dose. [Moderate] Study

Idelalisib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Severe] Study

Idelalisib is predicted to increase the exposure to vemurafenib. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose, p. 919. [Severe] Study

Idelalisib is predicted to increase the exposure to venlafaxine. [Moderate] Study

Idelalisib is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical → Also see TABLE 15 p. 1267

Idelalisib is predicted to increase the exposure to vitamin D substances (paricalcitol). [Moderate] Study

Idelalisib is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid or adjust dose. [Severe] Study

Idelalisib is predicted to increase the exposure to antihistamines, non-sedating (cetirizine). Avoid or adjust dose. [Severe] Study

Idelalisib is predicted to increase the exposure to antihistamines, non-sedating (loratadine). Avoid or adjust dose. [Severe] Study

Idelalisib is predicted to increase the concentration of antimalarials (piperazine). [Severe] Theoretical

Aprepitant is predicted to increase the exposure to imatinib. [Moderate] Theoretical

Asparaginase is predicted to increase the risk of hepatotoxicity when given with imatinib. [Severe] Theoretical → Also see TABLE 15 p. 1267

Imatinib is predicted to increase the exposure to axitinib. [Moderate] Theoretical → Also see TABLE 15 p. 1267

Imatinib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical

Bosentan is predicted to decrease the exposure to imatinib. [Moderate] Study

Imatinib is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical → Also see TABLE 15 p. 1267

Imatinib is predicted to increase the exposure to cabozantinib. [Moderate] Theoretical → Also see TABLE 15 p. 1267

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to imatinib. [Moderate] Theoretical

Downloaded from www.medicalbr.com
Imatinib (continued)
- **Imatinib** is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. (Moderate) Study

- Imatinib is predicted to increase the exposure to *ceritinib*. (Moderate) Theoretical → Also see TABLE 15 p. 1267
- **Imatinib** increases the concentration of *ciclosporin*. (Severe) Study

- **Cobicistat** is predicted to increase the exposure to imatinib. (Moderate) Study

- **Imatinib** is predicted to increase the exposure to *cobicistat*. (Severe) Theoretical

- **Imatinib** is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. (Moderate) Study

- Imatinib is predicted to increase the risk of bleeding events when given with *coumarins*. (Severe) Theoretical

- **Crisantaspase** is predicted to increase the risk of hepatotoxicity when given with imatinib. (Severe) Theoretical → Also see TABLE 15 p. 1267

- **Imatinib** is predicted to slightly increase the exposure to *darifenacin*. (Moderate) Study

- **Imatinib** is predicted to increase the exposure to *colchicine*. Adjust colchicine dose, p. 1020. (Severe) Study

- **Imatinib** is predicted to increase the exposure to *dostinex*. (Moderate) Study

- **Imatinib** is predicted to increase the exposure to *dasatinib*. (Severe) Study → Also see TABLE 15 p. 1267

- **Imatinib** increases the risk of QT-prolongation when given with *domperidone*. Avoid. (Severe) Study

- **Imatinib** is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). (Severe) Theoretical

- **Imatinib** is predicted to moderately increase the exposure to *dutasteride*. (Mild) Study

- **Efavirenz** is predicted to decrease the exposure to imatinib. (Moderate) Study

- **Enzalutamide** is predicted to decrease the exposure to imatinib. Avoid. (Moderate) Study

- **Imatinib** is predicted to increase the risk of ergotism when given with *ergometrine*. (Severe) Theoretical

- **Imatinib** is predicted to increase the risk of ergotism when given with *ergotamine*. (Severe) Theoretical

- **Imatinib** is predicted to increase the exposure to *erlotinib*. (Moderate) Theoretical

- **Imatinib** is predicted to increase the concentration of *everolimus*. Avoid or adjust dose. (Moderate) Study → Also see TABLE 15 p. 1267

- **Imatinib** is predicted to increase the exposure to *felodipine*. Adjust felodipine dose, p. 732. (Mild) Study

- **Imatinib** is predicted to increase the exposure to *gefitinib*. (Moderate) Theoretical → Also see TABLE 15 p. 1267

- **Grapefruit juice** is predicted to increase the exposure to imatinib. (Moderate) Theoretical

- **Imatinib** is predicted to increase the concentration of *guanfacine*. Adjust guanfacine dose, p. 335. (Moderate) Theoretical

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to imatinib. (Moderate) Study

- **Imatinib** is predicted to increase the exposure to *ibrutinib*. Avoid or adjust ibrutinib dose, p. 902. (Severe) Theoretical → Also see TABLE 15 p. 1267

- **Grapefruit juice** is predicted to increase the exposure to *fexefos rodone*. Adjust fexefos rodone dose, p. 205. (Severe) Theoretical

- **Imatinib** is predicted to increase the exposure to *iavabradine*. Adjust iavabradine dose, p. 281. (Severe) Study

- **Imatinib** is predicted to increase the exposure to *ivacaftor*. Adjust ivacaftor dose, p. 281. (Severe) Study

- **Imatinib** is predicted to increase the exposure to *lapatinib*. (Moderate) Study

- **Imatinib** is predicted to increase the exposure to *lomitapide*. Avoid. (Moderate) Theoretical

- **Imatinib** is predicted to increase the exposure to *lurasidone*. (Moderate) Study

- Macrolides (erythromycin) are predicted to increase the exposure to imatinib. (Moderate) Theoretical

- **Imatinib** is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. (Severe) Study

- **Imatinib** is predicted to increase the exposure to *naloxegol*. Adjust naloxegol dose and monitor side effects, p. 63. (Moderate) Study

- **Netupitant** is predicted to increase the exposure to imatinib. (Moderate) Theoretical

- **Nevirapine** is predicted to decrease the exposure to imatinib. (Moderate) Study

- **Imatinib** is predicted to increase the exposure to *olaparib*. Avoid or adjust olaparib dose, p. 919. (Moderate) Theoretical → Also see TABLE 15 p. 1267

- **Imatinib** is predicted to increase the exposure to *opioids* (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. (Moderate) Study

- **Imatinib** is predicted to increase the exposure to *opioids* (methadone, sufentanil). (Moderate) Theoretical

- **Imatinib** is predicted to increase the exposure to *oxybutynin*. (Mild) Theoretical

- **Imatinib** increases the risk of hepatotoxicity when given with *paracetamol*. (Severe) Anecdotal

- **Imatinib** is predicted to increase the exposure to *pazopanib*. (Moderate) Theoretical → Also see TABLE 15 p. 1267

- **Pegasparagse** is predicted to increase the risk of hepatotoxicity when given with imatinib. (Severe) Theoretical → Also see TABLE 15 p. 1267

- **Imatinib** is predicted to increase the risk of bleeding events when given with *phenindione*. (Severe) Theoretical

- **Imatinib** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 765. (Moderate) Theoretical

- **Imatinib** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Monitor and adjust sildenafil dose, p. 766. (Moderate) Study

- **Imatinib** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. (Severe) Theoretical

- **Imatinib** is predicted to increase the exposure to *pimozone*. Avoid. (Severe) Theoretical

- **Imatinib** is predicted to increase the exposure to *quetiapine*. Avoid. (Moderate) Study

- **Imatinib** is predicted to increase the exposure to *ranolazine*. Avoid. (Severe) Study

- **Rifaximin** is predicted to increase the exposure to *ruxolitinib*. (Moderate) Theoretical → Also see TABLE 15 p. 1267

- **Imatinib** is predicted to increase the exposure to saxagliptin. (Mild) Study

- **Imatinib** is predicted to increase the exposure to *simeprevir*. Avoid. (Severe) Study

- **Imatinib** increases the concentration of *sirolimus*. Monitor and adjust dose. (Moderate) Study

- **Imatinib** is predicted to increase the exposure to *SSRIs* (dapoxetine). Adjust dapoxetine dose, p. 773. (Moderate) Theoretical

- **St John’s Wort** is predicted to decrease the exposure to imatinib. (Moderate) Study

- **Imatinib** is predicted to increase the exposure to *statins* (atorvastatin). Monitor and adjust dose. (Severe) Theoretical

- **Imatinib** is predicted to increase the exposure to *statins* (simvastatin). Use with caution and adjust simvastatin dose, p. 198. (Severe) Study

- **Imatinib** is predicted to increase the exposure to *sunitinib*. Avoid. (Moderate) Theoretical

- **Imatinib** is predicted to increase the exposure to tacrolimus. (Severe) Study

- **Imatinib** is predicted to increase the exposure to *taxanes* (cabazitaxel). (Moderate) Theoretical → Also see TABLE 15 p. 1267

- **Tedorzol** is predicted to increase the exposure to imatinib. Avoid. (Moderate) Theoretical
**Imatinib** is predicted to increase the concentration of temsiroliimus. [Moderate] Theoretical  Also see TABLE 15 p. 1267

**Imatinib** is predicted to increase the exposure to tolvaptan. Adjust dose. [Moderate] Theoretical

**Imatinib** is predicted to increase the exposure to olaparib. Adjust dose. [Moderate] Theoretical

**Imatinib** is predicted to increase the exposure to trazodone. [Moderate] Theoretical

**Imatinib** is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study

**Imatinib** is predicted to increase the exposure to venoject. Avoid or adjust venoject dose, p. 919. [Severe] Study

**Imatinib** is predicted to increase the exposure to vinca alkaloids. [Severe] Theoretical  Also see TABLE 15 p. 1267

**Imatinib** is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study

Imidapril  see ACE inhibitors

Imipenem  see carbapenems

Imipramine  see tricyclic antidepressants

Indacaterol  see beta, agonists

Indapamide  see thiazide diuretics

Indinavir  see HIV- protease inhibitors

Indometacin  see alpha blockers

Infliximab  see monoclonal antibodies

Influenza vaccine  see live vaccines

Insulin  see insulins

Insulin aspart  see insulins

Insulin degludec  see insulins

Insulin detemir  see insulins

Insulin glargine  see insulins

Insulin glulisine  see insulins

Insulin lispro  see insulins

Insulin zinc suspension  see insulins

Insulins  see TABLE 14 p. 1267 (anti diabetic drugs)

Biphasic insulin aspart - Biphasic insulin lispro - Biphasic isophane insulin - insulin aspart - insulin degludec - insulin detemir - insulin glargine - insulin glulisine - insulin lispro - insulin zinc suspension - isophane insulin - protamine zinc insulin

**Fibrates** are predicted to increase the risk of hypoglycaemia when given with insulins. [Moderate] Theoretical

**Interferon alfa**  see interferons

**Interferon beta**  see interferons

**Interferons**  see TABLE 15 p. 1267 (myelosuppression)

Interferon alfa - interferon beta - peginterferon alfa

**Interferons** are predicted to slightly increase the exposure to aminophylline. Adjust dose. [Moderate] Theoretical

**Interferon alfa** is predicted to increase the risk of peripheral neuropathy when given with telbivudine. Avoid. [Severe] Theoretical

**Peginterferon alfa** increases the risk of peripheral neuropathy when given with telbivudine. Avoid. [Severe] Study

**Interferons** slightly increase the exposure to theophylline. Adjust dose. [Moderate] Study

**Interferon alfa** is predicted to increase the risk of glaucoma when given with irapronium. [Moderate] Anecdotal

Ibepesartan  see angiotensin-II receptor antagonists

Irinotecan  see TABLE 15 p. 1267 (myelosuppression)

Antiepileptics (Carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study

Cobicistat is predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study

Enalaprilat is predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study

**Idealisib** is predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study  Also see TABLE 15 p. 1267

**Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with irinotecan. Public Health England advises avoid. [Severe] Theoretical

**Macrolides (clarithromycin)** are predicted to increase the risk of toxicity when given with irinotecan. Avoid. [Moderate] Study

**Irinotecan** is predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Theoretical

**Pitolisant** is predicted to decrease the exposure to irinotecan. [Unknown] Theoretical

**Rifampicin** is predicted to decrease the exposure to irinotecan. Avoid. [Severe] Study

**St John’s Wort** slightly decreases the exposure to irinotecan. Avoid. [Severe] Study

**Irinotecan** is predicted to increase the risk of prolonged neuromuscular blockade when given with suxamethonium. [Moderate] Theoretical

**Iron (injectable)**

- Ferric carboxymaltose - iron dextran - iron isomaltoside 1000 - iron sucrose

Chloramphenicol decreases the efficacy of intravenous iron (injectable). [Moderate] Anecdotal

**Iron (oral)**

- Ferric maltol - ferrous fumarate - ferrous gluconate - ferrous sulfate - polysaccharide-iron complex - sodium feredate

Antacids decrease the absorption of iron (oral). Iron (oral) should be taken 1 hour before or 2 hours after antacids. [Moderate] Study

Iron (oral) is predicted to decrease the absorption of oral bisphosphonates (ibandronic acid). Avoid iron (oral) for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical

**Iron (oral)** decreases the absorption of bisphosphonates (risendronate). Separate administration by at least 2 hours. [Moderate] Study

Iron (oral) decreases the absorption of bisphosphonates (sodium clodronate). Avoid iron (oral) for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study

Calcium salts (calcium carbonate) decrease the absorption of iron (oral). Calcium carbonate should be taken 1 hour before or 2 hours after iron (oral). [Moderate] Study

Iron (oral) is predicted to decrease the exposure to carbidopa. [Moderate] Theoretical

Chloramphenicol decreases the efficacy of oral iron (oral). [Moderate] Theoretical

Iron (oral) decreases the absorption of duloxetine. Iron (oral) should be taken 2 hours before or 6 hours after duloxetine. [Moderate] Study

Iron (oral) is predicted to decrease the absorption of eltrombopag. Eltrombopag should be taken 2 hours before or 4 hours after iron (oral). [Severe] Theoretical

Iron (oral) is predicted to decrease the absorption of entacapone. Separate administration by at least 2 hours. [Moderate] Theoretical

Iron (oral) decreases the absorption of levodopa. [Moderate] Study

Iron (oral) decreases the absorption of levothyroxine. Separate administration by at least 4 hours. [Moderate] Study

Iron (oral) decreases the effects of methylxanthine. [Moderate] Study

Iron (oral) is predicted to decrease the absorption of penicillamine. Separate administration by at least 2 hours. [Mild] Study

Iron (oral) decreases the exposure to quinolones. Separate administration by at least 2 hours. [Moderate] Study

Iron (oral) decreases the absorption of tetracyclines. Tetracyclines should be taken 2 to 3 hours after iron (oral). [Moderate] Study

Trientine potentially decreases the absorption of iron (oral). [Moderate] Theoretical
Iron (oral) — Ivacaftor

Iron (oral) (continued)

- Zinc is predicted to decrease the efficacy of iron (oral) and iron (oral) are predicted to decrease the efficacy of zinc. [Moderate]

Iron chelators

deferasirox - desferrioxamine - deferoxamine

- Deferasirox is predicted to increase the exposure to aminophylline. Avoid. [Moderate] Theoretical

- Antacids (aluminium hydroxide) are predicted to decrease the exposure to deferasirox. Avoid. [Moderate] Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to deferasirox. Monitor serum ferritin and adjust dose. [Moderate] Theoretical

- Ascorbic acid is predicted to increase the risk of cardiovascular side-effects when given with desferrioxamine. Severe Theoretical

- Aspirin (high-dose) is predicted to increase the risk of gastrointestinal bleedings when given with deferasirox. Severe Theoretical

- Bisphosphonates are predicted to increase the risk of gastrointestinal bleeding when given with deferasirox. Severe Theoretical

- Deferasirox is predicted to increase the exposure to clozapine. Avoid. [Moderate] Theoretical

- Corticosteroids are predicted to increase the risk of gastrointestinal bleeding when given with deferasirox. Severe Theoretical

- AIDS are predicted to increase the risk of gastrointestinal bleeding when given with deferasirox. Severe Theoretical

- Deferasirox moderately increases the exposure to repaglinide. Avoid. [Moderate] Study

- Rifampicin is predicted to decrease the exposure to deferasirox. Monitor serum ferritin and adjust dose. [Moderate] Study

- Deferasirox increases the exposure to theophylline. Avoid. [Moderate] Study

- Deferasirox is predicted to increase the exposure to tizanidine. Avoid. [Moderate] Theoretical

Iron dextran → see iron (injectable)

Iron isomsaltsolide 1000 → see iron (injectable)

Iron sucrose → see iron (injectable)

Isavunozanol → see antifungals, azoles

Iscarboxazid → see monoamine-oxidase A and B inhibitors, irreversible

Isonflurane → see volatile halogenated anaesthetics

Isonetemepene → see sympathomimetics, vasconstrictor

Isoniazid → see TABLE 1. p. 1264 (hepatotoxicity), TABLE 12 p. 1267 (peripheral neuropathy)

FOOD AND LIFESTYLE Avoid tanyrime or histamine rich foods, as tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating reported.

- Isoniazid is predicted to affect the clearance of aminophylline. Severe Theoretical

- Isoniazid markedly increases the concentration of antiepileptics (carbamazepine) and antiepileptics (carbamazepine) increase the risk of hepatotoxicity when given with isoniazid. Monitor carbamazepine concentration and adjust dose. [Severe] Study Also see TABLE 1 p. 1264

- Isoniazid increases the concentration of antiepileptics (fosphenytoin, phenytoin). Moderate Study Also see TABLE 12 p. 1267

- Cyclophosphine increases the risk of CNS toxicity when given with isoniazid. Monitor and adjust dose. [Moderate] Study

- Isoniazid is predicted to increase the risk of peripheral neuropathy when given with didanosine. Severe Theoretical Also see TABLE 1 p. 1264 Also see TABLE 12 p. 1267

- Isoniazid increases the risk of optic neuropathy when given with etambutol. Severe Anecdotal

- Isoniazid decreases the effects of levodopa. [Moderate] Study

- Isoniazid is predicted to increase the exposure to tomatipide. Separate administration by 12 hours. [Unknown] Theoretical Also see TABLE 1 p. 1264

- Isoniazid is predicted to increase the risk of peripheral neuropathy when given with stavudine. [Severe] Theoretical Also see TABLE 12 p. 1267

- Isoniazid is predicted to affect the clearance of theophylline. Severe Anecdotal

Iron (oral) — Ivacaftor

Isoniazid insulin → see insulins

Iosorbide dinitrate → see nitrates

Iosorbide mononitrate → see nitrates

Isotretinoin → see retinoids

Isradipine → see calcium channel blockers

Itracnozole → see antifungals, azoles

Ivabradine → see TABLE 6 p. 1265 (bradycardia), TABLE 9 p. 1266 (QT-interval prolongation)

- Antiarhythms (dronedarone) are predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 205. Severe Theoretical

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ivabradine. Adjust dose. [Moderate] Theoretical

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 205. [Severe] Theoretical

- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to ivabradine. Avoid. [Severe] Study

- Aprepitant is predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 205. Severe Theoretical

- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ivabradine. Avoid. [Moderate] Study Also see TABLE 6 p. 1265

- Cobicistat is predicted to increase the exposure to ivabradine. Avoid. [Severe] Study

- Crizotinib is predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 205. Severe Theoretical Also see TABLE 6 p. 1265

- Enalapril is predicted to decrease the exposure to ivabradine. Adjust dose. [Moderate] Theoretical

- Grapefruit juice is predicted to increase the exposure to ivabradine. Avoid. [Moderate] Study

- HIV-protase inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to ivabradine. Avoid. [Severe] Study

- HIV-protase inhibitors (indinavir) increase the exposure to ivabradine. Adjust dose. [Severe] Theoretical

- Idealalisb is predicted to increase the exposure to ivabradine. Avoid. [Severe] Study

- Imatinib is predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 205. Severe Theoretical

- Macrolides (clarithromycin) are predicted to increase the exposure to ivabradine. Avoid. [Severe] Study

- Macrolides (erythromycin) are predicted to increase the exposure to ivabradine. Avoid. [Severe] Study

- Netupitant is predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 205. Severe Theoretical

- Nilotinib is predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 205. Severe Theoretical

- Rilpaminc is predicted to decrease the exposure to ivabradine. Adjust dose. [Moderate] Theoretical

- St John’s Wort decreases the exposure to ivabradine. Avoid. [Moderate] Study

Ivacaftor

FOOD AND LIFESTYLE Avoid bitter (Seville) oranges as they are predicted to increase the exposure to ivacafior.

- Antiarhythms (dronedarone) are predicted to increase the exposure to ivacaftor. Adjust ivacaftor dose, p. 281. [Severe] Study

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) markedly decrease the exposure to ivacaftor. Avoid. [Severe] Study

- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ivacaftor. Adjust ivacaftor dose, p. 281. [Severe] Study
### Enzalutamide

- **Rifampicin**
  - Adjust ivacaftor dose, p. 281. **(Severe)** Study

### Calcium channel blockers (diltiazem, verapamil)

- Decrease exposure to ivacaftor. **(Severe)** Study

### Aprepitant

- **Calcium channel blockers** decrease exposure to ivacaftor. **(Severe)** Study

### Calcium

- **Antifungals, azoles**
  - (itraconazole, ketoconazole, voriconazole)
  - Increase exposure to ivacaftor. **(Severe)** Study

### Lanreotide

- **Beta blockers, non-selective**
  - Decrease absorption of oral ciclosporin. **(Moderate)** Study

### Lansoprazole

- Proton pump inhibitors

### Memantine

- **Antifungals, azoles**
  - (itraconazole, ketoconazole, voriconazole)

### Ketorolac

- **Ivermectin**

- Potential increases the anticoagulant effect of coumarins. **(Severe)** Theoretical

### Ketamine

- **St John’s Wort**

### Ixazomib

- **Antifungals, azoles**
  - (itraconazole, ketoconazole, voriconazole)

### Ivermectin

- **St John's Wort**

### Ixekizumab

- **Antiepileptic**

### Kaolin

- **Antifungals, azoles**

### Ketamine

- **Colchicine**

### Lamivudine

- **Prednisolone**

### Lamotrigine

- **Antiepileptic**

### Lanreotide

- **Beta blockers, selective**

### Levothyroxine

- **Antifungals, azoles**

### Levamisole

- **Antifungals, azoles**

### Levodopa

- **Antifungals, azoles**

### Lacidipine

- **Antifungals, azoles**

### Lacosamide

  - **Antifungals, azoles**

- **Levothyroxine**
  - **Antifungals, azoles**

- **Lacidipine**
  - **Calcium channel blockers**

- **Lacosamide**
  - **Antiepileptic**
Lapatinib (continued)

- **Lapatinib** is predicted to slightly increase the exposure to edoxaban. [Severe] Theoretical
- **Efavirenz** is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
- **Enzalutamide** is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
- **Lapatinib** is predicted to increase the exposure to erlotinib.
  - Moderate Theoretical
- **Lapatinib** is predicted to increase the exposure to everolimus.
  - Moderate Theoretical
- **Lapatinib** is predicted to increase the exposure to fidaromacin. Avoid. [Moderate] Study
- **Grapefruit juice** is predicted to increase the exposure to lapatinib. Avoid. [Moderate] Study
- **H₂ receptor antagonists** are predicted to decrease the absorption of lapatinib.
  - Moderate Theoretical
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to lapatinib. Avoid. [Moderate] Study
  - Also see TABLE 9 p. 1266
- **HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to loperamide.
  - Moderate Study
- **Lapatinib** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- **Lapatinib** is predicted to increase the exposure to loperamide.
  - Moderate Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the exposure to lapatinib. Avoid. [Moderate] Study
  - Also see TABLE 9 p. 1266
- **Macrolides (erythromycin)** are predicted to increase the exposure to lapatinib. [Moderate] Study
- **Netupitant** is predicted to increase the exposure to lapatinib.
  - Moderate Study
- **Nevirapine** is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to lapatinib.
  - Moderate Study
  - Also see TABLE 9 p. 1266
- **Lapatinib** is predicted to increase the exposure to nintedanib.
  - Moderate Study
- **Lapatinib** is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
- **Lapatinib** is predicted to increase the exposure to sirolimus.
  - Moderate Theoretical
- **St John’s Wort** is predicted to decrease the exposure to lapatinib. Avoid. [Severe] Study
- **Lapatinib** slightly increases the exposure to taxanes (paclitaxel). [Severe] Study
- **Tedizolid** is predicted to increase the exposure to lapatinib. Avoid. [Moderate] Theoretical
- **Lapatinib** is predicted to increase the exposure to topotecan.
  - Severe Study
- **Lapatinib** is predicted to increase the concentration of trametinib. [Moderate] Theoretical
- **Lapatinib** is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. [Severe] Theoretical

Laronidase

- **Antimalarials (chloroquine)** are predicted to decrease the exposure to laronidase. Avoid simultaneous administration.
  - Severe Theoretical
- **Hydroxychloroquine** is predicted to decrease the exposure to laronidase. Avoid simultaneous administration. [Severe] Theoretical

Ledipasvir

- **Antacids** are predicted to decrease the exposure to ledipasvir. Separate administration by 4 hours. [Moderate] Theoretical
- **Ledipasvir** increases the risk of severe bradycardia or heart block when given with antiarrhythmics (amiodarone). Refer to specialist literature. [Severe] Anecdotal

- **Antiepileptics (carbamazepine)** are predicted to decrease the exposure to ledipasvir. Avoid. [Severe] Theoretical
- **Calcium salts (calcium carbonate)** are predicted to decrease the exposure to ledipasvir. Separate administration by 4 hours. [Moderate] Theoretical
- **H₂ receptor antagonists** are predicted to decrease the exposure to ledipasvir. Adjust dose, see sofosbuvir with ledipasvir p. 596. [Moderate] Study
- **Proton pump inhibitors** are predicted to decrease the exposure to ledipasvir. Adjust dose, see sofosbuvir with ledipasvir p. 596. [Moderate] Theoretical
- **Rifampicin** is predicted to decrease the exposure to ledipasvir. Avoid. [Severe] Theoretical
- **Ledipasvir** moderately increases the exposure to simprevir and simprevir slightly increases the exposure to ledipasvir. Avoid. [Severe] Study
- **St John’s Wort** is predicted to decrease the exposure to ledipasvir. Avoid. [Severe] Theoretical
- **Ledipasvir** is predicted to increase the exposure to statins (atorvastatin, simvastatin). Monitor and adjust dose. [Moderate] Theoretical
- **Ledipasvir** (with sofosbuvir) is predicted to increase the exposure to statins (fluvastatin, pravastatin). Monitor and adjust dose. [Moderate] Theoretical
- **Ledipasvir** is predicted to increase the exposure to statins (rosuvastatin). Avoid. [Severe] Theoretical
- **Ledipasvir** (with sofosbuvir) slightly increases the exposure to tenofovir. [Moderate] Study

Leflunomide → see TABLE 1 p. 1264 (hepatotoxicity), TABLE 15 p. 1267 (myelosuppression)

PHARMACOLOGY

Leflunomide has a long half-life; washout procedure recommended before switching to other DMARDS (consult product literature).

- **Leflunomide** increases the anticoagulant effect of coumarine.
  - Severe Anecdotal
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with leflunomide. Public Health England advises avoid. [Severe] Theoretical

Levallosofa

- **Lenvlumaride** is predicted to increase the risk of venous thromboembolism when given with lenalidomide. Avoid. [Severe] Theoretical
- **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with lenalidomide.
  - Severe Theoretical
- **Lercanidipine** → see calcium channel blockers

Levamisole

FOOD AND LIFESTYLE

Disulfiram-like reaction might occur on consumption of alcohol.

- **Albendazole** slightly decreases the exposure to levamisole and levamisole moderately decreases the exposure to albendazole. [Moderate] Study
- **Levamisole** increases the exposure to ivermectin. [Moderate] Study

Levetiracetam → see antiepileptics

Levobunolol → see beta blockers, non-selective

Levobupivacaine → see anaesthetics, local

Levocetirizine → see antihistamines, non-sedating

Levodopa → see TABLE 8 p. 1265 (hypotension)

GENERAL INFORMATION

Drugs with antimuscarinic effects might reduce the absorption of levodopa.

- **Amisulpride** is predicted to decrease the effects of levodopa. Avoid. [Severe] Theoretical
- **Antiepileptics (fosphenytoin, phenytoin)** decrease the effects of levodopa. [Moderate] Study
- **Aripiprazole** is predicted to decrease the effects of levodopa. [Severe] Theoretical
  - Also see TABLE 8 p. 1265
- **Asenapine** is predicted to decrease the effects of levodopa. Adjust dose. [Severe] Theoretical
  - Also see TABLE 8 p. 1265
- **Baclofen** is predicted to increase the risk of side-effects when given with levodopa. [Severe] Anecdotal
  - Also see TABLE 8 p. 1265
Benperidol is predicted to decrease the effects of levodopa. 

Bupropion increases the risk of side-effects when given with levodopa. Moderately predicted by study. Also see TABLE 8 p. 1265

Clozapine is predicted to decrease the effects of levodopa. Theoretical. Also see TABLE 8 p. 1265

Droperidol decreases the effects of levodopa. Severe. Published study. Also see TABLE 8 p. 1265

Entacapone increases the exposure to levodopa. Monitor side effects and adjust dose. Moderate. Published study. Also see TABLE 8 p. 1265

Flupentixol decreases the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. Severe. Theoretical. Also see TABLE 8 p. 1265

Haloperidol decreases the effects of levodopa. Severe. Published study. Also see TABLE 8 p. 1265

Iron (oral) decreases the absorption of levodopa. Moderate. Study

Isorniazid decreases the effects of levodopa. Moderate. Study

Levodopa is predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. Severe. Theoretical. Also see TABLE 8 p. 1265

Loxapine is predicted to decrease the effects of levodopa. Severe. Published study. Also see TABLE 8 p. 1265

Metoclopramide decreases the effects of levodopa. Avoid. Moderate. Study

Levodopa increases the risk of side-effects when given with moclobemide. Moderate. Study

Levodopa increases the risk of a hypertensive crisis when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. Severe. Published study. Also see TABLE 8 p. 1265

Monoamine-oxidase B inhibitors are predicted to increase the effects of levodopa. Adjust dose. Medium. Published study. Also see TABLE 8 p. 1265

Olanzapine decreases the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. Severe. Anecdotal. Also see TABLE 8 p. 1265

Opicapone increases the exposure to levodopa. Adjust levodopa dose. Moderate. Study

Phenothiazines decrease the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. Severe. Published study. Also see TABLE 8 p. 1265

Pimozide decreases the effects of levodopa. Severe. Theoretical. Also see TABLE 8 p. 1265

Quetiapine decreases the effects of levodopa. Severe. Anecdotal. Also see TABLE 8 p. 1265

Risperidone is predicted to decrease the effects of levodopa. Avoid or adjust dose. Severe. Anecdotal. Also see TABLE 8 p. 1265

Sulpiride is predicted to decrease the effects of levodopa. Avoid. Severe. Theoretical. Also see TABLE 8 p. 1265

Tetramazepam is predicted to decrease the effects of levodopa. Use with caution or avoid. Moderate. Theoretical

Tolcapone increases the exposure to levodopa. Monitor and adjust dose. Moderate. Study

Zuclopenthixol is predicted to decrease the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. Severe. Published study. Also see TABLE 8 p. 1265

Levofloxacin → see quinolones

Levofolinic acid → see folates

Levomepromazine → see phenothiazines

Levonorgestrel is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 747. Severe. Theoretical

Bosantan is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 747. Severe. Theoretical

Efavirenz is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 747. Severe. Theoretical

Fosaprepitant is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 747. Severe. Theoretical

Griseofulvin potentially decreases the efficacy of oral levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 747. Severe. Anecdotal

HIV-protease inhibitors (ritonavir) are predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 747. Severe. Theoretical

Modafinil is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 747. Severe. Theoretical

Nevirapine is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 747. Severe. Theoretical

Rifabutin is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 747. Severe. Theoretical

Rifampicin is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 747. Severe. Theoretical

St John’s Wort is predicted to decrease the efficacy of levonorgestrel. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 747. Severe. Theoretical

Sugar mandex is predicted to decrease the exposure to levonorgestrel. Use additional contraceptive precautions. Severe. Theoretical

Ulipristal is predicted to decrease the efficacy of levonorgestrel. Avoid. Severe. Theoretical

Levotiroxine

Antacids are predicted to decrease the absorption of levothyroxine. Separate administration by at least 4 hours. Moderate. Anecdotal

Antihypertensives (amlodipine) increase the risk of thyroid dysfunction when given with levothyroxine. Avoid. Moderate. Study

Antiepileptics (carbamazepine) increase the risk of hypothyroidism when given with levothyroxine. Monitor and adjust dose. Moderate. Study

Antiepileptics (fosphenytoin, phenytoin) increase the risk of hypothyroidism when given with levothyroxine. Moderate. Study

Antiepileptics (phenobarbital, primidone) are predicted to decrease the effects of levothyroxine. Moderate. Theoretical

Calcium salts are predicted to decrease the absorption of levothyroxine. Separate administration by at least 4 hours. Moderate. Anecdotal

Levothyroxine is predicted to affect the concentration of digoxin. Monitor and adjust dose. Moderate. Theoretical

Levothyroxine is predicted to decrease the effects of levotiroxine. Moderate. Theoretical

Iron (oral) decreases the absorption of levothyroxine. Separate administration by at least 4 hours. Moderate. Study

Lanthanum decreases the absorption of levothyroxine. Separate administration by 2 hours. Moderate. Study

Polystyrene sulfonate is predicted to decrease the absorption of levothyroxine. Separate administration by at least 4 hours. Moderate. Theoretical

Sucralfate decreases the absorption of levothyroxine. Separate administration by at least 4 hours. Moderate. Study

Lidocaine → see antihypertensives

Linaclotide is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. Moderate. Theoretical

Downloaded from www.medicalbr.com
**Linagliptin**

**Interactions**

- **Rifampicin** is predicted to decrease the exposure to linagliptin. **Moderate** Study

- **Linezolid** → see TABLE 15 p. 1267 (myelosuppression), **TABLE 13** p. 1267 (serotonin syndrome) **FOOD AND LIFESTYLE** Patients taking linezolid should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, salami, pickled herring, Bovril®, Oxo®, Marmite® or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).

- **β2 agonists** are predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. **Severe** Theoretical

- **Bupropion** is predicted to increase the risk of intraoperative hypertension when given with **linezolid**. **Severe** Anecdotal → Also see **TABLE 13** p. 1267

- **Buspirone** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. **Severe** Theoretical → Also see **TABLE 13** p. 1267

- **Lenvadopa** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. **Severe** Theoretical

- **Methylphenidate** is predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. **Severe** Theoretical

- **Moclobemide** is predicted to increase the risk of side-effects when given with **linezolid**. Avoid and for 14 days after stopping **moclobemide**. **Severe** Theoretical → Also see **TABLE 13** p. 1267

- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the risk of side-effects when given with **linezolid**. Avoid and for 14 days after stopping **moclobemide**. **Severe** Theoretical → Also see **TABLE 13** p. 1267

- **Monoamine-oxidase B inhibitors (rasagline, selegiline)** are predicted to increase the risk of side-effects when given with **linezolid**. Avoid and for 14 days after stopping the MAOI. **Severe** Theoretical → Also see **TABLE 13** p. 1267

- **Monoamine-oxidase B inhibitors (safinamide)** are predicted to increase the risk of side-effects when given with **linezolid**. Avoid and for 1 week after stopping **safinamide**. **Severe** Theoretical → Also see **TABLE 13** p. 1267

- **Reboxetine** is predicted to increase the risk of a hypertensive crisis when given with **linezolid**. Avoid. **Severe** Theoretical

- **Rifampicin** slightly decreases the exposure to **linezolid**. **Moderate** Study

- **Sympathomimetics, inotropic (dobutamine, dopamine)** are predicted to increase the risk of elevated blood pressure when given with **linezolid**. Avoid. **Severe** Theoretical

- **Sympathomimetics, vasoconstrictor (pseudoephedrine)** increase the risk of elevated blood pressure when given with **linezolid**. Avoid. **Severe** Study

**Liothyronine**

- **Antiarhythmic (amiodarone)** are predicted to increase the risk of thyroid dysfunction when given with **liothyronine**. Avoid. **Moderate** Theoretical

- **Antiepileptics (fosphenytoin, phenytoin)** are predicted to increase the risk of hypothyroidism when given with **liothyronine**. **Moderate** Theoretical

- **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the effects of **liothyronine**. **Moderate** Theoretical

- **Liothyronine** is predicted to affect the concentration of **lithium**. Monitor and adjust dose. **Moderate** Theoretical

- **Oral Hormone replacement therapy** is predicted to decrease the effects of **liothyronine**. **Moderate** Theoretical

- **Lanthanum** decreases the absorption of **liothyronine**. Separate administration by 2 hours. **Moderate** Study

**Liraglutide** → see **TABLE 14** p. 1267 (antidiabetic drugs)

**Lisdexamfetamine** → see amphetamines

**Lisinopril** → see ACE inhibitors

**Lithium** → see **TABLE 13** p. 1267 (serotonin syndrome), **TABLE 9** p. 1266 (QT-interval prolongation)

- **ACE inhibitors** are predicted to increase the concentration of **lithium**. Monitor and adjust dose. **Severe** Anecdotal

- **Acetazolamide** alters the concentration of **lithium**. **Severe** Anecdotal

- **Aldosterone antagonists (spironolactone)** potentially increase the concentration of **lithium**. **Moderate** Study

- **Aminophylline** is predicted to decrease the concentration of **lithium**. **Moderate** Theoretical

- **Angiotensin-II receptor antagonists** potentially increase the concentration of **lithium**. Monitor concentration and adjust dose. **Severe** Anecdotal

- **Antiepileptics (carbamazepine)** increase the risk of neurotoxicity when given with **lithium**. **Severe** Anecdotal

- **Antiepileptics (oxcarbazepine)** are predicted to increase the risk of neurotoxicity when given with **lithium**. **Severe** Theoretical

- **Calcitonin (salmon)** decreases the concentration of **lithium**. **Moderate** Study

- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the risk of neurotoxicity when given with **lithium**. **Severe** Anecdotal

- **Loop diuretics** increase the concentration of **lithium**. **Moderate** Study

- **Methylprednisolone** increases the risk of neurotoxicity when given with **lithium**. **Severe** Anecdotal

- **NSAID** increase the concentration of **lithium**. **Moderate** Study

- **Phenothiazines** potentially increase the risk of neurotoxicity when given with **lithium**. **Severe** Anecdotal

- **Quetiapine** potentially increases the risk of neurotoxicity when given with **lithium**. **Severe** Anecdotal

- **Risperidone** potentially increases the risk of neurotoxicity when given with **lithium**. **Severe** Anecdotal

- **Potassium-sparing diuretics (triamterene)** potentially increase the clearance of **lithium**. **Moderate** Study

- **Sodium bicarbonate** decreases the concentration of **lithium**. **Severe** Anecdotal

- **Sulpiride** potentially increases the risk of neurotoxicity when given with **lithium**. **Severe** Anecdotal

- **Thiazide diuretics** increase the concentration of **lithium**. Avoid or adjust **lithium** (lithium carbonate, lithium citrate) dose and monitor **lithium** (lithium carbonate, lithium citrate) concentration. **Severe** Study

- **Tricyclic antidepressants** potentially increase the risk of neurotoxicity when given with **lithium**. **Severe** Anecdotal → Also see **TABLE 9** p. 1266

- **Zuclopenthixol** potentially increases the risk of neurotoxicity when given with **lithium**. **Severe** Anecdotal → Also see **TABLE 9** p. 1266

**Live vaccines**

- Bacillus Calmette-Guérin vaccine · influenza vaccine · measles, mumps and rubella vaccine, live · rotavirus vaccine · typhoid vaccine · varicella-zoster vaccine · yellow fever vaccine, live

**ROUTE-SPECIFIC INFORMATION** Oral typhoid vaccine is inactivated by concurrent administration of antibacterials or antimalarials; antibacterials should be avoided for 3 days before and after oral typhoid vaccination; mefloquine should be avoided for at least 12 hours before or after oral typhoid vaccination; for other antimalarials oral typhoid vaccine vaccination should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydchloride with atovaquone, which can be given concurrently).

- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **abatacept**. Public Health England advises avoid. **Severe** Theoretical
Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
alkylating agents. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
amsacrine. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
anakinra. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
anthracyclines. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
azathioprine. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
betalactam. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
bleomycin. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
capetibatine. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
ciclosporin. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
cladribine. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
clofarabine. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
corticosteroids (high-dose). Public Health England advises avoid. **Severe**

Influenza vaccine potentially increases the risk of bleeding events when given with coumarins. **Severe** Anecdotal

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
cytarabine. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
dactinomycin. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
dimethyl fumarate. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
etanercept. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
etoposide. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
everolimus. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
fingolimod. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
fluorouracil. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
hydroxyurea. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
irinotecan. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
leflunomide. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
methotrexate. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
mitomycin. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
monoclonal antibodies. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
mycophenolate. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
pemetrexed. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
platinum compounds. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
procabazine. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
ralitrexed. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
sirolimus. Public Health England advises avoid. **Severe**

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with
tacrolimus. Public Health England advises avoid. **Severe**
Live vaccines – Lomitapide

**Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with taxanes (docetaxel, paclitaxel). Public Health England advises avoid. (Severe) Theoretical

**Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with tegafur. Public Health England advises avoid. (Severe) Theoretical

**Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with temsirolimus. Public Health England advises avoid. (Severe) Theoretical

**Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with teriflunomide. Public Health England advises avoid. (Severe) Theoretical

**Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with tioguanine. Public Health England advises avoid. (Severe) Theoretical

**Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with topotecan. Public Health England advises avoid. (Severe) Theoretical

**Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with trabectedin. Public Health England advises avoid. (Severe) Theoretical

**Venetoclax** potentially decreases the efficacy of live vaccines. Avoid. (Severe) theoretical

**Lofepramine** see tricyclic antidepressants

**Lofexidine** see Table 8 p. 1265 (hypotension), Table 9 p. 1266 (QT-interval prolongation), Table 11 p. 1266 (CNS depressant effects)

**Lomitapide** see Table 1 p. 1264 (hepatotoxicity)

**FOD AND LIFESTYLE** Bitter (Seville) orange is predicted to increase the exposure to lomitapide; separate administration by 12 hours.

**Alprazolam** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Antiarhythmic (amiodarone)** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Antiarhythmic (dronedarone)** are predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical

**Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to lomitapide. Monitor and adjust dose. (Moderate) Theoretical

Also see Table 1 p. 1264

**Antifungals, azoles (clotrimazole)** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical Also see Table 1 p. 1264

**Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to lomitapide. Avoid. (Severe) Study Also see Table 1 p. 1264

**Aprepitant** is predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical

**Bicalutamide** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Calcium channel blockers (amlodipine, lacidipine)** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical

**Ciclosporin** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Clofazimine** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Cobicistat** is predicted to markedly increase the exposure to lomitapide. Avoid. (Severe) Study

**Oral combined hormonal contraceptives** slightly increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Lomitapide** increases the exposure to coumarins (warfarin). Monitor INR and adjust warfarin dose. (Severe) Study

**Crizotinib** is predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical

**Enzalutamide** is predicted to decrease the exposure to lomitapide. Monitor and adjust dose. (Moderate) Theoretical

**Everolimus** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Fosaprepitant** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Grapefruit juice** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**H2 receptor antagonists (cimetidine, ranitidine)** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to markedly increase the exposure to lomitapide. Avoid. (Severe) Study

**HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical

**Idelalisib** is predicted to markedly increase the exposure to lomitapide. Avoid. (Severe) Study

**Imatinib** is predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical

**Isoniazid** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Unknown) Theoretical Also see Table 1 p. 1264

**Ivacaftor** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Lapatinib** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Linagliptin** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Macrolides (azithromycin)** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Macrolides (clarithromycin)** are predicted to markedly increase the exposure to lomitapide. Avoid. (Severe) Study

**Macrolides (erythromycin)** are predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical

**Nilotinib** is predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical

**Netupitant** is predicted to increase the exposure to lomitapide. Avoid. (Moderate) Theoretical

**Pazopanib** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Peppermint oil** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Pexelizumab (fluoxetine)** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Unknown) Theoretical

**Propiverine** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Ranolazine** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Rifampicin** is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Moderate) Theoretical

**Sibilities (fluoxetine)** are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. (Unknown) Theoretical
SSRIs (fluvoxamine) are predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical

Lomitapide increases the exposure to statins (atorvastatin). Adjust lomitapide dose or separate administration by 12 hours. [Mild] Study → Also see TABLE 1 p. 1264

Lomitapide increases the exposure to simvastatin. Monitor and adjust simvastatin dose, p. 198. [Moderate] Study → Also see TABLE 1 p. 1264

Tacrolimus is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical

Ticagrelor is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical

Tolvaptan is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical

Lomustine is predicted to decrease the exposure to antifungals, azoles (fluconazole). Adjust dose. [Mild] Theoretical

Lumacaftor is predicted to affect the exposure to aliskiren. [Moderate] Theoretical

Lumacaftor is predicted to decrease the exposure to antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone). Avoid. [Severe] Theoretical

Lumacaftor is predicted to decrease the exposure to antifungals, azoles (itraconazole, ketoconazole, voriconazole). [Moderate] Theoretical

Lumacaftor is predicted to decrease the exposure to antihistamines, non-sedating (fexofenadine). Monitor and adjust dose. [Moderate] Theoretical

Lumacaftor is predicted to decrease the exposure to bupropion. Adjust dose. [Moderate] Theoretical

Lumacaftor is predicted to decrease the exposure to circlosporin. Avoid. [Severe] Theoretical

Lumacaftor is predicted to affect the exposure to colchicine. [Moderate] Theoretical

Lumacaftor is predicted to affect the exposure to coumarins (warfarin). [Severe] Theoretical

Lumacaftor is predicted to affect the exposure to digoxin. Monitor and adjust dose. [Moderate] Theoretical

Lumacaftor is predicted to affect the exposure to edoxaban. [Moderate] Theoretical

Lumacaftor is predicted to decrease the exposure to everolimus. Avoid. [Severe] Theoretical

Lumacaftor is predicted to affect the exposure to H2 receptor antagonists (ranitidine). Monitor and adjust dose. [Moderate] Theoretical

Lumacaftor is predicted to affect the exposure to loperamide. [Moderate] Theoretical

Lumacaftor is predicted to decrease the exposure to macrolides (clarithromycin, erythromycin). [Moderate] Theoretical

Lumacaftor is predicted to decrease the exposure to midazolam. Avoid. [Severe] Theoretical

Lumacaftor is predicted to decrease the exposure to montelukast. [Moderate] Theoretical

Lumacaftor is predicted to decrease the exposure to NSAIDs (ibuprofen). Adjust dose. [Moderate] Theoretical

Lumacaftor is predicted to decrease the exposure to proton pump inhibitors (esomeprazole, lansoprazole, omeprazole). Adjust dose. [Moderate] Theoretical

Lumacaftor is predicted to decrease the exposure to repaglinide. Adjust dose. [Moderate] Theoretical

Lumacaftor is predicted to decrease the exposure to rifabutin. Adjust dose. [Moderate] Theoretical

Lumacaftor is predicted to decrease the exposure to sirolimus. Avoid. [Severe] Theoretical

Lumacaftor is predicted to decrease the exposure to SSRLs. (citalopram, escitalopram, sertraline). Adjust dose. [Moderate] Theoretical

Lumacaftor is predicted to decrease the exposure to tacrolimus. Avoid. [Severe] Theoretical
Lumacaftor — Macrolides

Lumacaftor (continued)

▶ Aprepitant is predicted to affect the exposure to temsirolimus. [Severe] Theoretical
▶ Lumacaftor is predicted to decrease the exposure to topotecan. [Moderate] Theoretical

Lumeferon fume → see antimalarials

Lurasidone → see TABLE 8 p. 1265 (hypotension), TABLE 11 p. 1266 (CNS depressant effects)

▶ Antiarrhythmics (dronedarone) are predicted to increase the exposure to lurasidone. [Moderate] Study
▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to lurasidone. Avoid. [Moderate] Study → Also see TABLE 11 p. 1266
▶ Antiinfective agents (clarithromycin, tsaunconazole, posaconazole) are predicted to increase the exposure to lurasidone. [Moderate] Study
▶ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to lurasidone. Avoid. [Severe] Study
▶ Enzalutamide is predicted to increase the exposure to lurasidone. Avoid. [Severe] Study

A1 1362 Lumacaftor — Macrolides

Macrolides → see TABLE 9 p. 1266 (QT-interval prolongation)

Azithromycin - clarithromycin - erythromycin

ROUTE-SPECIFIC INFORMATION
Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

▶ Clarithromycin is predicted to increase the exposure to abiraterone. [Severe] Theoretical
▶ Macrolides are predicted to increase the exposure to afatinib. Separate administration by 12 hours. [Moderate] Study
▶ Clarithromycin is predicted to markedly increase the exposure to aldosterone antagonists (eplerenone). Avoid. [Severe] Study
▶ Erythromycin is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 185. [Severe] Study
▶ Azithromycin is predicted to increase the exposure to aliskiren. [Moderate] Theoretical
▶ Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to aliskiren. [Moderate] Study
▶ Clarithromycin increases the exposure to almotriptan. [Mild] Study
▶ Clarithromycin is predicted to moderately increase the exposure to alpha blockers (alfuzosin, tamsulosin). Use with caution or avoid. [Moderate] Study
▶ Clarithromycin is predicted to increase the exposure to alpha blockers (doxazosin). [Moderate] Study
▶ Erythromycin is predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical
▶ Clarithromycin moderately increases the exposure to alprazolam. Avoid. [Moderate] Study
▶ Erythromycin is predicted to increase the exposure to alprazolam. [Severe] Study
▶ Azithromycin is predicted to increase the exposure to aminophylline. [Moderate] Theoretical
▶ Clarithromycin is predicted to increase the exposure to aminophylline. Adjust aminophylline dose. [Moderate] Theoretical
▶ Aminophylline is predicted to decrease the exposure to erythromycin. Adjust dose. [Severe] Study
▶ Clarithromycin very markedly increases the exposure to antiarrhythmics (dronedarone). Avoid. [Severe] Study → Also see TABLE 9 p. 1266
▶ Erythromycin is predicted to moderately increase the exposure to antiarrhythmics (dronedarone). Avoid. [Severe] Theoretical
▶ Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to antiarrhythmics (lidocaine). [Moderate] Theoretical
▶ Clarithromycin is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. [Severe] Study
▶ Erythromycin is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. [Moderate] Study
▶ Clarithromycin is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. [Moderate] Study
▶ Clarithromycin slightly increases the concentration of antiepileptics (carbamazepine). Monitor carbamazepine concentration and adjust dose. [Severe] Study
▶ Erythromycin markedly increases the concentration of antiepileptics (carbamazepine). Monitor carbamazepine concentration and adjust dose. [Severe] Study
▶ Clarithromycin is predicted to slightly increase the exposure to antiepileptics (perampanel). [Mild] Study
Clarithromycin is predicted to increase the exposure to antifungals, azoles (isavuconazole). Avoid or monitor side effects. [Severe] Study

Erythromycin is predicted to increase the exposure to antifungals, azoles (isavuconazole). [Moderate] Theoretical

Clarithromycin is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). Avoid. [Severe] Study

Erythromycin is predicted to increase the exposure to antihistamines, non-sedating (mizolastine). [Severe] Theoretical

Clarithromycin is predicted to increase the exposure to antimalarials (artemether) with lumefantrine. [Moderate] Study → Also see TABLE 9 p. 1266

Macrolides (clarithromycin, erythromycin) are predicted to increase the concentration of antimalarials (piperaquine). [Severe] Theoretical

Clarithromycin is predicted to increase the exposure to apixaban. Avoid. [Severe] Theoretical

Erythromycin is predicted to increase the exposure to apixaban. [Moderate] Theoretical

Clarithromycin is predicted to markedly increase the exposure to aprepitant. [Moderate] Study

Clarithromycin is predicted to slightly increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 376. [Moderate] Study

Clarithromycin is predicted to increase the exposure to axitinib. [Moderate] Study

Erythromycin is predicted to increase the exposure to axitinib. [Moderate] Theoretical

Clarithromycin is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Study → Also see TABLE 9 p. 1266

Erythromycin is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical

Macrolides are predicted to increase the exposure to beta blockers, non-selective (nadolol). [Moderate] Study

Clarithromycin is predicted to increase the exposure to beta-agonists (salmeterol). Avoid. [Severe] Study

Clarithromycin slightly increases the exposure to bortezomib. [Moderate] Study

Clarithromycin is predicted to increase the exposure to bosentan. [Moderate] Theoretical

Clarithromycin is predicted to markedly increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Study → Also see TABLE 9 p. 1266

Erythromycin is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. [Severe] Theoretical

Clarithromycin is predicted to increase the exposure to buprine. Adjust buprine dose, p. 325. [Severe] Study

Erythromycin is predicted to increase the exposure to buprine. Use with caution and adjust dose. [Moderate] Study

Clarithromycin slightly increases the exposure to cabozantinib. [Moderate] Study → Also see TABLE 9 p. 1266

Erythromycin is predicted to increase the exposure to cabozantinib. [Moderate] Theoretical

Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study

Erythromycin is predicted to increase the exposure to calcium channel blockers (diltiazem). [Severe] Theoretical

Clarithromycin is predicted to increase the exposure to calcium channel blockers (diltiazem, verapamil). [Severe] Study

Clarithromycin is predicted to markedly increase the exposure to calcium channel blockers (lercanidipine). Avoid. [Severe] Study

Erythromycin is predicted to increase the exposure to calcium channel blockers (verapamil). [Severe] Study

Clarithromycin is predicted to increase the exposure to cannabis extract. Use with caution and adjust dose. [Moderate] Theoretical

Clarithromycin is predicted to increase the exposure to certinib. Avoid or adjust certinib dose, p. 895. [Severe] Study → Also see TABLE 9 p. 1266

Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to certinib. [Moderate] Theoretical

Macrolides (clarithromycin, erythromycin) increase the concentration of ciclosporin. [Severe] Study

Clarithromycin is predicted to moderately increase the exposure to cilostazol. Adjust cilostazol dose, p. 226. [Moderate] Study

Erythromycin slightly increases the exposure to cilostazol. Adjust cilostazol dose, p. 226. [Moderate] Study

Clarithromycin is predicted to moderately increase the exposure to cinacalcet. Adjust dose. [Moderate] Study

Clarithromycin is predicted to markedly increase the exposure to cobimetinib. Avoid or monitor for toxicity. [Severe] Study

Erythromycin is predicted to increase the exposure to cobimetinib. [Severe] Theoretical

Azithromycin is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose, p. 1020. [Severe] Theoretical

Clarithromycin is predicted to increase the exposure to colchicine. Avoid or adjust colchicine dose, p. 1020. [Severe] Study

Erythromycin is predicted to increase the exposure to colchicine. Adjust colchicine dose, p. 1020. [Severe] Study

Clarithromycin is predicted to increase the exposure to corticosteroids (budesonide). Avoid. [Severe] Study

Clarithromycin is predicted to increase the exposure to corticosteroids (ciclesonide). Avoid. [Moderate] Theoretical

Clarithromycin is predicted to increase the risk of side-effects when given with corticosteroids (triamcinolone). [Severe] Theoretical

Macrolides (clarithromycin, erythromycin) increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Anecdotal

Clarithromycin is predicted to moderately increase the exposure to crizotinib. Avoid. [Moderate] Study → Also see TABLE 9 p. 1266

Erythromycin is predicted to increase the exposure to crizotinib. [Moderate] Theoretical

Macrolides (azithromycin, clarithromycin, erythromycin) are predicted to increase the exposure to dabigatran. [Moderate] Theoretical

Clarithromycin is predicted to increase the exposure to dabrafenib. Use with caution or avoid. [Moderate] Study

Clarithromycin is predicted to moderately increase the exposure to dacitoxsvir. Adjust dacitoxsvir dose, p. 591. [Moderate] Study

Clarithromycin is predicted to markedly to very markedly increase the exposure to darifenacin. Avoid. [Severe] Study

Erythromycin is predicted to slightly increase the exposure to darifenacin. [Severe] Study

Clarithromycin is predicted to markedly increase the exposure to dasatinib. Avoid. [Severe] Study → Also see TABLE 9 p. 1266

Erythromycin is predicted to increase the exposure to dasatinib. [Severe] Study

Clarithromycin very slightly increases the exposure to delamanid. [Severe] Study → Also see TABLE 9 p. 1266

Macrolides increase the concentration of digoxin. [Severe] Anecdotal

Macrolides (clarithromycin, erythromycin) increase the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study

Clarithromycin increases the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Study

Erythromycin is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical
Appendix 1

Macrolides

- Clarithromycin is predicted to increase the exposure to dutasteride. Monitor side effects and adjust dose. **Moderate**
- Theoretical

- Erythromycin is predicted to moderately increase the exposure to dutasteride. **Moderate** Study
- Erythromycin slightly increases the exposure to edoxaban. Adjust edoxaban dose, p. 122. **Severe** Study

- Macrolides (azithromycin, clarithromycin) are predicted to slightly increase the exposure to edoxaban. **Severe** Theoretical Study
- Efavirenz decreases the exposure to clarithromycin. **Moderate** Study

- Clarithromycin slightly to moderately increases the exposure to elbasvir. Avoid. **Severe** Study
- Clarithromycin is predicted to markedly increase the exposure to eletriptan. Avoid. **Severe** Study
- Erythromycin moderately increases the exposure to eletriptan. Avoid. **Moderate** Study

- Clarithromycin is predicted to increase the risk of ergotism when given with ergotamine. Avoid. **Severe** Theoretical Study
- Erythromycin is predicted to increase the risk of ergotism when given with ergotamine. Avoid. **Severe** Theoretical Study
- Clarithromycin is predicted to slightly increase the exposure to erlotinib. Use with caution and adjust dose. **Moderate** Study
- Macrolides (azithromycin, erythromycin) are predicted to increase the exposure to erlotinib. **Moderate** Theoretical Study
- Etatravine decreases the exposure to clarithromycin. **Severe** Study

- Clarithromycin is predicted to increase the concentration of everolimus. Avoid. **Severe** Study
- Erythromycin is predicted to increase the concentration of everolimus. Avoid or adjust dose. **Moderate** Study
- Clarithromycin is predicted to moderately increase the exposure to fosoterodine. Adjust fosoterodine dose; avoid in hepatic and renal impairment, p. 732. **Severe** Study
- Erythromycin is predicted to increase the exposure to fosoterodine. Adjust fosoterodine dose in hepatic and renal impairment, p. 732. **Mild** Study
- Macrolides are predicted to increase the exposure to fidaxomicin. Avoid. **Moderate** Study
- Clarithromycin is predicted to increase the exposure to fosaprepitant. **Moderate** Theoretical
- Clarithromycin is predicted to increase the exposure to gefitinib. **Moderate** Study
- Erythromycin is predicted to increase the exposure to gefitinib. **Moderate** Theoretical
- Clarithromycin is predicted to moderately to markedly increase the exposure to grazoprevir. Avoid. **Severe** Study
- Clarithromycin is predicted to increase the exposure to guanfacine. Adjust guanfacine dose, p. 335. **Moderate** Study
- Erythromycin is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 335. **Moderate** Theoretical
- H2 receptor antagonists (cimetidine) slightly increase the exposure to erythromycin. **Moderate** Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, ritonavir) slightly to moderately increase the exposure to clarithromycin. Adjust dose in renal impairment. **Severe** Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, ritonavir, tipranavir) are predicted to increase the exposure to erythromycin. **Severe** Theoretical Study
- Clarithromycin increases the exposure to HIV-protease inhibitors (saquinavir) and HIV-protease inhibitors (saquinavir) increase the exposure to clarithromycin. Avoid. **Severe** Study → Also see TABLE 9 p. 1266
- Erythromycin is predicted to increase the exposure to HIV-protease inhibitors (saquinavir). Avoid. **Severe** Theoretical
- Clarithromycin is predicted to very markedly increase the exposure to ibrutinib. Avoid or adjust ibrutinib dose, p. 902. **Severe** Study
- Erythromycin is predicted to increase the exposure to ibritunib. Avoid or adjust ibritunib dose, p. 902. **Severe** Theoretical Study
- Clarithromycin is predicted to increase the exposure to imatinib. **Moderate** Study
- Erythromycin is predicted to increase the exposure to imatinib. **Moderate** Theoretical Study
- Clarithromycin is predicted to increase the risk of toxicity when given with rituximab. Avoid. **Moderate** Study
- Clarithromycin is predicted to increase the exposure to ivabradine. Avoid. **Severe** Study
- Erythromycin is predicted to increase the exposure to ivabradine. Avoid. **Severe** Theoretical Study
- Clarithromycin is predicted to increase the exposure to ivacaftor. Adjust ivacaftor or lumacaftor with ivacaftor dose, p. 281. **Severe** Study
- Erythromycin is predicted to increase the exposure to ivacaftor. Adjust ivacaftor dose, p. 281. **Severe** Study
- Clarithromycin is predicted to increase the exposure to lapatinib. Avoid. **Moderate** Study → Also see TABLE 9 p. 1266
- Erythromycin is predicted to increase the exposure to lapatinib. **Moderate** Study
- Azithromycin is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. **Moderate** Theoretical Study
- Clarithromycin is predicted to markedly increase the exposure to lurasidone. Avoid. **Severe** Study
- Erythromycin is predicted to increase the exposure to lurasidone. Avoid. **Moderate** Theoretical Study
- Clarithromycin is predicted to increase the exposure to maraviroc. Adjust dose. **Severe** Study
- Clarithromycin is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust midazolam dose. **Severe** Study
- Erythromycin is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. **Severe** Study
- Clarithromycin is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 736. **Moderate** Study
- Clarithromycin is predicted to increase the exposure to mirtazapine. **Moderate** Study
- Clarithromycin is predicted to increase the exposure to modafinil. **Mild** Theoretical
- Clarithromycin increases the risk of neutropenia when given with monoclonal antibodies (brentuximab vedotin). Monitor and adjust dose. **Severe** Theoretical Study
- Clarithromycin is predicted to increase the exposure to monoclonal antibodies (trastuzumab emtansine). Avoid. **Severe** Theoretical
- Clarithromycin is predicted to markedly increase the exposure to naxogol. Avoid. **Severe** Study
- Erythromycin is predicted to increase the exposure to naxogol. Adjust naxogol dose and monitor side effects, p. 63. **Moderate** Study
- Clarithromycin is predicted to increase the exposure to netupitant. **Mild** Study
- Nevirapine decreases the exposure to clarithromycin. **Moderate** Study
- Clarithromycin is predicted to moderately increase the exposure to nilotinib. Avoid. **Severe** Study → Also see TABLE 9 p. 1286
- Erythromycin is predicted to increase the exposure to nilotinib. **Moderate** Theoretical Study
- Clarithromycin is predicted to increase the exposure to nilotinib. **Moderate** Theoretical Study
- Macrolides are predicted to increase the exposure to nintedanib. **Moderate** Study
- Clarithromycin is predicted to increase the exposure to nitidine. **Severe** Study
Macrolides – Macrolides 1365

- Clarithromycin is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Study
- Erythromycin is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Theoretical
- Clarithromycin is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl,oxycodeone). Monitor and adjust dose. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodeone, sufentanil). Monitor and adjust dose. [Severe] Study
- Clarithromycin is predicted to increase the exposure to opioids (methadone). [Moderate] Theoretical → Also see TABLE 9 p. 1266
- Erythromycin is predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical
- Clarithromycin is predicted to increase the exposure to oxybutynin. [Mild] Theoretical
- Clarithromycin is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose, p. 909. [Severe] Study
- Clarithromycin is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 864. [Moderate] Study → Also see TABLE 9 p. 1266
- Clarithromycin is predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study
- Clarithromycin is predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose, p. 909. [Moderate] Study → Also see TABLE 9 p. 1266
- Erythromycin is predicted to increase the exposure to pazopanib. [Moderate] Theoretical
- Erythromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 765. [Moderate] Theoretical
- Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. [Severe] Study → Also see TABLE 9 p. 1266
- Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Avoid or adjust sildenafil dose, p. 766. [Severe] Study → Also see TABLE 9 p. 1266
- Erythromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor and adjust sildenafil dose, p. 766. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). Use with caution or avoid. [Severe] Study
- Erythromycin is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). [Severe] Theoretical
- Clarithromycin is predicted to increase the exposure to pimozide. Avoid. [Severe] Study → Also see TABLE 9 p. 1266
- Erythromycin is predicted to increase the exposure to pimozide. Avoid. [Severe] Theoretical
- Clarithromycin is predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose, p. 911. [Moderate] Study
- Clarithromycin is predicted to moderately increase the exposure to praziquantel. [Mild] Study
- Clarithromycin is predicted to increase the exposure to quetiapine. Avoid. [Severe] Study
- Erythromycin is predicted to increase the exposure to quetiapine. Avoid. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to ranolazine. Avoid. [Severe] Study → Also see TABLE 9 p. 1266
- Erythromycin is predicted to increase the exposure to ranolazine. [Severe] Study
- Clarithromycin is predicted to increase the exposure to reboxetine. Avoid. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to regorafenib. Avoid. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to repaglinide. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to ranolazine. Avoid. [Severe] Study
- Clarithromycin is predicted to increase the concentration of sirolimus. Avoid. [Severe] Theoretical
- Clarithromycin is predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical
- Clarithromycin is predicted to increase the concentration of temsirolimus. [Moderate] Theoretical
- Clarithromycin is predicted to increase the exposure to retinooids (alitretinoin). Adjust alitretinoin dose, p. 1157. [Moderate] Theoretical
- Azithromycin increases the risk of neutropenia when given with rifabutin. [Severe] Study
- Clarithromycin increases the risk of uveitis when given with rifabutin. Adjust dose. [Severe] Study
- Rifampicin decreases the concentration of clarithromycin. [Severe] Study
- Clarithromycin is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study → Also see TABLE 9 p. 1266
- Clarithromycin is predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study
- Erythromycin is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
- Clarithromycin is predicted to increase the exposure to saxagliptin. [Mild] Study
- Erythromycin is predicted to increase the exposure to saxagliptin. [Mild] Theoretical
- Clarithromycin is predicted to increase the concentration of simvastatin. [Severe] Study
- Clarithromycin is predicted to increase the concentration of sirolimus. Monitor and adjust dose. [Moderate] Study
- Clarithromycin is predicted to increase the exposure to sofinafenac. Adjust sofinafenac or tamsulosin with sofinafenac dose; in hepatic and renal impairment, p. 734, p. 740. [Severe] Study
- Erythromycin is predicted to moderately increase the exposure to SSRIs (dapoxetine). Adjust or avoid dapoxetine dose, p. 773. [Severe] Study
- Erythromycin is predicted to increase the exposure to SSRIs (dapoxetine). Adjust dapoxetine dose, p. 773. [Moderate] Theoretical
- Clarithromycin is predicted to increase the exposure to statins (atorvastatin). Avoid or adjust dose and monitor rhabdomyolysis. [Severe] Study
- Erythromycin is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. [Severe] Theoretical
- Clarithromycin moderately increases the exposure to statins (pravastatin). [Severe] Study
- Erythromycin is predicted to increase the exposure to statins (pravastatin). [Severe] Theoretical
- Clarithromycin is predicted to increase the exposure to statins (simvastatin). Avoid. [Severe] Study
- Erythromycin is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 198. [Severe] Study
- Clarithromycin is predicted to slightly increase the exposure to sulfonylureas. [Moderate] Theoretical
- Clarithromycin is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 914. [Moderate] Study → Also see TABLE 9 p. 1266
- Erythromycin is predicted to increase the exposure to sunitinib. [Moderate] Theoretical
- Clarithromycin is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study
- Erythromycin is predicted to increase the concentration of tacrolimus. [Severe] Study
- Clarithromycin is predicted to increase the exposure to taxanes (cabazitaxel). Avoid. [Severe] Study
- Erythromycin is predicted to increase the exposure to taxanes (cabazitaxel). [Moderate] Theoretical
- Clarithromycin is predicted to moderately increase the exposure to taxanes (docetaxel). Avoid or adjust dose. [Severe] Study
- Clarithromycin is predicted to increase the exposure to taxanes (docetaxel). [Severe] Theoretical
- Erythromycin is predicted to increase the exposure to taxanes (docetaxel). [Moderate] Theoretical
- Clarithromycin is predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical
- Erythromycin is predicted to increase the concentration of temsirolimus. [Moderate] Theoretical
Macrolides (continued)

- **Erythromycin** decreases the clearance of **theophylline** and **theophylline** potentially decreases the clearance of erythromycin. Adjust dose. [Severe] Study
- **Macrolides** (azithromycin, clarithromycin) are predicted to increase the exposure to **theophylline**. Adjust dose. [Moderate] Anecdotal
- **Azithromycin** is predicted to increase the exposure to **ticagrelor**. Use with caution or avoid. [Severe] Study
- **Clarithromycin** is predicted to markedly increase the exposure to **ticagrelor**. Avoid. [Severe] Study
- **Clarithromycin** is predicted to increase the exposure to **tolterodine**. Avoid. [Severe] Study ○ Also see [TABLE 9] p. 1266
- **Erythromycin** is predicted to increase the exposure to **tolterodine**. [Theoretical]
- **Clarithromycin** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Severe] Study
- **Erythromycin** is predicted to increase the exposure to **tolvaptan**. Adjust dose. [Moderate] Theoretical
- **Macrolides** are predicted to increase the exposure to **topotecan**. [Severe] Study
- **Clarithromycin** is predicted to increase the exposure to **toremifene**. [Moderate] Theoretical ○ Also see [TABLE 9] p. 1266
- **Clarithromycin** is predicted to increase the exposure to **trabectedin**. Avoid or adjust dose. [Severe] Theoretical
- **Macrolides** are predicted to increase the concentration of **trametinib**. [Moderate] Theoretical
- **Clarithromycin** is predicted to moderately increase the exposure to **trazodone**. Avoid or adjust dose. [Moderate] Study
- **Erythromycin** is predicted to increase the exposure to **trazodone**. [Moderate] Theoretical
- **Clarithromycin** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Severe] Study
- **Erythromycin** is predicted to increase the exposure to **ulipristal**. Avoid if used for uterine fibroids. [Moderate] Study
- **Clarithromycin** is predicted to increase the exposure to **vemurafenib**. [Severe] Theoretical ○ Also see [TABLE 9] p. 1266
- **Azithromycin** is predicted to increase the exposure to **venetoclax**. Avoid or monitor for toxicity. [Severe] Theoretical
- **Macrolides** (clarithromycin, erythromycin) are predicted to increase the exposure to **venetoclax**. Avoid or adjust venetoclax dose. p. 919. [Severe] Study
- **Clarithromycin** is predicted to increase the exposure to **venlafaxine**. [Moderate] Study ○ Also see [TABLE 9] p. 1266
- **Macrolides** (clarithromycin, erythromycin) are predicted to increase the exposure to **vinca alkaloids**. [Severe] Theoretical
- **Clarithromycin** is predicted to increase the exposure to vitamin D substances (paricalcitol). [Moderate] Study
- **Clarithromycin** decreases the absorption of **zidovudine**. Separate administration by at least 2 hours. [Moderate] Study
- **Clarithromycin** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Theoretical
- **Erythromycin** is predicted to increase the exposure to **zopiclone**. Adjust dose. [Moderate] Study

**Magnesium**

- **Oral magnesium** decreases the absorption of **bisphosphonates (alendronic acid)**. Alendronic acid should be taken at least 30 minutes before magnesium. [Moderate] Study
- **Oral magnesium** is predicted to decrease the absorption of oral bisphosphonates (ibandronic acid). Avoid magnesium for at least 6 hours before or 1 hour after ibandronic acid. [Moderate] Theoretical
- **Oral magnesium** decreases the absorption of **bisphosphonates (risendronate)**. Separate administration by at least 2 hours. [Moderate] Study
- **Oral magnesium** decreases the absorption of bisphosphonates **(sodium clodronate)**. Avoid magnesium for 2 hours before or 1 hour after sodium clodronate. [Moderate] Study
- **Intravenous magnesium** potentially increases the risk of hypotension when given with calcium channel blockers **(amlodipine, clevidipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine, verapamil)** in pregnant women. [Severe] Anecdotal
- **Intravenous magnesium** increases the effects of **neuromuscular blocking drugs, non-depolarising**. [Moderate] Study
- **Intravenous magnesium** is predicted to increase the effects of **suxamethonium**. [Moderate] Study
- **Magnesium carbonate** → see antacids
- **Magnesium trisilicate** → see antacids

**Maraviroc**

- **Antiepileptics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to maraviroc. Adjust dose. [Severe] Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** markedly increase the exposure to maraviroc. Adjust dose. [Severe] Study
- **Bosentan** is predicted to decrease the exposure to maraviroc. Avoid. [Moderate] Theoretical
- **Cobicistat** markedly increases the exposure to maraviroc. Refer to specialist literature. [Severe] Study
- **Efavirenz** decreases the exposure to maraviroc. Refer to specialist literature. [Severe] Theoretical
- **Enzalutamide** is predicted to decrease the exposure to maraviroc. Adjust dose. [Severe] Study
- **Etravirine** (with a boosted protease inhibitor) increases the exposure to maraviroc. Avoid or adjust dose. [Moderate] Study
- **HIV-protease inhibitors (atazanavir, darunavir, lopinavir, ritonavir, saquinavir)** increase the exposure to maraviroc. Refer to specialist literature. [Severe] Study
- **Maraviroc** potentially decreases the exposure to HIV-protease inhibitors **(fosamprenavir)** and HIV-protease inhibitors **(fosamprenavir)** potentially decrease the exposure to maraviroc. Avoid. [Severe] Study
- **Idelalisib** markedly increases the exposure to maraviroc. Adjust dose. [Severe] Theoretical
- **Macrolides** (clarithromycin) are predicted to markedly increase the exposure to maraviroc. Adjust dose. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to maraviroc. Adjust dose. [Severe] Study
- **St John’s Wort** is predicted to decrease the exposure to maraviroc. Avoid. [Severe] Theoretical

**Medicines affecting platelet function**

- **Measles, mumps and rubella vaccine, live** → see live vaccines
- **Mebendazole**
  - H2 receptor antagonists (cimetidine) increase the concentration of mebendazole. [Moderate] Study
- **Medroxyprogesterone**
  - **Sugammadex** is predicted to decrease the exposure to medroxyprogesterone. Use additional contraceptive precautions. [Severe] Theoretical
- **Mefenamic acid** → see NSAIDs
- **Mefloquine** → see antimalarials
- **Melatonin** → see [TABLE 11] p. 1266 (CNS depressant effects)
- **Combined hormonal contraceptives** are predicted to increase the exposure to melatonin. [Moderate] Theoretical
- **Quinolones (ciprofloxacin)** are predicted to increase the exposure to melatonin. [Moderate] Theoretical
- **SSRIs (fluvoxamine)** very markedly increase the exposure to melatonin. Avoid. [Severe] Study
- **Meloxicam** → see NSAIDs
- **Melphalan** → see alkylating agents
- **Mempamine**
  - Dopamine receptor agonists (amantadine) increase the risk of CNS toxicity when given with memantine. Use with caution or avoid. [Severe] Theoretical
  - Memantine is predicted to increase the effects of dopamine receptor agonists **(apomorphine, bromocriptine, cabergoline, pergolide, pramipexole, quinagolide, ropinirole, rotigotine)**. [Moderate] Theoretical
  - Memantine is predicted to increase the risk of CNS side-effects when given with **ketamine**. Avoid. [Severe] Theoretical
  - Memantine is predicted to increase the effects of levodopa. [Moderate] Theoretical
- **Mepacrine**
  - **Mepacrine** is predicted to increase the concentration of antimalarials **(primamquine)**. Avoid. [Moderate] Theoretical
- **Mepivacaine** → see anaesthetics, local
- **Mepolizumab** → see monoclonal antibodies
- **Meprobamate** → see [TABLE 11] p. 1266 (CNS depressant effects)
Meptazinol ▶ see opioids
Mercaptopurine ▶ see TABLE 1 p. 1264 (hepatotoxicity), TABLE 15 p. 1267 (myelosuppression)
▶ Allopurinol potentially increases the risk of haematological toxicity when given with mercaptopurine. Adjust mercaptopurine dose. [Severity] Severe
▶ Mercaptopurine decreases the anticoagulant effect of coumarins. [Severity] Moderate
▶ Febuxostat is predicted to increase the exposure to mercaptopurine. Avoid. [Severity] Severe
▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with mercaptopurine. Public Health England advises avoid. [Severity] Severe
Metoponem ▶ see carbapenems
Mesalazine
ROUTE-SPECIFIC INFORMATION The manufacturers of some mesalazine gastro-resistant and modified-release medicines (Asacol MR tablets, Ipocol, Salofalk granules) suggest that preparations that lower stool pH (e.g. lactulose) might prevent the release of mesalazine.
Metaraminol ▶ see sympathomimetics, vasoconstrictor
Metformin ▶ see TABLE 14 p. 1267 (antidiabetic drugs)
FOOD AND LIFESTYLE Excessive alcohol consumption might increase the risk of lactic acidosis with metformin.
▶ Dolutegravir slightly to moderately increases the exposure to metformin. Use with caution and adjust dose. [Severity] Severe
▶ H2 receptor antagonists (cimetidine) slightly increase the exposure to metformin. Monitor and adjust dose. [Severity] Moderate
▶ Pitolistan is predicted to increase the exposure to metformin. [Severity] Unknown
▶ Vandetanib slightly increases the exposure to metformin. Monitor and adjust dose. [Severity] Moderate
Methadone ▶ see opioids
Methenamine is predicted to decrease the efficacy of methotrexate. Avoid. [Severity] Moderate
▶ Acetazolamide is predicted to decrease the efficacy of methotrexate. Avoid. [Severity] Moderate
▶ Potassium citrate is predicted to decrease the efficacy of methotrexate. Avoid. [Severity] Moderate
▶ Sodium bicarbonate is predicted to decrease the efficacy of methotrexate. Avoid. [Severity] Moderate
▶ Sodium citrate is predicted to decrease the efficacy of methotrexate. Avoid. [Severity] Moderate
▶ Methotrexate ▶ see TABLE 11 p. 1266 (CNS depressant effects)
▶ Methotrexate ▶ see TABLE 1 p. 1264 (hepatotoxicity), TABLE 15 p. 1267 (myelosuppression), TABLE 2 p. 1264 (nephrotoxicity), TABLE 5 p. 1264 (tromboembolism)
▶ Acetazolamide increases the urinary excretion of methotrexate. [Severity] Moderate
▶ Methotrexate is predicted to decrease the clearance of aminophylline. [Severity] Moderate
▶ Antiepileptics (levetiracetam) decrease the clearance of methotrexate. [Severity] Severe
▶ Antimalarials (pyrimethamine) are predicted to increase the risk of side-effects when given with methotrexate. [Severity] Severe
▶ Asparaginase affects the efficacy of methotrexate. [Severity] Severe
▶ Aspirin (high-dose) is predicted to increase the risk of toxicity when given with methotrexate. [Severity] Severe
▶ Crisantaspase affects the efficacy of methotrexate. [Severity] Severe
▶ Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with methotrexate. Public Health England advises avoid. [Severity] Severe
▶ NSAIDs are predicted to increase the risk of toxicity when given with methotrexate. Monitor and adjust dose. [Severity] Severe
▶ Pegaspargase affects the efficacy of methotrexate. [Severity] Severe
▶ Penicillins are predicted to increase the risk of toxicity when given with methotrexate. [Severity] Severe
▶ Proton pump inhibitors decrease the clearance of methotrexate. Use with caution or avoid. [Severity] Severe
▶ Quinolones (ciprofloxacin) potentially increase the risk of toxicity when given with methotrexate. Avoid. [Severity] Severe
▶ Regorafenib is predicted to increase the exposure to methotrexate. [Severity] Severe
▶ Retinoids (acitretin) are predicted to increase the concentration of methotrexate. Avoid. [Severity] Moderate
▶ Methotrexate is predicted to decrease the efficacy of sarpopterin. [Severity] Moderate
▶ Sulfonamides are predicted to increase the exposure to methotrexate. Use with caution or avoid. [Severity] Severe
▶ Tedizolid is predicted to increase the exposure to methotrexate. Avoid. [Severity] Moderate
▶ Methotrexate is predicted to increase the risk of toxicity when given with tegafur. [Severity] Severe
▶ Methotrexate decreases the clearance of theophylline. [Severity] Moderate
▶ Trimethoprim is predicted to increase the risk of side-effects when given with methotrexate. Avoid. [Severity] Severe
▶ Methotrexate is predicted to decrease the effects of apomorphine. Avoid. [Severity] Severe
▶ Methotrexate is predicted to increase the risk of elevated blood pressure when given with linzolide. Avoid. [Severity] Severe
▶ Methylenediphenylated is predicted to increase the risk of a hypertensive crisis when given with moclomide. [Severity] Severe
▶ Methylenidium chloride is predicted to increase the risk of severe hypertension when given with bupropion. Avoid. [Severity] Severe
▶ Metoclopromide ▶ see TABLE 13 p. 1267 (serotonin syndrome)
▶ Methylenidium chloride is predicted to increase the risk of severe hypertension when given with bupropion. Avoid. [Severity] Severe
▶ Metclopromide is predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Avoid. [Severity] Moderate
▶ Metclopromide decreases the concentration of antimalarials (atovaquone). Avoid. [Severity] Moderate
▶ Metclopromide is predicted to decrease the effects of dopamine receptor agonists (apomorphine, bromocriptine, cabergoline, pergolide, pramipexole, quinagolide, ropinirole, rotigotine). Avoid. [Severity] Moderate
▶ Metclopromide decreases the effects of levodopa. Avoid. [Severity] Moderate
▶ Metclopromide is predicted to increase the effects of neuromuscular blocking drugs, non-depolarising. [Severity] Moderate
▶ Metclopromide increases the effects of suxamethonium. [Severity] Moderate
▶ Metolazone ▶ see thiazide diuretics
▶ Metoprolol ▶ see beta blockers, selective
Metrodinazole ▶ see TABLE 12 p. 1267 (peripheral neuropathy)
▶ Disulfiram-like reaction can occur on the ingestion of alcohol. Ensure that alcohol is not consumed for at least
48 hours after stopping miconazole.

- **Miconazole** increases the risk of toxicity when given with alkylating agents (**busulfan**). *(Severe)* Study
- **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to miconazole. *(Moderate)* Study
- **Miconazole** is predicted to increase the risk of **capacitabine** p. 839 toxicity when given with **capacitabine**. *(Severe)* Theoretical
- **Miconazole** increases the anticoagulant effect of **coumarins**. Monitor INR and adjust dose. *(Severe)* Study
- **Disulfiram** increases the risk of acute psychoses when given with **miconazole**. *(Severe)* Study  Also see **TABLE 12** p. 1267
- **Miconazole** increases the risk of toxicity when given with **fluourouracil**. *(Severe)* Study

**Metyrapone**

- **Antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the effects of metyrapone. Avoid. *(Moderate)* Study
- **Antihistamines, sedating (cyproheptadine)** decrease the effects of metyrapone. Avoid. *(Moderate)* Study
- **Carbamazepine** decreases the effects of metyrapone. Avoid. *(Moderate)* Theoretical
- **Combined hormonal contraceptives** decrease the effects of metyrapone. Avoid. *(Moderate)* Theoretical
- **Phenothiazines (chlorpromazine)** decrease the effects of metyrapone. Avoid. *(Moderate)* Theoretical
- **Propylthiouracil** is predicted to decrease the effects of metyrapone. Avoid. *(Moderate)* Theoretical
- **Tricyclic antidepressants (amitriptyline)** decrease the effects of metyrapone. Avoid. *(Moderate)* Theoretical

**Mianserin**  Also see **TABLE 13** p. 1267 (serotonin syndrome). **TABLE 11** p. 1266 (CNS depressant effects)

- **Antiepileptics (carbamazepine)** markedly decrease the exposure to mianserin. Adjust dose. *(Moderate)* Study
- **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to mianserin. *(Moderate)* Study  Also see **TABLE 11** p. 1266
- **Mianserin** is predicted to increase the risk of toxicity when given with **moclubemide**. Avoid and for 1 week after stopping mianserin. *(Severe)* Theoretical  Also see **TABLE 13** p. 1267
- **Mianserin** is predicted to increase the risk of toxicity when given with **monoamine-oxidase A and B inhibitors, irreversible**. Avoid and for 14 days after stopping the MAOI. *(Severe)* Theoretical  Also see **TABLE 13** p. 1267
- **Mianserin** is predicted to decrease the efficacy of **pitolisant**. *(Unknown)* Theoretical
- **Mianserin** decreases the effects of sympathomimetics, vasoconstrictor (**ephedrine**). *(Severe)* Anecdotal

**Micafungin**  Also see **TABLE 1** p. 1264 (hepatotoxicity)

- **Micafungin** slightly increases the exposure to **amphotericin**. Avoid or monitor toxicity. *(Moderate)* Study

**Miconazole**  Also see **antifungals, azoles**

**Miconazole** is predicted to increase the exposure to **midazolam**. Monitor side effects and adjust dose. *(Severe)* Study

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to miconazole. *(Moderate)* Study  Also see **TABLE 11** p. 1266
- **Antifungals, azoles (fluconazole, itraconazole, ketoconazole)** are predicted to increase the exposure to miconazole. Monitor side effects and adjust dose. *(Moderate)* Study
- **Antifungals, azoles (miconazole)** are predicted to increase the exposure to intravenous miconazole. Use with caution and adjust dose. *(Moderate)* Theoretical
- **Antifungals, azoles (miconazole)** are predicted to increase the exposure to oral **midazolam**. Avoid. *(Moderate)* Theoretical
- **Aprepitant** is predicted to increase the exposure to miconazole. Monitor side effects and adjust dose. *(Severe)* Study
- **Boventan** is predicted to decrease the concentration of midazolam. Monitor and adjust dose. *(Moderate)* Theoretical
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. *(Severe)* Study
- **Cobicistat** is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust midazolam dose. *(Severe)* Study
- **Crizotinib** is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. *(Severe)* Study
- **Darifenacin** decreases the exposure to midazolam. Monitor and adjust dose. *(Moderate)* Study
- **Efavirenz** is predicted to alter the effects of midazolam. Avoid. *(Moderate)* Theoretical
- **Enalaprilat** is predicted to decrease the exposure to midazolam. Monitor and adjust dose. *(Moderate)* Study
- **Fosaprepitant** slightly increases the exposure to midazolam. *(Moderate)* Study
- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust midazolam dose. *(Severe)* Study
- **HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. *(Severe)* Study
- **Idealisib** is predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust midazolam dose. *(Severe)* Study
- **Lumacaftor** is predicted to decrease the exposure to midazolam. Avoid. *(Severe)* Theoretical
- **Macrolides (clarithromycin)** are predicted to markedly to very markedly increase the exposure to midazolam. Avoid or adjust midazolam dose. *(Severe)* Study
- **Macrolides (erythromycin)** are predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. *(Severe)* Study
- **Netapentin** is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. *(Severe)* Study
- **Nevirapine** decreases the concentration of midazolam. Monitor and adjust dose. *(Moderate)* Study
- **Nilotinib** is predicted to decrease the exposure to midazolam. Monitor side effects and adjust dose. *(Severe)* Study
- **Palbociclib** increases the exposure to midazolam. *(Moderate)* Study
- **Rifampicin** is predicted to decrease the exposure to midazolam. Monitor and adjust dose. *(Moderate)* Study
- **St John’s Wort** moderately decreases the exposure to midazolam. Monitor and adjust dose. *(Moderate)* Study
- **Midodrine**  Also see sympathomimetics, vasoconstrictor

**Mifamurtide**

- **Ciclosporin** is predicted to decrease the efficacy of mifamurtide. Avoid. *(Severe)* Theoretical
- **Corticosteroids** are predicted to decrease the efficacy of mifamurtide. Avoid. *(Severe)* Theoretical
- **NSAIDs** (high-dose) are predicted to decrease the efficacy of mifamurtide. Avoid. *(Severe)* Theoretical
- **Pimecrolimus** is predicted to decrease the efficacy of mifamurtide. Avoid. *(Severe)* Theoretical
- **Sirolimus** is predicted to decrease the efficacy of mifamurtide. Avoid. *(Severe)* Theoretical
- **Tacrolimus** is predicted to affect the efficacy of mifamurtide. Avoid. *(Severe)* Theoretical

**Mifepristone**

- **Mifepristone** is predicted to decrease the efficacy of corticosteroids. Use with caution and adjust dose. *(Moderate)* Theoretical

**Minocycline**  Also see tetracyclines

**Minoxidil**  Also see **TABLE 8** p. 1265 (hypotension)

**Mirabegron**

- **Mirabegron** is predicted to increase the exposure to **aliskiren**. *(Mild)* Theoretical
- **Mirabegron** is predicted to increase the exposure to **antiarhythmics (flecainide)**. *(Severe)* Theoretical
Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 736. [Moderate] Study

Mirabegron is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine). [Mild] Theoretical

Mirabegron is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). [Moderate] Theoretical

Mirabegron is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). [Moderate] Study

Cobicistat is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 736. [Moderate] Study

Mirabegron is predicted to increase the exposure to colchicine. [Mild] Theoretical

Mirabegron is predicted to increase the exposure to dabigatran. [Severe] Theoretical

Mirabegron slightly increases the exposure to digoxin. Monitor digoxin concentration and adjust dose. [Severe] Study

Mirabegron is predicted to increase the exposure to edoxaban. [Mild] Theoretical

Mirabegron is predicted to increase the exposure to everolimus. [Mild] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir,perindinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 736. [Moderate] Study

Idelalisib is predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 736. [Moderate] Study

Mirabegron is predicted to increase the exposure to loperamide. [Mild] Theoretical

Macrolides (clarithromycin) are predicted to increase the exposure to mirabegron. Adjust mirabegron dose in hepatic and renal impairment, p. 736. [Moderate] Study

Mirabegron is predicted to increase the exposure to sirolimus. [Mild] Theoretical

Mirabegron is predicted to increase the exposure to taxanes (paclitaxel). [Mild] Theoretical

Mirabegron is predicted to increase the exposure to topotecan. [Mild] Theoretical

Mirtazapine → see TABLE 13 p. 1267 (serotonin syndrome), TABLE 11 p. 1266 (CNS depressant effects)

Antiepileptics (Carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to mirtazapine. Adjust dose. [Moderate] Study → Also see TABLE 11 p. 1266

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to mirtazapine. [Moderate] Study

Cobicistat is predicted to increase the exposure to mirtazapine. [Moderate] Study

Enalaprilat is predicted to decrease the exposure to mirtazapine. Adjust dose. [Moderate] Study

H2 receptor antagonists (cimetidine) slightly increase the exposure to mirtazapine. Use with caution and adjust dose. [Moderate] Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir,perindinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to mirtazapine. [Moderate] Study

Idelalisib is predicted to increase the exposure to mirtazapine. [Moderate] Study

Macrolides (clarithromycin) are predicted to increase the exposure to mirtazapine. [Moderate] Study

Mirtazapine is predicted to increase the efficacy of pitolisant. [Unknown] Theoretical

Rifampicin is predicted to decrease the exposure to mirtazapine. Adjust dose. [Moderate] Study

Mitomycin → see TABLE 15 p. 1267 (myelosuppression), TABLE 5 p. 1264 (thromboembolism)

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with mitomycin. Public Health England advises avoid. [Severe] Theoretical

Mitotane → see TABLE 15 p. 1267 (myelosuppression)

Aldosterone antagonists (spironolactone) are predicted to decrease the effects of mitotane. Avoid. [Severe] Anecdotal

Mitoxantrone → see antarhycines

Mivacurium → see neuromuscular blocking drugs, non-depolarising

Mizolastine → see antihistamines, non-sedating

Moclobemide → see TABLE 13 p. 1267 (serotonin syndrome)

FOOD AND LIFESTYLE  Moclobemide is claimed to cause less potentiation of the presor effect of tyramine than the traditional (irreversible) MAOIs, but patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, salami, pickled herring, Bovril®, Oxo®, Marmit® or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).

Moclobemide is predicted to increase the risk of a hypertensive crisis when given with amifetamine (dexamfetamine). Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1267

Moclobemide is predicted to increase the risk of a hypertensive crisis when given with amifetamines (lisdexamfetamine). Avoid. [Severe] Anecdotal → Also see TABLE 13 p. 1267

Moclobemide is predicted to increase the risk of severe hypertension when given with buproprion. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1267

Moclobemide is predicted to increase the exposure to cilostazol. [Moderate] Theoretical

Moclobemide is predicted to decrease the efficacy of clopidogrel. Avoid. [Moderate] Study

H2 receptor antagonists (cimetidine) increase the exposure to moclobemide. Adjust moclobemide dose, p. 346. [Mild] Study

Levodopa increases the risk of side-effects when given with moclobemide. [Mild] Study

Moclobemide is predicted to increase the risk of side-effects when given with linezolid. Avoid and for 14 days after stopping moclobemide. [Severe] Theoretical → Also see TABLE 13 p. 1267

Methylphenidate is predicted to increase the risk of a hypertensive crisis when given with moclobemide. [Severe] Theoretical

Mianserin is predicted to increase the risk of toxicity when given with moclobemide. Avoid for 1 week after stopping mianserin. [Severe] Theoretical → Also see TABLE 13 p. 1267

Moclobemide is predicted to increase the effects of monoamine oxidase B inhibitors (rasagiline, selegiline). Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1267

Moclobemide is predicted to increase the risk of side-effects when given with monoamine-oxidase B inhibitors (safinamide). Avoid and for 1 week after stopping safinamide. [Severe] Theoretical → Also see TABLE 13 p. 1267

Opicapone is predicted to increase the risk of elevated blood pressure when given with moclobemide. Avoid. [Severe] Theoretical

Moclobemide increases the risk of side-effects when given with phenothiazines (levomepromazine). [Moderate] Study

Reboxetine is predicted to increase the risk of a hypertensive crisis when given with moclobemide. Avoid. [Severe] Theoretical

Moclobemide moderately increases the exposure to rizatRIPTAN. Avoid. [Moderate] Study → Also see TABLE 13 p. 1267

Moclobemide moderately increases the exposure to sumatriptan. Avoid. [Moderate] Study → Also see TABLE 13 p. 1267

Moclobemide is predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, vasoconstrictor (ephedrine, isomethepene, phenylephrine, pseudoephedrine). Avoid. [Severe] Study

Moclobemide is predicted to increase the risk of side-effects when given with tedizolid. [Severe] Theoretical → Also see TABLE 13 p. 1267

Tricyclic antidepressants are predicted to increase the effects of moclobemide. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1267
Modafinil

- **Antiepileptics (carbamazepine, phenobarbital, primidone)** are predicted to decrease the exposure to modafinil. **[Mid] Theoretical**
- **Antiepileptics (fosphenytoin, phenytoin)** are predicted to decrease the exposure to modafinil and modafinil is predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. **[Moderate] Theoretical**
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to modafinil. **[Mid] theoretical**
- **Modafinil** is predicted to decrease the exposure to bosutinib. Avoid. **[Severe] Theoretical**
- **Cobicistat** is predicted to increase the exposure to modafinil. **[Mid] Theoretical**
- **Modafinil** is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 747. **[Severe] Study**
- **Modafinil** is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. **[Severe] Theoretical**
- **Modafinil** is predicted to decrease the exposure to elbashvir. Avoid. **[Unknown] Theoretical**
- **Modafinil** is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. **[Severe] Theoretical**
- **Modafinil** is predicted to decrease the exposure to grazeprevir. Avoid. **[Unknown] Theoretical**
- **HIV-protease inhibitors** (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to modafinil. **[Mid] Theoretical**
- **Modafinil** is predicted to decrease the effects of Hormone replacement therapy. **[Moderate] Anecdotal**
- **Idelalisib** is predicted to increase the exposure to modafinil. **[Mid] Theoretical**
- **Modafinil** is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 747. **[Severe] Theoretical**
- **Macrolides (clarithromycin)** are predicted to increase the exposure to modafinil. **[Mid] Theoretical**
- **Modafinil** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 747. **[Severe] Anecdotal**
- **Rifampicin** is predicted to decrease the exposure to modafinil. **[Moderate] Theoretical**
- **Modafinil** decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 747. **[Severe] Anecdotal**

Moxeipril  see ACE inhibitors
Mometasone  see corticosteroids

**FOOD AND LIFESTYLE** Potentially life-threatening hypertensive crisis can develop in those taking MAOIs who eat tyramine-rich food (such as mature cheese, salami, pickled herring, Bovril®, Oxo®, Marmite® or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines) or foods containing dopa (such as broad bean pods). Avoid tyramine-rich or dopa-rich food or drinks with, or for 2 to 3 weeks after stopping, the MAOI.

- **Modafinil** is predicted to decrease the effects of alpha blockers (indoramin). Avoid. **[Severe] Theoretical**  Also see TABLE 8 p. 1265
- **Modafinil** is predicted to increase the risk of a hypertensive crisis when given with amfetamines. Avoid and for 14 days after stopping the MAOI. **[Severe] Anecdotal** Also see TABLE 13 p. 1267
- **Antiepileptics (phenobarbital, primidone)** are predicted to increase the effects of modafinil. **[Severe] Theoretical**
- **Modafinil** is predicted to increase the risk of antimuscarinic side-effects when given with antihistamines, non-sedating. Avoid. **[Severe] Theoretical**
- **Modafinil** is predicted to increase the risk of antimuscarinic side-effects when given with antihistamines, sedating. Avoid. **[Severe] Theoretical**
- **Modafinil** is predicted to increase the risk of side-effects when given with atomoxetine. Avoid and for 2 weeks after stopping the MAOI. **[Severe] Theoretical**  Also see TABLE 13 p. 1267
- **Bupropine** is predicted to increase the risk of elevated blood pressure when given with modafinil and B inhibitors, irreversible. Avoid. **[Severe] Anecdotal** Also see TABLE 13 p. 1267
- **Modafinil** is predicted to increase the effects of doxapram. **[Moderate] Theoretical**
- **Modafinil** is predicted to increase the risk of elevated blood pressure when given with modafinil and B inhibitors, irreversible. Avoid. **[Severe] Theoretical**
- **Modafinil** is predicted to decrease the antihypertensive effects of guanethidine. Avoid and for 14 days after stopping the MAOI. **[Severe] Theoretical**  Also see TABLE 8 p. 1265
- **Modafinil** is predicted to affect the exposure to histamine. Avoid. **[Severe] Theoretical**  Also see TABLE 8 p. 1265
- **Levodopa** increases the risk of a hypertensive crisis when given with modafinil and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. **[Severe] Study**  Also see TABLE 8 p. 1265
- **Modafinil** is predicted to increase the risk of side-effects when given with linezolid. Avoid and for 14 days after stopping the MAOI. **[Severe] Theoretical**  Also see TABLE 13 p. 1267
- **Modafinil** is predicted to alter the antihypertensive effects of methylprednisolone. Avoid. **[Severe] Theoretical**  Also see TABLE 8 p. 1265
- **Methylyphenidate** is predicted to increase the risk of a hypertensive crisis when given with modafinil and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. **[Severe] Theoretical**
- **Mianserin** is predicted to increase the risk of toxicity when given with modafinil and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. **[Severe] Theoretical**  Also see TABLE 13 p. 1267
- **Modafinil** is predicted to increase the risk of side-effects when given with modafinil and B inhibitors, irreversible. Avoid and for 1 week after stopping safinamide. **[Severe] Theoretical**  Also see TABLE 13 p. 1267
- **Nefopam** is predicted to increase the risk of serious elevations in blood pressure when given with modafinil and B inhibitors, irreversible. Avoid. **[Severe] Theoretical**
- **Opicapone** is predicted to increase the risk of elevated blood pressure when given with modafinil and B inhibitors, irreversible. Avoid. **[Severe] Theoretical**
Monoamine-oxidase A and B inhibitors — Monoamine-oxidase B inhibitors

- **Opioids** are predicted to increase the risk of CNS excitation or depression when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Study → Also see TABLE 13 p. 1267
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of neuroleptic malignant syndrome when given with phenothiazines. [Severe] Theoretical → Also see TABLE 8 p. 1265
- **Pholcodine** is predicted to increase the risk of CNS excitation or depression when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
- **Reboxetine** is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Theoretical
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the exposure to **rifampicin**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 1267
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, inotropic. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
- **Tolcapone** is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Theoretical
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of side-effects when given with **methylphenidate**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 1267
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of a hypertensive crisis when given with sympatheticomimetics, vasoconstrictor. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical
- **Tetrabenazine** is predicted to increase the risk of CNS toxicity when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 1267
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of side-effects when given with **tedizolid**. [Severe] Theoretical → Also see TABLE 13 p. 1267
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of side-effects when given with **sumatriptan**. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 1267
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the exposure to **zolmitriptan**. [Severe] Theoretical → Also see TABLE 13 p. 1267
- Monoamine-oxidase B inhibitors → see TABLE 6 p. 1265
  - (bradycardia), TABLE 8 p. 1265 (hypotension), TABLE 13 p. 1267 (serotonin syndrome)

Rasagiline | Safinamide | Selegiline

**FOOD AND LIFESTYLE**

Hypertension is predicted to occur when high-dose selegiline is taken with tyramine-rich foods (such as mature cheese, salami, pickled herring, Bovril®, Oxo®, Marmite® or any similar meat or yeast extract or fermented soya bean extract, and some beers, lagers or wines).

- Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of severe hypertension when given with amfetamines. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1267
- Safinamide is predicted to increase the risk of severe hypertension when given with amfetamines. [Severe] Theoretical → Also see TABLE 13 p. 1267
- Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of severe hypertension when given with betas, agonists. Avoid. [Severe] Theoretical
- Safinamide is predicted to increase the risk of severe hypertension when given with betas, agonists. [Severe] Theoretical
- Monoamine-oxidase B inhibitors are predicted to increase the risk of severe hypertension when given with buproprion. Avoid. [Moderate] Theoretical → Also see TABLE 13 p. 1267
- Combined hormonal contraceptives slightly increase the exposure to rasagiline. [Moderate] Study
- Combined hormonal contraceptives increase the exposure to selegiline. Avoid. [Severe] Study
- Hormone replacement therapy is predicted to increase the exposure to selegiline. Avoid. [Moderate] Study
- Monoamine-oxidase B inhibitors are predicted to increase the effects of levodopa. Adjust dose. [Mild] Study → Also see TABLE 8 p. 1265
- Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of side-effects when given with linezolid. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 13 p. 1267
- Safinamide is predicted to increase the risk of side-effects when given with linezolid. Avoid and for 1 week after stopping safinamide. [Severe] Theoretical → Also see TABLE 13 p. 1267
- Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of a hypertensive crisis when given with methylphenidate. Avoid. [Severe] Theoretical
- Moclobemide is predicted to increase the effects of monoamine-oxidase B inhibitors (rasagiline, selegiline). Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1267
- Moclobemide is predicted to increase the risk of side-effects when given with safinamide. Avoid and for 1 week after stopping safinamide. [Severe] Theoretical → Also see TABLE 13 p. 1267
- Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of side-effects when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical → Also see TABLE 8 p. 1265 → Also see TABLE 13 p. 1267
- Safinamide is predicted to increase the risk of side-effects when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 1 week after stopping safinamide. [Severe] Theoretical → Also see TABLE 13 p. 1267
- Opicapone is predicted to increase the risk of elevated blood pressure when given with monoamine-oxidase B inhibitors (rasagiline, selegiline). [Severe] Theoretical
- Rasagiline is predicted to increase the risk of side-effects when given with opioids (pethidine). Avoid and for 14 days after stopping rasagiline. [Severe] Theoretical → Also see TABLE 13 p. 1267
- Safinamide is predicted to increase the risk of side-effects when given with opioids (pethidine). Avoid and for 1 week after stopping safinamide. [Severe] Theoretical → Also see TABLE 13 p. 1267
- Selegiline increases the risk of side-effects when given with opioids (pethidine). Avoid. [Severe] Anecdotal → Also see TABLE 13 p. 1267
- Quinolones (ciprofloxacin) slightly increase the exposure to rasagiline. [Moderate] Study
- Reboxetine is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase B inhibitors (rasagiline, selegiline). Avoid. [Severe] Theoretical
- Monoamine-oxidase B inhibitors are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, inotropic. Avoid. [Severe] Anecdotal
- Monoamine-oxidase B inhibitors are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, vasoconstrictor. Avoid. [Severe] Anecdotal
- Monoamine-oxidase B inhibitors are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, vasoconstrictor. Avoid. [Severe] Anecdotal
- Monoamine-oxidase B inhibitors (rasagiline, selegiline) are predicted to increase the risk of side-effects when given with tedizolid. [Severe] Theoretical → Also see TABLE 13 p. 1267
- Safinamide is predicted to increase the risk of side-effects when given with tedizolid. Avoid and for 1 week after stopping safinamide. [Severe] Theoretical → Also see TABLE 13 p. 1267
- Monoclonal antibodies → see TABLE 15 p. 1267 (myelosuppression), TABLE 12 p. 1267 (peripheral neuropathy), TABLE 4 p. 1264 (antiplatelet effects)
  - adalimumab | alemtuzumab | alirocumab | basiliximab | belimumab | bevacizumab | blinatumomab | brentuximab vedotin | canakinumab | catumaxomab | certolizumab pegol | cetuximab | daclizumab | daratumumab | denosumab | eclizumab | elotuzumab | evolocumab | golimumab | idarucizumab | infliximab | ilipimumab | ixekizumab | mepolizumab | natalizumab | necitumumab | nivolumab | obinutuzumab | ofatumumab | omalizumab | panitumumab | pembrolizumab | pertuzumab | ramucirumab | reslizumab | rituximab | secukinumab | siltuximab | tocilizumab | trastuzumab | vedolizumab
  - Blinatumomab is predicted to transiently increase the exposure to aminophylline. Monitor and adjust dose. [Moderate] Theoretical
Monoclonal antibodies (continued)

- **Anthracyclines** are predicted to increase the risk of cardiotoxicity when given with monoclonal antibodies (trastuzumab, trastuzumab emtansine). Avoid. **Severe**
  - **Theoretical** → Also see TABLE 15 p. 1267
- **Antiarhythmics (dronedarone)** increase the risk of neutropenia when given with brentuximab vedotin. Monitor and adjust dose. **Severe** **Theoretical**
  - **Antiepileptics (carbamazepine)** are predicted to decrease the effects of brentuximab vedotin. **Severe** **Theoretical**
  - **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to trastuzumab emtansine. **Severe** **Theoretical**
  - **Antifungals, azoles (itraconazole, ketoconazole)** increase the risk of neutropenia when given with brentuximab vedotin. Monitor and adjust dose. **Severe** **Study**
  - **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to trastuzumab emtansine. Avoid. **Severe** **Theoretical**
  - **Brentuximab vedotin** increases the risk of pulmonary toxicity when given with **bleomycin**. Avoid. **Severe** **Study** → Also see TABLE 15 p. 1267
- **Blinatumomab** is predicted to transiently increase the exposure to **ciclosporin (warfarin)**. Monitor and adjust dose. **Moderate** **Theoretical**
  - **Cobicistat** is predicted to increase the exposure to **trastuzumab emtansine**. Avoid. **Severe** **Theoretical**
  - **Blinatumomab** is predicted to transiently increase the exposure to **coumarins (warfarin)**. Monitor and adjust dose. **Moderate** **Theoretical**
- **Enzalutamide** is predicted to decrease the exposure to **trastuzumab emtansine**. **Severe** **Theoretical**
- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to **trastuzumab emtansine**. Avoid. **Severe** **Theoretical**
- **HIV-protease inhibitors (lopinavir, ritonavir, saquinavir)** are predicted to increase the risk of neutropenia when given with brentuximab vedotin. Monitor and adjust dose. **Severe** **Study**
- **HIV-protease inhibitors (saquinavir, ritonavir)** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with mycophenolate. Public Health England advises avoid. **Severe** **Theoretical**
  - **Rifampicin** decreases the concentration of mycophenolate. Monitor and adjust dose. **Severe** **Study**
- **Moxifloxacin** is predicted to decrease the exposure to **trastuzumab emtansine**. **Severe** **Study** → Also see TABLE 15 p. 1267
  - **Nabumetone** is predicted to increase the risk of cardiovascular side-effects when given with amfetamines. **Severe** **Theoretical**
  - **Nadolol** is predicted to increase the risk of cardiovascular side-effects when given with amfetamines. **Severe** **Theoretical**
  - **Nalmefene** decreases the efficacy of **opioids**. Avoid. **Severe** **Theoretical**

### General information

- Discontinue treatment 1 week before anticipated use of opioids; if emergency analgesia is required during treatment, an increased dose of opioid analgesic might be necessary (monitor for opioid intoxication).

- **Nalmefene** is predicted to decrease the efficacy of **opioids**. Avoid. **Severe** **Theoretical**

### Naloxegol

- **Antiarhythmics (dronedarone)** are predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects, p. 63. **Moderate** **Study**
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to markedly decrease the exposure to **naloxegol**. Avoid. **Moderate** **Study**
- **Antifungals, azoles (itraconazole, ketoconazole, posaconazole)** are predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects, p. 63. **Moderate** **Study**
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to markedly increase the exposure to **naloxegol**. Avoid. **Severe** **Study**
- **Aprepitant** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects, p. 63. **Moderate** **Study**
  - **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects, p. 63. **Moderate** **Study**
  - **Cobicistat** is predicted to markedly increase the exposure to **naloxegol**. Avoid. **Severe** **Study**
  - **Crizotinib** is predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects, p. 63. **Moderate** **Study**
- **Enzalutamide** is predicted to markedly decrease the exposure to **naloxegol**. Avoid. **Moderate** **Study**
- **Grapefruit juice** is predicted to increase the exposure to **naloxegol**. Avoid. **Moderate** **Theoretical**
- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to markedly increase the exposure to **naloxegol**. Avoid. **Severe** **Study**
- **HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to **naloxegol**. Adjust **naloxegol** dose and monitor side effects, p. 63. **Moderate** **Study**

### Montelukast

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **montelukast**. **Mid** **Study**
- **Enzalutamide** is predicted to decrease the exposure to **montelukast**. **Mid** **Study**
- **Fibrates (gemfibrozil)** are predicted to moderately increase the exposure to **montelukast**. **Moderate** **Study**
- **Lumeflunast** is predicted to decrease the exposure to **montelukast**. **Moderate** **Theoretical**
- **Rifampicin** is predicted to decrease the exposure to **montelukast**. **Mid** **Study**

### Morphine

- **Morphine** see **opioids**

### Moxifloxacin

- **Moxifloxacin** see **quinolones**
Naloxegol — Netupitant 1373

- **Idelalisib** is predicted to markedly increase the exposure to naloxegol. Avoid. **(Severe) Study**
- **Imatinib** is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 63. **(Moderate) Study**
- **Macrolides (clarithromycin)** are predicted to markedly increase the exposure to naloxegol. Avoid. **(Severe) Study**
- **Macrolides (erythromycin)** are predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 63. **(Moderate) Study**
- **Netupitant** is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 63. **(Moderate) Study**
- **Nilotinib** is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 63. **(Moderate) Study**
- **Rifampicin** is predicted to markedly decrease the exposure to naloxegol. Avoid. **(Moderate) Study**
- **St John's Wort** is predicted to decrease the exposure to naloxegol. Avoid. **(Moderate) Theoretical**

### Naltrexone

**General Information**

Avoid concurrent use of opioids.

### Nandrolone

- **Nandrolone** is predicted to increase the anticoagulant effect of coumarins. Monitor and adjust dose. **(Severe) Theoretical**
- **Nandrolone** is predicted to increase the anticoagulant effect of phenindione. Monitor and adjust dose. **(Severe) Theoretical**

### Naproxen → see NSAIDs

### Naratriptan → see Table 13 p. 1267 (serotonin syndrome)

### Natalizumab → see monoclonal antibodies

### Nateglinide → see Table 14 p. 1267 (anti diabetic drugs)

### Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to slightly decrease the exposure to nateglinide. **(Mild) Study**

### Rifampicin is predicted to slightly decrease the exposure to nateglinide. **(Mild) Study**

### Sulfinpyrazone slightly increases the exposure to nateglinide. **(Mild) Study**

### Nebivolol → see beta blockers, selective

### Necitumumab → see monoclonal antibodies

### Nefopam → see Table 10 p. 1266 (antimacinics)

### Nefopam is predicted to increase the risk of vasocstriction when given with ergotamine. Separate administration by 24 hours. **(Severe) Theoretical**

### Natalizumab → see monoclonal antibodies

### Netupitant is predicted to increase the exposure of the aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 185. **(Severe) Study**

### Netupitant is predicted to increase the exposure to alpha blockers (tamsulosin). **(Moderate) Theoretical**

### Netupitant is predicted to increase the exposure to alprazolam. **(Severe) Study**

### Netupitant is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. **(Moderate) Study**

### Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to netupitant. Avoid. **(Moderate) Study**

### Antiinfectives, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to netupitant. **(Mild) Study**

### Netupitant is predicted to decrease the exposure to antiinfectives, azoles (isavuconazole). **(Moderate) Theoretical**

### Netupitant is predicted to increase the exposure to antihistamines, non-sedating (azelastine). **(Severe) Theoretical**

### Netupitant is predicted to increase the concentration of antimalarials (piperaquene). **(Severe) Theoretical**

### Netupitant is predicted to increase the exposure to axitinib. **(Moderate) Theoretical**

### Netupitant is predicted to increase the exposure to bedaquiline. Avoid prolonged use. **(Mild) Theoretical**

### Netupitant is predicted to increase the exposure to bosutinib. Avoid or adjust bosutinib dose. **(Severe) Theoretical**

### Netupitant is predicted to increase the exposure to buspirone. Use with caution and adjust dose. **(Moderate) Study**

### Netupitant is predicted to increase the exposure to caborbouznib. **(Moderate) Theoretical**

### Netupitant is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. **(Moderate) Study**

### Netupitant is predicted to increase the exposure to ceritinib. **(Moderate) Theoretical**

### Netupitant increases the concentration of cyclosporin. **(Severe) Study**

### Netupitant is predicted to increase the exposure to cobimetinib. **(Severe) Theoretical**

### Netupitant is predicted to increase the exposure to colchicine. Adjust colchicine dose, p. 1020. **(Severe) Study**

### Netupitant is predicted to increase the exposure to corticosteroids (dexamethasone, methylprednisolone). Monitor and adjust dose. **(Moderate) Study**

### Netupitant is predicted to increase the exposure to crizotinib. **(Severe) Theoretical**

### Netupitant is predicted to slightly increase the exposure to darifenacin. **(Moderate) Study**

### Netupitant is predicted to increase the exposure to dasatinib. **(Severe) Study**

### Netupitant increases the risk of QT-prolongation when given with domperidone. Avoid. **(Severe) Study**

### Netupitant is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). **(Severe) Theoretical**

### Netupitant is predicted to moderately increase the exposure to dutasteride. **(Mild) Study**

### Enzalutamide is predicted to decrease the exposure to netupitant. Avoid. **(Moderate) Study**

### Netupitant is predicted to increase the exposure to ergot derivatives (dihydroergotamine, ergonovine). **(Severe) Theoretical**

### Netupitant is predicted to increase the exposure to ergotamine. **(Severe) Theoretical**

### Netupitant is predicted to increase the exposure to erlotinib. **(Moderate) Theoretical**

### Netupitant is predicted to increase the concentration of everolimus. Avoid or adjust dose. **(Moderate) Study**

### Netupitant is predicted to increase the exposure to fosoterodine. Adjust fosoterodine dose in hepatic and renal impairment, p. 732. **(Mild) Study**

### Netupitant is predicted to increase the exposure to gefitinib. **(Moderate) Theoretical**

### Netupitant is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 335. **(Moderate) Theoretical**

### HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to netupitant. **(Mild) Study**

### Netupitant is predicted to increase the exposure to ibritinib. Avoid or adjust ibritinib dose, p. 902. **(Severe) Theoretical**

### Idelalisib is predicted to increase the exposure to netupitant. **(Mild) Study**

### Netupitant is predicted to increase the exposure to imatinib. **(Moderate) Theoretical**

### Netupitant is predicted to increase the exposure to ivabradine. Adjust ivabradine dose, p. 205. **(Severe) Theoretical**
Netupitant (continued)

- **Netupitant** is predicted to increase the exposure to *ivacaftor*. Adjust *ivacaftor* dose, p. 281. [Severe] Study

- **Netupitant** is predicted to increase the exposure to *lapatinib*. [Moderate] Study

- **Netupitant** is predicted to increase the exposure to *lomitapide*. Avoid. [Moderate] Theoretical

- **Netupitant** is predicted to increase the exposure to *lurasidone*. [Moderate] Study

- **Macrolides** (clarithromycin) are predicted to increase the exposure to netupitant. [Mild] Study

- **Netupitant** is predicted to increase the exposure to *midazolam*. Monitor side effects and adjust dose. [Severe] Study

- **Netupitant** is predicted to increase the exposure to *naloxegol*. Adjust naloxegol dose and monitor side effects, p. 63. [Moderate] Study

- **Netupitant** is predicted to increase the exposure to *nilotinib*. [Moderate] Theoretical

- **Netupitant** is predicted to increase the exposure to *olaparib*. Avoid or adjust olaparib dose, p. 919. [Moderate] Theoretical

- **Netupitant** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study

- **Netupitant** is predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical

- **Netupitant** is predicted to increase the exposure to *oxybutynin*. [Mild] Theoretical

- **Netupitant** is predicted to increase the exposure to *pazopanib*. [Moderate] Theoretical

- **Netupitant** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 765. [Moderate] Theoretical

- **Netupitant** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor and adjust sildenafil dose, p. 766. [Moderate] Study

- **Netupitant** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). [Severe] Theoretical

- **Netupitant** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. [Severe] Theoretical

- **Netupitant** is predicted to increase the exposure to *pimozone*. Avoid. [Severe] Theoretical

- **Netupitant** is predicted to increase the exposure to *quetiapine*. Avoid. [Moderate] Study

- **Rifampicin** is predicted to decrease the exposure to netupitant. Avoid. [Moderate] Study

- **Netupitant** is predicted to increase the exposure to *ranolazine*. [Severe] Study

- **Netupitant** is predicted to increase the exposure to *rifampicin*. Adjust rifampicin dose, p. 773. [Moderate] Theoretical

- **Netupitant** is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. [Severe] Theoretical

- **Netupitant** is predicted to increase the exposure to stavastatin. Use with caution and adjust stavastatin dose, p. 196. [Severe] Study

- **Netupitant** is predicted to increase the exposure to *simprevir*. Avoid. [Severe] Study

- **Netupitant** increases the concentration of *sirolimus*. Monitor and adjust dose. [Moderate] Study

- **Netupitant** is predicted to increase the exposure to *SSRIs* (dapoxetine). Adjust dapoxetine dose, p. 773. [Moderate] Theoretical

- **Netupitant** is predicted to increase the exposure to *statins* (lovastatin), Monitor and adjust dose. [Severe] Theoretical

- **Netupitant** is predicted to increase the exposure to stavastatin. Use with caution and adjust stavastatin dose, p. 196. [Severe] Study

- **Netupitant** is predicted to increase the exposure to *sunitinib*. [Moderate] Theoretical

- **Netupitant** is predicted to increase the concentration of *tacrolimus*. [Severe] Study

- **Netupitant** is predicted to increase the exposure to *taxanes* (cabazitaxel). [Moderate] Theoretical

- **Netupitant** is predicted to increase the concentration of *tepsiroliimus*. [Moderate] Theoretical

- **Netupitant** is predicted to increase the exposure to *tolerodine*. [Mild] Theoretical

- **Netupitant** is predicted to increase the exposure to *tolvaptan*. Adjust dose. [Moderate] Theoretical

- **Netupitant** is predicted to increase the exposure to *trazodone*. [Moderate] Theoretical

- **Netupitant** is predicted to increase the exposure to *ulipristal*. Avoid if used for uterine fibroids. [Moderate] Study

- **Netupitant** is predicted to increase the exposure to *venetoclax*. Avoid or adjust venetoclax dose, p. 919. [Severe] Study

- **Netupitant** is predicted to increase the exposure to *vinca alkaloids*. [Severe] Theoretical

- **Netupitant** is predicted to increase the exposure to *zopiclone*. Adjust dose. [Moderate] Study

**Neuromuscular blocking drugs, non-depolarising** → see TABLE 6 p. 1265 (bradycardia), TABLE 20 p. 1268 (neuromuscular blocking effects) atracurium - cisatracurium - mivacurium - pancuronium - rocuronium - vecuronium

- **Aminoglycosides** are predicted to increase the risk of prolonged neuromuscular blockade when given with neuromuscular blocking drugs, non-depolarising. [Severe] Theoretical → Also see TABLE 20 p. 1268

- **Anticholinesterases, centrally acting** are predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Theoretical → Also see TABLE 6 p. 1265

- **Antiepileptics (carbamazepine)** are predicted to decrease the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising. Monitor and adjust dose. [Moderate] Study

- **Antiepileptics (fosphenytoin, phenytoin)** decrease the effects of (but acute use increases the effects of) neuromuscular blocking drugs, non-depolarising (atracurium, cisatracurium, pancuronium, rocuronium, vecuronium). [Moderate] Study

- **Cldamycin** increases the effects of neuromuscular blocking drugs, non-depolarising. [Severe] Anecdotal

- **Colistimethate** increases the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Study

- **Dopamine** are predicted to increase the effects of neuromuscular blocking drugs, non-depolarising. [Severe] Anecdotal

- **Pancuronium** is predicted to increase the risk of cardiovascular side-effects when given with digoxin. [Severe] Anecdotal

- **Irinotecan** is predicted to decrease the effects of neuromuscular blocking drugs, non-depolarising. [Severe] Theoretical

- **Magnesium** increases the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Theoretical

- **Metoclopramide** is predicted to increase the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Theoretical

- **Penicillins (piperacillin)** increase the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Study

- **SSRIs potentially increase the risk of prolonged neuromuscular blockade when given with mivacurium.** [Unknown] Theoretical

**Nevirapine**

- **Nevirapine** is predicted to decrease the exposure to antiarrhythmics (dronedarone). [Severe] Theoretical

- **Nevirapine** is predicted to decrease the concentration of antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) and antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of nevirapine. [Severe] Study

- **Fungals, azoles (fluconazole)** slightly to moderately increase the exposure to nevirapine. [Moderate] Study

- **Nevirapine** is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. [Severe] Theoretical

- **Nevirapine** moderately decreases the exposure to antifungals, azoles (itraconazole). Avoid nevirapine for 14 days before and during treatment with itraconazole. [Moderate] Study

- **Nevirapine** moderately decreases the exposure to antifungals, azoles ( ketoconazole). Avoid. [Severe] Study

- **Nevirapine** is predicted to decrease the exposure to antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) increase the exposure to nevirapine. Monitor and adjust dose. [Severe] Theoretical
Nevirapine is predicted to decrease the exposure to **axitinib**. [Moderate] Theoretical

Nevirapine is predicted to decrease the exposure to **bedaquiline**. Avoid. [Severe] Study

Nevirapine is predicted to decrease the exposure to **bosutinib**. Avoid. [Severe] Theoretical

Nevirapine is predicted to decrease the exposure to **cabozantinib**. [Moderate] Theoretical

Nevirapine is predicted to decrease the exposure to **calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine)**. Monitor and adjust dose. [Moderate] Theoretical

Nevirapine is predicted to decrease the exposure to **caspofungin**. Adjust dose. [Moderate] Theoretical

Nevirapine is predicted to decrease the concentration of **ciclosporin**. [Moderate] Study

Nevirapine is predicted to decrease the exposure to **cobicistat**. Avoid. [Severe] Theoretical

Nevirapine is predicted to decrease the exposure to **cobimetinib**. Avoid. [Severe] Theoretical

Nevirapine is predicted to decrease the efficacy of **combined hormonal contraceptives**. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Study

Nevirapine potentially alters the antiocagulant effect of **coumarins**. [Severe] Anecdotal

Nevirapine is predicted to decrease the exposure to **crizotinib**. Avoid. [Severe] Theoretical

Nevirapine is predicted to decrease the exposure to **daclatasvir**. Avoid. [Severe] Theoretical

Nevirapine is predicted to decrease the exposure to **dasatinib**. [Severe] Study

Nevirapine is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical

Nevirapine decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study

Nevirapine decreases the concentration of **efavirenz**. Avoid. [Severe] Study

Nevirapine is predicted to moderately decrease the exposure to **elbasvir**. Avoid. [Severe] Study

Nevirapine is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical

Nevirapine is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical

Nevirapine is predicted to decrease the exposure to **erlotinib**. [Severe] Theoretical

Nevirapine is predicted to decrease the efficacy of **etanercept**. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical

Nevirapine is predicted to decrease the exposure to **etrapirine**. Avoid. [Severe] Study

Nevirapine is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study

Nevirapine is predicted to decrease the exposure to ** Gefitinib**. Avoid. [Severe] Theoretical

Nevirapine is predicted to markedly decrease the exposure to **grazoprevir**. Avoid. [Severe] Study

Nevirapine is predicted to decrease the concentration of **guanfacine**. Adjust dose. [Moderate] Theoretical

Nevirapine decreases the exposure to **HIV-protease inhibitors**. Refer to specialist literature. [Moderate] Study

Nevirapine is predicted to decrease the effects of **Hormone replacement therapy**. [Moderate] Anecdotal

Nevirapine is predicted to decrease the exposure to **imatinib**. [Moderate] Study

Nevirapine is predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study

Nevirapine is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical

Nevirapine is predicted to decrease the exposure to **lurasidone**. Monitor and adjust dose. [Moderate] Theoretical

Nevirapine decreases the exposure to **macrolides (clarithromycin)**. [Moderate] Study

Nevirapine decreases the concentration of **midazolam**. Monitor and adjust dose. [Moderate] Study

Nevirapine is predicted to decrease the exposure to **nelfinavir**. Avoid. [Severe] Theoretical

Nevirapine is predicted to decrease the efficacy of **norethisterone**. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal

Nevirapine is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical

Nevirapine decreases the exposure to **opioids (methadone)**. Monitor and adjust dose. [Severe] Study

Nevirapine is predicted to decrease the exposure to **osimertinib**. [Severe] Theoretical

Nevirapine is predicted to decrease the exposure to **paritaprevir** (with ritonavir and obitavir). Avoid. [Severe] Study

Nevirapine is predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors**. [Moderate] Theoretical

Rifampicin decreases the concentration of **nevirapine**. Avoid. [Severe] Study

Nevirapine is predicted to decrease the exposure to **rilpivirine**. Avoid. [Severe] Theoretical

Nevirapine is predicted to decrease the exposure to **ruxolitinib**. Monitor and adjust dose. [Moderate] Theoretical

Nevirapine is predicted to decrease the exposure to **simeprevir**. Avoid. [Severe] Study

Nevirapine is predicted to decrease the concentration of **sirolimus**. Monitor and adjust dose. [Moderate] Theoretical

St John’s Wort is predicted to decrease the concentration of **nevirapine**. Avoid. [Severe] Theoretical

Nevirapine slightly decreases the exposure to **statins** (atorvastatin). [Mild] Study

Nevirapine moderately decreases the exposure to **statins (simvastatin)**. [Moderate] Study

Nevirapine is predicted to decrease the concentration of **tacrolimus**. Monitor and adjust dose. [Moderate] Theoretical

Nevirapine is predicted to decrease the exposure to **taxanes (cabazitaxel)**. Avoid. [Severe] Study

Nevirapine is predicted to decrease the concentration of **tepsirimus**. Avoid. [Severe] Theoretical

Nevirapine is predicted to decrease the exposure to **ticagrelor**. [Moderate] Theoretical

Nevirapine is predicted to decrease the exposure to **tolvaptan**. [Moderate] Theoretical

Nevirapine decreases the efficacy of **ulipristal**. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal

Nevirapine is predicted to decrease the exposure to **velpatasvir**. Avoid. [Moderate] Theoretical

Nevirapine is predicted to decrease the concentration of **zidovudine**. Refer to specialist literature. [Severe] Theoretical

Nicardipine → see calcium channel blockers

Niconrandil → see **TABLE 8** p. 1265 (hypotension)

Astrin is predicted to increase the risk of gastrointestinal perforation when given with niconrandil. [Severe] Theoretical

Corticosteroids increase the risk of gastrointestinal perforation when given with niconrandil. [Severe] Anecdotal

Nicorandil is predicted to increase the risk of gastrointestinal perforation when given with NSAIDs. [Severe] Theoretical

Nicorandil is predicted to increase the risk of hypotension when given with **phosphodiesterase type-5 inhibitors**. Avoid. [Severe] Theoretical → Also see **TABLE 8** p. 1265

Nicotinic acid → see **TABLE 3** p. 1264 (anticoagulant effects)

Nicotinic acid is predicted to increase the risk of rhabdomyolysis when given with statins. [Severe] Theoretical

Nifupeptin = see calcium channel blockers

Nifotinib → see **TABLE 15** p. 1267 (myelosuppression), **TABLE 9** p. 1266

Nifotinib is predicted to increase the exposure to aldosterone antagonists (eplerenone). Adjust eplerenone dose, p. 185. [Severe] Study

Nifotinib is predicted to increase the exposure to alpha blockers (tamsulosin). [Moderate] Theoretical
Nilotinib (continued)

- **Nilotinib** is predicted to increase the exposure to alprazolam.  
  [Severe] Study

- **Antacids** are predicted to decrease the absorption of nilotinib. Separate administration by at least 2 hours. [Moderate] Theoretical

- **Antiarrhythmics (dronedarone)** are predicted to increase the exposure to nilotinib. [Moderate] Theoretical → Also see TABLE 9 p. 1266

- **Nilotinib** is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. [Moderate] Study

- **Antiarrhythmics** (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to nilotinib. Avoid. [Severe] Study

- **Antifungals, azoles** (fluconazole, posaconazole) are predicted to increase the exposure to nilotinib. [Moderate] Theoretical

- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to nilotinib. Avoid. [Severe] Study → Also see TABLE 9 p. 1266

- Nilotinib is predicted to increase the exposure to aprepitant. [Moderate] Theoretical

- Nilotinib is predicted to increase the exposure to axitinib. [Moderate] Theoretical → Also see TABLE 15 p. 1267

- Nilotinib is predicted to increase the exposure to bedaquiline. Avoid prolonged use. [Mild] Theoretical → Also see TABLE 9 p. 1266

- **Bosantan** is predicted to decrease the exposure to nilotinib. Avoid. [Severe] Theoretical

- **Nilotinib** is predicted to moderate the exposure to antimalarials (piperazine). [Severe] Theoretical

- **Aprepitant** is predicted to increase the exposure to nilotinib. [Mild] Study

- **Nilotinib** is predicted to increase the exposure to aripiprazole. [Moderate] Theoretical → Also see TABLE 9 p. 1267

- **Nilotinib** is predicted to change the concentration of amiodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study

- **Nilotinib** is predicted to increase the exposure to azacitidine. [Mild] Theoretical → Also see TABLE 15 p. 1267 → Also see TABLE 9 p. 1266

- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to nilotinib. [Moderate] Theoretical

- **Nilotinib** is predicted to increase the exposure to calcium channel blockers (amlodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Study

- **Nilotinib** is predicted to increase the exposure to ceritinib. [Moderate] Theoretical → Also see TABLE 15 p. 1267 → Also see TABLE 9 p. 1266

- **Nilotinib** increases the concentration of ciclosporin. [Severe] Study

- **Cobicistat** is predicted to moderately increase the exposure to nilotinib. Avoid. [Severe] Study

- **Nilotinib** is predicted to increase the exposure to cobimetinib. [Severe] Theoretical

- **Nilotinib** is predicted to increase the exposure to colchicine. Adjust colchicine dose, p. 1020. [Severe] Study

- **Nilotinib** is predicted to increase the exposure to corticosteroids (methylprednisolone). Monitor and adjust dose. [Moderate] Study

- **Nilotinib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical

- **Nilotinib** is predicted to slightly increase the exposure to darifenacin. [Moderate] Study

- **Nilotinib** is predicted to increase the exposure to dasatinib. [Severe] Study → Also see TABLE 15 p. 1267 → Also see TABLE 9 p. 1266

- **Nilotinib** increases the risk of QT-prolongation when given with domperidone. Avoid. [Severe] Study

- **Nilotinib** is predicted to increase the exposure to dopamine receptor agonists (bromocriptine, cabergoline). [Severe] Theoretical

- **Nilotinib** is predicted to moderately increase the exposure to dutasteride. [Mild] Study

- **Efavirenz** is predicted to decrease the exposure to nilotinib. Avoid. [Severe] Theoretical

- **Enzalutamide** is predicted to moderately decrease the exposure to nilotinib. Avoid. [Severe] Study

- **Nilotinib** is predicted to increase the risk of ergotism when given with ergometrine. [Severe] Theoretical

- **Nilotinib** is predicted to increase the risk of ergotism when given with ergotamine. [Severe] Theoretical

- **Nilotinib** is predicted to increase the exposure to erlotinib. [Mild] Theoretical

- **Nilotinib** is predicted to increase the concentration of everolimus. Avoid or adjust dose. [Moderate] Study → Also see TABLE 15 p. 1267

- **Nilotinib** is predicted to increase the exposure to fesoterodine. Adjust fesoterodine dose in hepatic and renal impairment, p. 732. [Mild] Study

- **Nilotinib** is predicted to increase the exposure to gefitinib. [Moderate] Theoretical → Also see TABLE 15 p. 1267

- **Grapefruit juice** is predicted to increase the exposure to nilotinib. Avoid. [Severe] Theoretical

- **Nilotinib** is predicted to increase the concentration of guanfacine. Adjust guanfacine dose, p. 335. [Moderate] Theoretical

- **H₂ receptor antagonists** are predicted to decrease the absorption of nilotinib. [Mild] Theoretical

- **HiV protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to moderately increase the exposure to nilotinib. Avoid. [Severe] Study → Also see TABLE 9 p. 1266

- **Nilotinib** is predicted to increase the exposure to ibudrulin. Avoid or adjust ibudrulin dose, p. 902. [Severe] Theoretical → Also see TABLE 15 p. 1267

- **Idelalisib** is predicted to moderately increase the exposure to nilotinib. Avoid. [Severe] Study → Also see TABLE 15 p. 1267

- **Nilotinib** is predicted to increase the exposure to icravirudin. Adjust icravirudin dose, p. 205. [Severe] Theoretical

- **Nilotinib** is predicted to increase the exposure to icravirudin. Adjust icravirudin dose, p. 281. [Severe] Study

- **Nilotinib** is predicted to increase the exposure to ivermectin. Adjust ivermectin dose and monitor side effects, p. 63. [Moderate] Study

- **Nilotinib** is predicted to increase the exposure to lurasidone. [Moderate] Study

- **Macrolides (clarithromycin)** are predicted to moderately increase the exposure to nilotinib. Avoid. [Severe] Study → Also see TABLE 9 p. 1266

- **Macrolides (erythromycin)** are predicted to increase the exposure to nilotinib. [Moderate] Theoretical

- **Nilotinib** is predicted to increase the exposure to midazolam. Monitor side effects and adjust dose. [Severe] Study

- **Nilotinib** is predicted to increase the exposure to naloxegol. Adjust naloxegol dose and monitor side effects, p. 63. [Moderate] Study

- **Netupitant** is predicted to increase the exposure to nilotinib. [Moderate] Theoretical

- **Nevirapine** is predicted to decrease the exposure to nilotinib. Avoid. [Severe] Theoretical

- **Nilotinib** is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Theoretical → Also see TABLE 15 p. 1267

- **Nilotinib** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study

- **Nilotinib** is predicted to increase the exposure to opioids (methylprednisolone). [Moderate] Theoretical → Also see TABLE 9 p. 1266

- **Nilotinib** is predicted to increase the exposure to oxycodone. [Mild] Theoretical

- **Nilotinib** is predicted to increase the exposure to pazopanib. [Moderate] Theoretical → Also see TABLE 15 p. 1267 → Also see TABLE 9 p. 1266

- **Nilotinib** is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical

- **Nilotinib** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil). Adjust avanafil dose, p. 765. [Moderate] Theoretical
### Nilotinib — Norethisterone 1377

- **Nilotinib** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (sildenafil). Monitor and adjust sildenafil dose, p. 766. **[Moderate] Study** → Also see TABLE 9 p. 1266
- **Nilotinib** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (tadalafil). **[Severe] Theoretical**
- **Nilotinib** is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (vardenafil). Adjust dose. **(Severe) Theoretical** → Also see TABLE 9 p. 1266
- **Nilotinib** is predicted to increase the exposure to pimozide. Avoid. **(Severe) Theoretical** → Also see TABLE 9 p. 1266
- **Nilotinib** is predicted to increase the exposure to quetiapine. Avoid. **[Moderate] Study**
- **Nilotinib** is predicted to increase the exposure to ranolazine. **(Severe) Study** → Also see TABLE 9 p. 1266
- **Rifampicin** is predicted to moderately decrease the exposure to nilotinib. Avoid. **(Severe) Study**
- **Nilotinib** is predicted to increase the exposure to ruxolitinib. **[Moderate] Theoretical** → Also see TABLE 15 p. 1267
- **Nilotinib** is predicted to increase the exposure to sunitinib. **[Moderate] Theoretical** → Also see TABLE 15 p. 1267 → Also see TABLE 9 p. 1266
- **Nilotinib** is predicted to increase the concentration of sirolimus. Monitor and adjust dose. **(Moderate) Study**
- **Nilotinib** is predicted to increase the exposure to SSRIs (dapoxetine). Adjust dapoxetine dose, p. 773. **[Moderate] Theoretical**
- **St John’s Wort** is predicted to decrease the exposure to nilotinib. Avoid. **(Severe) Theoretical**
- **Nilotinib** is predicted to increase the exposure to statins (atorvastatin). Monitor and adjust dose. **(Severe) Theoretical**
- **Nilotinib** is predicted to increase the exposure to statins (simvastatin). Use with caution and adjust simvastatin dose, p. 198. **(Severe) Study**
- **Nilotinib** is predicted to increase the exposure to sunitinib. **[Moderate] Theoretical** → Also see TABLE 15 p. 1267 → Also see TABLE 9 p. 1266
- **Nilotinib** is predicted to increase the concentration of tacrolimus. **(Severe) Study**
- **Nilotinib** is predicted to increase the exposure to taxanes (cabazitaxel). **[Moderate] Theoretical** → Also see TABLE 15 p. 1267
- **Nilotinib** is predicted to increase the concentration of temsirolimus. **[Moderate] Theoretical** → Also see TABLE 15 p. 1267
- **Nilotinib** is predicted to increase the exposure to tolterodine. **(Mild) Theoretical** → Also see TABLE 9 p. 1266
- **Nilotinib** is predicted to increase the exposure to tolvaptan. Adjust dose. **[Moderate] Theoretical**
- **Nilotinib** is predicted to increase the exposure to trazodone. **(Moderate) Theoretical**
- **Nilotinib** is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. **[Moderate] Study**
- **Nilotinib** is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose, p. 919. **(Severe) Study**
- **Nilotinib** is predicted to increase the exposure to vinca alkaloids. **(Severe) Theoretical** → Also see TABLE 9 p. 1266 → Also see TABLE 15 p. 1267
- **Nilotinib** is predicted to increase the exposure to zopiclone. Adjust dose. **(Moderate) Study**
- **Nimodipine** → see calcium channel blockers
- **Nintedanib**
  - Antiarrhythmics (amiloradone, dronedarone) are predicted to increase the exposure to nintedanib. **[Moderate] Study**
  - Antiepileptics (carbamazepine) are predicted to decrease the exposure to nintedanib. **[Moderate] Study**
  - Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to nintedanib. **[Moderate] Study**
  - Calcium channel blockers (verapamil) are predicted to increase the exposure to nintedanib. **[Moderate] Study**
  - Ciclosporin is predicted to increase the exposure to nintedanib. **[Moderate] Study**
  - HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to nintedanib. **[Moderate] Study**
  - Lapaatinib is predicted to increase the exposure to nintedanib. **[Moderate] Study**
- **Macrolides** are predicted to increase the exposure to nintedanib. **[Moderate] Study**
- **Ranolazine** is predicted to increase the exposure to nintedanib. **[Moderate] Study**
- **Rifampicin** is predicted to decrease the exposure to nintedanib. **[Moderate] Study**
- **St John’s Wort** is predicted to decrease the exposure to nintedanib. **[Moderate] Study**
- **Vemurafenib** is predicted to increase the exposure to nintedanib. **[Moderate] Study**

### Nitrisinone

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to nitrisinone. Adjust nitrisinone dose. **[Moderate] Theoretical**
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to nitrisinone. Adjust nitrisinone dose. **[Moderate] Theoretical**
- **Cobicistat** is predicted to decrease the exposure to nitrisinone. Adjust nitrisinone dose. **[Moderate] Theoretical**
- **Enalaprilat** is predicted to decrease the exposure to nitrisinone. Adjust nitrisinone dose. **[Moderate] Theoretical**
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to nitrisinone. Adjust nitrisinone dose. **[Moderate] Theoretical**
- **Idelalisib** is predicted to increase the exposure to nitrisinone. Adjust nitrisinone dose. **[Moderate] Theoretical**
- **Macrolides (clarithromycin)** are predicted to increase the exposure to nitrisinone. Adjust nitrisinone dose. **[Moderate] Theoretical**
- **Rifampicin** is predicted to decrease the exposure to nitrisinone. Adjust nitrisinone dose. **[Moderate] Theoretical**

### Nitrates

- **Nitrates** → see TABLE 7 p. 1265 (first-dose hypotension), TABLE 8 p. 1265 (hypotension)
  - glycercyl trinitrate • isosorbide dinitrate • isosorbide mononitrate

### Pharmacology

**Drugs with antimuscarinic effects can cause dry mouth, which can reduce the effectiveness of sublingual glyceryl trinitrate tablets.**

- **Nitrates** are predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Avoid. **(Severe) Theoretical**
- **Nitrates** are predicted to increase the risk of methaemoglobinemia when given with dapsone. **(Severe) Theoretical**
- **Nitrates** potentially increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. **(Severe) Study** → Also see TABLE 8 p. 1265
- **Nitrazepam** → see TABLE 11 p. 1266 (CNS depressant effects)
- **Rifampicin** increases the clearance of nitrazepam. **[Moderate] Study**

### Nitrofurantoin

- **Nitrofurantoin** is predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. **(Severe) Theoretical**
- Anticds (magnesium trisilicate) decrease the absorption of nitrofurantoin. **[Moderate] Study**
- **Nitrofurantoin** is predicted to increase the risk of methaemoglobinemia when given with dapsone. **(Severe) Theoretical**

### Nitrous oxide

- **Nitrous oxide** → see TABLE 8 p. 1265 (hypotension), TABLE 11 p. 1266 (CNS depressant effects)
- **Nivolumab** → see monoclonal antibodies
- **Nizatidine** → see H2 receptor antagonists
- **Noradrenaline/norepinephrine** → see sympathomimetics, vasoconstrictor

### Norethisterone

- **Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate)** are predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 747. **(Severe) Anecdotal**
- **Aprepitant** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 747. **(Severe) Anecdotal**
Norethisterone (continued)

- **Boventan** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 747. (Severe) Anecdotal
- **Eavirenz** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 747. (Severe) Anecdotal
- **Fosaprepitant** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 747. (Severe) Anecdotal
- **Grisofulvin** potentially decreases the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 747. (Severe) Anecdotal
- **HIV-protease inhibitors (ritonavir)** are predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 747. (Severe) Anecdotal
- **Modafinil** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 747. (Severe) Anecdotal
- **Nevirapine** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 747. (Severe) Anecdotal
- **Rifapentin** is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 747. (Severe) Anecdotal
- **St John's Wort** is predicted to decrease the efficacy of norethisterone. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 747. (Severe) Anecdotal
- **Sugammadex** is predicted to decrease the exposure to norethisterone. Use additional contraceptive precautions. (Severe) Anecdotal
- **Ulipristal** is predicted to decrease the efficacy of norethisterone. Avoid. (Severe) Theoretical
- **Norfloxacin** see quinolones

Nortriptyline see tricyclic antidepressants

**NSAIDs** see Table 18 p. 1268 (hypotension), Table 2 p. 1264 (nephrototoxicity), Table 16 p. 1268 (increased serum potassium), Table 4 p. 1264 (antiplaetlet effects)

ROUTE-SPECIFIC INFORMATION

Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- **Celecoxib** is predicted to increase the exposure to antirhythmic (flecainide, propafenone). Monitor and adjust dose. (Moderate) Theoretical
- **Antifungals, azoles (fluconazole)** moderately increase the exposure to celecoxib. Adjust celecoxib dose, p. 1031. (Moderate) Study
- **Antifungals, azoles (fluconazole)** increase the exposure to parecoxib. Monitor and adjust dose. (Moderate) Study
- **Antifungals, azoles (voriconazole)** slightly increase the exposure to diclofenac. Monitor and adjust dose. (Moderate) Study
- **Antifungals, azoles (voriconazole)** moderately increase the exposure to ibuprofen. Adjust dose. (Moderate) Study
- **NSAIDs** are predicted to increase the risk of gastrointestinal irritation when given with bisphosphonates (alendronic acid, ibandronic acid). (Moderate) Study
- **NSAIDs** are predicted to increase the risk of renal impairment when given with bisphosphonates (sodium clodronate). (Severe) Theoretical
- **Ceritinib** is predicted to increase the exposure to NSAIDs (celecoxib, diclofenac). Adjust dose. (Moderate) Theoretical
- **Ciclosporin** increases the concentration of diclofenac. (Severe) Study
- Also see Table 2 p. 1264
- Also see Table 16 p. 1268
- **Etoricoxib** slightly increases the exposure to combined hormonal contraceptives. (Moderate) Study
- **NSAIDs** increase the risk of gastrointestinal bleeding when given with corticosteroids. (Severe) Study
- **NSAIDs** increase the risk of renal impairment when given with daptomycin. (Moderate) Theoretical
- **Indomethacin** increases the concentration of digoxin. (Severe) Study
- **Topical dimethyl sulfoxide** potentially increases the risk of peripheral neuropathy when given with sulindac. Avoid. (Severe) Anecdotal
- **Erlotinib** is predicted to increase the risk of gastrointestinal perforation when given with NSAIDs. (Severe) Theoretical
- **Etoricoxib** slightly increases the exposure to Hormone replacement therapy. (Moderate) Study
- **NSAIDs** are predicted to increase the risk of gastrointestinal bleeding when given with iron chelators (deferasirox). (Severe) Theoretical
- **NSAIDs** increase the concentration of lithium. Monitor and adjust lithium (lithium carbonate, lithium citrate) dose. (Severe) Study
- **Lumacafor** is predicted to decrease the exposure to ibuprofen. Adjust dose. (Moderate) Theoretical
- **NSAIDs** are predicted to increase the risk of toxicity when given with methotrexate. Monitor and adjust dose. (Severe) Study
- Also see Table 2 p. 1264
- **NSAIDs** (high-dose) are predicted to decrease the efficacy of ifosfamide. Avoid. (Severe) Theoretical
- **Nicorandil** is predicted to increase the risk of gastrointestinal perforation when given with NSAIDs. (Severe) Theoretical
- **NSAIDs** are predicted to increase the exposure to pemtrexed. Use with caution or avoid. (Severe) Theoretical
- Also see Table 2 p. 1264
- **NSAIDs** potentially increase the risk of seizures when given with quinolones. (Severe) Theoretical
- **Regorafenib** is predicted to increase the exposure to mafenamic acid. Avoid. (Moderate) Theoretical
- Also see Table 4 p. 1264
- **Rifampicin** moderately decreases the exposure to NSAIDs (celecoxib, diclofenac, etoricoxib). (Moderate) Study
- **NSAIDs** increase the risk of acute renal failure when given with thiazide diuretics. (Severe) Theoretical
- Also see Table 18 p. 1268
- **Zidovudine** increases the risk of haematological toxicity when given with NSAIDs. (Severe) Study
- Also see Table 2 p. 1264
- **Obinutuzumab** see monoclonal antibodies
- **Octreotide**
- **Octreotide** decreases the absorption of oral ciclosporin. Adjust ciclosporin dose, p. 788. (Severe) Anecdotal
- Also see monoclonal antibodies
- **Olanzapine** see Table 8 p. 1265 (hypotension), Table 15 p. 1267 (myelosuppression), Table 11 p. 1266 (CNS depressant effects)

**FOOD AND LIFESTYLE** Dose adjustment might be necessary if smoking started or stopped during treatment.

- **Antiepileptics (carbamazepine)** potentially decrease the exposure to olanzapine. Monitor and adjust dose. (Moderate) Study
- **Olanzapine** is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical
- Also see Table 8 p. 1265
- **Olanzapine** is predicted to decrease the effects of histamine. Avoid. (Severe) Theoretical
- Also see Table 8 p. 1265
- **HIV-protease inhibitors (ritonavir)** moderately decrease the exposure to olanzapine. (Moderate) Study
- **Olanzapine** decreases the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. (Severe) Anecdotal
- Also see Table 8 p. 1265
- **SSRIs (fluvoxamine)** moderately increase the exposure to olanzapine. Adjust dose. (Severe) Anecdotal
- **Olaparib** see Table 15 p. 1267 (myelosuppression)

**FOOD AND LIFESTYLE** Bitter (Seville) orange is predicted to increase the exposure to olaparib.

- **Antirhythmic (dronedaron)** are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. (Moderate) Theoretical
Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to olaparib. Avoid. [Moderate] Theoretical

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose. [p. 919] [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Study

Aprepitant is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Theoretical

Bosentan is predicted to decrease the exposure to olaparib. Avoid. [Moderate] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Theoretical

Cobicistat is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Study

Crizotinib is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Theoretical

Efavirenz is predicted to decrease the exposure to olaparib. [Table 15] Avoid. [Study]

Enzalutamide is predicted to decrease the exposure to olaparib. Avoid. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to olaparib. Avoid. [Moderate] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Study

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Theoretical

Idelalisib is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Study [Also see Table 15 p. 1267]

Imatinib is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Theoretical [Also see Table 15 p. 1267]

Macrolides (clarithromycin) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Study

Macrolides (erythromycin) are predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Theoretical

Netupitant is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Theoretical

Nevirapine is predicted to decrease the exposure to olaparib. Avoid. [Moderate] Theoretical

Nilotinib is predicted to increase the exposure to olaparib. Avoid or adjust olaparib dose, p. 919. [Moderate] Theoretical [Also see Table 15 p. 1267]

Rifampicin is predicted to decrease the exposure to olaparib. Avoid. [Moderate] Theoretical

St John’s Wort is predicted to decrease the exposure to olaparib. Avoid. [Moderate] Theoretical

Olmesartan → see angiotensin-II receptor antagonists

Oxitotrol → see beta, agonists

Olsalazine → see Table 15 p. 1267 (myelosuppression)

Omazolam → see monoclonal antibodies

Ombitasvir

Antiepileptics (carbamazepine) are predicted to decrease the exposure to ombitasvir. Avoid. [Severe] Theoretical

Rifampicin is predicted to decrease the exposure to ombitasvir. Avoid. [Severe] Theoretical

St John’s Wort is predicted to decrease the exposure to ombitasvir. Avoid. [Severe] Theoretical

Omega-3 acid ethyl esters → see Table 3 p. 1264 (anticoagulant effects)

Omeprazole → see proton pump inhibitors

Ondansetron → see Table 13 p. 1267 (serotonin syndrome), Table 9 p. 1266 (QT-interval prolongation)

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ondansetron. [Moderate] Study

Dopamine receptor agonists (apomorphine) increase the risk of severe hypotension when given with ondansetron. Avoid. [Severe] Study [Also see Table 9 p. 1266]

Enzalutamide is predicted to decrease the exposure to ondansetron. [Moderate] Study

Rifampicin is predicted to decrease the exposure to ondansetron. [Moderate] Study

Opicapone

Opicapone increases the exposure to levodopa. Adjust levodopa dose. [Moderate] Study

Opicapone is predicted to increase the risk of elevated blood pressure when given with moclobemide. Avoid. [Severe] Theoretical

Opicapone is predicted to increase the risk of elevated blood pressure when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Theoretical

Opicapone is predicted to increase the risk of elevated blood pressure when given with monoamine-oxidase B inhibitors (rasagiline, selegiline). [Severe] Theoretical

Opicapone is predicted to increase the risk of cardiovascular side-effects when given with sympathicomimetics, inotropic (dobutamine, dopamine). [Severe] Theoretical

Opicapone is predicted to increase the risk of cardiovascular side-effects when given with sympathicomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). [Severe] Theoretical

Opioids → see Table 6 p. 1265 (bradycardia), Table 13 p. 1267 (serotonin syndrome), Table 9 p. 1266 (QT-interval prolongation), Table 11 p. 1266 (CNS depressant effects)

Alfentanil • buprenorphine • codeine • diamorphine • dihydromorphone • diphenoxylate • dipipanone • fentanyl • hydromorphone • meptazinol • methadone • morphine • oxycodone • papaveretum • pentazocine • pethidine • remifentanil • sufentanil • tapentadol • tramadol

Food and lifestyle Alcohol has been associated with rapid release of hydromorphone and morphine from extended-release preparations. Avoid alcohol consumption with extended-release preparations.

Abricerone is predicted to decrease the efficacy of tramadol. [Moderate] Study

Antiarrhythmics (amiodarone) are predicted to increase the concentration of fentanyl. [Moderate] Theoretical [Also see Table 6 p. 1265]

Antiarrhythmics (propafenone) are predicted to decrease the efficacy of tramadol. [Moderate] Study

Antiarrhythmics (dronedarone) are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study

Antiarrhythmics (dronedarone) are predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical [Also see Table 9 p. 1266]

Antiepileptics (carbamazepine) decrease the concentration of tramadol. Adjust dose. [Severe] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to buprenorphine. Monitor and adjust dose. [Moderate] Theoretical [Also see Table 11 p. 1266]

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the exposure to methadone. Monitor and adjust dose. [Moderate] Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to opioids (alfentanil, fentanyl). [Moderate] Study [Also see Table 11 p. 1266]

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to opioids (alfentanil, fentanyl). [Moderate] Theoretical [Also see Table 9 p. 1266]

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to methadone. [Moderate] Theoretical [Also see Table 9 p. 1266]

Olaparib – Opioids 1379

BNF 74

Interactions | Appendix 1
Opioids (continued)

- **Antifungals, azoles (micazoside)** are predicted to increase the exposure to alfentanil. Use with caution and adjust dose. [Moderate] Theoretical
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Severe] Study
- **Bupropion** is predicted to decrease the efficacy of codeine. [Moderate] Theoretical
- **Bupropion** is predicted to decrease the efficacy of tramadol. [Severe] Study → Also see **TABLE 13** p. 1267
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study → Also see **TABLE 6** p. 1265
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical → Also see **TABLE 6** p. 1265
- **Ceritinib** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Avoid. [Severe] Theoretical
- **Cinacalcet** is predicted to decrease the efficacy of codeine. [Moderate] Theoretical
- **Cinacalcet** is predicted to decrease the efficacy of tramadol. [Severe] Study
- **Cobicistat** is predicted to increase the exposure to methadone. [Moderate] Theoretical
- **Cobicistat** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. [Severe] Study
- **Crizotinib** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study → Also see **TABLE 6** p. 1265
- **Crizotinib** is predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical → Also see **TABLE 6** p. 1265 → Also see **TABLE 9** p. 1266
- **Dolutexte** is predicted to decrease the efficacy of tramadol. [Moderate] Study → Also see **TABLE 13** p. 1267
- **Efavirenz** decreases the exposure to methadone. Monitor and adjust dose. [Severe] Study
- **Enalaprilat** is predicted to decrease the exposure to buprenorphine. Monitor and adjust dose. [Moderate] Theoretical
- **Enalaprilat** decreases the exposure to methadone. Monitor and adjust dose. [Severe] Study
- **Enalaprilat** is predicted to decrease the exposure to opioids (alfentanil, fentanyl). [Moderate] Study
- **Enalaprilat** is predicted to decrease the exposure to oxycodone. Monitor and adjust dose. [Moderate] Study
- **H₂ receptor antagonists (cimetidine)** increase the concentration of alfentanil. Use with caution and adjust dose. [Severe] Study
- **H₂ receptor antagonists (cimetidine)** increase the exposure to fentanyl. [Moderate] Study
- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to methadone. [Moderate] Theoretical → Also see **TABLE 9** p. 1266
- **HIV-protease inhibitors (ritonavir)** are predicted to decrease the concentration of morphine. [Moderate] Theoretical
- **HIV-protease inhibitors (ritonavir)** increase the risk of CNS toxicity when given with pethidine. Avoid. [Severe] Study
- **HIV-protease inhibitors (ritonavir)** are predicted to decrease the efficacy of tramadol. [Moderate] Study
- **HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study
- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. [Severe] Study
- **HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical
- **Idelalisib** is predicted to increase the exposure to methadone. [Moderate] Theoretical
- **Idelalisib** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). Monitor and adjust dose. [Severe] Study
- **Imatinib** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study
- **Imatinib** is predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Study
- **Macrolides (clarithromycin)** are predicted to increase the exposure to methadone. [Moderate] Theoretical → Also see **TABLE 9** p. 1266
- **Macrolides (erythromycin)** are predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study
- **Macrolides (erythromycin)** are predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical
- **Mirabegron** is predicted to decrease the efficacy of tramadol. [Moderate] Study
- **Opioids** are predicted to increase the risk of CNS excitation or depression when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. [Severe] Study → Also see **TABLE 13** p. 1267
- **Monoamine-oxidase B inhibitors (rasagiline)** are predicted to increase the risk of side-effects when given with pethidine. Avoid and for 14 days after stopping rasagiline. [Severe] Theoretical → Also see **TABLE 13** p. 1267
- **Monoamine-oxidase B inhibitors (saframidale)** are predicted to increase the risk of side-effects when given with pethidine. Avoid and for 1 week after stopping saframidale. [Severe] Theoretical → Also see **TABLE 13** p. 1267
- **Nalbuphine** is predicted to decrease the efficacy of opioids. Avoid. [Severe] Theoretical
- **Netupitant** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study
- **Netupitant** is predicted to increase the exposure to opioids (methadone, sufentanil). [Moderate] Theoretical
- **Nevirapine** decreases the exposure to methadone. Monitor and adjust dose. [Severe] Study
- **Nilotinib** is predicted to increase the exposure to opioids (alfentanil, buprenorphine, fentanyl, oxycodone). Monitor and adjust dose. [Moderate] Study
- **Nilotinib** is predicted to increase the exposure to methadone (alfentanil, buprenorphine, fentanyl, oxycodone, sufentanil). [Moderate] Theoretical → Also see **TABLE 9** p. 1266
- **Opioids (buprenorphine)** are predicted to increase the risk of opiate withdrawal when given with opioids (alfentanil, pethidine, remifentanil, sufentanil, tapentadol, tramadol). [Severe] Theoretical → Also see **TABLE 11** p. 1266 → Also see **TABLE 13** p. 1267
- **Opioids (pentazocine)** are predicted to increase the risk of opiate withdrawal when given with opioids (alfentanil, codeine, diamorphine, dihydrocodeine, dipipanone, fentanyl,
Rifampicin is predicted to decrease the exposure to buprenorphine. Monitor and adjust dose. [Moderate] Theoretical

Rifampicin is predicted to decrease the exposure to methadone. Monitor and adjust dose. [Severe] Study

Rifampicin is predicted to decrease the exposure to opioids (alfentanil, fentanyl). [Moderate] Study

Rifampicin is predicted to decrease the exposure to codeine, phenytion, primidone) are predicted to moderately decrease the exposure to osimertinib. Avoid. [Moderate] Study

Bosentan is predicted to decrease the exposure to osimertinib. Avoid. [Moderate] Study

Efavirenz is predicted to decrease the exposure to osimertinib. [Moderate] Theoretical

Enzalutamide is predicted to moderately decrease the exposure to osimertinib. Avoid. [Moderate] Study

St John’s Wort is predicted to decrease the exposure to osimertinib. Avoid. [Moderate] Study

Osimertinib slightly increases the exposure to statins (rosuvastatin). [Moderate] Study

Oxaliplatin is predicted to increase the exposure to oxystibutynin. [Mild] Theoretical

Oxazepam → see TABLE 11 p. 1266 (CNS depressant effects)

Oxenbolone → see antagonists

Oxybutynin is predicted to increase the exposure to oxystibutynin. [Mild] Theoretical

Oxystibutynin potentially increases the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. [Severe] Theoretical

Antifungals, azoles (fluconazole, itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to oxystibutynin. [Mild] Theoretical

Aprepitant is predicted to increase the exposure to oxystibutynin. [Mild] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to oxystibutynin. [Mild] Theoretical

Cobicistat is predicted to increase the exposure to oxystibutynin. [Mild] Study

Crizotinib is predicted to increase the exposure to oxystibutynin. [Mild] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to oxystibutynin. [Mild] Study

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to oxystibutynin. [Mild] Study

Idelalisib is predicted to increase the exposure to oxystibutynin. [Mild] Study

Imatinib is predicted to increase the exposure to oxystibutynin. [Mild] Theoretical

Macrolides (clarithromycin) are predicted to increase the exposure to oxystibutynin. [Mild] Study

Macrolides (erythromycin) are predicted to increase the exposure to oxystibutynin. [Mild] Theoretical

Netupitant is predicted to increase the exposure to oxystibutynin. [Mild] Theoretical

Nilotinib is predicted to increase the exposure to oxystibutynin. [Mild] Theoretical

Oxybutynin → see opioids

Oxymetholone → see oxymetholone

Oxybutynin increases the antiocoagulant effect of coumarins. [Severe] Anecdotal

Oxymetholone increases the antiocoagulant effect of phenindione. [Severe] Anecdotal

Oxytetraycline → see tetracyclines

Palbociclib is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose, p. 909. [Severe] Study

Palbociclib is predicted to increase the exposure to cyclosporin. Adjust dose. [Moderate] Theoretical

Cobicistat is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose, p. 909. [Severe] Study

Enzalutamide is predicted to decrease the exposure to palbociclib. Avoid. [Severe] Study

Palbociclib is predicted to increase the exposure to ergotamine. Adjust dose. [Moderate] Theoretical

Palbociclib is predicted to increase the exposure to everolimus. Adjust dose. [Moderate] Theoretical

Grapefruit juice is predicted to increase the exposure to palbociclib. Avoid. [Severe] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose, p. 909. [Severe] Study

Idelalisib is predicted to increase the exposure to palbociclib. Avoid or adjust palbociclib dose, p. 909. [Severe] Study

Palbociclib increases the exposure to midazolam. Adjust dose. [Moderate] Study

Palbociclib is predicted to increase the exposure to opioids (alfentanil, fentanyl). Adjust dose. [Moderate] Theoretical

Palbociclib is predicted to increase the exposure to pimozide. Adjust dose. [Moderate] Theoretical

Rifampicinc is predicted to decrease the exposure to palbociclib. Avoid. [Severe] Study

Palbociclib is predicted to increase the exposure to sirolimus. Adjust dose. [Moderate] Theoretical

St John’s Wort is predicted to decrease the exposure to palbociclib. Avoid. [Severe] Theoretical

Palbociclib is predicted to increase the exposure to tacrolimus. Adjust dose. [Moderate] Theoretical

Paliperidone is predicted to increase the concentration of paliperidone. Adjust dose. [Moderate] Study

Orlistat might affect the absorption of concurrently administered drugs—consider separating administration. Particular care should be taken with antiepileptics, antiretrovirals, and drugs that have a narrow therapeutic index.
Paliperidone (continued)

- Paliperidone is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical
- Paliperidone is predicted to decrease the effects of levodopa. (Severe) Theoretical
- Rifampicin is predicted to decrease the exposure to paliperidone. Monitor and adjust paliperidone dose. (Moderate) Theoretical

Palonosetron → see TABLE 13 p. 1267 (serotonin syndrome), TABLE 9 p. 1266 (QT-interval prolongation)

- Dopamine receptor agonists (apomorphine) are predicted to increase the risk of severe hypotension when given with palonosetron. (Severe) Theoretical

Pancreatin → see bishosphonates

- Pancreatin is predicted to decrease the effects of acarbose. Avoid. (Moderate) Theoretical

Pancuronium → see neuromuscular blocking drugs, non-depolarising

Panitumumab → see monoclonal antibodies

Panobinostat → see TABLE 15 p. 1267 (myelosuppression), TABLE 9 p. 1266 (QT-interval prolongation)

FOOD AND LIFESTYLE

- Avoid pomegranate, pomegranate juice, and star fruit as they are predicted to increase panobinostat exposure.

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to panobinostat. Avoid. (Moderate) Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 864. (Moderate) Study → Also see TABLE 9 p. 1266
- Panobinostat is predicted to increase the exposure to atomoxetine. Monitor and adjust dose. (Severe) Theoretical
- Panobinostat is predicted to increase the exposure to beta blockers, selective (metoprolol). Monitor and adjust dose. (Moderate) Theoretical
- Cobicistat is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 864. (Moderate) Study
- Enzalutamide is predicted to decrease the exposure to panobinostat. Avoid. (Moderate) Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 864. (Moderate) Study → Also see TABLE 9 p. 1266
- Idelalisib is predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 864. (Moderate) Study → Also see TABLE 15 p. 1267
- Macrolides (clarithromycin) are predicted to increase the exposure to panobinostat. Adjust panobinostat dose; in hepatic impairment avoid, p. 864. (Moderate) Study → Also see TABLE 9 p. 1266
- Panobinostat is predicted to increase the exposure to phenothiazines (perphenazine). Monitor and adjust dose. (Severe) Theoretical
- Panobinostat is predicted to increase the exposure to pimozone. Avoid. (Severe) Theoretical
- Rifampicin is predicted to decrease the exposure to panobinostat. Avoid. (Moderate) Theoretical
- St John’s Wort is predicted to decrease the exposure to panobinostat. Avoid. (Severe) Theoretical
- Panoprazole → see proton pump inhibitors
- Papaveretum → see opioids
- Paracetamol → see TABLE 1 p. 1264 (hepatotoxicity)

FOOD AND LIFESTYLE

- Severe liver damage can occur with chronic alcohol consumption in some alcoholic and persistent heavy drinkers who take only moderate doses of paracetamol.
- Paracetamol is predicted to decrease the clearance of alkylation agents (busulfan). (Moderate) Theoretical
- Paracetamol is predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (proparacaine). Use with caution or avoid. (Severe) Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to paracetamol. (Moderate) Study → Also see TABLE 1 p. 1264
- Paracetamol increases the anticoagulant effect of coumarins. (Severe) Study
- Paracetamol is predicted to increase the risk of methaemoglobinemia when given with dapsone. (Severe) Theoretical
- Enzalutamide is predicted to decrease the exposure to paracetamol. (Moderate) Study
- Imatinib increases the risk of hepatotoxicity when given with paracetamol. (Severe) Ancrodatal
- Paracetamol is predicted to increase the anticoagulant effect of phenindione. (Severe) Theoretical
- Pitolisant is predicted to decrease the exposure to paracetamol. (Unknown) Theoretical
- Rifampicin is predicted to decrease the exposure to paracetamol. (Moderate) Study
- Paraldehyde → see antiepileptics
- Parecoxib → see NSAIDs
- Paricalcitol → see vitamin D substances

Paritaprevir

- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. (Severe) Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. (Severe) Theoretical
- Antifungals, azoles (posaconazole) are predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir) and paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to antifungals, azoles (posaconazole). Avoid. (Severe) Theoretical
- Bosentan is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. (Severe) Study
- Cobicistat is predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. (Severe) Study
- Paritaprevir (with ritonavir and ombitasvir) increases the risk of raised liver function tests when given with combined hormonal contraceptives. Avoid. (Severe) Study
- Efavirenz is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. (Severe) Study
- Enzalutamide is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. (Severe) Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. (Severe) Study
- HIV-protease inhibitors (indinavir) potentially increase the exposure to paritaprevir. Avoid. (Severe) Theoretical
- Idelalisib is predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. (Severe) Theoretical
- Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to loop diuretics (furosemide). Adjust furosemide dose. (Moderate) Study
- Macrolides (clarithromycin) are predicted to increase the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. (Severe) Theoretical
- Nevirapine is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. (Severe) Study
- Rifampicin is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. (Severe) Study
- St John’s Wort is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. (Severe) Study

1382 Paliperidone – Paritaprevir
Paritaprevir

- Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to statins (fluvacastatin). Avoid. [Moderate] Theoretical
- Paritaprevir (with ritonavir and ombitasvir) increases the exposure to statins (pravastatin). Adjust pravastatin dose, p. 197. [Moderate] Study
- Paritaprevir (with ritonavir and ombitasvir) increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose, p. 197. [Moderate] Study
- Paroxetine → see SSRIs
- Paritaprevir → see TABLE 6 p. 1265 (bradycardia), TABLE 9 p. 1266 (QT-interval prolongation)
- Paritaprevir is predicted to decrease the absorption of oral ciclosporin. Adjust dose. [Severe] Theoretical
- Pazopanib → see TABLE 15 p. 1267 (myelosuppression); TABLE 9 p. 1266 (QT-interval prolongation)
- Antacids are predicted to decrease the absorption of pazopanib. Pazopanib should be taken 1 hour before or 2 hours after antacids. [Moderate] Theoretical
- Antiarhythmics (dronedarone) are predicted to increase the exposure to pazopanib. [Moderate] Theoretical → Also see TABLE 9 p. 1266
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to pazopanib. Avoid. [Severe] Theoretical
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to pazopanib. [Moderate] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose, p. 909. [Moderate] Study → Also see TABLE 9 p. 1266
- Aprepitant is predicted to increase the exposure to pazopanib. [Moderate] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to pazopanib. [Moderate] Theoretical
- Cobicistat is predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose, p. 909. [Moderate] Study
- Pazopanib is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- Crizotinib is predicted to increase the exposure to pazopanib. [Moderate] Theoretical → Also see TABLE 15 p. 1267 → Also see TABLE 9 p. 1266
- Enzalutamide is predicted to decrease the exposure to pazopanib. Avoid. [Severe] Theoretical
- Grapefruit juice is predicted to increase the exposure to pazopanib. Avoid. [Severe] Theoretical
- H₂ receptor antagonists are predicted to decrease the exposure to pazopanib. H₂ receptor antagonists should be taken 10 hours before or 2 hours after pazopanib. [Moderate] Theoretical
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose, p. 909. [Moderate] Study → Also see TABLE 9 p. 1266
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to pazopanib. [Moderate] Theoretical
- Idelalisib is predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose, p. 909. [Moderate] Study → Also see TABLE 15 p. 1267
- Imatinib is predicted to increase the exposure to pazopanib. [Moderate] Theoretical → Also see TABLE 15 p. 1267
- Pazopanib is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to pazopanib. Avoid or adjust pazopanib dose, p. 909. [Moderate] Study → Also see TABLE 9 p. 1266
- Macrolides (erythromycin) are predicted to increase the exposure to pazopanib. [Moderate] Theoretical
- Netupitant is predicted to increase the exposure to pazopanib. [Moderate] Theoretical
- Nilotinib is predicted to increase the exposure to pazopanib. [Moderate] Theoretical → Also see TABLE 15 p. 1267 → Also see TABLE 9 p. 1266
- Pazopanib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Proton pump inhibitors are predicted to decrease the exposure to pazopanib. Avoid or administer concurrently without food. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to pazopanib. Avoid. [Severe] Theoretical
- Pegaspargase → see TABLE 1 p. 1264 (hepatotoxicity), TABLE 15 p. 1267 (myelosuppression)
- Pegaspargase is predicted to increase the risk of hepatotoxicity when given with imatinib. [Severe] Theoretical → Also see TABLE 15 p. 1267
- Pegaspargase affects the efficacy of methotrexate. [Severe] Anecdotal → Also see TABLE 1 p. 1264 → Also see TABLE 15 p. 1267
- Pegaspargase potentially increases the risk of neurotoxicity when given with vinca alkaloids (vincristine). Vincristine should be taken 3 to 24 hours before pegaspargase. [Severe] Anecdotal → Also see TABLE 1 p. 1264 → Also see TABLE 15 p. 1267
- Peginterferon alfa → see interferons
- Peginterferon beta-1a → see TABLE 15 p. 1267 (myelosuppression)
- Pembrolizumab → see monoclonal antibodies
- Pemetrexed → see TABLE 15 p. 1267 (myelosuppression), TABLE 2 p. 1264 (nephrotoxicity)
- Antimalarialys (pyrimethamine) are predicted to increase the risk of side-effects when given with pemetrexed. [Severe] Theoretical → Also see TABLE 15 p. 1267
- Asparin (high-dose) potentially increases the exposure to pemetrexed. Use with caution or avoid. [Severe] Theoretical
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with pemetrexed. Public Health England advises avoid. [Severe] Theoretical
- NSAIDs are predicted to increase the exposure to pemetrexed. Use with caution or avoid. [Severe] Theoretical → Also see TABLE 2 p. 1264
- Penicillamine → see TABLE 2 p. 1264 (nephrotoxicity)
- Antacids decrease the absorption of penicillamine. Separate administration by 2 hours. [Mild] Study
- Antimalarialys (chloroquine) are predicted to increase the risk of haematological toxicity when given with penicillamine. Avoid. [Severe] Theoretical
- Penicillamine potentially decreases the concentration of digoxin. Separate administration by 2 hours. [Severe] Anecdotal
- Hydroxychloroquine is predicted to increase the risk of haematological toxicity when given with penicillamine. Avoid. [Severe] Theoretical
- Iron (oral) is predicted to decrease the absorption of penicillamine. Separate administration by at least 2 hours. [Mild] Study
- Sodium aurothiomalate potentially increases the risk of side-effects when given with penicillamine (in those who have had previous adverse reactions to gold). Avoid. [Severe] Study
- Zinc is predicted to decrease the absorption of penicillamine. [Mild] Theoretical

Penicillins

amoxicillin - ampicillin - benzylpenicillin - flucloxacillin - phenoxymethylpenicillin - piperacillin - pivmecillinam - temocillin - ticarcillin

- Allopurinol increases the risk of skin rash when given with penicillins (amoxicillin, ampicillin). [Moderate] Study
- Penicillins potentially alter the anticoagulant effect of coumarins. Monitor INR and adjust dose. [Severe] Anecdotal
- Penicillins are predicted to increase the risk of toxicity when given with methotrexate. [Severe] Theoretical
- Piperacillin increases the effects of neuromuscular blocking drugs, non-depolarising. [Moderate] Study
- Penicillins are predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Piperacillin increases the effects of suxamethonium. [Moderate] Study
- Pentamidine → see TABLE 15 p. 1267 (myelosuppression), TABLE 2 p. 1264 (nephrotoxicity), TABLE 9 p. 1266 (QT-interval prolongation)
- Didanosine is predicted to increase the risk of pancreatitis when given with pentamidine. Avoid. [Severe] Study
- Foscarnet increases the risk of hypocalcaemia when given with pentamidine. [Severe] Anecdotal → Also see TABLE 2 p. 1264
- Pentazocine → see opioids
### Pentostatin – Phenothiazines

**Pentostatin** → see TABLE 15 p. 1267 (myelosuppression), TABLE 5 p. 1264 (thromboembolism)

- Alkylating agents (cyclophosphamide) (high-dose) increase the risk of toxicity when given with pentostatin. Avoid. [Severe] Anecdotal → Also see TABLE 15 p. 1267 → Also see TABLE 5 p. 1264
- Fluorarabine increases the risk of pulmonary toxicity when given with pentostatin. Avoid. [Severe] Study → Also see TABLE 15 p. 1267

**Pentoxifylline**

- Pentoxifylline is predicted to increase the concentration of aminophylline. Use with caution or avoid. [Severe] Theoretical
- Quinolones (ciprofloxacin) very slightly increase the exposure to pentoxifylline. [Moderate] Study
- SSRI (fluvoxamine) are predicted to increase the exposure to pentoxifylline. [Moderate] Study
- Pentoxifylline increases the concentration of theophylline. Monitor and adjust dose. [Severe] Study

**Peppermint oil**

- Peppermint oil is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical

### Peppermint oil

- Phenelzine
- Perindopril
- → Pethidine
- → Pertuzumab
- Perinephrine
- Perphenazine
- Pertuzumab
- Pethidine
- → Phenindione

**Phenindione** → see TABLE 3 p. 1264 (anticoagulant effects)

**FOOD AND LIFESTYLE** The effects of phenindione can be reduced or abolished by vitamin K, including that found in foods and in alcohol consumption can affect anticoagulant control.

- Antiarrhythmics (propafenone) are predicted to increase the anticoagulant effect of phenindione. Monitor and adjust dose. [Moderate] Theoretical
- Antifungals, azoles (miconazole) greatly increase the anticoagulant effect of phenindione. [Severe] Theoretical
- Axitinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Bosutinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Cabozantinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Cephalosporins (ceftriaxone) potentially increase the risk of bleeding events when given with phenindione. [Severe] Anecdotal
- Corticosteroids are predicted to increase the effects of phenindione. [Moderate] Theoretical
- Crizotinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Dasatinib is predicted to increase the risk of bleeding events when given with phenindone. [Severe] Theoretical
- Disulfiram is predicted to increase the anticoagulant effect of phenindione. [Severe] Theoretical
- Enteral feeds (vitamin-K containing) potentially decreases the effects of phenindione. [Severe] Theoretical
- Erlotinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Fibrates are predicted to increase the anticoagulant effect of phenindione. Monitor INR and adjust dose. [Severe] Study
- Gefitinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- H2 receptor antagonists (cimetidine) increase the exposure to phenindione. [Severe] Anecdotal
- Imatinib is predicted to increase the risk of bleeding events when given with phenindone. [Severe] Theoretical
- Lapatinib is predicted to increase the risk of bleeding events when given with phenindone. [Severe] Theoretical
- Nandrolone is predicted to increase the anticoagulant effect of phenindone. Monitor and adjust dose. [Severe] Theoretical
- Nilotinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Oxyxemolone increases the anticoagulant effect of phenindione. [Severe] Anecdotal
- Paracetamol is predicted to increase the anticoagulant effect of phenindione. [Severe] Theoretical
- Pazopanib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Pentamidine are predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Ponatinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Ranibizumab is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Regorafenib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Ruxolitinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Sorafenib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Statins (rosuvastatin) are predicted to increase the anticoagulant effect of phenindione. Monitor INR and adjust dose. [Severe] Theoretical
- Sunifiram is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Vandetanib is predicted to increase the risk of bleeding events when given with phenindone. [Severe] Theoretical
- Phenobarbital → see antiepileptics

**Phenothiazines** → see TABLE 8 p. 1265 (hypotension), TABLE 9 p. 1266 (QT-interval prolongation), TABLE 11 p. 1266 (CNS depressant effects), TABLE 10 p. 1266 (antimuscarinics)

- Chlorpromazine · fluphenazine · levomepromazine · perphenazine · perphenazine · prochlorperazine · promazine · trifluoperazine

**FOOD AND LIFESTYLE** Dose adjustment might be necessary if smoking started or stopped during treatment with chlorpromazine and fluphenazine.

- Amfetamines are predicted to decrease the effects of chlorpromazine. [Moderate] Study
- Phenothiazines are predicted to decrease the effects of amfetamines. [Moderate] Study
- Antacids decrease the absorption of phenothiazines. [Severe] Anecdotal
- Chlorpromazine decreases the concentration of antiepileptics (phenobarbital, primidone) and antiepileptics (phenobarbital, primidone) decrease the concentration of chlorpromazine. [Moderate] Study → Also see TABLE 11 p. 1266
- Chlorpromazine is predicted to increase the risk of hyponatraemia when given with desmopressin. [Severe] Theoretical
- Phenothiazines are predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Study → Also see TABLE 8 p. 1265 → Also see TABLE 9 p. 1266 → Also see TABLE 10 p. 1266
- Phenothiazines are predicted to decrease the antihypertensive effects of guanethidine. [Moderate] Theoretical → Also see TABLE 8 p. 1265
- Phenothiazines are predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 1265
- Phenothiazines decrease the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. [Severe] Study → Also see TABLE 8 p. 1265
- Phenothiazines potentially increase the risk of neurotoxicity when given with lithium. [Severe] Anecdotal → Also see TABLE 9 p. 1266
- Chlorpromazine decreases the effects of metyrapone. Avoid. [Moderate] Theoretical
- Moclubemide increases the risk of side-effects when given with levomepromazine. [Moderate] Study
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of neuroleptic malignant syndrome when given with phenothiazines. [Severe] Theoretical → Also see TABLE 8 p. 1265
- Panobinostat is predicted to increase the exposure to perphenazine. Monitor and adjust dose. [Severe] Theoretical
- SSRI (paroxetine) markedly increase the exposure to perphenazine. [Severe] Study
Phenoxyethylpenicillin – Phosphodiesterase type-5 inhibitors

Antiarrhythmics

▶ Antifungals, azoles

Antiepileptics

▶ Phenytoin

Pharmacodynamics

Phenoxyethylpenicillin – see penicillins
Phenytoin – see antiepileptics
Pholcodine

▶ Pholcodine is predicted to increase the risk of CNS excitation or depression when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid and for 14 days after stopping the MAOI. (Severe) Theoretical

Phosphodiesterase type-5 inhibitors – see TABLE 8 p. 1265 (hypotension), TABLE 9 p. 1266 (QT-interval prolongation)

alpha blockers cause significant hypotensive effects when given with phosphodiesterase type-5 inhibitors. Patient should be stabilised on first drug then second drug should be added at the lowest recommended dose. (Severe) Study → Also see TABLE 8 p. 1265

Antiarrhythmics (dronedarone) are predicted to increase the exposure to avanafil. Adjust avanafil dose, p. 765. (Moderate) Theoretical

Antiarrhythmics (dronedarone) are predicted to increase the exposure to sildenafil. Monitor and adjust sildenafil dose, p. 766. (Moderate) Study → Also see TABLE 8 p. 1265

Antiarrhythmics (dronedarone) are predicted to increase the exposure to tadalafil. (Severe) Theoretical

Antiarrhythmics (dronedarone) are predicted to increase the exposure to vardenafil. Adjust dose. (Severe) Theoretical → Also see TABLE 8 p. 1265

Cobicistat is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to sildenafil. Avoid or adjust sildenafil dose, p. 766. (Severe) Study

Cobicistat is predicted to increase the exposure to tadalafil. Use with caution or avoid. (Severe) Study

Crizotinib is predicted to increase the exposure to avanafil. Adjust avanafil dose, p. 765. (Moderate) Theoretical

Crizotinib is predicted to increase the exposure to sildenafil. Monitor and adjust sildenafil dose, p. 766. (Moderate) Study → Also see TABLE 9 p. 1266

Crizotinib is predicted to increase the exposure to tadalafil. Adjust dose. (Severe) Theoretical

Crizotinib is predicted to increase the exposure to vardenafil. Adjust dose, p. 765. (Moderate) Theoretical

Enzalutamide is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). (Moderate) Theoretical

Enzalutamide is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenafil). (Moderate) Theoretical

Etravirine moderately decreases the exposure to phosphodiesterase type-5 inhibitors. Adjust dose. (Moderate) Study

Grapefruit juice is predicted to increase the exposure to phosphodiesterase type-5 inhibitors. Use with caution or avoid. (Moderate) Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. (Severe) Study → Also see TABLE 9 p. 1266

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to sildenafil. Avoid or adjust sildenafil dose, p. 766. (Severe) Study → Also see TABLE 9 p. 1266

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to tadalafil. Use with caution or avoid. (Severe) Study

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to avanafil. Adjust avanafil dose, p. 765. (Moderate) Theoretical

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. (Severe) Study

Idelalisib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. (Severe) Study

Idelalisib is predicted to increase the exposure to sildenafil. Monitor and adjust sildenafil dose, p. 766. (Moderate) Study

Idelalisib is predicted to increase the exposure to tadalafil. (Severe) Theoretical

Idelalisib is predicted to increase the exposure to vardenafil. Adjust dose. (Severe) Theoretical

Idelalisib is predicted to increase the exposure to sildenafil. Avoid or adjust sildenafil dose, p. 766. (Severe) Study

Imatinib is predicted to increase the exposure to avanafil. Adjust avanafil dose, p. 765. (Moderate) Theoretical

Imatinib is predicted to increase the exposure to phosphodiesterase type-5 inhibitors (avanafil, vardenafil). Avoid. (Severe) Study

Imatinib is predicted to increase the exposure to sildenafil. Monitor and adjust sildenafil dose, p. 766. (Moderate) Study

Imatinib is predicted to increase the exposure to tadalafil. (Severe) Theoretical

Interactions | Appendix 1
Phosphodiesterase type-5 inhibitors (continued)

- **Imatinib** is predicted to increase the exposure to vardenafil. Adjust dose. *Severe* Theoretical

- **Macrolides** *(clarithromycin)* are predicted to increase the exposure to sildenafil. Avoid or adjust sildenafil dose, p. 766. *Severe* Study → Also see TABLE 9 p. 1266

- **Macrolides** *(erythromycin)* are predicted to increase the exposure to vardenafil. Use with caution or avoid. *Severe* Study

- **Macrolides** *(erythromycin)* are predicted to increase the exposure to tadalafil. Adjust dose. *Severe* Theoretical

- **Macrolides** *(erythromycin)* are predicted to increase the exposure to vardenafil. Adjust tadalafil dose, p. 766. *Moderate* Theoretical

- **Nilotinib** is predicted to increase the exposure to sildenafil. Adjust tadalafil dose, p. 766. *Moderate* Theoretical

- **Nilotinib** is predicted to increase the exposure to vardenafil. Adjust tadalafil dose, p. 766. *Moderate* Theoretical

- **Nilotinib** is predicted to increase the exposure to vardenafil. Monitor and adjust sildenafil dose, p. 766. *Moderate* Study

- **Netupitant** is predicted to increase the exposure to vardenafil. Adjust dose. *Severe* Theoretical

- **Netupitant** is predicted to increase the exposure to vardenafil. Adjust dose. *Severe* Theoretical

- **Nevirapine** is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors. *Moderate* Theoretical

- **Nicoardil** is predicted to increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. *Severe* Theoretical → Also see TABLE 8 p. 1265

- **Nilotinib** is predicted to increase the exposure to vardenafil. Adjust avanafil dose, p. 765. *Moderate* Theoretical

- **Nilotinib** is predicted to increase the exposure to sildenafil. Monitor and adjust sildenafil dose, p. 766. *Moderate* Study

- **Nilotinib** is predicted to increase the exposure to vardenafil. Monitor and adjust sildenafil dose, p. 766. *Moderate* Study

- **Netupitant** is predicted to increase the exposure to vardenafil. Adjust dose. *Severe* Theoretical

- **Netupitant** is predicted to increase the exposure to vardenafil. Adjust dose. *Severe* Theoretical

- **Netupitant** is predicted to increase the exposure to vardenafil. Monitor and adjust sildenafil dose, p. 766. *Moderate* Study

- **Netupitant** is predicted to increase the exposure to vardenafil. Adjust dose. *Severe* Theoretical

- **Nitrate**s potentially increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. *Severe* Study → Also see TABLE 8 p. 1265

- **Rifampicin** is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors *(avanafil, tadalafil)*. Avoid. *Severe* Study

- **Rifampicin** is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors *(sildenafil, vardenafil)*. *Moderate* Theoretical

- **Riociguat** is predicted to increase the risk of hypotension when given with phosphodiesterase type-5 inhibitors. Avoid. *Severe* Theoretical → Also see TABLE 8 p. 1265

- **Phosphodiesterase type-5 inhibitors** are predicted to increase the risk of hypotension when given with *sapropterin*. *Moderate* Theoretical → Also see TABLE 8 p. 1265

- **St John’s Wort** is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors. *Moderate* Theoretical

#### Pilocarpine

**ROUTE-SPECIFIC INFORMATION** Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

#### Pimecrolimus

**FOOD AND LIFESTYLE** Risk of facial flushing and skin irritation with alcohol consumption.

- **Pimecrolimus** is predicted to decrease the efficacy of *mifamurtide*. Avoid. *Severe* Theoretical

**Pimozide** → Also see TABLE 9 p. 1266 (hypotension), **TABLE 10 p. 1266 (QT-interval prolongation)**, **TABLE 11 p. 1266 (CNS depressant effects)**, **TABLE 10 p. 1266 (antimuscarinics)**

- **Antiarrhythmics** *(dronedarone)* are predicted to increase the exposure to *pimozide*. Avoid. *Severe* Theoretical → Also see **TABLE 9 p. 1266**

- **Antifungals, azoles** *(fluconazole, itraconazole, ketoconazole, voriconazole)* are predicted to increase the exposure to *pimozide*. Avoid. *Severe* Theoretical → Also see **TABLE 9 p. 1266**

- **Antifungals, azoles** *(miconazole)* are predicted to increase the exposure to *pimozide*. Avoid. *Severe* Theoretical

- **Aprepitant** is predicted to increase the exposure to *pimozide*. Avoid. *Severe* Theoretical

- **Calcium channel blockers** *(diltiazem, verapamil)* are predicted to increase the exposure to *pimozide*. Avoid. *Severe* Theoretical → Also see **TABLE 8 p. 1265**

- **Certitinib** is predicted to increase the exposure to *pimozide*. Avoid. *Severe* Theoretical

- **Cobicistat** is predicted to increase the exposure to *pimozide*. Avoid. *Severe* Study

- **Crizotinib** is predicted to increase the exposure to *pimozide*. Avoid. *Severe* Theoretical → Also see **TABLE 9 p. 1266**

- **Pimozide** is predicted to decrease the effects of dopamine receptor agonists. Avoid. *Moderate* Theoretical → Also see **TABLE 8 p. 1265**

- **Fosaprepitant** is predicted to increase the exposure to *pimozide*. Avoid. *Severe* Theoretical

- **Grapefruit juice** increases the exposure to *pimozide*. Avoid. *Severe* Theoretical

- **HIV- protease inhibitors** *(atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)* are predicted to increase the exposure to *pimozide*. Avoid. *Severe* Study → Also see **TABLE 9 p. 1266**

- **Itraconazole** is predicted to increase the exposure to *pimozide*. Avoid. *Severe* Theoretical → Also see **TABLE 10 p. 1266**

- **Lopinavir, ritonavir, saquinavir, tipranavir** are predicted to increase the exposure to *pimozide*. Avoid. *Severe* Theoretical → Also see **TABLE 11 p. 1266**

- **Macrolides** *(clarithromycin)* are predicted to increase the exposure to *pimozide*. Avoid. *Severe* Study → Also see **TABLE 8 p. 1265**

- **Macrolides** *(erythromycin)* are predicted to increase the exposure to *pimozide*. Avoid. *Severe* Study → Also see **TABLE 9 p. 1266**

- **Panobinostat** is predicted to increase the exposure to *pimozide*. Avoid. *Severe* Theoretical → Also see **TABLE 9 p. 1266**

- **Pentamidine** is predicted to increase the exposure to *pimozide*. Avoid. *Severe* Theoretical → Also see **TABLE 9 p. 1266**

- **Piroxicam** is predicted to increase the exposure to *pimozide*. Avoid. *Severe* Theoretical → Also see **TABLE 10 p. 1266**

- **Ponazuril** is predicted to increase the exposure to *pimozide*. Avoid. *Severe* Theoretical → Also see **TABLE 10 p. 1266**

- **Pral Rugiline** is predicted to increase the exposure to *pimozide*. Avoid. *Severe* Theoretical → Also see **TABLE 10 p. 1266**

- **Pimozide** is predicted to increase the exposure to *pimozide*. Avoid. *Severe* Theoretical → Also see **TABLE 9 p. 1266**

- **Pineal hormones** *(melatonin)* are predicted to increase the exposure to *pimozide*. Avoid. *Severe* Theoretical → Also see **TABLE 9 p. 1266**

- **Pimozide** decreases the effects of levodopa. Avoid. *Severe* Theoretical → Also see **TABLE 8 p. 1265**

- **Piroxicam** is predicted to increase the exposure to *pimozide*. Avoid. *Severe* Theoretical → Also see **TABLE 9 p. 1266**

- **Pitolisant** is predicted to increase the exposure to *pimozide*. Avoid. *Severe* Study

- **Pindolol** → Also see beta blockers, non-selective

**Pioglitazone** → Also see **TABLE 14 p. 1267 (antidiabetic drugs)**

- **Clodigrel** is predicted to increase the exposure to *pioglitazone*. *Severe* Theoretical

- **Fibrates** *(gemfibrozil)* markedly increase the exposure to *pioglitazone*. Monitor blood glucose and adjust dose. *Severe* Study

- **Rifampicin** moderately decreases the exposure to *pioglitazone*. Monitor and adjust *pioglitazone* dose. *Moderate* Theoretical

- **St John’s Wort** slightly decreases the exposure to *pioglitazone*. *Mild* Study

- **Piperacillin** → Also see penicillins

- **Piperacillin** → Also see antimalarials

**Pirfenidone**

**FOOD AND LIFESTYLE** Smoking increases pirfenidone clearance; patients should be encouraged to stop smoking before and during treatment with pirfenidone.
Pirfenidone – Ponatinib

Antiepileptics (fosphenytoin, phenytoin) are predicted to decrease the exposure to pirfenidone. Avoid. [Moderate]

**Theoretical**

- Combined hormonal contraceptives are predicted to increase the exposure to pirfenidone. Use with caution and adjust dose. [Moderate]
- HIV-protease inhibitors (ritonavir) are predicted to decrease the exposure to pirfenidone. Avoid. [Moderate] Theoretical
- Quinolones (ciprofloxacin) are predicted to increase the exposure to pirfenidone. Avoid. [Moderate] Theoretical

Abiraterone is predicted to decrease the exposure to pirfenidone. Avoid. [Moderate] Theoretical

Piroxicam is predicted to moderately decrease the exposure to pirfenidone. Use with caution and adjust dose. [Moderate] Study

**Rifampicin** is predicted to moderately reduce the exposure to ponatinib. [Moderate] Study

**Pitolisant** is predicted to decrease the exposure to sirolimus. Avoid. [Severe] Theoretical

SSRIs (fluvoxamine) are predicted to moderately increase the exposure to ponatinib. Avoid. [Severe] Theoretical

**St John’s Wort** is predicted to decrease the exposure to ponatinib. Monitor and adjust dose. [Moderate] Theoretical

**Pitolisant** is predicted to decrease the exposure to tacrolimus. Avoid. [Severe] Theoretical

**Pitolisant** is predicted to decrease the exposure to taxanes (docetaxel). Avoid. [Severe] Theoretical

**Pitolisant** is predicted to decrease the exposure to temsirolimus. Avoid. [Severe] Theoretical

**Terbinaine** is predicted to moderately increase the exposure to ponatinib. Use with caution and adjust dose. [Moderate] Study

**Tricyclic antidepressants** are predicted to decrease the efficacy of ponatinib. [Mild] Theoretical

**Pimecrolimus** → see penicillins

**Pikantrone** → see anticholinergics

**Pizotifen** → see antihistamines, sedating

**Platinum compounds** → see TABLE 15 p. 1267 (myelosuppression), TABLE 2 p. 1264 (nephrotoxicity), TABLE 19 p. 1268 (ototoxicity), TABLE 12 p. 1267 (peripheral neuropathy)

**Cisplatin – cisplatin - oxaliplatin**

- Cisplatin increases the risk of pulmonary toxicity when given with bleomycin. [Severe] Study Also see TABLE 15 p. 1267
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with platinum compounds. Public Health England advises avoid. [Severe] Theoretical

**Polymyxins** → see TABLE 2 p. 1264 (nephrotoxicity), TABLE 20 p. 1268 (neuromuscular blocking effects)

**Poly saccharide-iron complex** → see iron (oral)

**Poly styrene sulfonate**

- **Antacid** increases the risk of metabolic alkalosis when given with polystyrene sulfonate. [Severe] Theoretical
- **Poly styrene sulfonate** is predicted to decrease the absorption of levethyroxine. Separate administration by at least 4 hours. [Moderate] Theoretical

**Pomalidomide** → see TABLE 15 p. 1267 (myelosuppression), TABLE 5 p. 1264 (thromboembolism)

- **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with pomalidomide. Avoid. [Severe] Theoretical
- **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with pomalidomide. [Severe] Theoretical
- **Quinolones (ciprofloxacin)** are predicted to increase the exposure to pomalidomide. Adjust pomalidomide dose, p. 886. [Moderate] Theoretical

**Pomalidomide** is predicted to moderately increase the exposure to pomalidomide. Adjust pomalidomide dose, p. 886. [Moderate] Study

**Ponatinib**

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to ponatinib. Avoid. [Moderate] Theoretical
- **Anti fungs, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose, p. 911. [Moderate] Study
- **Cobicistat** is predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose, p. 911. [Moderate] Study

**Ponatinib** is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical

- **Enzalutamide** is predicted to decrease the exposure to ponatinib. Avoid. [Moderate] Theoretical
- **Grapefruit juice** is predicted to increase the exposure to ponatinib. [Moderate] Theoretical

- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to...
Ponatinib (continued)  
slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose, p. 911. (Moderate) Study
  ▶ **idelalisib** is predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose, p. 911. (Moderate) Study
  ▶ **Macrolides (clarithromycin)** are predicted to slightly increase the exposure to ponatinib. Monitor and adjust ponatinib dose, p. 911. (Moderate) Study
  ▶ **Ponatinib** is predicted to increase the risk of bleeding events when given with **phenindione**. (Severe) Theoretical
  ▶ **Rifampicin** is predicted to decrease the exposure to ponatinib. Avoid. (Moderate) Theoretical
  ▶ **St John’s Wort** is predicted to decrease the exposure to ponatinib. Avoid. (Severe) Theoretical
  ▶ **Posaconazole** is predicted to increase the exposure to ponatinib. Avoid. (Moderate) Theoretical
  ▶ **Prasugrel** is predicted to increase the risk of bleeding events when given with **cobicistat**. Avoid. (Moderate) Theoretical
  ▶ **Potassium canrenoate** is predicted to slightly increase the exposure to ponatinib. Avoid. (Moderate) Theoretical
  ▶ **Potassium citrate** is predicted to decrease the exposure to ponatinib. Avoid. (Moderate) Theoretical
  ▶ **Potassium chloride** is predicted to decrease the exposure to ponatinib. Avoid. (Moderate) Theoretical
  ▶ **Potassium citrate** is predicted to decrease the efficacy of methenamine. Avoid. (Moderate) Theoretical
  ▶ **Potassium citrate** is predicted to decrease the risk of side-effects when given with **sucralfate**. Avoid. (Moderate) Theoretical
  ▶ **Potassium-sparing diuretics** (**amiloride** and **spironolactone**). Avoid. (Moderate) Theoretical
  ▶ **Proton pump inhibitors** (**omeprazole** and **pantoprazole**). Avoid. (Moderate) Theoretical
  ▶ **Promazine** is predicted to slightly increase the exposure to ponatinib. Avoid. (Moderate) Theoretical
  ▶ **Promethazine** is predicted to decrease the exposure to ponatinib. Avoid. (Severe) Theoretical
  ▶ **Promazine** is predicted to slightly increase the exposure to ponatinib. Avoid. (Moderate) Theoretical
  ▶ **Propantheline** is predicted to increase the risk of bleeding events when given with **cobicistat**. Avoid. (Moderate) Theoretical
  ▶ **Praziquantel** is predicted to decrease the exposure to ponatinib. Avoid. (Moderate) Theoretical
  ▶ **Prasugrel** is predicted to increase the exposure to ponatinib. Avoid. (Moderate) Theoretical
  ▶ **Proton pump inhibitors** (**omeprazole**, **lansoprazole**, **esomeprazole**, **rabeprazole**). Avoid. (Moderate) Theoretical
  ▶ **Proton pump inhibitors** are predicted to decrease the absorption of **antifungals**. Avoid. (Moderate) Theoretical
  ▶ **Proton pump inhibitors** are predicted to decrease the absorption of **antifungals**. Avoid. (Moderate) Theoretical
  ▶ **Proton pump inhibitors** are predicted to decrease the absorption of **antifungals**. Avoid. (Moderate) Theoretical
  ▶ **Proton pump inhibitors** are predicted to decrease the absorption of **cetirizine**. Avoid. (Moderate) Theoretical
  ▶ **Proton pump inhibitors** are predicted to decrease the absorption of **dipivinil**. Avoid. (Moderate) Theoretical
  ▶ **Proton pump inhibitors** are predicted to decrease the absorption of **dipivinil**. Avoid. (Moderate) Theoretical
  ▶ **Proton pump inhibitors** are predicted to decrease the absorption of **dipivinil**. Avoid. (Moderate) Theoretical
  ▶ **Proton pump inhibitors** are predicted to decrease the absorption of **dipivinil**. Avoid. (Moderate) Theoretical
  ▶ **Proton pump inhibitors** are predicted to decrease the absorption of **dipivinil**. Avoid. (Moderate) Theoretical

**FOOD AND LIFESTYLE**  
Procarbazine is a mild monoamine-oxidase inhibitor and might rarely interact with tyramine-rich foods (such as mature cheese, salami, pickled herring, Bovril®).
Proton pump inhibitors decrease the exposure to HIV-protease inhibitors (atazanavir). Avoid or adjust dose. (Severe) Study

Proton pump inhibitors increase the exposure to HIV-protease inhibitors (saquinavir). Avoid. (Severe) Study

HIV-protease inhibitors (tipranavir) decrease the exposure to proton pump inhibitors. Avoid. (Severe) Study

Proton pump inhibitors are predicted to decrease the exposure to ledipasvir. Adjust dose, see sofosbuvir with ledipasvir p. 596. (Moderate) Theoretical

Lumacaftor is predicted to decrease the exposure to proton pump inhibitors (esomprazole, lanosprazole, omeprazole). Adjust dose. (Moderate) Theoretical

Proton pump inhibitors decrease the clearance of methotrexate. Use with caution or avoid. (Severe) Study

Proton pump inhibitors are predicted to decrease the exposure to pazzipanib. Avoid or administer concurrently without food. (Moderate) Study

Rifampicin is predicted to moderately decrease the exposure to omeprazole. (Moderate) Study

Proton pump inhibitors are predicted to decrease the exposure to rilpivirine. Avoid. (Severe) Study

Proton pump inhibitors potentially decrease the exposure to sofosbuvir. Adjust dose, see sofosbuvir with ledipasvir and sofosbuvir with velpatavir p. 596. (Moderate) Study

SSRs (fluvoxamine) are predicted to increase the exposure to proton pump inhibitors. (Mild) Study

Esomprazole is predicted to slightly to moderately increase the exposure to SSRIs (citalopram, escitalopram). Monitor and adjust dose. (Severe) Theoretical

Omeprazole slightly to moderately increases the exposure to SSRIs (citalopram, escitalopram). Monitor and adjust dose. (Severe) Study

Proton pump inhibitors are predicted to decrease the concentration of velpatavir. Adjust dose, see sofosbuvir with velpatavir p. 596. (Moderate) Study

Proxymetacaine → see anaesthetics, local

Pseudoephedrine → see sympathomimetics, vasoconstrictor

Pyrazinamide

Allopurinol is predicted to increase the risk of hyperuricaemia when given with pyrazinamide. (Moderate) Theoretical

Pyrazinamide is predicted to decrease the effects of sulfamethoxazole. (Moderate) Theoretical

Pyridostigmine → see antimuscarinics, anticholinesterase

Quetiapine → see antimuscarinics, anticholinesterase

Quetiapine is predicted to slightly to moderately increase the exposure to SSRIs (citalopram, escitalopram). Monitor and adjust dose. (Severe) Study

Omeprazole slightly to moderately increases the exposure to SSRIs (citalopram, escitalopram). Monitor and adjust dose. (Severe) Study

Proton pump inhibitors are predicted to decrease the concentration of velpatavir. Adjust dose, see sofosbuvir with velpatavir p. 596. (Moderate) Study

Proxymetacaine → see anaesthetics, local

Pseudoephedrine → see sympathomimetics, vasoconstrictor

Pyrazinamide

Allopurinol is predicted to increase the risk of hyperuricaemia when given with pyrazinamide. (Moderate) Theoretical

Pyrazinamide is predicted to decrease the effects of sulfamethoxazole. (Moderate) Theoretical

Pyridostigmine → see TABLE 6 p. 1265 (bradycardia), TABLE 20 p. 1268 (neuromuscular blocking effects)

Aminoglycosides are predicted to decrease the effects of pyridostigmine. (Moderate) Theoretical → Also see TABLE 20 p. 1268

Pyrimethamine → see antimalarials

Quetiapine → see TABLE 8 p. 1268 (hypotension), TABLE 11 p. 1266 (CNS depressant effects)

Antiarhythmics (dronedarone) are predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to quetiapine. (Moderate) Study → Also see TABLE 11 p. 1266

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to quetiapine. Avoid. (Severe) Study

Aprepitant is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study → Also see TABLE 8 p. 1265

Cobicistat is predicted to increase the exposure to quetiapine. Avoid. (Severe) Study

Crizotinib is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study

Quetiapine is predicted to decrease the effects of dopamine receptor agonists. Avoid. (Moderate) Theoretical → Also see TABLE 8 p. 1265

Enzalutamide is predicted to decrease the exposure to quetiapine. (Moderate) Study

Grapefruit juice is predicted to increase the exposure to quetiapine. Avoid. (Severe) Theoretical

Quetiapine is predicted to decrease the effects of histamine. Avoid. (Severe) Theoretical → Also see TABLE 8 p. 1265

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to quetiapine. Avoid. (Severe) Study

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study

Idelalisib is predicted to increase the exposure to quetiapine. Avoid. (Severe) Study

Imatinib is predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study

Quetiapine decreases the effects of levodopa. (Severe) Anecdotal → Also see TABLE 8 p. 1265

Quetiapine potentially increases the risk of neurotoxicity when given with lithium. (Severe) Anecdotal

Macrolides (clarithromycin) are predicted to increase the exposure to quetiapine. Avoid. (Severe) Study

Macrolides (erythromycin) are predicted to increase the exposure to quetiapine. Avoid. (Moderate) Study

Rifampicin is predicted to decrease the exposure to quetiapine. (Moderate) Study

Quinagolide → see dopamine receptor agonists

Quinapril → see ACE inhibitors

Quinoline → see antimalarials

Quinolones → see TABLE 9 p. 1266 (QT-interval prolongation)

ciprofloxacin • levofloxacin • moxifloxacin • nalidixic acid • norfloxacin • ofloxacin

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Ciprofloxacin is predicted to increase the exposure to agomelatine. (Moderate) Study

Quinolones (ciprofloxacin, norfloxacin) are predicted to increase the exposure to aminophylline. Adjust dose. (Moderate) Theoretical

Ciprofloxacin is predicted to increase the exposure to anagrelide. (Moderate) Theoretical

Antacids decrease the absorption of quinolones. Quinolones should be taken 2 hours before or 4 hours after antacids. (Moderate) Study

Ciprofloxacin slightly increases the exposure to antihistamines (lisdexa). (Mild) Study

Ciprofloxacin affects the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. (Severe) Study

Aspirin (high-dose) potentially increases the risk of seizures when given with quinolones. (Severe) Theoretical

Calcium salts (calcium carbonate) decrease the absorption of norfloxacin. Norfloxacin should be taken 2 hours before or 4 hours after calcium carbonate. (Moderate) Study

Calcium salts (calcium carbonate) decrease the absorption of quinolones (ciprofloxacin, nalidixic acid). Separate administration by 2 hours. (Moderate) Study

Ciprofloxacin increases the concentration of clozapine. Monitor side effects and adjust dose. (Severe) Study

Quinolones increase the anticoagulant effect of coumarins. (Severe) Anecdotal

Didanosine (buffered) is predicted to greatly decrease the exposure to oral quinolones. Didanosine should be taken 2 hours after quinolones. (Moderate) Study

Ciprofloxacin is predicted to increase the exposure to dopamine receptor agonists (ropinirole). Adjust dose. (Moderate) Study

Ciprofloxacin is predicted to increase the exposure to duloxetine. Avoid. (Moderate) Theoretical

Enteral feeds decreases the exposure to ciprofloxacin. (Moderate) Study

Ciprofloxacin slightly increases the exposure to erlotinib. Monitor side effects and adjust dose. (Moderate) Study
**Quinolones (continued)**

- **Ciprofloxacin** is predicted to increase the exposure to ibritunib. Avoid or adjust ibritunib dose. p. 902. [Severe] Theoretical
- **Iron (oral)** decreases the exposure to quinolones. Separate administration by at least 2 hours. [Moderate] Study
- **Lanthanum moderately decreases the exposure to quinolones. Quinolones should be taken 2 hours before or 4 hours after lanthanum.** [Moderate] Study
- **Ciprofloxacin** is predicted to increase the exposure to ioxapine. Avoid. [Unknown] Theoretical
- **Ciprofloxacin** is predicted to increase the exposure to melatonin. [Moderate] Theoretical
- **Ciprofloxacin** potentially increases the risk of toxicity when given with methotrexate. Avoid. [Severe] Anecdotal
- **Ciprofloxacin** slightly increases the exposure to monoamine-oxidase B inhibitors (rasagiline). [Moderate] Study
- **NSAIDs**: potentially increase the risk of seizures when given with quinolones. [Severe] Theoretical
- **Ciprofloxacin** very slightly increases the exposure to pentoxifylline. [Moderate] Study
- **Ciprofloxacin** is predicted to increase the exposure to pifremidine. Use with caution and adjust dose. [Moderate] Study
- **Ciprofloxacin** is predicted to increase the exposure to pomalidomide. Adjust pomalidomide dose. p. 886. [Moderate] Theoretical
- **Ciprofloxacin** is predicted to increase the exposure to riflumilast. [Moderate] Theoretical
- **Strontium ranelate** is predicted to decrease the absorption of quinolones. Avoid. [Moderate] Theoretical
- **Sucralfate** decreases the exposure to quinolones. Separate administration by 2 hours. [Moderate] Study
- **Ciprofloxacin** is predicted to increase the exposure to theophylline. Monitor and adjust dose. [Moderate] Theoretical
- **Norfloxacin** is predicted to increase the exposure to theophylline. Adjust dose. [Moderate] Anecdotal
- **Ciprofloxacin** increases the exposure to tizanidine. Avoid. [Moderate] Study
- **Zinc** is predicted to decrease the exposure to quinolones. Separate administration by 2 hours. [Moderate] Study
- **Ciprofloxacin** is predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose. p. 456. [Moderate] Theoretical

**Rabeprazole** → see proton pump inhibitors

**Rabies vaccine**
- **Antimalarials (chloroquine)** decrease the efficacy of rabies vaccine. Avoid. [Moderate] Study
- **Hydroxychloroquine** is predicted to decrease efficacy rabies vaccine. Avoid. [Moderate] Study

**Raloxifene** → see TABLE 5 p. 1264 (thromboembolism)

**Raltegravir**
- **Antacids** slightly decrease the exposure to raltegravir. Avoid. [Moderate] Study
- **HIV-protease inhibitors (darunavir)** increase the risk of rash when given with raltegravir. [Moderate] Study
- **HIV-protease inhibitors (fosamprenavir)** boosted with ritonavir decrease the exposure to raltegravir and raltegravir decreases the exposure to HIV-protease inhibitors (fosamprenavir) boosted with ritonavir. Avoid. [Severe] Study
- **Rifampicin** slightly decreases the exposure to raltegravir. Avoid or adjust dose. [Moderate] Study
- **Folates (folic acid)** are predicted to alter the effects of raltitrexed. Avoid. [Moderate] Theoretical
- **Folates (folic acid)** alter the effects of raltitrexed. Avoid. [Moderate] Study
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with raltitrexed. Public Health England advises avoid. [Severe] Theoretical

**Ramipril** → see ACE inhibitors

**Ranucumab** → see monoclonal antibodies

**Ranibizumab**
- **Ranibizumab** is predicted to increase the risk of bleeding events when given with argatroban. [Severe] Theoretical
- **Ranibizumab** is predicted to increase the risk of bleeding events when given with bivalirudin. [Moderate] Theoretical
- **Ranibizumab** increases the risk of bleeding events when given with coumarins. [Severe] Theoretical
- **Ranibizumab** is predicted to increase the risk of bleeding events when given with danaparoid. [Severe] Theoretical
- **Ranibizumab** increases the risk of bleeding events when given with heparin (unfractionated). [Severe] Theoretical
- **Ranibizumab** increases the risk of bleeding events when given with low molecular-weight heparins. [Severe] Theoretical
- **Ranibizumab** is predicted to increase the risk of bleeding events when given with phenytoin, primidone. [Severe] Theoretical
- **Ranibizumab** is predicted to increase the exposure to aliskiren. [Moderate] Theoretical
- **Antiarhythmic drugs (dronedarone)** are predicted to increase the exposure to ranolazine. [Severe] Study → Also see TABLE 9 p. 1266
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to ranolazine. Avoid. [Severe] Study
- **Antifungals, azoles (fluconazole, itraconazole, posaconazole)** are predicted to increase the exposure to ranolazine. [Severe] Study
- **Ranolazine** is predicted to increase the exposure to ceritinib. [Moderate] Theoretical → Also see TABLE 9 p. 1266
- **Ciclosporin** is predicted to increase the concentration of ranolazine and ranolazine is predicted to increase the concentration of ciclosporin. [Moderate] Theoretical
- **Cobicistat** is predicted to increase the exposure to ranolazine. Avoid. [Severe] Study
- **Ranolazine is predicted to increase the exposure to beta blockers, non-selective (nadolol). [Moderate] Study
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to ranolazine. [Severe] Study
- **Ranolazine is predicted to increase the exposure to erlotinib.** [Moderate] Theoretical
- **Ranolazine is predicted to increase the exposure to fidaxomicin.** Avoid. [Moderate] Study
- **Ranolazine is predicted to slightly increase the exposure to edoxaban.** [Severe] Theoretical
- **Enalapril** is predicted to decrease the exposure to edoxaban. [Severe] Theoretical
- **Ranolazine is predicted to increase the exposure to ebolavir.** Avoid or adjust ebolavir dose. p. 1020. [Severe] Theoretical
- **Crizotinib** is predicted to increase the exposure to ranolazine. [Severe] Study → Also see TABLE 9 p. 1266
- **Ranolazine is predicted to increase the exposure to dabigatran.** [Severe] Theoretical
- **Ranolazine increases the concentration of digoxin.** [Moderate] Study
- **Ranolazine is predicted to increase the exposure to ebrantib.** [Severe] Theoretical
- **Grapefruit juice** is predicted to increase the concentration of ranolazine. Avoid. [Severe] Theoretical
- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to ranolazine. Avoid. [Severe] Study → Also see TABLE 9 p. 1266
- **HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to ranolazine. [Severe] Study
- **Idelalisib** is predicted to increase the exposure to ranolazine. Avoid. [Severe] Study
- **Imatinib** is predicted to increase the exposure to ranolazine. [Severe] Study
- **Ranolazine is predicted to increase the exposure to lomitapide.** Separate administration by 12 hours. [Moderate] Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the exposure to ranolazine. Avoid. [Severe] Study → Also see TABLE 9 p. 1266
Macrolides (erythromycin) are predicted to increase the exposure to ranolazine. **Severe** Study

Netupitant is predicted to increase the exposure to ranolazine. **Severe** Study

Nilotinib is predicted to increase the exposure to ranolazine. **Severe** Study   
→ Also see TABLE 9 p. 1266

Ranolazine is predicted to increase the exposure to nintedanib. **Moderate** Study

Rifaximin is predicted to decrease the exposure to ranolazine. Avoid. **Severe** Study

St John's Wort is predicted to decrease the exposure to ranolazine. Avoid. **Severe** Study

Ranolazine is predicted to increase the exposure to statins (atorvastatin). **Moderate** Theoretical

Ranolazine slightly increases the exposure to statins (simvastatin). Adjust simvastatin dose, p. 198. **Moderate** Study

Ranolazine increases the concentration of tacrolimus. Adjust dose. **Severe** Anecdotal

Ranolazine is predicted to increase the exposure to ticagrelor. Use with caution or avoid. **Severe** Study

Ranolazine is predicted to increase the exposure to topotecan. **Severe** Study

Ranolazine is predicted to increase the concentration of trametinib. **Moderate** Theoretical

Ranolazine is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. **Severe** Theoretical

Rasagiline → see monoamine-oxidase B inhibitors

Reboxetine

Antiplatelets (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to reboxetine. **Moderate** Anecdotal

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to reboxetine. Avoid. **Moderate** Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of reboxetine. Use with caution and adjust dose. **Moderate** Theoretical

Cobicistat is predicted to increase the exposure to reboxetine. Avoid. **Moderate** Study

Enzalutamide is predicted to decrease the exposure to reboxetine. **Moderate** Anecdotal

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to reboxetine. Avoid. **Moderate** Study

Reboxetine is predicted to increase the risk of a hypertensive crisis when given with linezolid. Avoid. **Severe** Theoretical

Reboxetine is predicted to increase the risk of hypokalaemia when given with loop diuretics. **Moderate** Theoretical

Macrolides (clarithromycin) are predicted to increase the exposure to reboxetine. Avoid. **Moderate** Study

Reboxetine is predicted to increase the risk of a hypertensive crisis when given with moclobemide. Avoid. **Severe** Theoretical

Reboxetine is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase A and B inhibitors, irreversible. Avoid. **Severe** Theoretical

Reboxetine is predicted to increase the risk of a hypertensive crisis when given with monoamine-oxidase B inhibitors (rasagiline, selegiline). Avoid. **Severe** Theoretical

Reboxetine is predicted to decrease the exposure to reboxetine. **Moderate** Anecdotal

Reboxetine is predicted to increase the risk of hypokalaemia when given with thiazide diuretics. **Moderate** Anecdotal

Regorafenib → see TABLE 15 p. 1267 (myelosuppression), TABLE 4 p. 1264 (antiplatelet effects)

Antiplatelets (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to regorafenib. Avoid. **Moderate** Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to regorafenib. Avoid. **Moderate** Study

Cobicistat is predicted to increase the exposure to regorafenib. Avoid. **Moderate** Study

Regorafenib is predicted to increase the risk of bleeding events when given with coumarins. **Severe** Study

Enzalutamide is predicted to decrease the exposure to regorafenib. Avoid. **Moderate** Study

Grapefruit juice is predicted to increase the exposure to regorafenib. Avoid. **Moderate** Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to regorafenib. Avoid. **Moderate** Study

Idelalisib is predicted to increase the exposure to regorafenib. Avoid. **Moderate** Study   
→ Also see TABLE 15 p. 1267

Macrolides (clarithromycin) are predicted to increase the exposure to regorafenib. Avoid. **Moderate** Study

Regorafenib is predicted to increase the exposure to méthotrexate. **Severe** Theoretical   
→ Also see TABLE 15 p. 1267

Regorafenib is predicted to increase the exposure to NSAIDs (mefenamic acid). Avoid. **Moderate** Theoretical   
→ Also see TABLE 4 p. 1264

Regorafenib is predicted to increase the risk of bleeding events when given with phenindione. **Severe** Theoretical

Rifaximin is predicted to decrease the exposure to regorafenib. Avoid. **Moderate** Study

Regorafenib is predicted to increase the exposure to statins (atorvastatin, fluvastatin, rosuvastatin). **Severe** Theoretical

Remifentanil → see opioids

Repaglinide → see TABLE 14 p. 1267 (antidiabetic drugs)

Antiplatelets (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. **Moderate** Study

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to repaglinide. **Moderate** Study

Ciclosporin moderately increases the exposure to repaglinide. **Moderate** Study

Clopigogrel increases the exposure to repaglinide. **Severe** Study

Cobicistat is predicted to increase the exposure to repaglinide. Avoid. **Moderate** Study

Enzalutamide is predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. **Moderate** Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to repaglinide. **Moderate** Study

Idelalisib is predicted to increase the exposure to repaglinide. **Moderate** Study

Iron chelators (deferasirox) moderately increase the exposure to repaglinide. Avoid. **Moderate** Study

Lumacaftor is predicted to decrease the exposure to repaglinide. Adjust dose. **Moderate** Theoretical

Macrolides (clarithromycin) are predicted to increase the exposure to repaglinide. **Moderate** Study

Pitolisant is predicted to decrease the exposure to repaglinide. **Unknown** Theoretical

Rifaximin is predicted to decrease the exposure to repaglinide. Monitor blood glucose and adjust dose. **Moderate** Study

Teriflunomide increases the exposure to repaglinide. **Moderate** Study

Trimethoprim slightly increases the exposure to repaglinide. Avoid or monitor blood glucose. **Moderate** Study

Resilzumab → see monoclonal antibodies

Replease → see TABLE 3 p. 1264 (anticoagulant effects)

Retigabine → see antiplatelets

Retinoids → see TABLE 5 p. 1264 (thromboembolism)

Acitretin, adalapene, alitretinoin, bexarotene, isotretinoin, tazarotene, tretinoin

→ Consumption of alcohol might increase the serum concentration of etretinate in patients taking acitretin. Avoid alcohol during and for 2 months after stopping acitretin.
Retinoids (continued)

- Avoid concomitant use of keratolytics in patients taking acitretin and isotretinoin.

- Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

- Antiarrhythmics (amiodarone) are predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose, p. 1157. [Moderate] Theoretical

- Antifungals, azoles (fluconazole, itraconazole, ketoconazole, miconazole, voriconazole) are predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose, p. 1157. [Moderate] Theoretical

- Alitretinoin, acitretin (fluconazole, ketoconazole, voriconazole) are predicted to increase the risk of tretinoin toxicity when given with tretinoin. [Moderate] Study

- Cobicistat is predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose, p. 1157. [Moderate] Theoretical

- Azithromycin is predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose, p. 1157. [Moderate] Theoretical

- Cobicistat is predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose, p. 1157. [Moderate] Theoretical

- Fibrates (gemfibrozil) are predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose, p. 1157. [Moderate] Theoretical

- Fibrates (gemfibrozil) increase the concentration of bexarotene. Avoid. [Severe] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) are predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose, p. 1157. [Moderate] Theoretical

- Idelalisib is predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose, p. 1157. [Moderate] Theoretical

- Indinavir, ritonavir, saquinavir, tipranavir decreases the concentration of miconazole. Avoid. [Severe] Study

- Isavuconazole is predicted to decrease the concentration of ketoconazole. Avoid. [Severe] Study

- Acitretin, alitretinoin, isotretinoin, tretinoin increase the risk of benign intracranial hypertension when given with tetracyclines. Avoid. [Severe] Anecdotal

- Bexarotene is predicted to increase the risk of toxicity when given with vitamin A. Adjust dose. [Moderate] Theoretical

- Sulfinpyrazone is predicted to increase the exposure to alitretinoin. Adjust alitretinoin dose, p. 1157. [Moderate] Theoretical

- Retinoids (acitretin, alitretinoin, isotretinoin, tretinoin) increase the risk of benign intracranial hypertension when given with tetracyclines. Avoid. [Severe] Anecdotal

- Vitamin A is predicted to increase the risk of vitamin A toxicity when given with vitamin A. Avoid. [Severe] Study

Ribavirin

- Ribavirin is predicted to increase the exposure to didanosine. Avoid. [Severe] Study

- Ribavirin increases the risk of toxicity when given with stavudine. Avoid. [Severe] Study

- Ribavirin increases the risk of anaemia and/or leucopenia when given with zidovudine. Avoid. [Severe] Study

Rifabutin

GENERAL INFORMATION Although some manufacturers classify rifabutin as a potent inducer of CYP3A4, clinical data suggests it is potentially a weak inducer, and therefore the BNF does not extrapolate the interactions of potent CYP3A4 inducers to rifabutin. For those who wish to err on the side of caution, see the interactions of rifampicin but bear in mind other mechanisms might be involved.

- Antifungals, azoles (fluconazole) increase the risk of uveitis when given with rifabutin. Adjust dose. [Severe] Study

- Antifungals, azoles (itraconazole, posaconazole) increase the concentration of rifabutin and rifabutin decreases the concentration of antifungals, azoles (itraconazole, posaconazole). Avoid. [Severe] Study

- Antifungals, azoles (ketoconazole) are predicted to increase the concentration of rifabutin and rifabutin is predicted to decrease the concentration of antifungals, azoles (ketoconazole). Avoid. [Severe] Theoretical

- Antifungals, azoles (miconazole) are predicted to increase the concentration of rifabutin. Use with caution and adjust dose. [Moderate] Theoretical

- Rifabutin is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. [Severe] Theoretical

- Rifabutin decreases the concentration of antifungals, azoles (voriconazole) and antifungals, azoles (voriconazole) increase the concentration of rifabutin. Avoid or adjust voriconazole dose, p. 566. [Severe] Study

- Rifabutin slightly decreases the exposure to antimalarials (atovaquone). Avoid. [Moderate] Study

- Rifabutin decreases the concentration of cobicistat and cobicistat increases the exposure to rifabutin. Avoid or adjust dose. [Severe] Study

- Rifabutin is predicted to decrease the efficacy of combined hormonal contraceptives. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Study

- Rifabutin increases the clearance of dapsone. [Moderate] Study

- Rifabutin is predicted to decrease the efficacy of desogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical

- Efavirenz slightly decreases the exposure to rifabutin. Adjust dose. [Severe] Study

- Rifabutin is predicted to decrease the efficacy of etonogestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical

- Rifabutin decreases the exposure to etravirine. [Moderate] Study

- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) markedly increase the exposure to rifabutin. Monitor and adjust dose. [Severe] Study

- HIV-protease inhibitors (indinavir) increase the exposure to rifabutin and rifabutin decreases the exposure to HIV-protease inhibitors (indinavir). Avoid. [Severe] Study

- HIV-protease inhibitors (ritonavir) markedly increase the exposure to rifabutin. Avoid or adjust dose. [Severe] Study

- Rifabutin is predicted to decrease the effects of Hormone replacement therapy. [Moderate] Anecdotal

- Rifabutin is predicted to decrease the efficacy of levonorgestrel. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical

- Lumacaftor is predicted to decrease the exposure to rifabutin. Adjust dose. [Moderate] Theoretical

- Macrolides (azithromycin) increase the risk of neutropenia when given with rifabutin. [Severe] Study

- Macrolides (clarithromycin) increase the risk of uveitis when given with rifabutin. [Severe] Study

- Rifabutin is predicted to decrease the efficacy of norethisterone. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal

- Rifabutin slightly decreases the exposure to rilpivirine. Adjust dose. [Severe] Study

- Rifabutin is predicted to decrease the exposure to simprevir. Avoid. [Moderate] Theoretical

- Rifabutin decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal

Rifampicin

- Rifampicin is predicted to decrease the exposure to abacavir. [Moderate] Theoretical

- Rifampicin is predicted to decrease the exposure to abiraterone. Avoid. [Severe] Theoretical

- Rifampicin is predicted to decrease the exposure to afatinib. [Moderate] Study

- Rifampicin is predicted to decrease the exposure to agomelatine. [Moderate] Theoretical

- Rifampicin decreases the exposure to aliskiren. [Moderate] Study

- Rifampicin is predicted to decrease the exposure to alprazolam. Adjust alprazolam dose. [Moderate] Theoretical

- Rifampicin transiently increases the exposure to ambrisentan. [Moderate] Study

- Rifampicin decreases the exposure to aminophylline. Adjust dose. [Moderate] Study

- Antacids decrease the absorption of rifampicin. Rifampicin should be taken 1 hour before antacids. [Moderate] Study

- Rifampicin is predicted to decrease the exposure to antiarhythmics (disopyramide, droxidone). Avoid. [Severe] Study
Rifampicin

- Rifampicin is predicted to decrease the efficacy of antiarrhythmics (propafenone). [Moderate] Study
- Rifampicin is predicted to decrease the exposure to anticholinesterases, centrally acting (donepezil). [High] Study
- Antiepileptics (phenobarbital, primidone) are predicted to decrease the exposure to rifampicin and rifampin is predicted to decrease the exposure to antiepileptics (phenobarbital, primidone). Use with caution and adjust dose. [Moderate] Study
- Rifampicin slightly decreases the exposure to antiepileptics (brivaracetam). Adjust dose. [Moderate] Study
- Rifampicin decreases the concentration of antiepileptics (fosphenytoin, phenytoin). Use with caution and adjust dose. [Moderate] Study
- Rifampicin markedly increases the clearance of antiepileptics (lamotrigine). Adjust lamotrigine dose, p. 303. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to antiepileptics (perampanel). Monitor and adjust dose. [Moderate] Study
- Rifampicin slightly decreases the exposure to antifungals, azoles (fluconazole). Adjust dose. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. [Severe] Study
- Rifampicin markedly decreases the exposure to antifungals, azoles (itraconazole). Avoid rifampicin for 14 days before and during treatment with itraconazole. [Moderate] Study
- Rifampicin markedly decreases the exposure to antifungals, azoles (ketonazole) and antifungals, azoles (ketocazole) potentially decrease the exposure to rifampicin. Avoid. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to antimalarials (artemether) with lumefantrine. Avoid. [Severe] Study
- Rifampicin moderately decreases the exposure to antimalarials (atovaquone) and antimalarials (atovaquone) slightly increase the exposure to rifampicin. Avoid. [Moderate] Study
- Rifampicin moderately decreases the exposure to antimalarials (mefloquine). [Severe] Study
- Rifampicin is predicted to decrease the concentration of antimalarials (piperaquine). Avoid. [Moderate] Theoretical
- Rifampicin decreases the exposure to antimalarials (quinine). Avoid. [Severe] Study
- Rifampicin is predicted to moderately decrease the exposure to apixaban. Use with caution or avoid. [Severe] Study
- Rifampicin moderately decreases the exposure to apremilast. Avoid. [Severe] Study
- Rifampicin is predicted to markedly decrease the exposure to aprepitant. Avoid. [Moderate] Study
- Rifampicin is predicted to moderately decrease the exposure to arispiprazole. Adjust arispiprazole dose, p. 376. [Moderate] Study
- Rifampicin decreases the exposure to ataluren. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to axitinib. Avoid or adjust dose. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to bazadoxifene. [Moderate] Theoretical
- Rifampicin decreases the exposure to bedaquiline. Avoid. [Severe] Study
- Rifampicin decreases the exposure to beta blockers, non-selective (carvedilol). [Moderate] Study
- Rifampicin decreases the exposure to beta blockers, non-selective (propranolol). Monitor and adjust propranolol dose, p. 145. [Moderate] Study
- Rifampicin slightly decreases the exposure to beta blockers, selective (bisoprolol, metoprolol). [Mild] Study
- Rifampicin moderately decreases the exposure to beta blockers, selective (cecroprol). [Moderate] Study
- Rifampicin slightly decreases the exposure to bortezomib. Avoid. [Severe] Study
- Rifampicin affects the exposure to bosentan. Avoid. [Severe] Study
- Rifampicin is predicted to very markedly decrease the exposure to bosutinib. Avoid. [Severe] Study
- Rifampicin is predicted to markedly decrease the exposure to bupropion. [Severe] Study
- Rifampicin is predicted to decrease the exposure to buspirone. Use with caution and adjust dose. [Severe] Study
- Rifampicin moderately decreases the exposure to cabozantinib. Avoid. [Moderate] Study
- Rifampicin is predicted to moderately increase the clearance of caffeine citrate. Monitor and adjust dose. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to calcium channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine). Monitor and adjust dose. [Moderate] Study
- Rifampicin decreases the exposure to calcium channel blockers (diltiazem). [Severe] Study
- Rifampicin decreases the exposure to calcium channel blockers (isradipine). Avoid. [Moderate] Study
- Rifampicin moderately decreases the exposure to calcium channel blockers (nifedipine). Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to calcium channel blockers (verapamil). Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to cannabidiol. Avoid. [Severe] Study
- Rifampicin decreases the concentration of cannabidiol. Adjust cannabidiol dose, p. 661. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to cannabis extract. Avoid. [Severe] Theoretical
- Rifampicin decreases the concentration of citalopram. Avoid. [Severe] Study
- Rifampicin is predicted to alter the effects of cilostazol. [Moderate] Theoretical
- Rifampicin decreases the exposure to clomethiazole. Monitor and adjust dose. [Moderate] Study
- Rifampicin decreases the exposure to clozapine. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to cobicistat. Avoid. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical
- Rifampicin is predicted to decrease the efficacy of combined hormonal contraceptives. For FSHR guidance, see Contraceptives, interactions p. 747. [Severe] Study
- Rifampicin decreases the exposure to corticosteroids (budesonide, dexamethasone, methylprednisolone, prednisolone). Monitor and adjust dose. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to corticosteroids (fluticasone). [Unknown] Theoretical
- Rifampicin is predicted to decrease the exposure to corticosteroids (prednisone). [Mild] Study
- Rifampicin decreases the anticoagulant effect of coumarins. [Mild] Study
- Rifampicin is predicted to markedly decrease the exposure to crizotinib. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to dabigatran. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to dabrafenib. Avoid. [Moderate] Theoretical
- Rifampicin is predicted to moderately decrease the exposure to daclatasvir. Avoid. [Severe] Study
- Rifampicin moderately decreases the exposure to daspone. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to darifenacin. [Moderate] Theoretical
- Rifampicin is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical
Rifampicin (continued)

- **Rifampicin** is predicted to markedly decrease the exposure to **dasatinib**. Avoid. [Severe] Study
- **Rifampicin** is predicted to slightly decrease the exposure to **delamanid**. Avoid. [Moderate] Study
- **Rifampicin** is predicted to decrease the efficacy of **desogestrel**. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- **Rifampicin** moderately decreases the exposure to **diazepam**. Avoid. [Moderate] Study
- **Rifampicin** decreases the concentration of **digoxin**. [Moderate] Study
- **Rifampicin** decreases the exposure to **dolutegravir**. Adjust dose. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **edoxaban**. [Moderate] Study
- **Rifampicin** slightly decreases the exposure to **efavirenz**. Adjust dose. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **elbasvir**. Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the concentration of **elvitegravir**. Avoid. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the effects of **ergotamine**. [Moderate] Theoretical
- **Rifampicin** is predicted to decrease the exposure to **erlotinib**. Avoid or adjust erlotinib dose, p. 899. [Severe] Study
- **Rifampicin** is predicted to decrease the efficacy of **etogonastrel**. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the exposure to **etritavirine**. Avoid. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the concentration of **everolimus**. Avoid or adjust dose. [Severe] Study
- **Rifampicin** moderately decreases the exposure to **exemestane**. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **fesoterodine**. Avoid. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **fingolimod**. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **gefitinib**. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **grazoprevir**. Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **guanfacine**. Adjust guanfacine dose, p. 335. [Moderate] Study
- **Rifampicin** decreases the concentration of **haloperidol**. Adjust dose. [Moderate] Study
- **Rifampicin** moderately to markedly decreases the exposure to HIV-protease inhibitors (**atazanavir**, **darunavir**, **fosamprenavir**, **indinavir**, **lopinavir**, **saquinavir**, **tipranavir**). Avoid. [Severe] Study
- **Rifampicin** slightly decreases the exposure to HIV-protease inhibitors (**ritonavir**). [Severe] Study
- **Rifampicin** is predicted to decrease the effects of **Hormone replacement therapy**. [Moderate] Anecdotal
- **Rifampicin** is predicted to decrease the exposure to **ibrutinib**. Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **idelalisib**. Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **imatinib**. Avoid. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **irinotecan**. Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **iron chelators** (**deferasirox**). Monitor serum ferritin and adjust dose. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **ivabradine**. Adjust dose. [Moderate] Theoretical
- **Rifampicin** markedly decreases the exposure to **ivacaftor**. Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **izakomib**. Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **lapanitib**. Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the efficacy of **levonorgestrel**. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the exposure to **linagliptin**. [Moderate] Study
- **Rifampicin** slightly decreases the exposure to **linezolid**. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **lofatapide**. Monitor and adjust dose. [Moderate] Theoretical
- **Rifampicin** increases the clearance of **lorazepam**. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **lurasidone**. Avoid. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **macrolides (clarithromycin)**. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **maraviroc**. Adjust dose. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **midazolam**. Monitor and adjust dose. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **mirtazapine**. Adjust dose. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **modafinil**. [Moderate] Theoretical
- **Rifampicin** decreases the effects of monoclonal antibodies (**brentuximab vedotin**). [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to monoclonal antibodies (trastuzumab emtansine). [Severe] Theoretical
- **Rifampicin** is predicted to decrease the exposure to **montelukast**. [Mild] Study
- **Rifampicin** decreases the concentration of **mycophenolate**. Monitor and adjust dose. [Severe] Study
- **Rifampicin** is predicted to markedly decrease the exposure to **naloxegol**. Avoid. [Moderate] Study
- **Rifampicin** is predicted to slightly decrease the exposure to **nateglinide**. [Mild] Study
- **Rifampicin** is predicted to decrease the exposure to **netupitant**. Avoid. [Moderate] Study
- **Rifampicin** decreases the concentration of **nevirapine**. Avoid. [Severe] Study
- **Rifampicin** is predicted to moderately decrease the exposure to **nilotinib**. Avoid. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **nintedanib**. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **nitisinone**. Adjust nitisinone dose. [Moderate] Theoretical
- **Rifampicin** increases the clearance of **nirAZYapine**. [Moderate] Study
- **Rifampicin** is predicted to decrease the efficacy of **noothistone**. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- **Rifampicin** moderately decreases the exposure to NSAIDs (cecloxib, diclofenac, etoricoxib). [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **olaparib**. Avoid. [Moderate] Theoretical
- **Rifampicin** is predicted to decrease the exposure to **ombitasvir**. Avoid. [Severe] Theoretical
- **Rifampicin** is predicted to decrease the exposure to **ondansetron**. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **opioids (alfentanil, fentanyl)**. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to **opioids (buprenorphine)**. Monitor and adjust dose. [Moderate] Theoretical
- **Rifampicin** decreases the exposure to **opioids (codeine, morphine)**. [Moderate] Study
- **Rifampicin** decreases the exposure to **opioids (methadone)**. Monitor and adjust dose. [Severe] Study
- **Rifampicin** is predicted to decrease the exposure to **opioids (oxycodone)**. Monitor and adjust dose. [Moderate] Study
- **Rifampicin** is predicted to moderately decrease the exposure to **osimertinib**. Avoid. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to palbociclib. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to paliperdone. Monitor and adjust paliperdone dose. [Moderate] Theoretical
- Rifampicin is predicted to decrease the exposure to panobinostat. Avoid. [Moderate] Theoretical
- Rifampicin is predicted to decrease the exposure to paracetamol. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to paritaprevir (with ritonavir and ombitasvir). Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to pazopanib. Avoid. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (avansafir, tadalaflif). Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to phosphodiesterase type-5 inhibitors (sildenafil, vardenaflin). [Moderate] Theoretical
- Rifampicin moderately decreases the exposure to pioglitazone. Monitor and adjust pioglitazone dose. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to pifennidine. Avoid. [Moderate] Theoretical
- Rifampicin is predicted to moderately decrease the exposure to proton pump inhibitors (omeprazole). [Moderate] Study
- Rifampicin is predicted to decrease the exposure to raltegravir. Avoid or adjust dose. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to ranolazine. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to reboxetine. Avoid. [Moderate] Anecdotal
- Rifampicin is predicted to decrease the exposure to revaguline. Monitor blood glucose and adjust dose. [Moderate] Study
- Rifampicin markedly decreases the exposure to rilpivirine. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to risperidone. Adjust risperidone dose. [Moderate] Study
- Rifampicin is predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- Rifampicin is predicted to decrease the exposure to roflumilast. Avoid. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Study
- Rifampicin is predicted to increase the exposure to sacubitril. [Moderate] Theoretical
- Rifampicin is predicted to moderately decrease the exposure to saxagliptin. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to selexipag. [Unknown] Theoretical
- Rifampicin is predicted to decrease the exposure to simprevir. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the concentration of sirolimus. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to sofosbuvir. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to sofinenacin. [Moderate] Theoretical
- Rifampicin is predicted to decrease the exposure to sorafenin. [Moderate] Theoretical
- Rifampicin markedly decreases the exposure to statins (atorvastatin). Atorvastatin should be taken at the same time as rifampicin. [Moderate] Study
- Rifampicin moderately decreases the exposure to statins (fluvasatin). Monitor and adjust dose. [Moderate] Study
- Rifampicin very markedly decreases the exposure to statins (simvastatin). [Moderate] Study
- Rifampicin is predicted to decrease the exposure to sulfoniyureas. Avoid. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose. p. 914. [Moderate] Study
- Rifampicin decreases the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study
- Rifampicin markedly decreases the exposure to tamoxifen. [Unknown] Study
- Rifampicin is predicted to decrease the exposure to tadalafil (vafladafil, tadalafil). Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to taxanes (docetaxel). [Severe] Theoretical
- Rifampicin is predicted to decrease the concentration of temsirolimus. Avoid. [Severe] Study
- Rifampicin decreases the exposure to terbinafine. Adjust dose. [Moderate] Study
- Rifampicin decreases the exposure to tetracyclines (doxycycline). Monitor and adjust dose. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to theophylline. Adjust dose. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to ticagrelor. Avoid. [Severe] Study
- Rifampicin moderately decreases the exposure to tizanidine. [Mild] Study
- Rifampicin is predicted to decrease the exposure to tolvaptan. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to toremifene. Adjust dose. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to trabectedin. Avoid. [Severe] Theoretical
- Rifampicin decreases the exposure to trimethoprim. [Moderate] Study
- Rifampicin decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- Rifampicin is predicted to decrease the exposure to vandetanib. Avoid. [Moderate] Study
- Rifampicin is predicted to moderately decrease the exposure to velpatasvir. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to vemurafenib. Avoid. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to venetoclax. Avoid. [Severe] Study
- Rifampicin is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vinodines). [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to vinca alkaloids (vinfunine). Avoid. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to vinca alkaloids (vinorelbine). Use with caution or avoid. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to vismodegib. Avoid. [Moderate] Theoretical
- Rifampicin is predicted to decrease the exposure to vortoxetine. Monitor and adjust dose. [Moderate] Study
- Rifampicin markedly decreases the exposure to zaleplon. [Moderate] Study
- Rifampicin moderately decreases the exposure to zolpidem. [Moderate] Study
- Rifampicin is predicted to decrease the exposure to zopiclone. Adjust dose. [Moderate] Study
- Rifeximin
  - Ciclosporin very markedly increases the exposure to rifaximin. [Severe] Study
  - Rilpivirine
    - Antacids are predicted to decrease the exposure to rilpivirine. Antacids should be taken 2 hours before or 4 hours after rilpivirine. [Severe] Theoretical
    - Antileptigicales (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) markedly decrease the exposure to rilpivirine. Avoid. [Severe] Study
Rilpivirine (continued)

- Antiepileptics (oxcarbazepine) are predicted to decrease the concentration of rilpivirine. Avoid. [Severe] Theoretical
- Bosentan is predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Theoretical
- Calcium salts (calcium carbonate) are predicted to slightly decrease the exposure to rilpivirine. Calcium carbonate should be taken 2 hours before or 4 hours after rilpivirine. [Severe] Theoretical
- Efavirenz is predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Theoretical
- Enzalutamide markedly decreases the exposure to rilpivirine. Avoid. [Severe] Study
- Extravire is predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Theoretical
- H₂ receptor antagonists are predicted to decrease the exposure to rilpivirine. H₂ receptor antagonists should be taken 12 hours before or 4 hours after rilpivirine. [Severe] Study
- Nevinirine is predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Theoretical
- Proton pump inhibitors are predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Study
- Rifabutin slightly decreases the exposure to rilpivirine. Adjust dose. [Severe] Study
- Rifampin reportedly decreases the exposure to rilpivirine. Avoid. [Severe] Study
- St John’s Wort is predicted to decrease the exposure to rilpivirine. Avoid. [Severe] Theoretical

Riluzole

FOOD AND LIFESTYLE Charcoal-grilled foods are predicted to decrease the exposure to riluzole.

- SSRIs (fluvoxamine) are predicted to increase the exposure to riluzole. [Moderate] Theoretical
- Riociguat is predicted to decrease the exposure to riociguat. Antacids should be taken 2 hours before or 1 hour after riociguat. [Mild] Study
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to riociguat. Avoid. [Moderate] Study
- Antifungals, azoles (ketocazole) moderately increase the exposure to riociguat. Avoid. [Moderate] Study
- Ciclosporin is predicted to increase the exposure to riociguat. [Moderate] Theoretical
- HIV-protease inhibitors (ritonavir) are predicted to increase the exposure to riociguat. Avoid. [Moderate] Theoretical
- Rocephin is predicted to increase the exposure to riociguat. Avoid. [Moderate] Theoretical
- HIV-protease inhibitors (ritonavir) are predicted to moderately decrease the exposure to riociguat. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to riociguat. Avoid. [Moderate] Study

Risenedronate

- See bisphosphonates
- Risperidone is predicted to increase the exposure to risperidone. Adjust risperidone dose. [Moderate] Study
- Also see TABLE 8 p. 1265 (hypotension), TABLE 9 p. 1266 (QT-interval prolongation), TABLE 11 p. 1266 (CNS depressant effects)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to risperidone. Adjust dose. [Moderate] Study
- Also see TABLE 8 p. 1265
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- Also see TABLE 9 p. 1266
- Bupropion is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- Cilnidipine is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- Cobicistat is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- Risperidone is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical
- Also see TABLE 8 p. 1265
- Enzalutamide is predicted to decrease the exposure to risperidone. Adjust risperidone dose. [Moderate] Study
- Risperidone is predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical
- Also see TABLE 8 p. 1265
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study

- Idelalisib is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- Risperidone is predicted to decrease the effects of levodopa. Avoid or adjust dose. [Severe] Anecdotal
- Also see TABLE 8 p. 1265
- Risperidone potentially increases the risk of neurotoxicity when given with lithium. [Severe] Anecdotal
- Also see TABLE 9 p. 1266
- Macrolides (clarithromycin) are predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- Also see TABLE 9 p. 1266
- Rifampicin is predicted to decrease the exposure to risperidone. Adjust risperidone dose. [Moderate] Study
- SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- Terbinafine is predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study
- Ritonavir is predicted to increase the exposure to HIV-protease inhibitors

Rivaroxaban

- Also see TABLE 3 p. 1264 (anticoagulant effects)
- Antiarrhythmics (dronedarone) are predicted to increase the exposure to rivaroxaban. Avoid. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to rivaroxaban. Avoid. [Moderate] Study
- Enzalutamide is predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- HIV-protease inhibitors (ritonavir) moderately increase the exposure to rivaroxaban. Avoid. [Severe] Study
- Rifaximin is predicted to moderately decrease the exposure to rivaroxaban. Avoid unless patient can be monitored for signs of thrombosis. [Severe] Study
- Rivastigmine is predicted to increase the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after rivastriptan. [Severe] Theoretical
- Myclobutin moderately increases the exposure to rivaroxaban. Avoid. [Moderate] Study
- Also see TABLE 13 p. 1267
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the exposure to rivaroxaban. Avoid and separate administration by at least 2 hours. [Moderate] Study
- Rivastriptan is predicted to increase the risk of vasoconstriction when given with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after rivastriptan. [Severe] Theoretical
- Roflumilast moderately increases the exposure to rivaroxaban. Avoid. [Moderate] Study
- Also see TABLE 13 p. 1267
- Roflumilast is predicted to increase the exposure to rivaroxaban. Avoid. [Moderate] Study
- Also see TABLE 13 p. 1267
- Rocuronium is predicted to increase the exposure to rivaroxaban. Avoid. [Moderate] Study
- Also see TABLE 13 p. 1267
- Rocuronium is predicted to increase the exposure to rifampicin. Avoid. [Moderate] Theoretical
- Combined hormonal contraceptives are predicted to increase the exposure to roflumilast. [Moderate] Theoretical
- Enzalutamide is predicted to decrease the exposure to roflumilast. Avoid. [Moderate] Study
- H₂ receptor antagonists (cimetidine) slightly increase the exposure to roflumilast. [Moderate] Study
- Quinolones (ciprofloxacin) are predicted to decrease the exposure to roflumilast. Avoid. [Moderate] Study
- Theophylline is predicted to slightly increase the exposure to roflumilast. Avoid. [Moderate] Theoretical
- Ropivacaine is predicted to decrease the exposure to roflumilast. Avoid. [Moderate] Theoretical
- Ropivacaine is predicted to decrease the exposure to roflumilast. Avoid. [Moderate] Theoretical
- Ropivacaine is predicted to decrease the exposure to roflumilast. Avoid. [Moderate] Theoretical
- Ropivacaine is predicted to decrease the exposure to roflumilast. Avoid. [Moderate] Theoretical

Rotavirus vaccine 

Rotigotine → see dopamine receptor agonists
Rufinamide → see antiepileptics

Ruxolitinib → see TABLE 15 p. 1267 (myelosuppression)
  > Antirrhinums (dronedarone) are predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
  > Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Study
  > Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
  > Aprepitant is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
  > Bosantan is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Theoretical
  > Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
  > Cobicistat is predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study
  > Ruxolitinib is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
  > Crizotinib is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical → Also see TABLE 15 p. 1267
  > Efavirenz is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Theoretical
  > Enalaprilat is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Study
  > Grapefruit juice is predicted to increase the exposure to ruxolitinib. [Severe] Theoretical
  > HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study
  > HIV-protease inhibitors (indinavir) are predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
  > Idelalisib is predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study → Also see TABLE 15 p. 1267
  > Macrolides (clarithromycin) are predicted to increase the exposure to ruxolitinib. Adjust dose and monitor side effects. [Moderate] Study
  > Macrolides (erythromycin) are predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
  > Netupitant is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical
  > Nevirapine is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Theoretical
  > Nilotinib is predicted to increase the exposure to ruxolitinib. [Moderate] Theoretical → Also see TABLE 15 p. 1267
  > Ruxolitinib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
  > Rifaximin is predicted to decrease the exposure to ruxolitinib. Monitor and adjust dose. [Moderate] Study
  > St John's Wort is predicted to decrease the exposure to ruxolitinib. [Moderate] Theoretical
  > Sacubitril → see TABLE 8 p. 1265 (hypotension)
  > Ciclosporin is predicted to increase the exposure to sacubitril. [Moderate] Theoretical
  > Rifaximin is predicted to increase the exposure to sacubitril. [Moderate] Theoretical
  > Sacubitril is predicted to increase the exposure to statins. [Severe] Study
  > Tenofovir is predicted to increase the exposure to sacubitril. [Moderate] Theoretical
  > Sildenafil is predicted to decrease the exposure to sacubitril. [Severe] Study
  > Sartans → see monoamine-oxidase B inhibitors
  > Sildenafil is predicted to increase the exposure to statins. [Severe] Study
  > Methotrexate is predicted to decrease the efficacy of sapropterin. [Moderate] Theoretical
  > Phosphodiesterase type 5 inhibitors are predicted to increase the risk of hypotension when given with sapropterin. [Moderate] Theoretical → Also see TABLE 8 p. 1265
  > Trimethoprim is predicted to decrease the efficacy of sapropterin. [Moderate] Theoretical
  > Saquinavir → see HIV-protease inhibitors

Saxagliptin → see TABLE 14 p. 1267 (antidiabetic drugs)
  > Antirrhinums (dronedarone) are predicted to increase the exposure to saxagliptin. [Mild] Study
  > Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to saxagliptin. [Moderate] Study
  > Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to saxagliptin. [Mild] Study
  > Aprepitant is predicted to increase the exposure to saxagliptin. [Mild] Study
  > Enalaprilat is predicted to moderate decrease the exposure to saxagliptin. [Moderate] Study
  > Grapefruit juice is predicted to increase the exposure to saxagliptin. [Mild] Theoretical
  > HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to saxagliptin. [Moderate] Study
  > HIV-protease inhibitors (indinavir) are predicted to increase the exposure to saxagliptin. [Mild] Study
  > Idelalisib is predicted to increase the exposure to saxagliptin. [Moderate] Study
  > Imatinib is predicted to increase the exposure to saxagliptin. [Mild] Study
  > Macrolides (clarithromycin) are predicted to increase the exposure to saxagliptin. [Moderate] Study
  > Macrolides (erythromycin) are predicted to increase the exposure to saxagliptin. [Moderate] Study
  > Netupitant is predicted to increase the exposure to saxagliptin. [Mild] Study
  > Nilotinib is predicted to increase the exposure to saxagliptin. [Mild] Study
  > Rifaximin is predicted to moderately decrease the exposure to saxagliptin. [Moderate] Study
  > Secukinumab → see monoclonal antibodies
  > Sildenafil is predicted to increase the exposure to saxagliptin. [Unknown] Theoretical
  > Silver sulfadiazine

Silver might inactivate enzymatic debriding agents—concurrent use might not be appropriate.

Silver sulfadiazine

PHARMACOLOGY Silver might inactivate enzymatic debriding agents—concurrent use might not be appropriate.
Simeprevir

- **Interactions**

  - **Antiarrhythmics (dronedaron)** are predicted to increase the exposure to **simeprevir**. Avoid. (Severe) Study
  - **Simeprevir** is predicted to increase the concentration of **antiarrhythmics (amiodaron)**. Refer to specialist literature. (Severe) Anecdotal
  - **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to **simeprevir**. Avoid. (Severe) Study
  - **Antiepileptics (oxcarbazepine)** are predicted to decrease the exposure to **simeprevir**. Avoid. (Severe) Theoretical
  - **Antifungals, azoles (fluconazole, isavuconazole, itraconazole, ketoconazole, posaconazole, voriconazole)** are predicted to increase the exposure to **simeprevir**. Avoid. (Severe) Study
  - **Aprepitant** is predicted to increase the exposure to **simeprevir**. Avoid. (Severe) Study
  - **Bosantan** is predicted to decrease the exposure to **simeprevir**. Avoid. (Severe) Study
  - **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to **simeprevir**. Avoid. (Severe) Study
  - **Cobicistat** is predicted to increase the exposure to **simeprevir**. Avoid. (Severe) Study
  - **Crizotinib** is predicted to increase the exposure to **simeprevir**. Avoid. (Severe) Study
  - **Efavirenz** is predicted to decrease the exposure to **simeprevir**. Avoid. (Severe) Study
  - **Enzalutamide** is predicted to decrease the exposure to **simeprevir**. Avoid. (Severe) Study
  - **Etravirine** is predicted to decrease the exposure to **simeprevir**. Avoid. (Moderate) Study
  - **HIV-protease inhibitors** are predicted to increase the exposure to **simeprevir**. Avoid. (Severe) Study
  - **Idelalisib** is predicted to increase the exposure to **simeprevir**. Avoid. (Severe) Study
  - **Imatinib** is predicted to increase the exposure to **simeprevir**. Avoid. (Severe) Study
  - **Ledipasvir** moderately increases the exposure to **simeprevir** and **simeprevir** slightly increases the exposure to **ledipasvir**. Avoid. (Severe) Study
  - **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to **simeprevir**. Avoid. (Severe) Study
  - **Netupitant** is predicted to increase the exposure to **simeprevir**. Avoid. (Severe) Study
  - **Nevirapine** is predicted to decrease the exposure to **simeprevir**. Avoid. (Severe) Study
  - **Nilotinib** is predicted to increase the exposure to **simeprevir**. Avoid. (Severe) Study
  - **Rifabutin** is predicted to decrease the exposure to **simeprevir**. Avoid. (Moderate) Theoretical
  - **Rifampicin** is predicted to decrease the exposure to **simeprevir**. Avoid. (Severe) Study
  - **St John’s Wort** is predicted to decrease the exposure to **simeprevir**. Avoid. (Severe) Study
  - **Simeprevir** moderately increases the exposure to **statins (atorvastatin)**. Monitor and adjust dose. (Moderate) Study
  - **Simeprevir** is predicted to increase the exposure to **statins (pravastatin)**. Monitor and adjust dose. (Severe) Theoretical
  - **Simeprevir** moderately increases the exposure to **statins (rosuvastatin)**. Adjust **rosuvastatin** dose, p. 197. (Moderate) Study
  - **Simeprevir** slightly increases the exposure to **statins (simvastatin)**. Monitor and adjust dose. (Moderate) Study
  - **Simvastatin** ▶ see statins

**Sirolimus**

- **Antiarrhythmics (amiodaron)** are predicted to increase the concentration of **sirolimus**. (Severe) Anecdotal
- **Antiarrhythmics (dronedaron)** increase the concentration of **sirolimus**. Monitor and adjust dose. (Moderate) Study
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the concentration of **sirolimus**. Avoid. (Moderate) Study
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** increase the concentration of **sirolimus**. Monitor and adjust dose. (Moderate) Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the concentration of **sirolimus**. Avoid. (Severe) Study
- **Efavirenz** is predicted to decrease the concentration of **sirolimus** and **sirolimus** potentially increases the concentration of **bosantan**. Avoid. (Severe) Theoretical
- **Calcium channel blockers (diltiazem, verapamil)** increase the concentration of **sirolimus**. Monitor and adjust dose. (Moderate) Study
- **Ceritinib** is predicted to increase the exposure to **sirolimus**. Avoid. (Severe) Theoretical
- **Ciclosporin** moderately increases the exposure to **sirolimus**. Separate administration by 4 hours. (Severe) Study
- **Cobicistat** is predicted to increase the concentration of **sirolimus**. Avoid. (Severe) Study
- **Crizotinib** increases the concentration of **sirolimus**. Monitor and adjust dose. (Moderate) Study
- **Efavirenz** is predicted to decrease the concentration of **sirolimus**. Monitor and adjust dose. (Moderate) Theoretical
- **Enzalutamide** is predicted to decrease the concentration of **sirolimus**. Avoid. (Severe) Study
- **Grapefruit juice** increases the concentration of **sirolimus**. Avoid. (Moderate) Study
- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the concentration of **sirolimus**. Avoid. (Severe) Study
- **HIV-protease inhibitors (indinavir)** increase the concentration of **sirolimus**. Monitor and adjust dose. (Moderate) Study
- **Idelalisib** is predicted to increase the concentration of **sirolimus**. Avoid. (Severe) Study
- **Imatinib** increases the concentration of **sirolimus**. Monitor and adjust dose. (Moderate) Study
- **Lapatinib** is predicted to increase the exposure to **sirolimus**. (Moderate) Theoretical
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **sirolimus**. Public Health England advises avoid. (Severe) Theoretical
- **Lumacaftor** is predicted to decrease the exposure to **sirolimus**. Avoid. (Severe) Theoretical
- **Macrolides (clarithromycin)** are predicted to increase the concentration of **sirolimus**. Avoid. (Severe) Study
- **Macrolides (erythromycin)** increase the concentration of **sirolimus**. Monitor and adjust dose. (Moderate) Study
- **Sirolimus** is predicted to decrease the efficacy of **infacumabtid**. Avoid. (Severe) Theoretical
- **Mirabegron** is predicted to increase the exposure to **sirolimus**. (Mild) Theoretical
- **Netupitant** increases the concentration of **sirolimus**. Monitor and adjust dose. (Moderate) Study
- **Nevirapine** is predicted to decrease the concentration of **sirolimus**. Monitor and adjust dose. (Moderate) Study
- **Nilotinib** increases the concentration of **sirolimus**. Monitor and adjust dose. (Moderate) Study
- **Palbociclib** is predicted to increase the exposure to **sirolimus**. Adjust dose. (Moderate) Theoretical
- **Pitolisant** is predicted to decrease the exposure to **sirolimus**. Avoid. (Severe) Theoretical
- **Rifampicin** is predicted to decrease the concentration of **sirolimus**. Avoid. (Severe) Study
- **St John’s Wort** is predicted to decrease the concentration of **sirolimus**. Monitor and adjust dose. (Severe) Theoretical
- **Sirolimus** is predicted to decrease the concentration of **tacrolimus** and **tacrolimus** increases the exposure to **sirolimus**. (Severe) Study
- **Velpatasvir** is predicted to increase the exposure to **sirolimus**. (Severe) Theoretical

Sitagliptin ▶ see TABLE 14 p. 1267 (antidiabetic drugs)
Sodium aurothiomalate → ACE inhibitors are predicted to increase the risk of hypotension when given with sodium aurothiomalate. (Severe) Anecdotal

Sodium aurothiomalate potentially increases the risk of side-effects when given with penicillamine (in those who have had previous adverse reactions to gold). Avoid. (Severe) Study

Sodium bicarbonate → Sodium bicarbonate decreases the concentration of lithium. (Severe) Anecdotal

Sodium bicarbonate is predicted to decrease the efficacy of methenamine. Avoid. (Moderate) Theoretical

Sodium citrate → Sodium citrate is predicted to decrease the efficacy of methenamine. Avoid. (Moderate) Theoretical

Sodium citrate is predicted to increase the risk of side-effects when given with sulfafate. Avoid. (Moderate) Theoretical

Sodium clodronate → see bisphosphonates

Sodium feredetate → see iron (oral)

Sodium nitroprusside → see TABLE 8 p. 1265 (hypotension)

Sodium nitroprusside is predicted to increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. (Severe) Theoretical

Sodium nitroprusside is predicted to increase the risk of methaemoglobinemia when given with dapone. (Severe) Theoretical

Sodium oxybate → see TABLE 8 p. 1265 (hypotension), TABLE 11 p. 1266 (CNs depressant effects)

Antiepileptics (valproate) increase the exposure to sodium oxybate. Adjust sodium oxybate dose, p. 466. (Moderate) Study

Sodium phenylbutyrate → Antiepileptics (valproate) potentially decrease the effects of sodium phenylbutyrate. (Moderate) Anecdotal

Corticosteroids potentially decrease the effects of sodium phenylbutyrate. (Moderate) Anecdotal

Haloperidol potentially decreases the effects of sodium phenylbutyrate. (Moderate) Anecdotal

Sodium picosulfate → see TABLE 18 p. 1268 (hyponatraemia), TABLE 17 p. 1268 (reduced serum potassium)

Sodium stibogluconate → Sodium stibogluconate increases the risk of cardiovascular side-effects when given with amphotericin. Separate administration by 14 days. (Severe) Study

Sofosbuvir → Sofosbuvir is predicted to increase the risk of severe bradycardia or heart block when given with antiepileptics (amiodarone). Refer to specialist literature. (Severe) Anecdotal

Antiepileptics (carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sofosbuvir. Adjust dose. (Moderate) Theoretical

H₂ receptor antagonists potentially decrease the exposure to sofosbuvir. Adjust dose, see sofosbuvir with ledipasvir and sofosbuvir with velpatasvir p. 596. (Moderate) Study

HIV-protease inhibitors (tipranavir) are predicted to decrease the exposure to sofosbuvir. (Tipranavir). Adjust dose. (Severe) Theoretical

Proton pump inhibitors potentially decrease the exposure to sofosbuvir. Adjust dose, see sofosbuvir with ledipasvir and sofosbuvir with velpatasvir p. 596. (Moderate) Study

Rifampicin is predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Study

St. John’s Wort is predicted to decrease the exposure to sofosbuvir. Avoid. (Severe) Study

Solfenacin → see TABLE 10 p. 1266 (antimuscarinics)

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to solifenacin. (Moderate) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment. (Moderate) Theoretical

Cobicistat is predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment, p. 734, p. 740. (Severe) Study

Enalaprilat is predicted to decrease the exposure to solifenacin. (Moderate) Theoretical

Sofosbuvir with ledipasvir and sofosbuvir with velpatasvir are predicted to decrease the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment, p. 734, p. 740. (Severe) Study

Macrolides (clarithromycin) are predicted to increase the exposure to solifenacin. Adjust solifenacin or tamsulosin with solifenacin dose; avoid in hepatic and renal impairment, p. 734, p. 740. (Severe) Study

Rifampicin is predicted to decrease the exposure to solifenacin. (Moderate) Theoretical

Somatropin → Corticosteroids are predicted to decrease the effects of somatropin. (Moderate) Theoretical

Sorafenib → see TABLE 15 p. 1267 (myelosuppression), TABLE 9 p. 1266 (QT-interval prolongation)

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sorafenib. (Moderate) Theoretical

Sorafenib increases the anticoagulant effect of coumarins. (Severe) Anecdotal

Enalaprilat is predicted to decrease the exposure to sorafenib. (Moderate) Theoretical

Neomycin moderately decreases the exposure to sorafenib. (Moderate) Study

Sorafenib is predicted to increase the risk of bleeding events when given with phenindione. (Severe) Theoretical

Rifampicin is predicted to decrease the exposure to sorafenib. (Moderate) Theoretical

Sotalol → see beta blockers, non-selective

Spirolactone → see aldosterone antagonists

Sorafenib → see TABLE 18 p. 1268 (hyponatraemia), TABLE 13 p. 1267 (serotonin syndrome), TABLE 9 p. 1266 (QT-interval prolongation), TABLE 4 p. 1264 (antiplatelet effects)

citalopram - dapoxetine - escitalopram - fluoxetine - fluvaxamine - paroxetine - sertraline

Fluvoxamine very markedly increases the exposure to agomelatine. Avoid. (Severe) Study

Fluvoxamine moderately increases the exposure to alprazolam. Adjust dose. (Moderate) Study

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to amfetamines. (Severe) Theoretical → Also see TABLE 13 p. 1267

Fluvoxamine moderately to markedly increases the exposure to aminophylline. Avoid. (Severe) Study

Fluvoxamine decreases the clearance of anaesthetics, local (ropivacaine). Avoid prolonged use. (Moderate) Study

Fluvoxamine is predicted to increase the exposure to anagrelide. (Moderate) Theoretical → Also see TABLE 4 p. 1264

Antiarrrhythmics (dronedarone) are predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose, p. 773. (Moderate) Theoretical

Antiarrrhythmics (dronedarone) are predicted to increase the exposure to SSRIs (citalopram, escitalopram, fluoxetine, fluvoxamine, paroxetine, sertraline). (Severe) Theoretical → Also see TABLE 9 p. 1266

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to antiarrhythmics (flecainide). (Severe) Theoretical

SSRIs (fluoxetine, fluvoxamine, paroxetine) are predicted to increase the exposure to anticholinesterases, centrally acting (donepezil). (Moderate) Theoretical

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. (Moderate) Study

Antiepileptics (fosphenytoin, phenytoin) decrease the concentration of paroxetine. (Moderate) Study

Sertraline potentially increases the risk of toxicity when given with antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. (Severe) Anecdotal
### SSRIs — SSRIs

**SSRIs (continued)**

- SSRIs (fluoxetine, fluvoxamine) are predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor and adjust dose. **Severe** Anecdotal
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to moderately increase the exposure to fluvoxamine. Adjust dapoxetine dose, p. 773. **Moderate** Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to moderately increase the exposure to fluvoxamine. Avoid or adjust dapoxetine dose, p. 773. **Severe** Study
- Antifungals, azoles (voriconazole) are predicted to increase the exposure to citalopram. **Severe** Theoretical
- SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to citalopram. Adjust dapoxetine dose, p. 773. **Severe** Study
- SSRIs (fluoxetine, paroxetine) are predicted to moderately increase the exposure to atomoxetine. Adjust dose. **Severe** Study
- Fluvoxamine moderately increases the concentration of beta blockers, non-selective (carvedilol, timolol). **Moderate** Study
- Fluvoxamine moderately increases the concentration of beta blockers, non-selective (propranolol). **Moderate** Study
- SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). **Moderate** Study
- Bupropion is predicted to increase the exposure to dapoxetine. **Moderate** Theoretical → Also see TABLE 13 p. 1267
- Fluvoxamine markedly decreases the clearance of caffeine citrate. Monitor and adjust dose. **Severe** Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose, p. 773. **Moderate** Theoretical
- Fluvoxamine is predicted to increase the exposure to cilostazol. Adjust cilostazol dose, p. 226. **Moderate** Theoretical → Also see TABLE 4 p. 1264
- Cinacalcet is predicted to increase the exposure to dapoxetine. **Moderate** Theoretical
- Fluvoxamine is predicted to increase the exposure to cinacalcet. Adjust dose. **Moderate** Theoretical
- Fluvoxamine is predicted to decrease the efficacy of clopidogrel. Avoid. **Severe** Theoretical → Also see TABLE 4 p. 1264
- Fluvoxamine increases the concentration of clozapine. Monitor side effects and adjust dose. **Severe** Study
- Cobicistat is predicted to moderately increase the exposure to dapoxetine. Avoid or adjust dapoxetine dose, p. 773. **Severe** Study
- Crizotinib is predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose, p. 773. **Moderate** Theoretical
- SSRIs (fluoxetine, paroxetine) are predicted to slightly increase the exposure to darifenacin. **Mild** Study
- Fluvoxamine moderately increases the exposure to diazepam. **Moderate** Study
- Fluvoxamine is predicted to increase the exposure to dopamine receptor agonists (ropinirole). Adjust dose. **Moderate** Study
- Fluvoxamine is predicted to increase the exposure to duloxetine. Avoid. **Severe** Study → Also see TABLE 18 p. 1268 → Also see TABLE 13 p. 1267 → Also see TABLE 4 p. 1264
- Fluvoxamine is predicted to increase the exposure to erlotinib. Monitor side effects and adjust dose. **Moderate** Theoretical
- Fluvoxamine increases the concentration of frowiantin. **Severe** Study → Also see TABLE 13 p. 1267
- Grapefruit juice moderately increases the exposure to sertraline. Avoid. **Moderate** Study
- H₂ receptor antagonists (cimetidine) slightly increase the exposure to SSRIs (citalopram, escitalopram). Adjust dose. **Moderate** Study
- H₂ receptor antagonists (cimetidine) slightly increase the exposure to SSRIs (paroxetine, sertraline), **Moderate** Study
- Fluoxetine increases the concentration of haloperidol. Adjust dose. **Moderate** Anecdotal
- Fluvoxamine increases the concentration of haloperidol. Adjust dose. **Moderate** Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to moderately increase the exposure to dapoxetine. Avoid or adjust dapoxetine dose, p. 773. **Severe** Study
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose, p. 773. **Moderate** Theoretical
- Fluoxetine is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. **Unknown** Theoretical
- Fluvoxamine is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. **Moderate** Theoretical
- Fluvoxamine is predicted to increase the exposure to lioxyline. Avoid. **Unknown** Theoretical
- Lumacaftor is predicted to decrease the exposure to SSRIs (citalopram, escitalopram, sertraline). Adjust dose. **Moderate** Theoretical
- Macrolides (clarithromycin) are predicted to moderately increase the exposure to dapoxetine. Avoid or adjust dapoxetine dose, p. 773. **Severe** Study
- Macrolides (erythromycin) are predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose, p. 773. **Moderate** Theoretical
- SSRIs potentially increase the risk of prolonged neuromuscular blockade when given with neuromuscular blocking drugs, non-depolarising (miyacurium). **Unknown** Theoretical
- Nilotinib is predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose, p. 773. **Moderate** Theoretical
- Fluvoxamine very markedly increases the exposure to melatonin. Avoid. **Severe** Study
- Netupitant is predicted to increase the exposure to dapoxetine. Adjust dapoxetine dose, p. 773. **Moderate** Theoretical
- SSRIs (fluoxetine, paroxetine) are predicted to decrease the efficacy of opioids (codeine). **Moderate** Theoretical
- SSRIs (fluoxetine, paroxetine) are predicted to decrease the efficacy of opioids (tramadol). **Severe** Study → Also see TABLE 13 p. 1267
- Fluvoxamine is predicted to increase the exposure to pentoxifylline. **Moderate** Theoretical
- Paroxetine markedly increases the exposure to phenothiazines (perphenazine). **Severe** Study
- Fluvoxamine is predicted to moderately increase the exposure to pirfenidone. Avoid. **Moderate** Study
- SSRIs (fluoxetine, paroxetine) are predicted to moderately increase the exposure to pitolisant. Use with caution and adjust dose. **Moderate** Study
- Fluvoxamine moderately increases the exposure to pomalidomide. Adjust pomalidomide dose, p. 886. **Moderate** Study
- Paroxetine slightly increases the exposure to procyclidine. Monitor and adjust procyclidine dose. **Moderate** Study
- Proton pump inhibitors (esomeprazole) are predicted to slightly to moderately increase the exposure to citalopram. Monitor and adjust dose. **Severe** Theoretical
- Proton pump inhibitors (esomeprazole) are predicted to increase the exposure to escitalopram. Monitor and adjust dose. **Severe** Theoretical
- Fluvoxamine is predicted to increase the exposure to proton pump inhibitors. **Mild** Study
- Proton pump inhibitors (omeprazole) slightly to moderately increase the exposure to SSRIs (cITALOPRAM, escITALOPRAM). Monitor and adjust dose. **Severe** Study
Fluvoxamine is predicted to increase the exposure to rituximab. [Moderate] Theoretical

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to risperidone. Adjust dose. [Moderate] Study

Fluvoxamine is predicted to increase the exposure to roflumilast. [Moderate] Theoretical

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to SSRIs (dapoxetine). [Moderate] Theoretical → Also see table 18 p. 1268 also see table 13 p. 1267 also see table 4 p. 1264

SSRs potentially increase the risk of prolonged neuromuscular blockade when given with saximumethion. [Unknown] Theoretical

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to theophylline. Avoid. [Severe] Study

Terbinafine is predicted to increase the exposure to fluoxetine. Adjust dose. [Moderate] Theoretical

Terbinafine moderately increases the exposure to paroxetine. [Moderate] Study

Terbinafine is predicted to increase the exposure to SSRIs (citalopram, dapoxetine, escitalopram, fluvoxamine, sertraline). [Moderate] Theoretical

Fluvoxamine moderately to markedly increases the exposure to tricyclic antidepressants (amitriptyline, imipramine). Adjust dose. [Severe] Study → Also see table 18 p. 1268 also see table 13 p. 1267 also see table 4 p. 1264

Fluvoxamine markedly increases the exposure to tricyclic antidepressants (clomipramine). Adjust dose. [Severe] Study → Also see table 18 p. 1268 also see table 13 p. 1267 also see table 4 p. 1264

SSRIs (fluoxetine, paroxetine) are predicted to increase the exposure to vortioxetine. Monitor and adjust dose. [Moderate] Study → Also see table 13 p. 1267 also see table 13 p. 1267 also see table 4 p. 1264

Fluvoxamine is predicted to increase the exposure to zolmitriptan. Adjust zolmitriptan dose, p. 456. [Severe] Theoretical → Also see table 13 p. 1267

St John’s Wort is predicted to decrease the exposure to afatinib. [Moderate] Study

St John’s Wort is predicted to slightly decrease the exposure to aldosterone antagonists (eplerenone). Avoid. [Moderate] Study

St John’s Wort decreases the exposure to ailskiren. [Moderate] Study

St John’s Wort moderately decreases the exposure to alprazolam. [Moderate] Study

St John’s Wort is predicted to decrease the concentration of aminophylline. [Severe] Theoretical

St John’s Wort is predicted to decrease the exposure to antiarrhythmics (dronedarone). Avoid. [Severe] Theoretical

St John’s Wort is predicted to decrease the exposure to antiepileptics (brivaracetam). [Moderate] Theoretical

St John’s Wort is predicted to decrease the concentration of antiepileptics (carbamazepine). Monitor and adjust dose. [Moderate] Theoretical

St John’s Wort is predicted to decrease the concentration of antiepileptics (fosphenytoin, phenobarbital, phenytoin, primidone). Avoid. [Severe] Theoretical

St John’s Wort is predicted to decrease the exposure to antiepileptics (perampanel). Monitor and adjust dose. [Moderate] Theoretical

St John’s Wort is predicted to decrease the exposure to antifungals, azoles (isavuconazole). Avoid. [Severe] Theoretical

St John’s Wort moderately decreases the exposure to antifungals, azoles (voriconazole). Avoid. [Moderate] Study

St John’s Wort is predicted to decrease the concentration of antimalarials (piperaquiline). Avoid. [Moderate] Theoretical

St John’s Wort is predicted to decrease the exposure to apixaban. Use with caution or avoid. [Moderate] Theoretical

St John’s Wort is predicted to decrease the exposure to apremilast. Avoid. [Severe] Theoretical

St John’s Wort is predicted to decrease the exposure to aprepitant. Avoid. [Moderate] Theoretical

St John’s Wort is predicted to decrease the exposure to axitinib. [Moderate] Theoretical

St John’s Wort is predicted to decrease the exposure to bedaquiline. Avoid. [Severe] Study

St John’s Wort is predicted to decrease the exposure to bosentan. Avoid. [Moderate] Theoretical

St John’s Wort is predicted to decrease the exposure to bosutinib. Avoid. [Severe] Theoretical

St John’s Wort is predicted to decrease the exposure to cabozantinib. [Moderate] Theoretical

St John’s Wort is predicted to decrease the exposure to calcium channel blockers (amiodipine, felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine). Monitor and adjust dose. [Moderate] Theoretical

St John’s Wort is predicted to decrease the exposure to calcium channel blockers (diltiazem, verapamil). [Moderate] Theoretical

St John’s Wort is predicted to decrease the exposure to certinib. Avoid. [Severe] Theoretical

St John’s Wort decreases the concentration of ciclosporin. Avoid. [Moderate] Study

St John’s Wort is predicted to alter the effects of cilostazol. [Moderate] Theoretical

St John’s Wort is predicted to decrease the exposure to cobimetinib. Avoid. [Severe] Theoretical

St John’s Wort decreases the efficacy of combined hormonal contraceptives. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Aneotald

St John’s Wort decreases the anticoagulant effect of coumarins. Avoid. [Severe] Aneotald

St John’s Wort is predicted to decrease the exposure to crizotinib. Avoid. [Severe] Theoretical

St John’s Wort is predicted to decrease the exposure to dabigatran. Avoid. [Severe] Study

St John’s Wort is predicted to decrease the exposure to daclatasvir. Avoid. [Severe] Theoretical

St John’s Wort is predicted to decrease the exposure to darifenacin. [Moderate] Theoretical

St John’s Wort is predicted to decrease the exposure to dasabuvir. Avoid. [Severe] Theoretical

St John’s Wort is predicted to decrease the exposure to dasatinib. [Severe] Study

St John’s Wort is predicted to decrease the efficacy of desogestrel. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical

St John’s Wort decreases the concentration of digoxin. Avoid. [Severe] Aneotald

St John’s Wort is predicted to decrease the exposure to dolasetrobin. Adjust dose. [Severe] Study

St John’s Wort is predicted to decrease the exposure to edoxaban. [Moderate] Study

St John’s Wort is predicted to decrease the concentration of efavirenz. Avoid. [Severe] Theoretical

St John’s Wort is predicted to moderately decrease the exposure to elbasvir. Avoid. [Severe] Study

St John’s Wort is predicted to decrease the concentration of elvitegravir. Avoid. [Severe] Theoretical

St John’s Wort is predicted to decrease the effects of ergotamine. [Moderate] Theoretical

St John’s Wort is predicted to decrease the exposure to erlotinib. [Severe] Theoretical

St John’s Wort is predicted to decrease the efficacy of etonogestrel. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Theoretical

St John’s Wort is predicted to decrease the exposure to etravirine. Avoid. [Severe] Study

St John’s Wort is predicted to decrease the concentration of everolimus. Avoid or adjust dose. [Severe] Study

St John’s Wort is predicted to decrease the exposure to exemestane. [Moderate] Theoretical
St John’s Wort is continued.

- **St John’s Wort** is predicted to decrease the exposure to **fesoterodine**. Avoid. [Mild] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **felodipine**. Avoid. [Moderate] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **vodaprepitant**. Avoid. [Mild] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **gefitinib**. Avoid. [Severe] Theoretical
- **St John’s Wort** is predicted to markedly decrease the exposure to **grazoprevir**. Avoid. [Severe] Study
- **St John’s Wort** is predicted to decrease the concentration of **guanfacine**. Adjust dose. [Mild] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **HIV-1 protease inhibitors**. Avoid. [Severe] Study
- **St John’s Wort** is predicted to decrease the efficacy of **Hormone replacement therapy**. [Mild] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **ibritunib**. Avoid. [Severe] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **idelalisib**. Avoid. [Severe] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **imatinib**. [Mild] Study
- **St John’s Wort** slightly decreases the exposure to **irinotecan**. Avoid. [Severe] Study
- **St John’s Wort** decreases the exposure to **ivanabradine**. Avoid. [Mild] Study
- **St John’s Wort** is predicted to decrease the exposure to **ivacaftor**. Avoid. [Severe] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **ixazomib**. Avoid. [Severe] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **lapatinib**. Avoid. [Severe] Study
- **St John’s Wort** is predicted to decrease the exposure to **ledipasvir**. Avoid. [Severe] Theoretical
- **St John’s Wort** is predicted to decrease the efficacy of **levonordestrol**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 747. [Mild] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **lurasidone**. Monitor and adjust dose. [Mild] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **macitentan**. Avoid. [Severe] Theoretical
- **St John’s Wort** moderately decreases the exposure to **mibefradil**. Monitor and adjust dose. [Mild] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **midazolam**. Monitor and adjust dose. [Mild] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **naloxegol**. Avoid. [Mild] Theoretical
- **St John’s Wort** is predicted to decrease the concentration of **nevirapine**. Avoid. [Severe] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **nicotinib**. Avoid. [Severe] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **nintedanib**. [Mild] Study
- **St John’s Wort** is predicted to decrease the efficacy of **norethisterone**. MHRA advises avoid. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- **St John’s Wort** is predicted to decrease the exposure to **olaparib**. Avoid. [Mild] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **opioids (methadone)**. Monitor and adjust dose. [Severe] Study → Also see TABLE 13 p. 1267
- **St John’s Wort** moderately decreases the exposure to **opioids (oxycodeone)**. Adjust dose. [Mild] Study
- **St John’s Wort** is predicted to decrease the exposure to **osimertinib**. Avoid. [Moderate] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **pablociclib**. Avoid. [Severe] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **panobinostat**. Avoid. [Moderate] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **paritaprevir** (with ritonavir and ombitasvir). Avoid. [Severe] Study
- **St John’s Wort** is predicted to decrease the exposure to **phosphodiesterase type-5 inhibitors**. [Mild] Theoretical
- **St John’s Wort** slightly decreases the exposure to **pioglitazone**. [Mild] Study
- **St John’s Wort** is predicted to decrease the exposure to **pitolisant**. Monitor and adjust dose. [Mild] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **ponatinib**. Avoid. [Severe] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **ranolazine**. Avoid. [Severe] Study
- **St John’s Wort** is predicted to decrease the exposure to **rilpivirine**. Avoid. [Severe] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **rufoxatinib**. Monitor and adjust dose. [Mild] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **simeprevir**. Avoid. [Severe] Study
- **St John’s Wort** is predicted to decrease the concentration of **sirolimus**. Monitor and adjust dose. [Severe] Study
- **St John’s Wort** is predicted to decrease the exposure to **sofosbuvir**. Avoid. [Mild] Study
- **St John’s Wort** slightly decreases the exposure to **statins (atorvastatin)**. [Mild] Study
- **St John’s Wort** moderately decreases the exposure to **statins (simvastatin)**. [Mild] Study
- **St John’s Wort** decreases the concentration of **tacrolimus**. Avoid. [Severe] Study
- **St John’s Wort** is predicted to decrease the exposure to **taxanes (cabazitaxel)**. Avoid. [Severe] Study
- **St John’s Wort** is predicted to decrease the concentration of **temsirolimus**. Avoid. [Severe] Theoretical
- **St John’s Wort** potentially decreases the exposure to **theophylline**. Avoid. [Mild] Anecdotal
- **St John’s Wort** is predicted to decrease the exposure to **ticagrelor**. [Mild] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **tolvaptan**. [Mild] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **topotecan**. [Mild] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **velpatasvir**. Avoid. [Mild] Theoretical
- **St John’s Wort** is predicted to decrease the exposure to **vismodegib**. Avoid. [Moderate] Theoretical

**Statins** → see TABLE 1 p. 1264 (hepatotoxicity)
- **Antiepileptics (fosphenytoin, phenytoin)** potentially decrease the exposure to statins (atorvastatin, simvastatin). (Moderate Anecdotal)

- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to atorvastatin. Monitor and adjust dose. (Severe Theoretical) → Also see TABLE 1 p. 1264

- **Antifungals, azoles (fluconazole, miconazole)** are predicted to increase the exposure to fluvastatin. (Severe Theoretical) → Also see TABLE 1 p. 1264

- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to atorvastatin. Avoid or adjust dose and monitor rhabdomyolysis. (Severe Study) → Also see TABLE 1 p. 1264

- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 198. (Severe Study) → Also see TABLE 1 p. 1264

- **Antifungals, azoles (miconazole)** are predicted to increase the exposure to atorvastatin. (Severe Anecdotal)

- **Antifungals, azoles (miconazole)** are predicted to increase the exposure to simvastatin. (Severe Theoretical)

- **Aprepitant** is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. (Severe Theoretical)

- **Aprepitant** is predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 198. (Severe Study)

- **Bosentan** slightly decreases the exposure to atorvastatin. (Mid Study)

- **Bosentan** moderately decreases the exposure to simvastatin. (Moderate Study)

- **Calcium channel blockers (amlodipine)** slightly increase the exposure to simvastatin. Adjust simvastatin dose, p. 198. (Mid Study)

- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to atorvastatin. Monitor and adjust dose. (Severe Theoretical)

- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 198. (Severe Study)

- **Cephalosporins (ceftobiprole)** are predicted to increase the concentration of statins. (Moderate Theoretical)

- **Ciclosporin** very markedly increases the exposure to atorvastatin. Avoid or adjust atorvastatin dose, p. 196. (Severe Study)

- **Ciclosporin** moderately increases the exposure to fluvastatin. (Severe Study)

- **Ciclosporin** markedly to very markedly increases the exposure to pravastatin. Adjust pravastatin dose, p. 197. (Severe Study)

- **Ciclosporin** markedly increases the exposure to statins (rosuvastatin, simvastatin). Avoid. (Severe Study)

- **Clopidogrel** increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 197. (Moderate Study)

- **Cobicistat** is predicted to increase the exposure to atorvastatin. Avoid or adjust dose and monitor rhabdomyolysis. (Severe Study)

- **Cobicistat** is predicted to increase the exposure to simvastatin. Avoid. (Severe Study)

- **Colchicine** increases the risk of rhabdomyolysis when given with statins. (Severe Anecdotal)

- **Statins (fluvastatin, rosuvastatin)** increase the anticoagulant effect of coumarins. Monitor INR and adjust dose. (Severe Study)

- **Crizotinib** is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. (Severe Theoretical)

- **Crizotinib** is predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 198. (Severe Study)

- **Danazol** is predicted to increase the risk of rhabdomyolysis when given with atorvastatin. (Severe Theoretical)

- **Danazol** increases the risk of rhabdomyolysis when given with simvastatin. Avoid. (Severe Anecdotal)

- **Statins** are predicted to increase the risk of rhabdomyolysis when given with daptomycin. (Severe Theoretical)

- **Dasabuvir** increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 197. (Moderate Study)

- **Dasatinib** is predicted to increase the exposure to simvastatin. (Moderate Theoretical)

- **Efavirenz** slightly decreases the exposure to atorvastatin. (Mid Study)

- **Efavirenz** moderately decreases the exposure to simvastatin. (Moderate Study)

- **Elbasvir** potentially increases the exposure to atorvastatin. Adjust atorvastatin dose, p. 196. (Moderate Study)

- **Elbasvir** is predicted to increase the exposure to fluvastatin. Adjust fluvastatin dose, p. 196. (Unknown Theoretical)

- **Elbasvir** increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 197. (Moderate Study)

- **Elbasvir** is predicted to increase the exposure to simvastatin. Adjust simvastatin dose, p. 198. (Unknown Theoretical)

- **Eltrombopag** is predicted to increase the exposure to statins. Monitor and adjust dose. (Moderate Study)

- **Ezetimibe** potentially increases the risk of rhabdomyolysis when given with simvastatin. (Severe Anecdotal)

- **Fibrates (bezafibrate, ciprofibrate)** increase the risk of rhabdomyolysis when given with pravastatin. Avoid. (Severe Study)

- **Fibrates (bezafibrate, ciprofibrate)** increase the risk of rhabdomyolysis when given with rosuvastatin. Adjust rosuvastatin dose, p. 197. (Severe Study)

- **Fibrates (ciprofibrate)** increase the risk of rhabdomyolysis when given with atorvastatin. Avoid or adjust dose. (Severe Study)

- **Fibrates (ciprofibrate)** increase the risk of rhabdomyolysis when given with fluvastatin. Adjust fluvastatin dose, p. 197. (Severe Study)

- **Fibrates (fenofibrate)** are predicted to increase the risk of rhabdomyolysis when given with fluvastatin. Adjust fenofibrate dose, p. 193. (Severe Theoretical)

- **Fibrates (fenofibrate)** are predicted to increase the risk of rhabdomyolysis when given with simvastatin. Adjust fenofibrate dose, p. 193. (Severe Anecdotal)

- **Fusidic acid** increases the risk of rhabdomyolysis when given with statins. Avoid. (Severe Anecdotal)

- **Grapefruit juice** increases the exposure to atorvastatin. (Mid Study)

- **Grapefruit juice** increases the exposure to simvastatin. Avoid. (Severe Study)

- **Grazoprevir** increases the exposure to atorvastatin. Adjust atorvastatin dose, p. 196. (Moderate Study)

- **Grazoprevir** is predicted to increase the exposure to fluvastatin. Adjust fluvastatin dose, p. 196. (Unknown Theoretical)

- **Grazoprevir** increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 197. (Moderate Study)

- **Grazoprevir** is predicted to increase the exposure to simvastatin. Adjust simvastatin dose, p. 198. (Unknown Theoretical)

- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to atorvastatin. Avoid or adjust dose and monitor rhabdomyolysis. (Moderate Study)

- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to simvastatin. Avoid. (Severe Study)
Statin interactions

- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to atorvastatin. Monitor and adjust dose. **Severe**
- HIV-protease inhibitors slightly to moderately increase the exposure to rosuvastatin. Avoid or adjust dose. **Severe**
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 198. **Severe** Study
- Idelalisib is predicted to increase the exposure to atorvastatin. Avoid or adjust dose and monitor rhabdomyolysis. **Severe** Study
- Idelalisib is predicted to increase the exposure to simvastatin. Avoid. **Severe** Study
- Lomitapide increases the exposure to atorvastatin. Adjust lomitapide dose or separate administration by 12 hours. **Mild** Study → Also see TABLE 1 p. 1264
- Lomitapide increases the exposure to simvastatin. Monitor and adjust simvastatin dose, p. 198. **Moderate** Study → Also see TABLE 1 p. 1264
- Macrolides (clarithromycin) are predicted to increase the exposure to atorvastatin. Avoid or adjust dose and monitor rhabdomyolysis. **Severe** Study
- Macrolides (clarithromycin) moderately increase the exposure to pravastatin. **Severe** Study
- Macrolides (erythromycin) are predicted to increase the exposure to simvastatin. Avoid. **Severe** Study
- Macrolides (erythromycin) are predicted to increase the exposure to pravastatin. **Severe** Study
- Macrolides (erythromycin) are predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 198. **Severe** Study
- Monoclonal antibodies (tocilizumab) are predicted to decrease the exposure to atorvastatin. Monitor and adjust dose. **Moderate** Theoretical
- Monoclonal antibodies (tocilizumab) moderately decrease the exposure to simvastatin. Monitor and adjust dose. **Moderate** Study
- Netupitant is predicted to increase the exposure to atorvastatin. Monitor and adjust dose. **Severe** Theoretical
- Netupitant is predicted to increase the exposure to simvastatin. Use with caution and adjust simvastatin dose, p. 198. **Severe** Study
- Nevirapine slightly decreases the exposure to atorvastatin. **Mild** Study
- Nevirapine moderately decreases the exposure to simvastatin. **Moderate** Study
- Paritaprevir (with ritonavir and ombitasvir) is predicted to increase the exposure to pravastatin. Adjust pravastatin dose, p. 197. **Moderate** Study
- Paritaprevir (with ritonavir and ombitasvir) increases the exposure to rosuvastatin. Adjust rosuvastatin dose, p. 197. **Moderate** Study
- Rosuvastatin is predicted to increase the anticoagulant effect of phenindione. Monitor INR and adjust dose. **Severe** Theoretical
- Ranolazine is predicted to increase the exposure to atorvastatin. **Moderate** Theoretical
- Ranolazine slightly increases the exposure to simvastatin. Adjust simvastatin dose, p. 198. **Moderate** Study
- Regorafenib is predicted to increase the exposure to statins (atorvastatin, fluvastatin, rosuvastatin). **Severe** Theoretical
- Rifampicin markedly decreases the exposure to atorvastatin. Atorvastatin should be taken at the same time as rifampicin. **Moderate** Study
- Rifampicin moderately decreases the exposure to fluvastatin. Monitor and adjust dose. **Moderate** Study
- Rifampicin very markedly decreases the exposure to simvastatin. **Moderate** Study
- Simeprevir moderately increases the exposure to atorvastatin. Monitor and adjust dose. **Moderate** Study
- Simeprevir is predicted to increase the exposure to pravastatin. Monitor and adjust dose. **Severe** Theoretical
- Simvastatin decreases the exposure to statins. **Mild** Study
- Simvastatin is predicted to increase the exposure to pravastatin. **Moderate** Study
- Simvastatin is predicted to increase the exposure to rosuvastatin. **Moderate** Study
- Simeprevir slightly increases the exposure to simvastatin. Monitor and adjust dose. **Moderate** Study
- ST John’s Wort slightly decreases the exposure to atorvastatin. **Mild** Study
- ST John’s Wort moderately decreases the exposure to simvastatin. **Moderate** Study
- Sulfinpyrazone is predicted to increase the exposure to fluvastatin. **Severe** Theoretical
- Fluvastatin slightly increases the exposure to sulfonylureas (glibenclamide). **Mild** Study
- Tedizolid is predicted to increase the exposure to rosvastatin. Avoid. **Moderate** Theoretical
- Teriflunomide moderately increases the exposure to rosvastatin. Adjust rosvastatin dose, p. 197. **Moderate** Study
- Tigracorol slightly increases the exposure to simvastatin. Adjust simvastatin dose, p. 198. **Moderate** Study
- Velpatasvir increases the exposure to rosuvastatin. Adjust rosuvastatin dose and monitor side effects, p. 197. **Severe** Study
- Velpatasvir is predicted to increase the exposure to statins (atorvastatin, simvastatin). Monitor side effects and adjust dose. **Severe** Theoretical
- Statin interactions see TABLE 12 p. 1267
- Didanosine increases the risk of toxicity when given with stavudine. Avoid. **Severe** Study → Also see TABLE 12 p. 1267
- Hydroxypropamide increases the risk of toxicity when given with stavudine. Avoid. **Severe** Study
- Isoniazid is predicted to increase the risk of peripheral neuropathy when given with stavudine. **Severe** Theoretical → Also see TABLE 12 p. 1267
- Ribavirin increases the risk of toxicity when given with stavudine. Avoid. **Severe** Study
- Stavudine is predicted to decrease the efficacy of stavudine. Avoid. **Severe** Theoretical
- Stavudine → see TABLE 12 p. 1267 (peripheral neuropathy)
- Didanosine increases the risk of toxicity when given with stavudine. Avoid. **Severe** Study → Also see TABLE 12 p. 1267
- Hydroxypropamide increases the risk of toxicity when given with stavudine. Avoid. **Severe** Study
- Isoniazid is predicted to increase the risk of peripheral neuropathy when given with stavudine. **Severe** Theoretical → Also see TABLE 12 p. 1267
- Ribavirin increases the risk of toxicity when given with stavudine. Avoid. **Severe** Study
- Stavudine is predicted to decrease the efficacy of stavudine. Avoid. **Severe** Theoretical
- Stavudine → see antiepileptics
- Streptokinase → see TABLE 3 p. 1264 (anticoagulant effects)
- Streptokinase → see aminoglycosides
- Strontium ranelate → see TABLE 5 p. 1264 (thromboembolism)
- Antacids decrease the absorption of strontium ranelate. Separate administration by 2 hours. **Moderate** Study
- Oral calcium salts decrease the absorption of strontium ranelate. Separate administration by 2 hours. **Moderate** Study
- Strontium ranelate is predicted to decrease the absorption of quinolones. Avoid. **Moderate** Theoretical
- Strontium ranelate is predicted to decrease the absorption of tetracyclines. Avoid. **Moderate** Theoretical
Sucralfate
- Sucralfate potentially decreases the effects of coumarins (warfarin). Separate administration by 2 hours. [Moderate] Anecdotal
- Sucralfate decreases the absorption of digoxin. Separate administration by 2 hours. [Severe] Anecdotal
- Sucralfate decreases the absorption of dolutegravir. [Moderate] Study
- Sucralfate increases the risk of blocked enteral or nasogastric tubes when given with enteral feeds. Separate administration by 1 hour. [Moderate] Study
- Sucralfate decreases the absorption of levothyroxine. Separate administration by at least 4 hours. [Moderate] Study
- Potassium citrate increases the risk of side-effects when given with sucralfate. Avoid. [Moderate] Theoretical
- Sucralfate decreases the exposure to quinolones. Separate administration by 2 hours. [Moderate] Study
- Sodium citrate is predicted to increase the risk of side-effects when given with sucralfate. Avoid. [Moderate] Theoretical
- Sucralfate decreases the absorption of sulphasalazine. Separate administration by 2 hours. [Moderate] Study
- Sucralfate potentially decreases the absorption of theophylline. Separate administration by at least 2 hours. [Moderate] Study
- Sucralfate is predicted to decrease the absorption of tricyclic antidepressants. [Moderate] Study

Sufentanil
- Sufentanil is predicted to decrease the absorption of oral combined hormonal contraceptives. Refer to patient information leaflet for missed pill advice. [Severe] Theoretical
- Sufentanil is predicted to decrease the exposure to desogestrel. Refer to patient information leaflet for missed pill advice. [Severe] Theoretical
- Sufentanil is predicted to decrease the efficacy of etonogestrel. Use additional contraceptive precautions. [Severe] Theoretical
- Sufentanil is predicted to decrease the exposure to levonorgestrel. Use additional contraceptive precautions. [Severe] Theoretical
- Sufentanil is predicted to decrease the exposure to medroxyprogesterone. Use additional contraceptive precautions. [Severe] Theoretical
- Sufentanil is predicted to decrease the exposure to norethisterone. Use additional contraceptive precautions. [Severe] Theoretical

Sulfinpyrazone
- Sulfinpyrazone is predicted to increase the exposure to retinoids (alitretinoin). Adjust alitretinoin dose, p. 1157. [Moderate] Theoretical
- Sulfinpyrazone is predicted to increase the exposure to statins (fluvastatin). [Severe] Theoretical
- Sulfinpyrazone is predicted to increase the exposure to sulfonlureas. Use with caution and adjust dose. [Moderate] Study

Sulfonamides
- See table 15 p. 1267 (myelosuppression) co-trimoxazole - sulfaadoxine
- Sulfonamides potentially increase the risk of methaemoglobinemia when given with topical anaesthetics, local (prilocaine). Use with caution or avoid. [Severe] Anecdotal
- Sulfinpyrazone is predicted to increase the concentration of antiepileptics (fosphenytoin). Monitor and adjust dose. [Moderate] Study
- Sulfinpyrazone increases the concentration of antiepileptics (phenytoin). Monitor and adjust dose. [Moderate] Study
- Antimalarials (pyrimethamine) increase the risk of side-effects when given with sulfonamides. [Severe] Study  Also see table 15 p. 1267
- Sulfinpyrazone is predicted to increase the anticoagulant effect of coumarins. [Severe] Theoretical
- Sulfinpyrazone are predicted to increase the risk of methaemoglobinemia when given with dapsone. [Severe] Theoretical
- Sulfinpyrazone are predicted to increase the exposure to methotrexate. Use with caution or avoid. [Severe] Theoretical  Also see table 15 p. 1267
- Sulfinpyrazone are predicted to increase the exposure to sulfonlureas. [Moderate] Study
- Sulfinpyrazone are predicted to increase the effects of thiopental. [Moderate] Theoretical

Sulfonylureas
- See table 14 p. 1267 (antidiabetic drugs) glibenclamide - gliclazide - glimepiride - glipizide - tolbutamide
- Antiarrhythmics (amiodarone) are predicted to increase the exposure to sulfonylureas. Use with caution and adjust dose. [Moderate] Study
- Antifungals, azoles (fluconazole, miconazole, voriconazole) are predicted to increase the exposure to sulfonylureas. Use with caution and adjust dose. [Moderate] Study
- Bosentan increases the risk of hepatotoxicity when given with glibenclamide. Avoid. [Severe] Study
- Cephalosporins (cefotibiprole) are predicted to increase the concentration of glibenclamide. [Moderate] Theoretical
- Ceritinib is predicted to increase the exposure to glimepiride. Adjust dose. [Moderate] Theoretical
- Chloramphenicol is predicted to increase the exposure to sulfonylureas. [Severe] Study
- Fibrates are predicted to increase the risk of hypoglycaemia when given with sulfonylureas. [Moderate] Theoretical
- Macrolides (clarithromycin) are predicted to slightly increase the exposure to sulfonylureas. [Moderate] Theoretical
- Rifampicin is predicted to decrease the exposure to sulfonylureas. [Moderate] Study
- Statins (fluvastatin) slightly increase the exposure to glibenclamide. [Mild] Study
- Sulfinpyrazone is predicted to increase the exposure to sulfonylureas. Use with caution and adjust dose. [Moderate] Study
- Sulfinpyrazone are predicted to increase the exposure to sulfonylureas. [Moderate] Study
- Sulfinpyrazone are predicted to increase the exposure to sulfonlureas. [Moderate] Study

Sulindac  See NSAIDs
Sulpiride
- See table 8 p. 1265 (hypotension), table 9 p. 1266 (QT-interval prolongation), table 11 p. 1266 (CNS depressant effects)
- Sulpiride is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical  Also see table 8 p. 1265 Also see table 9 p. 1266
- Sulpiride is predicted to decrease the effects of levodopa. Avoid. [Severe] Theoretical  Also see table 8 p. 1265
- Sulpiride potentially increases the risk of neurotoxicity when given with lithium. [Severe] Anecdotal  Also see table 9 p. 1266
- Sucralfate decreases the absorption of sulpiride. Separate administration by 2 hours. [Moderate] Study

Sugammadex
- Sugammadex decreases the concentration of folic acid. [Moderate] Study
- Sugammadex increases the anticoagulant effect of coumarins. [Severe] Study

Sulphasalazine
- See table 1 p. 1264 (hepatotoxicity), table 15 p. 1267 (myelosuppression)
- Sulphasalazine decreases the concentration of digoxin. [Moderate] Study
- Sulphasalazine decreases the absorption of folates (folic acid). [Moderate] Study
- Sulphasalazine is predicted to decrease the absorption of folates (folic acid). [Moderate] Theoretical
- Tedizolid is predicted to increase the exposure to sulphasalazine. Avoid. [Moderate] Theoretical
- Sulfinpyrazone is predicted to increase the concentration of antiepileptics (fosphenytoin, phenytoin). [Moderate] Study
- Aspirin decreases the effects of sulfinpyrazone. [Moderate] Study Also see table 4 p. 1264
- Sulfinpyrazone decreases the exposure to calcium channel blockers (verapamil). [Moderate] Study
- Sulfinpyrazone decreases the concentration of ciclosporin. [Severe] Study
- Sulfinpyrazone increases the anticoagulant effect of coumarins. Avoid. [Severe] Study
- Sulfinpyrazone slightly increases the exposure to nateglinide. [Mild] Study
- Pyrazinamide is predicted to decrease the effects of sulfinpyrazone. [Moderate] Theoretical

Sulphate - Sulpiride 1405
Sumatriptan  ▶ see TABLE 13 p. 1267 (serotonin syndrome)
  ▶ Sumatriptan increases the risk of vasovagal event which can occur with ergotamine. Ergotamine should be taken at least 24 hours before or 6 hours after sumatriptan. Severe  Study  Also see TABLE 13 p. 1267
  ▶ Moclobemide moderately increases the exposure to sumatriptan. Avoid. Moderate  Study  Also see TABLE 13 p. 1267
  ▶ Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the exposure to sumatriptan. Avoid and for 14 days after stopping the MAOI. Severe  Theoretical  Also see TABLE 13 p. 1267
Sunitinib  ▶ see TABLE 15 p. 1267 (myelosuppression), TABLE 9 p. 1266 (QT-interval prolongation)
  ▶ Antiarrhythmics (dronedarone) are predicted to increase the exposure to sunitinib. Moderate  Theoretical  Also see TABLE 9 p. 1266
  ▶ Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 914. Moderate  Study
  ▶ Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to sunitinib. Moderate  Theoretical
  ▶ Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 914. Moderate  Study  Also see TABLE 9 p. 1266
  ▶ Aprepitant is predicted to increase the exposure to sunitinib. Moderate  Theoretical
  ▶ Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to sunitinib. Moderate  Theoretical
  ▶ Cobicistat is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 914. Moderate  Study  Also see TABLE 9 p. 1266
  ▶ Sunitinib is predicted to increase the risk of bleeding events when given with coumarins. Severe  Theoretical
  ▶ Crizotinib is predicted to increase the exposure to sunitinib. Moderate  Theoretical  Also see TABLE 15 p. 1267  Also see TABLE 9 p. 1266
  ▶ Enzalutamide is predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 914. Moderate  Study
  ▶ Grapefruit juice is predicted to increase the exposure to sunitinib. Avoid. Moderate  Theoretical
  ▶ HIV- protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 914. Moderate  Study  Also see TABLE 9 p. 1266
  ▶ HIV- protease inhibitors (indinavir) are predicted to increase the exposure to sunitinib. Moderate  Theoretical
  ▶ Idelalisib is predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 914. Moderate  Study  Also see TABLE 15 p. 1267
  ▶ Imatinib is predicted to increase the exposure to sunitinib. Moderate  Theoretical  Also see TABLE 15 p. 1267
  ▶ Macrolides (clarithromycin) are predicted to slightly increase the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 914. Moderate  Study  Also see TABLE 9 p. 1266
  ▶ Macrolides (erythromycin) are predicted to increase the exposure to sunitinib. Moderate  Theoretical
  ▶ Netupitant is predicted to increase the exposure to sunitinib. Moderate  Theoretical
  ▶ Nilotinib is predicted to increase the exposure to sunitinib. Moderate  Theoretical  Also see TABLE 15 p. 1267  Also see TABLE 9 p. 1266
  ▶ Sunitinib is predicted to increase the risk of bleeding events when given with phenindione. Severe  Theoretical
  ▶ Rifampicin is predicted to decrease the exposure to sunitinib. Avoid or adjust sunitinib dose, p. 914. Moderate  Study
Suxamethonium  ▶ see TABLE 20 p. 1268 (neuromuscular blocking effects)
  ▶ Alkylating agents (cyclophosphamide) increase the risk of prolonged neuromuscular blockade when given with suxamethonium. Moderate  Study
  ▶ Aminoglycosides are predicted to increase the risk of prolonged neuromuscular blockade when given with suxamethonium. Severe  Theoretical  Also see TABLE 20 p. 1268
  ▶ Antiarhythmic effects (lidocaine) are predicted to increase the effects of suxamethonium. Moderate  Study
  ▶ Anticholinesterases, centrally acting increase the effects of suxamethonium. Moderate  Theoretical
  ▶ Antiepileptics (carbamazepine) increase the risk of prolonged neuromuscular blockade when given with suxamethonium. Moderate  Study
  ▶ Antiepileptics (fosphenytoin, phenytoin) increase the effects of suxamethonium. Moderate  Study
  ▶ Clindamycin increases the effects of suxamethonium. Severe  Anecdotal
  ▶ Colistimethate increases the effects of suxamethonium. Monitor and adjust dose. Moderate  Study  Also see TABLE 20 p. 1268
  ▶ Corticosteroids are predicted to decrease the effects of suxamethonium. Severe  Anecdotal
  ▶ Suxamethonium is predicted to increase the risk of cardiovascular side-effects when given with digoxin. Severe  Anecdotal
  ▶ Irinotecan is predicted to increase the risk of prolonged neuromuscular blockade when given with suxamethonium. Moderate  Theoretical
  ▶ Intravenous magnesium is predicted to increase the effects of suxamethonium. Moderate  Study
  ▶ Metoclopromide increases the effects of suxamethonium. Moderate  Study
  ▶ Penicillins (piperaclillin) increase the effects of suxamethonium. Moderate  Study
  ▶ SSRI: potentially increase the risk of prolonged neuromuscular blockade when given with suxamethonium. Unknown  Theoretical

### Sympathomimetics, inotropic

- Dobutamine - dopamine - doxepamine
  - Sympathomimetics, inotropic are predicted to increase the effects of apraclonidine. Avoid. Severe  Theoretical
  - Beta blockers, non-selective increase the risk of hypertension and bradycardia when given with dobutamine. Severe  Theoretical
  - Beta blockers, selective increase the risk of hypertension and bradycardia when given with dobutamine. Moderate  Theoretical
  - Entacapone is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, inotropic (dobutamine, dopamine). Moderate  Theoretical
  - Ergotamine potentially increases the risk of peripheral vasosconstriction when given with dopamine. Avoid. Severe  Anecdotal
  - Guanethidine is predicted to increase the effects of dopamine. Severe  Theoretical
  - Sympathomimetics, inotropic (dobutamine, dopamine) are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. Severe  Theoretical
  - Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, inotropic. Avoid and for 14 days after stopping the MAOI. Severe  Theoretical
  - Monoamine-oxidase B inhibitors are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, inotropic. Avoid. Severe  Anecdotal
  - Opicapone is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, inotropic (dobutamine, dopamine). Severe  Theoretical
  - Tolcapone is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, inotropic (dobutamine, dopamine). Moderate  Theoretical

### Sympathomimetics, vasoconstrictor

- Adrenaline - ephedrine - epinephrine - isomethepeine - metaraminol - midodrine - noradrenaline/norepinephrine - phenylephrine - pseudoephedrine - xylometazoline

**ROUTE-SPECIFIC INFORMATION**  Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.
Sympathomimetics, vasoconstrictor ↔ Tacrolimus

- Sympathomimetics, vasoconstrictor are predicted to decrease the effects of apraclonidine. Avoid. [Severe] Theoretical
- Atropine increases the risk of severe hypertension when given with phenylephrine. [Severe] Study
- Beta blockers, non-selective are predicted to increase the risk of hypertension and bradycardia when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). [Severe] Study
- Beta blockers, selective are predicted to increase the risk of hypertension and bradycardia when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). [Severe] Study
- Entacapone is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). [Moderate] Study
- Ergometrine is predicted to increase the risk of peripheral vasocostriction when given with noradrenaline/norepinephrine. [Severe] Anecdotal
- Guanethidine increases the effects of metaraminol. [Severe] Anecdotal
- Guanethidine increases the effects of phenylephrine. [Severe] Study
- Guanethidine is predicted to increase the effects of sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). [Moderate] Study
- Pseudoephedrine increases the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Study
- Sympathomimetics, vasoconstrictor (adrenaline/epinephrine, ephedrine, isomethepene, noradrenaline/norepinephrine, phenylephrine) are predicted to increase the risk of elevated blood pressure when given with linezolid. Avoid. [Severe] Theoretical
- Mianserin decreases the effects of ephedrine. [Severe] Anecdotal
- Moclubemide is predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, vasoconstrictor (ephedrine, isomethepene, phenylephrine, pseudoephedrine). Avoid. [Severe] Study
- Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, vasoconstrictor. Avoid and for 14 days after stopping the MAOI. [Severe] Study
- Monoamine-oxidase B inhibitors are predicted to increase the risk of a hypertensive crisis when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). [Severe] Anecdotal
- Opicapone is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). [Severe] Theoretical
- Ephedrine increases the risk of side-effects when given with theophylline. Avoid in children. [Moderate] Study
- Tolcapone is predicted to increase the effects of sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). [Moderate] Theoretical
- Tricyclic antidepressants are predicted to decrease the effects of ephedrine. Avoid. [Severe] Study
- Tricyclic antidepressants increase the effects of sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine, phenylephrine). Avoid. [Severe] Study
- Tacalcitol → see vitamin D substances
- Tacrolimus → see TABLE 2 p. 1264 (nephrotoxicity), TABLE 16 p. 1268 (increased serum potassium)
  - Risk of facial flushing and skin irritation with alcohol consumption in those using topical tacrolimus (does not apply to tacrolimus taken systemically). Pomelo might greatly increase the concentration of tacrolimus.
  - Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.
- Antihistamines (amiodarone) are predicted to increase the concentration of tacrolimus. [Severe] Anecdotal
- Antihistamines (dronedarone) are predicted to increase the concentration of tacrolimus. [Severe] Study
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) decrease the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study
- Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of tacrolimus. [Severe] Study
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study
- Antifungals, azoles (miconazole) are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study
- Theoretical
- Aprepitant is predicted to increase the concentration of tacrolimus. [Severe] Study
- Bosentan is predicted to decrease the concentration of tacrolimus and tacrolimus potentially increases the concentration of bosentan. Avoid. [Severe] Theoretical
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of tacrolimus. [Severe] Study
- Calcium channel blockers (nicardipine) potentially increase the concentration of tacrolimus. Monitor concentration and adjust dose. [Severe] Anecdotal
- Certitinib is predicted to increase the exposure to tacrolimus. Avoid. [Severe] Theoretical
- Chloramphenicol increases the concentration of tacrolimus. [Severe] Study
- Ciclosporin increases the concentration of tacrolimus. Avoid. [Severe] Study → Also see TABLE 2 p. 1264 → Also see TABLE 16 p. 1268
- Cobicistat is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study
- Crizotinib is predicted to increase the concentration of tacrolimus. [Severe] Study
- Danazol potentially increases the concentration of tacrolimus. [Severe] Anecdotal
- Efavirenz is predicted to decrease the concentration of tacrolimus. Monitor and adjust dose. [Moderate] Theoretical
- Enzalutamide decreases the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study
- Grapefruit juice increases the concentration of tacrolimus. Avoid. [Severe] Study
- Grazoprevir increases the exposure to tacrolimus. [Moderate] Study
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study
- HIV-protease inhibitors (indinavir) are predicted to increase the concentration of tacrolimus. [Severe] Study
- Idelalisib is predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study
- Imatinib is predicted to increase the concentration of tacrolimus. [Severe] Study
- Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with tacrolimus. Public Health England advises avoid. [Severe] Theoretical
- Tacrolimus is predicted to increase the exposure to lomitapide. Separate administration by 12 hours. [Moderate] Theoretical
- Lumacaftor is predicted to decrease the exposure to tacrolimus. Avoid. [Severe] Theoretical
- Macrolides (clarithromycin) are predicted to increase the concentration of tacrolimus. Monitor and adjust dose. [Severe] Study
- Macrolides (erythromycin) are predicted to increase the concentration of tacrolimus. [Severe] Study
- Tacrolimus is predicted to affect the efficacy of mifamurtide. Avoid. [Severe] Theoretical
- Netupitant is predicted to increase the concentration of tacrolimus. [Severe] Study
- Nevirapine is predicted to decrease the concentration of tacrolimus. Monitor and adjust dose. [Moderate] Theoretical
- Nilotinib is predicted to increase the concentration of tacrolimus. [Severe] Study
- Palbociclib is predicted to increase the exposure to tacrolimus. Adjust dose. [Moderate] Theoretical

Downloaded from www.medicalbr.com
Tacrolimus (continued)

- **Pitolisant** is predicted to decrease the exposure to tacrolimus. Avoid. [Severe] Theoretical
- **Ranolazine** increases the concentration of tacrolimus. Adjust dose. [Severe] Anecdotal
- **Rifampicin** decreases the concentration of tacrolimus. Monitor and adjust dose. [Severe] study
- **Sirolimus** is predicted to decrease the concentration of tacrolimus and tacrolimus increases the exposure to sirolimus. [Severe] Study
- **St John’s Wort** decreases the concentration of tacrolimus. Avoid. [Severe] Study
- **Tacrolimus** potentially increases the risk of serotonin syndrome when given with *venlafaxine*. [Severe] Anecdotal

**Tamoxifen**

- **Bupropion** is predicted to decrease the efficacy of tamoxifen. Avoid. [Severe] Study
- **Cinacalcet** is predicted to decrease the efficacy of tamoxifen. Avoid. [Severe] Study
- **Terbinafine** is predicted to decrease the efficacy of tamoxifen. Avoid. [Severe] Study
- **Antifungals, azoles** are predicted to decrease the concentration of tamoxifen. [Unknown] Study
- **Rifampicin** is predicted to decrease the efficacy of tamoxifen. [Severe] Study
- **Antiepileptics** are predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. [Severe] Study
- **Tamsulosin** is predicted to decrease the efficacy of tamoxifen. [Severe] Study
- **Tamsulosin** is predicted to decrease the efficacy of tamoxifen. [Severe] Study
- **Taxanes** are predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). [Severe] Study
- **Tapiental** is predicted to decrease the efficacy of tamoxifen. [Severe] Study
- **Caution.** Food and lifestyle factors and co-administered drugs may influence the concentration of tamoxifen. Avoid any similar meat or yeast extract or fermented mature cheese, salami, pickled herring, Bovril. See Food and lifestyle.

- **Antithrombotics**
  - **Droxtia** is predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. [Moderate] Theoretical
  - **Enoxaparin** is predicted to moderate increase the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. [Moderate] Theoretical
  - **Fabrazyme** is predicted to increase the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. [Moderate] Theoretical
  - **Naproxen** is predicted to moderate increase the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. [Moderate] Theoretical
  - **Pentoxifylline** is predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. [Moderate] Theoretical
  - **St John’s Wort** decreases the concentration of taxanes (cabazitaxel, paclitaxel). Avoid. [Severe] Study

**Antithrombotics**

- **Droxtia** is predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. [Moderate] Theoretical
- **Enoxaparin** is predicted to moderate increase the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. [Moderate] Theoretical
- **Fabrazyme** is predicted to increase the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. [Moderate] Theoretical
- **Naproxen** is predicted to moderate increase the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. [Moderate] Theoretical
- **Pentoxifylline** is predicted to decrease the exposure to taxanes (cabazitaxel, paclitaxel). Avoid. [Moderate] Theoretical
- **St John’s Wort** decreases the concentration of taxanes (cabazitaxel, paclitaxel). Avoid. [Severe] Study

**Antithrombotics**
Moclobemide is predicted to increase the risk of side-effects when given with tedizolid. [Severe] Theoretical → Also see TABLE 13 p. 1267

Monoamine-oxidase A and B inhibitors, irreversible are predicted to increase the risk of side-effects when given with tedizolid. [Severe] Theoretical → Also see TABLE 13 p. 1267

Monoamine-oxidase B inhibitors (rasagline, selegiline) are predicted to increase the risk of side-effects when given with tedizolid. [Severe] Theoretical → Also see TABLE 13 p. 1267

Monoamine-oxidase B inhibitors (safinamide) are predicted to increase the risk of side-effects when given with tedizolid. [Severe] Theoretical → Also see TABLE 13 p. 1267

Tedizolid is predicted to increase the exposure to statins (Rosuvastatin). Avoid. [Moderate] Theoretical

Tedizolid is predicted to increase the exposure to sulfasalazine. Avoid. [Moderate] Theoretical

Tedizolid is predicted to increase the exposure to topotecan. Avoid. [Moderate] Theoretical

Tegafur

Tegafur potentially increases the concentration of antiepileptics (fosphenytoin, phenytoin). Monitor concentration and adjust dose. [Severe] Anecdotal

Tegafur increases the anticoagulant effect of coumarins. [Moderate] Theoretical

Folates (folic acid, folinic acid) are predicted to increase the risk of tegafur toxicity when given with tegafur. [Severe] Theoretical

H₂ receptor antagonists (cimetidine) are predicted to increase the risk of toxicity when given with tegafur. [Severe] Theoretical

Live vaccines are predicted to increase the risk of generalisation infection (possibly life-threatening) when given with tegafur. Public Health England advises avoid. [Severe] Theoretical

Methotrexate is predicted to increase the risk of toxicity when given with tegafur. [Severe] Theoretical

Teicoplanin

GENERAL INFORMATION If other nephrotoxic or neurotoxic drugs are given, monitor renal and auditory function on prolonged administration.

Telavancin → see TABLE 2 p. 1264 (nephrotoxicity), TABLE 19 p. 1268 (ototoxicity), TABLE 9 p. 1266 (QT-interval prolongation)

Telavancin is predicted to increase the risk of ototoxicity when given with aminoglycosides. [Moderate] Theoretical → Also see TABLE 2 p. 1264 → Also see TABLE 19 p. 1268

Telbivudine

Interferon (interferon alfa) are predicted to increase the risk of peripheral neuropathy when given with telbivudine. Avoid. [Severe] Theoretical

Interferons (peginterferon alfa) increase the risk of peripheral neuropathy when given with telbivudine. Avoid. [Severe] Study

Telmisartan → see angiotensin-II receptor antagonists

Temazepam → see TABLE 11 p. 1266 (CNS depressant effects)

Temocillin → see penicillins

Temozolomide → see alkylating agents

Temsirolimus → see TABLE 15 p. 1267 (myelosuppression)

Antiarrhythmics (dronedarone) are predicted to increase the concentration of temsirolimus. [Moderate] Theoretical

Antiarrhythmics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the concentration of temsirolimus. Avoid. [Severe] Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the concentration of temsirolimus. [Moderate] Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical

Aprepitant is predicted to increase the concentration of temsirolimus. [Moderate] Theoretical

Bosentan is predicted to decrease the concentration of temsirolimus. Avoid. [Severe] Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the concentration of temsirolimus. [Moderate] Theoretical

Cobicistat is predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical

Crizotinib is predicted to increase the concentration of temsirolimus. [Moderate] Theoretical → Also see TABLE 15 p. 1267

Efavirenz is predicted to decrease the concentration of temsirolimus. Avoid. [Severe] Theoretical

Enzalutamide is predicted to decrease the concentration of temsirolimus. Avoid. [Severe] Study

Grapefruit juice is predicted to increase the concentration of temsirolimus. Use with caution or avoid. [Moderate] Theoretical

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical

HIV-protease inhibitors (indinavir) are predicted to increase the concentration of temsirolimus. [Moderate] Theoretical

Idelalisib is predicted to increase the concentration of temsirolimus. Avoid. [Severe] Theoretical → Also see TABLE 15 p. 1267

Imatinib is predicted to increase the concentration of temsirolimus. [Moderate] Theoretical → Also see TABLE 15 p. 1267

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with temsirolimus. Public Health England advises avoid. [Severe] Theoretical

St John’s Wort is predicted to decrease the concentration of temsirolimus. Avoid. [Severe] Theoretical

Temseplase → see TABLE 3 p. 1264 (anticoagulant effects)

Tenofovir → see TABLE 2 p. 1264 (nephrotoxicity)

Tenofovir increases the risk of toxicity when given with didanosine. Avoid. [Severe] Study

Ledipasvir (with sofosbuvir) slightly increases the exposure to tenofovir. [Moderate] Study

Tenofovir is predicted to increase the exposure to sacubitril. [Moderate] Theoretical

Velpatasvir increases the exposure to tenofovir. [Moderate] Study

Tenoxican → see NSAIDs

Terazosin → see alpha blockers

Terbinafine

ROUTE-SPECIFIC INFORMATION Since systemic absorption can follow topical application, the possibility of interactions should be borne in mind.

Terbinafine is predicted to increase the exposure to antiarrhythmics (flecainide). [Severe] Theoretical

Terbinafine is predicted to increase the exposure to antiarrhythmics (propafenone). Monitor and adjust dose. [Moderate] Study

Terbinafine is predicted to increase the exposure to anticholinesterases, centrally acting (donepezil). [Moderate] Theoretical

Terbinafine is predicted to increase the exposure to anticholinesterases, centrally acting (galantamine). Monitor and adjust dose. [Moderate] Theoretical

Terbinafine is predicted to moderately increase the exposure to aripiprazole. Adjust aripiprazole dose, p. 376. [Moderate] Study

Terbinafine is predicted to markedly increase the exposure to atomoxetine. Adjust dose. [Severe] Study

Terbinafine is predicted to increase the exposure to beta blockers, non-selective (carvedilol, timolol). [Moderate] Study

Terbinafine is predicted to increase the exposure to beta blockers, selective (metoprolol, nebivolol). [Moderate] Study
Terbinafine (continued)

- **Terbinafine** is predicted to slightly increase the exposure to **darafenib**. [Mild] Study
- **Terbinafine** is predicted to decrease the efficacy of **opioids (codeine)**. [Moderate] Theoretical
- **Terbinafine** is predicted to decrease the efficacy of **opioids (tramadol)**. [Severe] Study
- **Terbinafine** is predicted to moderately increase the exposure to **pitolisant**. Use with caution and adjust dose. [Moderate] Study
- **Rifampicin** decreases the exposure to **terbinafine**. Adjust dose. [Moderate] Study
- **Terbinafine** is predicted to increase the exposure to **risperidone**. Adjust dose. [Moderate] Study
- **Terbinafine** is predicted to increase the exposure to **SSRIs (citalopram, dапoxetine, escitalopram, fluoxetine, sertraline)**. [Moderate] Theoretical
- **Terbinafine** is predicted to increase the exposure to **SSRIs (fluoxetine)**. Adjust dose. [Moderate] Theoretical
- **Terbinafine** moderately increases the exposure to **SSRIs (paroxetine)**. [Moderate] Study
- **Terbinafine** is predicted to decrease the efficacy of **tamoxifen**. Avoid. [Severe] Study
- **Terbinafine** is predicted to increase the exposure to **tricyclic antidepressants**. Monitor for toxicity and adjust dose. [Severe] Study
- **Terbinafine** is predicted to increase the exposure to **vortioxetine**. Monitor and adjust dose. [Moderate] Study

Terbutaline → see beta agonists

**Teriflunomide**

- **Teriflunomide** affects the anticoagulant effect of **coumarins**. [Severe] Study
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with **teriflunomide**. Public Health England advises avoid. [Severe] Theoretical
- **Teriflunomide** increases the exposure to **repaglinide**. [Moderate] Study
- **Teriflunomide** moderately increases the exposure to **statins (rosuvastatin)**. Adjust **rosuvastatin** dose, p. 197. [Moderate] Study

*Tetrabenazine* → see TABLE 9 p. 1266 (QT-interval prolongation)

- **Tetrabenazine** is predicted to decrease the effects of **levodopa**. Use with caution or avoid. [Moderate] Theoretical
- **Tetrabenazine** is predicted to increase the risk of CNS toxicity when given with **monoamine-oxidase A and B inhibitors**, irreversible. Avoid and for 14 days after stopping the MAOI. [Severe] Theoretical

*Tetracaine* → see anaesthetics, local

**Tetracyclines** → see tetracyclines

- **demeclocycline**, **doxycycline**, **lymecycline**, **minocycline**, **oxytetracycline**, **tetracycline**, **tigecycline**
- **ACE inhibitors (quinapril)** (tablet) decrease the absorption of oral **tetracycline**. Avoid. [Moderate] Study
- **Antacids** decrease the absorption of **tetracyclines**. Separate administration by 2 to 3 hours. [Moderate] Study
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** decrease the exposure to **doxycycline**. Monitor and adjust dose. [Moderate] Study → Also see TABLE 1 p. 1264
- **Tetracycline** decreases the concentration of **antimalarials (atovaquone)**. [Moderate] Study
- **Calcium salts (calcium carbonate)** are predicted to decrease the absorption of **tetracyclines**. Separate administration by 2 to 3 hours. [Moderate] Theoretical
- **Tetracyclines** increase the risk of bleeding events when given with **coumarins**. [Moderate] Anecdotal
- **Dairy products** decreases the exposure to tetracyclines. (demeclocycline, oxytetracycline, tetracycline). Avoid. [Moderate] Study
- **Enzalutamide** decreases the exposure to **doxycycline**. Monitor and adjust dose. [Moderate] Study
- **Iron (oral)** decreases the absorption of **tetracyclines**. Tetracyclines should be taken 2 to 3 hours after iron (oral). [Moderate] Study

- **Kaolin** is predicted to decrease the absorption of **tetracyclines**. [Moderate] Theoretical
- **Lanthanum** is predicted to decrease the absorption of **tetracyclines**. Separate administration by 2 hours. [Moderate] Theoretical
- **Retinoids (acitretin, allitretinoin, isotretinoin, tretinoin)** increase the risk of benign intracranial hypertension when given with **tetracyclines**. Avoid. [Severe] Anecdotal
- **Rifampicin** decreases the exposure to **doxycycline**. Monitor and adjust dose. [Moderate] Study
- **Strontium ranelate** is predicted to decrease the absorption of **tetracyclines**. Avoid. [Moderate] Theoretical
- **Oral zinc** is predicted to decrease the absorption of **tetracyclines**. Separate administration by 2 to 3 hours. [Moderate] Theoretical

**Thalidomide** → see TABLE 6 p. 1265 (bradycardia), TABLE 15 p. 1267 (myelosuppression), TABLE 12 p. 1267 (peripheral neuropathy), TABLE 5 p. 1264 (thromboembolism), TABLE 11 p. 1266 (CNS depressant effects)

- **Combined hormonal contraceptives** are predicted to increase the risk of venous thromboembolism when given with **thalidomide**. Avoid. [Severe] Study
- **Hormone replacement therapy** is predicted to increase the risk of venous thromboembolism when given with **thalidomide**. [Severe] Theoretical

**Theophylline** → see TABLE 17 p. 1268 (reduced serum potassium)

**FOOD AND LIFESTYLE** Smoking can increase **theophylline** clearance and increased doses of **theophylline** are therefore required; dose adjustments are likely to be necessary if smoking started or stopped during treatment.

- **Aclidirovir** is predicted to increase the exposure to **theophylline**. Monitor **theophylline** concentration and adjust dose. [Severe] Theoretical
- **Theophylline** decreases the efficacy of **antiarrhythmics (adenosine)**. Separate administration by 24 hours. [Mild] Study
- **Antiepileptics (carbamazepine)** potentially increase the clearance of **theophylline** and **theophylline** decreases the exposure to **antiepileptics (carbamazepine)**. Adjust dose. [Moderate] Anecdotal
- **Antiepileptics (fosphenytoin)** are predicted to increase the clearance of **theophylline**. Adjust dose. [Moderate] Study
- **Antiepileptics (phenobarbital, primidone)** are predicted to increase the clearance of **theophylline**. Adjust dose. [Moderate] Theoretical
- **Antiepileptics (phenytoin)** are predicted to decrease the exposure to **theophylline**. Adjust dose. [Moderate] Study
- **Beta blockers, non-selective** are predicted to increase the risk of bronchospasm when given with **theophylline**. Avoid. [Severe] Theoretical
- **Beta blockers, selective** are predicted to increase the risk of bronchospasm when given with **theophylline**. Avoid. [Severe] Theoretical
- **Caffeine citrate** decreases the clearance of **theophylline**. [Moderate] Study
- **Combined hormonal contraceptives** are predicted to increase the exposure to **theophylline**. Monitor and adjust dose. [Moderate] Theoretical
- **Theophylline** increases the risk of agitation when given with **antidepressants**. [Theoretical]
- **Theophylline** increases the risk of agitation when given with **monoamine-oxidase A and B inhibitors**, irreversible. Avoid. [Theoretical]
- **Theophylline** decreases the exposure to **theophylline**. [Theoretical]
- **Iron (oral)** decreases the absorption of **tetracyclines**. Tetracyclines should be taken 2 to 3 hours after iron (oral). [Moderate] Study
- **H2 receptor antagonists (cimetidin)** increase the concentration of **theophylline**. Adjust dose. [Severe] Study
- **HIV-protease inhibitors (ritonavir)** are predicted to decrease the exposure to **theophylline**. Adjust dose. [Moderate] Study
- **Interferon** slightly increase the exposure to **theophylline**. Adjust dose. [Moderate] Study
- **Iron chelators (deferasirox)** increase the exposure to **theophylline**. Avoid. [Moderate] Study
- **Isoniazid** is predicted to affect the clearance of **theophylline**. [Severe] Anecdotal
- **Theophylline** is predicted to decrease the concentration of **lithium**. [Moderate] Anecdotal
- **Theophylline** is predicted to decrease the absorption of **azithromycin, clarithromycin** are predicted to increase the exposure to **theophylline**. Adjust dose. [Moderate] Anecdotal
- **Theophylline** decreases the exposure to **theophylline**. [Theoretical]
Macrolides (erythromycin) decrease the clearance of theophylline and theophylline potentially decreases the clearance of macrolides (erythromycin). Adjust dose. **Severe** Study

**Methotrexate** decreases the clearance of theophylline. **Moderate** Study

Monoclonal antibodies (blinatumomab) are predicted to transiently increase the exposure to theophylline. Monitor and adjust dose. **Moderate** Theoretical

**Pentoxifylline** increases the concentration of theophylline. Monitor and adjust dose. **Severe** Study

Quinolones (ciprofloxacin) are predicted to increase the exposure to theophylline. Monitor and adjust dose. **Moderate** Theoretical

Quinolones (norfloxacin) are predicted to increase the exposure to theophylline. Adjust dose. **Moderate** Anecdotal

**Rifampicin** is predicted to decrease the exposure to theophylline. Adjust dose. **Moderate** Study

Theophylline is predicted to slightly increase the exposure to **rolflumilast**. Avoid. **Moderate** Theoretical

SSRIs (fluvoxamine) moderately to markedly increase the exposure to theophylline. Avoid. **Severe** Study

**St John’s Wort** potentially decreases the exposure to theophylline. **Severe** Anecdotal

Sucralfate potentially decreases the absorption of theophylline. Separate administration by at least 2 hours. **Moderate** Study

**Symptomimetics, vasoconstrictor (ephrine)** increase the risk of side-effects when given with theophylline. Avoid in children. **Moderate** Study

**Valaciclovir** is predicted to increase the exposure to theophylline. **Severe** Theoretical

Thiazide diuretics → see TABLE 18 p. 1268 (hyponatraemia), TABLE 8 p. 1265 (hypoosmolarity), TABLE 17 p. 1268 (reduced serum potassium)

- Bendroflumethiazide
- Chlorthalidone
- Clopamide
- Cyclopenthiazide
- Hydrochlorothiazide
- Hydroflumethiazide
- Indapamide
- Metolazone
- Xipamide

Thiazide diuretics are predicted to increase the risk of hypersensitivity reactions when given with allopurinol. **Severe** Theoretical

**Aspirin** (high-dose) increases the risk of acute renal failure when given with thiazide diuretics. **Severe** Theoretical

Thiazide diuretics increase the concentration of lithium. Avoid or adjust lithium (lithium carbonate, lithium citrate) dose and monitor lithium (lithium carbonate, lithium citrate) concentration. **Severe** Study

**NSAIDs** increase the risk of acute renal failure when given with thiazide diuretics. **Severe** Theoretical. Also see TABLE 18 p. 1268

**Reboxetine** is predicted to increase the risk of hyponatraemia when given with thiazide diuretics. **Moderate** Anecdotal

Thiazide diuretics are predicted to increase the risk of hypercalcaemia when given with calcium salts. **Severe** Anecdotal

**Ticagrelor** is predicted to markedly increase the exposure to ticagrelor. Avoid. **Severe** Study

**Tricyclic antidepressants** increase the risk of cardiac arrhythmias and hypotension when given with thioridazepine. **Severe** Theoretical

**Tricyclic antidepressants** increase the risk of atrioventricular block when given with tricyclic antidepressants. **Severe** Theoretical

Thiopental → see TABLE 8 p. 1265 (hypotension), TABLE 11 p. 1266 (CNS depressant effects)

Sulfonylureas are predicted to increase the effects of thioridazepine. **Moderate** Theoretical

**Tricyclic antidepressants** increase the risk of cardiac arrhythmias and hypotension when given with thioridazepine. **Severe** Moderate Study

Thioridazine → see also see TABLE 8 p. 1265

**Ticagrelor** is predicted to markedly increase the exposure to ticagrelor. Use with caution or avoid. **Severe** Study

Antiplatelet agents (Carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to markedly decrease the exposure to ticagrelor. Avoid. **Severe** Study

Antifungals, azaoles (itraconazole, ketoconazole, voriconazole) are predicted to markedly increase the exposure to ticagrelor. Avoid. **Severe** Study

**Bosentan** is predicted to decrease the exposure to ticagrelor. **Moderate** Theoretical

**Ciclosporin** is predicted to increase the exposure to ticagrelor. Use with caution or avoid. **Severe** Study

**Cobicistat** is predicted to markedly increase the exposure to ticagrelor. Avoid. **Severe** Study

**Ticagrelor** increases the concentration of digoxin. **Moderate** Study

**Elafirenz** is predicted to decrease the exposure to ticagrelor. **Moderate** Theoretical

Enzalutamide is predicted to markedly decrease the exposure to ticagrelor. Avoid. **Severe** Study

Grapefruit juice moderately increases the exposure to ticagrelor. **Moderate** Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to markedly increase the exposure to ticagrelor. Avoid. **Severe** Study

**Idelalisib** is predicted to markedly increase the exposure to ticagrelor. Avoid. **Severe** Study

**Ticagrelor** is predicted to increase the exposure to tolimipide. Separate administration by 12 hours. **Moderate** Theoretical

Macrolides (azithromycin) are predicted to increase the exposure to ticagrelor. Use with caution or avoid. **Severe** Study

**Ticagrelor** moderately increases the exposure to ticagrelor. Avoid. **Severe** Study

**Ticagrelor** increases the exposure to thioridazepine. Use with caution or avoid. **Severe** Study

**Ticagrelor** is predicted to increase the exposure to tolimipide. Separate administration by 12 hours. **Moderate** Theoretical

**Valproic acid** is predicted to increase the exposure to ticagrelor. Avoid. **Severe** Study

**Tizanidine** increases the exposure to theophylline when given with thrombolytics (alteplase, anistreplase, urokinase, tenecteplase). Use with caution or avoid. **Severe** Study

**Tioguanine** is predicted to increase the exposure to ticagrelor. Avoid. **Severe** Study

**Ticarcillin** see penicillins

**Timolol** see beta blockers, non-selective

**Tinidazole**

**FOOD AND LIFESTYLE** Disulfiram-like reaction is predicted to occur on the ingestion of alcohol. Ensure that alcohol is not consumed for 72 hours after stopping tinidazole.

**Tinidazole** is predicted to increase the anticoagulant effect of warfarin. **Moderate** Theoretical

**Tinzaparin** see low molecular-weight heparins

**Tioguanine** see TABLE 15 p. 1267 (myelosuppression)

**Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with tioguanine. Public Health England advises avoid. **Severe** Theoretical

**Tiopronin** see TABLE 10 p. 1266 (antimucarins)

**Tirapamil** see HIV-protease inhibitors

**Tirofiban** see TABLE 1 p. 1264 (antiplatelet effects)

**Tizanidine** see TABLE 6 p. 1265 (bradycardia), TABLE 8 p. 1265 (hypoosmolarity), TABLE 9 p. 1266 (QT-interval prolongation), TABLE 11 p. 1266 (CNS depressant effects)

Antiepileptics (fosphenytoin, phenytoin) moderately decrease the exposure to tizanidine. **Mild** Study

**Combined hormonal contraceptives** increases the exposure to tizanidine. **Moderate** Study

HIV-protease inhibitors (ritonavir) moderately decrease the exposure to tizanidine. **Mild** Study

**Iron chelators (deferasirox)** are predicted to increase the exposure to tizanidine. **Mild** Study

Rifampicin moderately decreases the exposure to tizanidine. **Mild** Study
Tolcapone ▶

Tolcapone increases the exposure to levodopa. Monitor and adjust dose. (Moderate) Study

Tolcapone is predicted to increase the effects of monoamine-oxidase A and B inhibitors, irreversible. Avoid. (Severe) Study

Tolcapone is predicted to increase the risk of cardiovascular side-effects when given with sympathomimetics, isotropic (dobutamine, dopamine). (Moderate) Theoretical

Tolcapone is predicted to increase the effects of sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine). (Moderate) Theoretical

Tolfinamic acid ▶ see NSAIDs

Tolterodine ▶ see TABLE 9 p. 1266 (QT-interval prolongation), TABLE 10 p. 1266 (antimuscarinics)

Antiarrhythmics (dronedarone) are predicted to increase the exposure to tolterodine. (Mild) Theoretical Also see TABLE 9 p. 1266

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to tolterodine. Avoid. (Severe) Study Also see TABLE 9 p. 1266

Aprepitant is predicted to increase the exposure to tolterodine. (Mild) Theoretical

Calcium Channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tolterodine. (Mild) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tolterodine. Avoid. (Severe) Study

Cobicistat is predicted to increase the exposure to tolterodine. Avoid. (Severe) Study

Crizotinib is predicted to increase the exposure to tolterodine. (Mild) Theoretical Also see TABLE 9 p. 1266

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to tolterodine. Avoid. (Severe) Study Also see TABLE 9 p. 1266

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to tolterodine. Adjust dose. (Mild) Theoretical

Idelalisib is predicted to increase the exposure to tolterodine. (Mild) Theoretical Also see TABLE 9 p. 1266

Nevirapine is predicted to increase the exposure to tolterodine. Avoid. (Severe) Study Also see TABLE 9 p. 1266

Imatinib is predicted to increase the exposure to tolterodine. (Mild) Theoretical

Macrolides (clarithromycin) are predicted to increase the exposure to tolterodine. Avoid. (Severe) Study Also see TABLE 9 p. 1266

Macrolides (erythromycin) are predicted to increase the exposure to tolterodine. (Mild) Theoretical

Idelalisib is predicted to increase the exposure to tolterodine. (Mild) Theoretical Also see TABLE 9 p. 1266

Netupitant is predicted to increase the exposure to tolterodine. (Mild) Theoretical Also see TABLE 9 p. 1266

Nilotinib is predicted to increase the exposure to tolterodine. (Mild) Theoretical Also see TABLE 9 p. 1266

Panobinostat is predicted to increase the exposure to tolterodine. (Moderate) Theoretical Also see TABLE 9 p. 1266

Tolvaptan ▶ see TABLE 16 p. 1268 (increased serum potassium)

GENERAL INFORMATION Avoid concurrent use of drugs that increase serum-sodium concentrations.

Antiarrhythmics (dronedarone) are predicted to increase the exposure to tolvaptan. Adjust dose. (Moderate) Theoretical

Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to tolvaptan. Avoid. (Severe) Study

Antifungals, azoles (fluconazole, isavuconazole, posaconazole) are predicted to increase the exposure to tolvaptan. Adjust dose. (Moderate) Theoretical

Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to tolvaptan. Adjust dose. (Severe) Study

Aprepitant is predicted to increase the exposure to tolvaptan. Adjust dose. (Moderate) Theoretical

Boventan is predicted to decrease the exposure to tolvaptan. (Moderate) Theoretical

Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to tolvaptan. Adjust dose. (Moderate) Theoretical

Cobicistat is predicted to increase the exposure to tolvaptan. Adjust dose. (Severe) Study

Crizotinib is predicted to increase the exposure to tolvaptan. Adjust dose. (Moderate) Theoretical

Tolvaptan increases the concentration of digoxin. (Mild) Study

Efavirenz is predicted to decrease the exposure to tolvaptan. (Moderate) Theoretical

Enzalutamide is predicted to decrease the exposure to tolvaptan. Avoid. (Severe) Study

Grapefruit juice increases the exposure to tolvaptan. Avoid. (Mild) Study

HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to tolvaptan. Adjust dose. (Severe) Study

HIV-protease inhibitors (indinavir) are predicted to increase the exposure to tolvaptan. Adjust dose. (Moderate) Theoretical

Idelalisib is predicted to increase the exposure to tolvaptan. Adjust dose. (Mild) Theoretical

Netupitant is predicted to increase the exposure to tolvaptan. Adjust dose. (Mild) Theoretical

Nilotinib is predicted to increase the exposure to tolvaptan. Adjust dose. (Mild) Theoretical

Rifampicin is predicted to decrease the exposure to tolvaptan. Avoid. (Severe) Study

ST John’s Wort is predicted to decrease the exposure to tolvaptan. (Moderate) Theoretical

Topiramate ▶ see antiepileptics

Topotecan ▶ see TABLE 15 p. 1267 (myelosuppression)

Antiarrhythmics (amiodarone, dronedarone) are predicted to increase the exposure to topotecan. (Severe) Study

Antiepileptics ( fosphenytoin, phenytoin) increase the clearance of topotecan. (Moderate) Study

Antifungals, azoles (itraconazole, ketoconazole) are predicted to increase the exposure to topotecan. (Severe) Study

Calcium channel blockers (verapamil) are predicted to increase the exposure to topotecan. (Severe) Study

Ciclosporin is predicted to increase the exposure to topotecan. (Mild) Theoretical Also see TABLE 15 p. 1267

Cyclosporin is predicted to increase the exposure to topotecan. (Severe) Study

HIV-protease inhibitors (lopinavir, ritonavir, saquinavir) are predicted to increase the exposure to topotecan. Adjust dose. (Severe) Study

Lapatinib is predicted to increase the exposure to topotecan. (Severe) Study

Live vaccines are predicted to increase the risk of generalised infection (possibly life-threatening) when given with topotecan. Public Health England advises avoid. (Severe) Theoretical

Lumacaftor is predicted to affect the exposure to topotecan. (Moderate) Theoretical

Macrolides are predicted to increase the exposure to topotecan. (Severe) Study

Mirabegron is predicted to increase the exposure to topotecan. (Mild) Theoretical

Ranolazine is predicted to increase the exposure to topotecan. (Severe) Study

ST John’s Wort is predicted to increase the exposure to topotecan. (Severe) Theoretical

Tedizolid is predicted to decrease the exposure to topotecan. Avoid. (Moderate) Theoretical
Topotecan – Tricyclic antidepressants

- **Velpatasvir** is predicted to increase the exposure to topotecan. [Severe] Theoretical
- **Vemurafenib** is predicted to increase the exposure to topotecan. [Severe] Study

**Torsemide**
- See loop diuretics

**Toremifene**
- See TABLE 5 p. 1264 (thromboembolism), TABLE 9 p. 1266 (QT-interval prolongation)

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to toremifene. Adjust dose. [Moderate] Study

- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to toremifene. [Moderate] Theoretical -> Also see TABLE 9 p. 1266

- **Cobicistat** is predicted to increase the exposure to toremifene. [Moderate] Theoretical

- **Toremifene** is predicted to increase the anticoagulant effect of warfarin. [Severe] Theoretical

- **Enzalutamide** is predicted to decrease the exposure to toremifene. Adjust dose. [Moderate] Study

- **Thiazide diuretics** are predicted to increase the risk of hypercalcaemia when given with toremifene. [Severe] Theoretical

**Trabectedin**
- See TABLE 1 p. 1264 (hepatotoxicity), TABLE 15 p. 1267 (myelosuppression)

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to trabectedin. Avoid. [Severe] Theoretical -> Also see TABLE 1 p. 1264

- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to decrease the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical -> Also see TABLE 1 p. 1264

- **Cobicistat** is predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical

- **Enzalutamide** is predicted to decrease the exposure to trabectedin. Avoid. [Severe] Theoretical

- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical

- **Idelalisib** is predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical

- **Toremifene** is predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Severe] Theoretical

- **HIV-protease inhibitors (indinavir)** are predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Moderate] Study

- **Idelalisib** is predicted to moderately increase the exposure to trabectedin. Avoid or adjust dose. [Moderate] Study

- **Imatinib** is predicted to increase the exposure to trabectedin. [Moderate] Theoretical

- **Macrolides (clarithromycin)** are predicted to increase the exposure to trabectedin. Avoid or adjust dose. [Moderate] Study

- **Vemurafenib** is predicted to increase the concentration of trabectedin. [Moderate] Theoretical

- **Ranolazine** is predicted to increase the concentration of trabectedin. [Moderate] Theoretical

- **Vemurafenib** is predicted to increase the concentration of trabectedin. [Moderate] Theoretical

- **Trandolapril** is predicted to increase the concentration of trabectedin. [Moderate] Theoretical

- **Tramexamic acid** is predicted to increase the concentration of trabectedin. Adjust dose. [Moderate] Theoretical

- **Tranylcypromine** is predicted to increase the concentration of trabectedin. [Moderate] Theoretical

**Triflusal**
- See nonsteroidal anti-inflammatory drugs

- **Trazodone** is predicted to increase the exposure to trabectedin. [Moderate] Theoretical

- **Anticonvulsants (carbamazepine)** are predicted to increase the concentration of trabectedin. [Moderate] Theoretical

- **Imatinib** is predicted to increase the concentration of trabectedin. [Moderate] Theoretical

- **Trazodone** is predicted to increase the concentration of trabectedin. [Moderate] Theoretical

- **Tramazulam** is predicted to increase the concentration of trabectedin. [Moderate] Theoretical

- **Trazodone** is predicted to increase the concentration of trabectedin. [Moderate] Theoretical

**Tricyclic antidepressants**

- **Amitriptyline**
- **Clomipramine**
- **Dosulepin**
- **Doxepin**
- **Imipramine**
- **Lofepramine**
- **Nortriptyline**
- **Trimipramine**

- **Antiarrhythmics (dronedarone)** are predicted to increase the risk of torsade de pointes when given with tricyclic antidepressants. Avoid. [Severe] Theoretical -> Also see TABLE 9 p. 1266

- **Antiarrhythmics (propafenone)** are predicted to increase the concentration of tricyclic antidepressants. [Moderate] Theoretical -> Also see TABLE 10 p. 1266
Tricyclic antidepressants (continued)

- **Antiepileptics (carbamazepine)** decrease the exposure to tricyclic antidepressants. Adjust dose. [Moderate] Study → Also see TABLE 18 p. 1268
- **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the exposure to tricyclic antidepressants. [Moderate] Study
- **Tricyclic antidepressants (clomipramine, imipramine)** potentially increase the risk of overheating and dehydration when given with antiepileptics (zonisamide). Avoid in children. [Severe] Theoretical
- **Bupropion** is predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. [Severe] Study → Also see TABLE 13 p. 1267
- **Cinacalcet** is predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. [Severe] Study
- **Tricyclic antidepressants** decrease the antihypertensive effects of *Clonidine*. Monitor and adjust dose. [Moderate] Anecdotal
  → Also see TABLE 8 p. 1265
- **Cobicistat** is predicted to slightly increase the exposure to tricyclic antidepressants. [MID] Study
- **Darifenacin** is predicted to decrease the antihypertensive effects of *guanethidine*. [Moderate] Study → Also see TABLE 8 p. 1265
- **H₂ receptor antagonists (cimetidine)** increase the exposure to tricyclic antidepressants. [Moderate] Study
- **Tricyclic antidepressants** are predicted to decrease the effects of *histamine*. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 1265
- **HIV- protease inhibitors (ritonavir, tipranavir)** are predicted to increase the exposure to tricyclic antidepressants. [Moderate] Theoretical
- **Tricyclic antidepressants** potentially increase the risk of neurotoxicity when given with *lithium*. [Severe] Anecdotal → Also see TABLE 8 p. 1266 → Also see TABLE 13 p. 1267
- **Amitriptyline** decreases the effects of *metyrapone*. Avoid. [Moderate] Theoretical
- **Tricyclic antidepressants** are predicted to increase the effects of *moclobemide*. Avoid. [Severe] Theoretical → Also see TABLE 13 p. 1267
- **Tricyclic antidepressants** are predicted to increase the effects of *monoamine-oxidase A and B inhibitors, irreversible*. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 1265 → Also see TABLE 13 p. 1267
- **Tricyclic antidepressants** are predicted to decrease the effects of *moxonidine*. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1265
- **Tricyclic antidepressants** are predicted to decrease the efficacy of *pituitary*. [MID] Theoretical
- **SSRIs (fluoxetine, paroxetine)** are predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. [Severe] Study → Also see TABLE 13 p. 1267 → Also see TABLE 18 p. 1268
- **SSRIs (fluvoxamine)** markedly increase the exposure to clomipramine. Adjust dose. [Severe] Study → Also see TABLE 18 p. 1268 → Also see TABLE 13 p. 1267
- **SSRIs (fluvoxamine)** increase the exposure to tricyclic antidepressants (amitriptyline, imipramine). Adjust dose. [Severe] Study → Also see TABLE 18 p. 1268 → Also see TABLE 13 p. 1267
- **Sucralfate** is predicted to decrease the absorption of tricyclic antidepressants. [Moderate] Study
- **Tricyclic antidepressants** increase the effects of sympathomimetics, vasoconstrictor (adrenaline/epinephrine, noradrenaline/norepinephrine, phenylephrine). Avoid. [Severe] Study
- **Tricyclic antidepressants** are predicted to decrease the effects of sympathomimetics, vasoconstrictor (*ephedrine*). Avoid. [Severe] Study
- **Terbutaline** is predicted to increase the exposure to tricyclic antidepressants. Monitor for toxicity and adjust dose. [Severe] Study
- **Tricyclic antidepressants** increase the risk of cardiac arrhythmias and hypotension when given with *thiopental*. [Moderate] Study → Also see TABLE 8 p. 1265
- **Trientine** potentially decreases the absorption of *iron (oral)*. [Moderate] Theoretical
- **Trientine** potentially decreases the absorption of *zinc*. [Moderate] Theoretical
- **Trifluoperazine** → see phenothiazines
- **Trilexphenidyl** → see TABLE 10 p. 1266 (antimuscarinics)
- **Trimethoprim** → see TABLE 18 p. 1268 (hyponatraemia), TABLE 2 p. 1264 (nephrotoxicity), TABLE 16 p. 1268 (increased serum potassium)
- **Trimethoprim** increases the concentration of antiepileptics ( fosphenytoin, phenytoin). [Moderate] Study
- **Antimalarials (pyrimethamine) increase the risk of side-effects when given with trimethoprim. [Severe] Study
- **Trimethoprim** is predicted to increase the antiocoagulant effect of *coumarins*. [Severe] Study
- **Dapsone** increases the exposure to *trimethoprim* and trimethoprim increases the exposure to *dapsone*. [Severe] Study
- **Trimethoprim** increases the concentration of *digoxin*. [Moderate] Study
- **Trimethoprim** slightly increases the exposure to *lamivudine*. [Moderate] Study
- **Trimethoprim** is predicted to increase the risk of side-effects when given with *methotrexate*. Avoid. [Severe] Theoretical → Also see TABLE 2 p. 1264
- **Trimethoprim** slightly increases the exposure to *repaglinide*. Avoid or monitor blood glucose. [Moderate] Study
- **Rifampicin** decreases the exposure to *trimethoprim*. [Moderate] Study
- **Trimethoprim** is predicted to decrease the efficacy of *sapropterin*. [Moderate] Theoretical
- **Trimipramine** → see tricyclic antidepressants
- **Tropicamide** → see TABLE 10 p. 1266 (antimuscarinics)
- **Trosplium** → see live vaccines

**Ulipristal**

- **Antiarhythmics (dronedarone)** are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study
- **Antiepileptics (carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rufinamide, topiramate)** decrease the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Severe] Study
- **Aprepitant** decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- **Bozentan** decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study
- **Cobicistat** is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Severe] Study
- **Ulipristal** is predicted to decrease the efficacy of combined hormonal contraceptives. Avoid. [Severe] Theoretical
- **Crizotinib** is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study
- **Efavirenz** decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- **Enzalutamide** is predicted to markedly decrease the exposure to ulipristal. Avoid and for 4 weeks after stopping ulipristal. [Severe] Theoretical
Ulipristal is predicted to decrease the efficacy of etonogestrel. Avoid. [Severe] Theoretical

- Fosaprepitant decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- Grapefruit juice is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Theoretical
- Griseofulvin potentially decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, saquinavir, tipranavir) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Severe] Study
- HIV-protease inhibitors (indinavir) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study
- HIV-protease inhibitors (ritonavir) decrease the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- Idelalisib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Severe] Study
- Imatinib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study
- Ulipristal is predicted to decrease the efficacy of levonorgestrel. Avoid. [Severe] Theoretical
- Macrolides (clarithromycin) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Severe] Study
- Macrolides (erythromycin) are predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study
- Modafinil decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- Netupitant is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study
- Nevirapine decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- Nitotinib is predicted to increase the exposure to ulipristal. Avoid if used for uterine fibroids. [Moderate] Study
- Ulipristal is predicted to decrease the efficacy of norethisterone. Avoid. [Severe] Theoretical
- Rifabutin decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- Rifampicin decreases the efficacy of ulipristal. For FSRH guidance, see Contraceptives, interactions p. 747. [Severe] Anecdotal
- Umeclidinium → see TABLE 10 p. 1266 (antimuscarinics)
- Urokinase → see TABLE 3 p. 1264 (anticoagulant effects)
- Ursodeoxycholic acid
  - Antacids are predicted to decrease the absorption of ursodeoxycholic acid. Separate administration by 2 hours. [Moderate] Theoretical
  - Ursodeoxycholic acid affects the concentration of ciclosporin. Use with caution and adjust dose. [Severe] Anecdotal
  - Fibrates are predicted to decrease the efficacy of ursodeoxycholic acid. Avoid. [Severe] Theoretical
- Ustekinumab → see monoclonal antibodies
- Valaciclovir → see TABLE 2 p. 1264 (nephrotoxicity)
- Valaciclovir is predicted to increase the exposure to aminophylline. [Severe] Anecdotal
- Mycophenolate is predicted to increase the risk of haematological toxicity when given with valaciclovir. [Moderate] Theoretical
- Valaciclovir is predicted to increase the exposure to theophylline. [Severe] Theoretical
- Valganciclovir → see TABLE 15 p. 1267 (myelosuppression), TABLE 2 p. 1264 (nephrotoxicity)
- Valganciclovir is predicted to increase the risk of seizures when given with carbapenems (imipenem). Avoid. [Severe] Anecdotal
- Valganciclovir is predicted to increase the exposure to didanosine. [Moderate] Study
- Mycophenolate is predicted to increase the risk of haematological toxicity when given with valganciclovir. [Moderate] Theoretical → Also see TABLE 15 p. 1267
- Valproate → see antiepileptics
- Valsartan → see angiotensin-II receptor antagonists
- Vancomycin → see TABLE 2 p. 1264 (nephrotoxicity), TABLE 19 p. 1268 (ototoxicity)
- Vancomycin increases the risk of nephrotoxicity when given with aminoglycosides. Avoid. [Moderate] Study → Also see TABLE 2 p. 1264 → Also see TABLE 19 p. 1268
- Vandetanib → see TABLE 9 p. 1266 (QT-interval prolongation)
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to vandetanib. Avoid. [Moderate] Study
- Vandetanib is predicted to increase the risk of bleeding events when given with coumarins. [Severe] Theoretical
- Vandetanib slightly increases the exposure to digoxin. Monitor ECG and adjust dose. [Moderate] Study
- Enzalutamide is predicted to decrease the exposure to vandetanib. Avoid. [Moderate] Study
- Vandetanib slightly increases the exposure to metformin. Monitor and adjust dose. [Moderate] Study
- Vandetanib is predicted to increase the risk of bleeding events when given with phenindione. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to vandetanib. Avoid. [Moderate] Study
- Vardenafil → see phosphodiesterase type-5 inhibitors
- Varicella-zoster vaccine → see live vaccines
- Vecuronium → see neuromuscular blocking drugs, non-depolarising
- Vedolizumab → see monoclonal antibodies
- Velpatasvir
  - Velpatasvir is predicted to increase the exposure to aliskiren. [Severe] Theoretical
  - Antacids are predicted to decrease the concentration of velpatasvir. Separate administration by 4 hours. [Moderate] Theoretical
  - Antiarrhythmics (amiodarone) are predicted to increase the concentration of velpatasvir. Avoid or monitor. [Moderate] Theoretical
  - Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to moderately decrease the exposure to velpatasvir. Avoid. [Severe] Study
  - Antiepileptics (oxcarbazepine) are predicted to decrease the exposure to velpatasvir. Avoid. [Severe] Theoretical
  - Velpatasvir is predicted to increase the exposure to antihistamines, non-sedating (fexofenadine). [Severe] Theoretical
  - Bosantan is predicted to decrease the exposure to velpatasvir. Avoid. [Moderate] Theoretical
  - Calcium salts (calcium carbonate) are predicted to decrease the concentration of velpatasvir. Separate administration by 4 hours. [Moderate] Anecdotal
  - Velpatasvir is predicted to increase the exposure to colchicine. [Severe] Theoretical
  - Velpatasvir is predicted to increase the exposure to dabigatran. [Severe] Theoretical
  - Velpatasvir is predicted to increase the exposure to digoxin. [Severe] Study
  - Velpatasvir is predicted to increase the exposure to edoxaban. [Severe] Theoretical
  - Elafirenz is predicted to decrease the exposure to velpatasvir. Avoid. [Moderate] Theoretical
  - Enzalutamide is predicted to moderately decrease the exposure to velpatasvir. Avoid. [Severe] Study
  - Velpatasvir is predicted to increase the exposure to everolimus. [Severe] Theoretical
  - H2 receptor antagonists are predicted to decrease the concentration of velpatasvir. Adjust dose, see sofosbuvir with velpatasvir p. 596. [Moderate] Study
  - Velpatasvir is predicted to increase the exposure to loperamide. [Severe] Theoretical
  - Nevirapine is predicted to decrease the exposure to velpatasvir. Avoid. [Moderate] Theoretical
  - Proton pump inhibitors are predicted to decrease the concentration of velpatasvir. Adjust dose, see sofosbuvir with velpatasvir p. 596. [Moderate] Study
Velpatasvir (continued)

- Rifampicin is predicted to moderately decrease the exposure to velpatasvir. Avoid. [Severe] Study
- Velpatasvir is predicted to increase the exposure to sirolimus. [Severe] Theoretical
- St John’s Wort is predicted to decrease the exposure to velpatasvir. Avoid. [Moderate] Theoretical
- Velpatasvir is predicted to increase the exposure to statins (atorvastatin, simvastatin). Monitor side effects and adjust dose. [Severe] Theoretical
- Velpatasvir increases the exposure to statins (rosuvastatin). Adjust rosuvastatin dose and monitor side effects, p. 197. [Severe] Study
- Velpatasvir is predicted to increase the exposure to taxanes (paclitaxel). Use with caution and adjust dose. [Moderate] Theoretical
- Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone) are predicted to decrease the exposure to velpatasvir. Avoid. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to velpatasvir. Avoid. [Severe] Theoretical
- Velpatasvir is predicted to increase the exposure to topotecan. [Severe] Theoretical
- Venetoclax is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose, p. 919. [Severe] Study
- Aprepitant is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose, p. 919. [Severe] Study
- Calcium channel blockers (diltiazem, verapamil) are predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose, p. 919. [Severe] Study
- Ciclosporin is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. [Severe] Theoretical
- Cobicistat is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose, p. 919. [Severe] Study
- Venetoclax slightly increases the exposure to coumarins (warfarin). [Moderate] Study
- Crizotinib is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose, p. 919. [Severe] Study
- Enzalutamide is predicted to decrease the exposure to venetoclax. Avoid. [Severe] Study
- Grapefruit juice is predicted to increase the exposure to venetoclax. Avoid. [Severe] Theoretical
- HIV-protease inhibitors are predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose, p. 919. [Severe] Study
- Idelalisib is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose, p. 919. [Severe] Study
- Imatinib is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose, p. 919. [Severe] Study
- Lapatinib is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. [Severe] Theoretical
- Venetoclax potentially decreases the efficacy of live vaccines. Avoid. [Severe] Theoretical
- Macrolides (azithromycin) are predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. [Severe] Theoretical
- Macrolides (clarithromycin, erythromycin) are predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose, p. 919. [Severe] Study
- Netupitant is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose, p. 919. [Severe] Study
- Nilotinib is predicted to increase the exposure to venetoclax. Avoid or adjust venetoclax dose, p. 919. [Severe] Study
- Ranolazine is predicted to increase the exposure to venetoclax. Avoid or monitor for toxicity. [Severe] Theoretical
- Rifampicin is predicted to decrease the exposure to venetoclax. Avoid. [Severe] Study
- Venlafaxine is predicted to increase the serotonin syndrome, TABLE 9 p. 1267 (serotonin syndrome). TABLE 9 p. 1266 (QT-interval prolongation), TABLE 11 p. 1266 (CNS depressant effects), TABLE 4 p. 1264 (antiplatelet effects)
- Abiraterone potentially increases the exposure to venlafaxine. [Severe] Theoretical
- Antifungals, azoles (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to venlafaxine. Avoid or adjust venlafaxine dose, p. 919. [Severe] Study
- H<sub>2</sub> receptor antagonists (cimetidine) slightly increase the exposure to venlafaxine. [Moderate] Study
- Venlafaxine slightly increases the exposure to haloperidol. [Severe] Study → Also see TABLE 9 p. 1266
- HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir) are predicted to increase the exposure to venlafaxine. Avoid or adjust venlafaxine dose, p. 919. [Severe] Study
- Idelalisib is predicted to increase the exposure to venlafaxine. [Moderate] Study
- Macrolides (clarithromycin) are predicted to increase the exposure to venlafaxine. [Moderate] Study
- Tacrolimus potentially increases the risk of serotonin syndrome when given with venlafaxine. [Severe] Anecdotal

**Verapamil** → see calcium channel blockers
Verteporfin

**General Information**
Caution on concurrent use with other photosensitising drugs.

**Vigabatrin** ➔ anti-epileptics

**Valterol** ➔ see beta agonists

**Vildagliptin** ➔ see Table 14 p.1267 (antidiabetic drugs)

**Vinblastine** ➔ see vinclozols

**Vinca alkaloids** ➔ see Table 1 p.1264 (hepatotoxicity), Table 15 p.1267 (myelosuppression), Table 19 p.1268 (ototoxicity), Table 12 p.1267 (peripheral neuropathy), Table 5 p.1264 (thromboembolism), Table 9 p.1266 (QT-interval prolongation)

Vinblastine • vincristine • vindesine • vinflunine • vinorelbine

- **Antiarhythmics (dronedaran)** are predicted to increase the exposure to vinca alkaloids. *Severe* Theoretical ➔ Also see Table 9 p.1266
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to vinflunine. Avoid. *Severe* Theoretical ➔ Also see Table 12 p.1267
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to vinorelbine. Use with caution or avoid. *Severe* Theoretical ➔ Also see Table 12 p.1267
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindesine). *Severe* Theoretical ➔ Also see Table 12 p.1267
- **Antifungals, azoles** (itraconazole, ketoconazole, voriconazole) are predicted to increase the exposure to vinca alkaloids. *Severe* Theoretical ➔ Also see Table 1 p.1264 ➔ Also see Table 12 p.1267
- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to vinca alkaloids. *Severe* Theoretical ➔ Also see Table 1 p.1264 ➔ Also see Table 15 p.1267
- **Cobicistat** is predicted to increase the exposure to vinca alkaloids. *Severe* Theoretical
- **Crisantaspase** potentially increases the risk of neurotoxicity when given with vincristine. Vincristine should be taken 3 to 24 hours before crisantaspase. *Severe* Anecdotal ➔ Also see Table 1 p.1264 ➔ Also see Table 15 p.1267
- **Cobimetinib** is predicted to increase the exposure to vinca alkaloids. *Severe* Theoretical ➔ Also see Table 9 p.1266 ➔ Also see Table 15 p.1267
- **Enzalutamide** is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindesine). *Severe* Theoretical
- **Enzalutamide** is predicted to decrease the exposure to vinflunine. Avoid. *Severe* Theoretical
- **Enzalutamide** is predicted to decrease the exposure to vinorelbine. Use with caution or avoid. *Severe* Theoretical
- **HIV-protease inhibitors** are predicted to increase the exposure to vinca alkaloids. *Severe* Theoretical ➔ Also see Table 9 p.1266
- **Idelalisib** is predicted to increase the exposure to vinca alkaloids. *Severe* Theoretical ➔ Also see Table 15 p.1267
- **Imatinib** is predicted to increase the exposure to vinca alkaloids. *Severe* Theoretical ➔ Also see Table 15 p.1267
- **Live vaccines** are predicted to increase the risk of generalised infection (possibly life-threatening) when given with vinclozols. Public Health England advises avoid. *Severe* Theoretical
- **Macrolides (clarithromycin, erythromycin)** are predicted to increase the exposure to vinca alkaloids. *Severe* Theoretical ➔ Also see Table 9 p.1266
- **Netupitant** is predicted to increase the exposure to vinca alkaloids. *Severe* Theoretical
- **Nilotinib** is predicted to increase the exposure to vinca alkaloids. *Severe* Theoretical
- **Pegasparagase** potentially increases the risk of neurotoxicity when given with vincristine. Vincristine should be taken 3 to 24 hours before pegasparagase. *Severe* Anecdotal ➔ Also see Table 1 p.1264 ➔ Also see Table 15 p.1267
- **Rifampicin** is predicted to decrease the exposure to vinca alkaloids (vinblastine, vincristine, vindesine). *Severe* Theoretical
- **Rifampicin** is predicted to decrease the exposure to vinflunine. Use with caution or avoid. *Severe* Theoretical
- **Rifampicin** is predicted to decrease the exposure to vinorelbine. Use with caution or avoid. *Severe* Theoretical
- **Vincristine** ➔ see vinca alkaloids
- **Vinflunine** ➔ see vinca alkaloids
- **Vinorelbine** ➔ see vinca alkaloids
- **Vismodegib** ➔ see Table 15 p.1267 (myelosuppression)
- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to vismodegib. Avoid. *Moderate* Theoretical
- **Enzalutamide** is predicted to decrease the exposure to vismodegib. Avoid. *Moderate* Theoretical
- **Rifampicin** is predicted to decrease the exposure to vismodegib. Avoid. *Moderate* Theoretical
- **St John’s Wort** is predicted to decrease the exposure to vismodegib. Avoid. *Moderate* Theoretical
- **Vitamin A**
  - **Retinoids (acitretin, altiretinoin, isotretinoin)** are predicted to increase the risk of vitamin A toxicity when given with vitamin A. Avoid. *Severe* Theoretical
  - **Retinoids (bexarotene)** are predicted to increase the risk of toxicity when given with vitamin A. Adjust dose. *Moderate* Theoretical
  - **Retinoids (tretinoin)** are predicted to increase the risk of vitamin A toxicity when given with vitamin A. Avoid. *Severe* Study

**Vitamin D substances**
- alfalcacidol • calcipotriol • calcitriol • cokedicaliferol • dihydrotachysterol • ergocalciferol • paricalcitol • tachicalitol
- **Antiepileptics (carbamazepine)** are predicted to decrease the effects of vitamin D substances. *Moderate* Study
- **Antiepileptics (fosphenytoin, phenytoin)** decrease the effects of vitamin D substances. *Moderate* Study
- **Antiepileptics (phenobarbital, primidone)** are predicted to decrease the effects of vitamin D substances. *Moderate* Theoretical
- **Antifungals, azoles (clotrimazole, ketoconazole)** are predicted to decrease the exposure to cokedicaliferol. *Moderate* Theoretical
- **Antifungals, azoles (itraconazole, ketoconazole, voriconazole)** are predicted to increase the exposure to paricalcitol. *Moderate* Study
- **Cobicistat** is predicted to increase the exposure to paricalcitol. *Moderate* Study
- **Vitamin D substances** are predicted to increase the risk of toxicity when given with digoxin. *Severe* Theoretical
- **HIV-protease inhibitors (atazanavir, darunavir, fosamprenavir, lopinavir, ritonavir, saquinavir, tipranavir)** are predicted to increase the exposure to paricalcitol. *Moderate* Study
- **Idelalisib** is predicted to increase the exposure to paricalcitol. *Moderate* Study
- **Macrolides (clarithromycin)** are predicted to increase the exposure to paricalcitol. *Moderate* Study
- **Thiazide diuretics** increase the risk of hypercalcæmia when given with vitamin D substances. *Moderate* Theoretical

**Vitamin E substances**
- alpha tocopherol • alpha tocopheryl acetate
- **Vitamin E substances** affect the exposure to ciclosporin. *Moderate* Study

**Volatile halogenated anaesthetics** ➔ see Table 8 p.1265 (hypotension), Table 11 p.1266 (CNS depressant effects)
- desflurane • isoflurane • sevoflurane
- **Voriconazole** ➔ see antifungals, azoles
- **Vortioxetine** ➔ see Table 13 p.1267 (serotonin syndrome), Table 4 p.1264 (antiplatelet effects)
Vortioxetine – Zopiclone

Interactions

**Appendix 1**

**Zinc**

- **Terbinafine** predicted to increase the exposure to vortioxetine. Monitor and adjust dose. **(Moderate) Study**

- **Enalapril** is predicted to decrease the absorption of zinc. **(Moderate) Study**

- **Zidovudine** predicted to decrease the absorption of oral zinc. **(Moderate) Study**

- **Zinc** is predicted to decrease the absorption of penicillamine. **(Mild) Theoretical**

- **Zinc** is predicted to decrease the exposure to quinolones. Separate administration by 2 hours. **(Moderate) Study**

- **Oral zinc** is predicted to decrease the absorption of tetracyclines. Separate administration by 2 to 3 hours. **(Moderate) Study**

- **Tricaine** potentially decreases the absorption of zinc. **(Moderate) Theoretical**

**Zoledronic acid** → see bisphosphonates

**Zolmitrip坦** → see TABLE 13 p. 1267 (serotonin syndrome)

- **Combined hormonal contraceptives** are predicted to increase the exposure to zolmitrip坦. Adjust zolmitrip坦 dose, p. 456. **(Moderate) Theoretical**

- **H₃ receptor antagonists (cimetidine)** slightly increase the exposure to zolmitrip坦. Adjust zolmitrip坦 dose, p. 456. **(Mild) Study**

- **Moclobemide** slightly increases the exposure to zolmitrip坦. Adjust zolmitrip坦 dose, p. 456. **(Moderate) Study**

- **Monoamine-oxidase A and B inhibitors, irreversible** are predicted to increase the exposure to zolmitrip坦. **(Severe) Theoretical** → Also see TABLE 13 p. 1267

- **Quinolones (ciprofloxacin)** are predicted to increase the exposure to zolmitrip坦. Adjust zolmitrip坦 dose, p. 456. **(Moderate) Theoretical**

- **SSRIs (fluvoxamine)** are predicted to increase the exposure to zolmitrip坦. Adjust zolmitrip坦 dose, p. 456. **(Severe) Theoretical** → Also see TABLE 13 p. 1267

**Zolpidem** → see TABLE 11 p. 1266 (CNS depressant effects)

- **Antiepileptics (carbamazepine)** moderately decrease the exposure to zolpidem. **(Moderate) Study**

- **Zopiclone** is predicted to decrease the exposure to zolpidem. **(Moderate) Study**

- **Zonisamide** → see antiepileptics

**Zopiclone** → see TABLE 11 p. 1266 (CNS depressant effects)

- **Antarrhythms (dronedarone)** are predicted to increase the exposure to zopiclone. Adjust dose. **(Moderate) Study**

- **Antiepileptics (carbamazepine, fosphenytoin, phenobarbital, phenytoin, primidone)** are predicted to decrease the exposure to zopiclone. Adjust dose. **(Moderate) Study** → Also see TABLE 11 p. 1266

- **Antifungals, azoles (fluconazole, itraconazole, posaconazole)** are predicted to increase the exposure to zopiclone. Adjust dose. **(Moderate) Study**

- **Antifungals, azoles (fluconazole, isavuconazole, posaconazole)** are predicted to decrease the exposure to zopiclone. Adjust dose. **(Moderate) Study**

- **Calcium channel blockers (diltiazem, verapamil)** are predicted to increase the exposure to zopiclone. Adjust dose. **(Moderate) Study**

- **Cobicistat** is predicted to increase the exposure to zopiclone. Adjust dose. **(Moderate) Theoretical**

- **Crixotinib** is predicted to increase the exposure to zopiclone. Adjust dose. **(Moderate) Study**

- **Enalapril** is predicted to decrease the exposure to zopiclone. Adjust dose. **(Moderate) Study**

- **Zopiclone** is predicted to decrease the exposure to zopiclone. Adjust dose. **(Moderate) Study**

- **Imatinib** is predicted to increase the exposure to zopiclone. Adjust dose. **(Moderate) Theoretical**

- **Macrolides (clarithromycin)** are predicted to increase the exposure to zopiclone. Adjust dose. **(Moderate) Theoretical**

- **Macrolides (erythromycin)** are predicted to increase the exposure to zopiclone. Adjust dose. **(Moderate) Study**

- **Netupitant** is predicted to increase the exposure to zopiclone. Adjust dose. **(Moderate) Study**
- **Nilotinib** is predicted to increase the exposure to zopiclone. Adjust dose. [Moderate] Study
- **Rifampicin** is predicted to decrease the exposure to zopiclone. Adjust dose. [Moderate] Study

**Zuclopenthixol** → see TABLE 8 p. 1265 (hypotension), TABLE 9 p. 1266 (QT-interval prolongation), TABLE 11 p. 1266 (CNS depressant effects)
- **Zuclopenthixol** is predicted to decrease the effects of dopamine receptor agonists. Avoid. [Moderate] Theoretical → Also see TABLE 8 p. 1265 → Also see TABLE 9 p. 1266
- **Zuclopenthixol** is predicted to decrease the effects of histamine. Avoid. [Severe] Theoretical → Also see TABLE 8 p. 1265
- **Zuclopenthixol** is predicted to decrease the effects of levodopa. Avoid or monitor worsening parkinsonian symptoms. [Severe] Theoretical → Also see TABLE 8 p. 1265
- **Zuclopenthixol** potentially increases the risk of neurotoxicity when given with lithium. [Severe] Anecdotal → Also see TABLE 9 p. 1266

Phenylketonuria ...................................................................... 1450
Tyrosinaemia .......................................................................... 1452

In certain conditions some foods (and toilet preparations) have characteristics of drugs and the Advisory Committee on Borderline Substances (ACBS) advises as to the circumstances in which such substances may be regarded as drugs. Prescriptions issued in accordance with the Committee’s advice and endorsed ‘ACBS’ will normally not be investigated.

Information
General Practitioners are reminded that the ACBS recommends products on the basis that they may be regarded as drugs for the management of specified conditions. Doctors should satisfy themselves that the products can safely be prescribed, that patients are adequately monitored and that, where necessary, expert hospital supervision is available.

Foods which may be prescribed on FP10, GP10 (Scotland), or WP10 (Wales)
All the food products listed in this appendix have ACBS approval. The clinical condition for which the product has been approved is included with each entry.

Note Foods included in this appendix may contain cariogenic sugars and patients should be advised to take appropriate oral hygiene measures.

Enteral feeds and supplements
For most enteral feeds and nutritional supplements, the main source of carbohydrate is either maltodextrin or glucose syrup; other carbohydrate sources are listed in the relevant table, below. Feeds containing residual lactose (less than 1 g lactose/100 mL formula) are described as ‘clinically lactose-free’ or ‘lactose-free’ by some manufacturers. The presence of lactose (including residual lactose) in feeds is indicated in the relevant table, below. The primary sources of protein or amino acids are included with each product entry. The fat or oil content is derived from a variety of sources such as vegetables, soya bean, corn, palm nuts, and seeds; where the fat content is derived from animal or fish sources, this information is included in the relevant table, below. The presence of medium chain triglycerides (MCT) is also noted where the quantity exceeds 30% of the fat content.

Enteral feeds and nutritional supplements can contain varying amounts of vitamins, minerals, and trace elements—the manufacturer’s product literature should be consulted for more detailed information. Feeds containing vitamin K may affect the INR in patients receiving warfarin; see Interactions: Appendix 1: Enteral feeds.

The suitability of food products for patients requiring a vegan, kosher, halal, or other compliant diet should be confirmed with individual manufacturers.

Note Feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be avoided in children unless recommended by an appropriate specialist or dietician.

Nutritional values
Nutritional values of products vary with flavour and pack size—consult product literature.

Other conditions for which ACBS products can be prescribed
This is a list of clinical conditions for which the ACBS has approved toilet preparations.

Birthmarks
Dermatitis
Eczema and Pruritus
Aveeno® Bath Oil; Aveeno® Cream; Aveeno® Lotion; E45® Emollient Bath Oil; E45® Emollient Wash Cream; E45® Lotion
Disfiguring skin lesions (birthmarks, mutilating lesions, scars, vitiligo)
Covermark® classic foundation and finishing powder; Dermoblend® Ultra corrective foundation; Dermacolor® Camouflage cream and fixing powder; Keromask® masking cream and finishing powder; Veil® Cover cream and Finishing Powder. (Cleansing Creams, Cleansing Milks, and Cleansing Lotions are excluded).
Disinfectants (antiseptics)
May be prescribed on an FP10 only when ordered in such quantities and with such directions as are appropriate for
the treatment of patients, but not for general hygenic purposes.

**Dry mouth (xerostomia)**
For patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome.  
AS Saliva Orthana®; Biotène Oralbalance®; Glandosane®; Saliveze®

**Photodermatoses (skin protection in)**
Anthelios® XL SPF 50+ Melt-in cream; Sunsense® Ultra; Uvistat® Lipscreen SPF 50, Uvistat® Suncream SPF 30 and 50

**Standard ACBS indications:** Disease-related malnutrition, intractable malabsorption, pre-operative preparation of malnourished patients, dysphagia, proven inflammatory bowel disease, following total gastrectomy, short-bowel syndrome, bowel fistula
### Table 1 Enteral feeds (non-disease specific)

#### Less than 5 g protein/100 mL

**Enteral feeds: 1 kcal/mL and less than 5 g protein/100 mL**

Not suitable for use in child under 1 year unless otherwise stated; not recommended for child 1-6 years

- VSL#3 Probiotic Food Supplement oral powder 4.4g sachets (Ferring Pharmaceuticals Ltd)
  30 sachet (ACBS) • NHS indicative price = £34.36

Feed thickeners and pre-thickened drinks

Carobel, Instant®
- For thickening feeds in the treatment of vomiting.
- POWDER, carob seed flour.

Instant Carobel powder (Cow & Gate Ltd)
  135gram (ACBS) • NHS indicative price = £2.84
- Multi-thick®
- For thickening of liquids and foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive.
  - POWDER, modified maize starch, gluten- and lactose-free.
- Multi-thick powder (Abbott Laboratories Ltd)
  250gram (ACBS) • NHS indicative price = £4.83
- Nutillis® Clear
  - For thickening of liquids or foods in dysphagia. Not suitable for children under 3 years.
  - POWDER, maltodextrin, xanthan gum, guar gum, gluten- and lactose-free.
- Nutillis Clear powder (Nutricia Ltd)
  72gram (ACBS) • NHS indicative price = £11.04 | 175gram (ACBS) • NHS indicative price = £8.46
- Nutillis® Powder
- For thickening of foods in dysphagia. Not suitable for child under 3 years.
  - POWDER, carbohydrate 86g, energy 1520 kJ (358 kcal)/100g, modified maize starch, gluten- and lactose-free.
- Nutillis powder (Nutricia Ltd)
  240gram (ACBS) • NHS indicative price = £6.80 | 300gram (ACBS) • NHS indicative price = £5.11
- Resource® Thickened Drink
  - For dysphagia. Not suitable for children under 1 year.
  - LIQUID, carbohydrate 22 g, energy: orange 382 kJ (90 kcal); apple 376 kJ (89 kcal)/100 mL, Gluten- and lactose-free.
- Resource Thickened Drink custard apple (Nestle Health Science)
  114ml (ACBS) • NHS indicative price = £0.73
- Resource Thickened Drink custard orange (Nestle Health Science)
  114ml (ACBS) • NHS indicative price = £0.73
- Resource Thickened Drink syrup apple (Nestle Health Science)
  114ml (ACBS) • NHS indicative price = £0.73
- Resource Thickened Drink syrup orange (Nestle Health Science)
  114ml (ACBS) • NHS indicative price = £0.73
- Resource® ThickenUp Clear
  - For thickening of liquids or foods in dysphagia. Not suitable for children under 3 years.
  - POWDER, maltodextrin, xanthan gum, gluten- and lactose-free.
- Resource ThickenUp Clear powder (Nestle Health Science)
  28.8gram (ACBS) • NHS indicative price = £5.28 | 125gram (ACBS) • NHS indicative price = £8.46
- Resource® ThickenUp®
  - For thickening of foods in dysphagia. Not suitable for children under 1 year.
  - POWDER, modified maize starch. Gluten- and lactose-free.
- Resource ThickenUp powder (Nestle Health Science)
  227gram (ACBS) • NHS indicative price = £4.66 | 337.5gram (ACBS) • NHS indicative price = £17.86
- SLO Drinks®
  - Nutritional supplement for patient hydration in the dietary management of dysphagia. Not suitable for children under 3 years.
  - POWDER, carbohydrate content varies with flavour and chosen consistency (3 consistencies available), see product literature.
- SLO Drink 1 oral powder lemon (SLO Drinks Ltd)
  25 cup (ACBS) • NHS indicative price = £7.50
- SLO Drink 1 oral powder orange (SLO Drinks Ltd)
  25 cup (ACBS) • NHS indicative price = £7.50
- SLO Drink 1 oral powder hot chocolate (SLO Drinks Ltd)
  25 cup (ACBS) • NHS indicative price = £7.50
- SLO Drink 1 oral powder white coffee (SLO Drinks Ltd)

Barkat gluten free wholemeal bread sliced (Gluten Free Foods Ltd)
500gram (ACBS) - NHS indicative price = £3.98
Barkat gluten free white rice bread (Gluten Free Foods Ltd)
500gram (ACBS) - NHS indicative price = £5.73
Ener-G ® Loaves
GLUTEN-FREE
Ener-G gluten free brown rice bread (General Dietary Ltd)
474gram (ACBS) - NHS indicative price = £5.47
Ener-G gluten free tapioca bread (General Dietary Ltd)
480gram (ACBS) - NHS indicative price = £5.47
Ener-G gluten free rice loaf (General Dietary Ltd)
612gram (ACBS) - NHS indicative price = £5.47
Ener-G gluten free Seattle brown loaf (General Dietary Ltd)
454gram (ACBS) - NHS indicative price = £6.22
Ener-G gluten free white rice bread (General Dietary Ltd)
456gram (ACBS) - NHS indicative price = £5.47
Genius Gluten Free ® Loaf
GLUTEN-FREE
Genius gluten free brown bread sliced (Genius Foods Ltd)
400gram (ACBS) - NHS indicative price = £2.88
Genius gluten free brown bread unsliced (Genius Foods Ltd)
400gram (ACBS) - NHS indicative price = £2.77
Genius gluten free brown sandwich bread sliced (Genius Foods Ltd)
555gram (ACBS) - NHS indicative price = £3.73
Genius gluten free white bread sliced (Genius Foods Ltd)
400gram (ACBS) - NHS indicative price = £2.88
Genius gluten free white bread unsliced (Genius Foods Ltd)
400gram (ACBS) - NHS indicative price = £2.77
Genius gluten free white sandwich bread sliced (Genius Foods Ltd)
555gram (ACBS) - NHS indicative price = £3.73
Glutafin ® Loaves
GLUTEN-FREE
Glutafin gluten free fibre loaf sliced (Dr Schar UK Ltd)
300gram (ACBS) - NHS indicative price = £2.89
Glutafin gluten free white loaf sliced (Dr Schar UK Ltd)
300gram (ACBS) - NHS indicative price = £2.89
Glutafin ® Select Loaves
GLUTEN-FREE
Glutafin gluten free Select fibre loaf sliced (Dr Schar UK Ltd)
400gram (ACBS) - NHS indicative price = £3.43
Glutafin gluten free Select fresh brown loaf sliced (Dr Schar UK Ltd)
400gram (ACBS) - NHS indicative price = £3.43
Glutafin gluten free Select fresh white loaf sliced (Dr Schar UK Ltd)
400gram (ACBS) - NHS indicative price = £3.43
Glutafin gluten free Select seeded loaf sliced (Dr Schar UK Ltd)
400gram (ACBS) - NHS indicative price = £3.72
Glutafin gluten free Select white loaf sliced (Dr Schar UK Ltd)
400gram (ACBS) - NHS indicative price = £3.43
Juvela ® Loaf
GLUTEN-FREE
Juvela gluten fresh fibre loaf sliced (Hero UK Ltd)
400gram (ACBS) - NHS indicative price = £3.39
Juvela gluten fresh white loaf sliced (Hero UK Ltd)
400gram (ACBS) - NHS indicative price = £3.69
Juvela gluten fibre loaf sliced (Hero UK Ltd)
400gram (ACBS) - NHS indicative price = £3.54
Juvela gluten free part baked loaf (Hero UK Ltd)
400gram (ACBS) - NHS indicative price = £3.95
Juvela gluten free part baked fibre loaf (Hero UK Ltd)
400gram (ACBS) - NHS indicative price = £3.80
Juvela gluten free loaf unsliced (Hero UK Ltd)
400gram (ACBS) - NHS indicative price = £3.54
Juvela gluten free fibre loaf unsliced (Hero UK Ltd)
400gram (ACBS) - NHS indicative price = £3.54
Lifestyle ® Loaf
GLUTEN-FREE
Lifestyle gluten free brown bread sliced (Ultrapharm Ltd)
400gram (ACBS) - NHS indicative price = £2.82
Lifestyle gluten free high fibre bread sliced (Ultrapharm Ltd)
400gram - NHS indicative price = £2.82
Lifestyle gluten free white bread sliced (Ultrapharm Ltd)
400gram (ACBS) - NHS indicative price = £2.82
Warburtons ® Loaf
GLUTEN-FREE
Warburtons gluten free brown bread sliced (Warburtons Ltd)
400gram (ACBS) • NHS indicative price = £3.06
Warburtons gluten free white bread sliced (Warburtons Ltd)
400gram (ACBS) • NHS indicative price = £3.06
Wellfoods ® Loaf
GLUTEN-FREE
Wellfoods gluten free loaf sliced (Wellfoods Ltd)
600gram (ACBS) • NHS indicative price = £5.05
Wellfoods gluten free loaf unsliced (Wellfoods Ltd)
600gram (ACBS) • NHS indicative price = £4.95
BAGUETTES, BUNS AND ROLLS
Barkat ® Baguettes and rolls
GLUTEN-FREE
Barkat gluten free par baked rolls (Gluten Free Foods Ltd)
200gram (ACBS) • NHS indicative price = £3.98
Barkat gluten free par baked baguette (Gluten Free Foods Ltd)
200gram (ACBS) • NHS indicative price = £3.98
Ener-G ® Rolls
GLUTEN-FREE
Ener-G gluten free dinner rolls (General Dietary Ltd)
280gram (ACBS) • NHS indicative price = £3.71
Ener-G gluten free white round rolls (General Dietary Ltd)
220gram (ACBS) • NHS indicative price = £2.98
Ener-G gluten free white long rolls (General Dietary Ltd)
220gram (ACBS) • NHS indicative price = £2.98
Glutafin ® Baguettes and rolls
GLUTEN-FREE
Glutafin gluten free baguette (Dr Schar UK Ltd)
350gram (ACBS) • NHS indicative price = £3.51
Glutafin gluten free 4 white rolls (Dr Schar UK Ltd)
200gram (ACBS) • NHS indicative price = £3.68
Glutafin gluten free part baked 4 fibre rolls (Dr Schar UK Ltd)
200gram (ACBS) • NHS indicative price = £3.68
Glutafin ® Select Rolls
GLUTEN-FREE
Glutafin gluten free part baked 4 white rolls (Dr Schar UK Ltd)
200gram (ACBS) • NHS indicative price = £3.68
Glutafin gluten free part baked 2 long white rolls (Dr Schar UK Ltd)
150gram (ACBS) • NHS indicative price = £2.81
Juvela ® Rolls
GLUTEN-FREE
Juvela gluten free fresh fibre rolls (Hero UK Ltd)
425gram (ACBS) • NHS indicative price = £4.42
Juvela gluten free fresh white rolls (Hero UK Ltd)
425gram (ACBS) • NHS indicative price = £4.42
Juvela gluten free fibre bread rolls (Hero UK Ltd)
425gram (ACBS) • NHS indicative price = £4.77
Juvela gluten free bread rolls (Hero UK Ltd)
425gram (ACBS) • NHS indicative price = £4.77
Juvela gluten free part baked fibre bread rolls (Hero UK Ltd)
375gram (ACBS) • NHS indicative price = £4.94
Juvela gluten free part baked white bread rolls (Hero UK Ltd)
375gram (ACBS) • NHS indicative price = £4.94
Lifestyle ® Rolls
GLUTEN-FREE
Lifestyle gluten free brown bread rolls (Ultrapharm Ltd)
400gram (ACBS) • NHS indicative price = £2.82
Lifestyle gluten free high fibre bread rolls (Ultrapharm Ltd)
400gram (ACBS) • NHS indicative price = £2.82
Lifestyle gluten free white bread rolls (Ultrapharm Ltd)
400gram (ACBS) • NHS indicative price = £2.82
Proceli ® Baguettes, buns and rolls
GLUTEN-FREE
Proceli gluten free part baked baguette (Ambe Ltd)
250gram (ACBS) • NHS indicative price = £3.24

Innovative Solutions Pure xanthan gum (Innovative Solutions (UK) Ltd) 1000gram (ACBS) • NHS indicative price = £6.85

Pasta

Barkat® Pasta GLUTEN-FREE

Barkat gluten free pasta shapes (Gluten Free Foods Ltd) 500gram (ACBS) • NHS indicative price = £5.88
Borderline substances

Appendix 2

Barkat gluten free pasta macaroni (Gluten Free Foods Ltd)
500gram (ACBS) · NHS indicative price = £5.88

Barkat gluten free pasta spaghetti (Gluten Free Foods Ltd)
500gram (ACBS) · NHS indicative price = £5.88

Barkat gluten free pasta spirals (Gluten Free Foods Ltd)
500gram (ACBS) · NHS indicative price = £5.88

Barkat gluten free pasta tagliatelle (Gluten Free Foods Ltd)
500gram (ACBS) · NHS indicative price = £5.88

Barkat gluten free pasta buckwheat penne (Gluten Free Foods Ltd)
250gram (ACBS) · NHS indicative price = £2.93

Barkat gluten free pasta buckwheat spirals (Gluten Free Foods Ltd)
250gram (ACBS) · NHS indicative price = £2.93

BiAlimenta ® Pasta
GLUTEN-FREE

BiAlimenta gluten free pasta spirals (Drossa Ltd)
spirals, sagnette 500 gram (ACBS) · NHS indicative price = £5.11

Ener-G ® Pasta
GLUTEN-FREE

General Dietary gluten free macaroni (General Dietary Ltd)
454gram (ACBS) · NHS indicative price = £5.03

General Dietary gluten free spaghetti (General Dietary Ltd)
454gram (ACBS) · NHS indicative price = £5.03

General Dietary gluten free vermicelli (General Dietary Ltd)
300gram (ACBS) · NHS indicative price = £5.03

Glutafin ® Pasta
GLUTEN-FREE

Glutafin gluten free pasta macaroni penne (Dr Schar UK Ltd)
500gram (ACBS) · NHS indicative price = £6.73

Glutafin gluten free pasta shells (Dr Schar UK Ltd)
500gram (ACBS) · NHS indicative price = £6.73

Glutafin gluten free pasta spirals (Dr Schar UK Ltd)
500gram (ACBS) · NHS indicative price = £6.73

Glutafin gluten free pasta long-cut spaghetti (Dr Schar UK Ltd)
500gram (ACBS) · NHS indicative price = £6.73

Juvela ® Pasta
GLUTEN-FREE

Juvela gluten free fibre penne (Hero UK Ltd)
500gram (ACBS) · NHS indicative price = £6.61

Juvela gluten free pasta fusilli (Hero UK Ltd)
500gram (ACBS) · NHS indicative price = £7.21

Juvela gluten free pasta lasagne (Hero UK Ltd)
250gram (ACBS) · NHS indicative price = £3.68

Juvela gluten free pasta macaroni (Hero UK Ltd)
500gram (ACBS) · NHS indicative price = £7.21

Juvela gluten free pasta spaghetti (Hero UK Ltd)
500gram (ACBS) · NHS indicative price = £7.21

Juvela gluten free pasta tagliatelle (Hero UK Ltd)
250gram (ACBS) · NHS indicative price = £3.47

Orgran ® Pasta
GLUTEN-FREE

Orgran gluten free pasta rice & corn lasagne (Naturally Good Food Ltd)
200gram (ACBS) · NHS indicative price = £3.13

Orgran gluten free pasta rice & corn macaroni (Naturally Good Food Ltd)
250gram (ACBS) · NHS indicative price = £2.42

Orgran gluten free pasta buckwheat spirals (Naturally Good Food Ltd)
250gram (ACBS) · NHS indicative price = £2.42

Orgran gluten free pasta corn spirals (Naturally Good Food Ltd)
250gram (ACBS) · NHS indicative price = £2.42

Orgran gluten free pasta brown rice spirals (Naturally Good Food Ltd)
250gram (ACBS) · NHS indicative price = £2.42

Orgran gluten free pasta rice & corn spirals (Naturally Good Food Ltd)
250gram (ACBS) · NHS indicative price = £2.42

Orgran gluten free pasta rice & millet spirals (Naturally Good Food Ltd)
250gram (ACBS) · NHS indicative price = £2.42

Rizopia ® Pasta
GLUTEN-FREE

Rizopia gluten free organic brown rice pasta fusilli (PGR Health Foods Ltd)
500gram (ACBS) · NHS indicative price = £2.72

Rizopia gluten free organic brown rice pasta lasagne (PGR Health Foods Ltd)
575gram (ACBS) · NHS indicative price = £2.72

Rizopia gluten free organic brown rice pasta penne (PGR Health Foods Ltd)
500gram (ACBS) · NHS indicative price = £2.72

Rizopia gluten free organic brown rice pasta spaghetti (PGR Health Foods Ltd)
500gram (ACBS) · NHS indicative price = £2.72

Pizza bases

Barkat ®, Pizza crust
GLUTEN-FREE

Barkat gluten free brown rice pizza crust (Gluten Free Foods Ltd)
150gram (ACBS) · NHS indicative price = £5.00

Barkat gluten free white rice pizza crust (Gluten Free Foods Ltd)
150gram (ACBS) · NHS indicative price = £5.00

Glutafin ® Pizza base
GLUTEN-FREE

Glutafin gluten free pizza base (Dr Schar UK Ltd)
300gram (ACBS) · NHS indicative price = £6.56

Juvela ® Pizza base
GLUTEN-FREE

Juvela gluten free pizza base (Hero UK Ltd)
360gram (ACBS) · NHS indicative price = £8.78

Proceli ® Pizza base
GLUTEN-FREE

Proceli gluten free pizza base (Ambe Ltd)
250gram (ACBS) · NHS indicative price = £3.90

Wellfoods ® Pizza base
GLUTEN-FREE

Wellfoods gluten free pizza base (Wellfoods Ltd)
600gram (ACBS) · NHS indicative price = £9.13

Gluten- and wheat-free foods

ACBS indications: established gluten-sensitive enteropathies with coexisting established wheat sensitivity only.

Ener-G ® Bread loaves, rolls and pizza bases
GLUTEN-FREE, WHEAT-FREE

Ener-G gluten free Seattle brown hamburger rolls (General Dietary Ltd)
320gram (ACBS) · NHS indicative price = £4.08

Ener-G gluten free Seattle brown hot dog rolls (General Dietary Ltd)
320gram (ACBS) · NHS indicative price = £4.08

Glutafin ® Flour mix, fibre and crispbread
GLUTEN-FREE, WHEAT-FREE

Glutafin gluten free crispbread (Dr Schar UK Ltd)
150gram (ACBS) · NHS indicative price = £3.25

Glutafin gluten free bread mix (Dr Schar UK Ltd)
500gram (ACBS) · NHS indicative price = £6.66

Glutafin gluten free fibre bread mix (Dr Schar UK Ltd)
500gram (ACBS) · NHS indicative price = £6.66

Glutafin gluten free wheat free fibre mix (Dr Schar UK Ltd)
500gram (ACBS) · NHS indicative price = £6.66

Heron Foods ® Flour mixes
GLUTEN-FREE, WHEAT-FREE

Heron gluten free organic bread mix (Gluten Free Foods Ltd)
500gram (ACBS) · NHS indicative price = £8.96

Spreads
Taranis Spread
LOW-PROTEIN
Taranis low protein hazelnut spread (Lactalis Nutrition Sante)
250gram (ACBS) • NHS indicative price = £7.87

**Nutritional supplements for metabolic diseases**

**Glutaric aciduria (type 1)**

**GA Gel**
- Nutritional supplement for dietary management of type 1 glutaric aciduria in children 6 months–10 years.
  - Gel, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 10 g, carbohydrate 10.3 g, fat trace, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1441.

**GA gel oral powder 24g sachets** (Vitaflor International Ltd)
30 sachet (ACBS) • NHS indicative price = £216.48

**GA1 Anamix Infant**
- Nutritional supplement for the dietary management of proven glutaric aciduria (type 1) in children from birth to 3 years.
  - Powder, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 13.1 g, carbohydrate 49.5 g, fat 23.5 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**GA1 Anamix infant powder** (Nutricia Ltd)
400gram (ACBS) • NHS indicative price = £39.45

**GA1 Maxamaid**
- Nutritional supplement for the dietary management of type 1 glutaric aciduria.
  - Powder, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1511 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Maxamaid products are generally intended for use in children 1–8 years.

**GA1 Maxamaid powder** (Nutricia Ltd)
500gram (ACBS) • NHS indicative price = £99.61

**XL5S TRY Glutaridon**
- Nutritional supplement for the dietary management of type 1 glutaric aciduria in children and adults; requires additional source of vitamins, minerals, and trace elements.
  - Powder, protein equivalent (essential and non-essential amino acids except lysine and tryptophan) 79 g, carbohydrate 4 g, energy 1411 kJ (352 kcal)/100 g.

**XL5S TRY Glutaridon powder** (Nutricia Ltd)
500gram (ACBS) • NHS indicative price = £188.69

**Glycogen storage disease**

**Corn flour and corn starch**
- For glycogen storage disease

**Glycosade**
- A nutritional supplement for use in the dietary management of glycogen storage disease and other metabolic conditions where a constant supply of glucose is essential. Not suitable for use in children under 2 years.
  - Powder, protein 200 mg, carbohydrate (maize starch) 47.6 g, fat 100 mg, fibre less than 600 mg, energy 803 kJ (192 kcal)/60 g.

**Glycosade oral powder 60g sachets** (Vitaflor International Ltd)
30 sachet (ACBS) • NHS indicative price = £113.77

**Homocystinuria or hypermethioninaemia**

**HCU Anamix Infant**
- Nutritional supplement for the dietary management of proven vitamin B6 non-responsive homocystinuria or hypermethioninaemia in children from birth to 3 years.
  - Powder, protein equivalent (essential and non-essential amino acids except methionine) 15.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**HCU Anamix Infant powder** (Nutricia Ltd)
400gram (ACBS) • NHS indicative price = £39.45

**HCU cooler 15 liquid**
- A methionine-free protein substitute for use as a nutritional supplement in children over 3 years with homocystinuria.
  - Liquid, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 7 g, fat 500 mg, energy 393 kJ (92 kcal)/150 mL, with vitamins, minerals, and trace elements.

**HCU orange cooler 15 liquid** (Vitaflor International Ltd)
150ml (ACBS) • NHS indicative price = £11.42

**HCU Express 15**
- A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria.
  - Powder, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 3.8 g, fat 30 mg, energy 315 kJ (75.3 kcal)/25 g with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1441.

**HCU express 15 oral powder 25g sachets** (Vitaflor International Ltd)
30 sachet (ACBS) • NHS indicative price = £33.16

**HCU Express 20**
- A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria.
  - Powder, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 4.7 g, fat 70 mg, energy 416 kJ (99 kcal)/34 g with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1441.

**HCU express 20 oral powder 34g sachets** (Vitaflor International Ltd)
30 sachet (ACBS) • NHS indicative price = £43.31

**HCU gel**
- A methionine-free protein substitute for use as a nutritional supplement for the dietary management of children 1–10 years with homocystinuria.
  - Powder, protein (essential and non-essential amino acids except methionine) 10 g, carbohydrate 10.3 g, fat 20 mg, energy 339 kJ (81 kcal)/24 g with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1441.

**HCU gel oral powder 24g sachets** (Vitaflor International Ltd)
30 sachet (ACBS) • NHS indicative price = £216.42
HCU Lophex ® LQ 20
- Nutritional supplement for the dietary management of homocystinuria in children over 3 years.
- LIQUID, protein equivalent (essential and non-essential amino acids except methionine) 20 g, carbohydrate 8.8 g, fat 440 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements.

HCU Lophex LQ 20 liquid (Nutricia Ltd)
- 125 mL (ACBS) - NHS indicative price = £16.27

HCU LV ®
- Nutritional supplement for the dietary management of hypermethioninaemia or vitamin B6 non-responsive homocystinuria in children over 8 years.
- POWDER, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 2.5 g, fat 190 mg, energy 390 kJ (92 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements.

HCU LV oral powder 27.8g sachets tropical (Nutricia Ltd)
- 30 sachet (ACBS) - NHS indicative price = £500.10

HCU LV oral powder 27.8g sachets unflavoured (Nutricia Ltd)
- 30 sachet (ACBS) - NHS indicative price = £500.10

XMET Homidon ®
- Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria in children and adults.
- POWDER, protein equivalent (essential and non-essential amino acids, except methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.

XMET Homidon powder (Nutricia Ltd)
- 500 g (ACBS) - NHS indicative price = £188.69

HCU Maxamaid ®
- Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria.
- POWDER, protein equivalent (essential and non-essential amino acids except methionine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Maxamaid products are generally intended for use in children 1-8 years.

HCU Maxamaid powder (Nutricia Ltd)
- 500 g (ACBS) - NHS indicative price = £99.61

HCU Maxamum ®
- Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria.
- POWDER, protein equivalent (essential and non-essential amino acids except methionine) 39 g, carbohydrate 54 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Maxamum products are generally intended for use in children 1-8 years.

HCU Maxamum powder (Nutricia Ltd)
- 500 g (ACBS) - NHS indicative price = £159.66

Hyperlysinaemia

HYPER LYS Anamix ® Infant
- Nutritional supplement for the dietary management of hyperlysinaemia in children from birth to 3 years.
- POWDER, protein equivalent (essential and non-essential amino acids except lysine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

HYPER LYS Anamix Infant powder (Nutricia Ltd)
- 400 g (ACBS) - NHS indicative price = £39.45

HYPER LYS Maxamaid ®
- Nutritional supplement for the dietary management of hyperlysinaemia.
- POWDER, protein equivalent (essential and non-essential amino acids except lysine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g with vitamins, minerals, and trace elements. Maxamaid products are generally intended for use in children 1-8 years.

HYPER LYS Maxamaid powder (Nutricia Ltd)
- 500 g (ACBS) - NHS indicative price = £99.61

Isovaleric acidaemia

IVA Anamix ® Infant
- Nutritional supplement for the dietary management of proven isovaleric acidaemia or other proven disorders of leucine metabolism in children from birth to 3 years.
- POWDER, protein equivalent (essential and non-essential amino acids except leucine) 15.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

IVA Anamix Infant powder (Nutricia Ltd)
- 400 g (ACBS) - NHS indicative price = £39.45

IVA Maxamaid ®
- Nutritional supplement for the dietary management of isovaleric acidaemia.
- POWDER, protein equivalent (essential and non-essential amino acids except leucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g with vitamins, minerals, and trace elements. Maxamaid products are generally intended for use in children 1-8 years.

IVA Maxamaid powder (Nutricia Ltd)
- 500 g (ACBS) - NHS indicative price = £99.61

Maple syrup urine disease

MSUD Aid III ®
- Nutritional supplement for the dietary management of maple syrup urine disease and related conditions in children and adults where it is necessary to limit the intake of branched chain amino acids.
- POWDER, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.

MSUD Aid III powder (Nutricia Ltd)
- 500 g (ACBS) - NHS indicative price = £188.69

MSUD Anamix ® Infant
- Nutritional supplement for the dietary management of proven maple syrup urine disease in children from birth to 3 years.
- POWDER, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

MSUD Anamix Infant powder (Nutricia Ltd)
- 400 g (ACBS) - NHS indicative price = £39.45

MSUD Anamix ® Junior
- Nutritional supplement for the dietary management of maple syrup urine disease in children 1-10 years.
- POWDER, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 8.4 g, carbohydrate 11 g, fat 3.9 g, energy 474 kJ (113 kcal)/29-g sachet, with vitamins, minerals, and trace elements.

MSUD Anamix Junior oral powder 36g sachets (Nutricia Ltd)
- 30 sachet (ACBS) - NHS indicative price = £210.90

MSUD Anamix ® Junior LQ
- Nutritional supplement for the dietary management of maple syrup urine disease in children 1-10 years.
- LIQUID, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free.
Nutritional supplements for the dietary management of inborn errors of metabolism

- **MSUD Anamix Junior LQ liquid** (Nutricia Ltd)
  125ml (ACBS) - NHS indicative price = £9.15

- **MSUD Maxamum powder orange** (Nutricia Ltd)
  500gram (ACBS) - NHS indicative price = £159.66

- **MSUD Maxamum powder unflavoured** (Nutricia Ltd)
  500gram (ACBS) - NHS indicative price = £159.66

**Methylmalonic or propionic acidaemia**

- **MMA/PA Anamix® Infant**
  - Nutritional supplement for the dietary management of proven methylmalonic acidaemia or propionic acidaemia in children from birth to 3 years.
  - POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 13.1 g, carbohydrate 49.5 g, fat 25 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

- **MMA / PA Anamix Infant powder** (Nutricia Ltd)
  400gram (ACBS) - NHS indicative price = £39.45

- **XMTVI Asadon**
  - Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia in children and adults.
  - POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.

- **XMTVI Asadon powder** (Nutricia Ltd)
  200gram (ACBS) - NHS indicative price = £75.47

- **MMA/PA Maxamaid®**
  - Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia.
  - POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 32 g, carbohydrate 4.5 g, fat nil, energy 800 kJ (186 kcal)/25 g, with vitamins, minerals, and trace elements. Maxamaid products are generally intended for use in children 1–8 years.

- **MMA/PA Maxamaid powder** (Nutricia Ltd)
  500gram (ACBS) - NHS indicative price = £99.61

- **MMA/PA Maxamum®**
  - Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia.
  - POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Maxamum products are generally intended for use in children over 8 years.

- **MMA/PA Maxamum powder** (Nutricia Ltd)
  500gram (ACBS) - NHS indicative price = £159.66

Other inborn errors of metabolism

- **Cystine500®**
  - Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
  - POWDER, cystine 500 mg, carbohydrate 3.5 g, fat nil, energy 63 kJ (15 kcal)/4 g

- **Cystine500 oral powder 4g sachets** (Vitaflor International Ltd)
  30 sachet (ACBS) - NHS indicative price = £55.00

- **DocOmega®**
  - Nutritional supplement for the dietary management of inborn errors of metabolism for adults and children from birth.
  - POWDER, protein (cows’ milk, soya) 100 mg, carbohydrate 5.2 g, fat 500 mg (of which docosahexaenoic acid 200 mg), fibre nil, energy 74 kJ (18 kcal)/4 g, with minerals

- **DocOmega oral powder 4g sachets** (Vitaflor International Ltd)
  30 sachet (ACBS) - NHS indicative price = £39.80

Downloaded from www.medicalbr.com
Nutritional supplements for metabolic diseases

EAA® Supplement
- Nutritional supplement for the dietary management of disorders of protein metabolism including urea cycle disorders in children over 5 years. POWDER, protein equivalent (essential amino acids) 5 g, carbohydrate 4 g, fat nil, energy 151 kJ (36 kcal)/12.5 g, with vitamins, minerals, and trace elements.

EAA Supplement oral powder 12.5g sachets (Vitaflo International Ltd) 50 sachet (ACBS) - NHS indicative price = £207.51

Isoleucine50®
- Nutritional supplement for use in the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
POWDER, isoleucine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g

Isoleucine50 oral powder 4g sachets (Vitaflo International Ltd) 30 sachet (ACBS) - NHS indicative price = £55.00

KeyOmega®
- Nutritional supplement for the dietary management of inborn errors of metabolism.
POWDER, protein (cows’ milk, soya) 170 mg, carbohydrate 2.8 g, fat 800 mg (of which arachidonic acid 200 mg, docosahexaenoic acid 100 mg), energy 80 kJ (19 kcal)/4 g.

KeyOmega oral powder 4g sachets (Vitaflo International Ltd) 30 sachet (ACBS) - NHS indicative price = £40.70

Leucine100®
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
POWDER, leucine 100 mg, carbohydrate 3.7 g, fat nil, energy 63 kJ (15 kcal)/4 g

Leucine100 oral powder 4g sachets (Vitaflo International Ltd) 30 sachet (ACBS) - NHS indicative price = £55.00

Low protein drink
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children over 1 year.
POWDER, protein (cows’ milk) 4.5 g (phenylalanine 100 mg), carbohydrate 59.5 g, fat 29.9 g, fibre nil, energy 2194 kJ (528 kcal)/100 g, with vitamins, minerals, and trace elements. Contains lactose. Termed Milupa® lp-drink by manufacturer.

Milupa LP drink (Nutricia Ltd) 400gram (ACBS) - NHS indicative price = £9.36

Phenylalanine50®
- Nutritional supplement for use in the dietary management of inborn errors of metabolism in adults and children from birth.
POWDER, phenylalanine 50 mg, carbohydrate 5.8 g, fat nil, energy 63 kJ (15 kcal)/4 g

Phenylalanine50 oral powder sachets (Vitaflo International Ltd) 30 sachet (ACBS) - NHS indicative price = £55.00

ProZero®
- A protein-free nutritional supplement for the dietary management of inborn errors of metabolism in children over 6 months and adults.
LIQUID, carbohydrate 8.1 g (of which sugars 3.5 g), fat 3.8 g, energy 278 kJ (66 kcal)/100 mL. Contains lactose.

ProZero liquid (Vitaflo International Ltd) 250ml (ACBS) - NHS indicative price = £1.46

Tyrosine1000®
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
POWDER, tyrosine 1 g, carbohydrate 2.9 g, fat nil, energy 63 kJ (15 kcal)/4 g sachet.

Tyrosine1000 oral powder 4g sachets (Vitaflo International Ltd) 30 sachet (ACBS) - NHS indicative price = £5.04

Valine50®
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
POWDER, valine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g

Valine50 oral powder 4g sachets (Vitaflo International Ltd) 30 sachet (ACBS) - NHS indicative price = £55.00

Phenylketonuria

Add-Ins®
- Nutritional supplement for the dietary management of proven phenylketonuria in children over 4 years.
POWDER, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate nil, fat 5.1 g, energy 359 kJ (86 kcal)/18.2 g sachet, with vitamins, minerals, and trace elements.

Add ins oral powder 18.2g sachets (Nutricia Ltd) 60 sachet (ACBS) - NHS indicative price = £381.00

Easiphen®
- Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years.
LIQUID, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 6.7 g, carbohydrate 5.1 g, fat 2 g, energy 275 kJ (65 kcal)/100 mL with vitamins, minerals, and trace elements.

Easiphen liquid (Nutricia Ltd) 250ml (ACBS) - NHS indicative price = £9.79

L-Tyrosine
- Nutritional supplement for the dietary management of phenylketonuria in pregnant women with low plasma tyrosine concentrations.
POWDER, L-tyrosine 20 g, carbohydrate 76.8 g, fat nil, energy 1612 kJ (379 kcal)/100 g.

L-Tyrosine powder (Nutricia Ltd) 100gram (ACBS) - NHS indicative price = £22.22

Lophlex®
- Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years and adults including pregnant women.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 2.5 g, fat 60 mg, fibre 220 mg, energy 385 kJ (91 kcal)/27.8 g sachet, with vitamins, minerals, and trace elements.

Lophlex powder 27.8g sachets berry (Nutricia Ltd) 30 sachet (ACBS) - NHS indicative price = £294.00

Lophlex powder 27.8g sachets orange (Nutricia Ltd) 30 sachet (ACBS) - NHS indicative price = £294.00

Lophlex powder 27.8g sachets unflavoured (Nutricia Ltd) 30 sachet (ACBS) - NHS indicative price = £294.00

Loprofin® PKU Drink
- Nutritional supplement for the dietary management of phenylketonuria in children over 1 year and adults.
LIQUID, protein (cows’ milk) 400 mg (phenylalanine 10 mg), lactose 9.4 g, fat 2 g, energy 165 kJ (40 kcal)/100 mL.

Loprofin PKU drink (Nutricia Ltd) 200ml (ACBS) - NHS indicative price = £0.76

Loprofin® Sno-Pro
- Nutritional supplement for the dietary management of phenylketonuria, chronic renal failure and other inborn errors of amino acid metabolism.
LIQUID, protein (cows’ milk) 220 mg (phenylalanine 12.5 mg), carbohydrate 8 g, fat 3.8 g, energy 275 kJ (65 kcal)/100 mL. Contains lactose.

Loprofin SNO-PRO drink (Nutricia Ltd) 200ml (ACBS) - NHS indicative price = £1.27
Phlexy-10® Exchange System

- Nutritional supplement for the dietary management of phenylketonuria.

**CAPSULES**, protein equivalent (essential and non-essential amino acids except phenylalanine) 416.5 mg/capsule.

**Phlexy-10 500mg capsules** (Nutricia Ltd)
- 200 capsule (ACBS) · NHS indicative price = £44.00
- TABLETS, protein equivalent (essential and non-essential amino acids except phenylalanine) 833 mg tablet.

**Phlexy-10 tablets** (Nutricia Ltd)
- 75 tablet (ACBS) · NHS indicative price = £28.50

**DRINK MIX**, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.33 g, carbohydrate 8.8 g/20-g sachet.

**Phlexy-10 drink mix apple & blackcurrant** (Nutricia Ltd)
- 600 gram (ACBS) · NHS indicative price = £130.20

**Phlexy-10 drink mix citrus burst** (Nutricia Ltd)
- 600 gram (ACBS) · NHS indicative price = £130.20

**Phlexy-Vits**
- For use as a vitamin and mineral component of restricted therapeutic diets in children over 11 years and adults with phenylketonuria and similar amino acid abnormalities.

**POWDER**, vitamins, minerals, and trace elements

**Phlexy-Vits powder** (Nutricia Ltd)
- 210 gram (ACBS) · NHS indicative price = £72.30
- TABLETS, vitamins, minerals, and trace elements

**Phlexy-Vits tablets** (Nutricia Ltd)
- 180 tablet (ACBS) · NHS indicative price = £82.80

**PK Aid 4®**
- Nutritional supplement for the dietary management of phenylketonuria in children and adults.

**POWDER**, protein equivalent (essential and non-essential amino acids except phenylalanine) 79 g, carbohydrate 4.5 g, fat nil, energy 1420 kJ (354 kcal)/100 g.

**PK Aid 4 powder** (Nutricia Ltd)
- 500 gram (ACBS) · NHS indicative price = £145.04

**PKU Anamix Junior LQ®**
- LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free.

**PKU Anamix Junior LQ liquid berry** (Nutricia Ltd)
- 125 mL (ACBS) · NHS indicative price = £5.69

**PKU Anamix Infant®**
- Nutritional supplement for the dietary management of proven phenylketonuria in children from birth to 3 years.

**POWDER**, protein equivalent (essential and non-essential amino acids except phenylalanine) 15.1 g, carbohydrate 49.5 g, fat 25 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**PKU Anamix Infant powder** (Nutricia Ltd)
- 400 gram (ACBS) · NHS indicative price = £35.86

**PKU Anamix® Junior**
- Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years.

**POWDER**, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.4 g, carbohydrate 9.9 g, fat 3.9 g, energy 455 kJ (108 kcal)/29-g sachet, with vitamins, minerals, and trace elements

**PKU Anamix Junior powder chocolate** (Nutricia Ltd)
- 1080 gram (ACBS) · NHS indicative price = £128.10

**PKU Anamix Junior powder neutral** (Nutricia Ltd)
- 1080 gram (ACBS) · NHS indicative price = £128.10

PKU Anamix® Junior LQ
- Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years.

**LIQUID**, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free.

**PKU Anamix Junior LQ liquid berry** (Nutricia Ltd)
- 125 mL (ACBS) · NHS indicative price = £5.69

**PKU Anamix Junior LQ liquid orange** (Nutricia Ltd)
- 125 mL (ACBS) · NHS indicative price = £5.69

**PKU cooler10®**
- Nutritional supplement for the dietary management of phenylketonuria in children over 3 years.

**LIQUID**, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 5.1 g, energy 258 kJ (62 kcal)/87-mL pouch, with vitamins, minerals, and trace elements.

**PKU orange cooler 10 liquid** (Vitaflo International Ltd)
- 87 mL (ACBS) · NHS indicative price = £4.65

**PKU purple cooler 10 liquid** (Vitaflo International Ltd)
- 87 mL (ACBS) · NHS indicative price = £4.65

**PKU red cooler 10 liquid** (Vitaflo International Ltd)
- 87 mL (ACBS) · NHS indicative price = £4.65

**PKU white cooler 10 liquid** (Vitaflo International Ltd)
- 87 mL (ACBS) · NHS indicative price = £4.65

**PKU cooler15®**
- Nutritional supplement for the dietary management of phenylketonuria in children over 5 years.

**LIQUID**, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 7.8 g, energy 386 kJ (92 kcal)/130-mL pouch, with vitamins, minerals, and trace elements.

**PKU orange cooler 15 liquid** (Vitaflo International Ltd)
- 130 mL (ACBS) · NHS indicative price = £6.92

**PKU purple cooler 15 liquid** (Vitaflo International Ltd)
- 130 mL (ACBS) · NHS indicative price = £6.92

**PKU red cooler 15 liquid** (Vitaflo International Ltd)
- 130 mL (ACBS) · NHS indicative price = £6.92

**PKU white cooler 15 liquid** (Vitaflo International Ltd)
- 130 mL (ACBS) · NHS indicative price = £6.92

**PKU cooler20®**
- Nutritional supplement for the dietary management of phenylketonuria in children over 5 years.

**LIQUID**, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 10.2 g, energy 287 kJ (69 kcal)/87-mL pouch, with vitamins, minerals, and trace elements.

**PKU orange cooler 20 liquid** (Vitaflo International Ltd)
- 174 mL (ACBS) · NHS indicative price = £9.30

**PKU purple cooler 20 liquid** (Vitaflo International Ltd)
- 174 mL (ACBS) · NHS indicative price = £9.30

**PKU red cooler 20 liquid** (Vitaflo International Ltd)
- 174 mL (ACBS) · NHS indicative price = £9.30

**PKU white cooler 20 liquid** (Vitaflo International Ltd)
- 174 mL (ACBS) · NHS indicative price = £9.30

**PKU express15®**
- Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years.

**POWDER**, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 2.4 g, energy 295 kJ (70 kcal)/25 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1441.

**PKU express 15 powder lemon** (Vitaflo International Ltd)
- 750 g (ACBS) · NHS indicative price = £203.80

**PKU express 15 powder orange** (Vitaflo International Ltd)
- 750 g (ACBS) · NHS indicative price = £203.80
Nutritional supplements for metabolic diseases

PKU express 15 powder tropical (Vitaflor International Ltd)
750g (ACBS) - NHS indicative price = £203.80
PKU express 15 powder unflavoured (Vitaflor International Ltd)
750g (ACBS) - NHS indicative price = £203.80
PKU express 20®
Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years. POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 5.3 g, energy 389 kJ (93 kcal)/34 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1441.
PKU express 20 powder lemon (Vitaflor International Ltd)
1020g (ACBS) - NHS indicative price = £263.30
PKU express 20 powder orange (Vitaflor International Ltd)
1020g (ACBS) - NHS indicative price = £263.30
PKU express 20 powder tropical (Vitaflor International Ltd)
1020g (ACBS) - NHS indicative price = £263.30
PKU express 20 powder unflavoured (Vitaflor International Ltd)
1020g (ACBS) - NHS indicative price = £263.30
PKU gel®
For use as part of the low-protein dietary management of phenylketonuria in children 1-10 years. POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.9 g, fat less than 100 mg, energy 318 kJ (76 kcal)/24 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1441.
PKU gel powder orange (Vitaflor International Ltd)
720g (ACBS) - NHS indicative price = £140.99
PKU gel powder raspberry (Vitaflor International Ltd)
720g (ACBS) - NHS indicative price = £140.99
PKU gel powder unflavoured (Vitaflor International Ltd)
720g (ACBS) - NHS indicative price = £140.99
PKU Lophlex® LQ 10
Nutritional supplement for the dietary management of phenylketonuria in children under 4 years and adults including pregnant women. LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 4.4 g, fibre 250 mg, energy 245 kJ (58 kcal)/62.5 mL, with vitamins, minerals, and trace elements.
PKU Lophlex LQ 10 liquid berry (Nutricia Ltd)
62.5ml (ACBS) - NHS indicative price = £5.25
PKU Lophlex LQ 10 liquid juicy berries (Nutricia Ltd)
62.5ml (ACBS) - NHS indicative price = £5.25
PKU Lophlex LQ 10 liquid juicy orange (Nutricia Ltd)
62.5ml (ACBS) - NHS indicative price = £5.25
PKU Lophlex® LQ 20
Nutritional supplement for the dietary management of phenylketonuria in children under 4 years and adults including pregnant women. LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 8.8 g, fibre 340 mg, energy 490 kJ (115 kcal)/125 mL, with vitamins, minerals, and trace elements.
PKU Lophlex LQ 20 liquid berry (Nutricia Ltd)
125ml (ACBS) - NHS indicative price = £10.47
PKU Lophlex LQ 20 liquid juicy berries (Nutricia Ltd)
125ml (ACBS) - NHS indicative price = £10.47
PKU Lophlex LQ 20 liquid orange (Nutricia Ltd)
125ml (ACBS) - NHS indicative price = £10.47
PKU Lophlex® Sensation 20
Nutritional supplement for the dietary management of phenylketonuria in children under 4 years and adults including pregnant women. SEMI-SOILD, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 20.2 g, fibre 1 g, energy 706 kJ (166 kcal)/109 g, with vitamins, minerals, and trace elements.
PKU Lophlex Sensation 20 berries (Nutricia Ltd)
327g (ACBS) - NHS indicative price = £33.45
PKU Lophlex Sensation 20 orange (Nutricia Ltd)
327g (ACBS) - NHS indicative price = £33.45
PKU squeeze®
Nutritional supplement for the dietary management of phenylketonuria in children from 6 months to 10 years. LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 22.5 g, fat 500 mg, energy 565 kJ (135 kcal)/85 g, with vitamins, minerals, and trace elements.
PKU squeeze liquid (Vitaflor International Ltd)
2550g (ACBS) - NHS indicative price = £134.78
PKU Maxamaid®
Nutritional supplement for the dietary management of phenylketonuria in children 1-8 years. POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements.
PKU Maxamaid powder orange (Nutricia Ltd)
500g (ACBS) - NHS indicative price = £58.92
PKU Maxamaid powder unflavoured (Nutricia Ltd)
500g (ACBS) - NHS indicative price = £58.92
PKU Maxamum®
Nutritional supplement for the dietary management of phenylketonuria in children over 8 years and adults. POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements.
PKU Maxamum oral powder 50g sachets orange (Nutricia Ltd)
30 sachet (ACBS) - NHS indicative price = £273.30
PKU Maxamum oral powder 50g sachets unflavoured (Nutricia Ltd)
30 sachet (ACBS) - NHS indicative price = £273.30
PKU Maxamum powder orange (Nutricia Ltd)
500g (ACBS) - NHS indicative price = £91.14
PKU Maxamum powder unflavoured (Nutricia Ltd)
500g (ACBS) - NHS indicative price = £91.14

Tyrosinaemia
Methionine-free TYR Anamix® Infant
Nutritional supplement for the dietary management of proven tyrosinaemia type 1 in children from birth to 3 years. POWDER, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.5 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 5.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.
TYR Anamix Infant methionine free powder (Nutricia Ltd)
400g (ACBS) - NHS indicative price = £93.45
TYR Anamix® Infant
Nutritional supplement for the dietary management of proven tyrosinaemia where plasma-methionine concentrations are normal in children from birth to 3 years. POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 5.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.
TYR Anamix Infant methionine free powder (Nutricia Ltd)
400g (ACBS) - NHS indicative price = £93.45
TYR Anamix Infant powder (Nutricia Ltd)
400g (ACBS) - NHS indicative price = £93.45
**TYR Anamix® Junior**
- Nutritional supplement for the dietary management of proven tyrosinaemia in children 1–10 years.
- POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 8.4 g, carbohydrate 11 g, fat 5.9 g, energy 475 kJ (115 kcal)/29-g sachet, with vitamins, minerals, and trace elements.

**TYR Anamix® Junior Oral powder 29g sachets** (Nutricia Ltd)
- 30 sachet (ACBS) · NHS indicative price = £206.40

**TYR Anamix® Junior LQ**
- Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years and adults.
- LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 8.8 g, fat 4.8 g, fibre 310 mg, energy 500 kJ (119 kcal)/125 mL, with vitamins, minerals, and trace elements.

**TYR Anamix® Junior LQ liquid** (Nutricia Ltd)
- 125ml (ACBS) · NHS indicative price = £9.15

**TYR cooler® 15**
- Nutritional supplement for the dietary management of tyrosinaemia in children over 5 years and adults.
- LIQUID, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 7 g, fat 500 mg, energy 593 kJ (92 kcal)/150 mL, with vitamins, minerals, and trace elements.

**TYR orange cooler 15 liquid** (Vitaflo International Ltd)
- 150ml (ACBS) · NHS indicative price = £11.42

**TYR red cooler 10 liquid** (Vitaflo International Ltd)
- 87 ml (ACBS) · NHS indicative price = £7.32

**TYR red cooler 15 liquid** (Vitaflo International Ltd)
- 150 ml (ACBS) · NHS indicative price = £11.42

**TYR red cooler 20 liquid** (Vitaflo International Ltd)
- 174 ml (ACBS) · NHS indicative price = £15.29

**TYR expressS®**
- Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years and adults.
- POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 3.4 g, fat less than 100 mg, energy 310 kJ (74 kcal)/25 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1441.

**TYR express 15 oral powder 25g sachets** (Vitaflo International Ltd)
- 30 sachet (ACBS) · NHS indicative price = £336.16

**TYR express 20®**
- Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years.
- POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1441.

**TYR express 20 oral powder 34g sachets** (Vitaflo International Ltd)
- 30 sachet (ACBS) · NHS indicative price = £434.31

**TYR Gel®**
- Nutritional supplement for the dietary management of tyrosinaemia in children 1–10 years.
- GEL, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 10 g, carbohydrate 10.3 g, fat less than 100 mg, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1441.

**TYR gel oral powder 24g sachets** (Vitaflo International Ltd)
- 30 sachet (ACBS) · NHS indicative price = £216.42

**TYR Lophlex® LQ 20**
- Nutritional supplement for the dietary management of tyrosinaemia in children over 5 years and adults.
- LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, fibre 500 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements.

**TYR Lophlex LQ 20 liquid** (Nutricia Ltd)
- 125ml (ACBS) · NHS indicative price = £16.27

**TYR Maxamaid®**
- Nutritional supplement for the dietary management of tyrosinaemia in children 1–8 years.
- POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements.

**TYR Maxamaid powder** (Nutricia Ltd)
- 500 gram (ACBS) · NHS indicative price = £39.61

**XPHEN TYR Tyrosidon®**
- Nutritional supplement for the management of tyrosinaemia in children and adults where plasma-methionine concentrations are normal.
- POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.

**XPHEN TYR Tyrosidon Free AA Mix powder** (Nutricia Ltd)
- 500 gram (ACBS) · NHS indicative price = £188.69

**XPTM Tyrosidon®**
- Nutritional supplement for the dietary management of tyrosinaemia type I in children and adults where plasma-methionine concentrations are above normal.
- POWDER, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1586 kJ (326 kcal)/100 g.

**XPTM Tyrosidon powder** (Nutricia Ltd)
- 500 gram · NHS indicative price = £91.31
Appendix 3
Cautionary and advisory labels for dispensed medicines

Guidance for cautionary and advisory labels
Medicinal forms within BNF publications include code numbers of the cautionary labels that pharmacists are recommended to add when dispensing. It is also expected that pharmacists will counsel patients and carers when necessary. Counselling needs to be related to the age, experience, background, and understanding of the individual patient or carer. The pharmacist should ensure understanding of how to take or use the medicine and how to follow the correct dosage schedule. Any effects of the medicine on co-ordination, performance of skilled tasks (e.g. driving or work), any foods or medicines to be avoided, and what to do if a dose is missed should also be explained. Other matters, such as the possibility of staining of the clothes or skin, or discolouration of urine or stools by a medicine should also be mentioned.

For some medicines there is a special need for counselling, such as an unusual method or time of administration or a potential interaction with a common food or domestic remedy, and this should be mentioned where necessary.

Original packs
Most preparations are dispensed in unbroken original packs that include further advice for the patient in the form of patient information leaflets. Label 10 may be of value where appropriate. More general leaflets advising on the administration of preparations such as eye drops, eye ointments, inhalers, and suppositories are also available.

Scope of labels
In general no label recommendations have been made for injections on the assumption that they will be administered by a healthcare professional or a well-instructed patient. The labelling is not exhaustive and pharmacists are recommended to use their professional discretion in labelling new preparations and those for which no labels are shown.

Individual labelling advice is not given on the administration of the large variety of antacids. In the absence of instructions from the prescriber, and if on enquiry the patient has had no verbal instructions, the directions given under 'Dose' should be used on the label.

It is recognised that there may be occasions when pharmacists will use their knowledge and professional discretion and decide to omit one or more of the recommended labels for a particular patient. In this case counselling is of the utmost importance. There may also be an occasion when a prescriber does not wish additional cautionary labels to be used, in which case the prescription should be endorsed 'NCL.' (no cautionary labels). The exact wording that is required instead should then be specified on the prescription.

Pharmacists label medicines with various wordings in addition to those directions specified on the prescription. Such labels include 'Shake the bottle', 'For external use only', and 'Store in a cool place', as well as 'Discard..... days after opening' and 'Do not use after.....', which apply particularly to antibiotic mixtures, diluted liquid and topical preparations, and to eye drops. Although not listed in the BNF these labels should continue to be used when appropriate; indeed, 'For external use only' is a legal requirement on external liquid preparations, while 'Keep out of the reach of children' is a legal requirement on all dispensed medicines. Care should be taken not to obscure other relevant information with adhesive labelling.

It is the usual practice for patients to take standard tablets with water or other liquid and for this reason no separate label has been recommended.

The label wordings recommended by the BNF apply to medicines dispensed against a prescription. Patients should be aware that a dispensed medicine should never be taken by, or shared with, anyone other than for whom the prescriber intended it. Therefore, the BNF does not include warnings against the use of a dispensed medicine by persons other than for whom it was specifically prescribed.

The label or labels for each preparation are recommended after careful consideration of the information available. However, it is recognised that in some cases this information may be either incomplete or open to a different interpretation. The BNF will therefore be grateful to receive any constructive comments on the labelling suggested for any preparation.

Recommended label wordings
For BNF 61 (March 2011), a revised set of cautionary and advisory labels were introduced. All of the existing labels were user-tested, and the revised wording selected reflects terminology that is better understood by patients.

Wordings which can be given as separate warnings are labels 1–19, 29–30, and 32. Wordings which can be incorporated in an appropriate position in the directions for dosage or administration are labels 21–28. A label has been omitted for number 20; labels 31 and 33 no longer apply to any medicines in the BNF and have therefore been deleted.

If separate labels are used it is recommended that the wordings be used without modification. If changes are made to suit computer requirements, care should be taken to retain the sense of the original.

Welsh labels
Comprehensive Welsh translations are available for each cautionary and advisory label. These appear directly under the English label.

Labels
1 Warning: This medicine may make you sleepy
Rhybudd: Gall y fedyginiaeth hon eich gwneud yn gysglyd
To be used on preparations for children containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.

2 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol
Rhybudd: Gall y fedyginiaeth hon eich gwneud yn gysglyd. Peidwch á gyrru, defnyddio offer llaw neu beiriannau os yw hyn yn digwydd. Peidwch ag yfed alchohol
To be used on preparations for adults that can cause drowsiness, thereby affecting coordination and the ability to drive and operate hazardous machinery; label 1 is more appropriate for children. *It is an offence to drive while under the influence of drink or drugs.*

Some of these preparations only cause drowsiness in the first few days of treatment and some only cause drowsiness in higher doses.

In such cases the patient should be told that the advice applies until the effects have worn off. However many of these preparations can produce a slowing of reaction time and a loss of mental concentration that can have the same effects as drowsiness.

Avoidance of alcoholic drink is recommended because the effects of CNS depressants are enhanced by alcohol. Strict prohibition however could lead to some patients not taking...
the medicine. Pharmacists should therefore explain the risk and encourage compliance, particularly in patients who may think they already tolerate the effects of alcohol (see also label 3). Queries from patients with epilepsy regarding fitness to drive should be referred back to the patient’s doctor.

Side-effects unrelated to drowsiness that may affect a patient’s ability to drive or operate machinery safely include blurred vision, dizziness, or nausea. In general, no label has been recommended to cover these cases, but the patient should be suitably counselled.

3 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines

Rhybudd: Gall y feddygyniaeth hon eich gwneud yn gysglyd. Peidiwch â gyruf, defnyddio offer llaw neu beiriannau os yw hyn yn digwydd

To be used on preparations containing monoamine-oxidase inhibitors; the warning to avoid alcohol and deacoholised (low alcohol) drink is covered by the patient information leaflet.

Also to be used as for label 2 but where alcohol is not an issue.

4 Warning: Do not drink alcohol

Rhybudd: Peidiwch ag yfed alcohol

To be used on preparations where a reaction such as flushing may occur if alcohol is taken (e.g. metronidazole). Alcohol may also enhance the hypoglycaemia produced by some oral antidiabetic drugs but routine application of a warning label is not considered necessary.

Patients should be advised not to drink alcohol for as long as they are receiving/using a course of medication, and in some cases for a period of time after the course is finished.

5 Do not take indigestion remedies 2 hours before or after you take this medicine

Peidiwch â chymryd meddygyniaethau camdrueliad 2 awr cyn neu ar ôl y feddygyniaeth hon

To be used with label 25 on preparations coated to resist gastric acid (e.g. enteric-coated tablets). This is to avoid the possibility of premature dissolution of the coating in the presence of an alkaline pH.

Label 5 also applies to drugs such as gabapentin where the absorption is significantly affected by antacids. Pharmacists will be aware (from a knowledge of physiology) that the usual time during which indigestion remedies should be avoided is at least 2 hours before and after the majority of medicines have been taken; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

6 Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine

Peidiwch â chymryd meddygyniaethau camdrueliad neu feddygyniaethau sy’n cynnwys haearn neu sinc, 2 awr cyn neu ar ôl y feddygyniaeth hon

To be used on preparations containing olsxacin and some other quinolones, doxycycline, lymecycline, minocycline, and penicillamine. These drugs chelate calcium, iron, and zinc and are less well absorbed when taken with calcium-containing antacids or preparations containing iron or zinc. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

7 Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine

Peidiwch â chymryd laeth, meddygyniaethau camdrueliad, neu feddygyniaeth sy’n cynnwys haearn neu sinc, 2 awr cyn neu ar ôl cymryd y feddygyniaeth hon

To be used on preparations containing ciprofloxacín, norfloxacín, or tetracyclines that chelate calcium, iron, magnesium, and zinc, and are thus less available for absorption. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

Doxycycline, lymecycline, and minocycline are less liable to form chelates and therefore only require label 6 (see above).

8 Warning: Do not stop taking this medicine unless your doctor tells you to stop

Rhybudd: Peidiwch â stopio cymryd y feddygyniaeth hon, oni bai fodi eich meddyg yn dweud wrthych am stopio

To be used on preparations that contain a drug which is required to be taken over long periods without the patient necessarily perceiving any benefit (e.g. antituberculous drugs). Also to be used on preparations that contain a drug whose withdrawal is likely to be a particular hazard (e.g. clonidine for hypertension). Label 10 (see below) is more appropriate for corticosteroids.

9 Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop

Gadewch yr un faint o amser rhwng pob dôs yn ystod y dydd. Parhewch i gymryd y feddygyniaeth hon esbod y cyfan wedi’i orffen, oni bai eich bod yn cael cyngor i stopio

To be used on preparations where a course of treatment should be completed to reduce the incidence of relapse or failure of treatment.

The preparations are antimicrobial drugs given by mouth. Very occasionally, some may have severe side-effects (e.g. diarrhoea in patients receiving clindamycin) and in such cases the patient may need to be advised of reasons for stopping treatment quickly and returning to the doctor.

10 Warning: Read the additional information given with this medicine

Rhybudd: Darlennwch y wybodaeth ychwanegol gyda’r feddygyniaeth hon

To be used particularly on preparations containing anticoagulants, lithium, and oral corticosteroids. The appropriate treatment card should be given to the patient and any necessary explanations given. This label may also be used on other preparations to remind the patient of the instructions that have been given.

11 Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds

Diolgelwch eich croen rhag golau’r haul, hyd yn oed ar ddiwrnod braf ond cymylog. Peidiwch â defnyddio gwely haul

To be used on preparations that may cause phototoxic or photoallergic reactions if the patient is exposed to ultraviolet radiation. Many drugs other than those listed in Appendix 3 (e.g. phenothiazines and sulfonamides) may, on rare occasions, cause reactions in susceptible patients. Exposure to high intensity ultraviolet radiation from sunray lamps and sunbeds is particularly likely to cause reactions.

12 Do not take anything containing aspirin while taking this medicine

Peidiwch â chymryd unrhyw beth sy’n cynnwys aspirin gyda’r feddygyniaeth hon

To be used on preparations containing anticoagulants, lithium, and oral corticosteroids. This label may also be used on other preparations to remind the patient of the instructions that have been given.

Label 12 should not be used for anticoagulants since label 10 is more appropriate.

13 Dissolve or mix with water before taking

Gadewch i doddi mewn dŵr cyn ei gymryd

To be used on preparations that are intended to be dissolved in water (e.g. soluble tablets) or mixed with water (e.g. powders, granules) before use. In a few cases other liquids such as fruit juice or milk may be used.
14 This medicine may colour your urine. This is harmless
Gall y feddyginiaeth hon liwio eich dŵr. Nid yw hyn yn arwydd o ddrwgy
To be used on preparations that may cause the patient’s urine to turn an unusual colour. These include triamterene (blue under some lights), levodopa (dark reddish), and rifampicin (red).

15 Caution: flammable. Keep your body away from fire or flames
Rhybudd: Fflamadwy. Ar ôl rohi’r feddyginiaeth ymlaen, cadwch yn glir o dân neu ffilmaw
To be used on preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame.

16 Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening
Rhôwch y dabledd i doddi dan eich tafod - peidiwch â’i lyncu. Cadwch y tabledi yn y botel yma gyda’r weddi’i gau yn dynn. Gofynnwch am dabledi newyd 8 wythnos ar ôl ei hagor
To be used on glyceryl trinitrate tablets to remind the patient not to transfer the tablets to plastic or less suitable containers.

17 Do not take more than... in 24 hours
Peidiwch â chymryd mwy na... mewn 24 awr
To be used on preparations for the treatment of acute migraine except those containing ergotamine, for which label 18 is used. The dose form should be specified, e.g. tablets or capsules.
It may also be used on preparations for which no dose has been specified by the prescriber.

18 Do not take more than... in 24 hours. Also, do not take more than... in any one week
Peidiwch â chymryd mwy na... mewn 24 awr. Hefyd, peidiwch â chymryd mwy na... mewn wythnos
To be used on preparations containing ergotamine. The dose form should be specified, e.g. tablets or suppositories.

19 Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
Rhûbudd: Bydd y feddyginiaeth hon yn eich gwneud yn gysglyd. Os ydych yn dal i deimlo’n gysglyd drannoeth, peidiwch â gyrru, defnyddio offer llaw neu beiriannau. Peidiwch ag yfed alcohol
To be used on preparations containing hypnotics (or some other drugs with sedative effects) prescribed to be taken at night. On the rare occasions when hypnotics are prescribed for daytime administration (e.g. nitrazepam in epilepsy), this label would clearly not be appropriate. Also to be used as an alternative to the label 2 wording (the choice being at the discretion of the pharmacist) for anxioalytics prescribed to be taken at night.
It is hoped that this wording will convey adequately the problem of residual morning sedation after taking ‘sleeping tablets’.

20 Take with or just after food, or a meal
Cymerwch gyda neu ar ôl bwyd
To be used on preparations that are liable to cause gastric irritation, or those that are better absorbed with food.
Patients should be advised that a small amount of food is sufficient.

21 Take with or just after food, or a meal
Cymerwch gyda neu ar ôl bwyd
To be used on preparations that are liable to cause gastric irritation, or those that are better absorbed with food.
Patients should be advised that a small amount of food is sufficient.

22 Take 30 to 60 minutes before food
Cymerwch 30 i 60 munud cyn bwyd
To be used on some preparations whose absorption is thereby improved.
Most oral antibacterials require label 25 instead (see below).

23 Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
Cymerwch y feddyginiaeth hon ar stumog wag. Mae hyn yn gogygu awr cyn, neu 2 awr ar ôl bwyd
To be used on oral antibacterials whose absorption may be reduced by the presence of food and acid in the stomach.

24 Suck or chew this medicine
Bydd angen cni neu sugnro’r feddyginiaeth hon
To be used on preparations that should be sucked or chewed.
The pharmacist should use discretion as to which of these words is appropriate.

25 Swallow this medicine whole. Do not chew or crush
Llynchwch yn gyfan. Peidiwch â chni neu falu’n fân
To be used on preparations that are enteric-coated or designed for modified-release.
Also to be used on preparations that taste very unpleasant or may damage the mouth if not swallowed whole.
Patients should be advised (where relevant) that some modified-release preparations can be broken in half, but that the halved tablet should still be swallowed whole, and not chewed or crushed.

26 Dissolve this medicine under your tongue
Gadwch i’r feddyginiaeth hon doddi o dan y tafod
To be used on preparations designed for sublingual use.
Patients should be advised to hold under the tongue and avoid swallowing until dissolved. The buccal mucosa between the gum and cheek is occasionally specified by the prescriber.

27 Take with a full glass of water
Cymerwch gyda llond gwyrdd o dŵr
To be used on preparations that should be well diluted (e.g. chloral hydrate), where a high fluid intake is required (e.g. sulfonamides), or where water is required to aid the action (e.g. methylcellulose).
The patient should be advised that ‘a full glass’ means at least 150 mL. In most cases fruit juice, tea, or coffee may be used.

28 Spread thinly on the affected skin only
Taeu this medicine as appropriate. Yn unig
To be used on external preparations that should be applied sparingly (e.g. corticosteroids, dithranol).

29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
Peidiwch â chymryd mwy na 2 ar un rhwym un adeg. Peidiwch â chymryd mwy nag 8 mewn 24 awr
To be used on containers of dispensed solid dose preparations containing paracetamol for adults when the instruction on the label indicates that the dose can be taken on an ‘as required’ basis.
The dose form should be specified, e.g. tablets or capsules.
This label has been introduced because of the serious consequences of overdosage with paracetamol.

30 Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well
Yn cynnwys paracetamol. Peidiwch â chymryd unrhyw beth arall sy’n cynnwys paracetamol tra’n cymryd y feddyginiaeth hon. Siaradwch gyda’r meddyg ar unwaith os ydych yn cymryd gormod, hyd yw oed os ydych yn teimlo’n iawn
To be used on all containers of dispensed preparations containing paracetamol.

32 Contains aspirin. Do not take anything else containing aspirin while taking this medicine
Yn cynnwys aspirin. Peidiwch â chymryd unrhyw beth arall sy’n cynnwys aspirin tra’n cymryd y feddyginiaeth hon
To be used on containers of dispensed preparations containing aspirin when the name on the label does not include the word ‘aspirin’.

25 Swallow this medicine whole. Do not chew or crush
Llynchwch yn gyfan. Peidiwch â chni neu falu’n fân
To be used on preparations that are enteric-coated or designed for modified-release.
Also to be used on preparations that taste very unpleasant or may damage the mouth if not swallowed whole.
Patients should be advised (where relevant) that some modified-release preparations can be broken in half, but that the halved tablet should still be swallowed whole, and not chewed or crushed.

The correct dressing for wound management depends not only on the type of wound but also on the stage of the healing process. The principal stages of healing are: cleansing, removal of debris; granulation, vascularisation; epithelialisation. The ideal dressing for moist wound healing needs to ensure that the wound remains: moist with the volume and viscosity of exudate changes as the wound heals. There are certain circumstances where moist wound healing is not appropriate (e.g. gangrenous toes associated with vascular disease).

Advanced wound dressings are designed to control the environment for wound healing, for example to donate fluid (hydrogels), maintain hydration (hydrocolloids), or to absorb wound exudate (alginites, foams).

Practices such as the use of irritant cleansers and desloughing agents may be harmful and are largely obsolete; removal of debris and dressing remnants should need minimal irrigation with lukewarm sterile sodium chloride 0.9% solution or water.

Hydrogel, hydrocolloid, and medical grade honey dressings can be used to deslough wounds by promoting autolytic debridement; there is insufficient evidence to support any particular method of debridement for difficult-to-heal surgical wounds. Sterile larvae (maggots) are also available for biosurgical removal of wound debris.

There have been few clinical trials able to establish a clear advantage for any particular product. The choice between different dressings depends not only on the type and stage of the wound, but also on patient preference or tolerance, site of the wound, and cost. For further information, see Buyers’ Guide: Advanced wound dressings (October 2008); NHS Purchasing and Supply Agency, Centre for Evidence-based Purchasing.

Prices quoted in Appendix 4 are basic NHS net prices; for further information see Prices in the BNF under How to use the BNF.

The table below gives suggestions for choices of primary dressing depending on the type of wound (a secondary dressing may be needed in some cases).

Basic wound contact dressings

Low adherence dressing

Low adherence dressings are used as interface layers under secondary absorbent dressings. Placed directly on the wound bed, non-absorbent, low adherence dressings are suitable for clean, granulating, lightly exuding wounds without necrosis, and protect the wound bed from direct contact with secondary dressings. Care must be taken to avoid granulation tissue growing into the weave of these dressings.

**N-A Ultra dressing** (Systagenix Wound Management Ltd) 19cm × 9.5cm= £0.67, 9.5cm × 9.5cm= £0.35

**Atrauman dressing** (Paul Hartmann Ltd) 10cm × 20cm= £0.63, 20cm × 30cm= £0.74, 5cm × 5cm= £0.27, 7.5cm × 10cm= £0.28

**N-A Ultra** Warp knitted fabric manufactured from a bright viscose monofilament.

Tulle dressings are manufactured from cotton or viscose fibres which are impregnated with white or yellow soft paraffin to prevent the fibres from sticking, but this is only partly successful and it may be necessary to change the dressings frequently. The paraffin reduces absorbency of the dressing. Dressings with a reduced content (light loading) of soft paraffin are less liable to interfere with absorption; dressings with ‘normal loading’ (such as Jelonet®) have been used for skin graft transfer. Knitted viscose primary dressing is an alternative to tulle dressings for exuding wounds; it can be used as the initial layer of multi-layer compression bandaging in the treatment of venous leg ulcers.

**Knitted polyester primary dressing**

**Atrauman dressing** (Paul Hartmann Ltd) 10cm × 20cm= £0.63, 20cm × 30cm= £1.74, 5cm × 5cm= £0.27, 7.5cm × 10cm= £0.28

**N-A Ultra dressing** (Systagenix Wound Management Ltd) 19cm × 9.5cm= £0.67, 9.5cm × 9.5cm= £0.35

**N-A Ultra** Warp knitted fabric manufactured from a bright viscose monofilament.

**N-A Ultra dressing** (Systagenix Wound Management Ltd) 19cm × 9.5cm= £0.67, 9.5cm × 9.5cm= £0.35

**Profore** Warp knitted fabric manufactured from a bright viscose monofilament.

**Tricotex dressing** (Smith & Nephew Healthcare Ltd) 9.5cm × 9.5cm= £0.34

**Cuticell** (Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin; for light or normal loading

**Jelonet dressing** (Smith & Nephew Healthcare Ltd) 10cm × 10cm= £0.41

**Paraffin Gauze Dressing**

**Cuticell** (Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin; for light or normal loading

**Jelonet** (Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin; for light or normal loading

**Cuticell** (BSN medical Ltd) Classic dressing 10cm × 10cm= £0.29
Neotulle (Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin; for light or normal loading

Neotulle (Neomedic Ltd) dressing 10cm x 10cm= £0.29

Paragaue (Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin; for light or normal loading

Paragaue (C D Medical Ltd) dressing 10cm x 10cm= £0.28

Paranet (Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin; for light or normal loading

Paranet (Synergy Health Plc) dressing 10cm x 10cm= £0.25

Absorbent dressings

Perforated film absorbent dressings are suitable only for wounds with mild to moderate amounts of exudate; they are not appropriate for leg ulcers or for other lesions that produce large quantities of viscous exudate. Dressings with an absorbent cellulose or polymer wadding layer are suitable for use on moderately to heavily exuding wounds.

Absorbent cellulose dressing

CelluDress

CelluDress Dressing (Medicareplus International Ltd) 10cm x 10cm= £0.19, 10cm x 15cm= £0.20, 10cm x 20cm= £0.22, 15cm x 20cm= £0.30, 20cm x 25cm= £0.40, 20cm x 30cm= £0.85

Eclipsy

Absorbent Cellulose Dressing with Fluid Repellent Backing

Eclipsy (Advancis Medical) Boot dressing 60cm x 70cm= £13.78, dressing 15cm x 15cm= £0.97, 20cm x 30cm= £2.14, 60cm x 40cm= £8.15

Exu-Dry

Absorbent Cellulose Dressing with Fluid Repellent Backing

Exu-Dry dressing (Smith & Nephew Healthcare Ltd) 10cm x 15cm= £1.14, 15cm x 23cm= £2.32, 23cm x 38cm= £5.40

Mesorb

Cellulose wadding pad with gauze wound contact layer and non-woven repellent backing

Mesorb dressing (Mohlycke Health Care Ltd) 10cm x 10cm= £0.62, 10cm x 15cm= £0.81, 10cm x 20cm= £1.00, 15cm x 20cm= £1.43, 20cm x 25cm= £2.25, 20cm x 30cm= £2.55

Telfa Max

Absorbent Cellulose Dressing with Fluid Repellent Backing

Zetuvit E

Absorbent Cellulose Dressing with Fluid Repellent Backing; sterile or non-sterile

Zetuvit E (Paul Hartmann Ltd) non-sterile dressing 10cm x 10cm= £0.07, 10cm x 20cm= £0.09, 20cm x 20cm= £0.14, 20cm x 40cm= £0.28, sterile dressing 10cm x 10cm= £0.21, 10cm x 20cm= £0.25, 20cm x 20cm= £0.39, 20cm x 40cm= £1.11

Absorbent perforated dressing

Adpore

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Adpore dressing (Medicareplus International Ltd) 10cm x 10cm= £0.10, 10cm x 15cm= £0.16, 10cm x 20cm= £0.30, 10cm x 25cm= £0.34, 10cm x 30cm= £0.42, 10cm x 35cm= £0.50, 7cm x 8cm= £0.08

Cosmopore E

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Cosmopore E dressing (Paul Hartmann Ltd) 10cm x 20cm= £0.46, 10cm x 25cm= £0.56, 10cm x 35cm= £0.78, 5cm x 7.2cm= £0.08, 8cm x 10cm= £0.18, 8cm x 15cm= £0.28

Cutiplast Steril

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Cutiplast Steril dressing (Smith & Nephew Healthcare Ltd) 10cm x 20cm= £0.31, 10cm x 25cm= £0.32, 10cm x 30cm= £0.43, 8cm x 10cm= £0.11, 8cm x 15cm= £0.25

Leukomed

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Leukomed dressing (BSM medical Ltd) 10cm x 20cm= £0.44, 10cm x 25cm= £0.49, 10cm x 30cm= £0.63, 10cm x 35cm= £0.73, 5cm x 7.2cm= £0.09, 8cm x 10cm= £0.19, 8cm x 15cm= £0.33

Medipore + Pad

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Medipore + Pads dressing (3M Health Care Ltd) 10cm x 10cm= £0.15, 10cm x 15cm= £0.25, 10cm x 20cm= £0.37, 10cm x 25cm= £0.46, 10cm x 35cm= £0.64, 5cm x 7.2cm= £0.07

Medisafe

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Medisafe dressing (Neomedic Ltd) 6cm x 8cm= £0.08, 8cm x 10cm= £0.13, 8cm x 12cm= £0.23, 9cm x 15cm= £0.29, 9cm x 20cm= £0.34, 9cm x 25cm= £0.36

Mepore

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Mepore dressing (Mohlycke Health Care Ltd) 10cm x 11cm= £0.22, 11cm x 15cm= £0.36, 7cm x 8cm= £0.11, 9cm x 20cm= £0.44, 9cm x 25cm= £0.61, 9cm x 30cm= £0.70, 9cm x 35cm= £0.76

PremierPore

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

PremierPore dressing (Shermond) 10cm x 10cm= £0.12, 10cm x 15cm= £0.18, 10cm x 20cm= £0.32, 10cm x 25cm= £0.36, 10cm x 30cm= £0.45, 10cm x 35cm= £0.52, 5cm x 7cm= £0.05

Primapore

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Primapore dressing (Smith & Nephew Healthcare Ltd) 10cm x 20cm= £0.44, 10cm x 25cm= £0.50, 10cm x 30cm= £0.63, 10cm x 35cm= £0.97, 6cm x 8.3cm= £0.18, 8cm x 10cm= £0.19, 8cm x 15cm= £0.34

Softpore

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Softpore dressing (Richardson Healthcare Ltd) 10cm x 10cm= £0.13, 10cm x 15cm= £0.20, 10cm x 20cm= £0.35, 10cm x 25cm= £0.40, 10cm x 30cm= £0.49, 10cm x 35cm= £0.58, 6cm x 7cm= £0.06

Sterifix

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Telfa Island

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Telfa Island dressing (Aria Medical Ltd) 10cm x 12.5cm= £0.27, 10cm x 20cm= £0.35, 10cm x 25.5cm= £0.45, 10cm x 35cm= £0.62, 5cm x 10cm= £0.08

Absorbent perforated plastic film faced dressing

Absopad

Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Absopad dressing (Medicareplus International Ltd) 10cm x 10cm= £0.13, 20cm x 10cm= £0.28

Askina Pad

Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Askina (B.Braun Medical Ltd) Pad dressing 10cm x 10cm= £0.21
Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Interpose
Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Melolin
Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Melolin dressing (Smith & Nephew Healthcare Ltd) 10cm × 10cm= £0.28, 20cm × 10cm= £0.54, 5cm × 5cm= £0.17

Skintact
Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Skintact dressing (Robinson Healthcare) 10cm × 10cm= £0.17, 20cm × 10cm= £0.34, 5cm × 5cm= £0.10

Solviline N
Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Solviline N dressing (Lohmann & Rauscher (UK) Ltd) 10cm × 10cm= £0.18, 20cm × 10cm= £0.36, 5cm × 5cm= £0.10

Telfa
Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Telfa dressing (Aria Medical Ltd) 10cm × 7.5cm= £0.16, 15cm × 7.5cm= £0.18, 20cm × 7.5cm= £0.29, 7.5cm × 5cm= £0.10

Super absorbent cellulose and polymer primary dressing

Curea PI
Super absorbent cellulose and polymer primary dressing

Curea PI dressing (Charles S. Bullen Stomacare Ltd) 10cm × 10cm square= £2.15, 10cm × 30cm rectangular= £3.64, 10cm × 30cm rectangular= £5.20, 12cm × 12cm square= £2.65, 20cm × 20cm square= £6.89, 20cm × 30cm rectangular= £10.03, 7.5cm × 7.5cm square= £1.72

Curea P2
Super absorbent cellulose and polymer primary dressing (non-adherent)

Curea P2 dressing (Charles S. Bullen Stomacare Ltd) 10cm × 20cm rectangular= £4.49, 11cm × 11cm square= £2.47, 20cm × 20cm square= £7.82, 20cm × 30cm rectangular= £10.60

Cutisorb Ultra
Super absorbent cellulose and polymer primary dressing

Cutisorb Ultra dressing (BSN medical Ltd) 10cm × 10cm square= £2.13, 10cm × 20cm rectangular= £3.56, 20cm × 20cm square= £6.66, 20cm × 30cm rectangular= £10.06

DryMax Extra
Super absorbent cellulose and polymer primary dressing

DryMax Extra dressing (Aspen Medical Europe Ltd) 10cm × 10cm square= £0.87, 10cm × 20cm rectangular= £1.04, 20cm × 20cm square= £1.84, 20cm × 30cm rectangular= £2.33

ELECT Superabosorber
Super absorbent cellulose and polymer primary dressing

ELECT Superabosorber dressing (Smith & Nephew Healthcare Ltd) 10cm × 10cm square= £0.96, 10cm × 20cm rectangular= £1.13, 20cm × 20cm square= £2.01, 20cm × 30cm rectangular= £2.54

Zetuvit Plus
Super absorbent cellulose primary dressing

Zetuvit Plus dressing (Paul Hartmann Ltd) 10cm × 10cm= £0.64, 10cm × 20cm= £0.88, 15cm × 20cm= £1.01, 20cm × 25cm= £1.38, 20cm × 40cm= £2.13

Super absorbent hydroconductive dressing

Dartex dressing (Martindale Pharmaceuticals Ltd) 10cm × 1.3m= £16.00, 10cm × 10cm= £2.24, 10cm × 1m= £16.00, 20cm × 20cm= £6.00, 20cm × 1m= £25.00, 20cm × 20cm= £6.98, 5cm × 5cm= £0.95, 7.5cm × 1m= £15.50, 7.5cm × 7.5cm= £1.77

Advanced wound dressings

Hydrogel dressings
Hydrogel dressings are most commonly supplied as an amorphous, cohesive topical application that can take up the shape of a wound. A secondary, non-absorbing dressing is needed. These dressings are generally used to donate liquid to dry sloughy wounds and facilitate autolytic debridement of necrotic tissue; some also have the ability to absorb very small amounts of exudate. Hydrogel products that do not contain propylene glycol should be used if the wound is to be treated with larval therapy. Hydrogel sheets have a fixed structure and limited fluid-handling capacity; hydrogel sheet dressings are best avoided in the presence of infection, and are unsuitable for heavily exuding wounds.

Hydrogel application (amorphous)

ActivHeal Hydrogel
Hydrogel containing guar gum and propylene glycol

ActivHeal (Advanced Medical Solutions Ltd) Hydrogel dressing= £1.41

Aquaform
Hydrogel containing modified starch copolymer

AquaForm (Aspen Medical Europe Ltd) Hydrogel dressing= £2.02

Askina Gel
Hydrogel containing modified starch and glycerol

Askina (B.Braun Medical Ltd) Gel dressing= £2.03

Cutimed
Hydrogel

Cutimed (BSN medical Ltd) Gel dressing= £3.05

Flexigran
Hydrogel containing modified starch and glycerol

Flexigran (A1 Pharmaceuticals) Gel dressing= £1.90

GranuGel
Hydrogel containing carboxymethylcellulose, pectin and propylene glycol

GranuGel (Convatec Ltd) Hydrocolloid Gel dressing= £2.35

Intraseal Gel
Hydrogel containing modified carmellose polymer and propylene glycol

IntraSite (Smith & Nephew Healthcare Ltd) Gel dressing= £3.63

Nu-Gel
Hydrogel containing alginate and propylene glycol

Nu-Gel (Systagenix Wound Management Ltd) dressing= £2.09

Purilon Gel
Hydrogel containing carboxymethylcellulose and calcium alginate

Purilon (Coloplast Ltd) Gel dressing= £2.30

Hydrogel sheet dressings

ActiFormCool
Hydrogel dressing

ActiFormCool sheet (Activa Healthcare Ltd) 10cm × 10cm square= £2.66, 10cm × 15cm rectangular= £3.83, 20cm × 20cm square= £8.01, 5cm × 6.5cm rectangular= £1.81

Aquaflo
Hydrogel dressing

Aquaflo (Covidien (UK) Commercial Ltd) sheet 7.5cm discs= £2.60

Coolie
Hydrogel dressing (without adhesive border)

Coolie (Zederbraun Ltd) sheet 7cm discs= £1.96
Vapour-permeable films and membranes

**Gel FX**
Hydrogel dressing (without adhesive border)
**Gel FX sheet** (Synergy Health Plc) 10cm x 10cm square = £1.60, 15cm x 15cm square = £3.20

**Geliperm**
Hydrogel sheets
**Geliperm** (Geistlich Sons Ltd) sheet 10cm x 10cm square = £2.53

**Hydrosorb**
Absorbent, transparent, hydrogel sheets containing polyurethane polymers covered with a semi-permeable film
**Hydrosorb sheet** (Paul Hartmann Ltd) 10cm x 10cm square = £2.26, 20cm x 20cm square = £6.77, 5cm x 7.5cm rectangular = £1.58

**Hydrosorb Comfort**
Absorbent, transparent, hydrogel sheets containing polyurethane polymers covered with a semi-permeable film (with adhesive border, waterproof)
**Hydrosorb Comfort sheet** (Paul Hartmann Ltd) 12.5cm x 12.5cm square = £3.61, 4.5cm x 6.5cm rectangular = £1.87, 7.5cm x 10cm rectangular = £2.48

**Intrasite Conformable**
Soft non-woven dressing impregnated with Intrasite® gel
**IntraSite Conformable dressing** (Smith & Nephew Healthcare Ltd) 10cm x 10cm square = £1.82, 10cm x 20cm rectangular = £2.46, 10cm x 40cm rectangular = £4.40

**Novogel**
Glycerol-based hydrogel sheets (standard or thin)
**Novogel sheet** (Ford Medical Associates Ltd) 10cm x 10cm square = £3.18, 15cm x 20cm rectangular = £6.07, 20cm x 40cm rectangular = £11.56, 30cm x 30cm (0.15cm thickness) square = £12.71, (0.30cm thickness) square = £13.47, 5cm x 7.5cm rectangular = £1.99, 7.5cm diameter circular = £2.89

**SanoSkin NET**
Hydrogel sheet (without adhesive border)
**SanoSkin** (Ideal Medical Solutions Ltd) NET sheet 8.5cm x 12cm rectangular = £2.28

**Vacunet**
Non-adherent, hydrogel coated polyester net dressing
**Vacunet dressing** (Proxet Healthcare Ltd) 10cm x 10cm square = £1.93, 10cm x 15cm rectangular = £2.86

**Sodium hyaluronate dressings**
The hydrating properties of sodium hyaluronate promote wound healing, and dressings can be applied directly to the wound, or to a primary dressing (a secondary dressing should also be applied). The iodine and potassium iodide in these dressings prevent the bacterial decay of sodium hyaluronate in the wound. 
**Hyiodine** should be used with caution in thyroid disorders.

**Hyiodine**
Sodium hyaluronate 1.5%, potassium iodide 0.15%, iodine 0.1%, in a viscous solution
**Hyiodine** (H & R Healthcare Ltd) dressing = £35.00

**Vapour-permeable films and membranes**
Vapour-permeable films and membranes allow the passage of water vapour and oxygen but are impermeable to water and micro-organisms, and are suitable for lightly exuding wounds. They are highly conformable, provide protection, and a moist healing environment; transparent film dressings permit constant observation of the wound. Water vapour loss can occur at a slower rate than exudate is generated, so that fluid accumulates under the dressing, which can lead to tissue maceration and to wrinkling at the adhesive contact site (with risk of bacterial entry). Newer versions of these dressings have increased moisture vapour permeability. Despite these advances, vapour-permeable films and membranes are unsuitable for infected, large heavily exuding wounds, and chronic leg ulcers. Vapour-permeable films and membranes are suitable for partial-thickness wounds with minimal exudate, or wounds with eschar. Most commonly, they are used as a secondary dressing over alginates or hydrogels; film dressings can also be used to protect the fragile skin of patients at risk of developing minor skin damage caused by friction or pressure.

**Non-woven fabric dressing with viscose-rayon pad.**

**Niko Fix**
For intravenous and subcutaneous catheter sites
**Niko** (Unomedical Ltd) Fix dressing 7cm x 8.5cm = £0.19

**Vapour-permeable Adhesive Film Dressing (Semi-permeable Adhesive Dressing)**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

**Askina Derm**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
**Askina Derm dressing** (B.Braun Medical Ltd) 10cm x 12cm = £1.10, 10cm x 20cm = £2.08, 15cm x 20cm = £2.52, 20cm x 30cm = £4.51, 6cm x 7cm = £0.38

**C-View**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
**C-View dressing** (Aspen Medical Europe Ltd) 10cm x 12cm = £1.02, 12cm x 12cm = £1.09, 15cm x 20cm = £2.36, 6cm x 7cm = £0.38

**Dressfilm**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
**Dressfilm** (St Georges Medical Ltd) dressing 15cm x 20cm = £1.90

**Hydrolfilm**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
**Hydrolfilm dressing** (Paul Hartmann Ltd) 10cm x 12.5cm = £0.42, 10cm x 15cm = £0.53, 10cm x 25cm = £0.82, 12cm x 25cm = £0.87, 15cm x 20cm = £0.97, 20cm x 30cm = £1.61, 6cm x 7cm = £0.23

**Hypafix Transparent**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
**Hypafix Transparent** (BSN medical Ltd) dressing 10cm x 2m = £8.88

**Leukomed T**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
**Leukomed T dressing** (BSN medical Ltd) 10cm x 12.5cm = £1.04, 11cm x 14cm = £1.25, 15cm x 20cm = £2.40, 15cm x 25cm = £2.56, 7.2cm x 5cm = £0.38, 8cm x 10cm = £0.71

**Mepitel Film**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
**Mepitel Film dressing** (Molnlycke Health Care Ltd) 10.5cm x 12cm = £1.31, 10.5cm x 25cm = £2.55, 15.5cm x 20cm = £3.24, 6.5cm x 7cm = £0.49

**Mepore Film**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
**Mepore Film dressing** (Molnlycke Health Care Ltd) 10cm x 12cm = £1.23, 10cm x 25cm = £2.39, 15cm x 20cm = £3.04, 6cm x 7cm = £0.46

**OpSite Flexifix**
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
**OpSite Flexifix dressing** (Smith & Nephew Healthcare Ltd) 10cm x 1m = £6.67, 5cm x 1m = £3.95
OpSite Flexigrid
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

OpSite Flexigrid dressing (Smith & Nephew Healthcare Ltd) 12cm × 12cm = £1.14, 15cm × 20cm = £2.88, 6cm × 7cm = £0.40

Polyskin II
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Kendall Film dressing (Aria Medical Ltd) 10cm × 12cm = £1.03, 15cm × 20cm = £2.04, 15cm × 20cm = £2.35, 20cm × 25cm = £4.11, 4cm × 4cm = £0.36, 5cm × 7cm = £0.40

ProtectFilm
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

ProtectFilm dressing (Wallace, Cameron & Company Ltd) 10cm × 12cm = £0.20, 15cm × 20cm = £0.40, 6cm × 7cm = £0.11

Suprasorb F
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Suprasorb F dressing (Lohmann & Rauscher (UK) Ltd) 10cm × 12cm = £0.81, 15cm × 20cm = £2.52, 5cm × 7cm = £0.34

Tegaderm
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Tegaderm Film dressing (3M Health Care Ltd) 10cm × 12cm = £1.11, 15cm × 20cm = £2.41, 6cm × 7cm = £0.39

Tegaderm diamond
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Tegaderm Diamond dressing (3M Health Care Ltd) 10cm × 12cm = £1.21, 6cm × 7cm = £0.45

Vellafilm
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Vellafilm dressing (Advancis Medical) 12cm × 12cm = £1.10, 12cm × 35cm = £0.75, 15cm × 20cm = £2.10

Vapour-permeable Adhesive Film Dressing with absorbent pad

Adapore Ultra
Film dressing with absorbent pad

Adapore Ultra dressing (Mediceplus International Ltd) 10cm × 10cm = £0.14, 10cm × 15cm = £0.22, 10cm × 20cm = £0.33, 10cm × 25cm = £0.35, 15cm × 20cm = £0.52, 7cm × 8cm = £0.12

Vapour-permeable Adhesive Film Dressing with absorbent pad

Alldress
Film dressing with absorbent pad

Alldress dressing (Molynxe Health Care Ltd) 10cm × 10cm = £0.96, 15cm × 15cm = £2.10, 15cm × 20cm = £2.59

C-View Post-Op
Film dressing with absorbent pad

C-View Post-Op dressing (Aspen Medical Europe Ltd) 10cm × 12cm = £1.10, 10cm × 25cm = £1.60, 10cm × 35cm = £2.60, 6cm × 7cm = £0.40

Clearpore
Film dressing with absorbent pad

Clearpore dressing (Richardsioneer Healthcare Ltd) 10cm × 10cm = £0.20, 10cm × 15cm = £0.24, 10cm × 20cm = £0.36, 10cm × 25cm = £0.40, 10cm × 30cm = £0.65, 6cm × 10cm = £0.15, 6cm × 7cm = £0.12

Hydrolfilm Plus
Film dressing with absorbent pad

Hydrolfilm Plus dressing (Paul Hartmann Ltd) 10cm × 20cm = £0.46, 10cm × 25cm = £0.61, 10cm × 30cm = £0.69, 7.2cm × 5cm = £0.18, 9cm × 10cm = £0.27, 9cm × 15cm = £0.30

Leukomed T Plus
Film dressing with absorbent pad

Leukomed T plus dressing (BSN medical Ltd) 10cm × 20cm = £1.36, 10cm × 25cm = £1.53, 10cm × 30cm = £2.56, 10cm × 35cm = £3.11, 7.2cm × 5cm = £0.27, 8cm × 10cm = £0.54, 8cm × 15cm = £0.82

Mepore Film & Pad
Film dressing with absorbent pad

Mepore Film & Pad dressing (Molynxe Health Care Ltd) 4cm × 5cm = £0.24, 5cm × 7cm = £0.24, 9cm × 10cm = £0.62, 9cm × 15cm = £0.92, 9cm × 20cm = £1.36, 9cm × 25cm = £1.50, 9cm × 30cm = £2.01, 9cm × 35cm = £2.50

Mepore Ultra
Film dressing with absorbent pad

Mepore Ultra dressing (Molynxe Health Care Ltd) 10cm × 11cm = £0.80, 11cm × 15cm = £1.18, 7cm × 8cm = £0.40, 9cm × 20cm = £1.51, 9cm × 25cm = £1.67, 9cm × 30cm = £2.75

OpSite Plus
Film dressing with absorbent pad

OpSite Plus dressing (Smith & Nephew Healthcare Ltd) 10cm × 12cm = £1.21, 10cm × 20cm = £0.94, 10cm × 35cm = £3.38, 6.5cm × 5cm = £0.33, 8.5cm × 9.5cm = £0.89

OpSite Post-op
Film dressing with absorbent pad

OpSite Post-op dressing (Smith & Nephew Healthcare Ltd) 10cm × 12cm = £1.19, 10cm × 20cm = £2.00, 10cm × 25cm = £2.52, 10cm × 30cm = £2.98, 10cm × 35cm = £3.32, 8.5cm × 15.5cm = £1.21, 8.5cm × 9.5cm = £0.87

Pharmapore-PU
Film dressing with absorbent pad

Pharmapore-PU dressing (Wallace, Cameron & Company Ltd) 10cm × 25cm = £0.38, 10cm × 30cm = £0.58, 8.5cm × 15.5cm = £0.20

PremierPore VP
Film dressing with absorbent pad

PremierPore VP dressing (Shermond) 10cm × 10cm = £0.16, 10cm × 15cm = £0.24, 10cm × 20cm = £0.36, 10cm × 25cm = £0.38, 10cm × 30cm = £0.57, 10cm × 35cm = £0.69, 5cm × 7cm = £0.13

Tegaderm
Film dressing with absorbent pad

Tegaderm + Pad dressing (3M Health Care Ltd) 5cm × 7cm = £0.26, 9cm × 10cm = £0.65, 9cm × 15cm = £0.95, 9cm × 20cm = £1.40, 9cm × 25cm = £1.57, 9cm × 35cm = £2.60

Tegaderm Absorbent Clear
Film dressing with clear acrylic polymer oval-shaped pad or rectangular-shaped pad

Tegaderm Absorbent Clear Acrylic dressing (3M Health Care Ltd) 11.1cm × 12.7cm oval = £4.11, 14.2cm × 15.8cm oval = £5.78, 14.9cm × 15.2cm rectangular = £8.66, 16.8cm × 19cm sacral = £10.37, 20cm × 20.3cm rectangular = £13.91, 7.6cm × 9.5cm oval = £3.17

Vapour-permeable transparent film dressing with adhesive foam border.

Central Gard
For intravenous and subcutaneous catheter sites

Central Gard dressing (Unomedical Ltd) 16cm × 7cm = £0.96, 16cm × 8.8cm = £1.05

Easi-V
For intravenous and subcutaneous catheter sites

Easi-V (ConvaTec Ltd) dressing 7cm × 7.5cm = £0.38

Vapour-permeable transparent, adhesive film dressing.

Hydrofilm I.V. Control
For intravenous and subcutaneous catheter sites

Hydrofilm (Paul Hartmann Ltd) I.V. Control dressing 7cm × 9cm = £0.31

Vapour-permeable, transparent, adhesive film dressing.

IV3000
For intravenous and subcutaneous catheter sites

IV3000 dressing (Smith & Nephew Healthcare Ltd) 10cm × 12cm = £1.41, 5cm × 6cm = £0.43, 6cm × 7cm = £0.56, 7cm × 9cm = £0.74, 9cm × 12cm = £1.47
Mepore IV
For intravenous and subcutaneous catheter sites
Mepore IV dressing (Molyncke Health Care Ltd) 10cm × 11cm = £1.07, 5cm × 5.5cm = £0.31, 8cm × 9cm = £0.40

Pharmapore-PU IV
For intravenous and subcutaneous catheter sites
Pharmapore-PU IV dressing (Wallace, Cameron & Company Ltd) 6cm × 7cm = £0.08, 7cm × 8.5cm = £0.07, 7cm × 9cm = £0.17

Tegaderm IV
For intravenous and subcutaneous catheter sites
Tegaderm IV dressing with securing tapes (3M Health Care Ltd) 10cm × 15.5cm = £1.67, 7cm × 8.5cm = £0.99, 8.5cm × 10.5cm = £1.16

Soft polymer dressings
Dressings with soft polymer, often a soft silicone polymer, in a non-adherent or gently adherent layer are suitable for use on lightly to moderately exuding wounds. For moderately to heavily exuding wounds, an absorbent secondary dressing can be added, or a soft polymer dressing with an absorbent pad can be used. Wound contact dressings coated with soft silicone have gentle adhesive properties and can be used on fragile skin areas or where it is beneficial to reduce the frequency of primary dressing changes. Soft polymer dressings should not be used on heavily bleeding wounds; blood clots can cause the dressing to adhere to the wound surface. For silicone keloid dressings see under Specialised dressings.

Cellulose dressings
Sorbion Sachet Border
Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope, with adhesive border
Cutimed Sorbion Sachet Border dressing (BSN medical Ltd) 10cm × 10cm square= £2.98, 15cm × 15cm square= £4.54, 25cm × 15cm rectangular= £7.06

Sorbion Sachet EXTRA
Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope
Cutimed Sorbion Sachet Extra dressing (BSN medical Ltd) 10cm × 10cm= £2.27, 20cm × 10cm= £3.77, 20cm × 20cm= £7.08, 30cm × 20cm= £10.09, 5cm × 5cm= £1.47, 7.5cm × 7.5cm= £1.80

Sorbion Sachet Multi Star
Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope
Cutimed Sorbion Sachet Multi Star dressing (BSN medical Ltd) 14cm × 14cm = £4.94, 8cm × 8cm = £3.02

Sorbion Sachet S Drainage
Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope (‘Y’ shaped dressing)
Cutimed (BSN medical Ltd) Sorbion Sachet S drainage dressing 10cm × 10cm = £2.67

Suprasorb X
Biosynthetic cellulose fibre dressing
Suprasorb X dressing (Lohmann & Rauscher (UK) Ltd) 14cm × 20cm rectangular= £8.46, 2cm × 21cm roller= £6.58, 5cm × 5cm square= £2.05, 9cm × 9cm square= £4.27

With absorbent pad
Advazorb Border
Soft silicone wound contact dressing with polyurethane foam film backing and adhesive border
Advazorb Border dressing (Advancis Medical) 10cm × 10cm= £2.10, 10cm × 20cm= £2.90, 10cm × 30cm= £4.25, 12.5cm × 12.5cm= £2.58, 15cm × 15cm= £3.15, 20cm × 20cm= £5.46, 7.5cm × 7.5cm = £1.19

Advazorb Border Lite
Soft silicone wound contact dressing with polyurethane foam film backing and adhesive border
Advazorb Border Lite dressing (Advancis Medical) 10cm × 10cm = £1.89, 10cm × 20cm= £2.61, 10cm × 30cm= £3.83, 12.5cm × 12.5cm= £2.32, 15cm × 15cm= £2.84, 20cm × 20cm= £4.91, 7.5cm × 7.5cm= £1.07

Advazorb Silfix
Soft silicone wound contact dressing with polyurethane foam film backing
Advazorb Silfix dressing (Advancis Medical) 10cm × 10cm= £1.85, 10cm × 20cm= £3.18, 12.5cm × 12.5cm= £2.59, 15cm × 15cm= £3.36, 20cm × 20cm= £4.98, 7.5cm × 7.5cm= £0.99

Advazorb Silfix Lite
Soft silicone wound contact dressing with polyurethane foam film backing
Advazorb Silfix Lite dressing (Advancis Medical) 10cm × 10cm= £1.67, 10cm × 20cm= £2.86, 12.5cm × 12.5cm= £2.33, 15cm × 15cm= £3.02, 20cm × 20cm= £4.48, 7.5cm × 7.5cm= £0.89

Allevyn Gentle
Soft gel wound contact dressing, with polyurethane foam film backing
Allevyn Gentle dressing (Smith & Nephew Healthcare Ltd) 10cm × 10cm= £2.53, 10cm × 20cm= £4.07, 15cm × 15cm= £4.25, 20cm × 20cm= £6.78, 5cm × 5cm= £1.27

Allevyn Gentle Border
Silicone gel wound contact dressing, with polyurethane foam film backing
Allevyn Gentle Border dressing (Smith & Nephew Healthcare Ltd) Heel dressing 23cm × 23.2cm= £9.74, dressing 10cm × 10cm= £2.21, 12.5cm × 12.5cm= £2.71, 17.5cm × 17.5cm= £5.34, 7.5cm × 7.5cm= £1.51,

Allevyn Gentle Border Lite
Silicone gel wound contact dressing, with polyurethane foam film backing
Allevyn Gentle Border Lite dressing (Smith & Nephew Healthcare Ltd) 10cm × 10cm= £2.18, 15cm × 15cm= £3.85, 5.5cm × 12cm= £1.86, 5cm × 5cm= £0.91, 8cm × 15cm= £3.47

Allevyn Life
Soft silicone wound contact dressing, with central mesh screen, polyurethane foam film backing and adhesive border
Allevyn Life dressing (Smith & Nephew Healthcare Ltd) 10.3cm × 10.3cm= £1.71, 12.9cm × 12.9cm= £2.51, 15.4cm × 15.4cm= £3.06, 21cm × 21cm= £6.04

Cutimed Siltec
Soft silicone wound contact dressing, with polyurethane foam film backing
Cutimed Siltec (BSN medical Ltd) Heel dressing 16cm × 24cm= £7.29, Sacrum dressing 17.5cm × 17.5cm= £4.64, 23cm × 23cm= £7.43, dressing 10cm × 10cm= £2.51, 10cm × 20cm= £4.14, 15cm × 15cm= £4.69, 20cm × 20cm= £7.11, 5cm × 6cm= £1.34,

Cutimed Siltec B
Soft silicone wound contact dressing, with polyurethane foam film backing, with adhesive border, for lightly to moderately exuding wounds
Cutimed Siltec B dressing (BSN medical Ltd) 12.5cm × 12.5cm= £3.30, 15cm × 15cm= £5.08, 17.5cm × 17.5cm= £5.35, 22.5cm × 22.5cm= £8.64, 7.5cm × 7.5cm= £1.56

Cutimed Siltec L
Soft silicone wound contact dressing, with polyurethane foam film backing, for lightly to moderately exuding wounds
Cutimed Siltec L dressing (BSN medical Ltd) 10cm × 10cm = £2.16, 15cm × 15cm = £3.55, 5cm × 6cm = £1.07

Eclypse Adherent
Soft silicone wound contact layer with absorbent pad and film backing
Eclypse Adherent dressing (Advancis Medical) 10cm × 10cm= £2.99, 10cm × 20cm= £3.75, 15cm × 15cm= £4.99, 20cm × 20cm= £9.99, 17cm × 19cm sacral= £3.76, 22cm × 23cm sacral= £6.23

Flivasorb
Absorbent polymer dressing with non-adherent wound contact layer
Flivasorb dressing (Lohmann & Rauscher (UK) Ltd) 10cm × 10cm square= £0.89, 10cm × 20cm rectangular= £1.06, 20cm × 20cm square= £1.88, 20cm × 30cm rectangular= £2.37

<td></td>
</tr>
<tr>
<td><strong>Hydrocolloid dressings</strong></td>
<td>Hydrocolloid dressings are usually presented as a hydrocolloid layer on a vapour-permeable film or foam pad. Semi-permeable to water vapour and oxygen, these dressings form a gel in the presence of exudate to facilitate rehydration in lightly to moderately exuding wounds and promote autolytic debridement of dry, sloughy, or necrotic wounds; they are also suitable for promoting granulation. Hydrocolloid-fibrous dressings made from modified carmellose fibres resemble alginate dressings; hydrocolloid-fibrous dressings are more absorptive and suitable for moderately to heavily exuding wounds.</td>

</table>
With adhesive border

**Biatain Super**
Semi-permeable hydrocolloid dressing; without adhesive border

**Biatain Super dressing (adhesive)** (Coloplast Ltd) 10cm × 10cm square= £2.18, 12.5cm × 12.5cm square= £3.60, 15cm × 15cm rectangular= £3.61, 15cm × 15cm square= £4.35, 20cm × 20cm square= £6.78

**Granuflex Bordered**
Hydrocolloid wound contact layer bonded to plastic foam layer, with outer semi-permeable polyurethane film

**Granuflex Bordering dressing** (Convatec Ltd) 10cm × 10cm square= £3.37, 10cm × 13cm triangular= £3.97, 15cm × 15cm square= £6.43, 15cm × 18cm triangular= £6.19, 6cm × 6cm square= £1.78

**Hydocoll Border**
Hydrocolloid dressing with adhesive border and absorbent wound contact pad

**Hydocoll Border (bevelled edge) dressing** (Paul Hartmann Ltd) 10cm × 10cm square= £4.75, 12cm × 12cm square= £5.64, 15cm × 15cm square= £8.57, 5cm × 5cm square= £1.01, 7.5cm × 7.5cm square= £1.67, 6cm × 12cm concave= £2.14

**Tegaderm Hydrocolloid**
Hydrocolloid dressing with adhesive border; normal or thin

**Tegaderm Hydrocolloid (3M Health Care Ltd) Thin dressing** 10cm × 12cm oval= £1.55, 13cm × 15cm oval= £2.89, dressing 10cm × 12cm oval= £2.33, 13cm × 15cm oval= £4.34, 17.1cm × 16.1cm sacral= £4.85

**Ultec Pro**
Semi-permeable hydrocolloid dressing with adhesive border

**Ultec Pro dressing (adhesive)** (Covidien (UK) Commercial Ltd) 15cm × 18cm sacral= £3.30, 19.5cm × 23cm sacral= £4.98, 21cm × 21cm square= £4.67

**Without adhesive border**

**ActivHeal Hydrocolloid**
Semi-permeable polyurethane film backing, hydrocolloid wound contact layer, with or without polyurethane foam later

**ActivHeal Hydrocolloid** (Advanced Medical Solutions Ltd) dressing 10cm × 10cm square= £1.58, 15cm × 15cm square= £3.43, 15cm × 18cm sacral= £3.98, 5cm × 7.5cm rectangular= £0.78, foam backed dressing 10cm × 10cm square= £1.55, 15cm × 15cm square= £2.91, 15cm × 18cm sacral= £3.36, 5cm × 7.5cm rectangular= £0.97

**Askina Biofilm Transparent**
Semi-permeable, polyurethane film dressing with hydrocolloid adhesive

**Askina Biofilm Transparent dressing** (B.Braun Medical Ltd) 10cm × 10cm square= £1.08, 20cm × 20cm square= £3.20

**Biatain Super**
Semi-permeable, hydrocolloid film dressing without adhesive border

**Biatain Super dressing (non-adhesive)** (Coloplast Ltd) 10cm × 10cm square= £2.18, 12.5cm × 12.5cm square= £3.60, 15cm × 15cm rectangular= £3.61, 15cm × 15cm square= £4.35, 20cm × 20cm square= £6.78

**Comfeel Plus Contour**
Hydrocolloid dressings containing carmelllose sodium and calcium alginate

**Comfeel Plus Contour dressing** (Coloplast Ltd) 6cm × 8cm= £2.23, 9cm × 11cm= £3.87

**Comfeel Plus Pressure Relieving**
Hydrocolloid dressings containing carmelllose sodium and calcium alginate

**Comfeel Plus Pressure Relieving dressing** (Coloplast Ltd) 10cm diameter circular= £4.66, 15cm diameter circular= £7.01, 7cm diameter circular= £3.48

**Comfeel Plus Transparent**
Hydrocolloid dressings containing carmelllose sodium and calcium alginate

**Comfeel Plus Transparent dressing** (Coloplast Ltd) 10cm × 10cm square= £1.28, 15cm × 15cm square= £3.35, 15cm × 20cm rectangular= £3.40, 20cm × 20cm square= £3.42, 5cm × 15cm rectangular= £1.59, 5cm × 25cm rectangular= £2.59, 9cm × 7cm rectangular= £0.67, 9cm × 14cm rectangular= £2.44, 9cm × 25cm rectangular= £3.47

**Comfeel Plus Ulcer**
Hydrocolloid dressings containing carmelllose sodium and calcium alginate

**Comfeel Plus Ulcer (bevelled edge) dressing** (Coloplast Ltd) 10cm × 10cm square= £2.46, 18cm × 20cm triangular= £5.73, 20cm × 20cm square= £7.59, 4cm × 6cm rectangular= £0.96

**DuoDERM Extra Thin**
Semi-permeable hydrocolloid dressing

**DuoDERM Extra Thin dressing** (Convatec Ltd) 10cm × 10cm square= £1.33, 15cm × 15cm square= £2.88, 5cm × 10cm rectangular= £0.77, 7.5cm × 7.5cm square= £0.81, 9cm × 15cm rectangular= £1.78, 9cm × 25cm rectangular= £2.85, 9cm × 35cm rectangular= £3.98

**DuoDERM Signal**
Semi-permeable hydrocolloid dressing with ‘Time to change’ indicator

**DuoDERM Signal dressing** (Convatec Ltd) 10cm × 10cm square= £2.14, 11cm × 19cm oval= £3.28, 14cm × 14cm square= £3.75, 18.5cm × 19.5cm heel= £5.25, 20cm × 20cm square= £7.46, 22.5cm × 20cm sacral= £6.13

**Flexigran**
Semi-permeable hydrocolloid dressing without adhesive border; normal or thin

**Flexigran (A1 Pharmaceuticals) Thin dressing** 10cm × 10cm square= £1.08, dressing 10cm × 10cm square= £2.19

**Granuflex**
Hydrocolloid wound contact layer bonded to plastic foam layer, with outer semi-permeable polyurethane film

**Granuflex (modified dressing)** (Convatec Ltd) 10cm × 10cm square= £2.83, 15cm × 15cm square= £5.36, 15cm × 20cm rectangular= £5.81, 20cm × 20cm square= £8.07

**Hydocoll Basic**
Hydrocolloid dressing with absorbent wound contact pad

**Hydocoll (Paul Hartmann Ltd) Basic dressing** 10cm × 10cm square= £2.47

**Hydocoll Thin Film**
Thin hydrocolloid dressing with absorbent wound contact pad

**Hydocoll Thin Film dressing** (Paul Hartmann Ltd) 10cm × 10cm square= £1.16, 15cm × 15cm square= £2.61, 7.5cm × 7.5cm square= £0.70

**Nu-Derm**
Semi-permeable hydrocolloid dressing (normal and thin)

**Nu-Derm dressing** (Systagenix Wound Management Ltd) 10cm × 10cm square= £1.56, 15cm × 15cm square= £3.18, 15cm × 18cm sacral= £4.45, 20cm × 20cm square= £6.36, 5cm × 5cm square= £0.85, 8cm × 12cm heel/elbow= £3.18, thin 10cm × 10cm square= £1.06

**Tegaderm Hydrocolloid**
Hydrocolloid dressing without adhesive border; normal and thin

**Tegaderm Hydrocolloid** (3M Health Care Ltd) Thin dressing 10cm × 10cm square= £1.55, dressing 10cm × 10cm square= £2.37

**Ultec Pro**
Semi-permeable hydrocolloid dressing; without adhesive border

**Ultec Pro dressing** (Covidien (UK) Commercial Ltd) 10cm × 10cm square= £2.28, 15cm × 15cm square= £4.44, 20cm × 20cm square= £6.69

**Foam dressings**
Dressings containing hydrophilic polyurethane foam (adhesive or non-adhesive), with or without plastic film-backing, are suitable for all types of exuding wounds, but not for dry wounds; some foam dressings have a moisture-sensitive film backing with variable permeability dependant
on the level of exudate. Foam dressings vary in their ability to absorb exudate; some are suitable only for lightly to moderately exuding wounds, others have greater fluid-handling capacity and are suitable for heavily exuding wounds. Saturated foam dressings can cause maceration of healthy skin if left in contact with the wound. Foam dressings can be used in combination with other primary wound contact dressings. If used under compression bandaging or compression garments, the fluid-handling capacity of the foam dressing may be reduced. Foam dressings can also be used to provide a protective cushion for fragile skin. A foam dressing containing ibuprofen is available and may be useful for treating painful exuding wounds.

**Cavi-Care**
Soft, conforming cavity wound dressing prepared by mixing thoroughly for 15 seconds immediately before use and allowing to expand its volume within the cavity

**Polymem Foam Dressing**

Alginate dressings
  Non-woven or fibrous, non-occlusive, alginate dressings, made from calcium alginate, or calcium sodium alginate, derived from brown seaweed, form a soft gel in contact with wound exudate. Alginate dressings are highly absorbent and suitable for use on exuding wounds, and for the promotion of autolytic debridement of debris in very moist wounds. Alginate dressings also act as a haemostatic, but caution is needed because blood clots can cause the dressing to adhere to the wound surface. Alginate dressings should not be used if bleeding is heavy and extreme caution is needed if used for tumours with friable tissue. Alginate sheets are suitable for use as a wound contact dressing for moderately to heavily exuding wounds and can be layered into deep wounds; alginate rope can be used in sinus and cavity wounds to improve absorption of exudate and prevent maceration. If the dressing does not have an adhesive border or integral adhesive plastic film backing, a secondary dressing will be required.

ActivHeal Alginate
  Calcium sodium alginate dressing

ActivHeal Alginate dressing

Calcium alginate dressing

**Suprasorb A** (Lohmann & Rauscher (UK) Ltd) alginate dressing 10 cm × 10 cm = £1.23, 5 cm × 5 cm = £0.63, cavity dressing 2g = £2.28

**Tegaderm Alginate**
Calcium alginate dressing

**Tegaderm Alginate dressing** (3M Health Care Ltd) 10 cm × 10 cm = £1.72, 2 cm × 3.4 cm = £2.87, 5 cm × 5 cm = £0.81

**Urgosorb**
Alginate and carboxymethylcellulose dressing without adhesive layer

**Urgosorb** (Urgo Ltd) Pad dressing 10 cm × 10 cm = £2.13, 10 cm × 20 cm = £3.91, 5 cm × 5 cm = £0.89, Rope dressing 30 cm = £2.79

**Capillary-acting dressings**

**Advadraw**
Non-adherent dressing consisting of a soft viscose and polyester absorbent pad with central wicking layer between two perforated permeable wound contact layers

**Advadraw dressing** (Advancis Medical) 10 cm × 10 cm = £0.88, 10 cm × 15 cm = £1.19, 15 cm × 20 cm = £1.57, 5 cm × 7.5 cm = £0.57

**Advadraw Spiral**

**Advadraw** (Advancis Medical) Spiral dressing 0.5 cm × 40 cm = £0.82

**Cerdak Aerocloth**
Non-adhesive wound contact sachet containing ceramic spheres, with non-woven fabric adhesive backing

**Cerdak Aerocloth dressing** (Apollo Medical Products Ltd) 5 cm × 10 cm = £1.94, 5 cm × 5 cm = £1.37

**Cerdak Aerofilim**
Non-adhesive wound contact sachet containing ceramic spheres, with waterproof transparent adhesive film backing

**Cerdak Aerofilim dressing** (Apollo Medical Products Ltd) 5 cm × 10 cm = £2.07, 5 cm × 5 cm = £1.51

**Cerdak Basic**
Non-adhesive wound contact sachet containing ceramic spheres

**Cerdak Basic dressing** (Apollo Medical Products Ltd) 10 cm × 10 cm = £1.56, 10 cm × 15 cm = £2.08, 5 cm × 5 cm = £0.70

**Sumar Life**

**Sumar Life dressing** (Lantor (UK) Ltd) 10 cm × 10 cm = £1.59, 10 cm × 15 cm = £2.12, 5 cm × 5 cm = £0.93

**Sumar Max**

**Sumar Max dressing** (Lantor (UK) Ltd) 10 cm × 10 cm = £1.61, 10 cm × 15 cm = £2.15, 5 cm × 5 cm = £0.95

**Sumar Spiral**

**Sumar** (Lantor (UK) Ltd) Spiral dressing 0.5 cm × 40 cm = £1.57

**Vacutex**
Low-adherent dressing consisting of two external polyester wound contact layers with central wicking polyester/cotton mix absorbent layer

**Vacutex dressing** (Haddenham Healthcare Ltd) 10 cm × 10 cm = £1.68, 10 cm × 15 cm = £2.25, 10 cm × 20 cm = £2.70, 5 cm × 5 cm = £0.95

**Odour absorbent dressings**

Dressings containing activated charcoal are used to absorb odour from wounds. The underlying cause of wound odour should be identified. Wound odour is most effectively reduced by debridement of slough, reduction in bacterial levels, and frequent dressing changes. Fungating wounds and chronic infected wounds produce high volumes of exudate which can reduce the effectiveness of odour absorbent dressings. Many odour absorbent dressings are intended for use in combination with other dressings; odour absorbent dressings with a suitable wound contact layer can be used as a primary dressing.

**Askina Carbosorb**
Activated charcoal and non-woven viscose rayon dressing

**Askina Carbosorb dressing** (B.Braun Medical Ltd) 10 cm × 10 cm = £2.92, 10 cm × 20 cm = £5.64

**CarboFLEX**
Dressing in 5 layers: wound-facing absorbent layer containing alginate and hydrocollod; water-resistant second layer; third layer containing activated charcoal; non-woven absorbent fourth layer; water-resistant backing layer

**CarboFlex dressing** (ConvaTec Ltd) 10 cm × 10 cm = £3.24, 15 cm × 20 cm = £7.38, 8 cm × 15 cm = £3.89

**Carbopad VC**
Activated charcoal non-absorbent dressing

**Carbopad VC dressing** (Synergy Health Plc) 10 cm × 10 cm = £1.62, 10 cm × 20 cm = £2.19

**Clinisorb Odour Control Dressings**
Activated charcoal cloth enclosed in viscose rayon with outer polyamide coating

**Clinisorb dressing** (Climed Ltd) 10 cm × 10 cm = £1.91, 10 cm × 20 cm = £2.54, 15 cm × 25 cm = £4.09

**Antimicrobial dressings**

Spreading infection at the wound site requires treatment with systemic antibacterials. For local wound infection, a topical antimicrobial dressing can be used to reduce the level of bacteria at the wound surface but will not eliminate a spreading infection. Some dressings are designed to release the antimicrobial into the wound, others act upon the bacteria after absorption from the wound. The amount of exudate present and the level of infection should be taken into account when selecting an antimicrobial dressing. Medical grade honey has antimicrobial and anti-inflammatory properties. Dressings impregnated with iodine can be used to treat clinically infected wounds. Dressings containing silver should be used only when clinical signs or symptoms of infection are present. Dressings containing other antimicrobials such as polihexanide (polyhexamethylene biguanide) or dialkylcarnamol chloride are available for use on infected wounds. Although hypersensitivity is unlikely with chlorhexidine impregnated tulle dressing, the antibacterial efficacy of these dressings has not been established.

**Honey**
Medical grade honey has antimicrobial and anti-inflammatory properties and can be used for acute or chronic wounds. Medical grade honey has osmotic properties, producing an environment that promotes autolytic debridement; it can help control wound malodour. Honey dressings should not be used on patients with extreme sensitivity to honey, bee stings or bee products. Patients with diabetes should be monitored for changes in blood-glucose concentrations during treatment with topical honey or honey-impregnated dressings.

For **Activon Tulle**®, where no size is stated by the prescriber the 5 cm size is to be supplied. **Medihoney® Antimicrobial Wound Gel** is not recommended for use in deep wounds or body cavities where removal of waxes may be difficult.

**Honey-based topical application**

**Activon Honey**
Medical grade manuka honey

**L-Mesitran SOFT ointment dressing**

Honey (medical grade) 40%

**L-Mesitran** (Aspen Medical Europe Ltd) SOFT ointment dressing= £3.59

**MANUKApil Honey**
Medical grade manuka honey

**MANUKApil** (Manuka Medical Ltd) dressing= £5.90

**Medihoney Antimicrobial Medical Honey**
Medical grade, Leptospermum sp.

**Medihoney** (Derma Sciences Europe, Ltd) Antimicrobial Medical Honey dressing= £9.90

**Medihoney Antimicrobial Wound Gel**
Medical grade, Leptospermum sp. 80% in natural waxes and oils

**Medihoney** (Derma Sciences Europe, Ltd) Antimicrobial Wound Gel dressing= £4.02
**Mesitran Ointment**
Honey (medical grade) 47%

**Excipients** include lanolin

Mesitran (Aspen Medical Europe Ltd) ointment dressing= £9.90

**Sheet dressing**

**Actilite**
Knitted viscose impregnated with medical grade manuka honey and manuka oil

Actilite gauze dressing (Advancis Medical) 10cm x 10cm= £0.98, 10cm x 20cm= £1.90, 5cm x 5cm= £0.57

**Activon Tulle**
Knitted viscose impregnated with medical grade manuka honey

Activon Tulle gauze dressing (Advancis Medical) 10cm x 10cm= £2.97, 5cm x 5cm= £1.80

**Algivon**
Absorbent, non-adherent calcium alginate dressing impregnated with medical grade manuka honey

Algivon dressing (Advancis Medical) 10cm x 10cm= £3.40, 5cm x 5cm= £1.98

**Algivon Plus**
Reinforced calcium alginate dressing impregnated with medical grade manuka honey

Algivon Plus (Advancis Medical) Ribbon dressing 2.5cm x 20cm= £3.36, dressing 10cm x 10cm= £3.36, 5cm x 5cm= £1.96

**L-Mesitran Border**
Hydrogel, semi-permeable dressing impregnated with medical grade honey, with adhesive border

L-Mesitran (Aspen Medical Europe Ltd) Border sheet 10cm x 10cm square= £2.74

**L-Mesitran Hydro**
Hydrogel, semi-permeable dressing impregnated with medical grade honey, without adhesive border

L-Mesitran Hydro sheet (Aspen Medical Europe Ltd) 10cm x 10cm square= £2.63, 15cm x 20cm rectangular= £5.48

**L-Mesitran Net**
Hydrogel, non-adherent wound contact layer, without adhesive border

L-Mesitran (Aspen Medical Europe Ltd) Net sheet 10cm x 10cm square= £2.53

**Medihoney Antimicrobial Honey Apinate**
Non-adherent calcium alginate dressing, impregnated with medical grade honey

Medihoney Antibacterial Honey Apinate (Derma Sciences Europe, Ltd) dressing 10cm x 10cm square= £3.40, 5cm x 5cm square= £2.00, rope dressing 1.9cm x 30cm= £4.20

**Medihoney Antibacterial Honey Tulle**
Woven fabric impregnated with medical grade manuka honey

Medihoney (Derma Sciences Europe, Ltd) Tulle dressing 10cm x 10cm= £2.98

**Medihoney Gel Sheet**
Sodium alginate dressing impregnated with medical grade honey

Medihoney Gel Sheet dressing (Derma Sciences Europe, Ltd) 10cm x 10cm= £4.20, 5cm x 5cm= £1.75

**MelMax**
Acetate wound contact layer impregnated with buckwheat honey 75% in ointment basis

MelMax dressing (CliniMed Ltd) 5cm x 6cm rectangular= £4.82, 8cm x 10cm rectangular= £9.90, 8cm x 20cm rectangular= £19.79

**Melladerm Plus Tulle**
Knitted viscose impregnated with medical grade honey (Bulgarian, mountain flower) 45% in a basis containing polyethylene glycol

Melladerm (SanoMed Manufacturing BV) Plus Tulle dressing 10cm x 10cm= £2.10

**Iodine**

Cadeoxem–iodine, like povidone–iodine, releases free iodine when exposed to wound exudate. The free iodine acts as an antiseptic on the wound surface, the cadexomer absorbs wound exudate and encourages de-sloughing. Two-component hydrogel dressings containing glucose oxidase and iodide ions generate a low level of free iodine in the presence of moisture and oxygen. Povidone–iodine fabric dressing is a knitted viscose dressing with povidone–iodine incorporated in a hydrophilic polyethylene glycol basis; this facilitates diffusion of the iodine into the wound and permits removal of the dressing by irrigation. The iodine has a wide spectrum of antimicrobial activity but it is rapidly deactivated by wound exudate. Systemic absorption of iodine may occur, particularly from large wounds or with prolonged use.

Iodosorb® and Iodosette® are used for the treatment of chronic exuding wounds; max. single application 50 g, max. weekly application 150 g; max. duration up to 3 months in any single course of treatment. They are contra-indicated in patients receiving lithium, in thyroid disorders, in pregnancy and breast feeding, and in children; they should be used with caution in patients with severe renal impairment or history of thyroid disorder.

Iodoxyme® is an antimicrobial dressing used for moderately exuding wounds. It is contra-indicated in thyroid disorders and in patients receiving lithium; it should be used with caution in children and in women who are pregnant or breast-feeding.

Oxyzyme® is used for non-infected, dry to moderately exuding wounds. It is contra-indicated in thyroid disorders and in patients receiving lithium; it should be used with caution in children and in women who are pregnant or breast-feeding.

Povidone–iodine Fabric Dressing is used as a wound contact layer for abrasions and superficial burns. It is contra-indicated in patients with severe renal impairment and in women who are pregnant or breast-feeding; it should be used with caution in patients with thyroid disease and in children under 6 months.

**Iodoflex Paste**
Iodine 0.9% as cadeoxem–iodine in a paste basis with gauze backing

**Iodosorb Ointment**
Iodine 0.9% as cadeoxem–iodine in an ointment basis

**Iodosorb Powder**
Iodine 0.9% as cadeoxem–iodine microbeads; 3-g sachet

**Iodosource Powder**
(Iodosorb (Smith & Nephew Healthcare Ltd) powder dressing sachets= £1.95

**Iodoxyme Hydrogel**
Hydrogel (two-component dressing containing glucose oxidase and iodide ions)

Iodoxyme dressing (Crawford Healthcare Ltd) 10cm x 10cm square= £12.62, 6.5cm x 5cm rectangular= £7.57

**Oxyzyme Hydrogel**
Hydrogel (two-component dressing containing glucose oxidase and iodide ions)

Oxyzyme dressing (Crawford Healthcare Ltd) 10cm x 10cm square= £10.10, 6.5cm x 5cm rectangular= £6.06

**Povidone–iodine fabric dressing**

**Inadine**

(Drug Tariff specification 43). Knitted viscose primary dressing impregnated with povidone–iodine ointment 10%

**Inadine dressing** (Systagenix Wound Management Ltd) 5cm x 5cm= £0.33, 9.5cm x 9.5cm= £0.49

**Silver**

Antimicrobial dressings containing silver should be used only when infection is suspected as a result of clinical signs or symptoms (see also notes above). Silver ions exert an antimicrobial effect in the presence of wound exudate; the
volume of wound exudate as well as the presence of infection should be considered when selecting a silver-containing dressing. Silver-impregnated dressings should not be used routinely for the management of uncomplicated ulcers. It is recommended that these dressings should not be used on acute wounds as there is some evidence to suggest they delay wound healing. Dressings impregnated with silver sulfadiazine have broad antimicrobial activity; if silver sulfadiazine is applied to large areas, or used for prolonged periods, there is a risk of blood disorders and skin discoloration. The use of silver sulfadiazine-impregnated dressings is contra-indicated in neonates, in pregnancy, and in patients with significant renal or hepatic impairment, sensitivity to sulfonamides, or G6PD deficiency. Large amounts of silver sulfadiazine applied topically may interact with other drugs—see Appendix 1 (sulfonamides).

**Calcium alginate dressing, with silver**

*Sorbsan Silver Plus dressing* (Aspen Medical Europe Ltd) 10cm x 15cm = £5.56, 10cm x 20cm = £6.77, 15cm x 20cm = £9.08, 7.5cm x 10cm = £3.35

*Sorbsan Silver Ribbon* With silver

*Sorbsan* (Aspen Medical Europe Ltd) Silver Ribbon dressing 1g = £4.15

*Sorbsan Silver Surgical Packing* With silver

*Sorbsan* (Aspen Medical Europe Ltd) Silver Packing dressing 2g = £5.76

**Suprasorb A + Ag**

Calcium alginate dressing, with silver

**Suprasorb A + Ag** (Lohmann & Rauscher (UK) Ltd) dressing 10cm x 10cm = £4.11, 10cm x 20cm = £7.59, 5cm x 5cm = £1.63, rope dressing 2g = £6.08.

**Tegaderm Alginate Ag**

Calcium alginate and carboxymethylcellulose dressing, with silver

**Tegaderm Alginate Ag dressing** (3M Health Care Ltd) 10cm x 10cm = £3.24, 3cm x 30cm = £3.70, 5cm x 5cm = £1.39

**Urgosorb Silver**

Alginate and carboxymethylcellulose dressing, impregnated with silver

**Urgosorb Silver** (Urgo Ltd) Rope dressing 2.5cm x 30cm = £3.71, dressing 10cm x 10cm = £6.95, 10cm x 20cm = £5.94, 5cm x 5cm = £1.54

**Foam dressings**

**Acticoat Moisture Control**

Three layer polyurethane dressing consisting of a silver coated layer, a foam layer, and a waterproof layer

**Acticoat Moisture Control dressing** (Smith & Nephew Healthcare Ltd) 10cm x 10cm square = £16.95, 10cm x 20cm rectangular = £33.04, 5cm x 5cm square = £7.25

**Allevyn Ag**

Silver sulfadiazine impregnated polyurethane foam film dressing with or without adhesive border

**Allevyn Ag** (Smith & Nephew Healthcare Ltd) Adhesive dressing 10cm x 10cm square = £5.55, 12.5cm x 12.5cm square = £7.30, 17.5cm x 17.5cm square = £14.04, 17cm x 17cm sacral = £10.96, 22cm x 22cm sacral = £14.69, 7.5cm x 7.5cm square = £3.53, Heel Non-Adhesive dressing 10.5cm x 13.5cm = £10.87, Non-Adhesive dressing 10cm x 10cm square = £6.20, 15cm x 15cm square = £11.76, 20cm x 20cm square = £17.22, 5cm x 5cm square = £3.29

**Biatain Ag**

Silver impregnated polyurethane foam film dressing, with or without adhesive border

**Biatain Ag** (Coloplast Ltd) cavity dressing 5cm x 8cm = £4.07, dressing 10cm x 10cm square = £8.16, 10cm x 20cm rectangular = £15.00, 12.5cm x 12.5cm square = £9.34, 15cm x 15cm square = £16.38, 18cm x 18cm square = £18.73, 19cm x 20cm heel = £18.47, 20cm x 20cm square = £23.11, 23cm x 23cm sacral = £19.63, 5cm x 7cm rectangular = £3.35

**PolyMem Silver**

Silver impregnated polyurethane foam film dressing, with or without adhesive border

**PolyMem Silver** (Aspen Medical Europe Ltd) WIC dressing 8cm x 8cm = £7.05, dressing 10.8cm x 10.8cm square = £8.86, 12.7cm x 8.8cm oval = £5.60, 17cm x 19cm rectangular = £17.76, 5cm x 7.6cm oval = £2.27

**UrgoCell Silver**

Non-adherent, polyurethane foam film dressing with silver in wound contact layer

**UrgoCell Silver dressing** (Urgo Ltd) 10cm x 10cm = £5.95, 15cm x 20cm = £10.90, 6cm x 6cm = £4.33

**Hydrocolloid dressings**

**Aquacel Ag**

Soft non-woven pad containing hydrocolloid fibres, (silver impregnated)

**Aquacel Ag** (Convatec Ltd) Ribbon dressing 1cm x 45cm = £3.12, 2cm x 45cm = £4.76, dressing 10cm x 10cm square = £4.74, 15cm x 15cm square = £8.92, 20cm x 30cm rectangular = £22.12, 4cm x 10cm rectangular = £2.88, 4cm x 20cm rectangular = £3.76, 4cm x 30cm rectangular = £5.63

**Physiotulle Ag**

Non-adherent polyester fabric with hydrocolloid and silver sulfadiazine

**Physiotulle** (Coloplast Ltd) dressing 10cm x 10cm = £2.28
Low adherence dressing

**Acticoat**
Three-layer antimicrobial barrier dressing consisting of a polyurethane foam dressing with acetate fabric coated with dialkylcarbamoyl chloride, with adhesive border

**Acticoat dressing** (Smith & Nephew Healthcare Ltd) 10cm × 10cm rectangular= £8.65, 10cm × 20cm rectangular= £13.53, 20cm × 40cm rectangular= £46.28, 5cm × 5cm square= £3.54

**Acticoat 7**
Five-layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 7-day wear)

**Acticoat 7 dressing** (Smith & Nephew Healthcare Ltd) 10cm × 12.5 cm rectangular= £18.34, 15cm × 15cm square= £32.97, 5cm × 5cm square= £6.16

**Acticoat Flex 3**
Conformable antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 3-day wear)

**Acticoat Flex 3 dressing** (Smith & Nephew Healthcare Ltd) 10cm × 10cm square= £8.73, 10cm × 20cm rectangular= £13.64, 20cm × 40cm rectangular= £46.69, 5cm × 5cm square= £3.57

**Acticoat Flex 7**
Conformable antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 7-day wear)

**Acticoat Flex 7 dressing** (Smith & Nephew Healthcare Ltd) 10cm × 12.5cm rectangular= £18.50, 15cm × 15cm square= £33.27, 5cm × 5cm square= £6.21

**Atrauma Ag**
Non-adherent polyamide fabric impregnated with silver and neutral triglycerides

**Atrauma Ag dressing** (Paul Hartmann Ltd) 10cm × 10cm= £1.26, 10cm × 20cm= £2.47, 5cm × 5cm= £0.52

**Soft polymer dressings**

**Allevyn Ag Gentle**
Soft polymer wound contact dressing, with silver sulfadiazine impregnated polyurethane foam layer, with or without adhesive border

**Allevyn Ag Gentle** (Smith & Nephew Healthcare Ltd) Border dressing 10cm × 10cm= £6.43, 12.5cm × 12.5cm= £8.26, 17.5cm × 17.5cm= £15.75, 7.5cm × 7.5cm= £4.28, dressing 10cm × 10cm= £5.24, 10cm × 20cm= £10.31, 15cm × 15cm= £11.61, 20cm × 20cm= £12.19, 5cm × 5cm= £3.35

**Mepilex**
Soft silicone wound contact dressing with polyurethane foam film backing, with silver, with or without adhesive border

**Mepilex** (Molnlycke Health Care Ltd) Ag dressing 10cm × 10cm= £6.12, 10cm × 20cm= £10.09, 15cm × 15cm= £11.36, 20cm × 20cm= £16.84, 20cm × 50cm= £63.20, Border Ag dressing 10cm × 12.5cm= £6.16, 10cm × 20cm= £8.97, 10cm × 30cm= £13.46, 15cm × 17.5cm= £11.31, 17cm × 20cm= £14.66, 7cm × 7.5cm= £3.41, Border Sacrum Ag dressing 18cm × 18cm= £11.83, 20cm × 20cm= £14.58, 23cm × 23cm= £18.69, Heel Ag dressing 13cm × 20cm= £12.78, 15cm × 22cm= £14.32

**Urgotol Silver**
Non-adherent soft polymer wound contact dressing, with silver

**Urgotol Silver dressing** (Urgo Ltd) 10cm × 12cm= £3.58, 15cm × 20cm= £9.75

**Urgotol Duo Silver**
Non-adherent soft polymer wound contact dressing, with silver and charcoal

**With charcoal**

**Actisorb Silver 220**
Knitted fabric of activated charcoal, with one-way stretch, with silver residues, within spun-bonded nylon sleeve

**Actisorb Silver 220 dressing** (Systagenix Wound Management Ltd) 10.5cm × 10.5cm= £2.58, 10.5cm × 19cm= £4.70, 6.5cm × 9.5cm= £1.64

**Other antimicrobials**

**Cutimed Siltec Sorbact**
Polyurethane foam dressing with acetate fabric coated with dialkylcarbamoyl chloride, with adhesive border

**Cutimed Siltec Sorbact dressing** (BSN medical Ltd) 12.5cm × 12.5cm= £6.51, 15cm × 15cm= £8.07, 17.5cm × 17.5cm= £11.29, 22.5cm × 22.5cm= £17.17, 7.5cm × 7.5cm= £2.54, 17.5cm × 17.5cm sacral= £8.16, 23cm × 23cm sacral= £12.26

**Cutimed Sorbact**
Low adherence acetate tissue impregnated with dialkylcarbamoyl chloride; dressing pad, swabs, round swabs or ribbon gauze, cotton

**Cutimed Sorbact** (BSN medical Ltd) Ribbon dressing 2cm × 50cm= £4.08, 5cm × 200cm= £8.03, Round swab 3cm= £3.33, dressing pad 10cm × 10cm= £5.55, 10cm × 20cm= £8.67, 7cm × 9cm= £3.56, swab 4cm × 6cm= £1.67, 7cm × 9cm= £2.78

**Cutimed Sorbact Gel**
Hydrogel dressing impregnated with dialkylcarbamoyl chloride

**Cutimed Sorbact Gel dressing** (BSN medical Ltd) 7.5cm × 15cm rectangular= £4.52, 7.5cm × 7.5cm square= £2.68

**Cutimed Sorbact Hydroactive**
Non-adhesive gel dressing with hydropolymer matrix and acetate fabric coated with dialkylcarbamoyl chloride

**Cutimed Sorbact Hydroactive dressing** (BSN medical Ltd) 14cm × 14cm= £5.42, 14cm × 24cm= £8.69, 15cm × 19cm= £10.21, 24cm × 24cm= £15.47, 7cm × 8.5cm= £3.71

**Cutimed Sorbact Hydroactive B**
Gel dressing with hydropolymer matrix and acetate fabric coated with dialkylcarbamoyl chloride, with adhesive border

**Cutimed Sorbact Hydroactive B dressing** (BSN medical Ltd) 10cm × 10cm= £7.16, 10cm × 20cm= £11.47, 15cm × 15cm= £13.48, 5cm × 6.5cm= £4.02

**Flaminal Forte gel**
Alginate with glucose oxidase and lactoperoxidase, for moderately to heavily exuding wounds

**Flaminal Forte dressing** (Flenn Health UK Ltd) 15g= £7.73, 50g= £25.60

**Flaminal Hydro gel**
Alginate with glucose oxidase and lactoperoxidase, for lightly to moderately exuding wounds

**Flaminal Hydro gel dressing** (Flenn Health UK Ltd) 15g= £7.73, 50g= £25.60

**Kendall AMD**
Foam dressing with polyhexamidine, without adhesive border

**Kendall AMD Antimicrobial foam dressing** (Aria Medical Ltd) 10cm × 10cm square= £4.71, 10cm × 20cm rectangular= £8.92, 15cm × 15cm= £8.92, 20cm × 20cm square= £13.07, 5cm × 5cm square= £2.50, 8.8cm × 7.5cm rectangular (fenestrated)= £4.23

**Kendall AMD Plus**
Foam dressing with polyhexamidine, without adhesive border

**Kendall AMD Antimicrobial Plus foam dressing** (Aria Medical Ltd) 10cm × 10cm square= £4.94, 8.8cm × 7.5cm rectangular (fenestrated)= £4.43

**Oncolin Wound gel**
Wound gel, hydroxyethylcellulose and propylene glycol, with octenidine hydrochloride

**Oncolin Wound gel dressing** (Schulke & Mayr Ltd) 20ml= £4.78

**Prontosan Wound Gel**
Hydrogel containing betaine surfactant and polihexanide

**Prontosan Wound Gel dressing** (B. Braun Medical Ltd) 30ml= £6.44

**Suprasorb X + PHMB**
Biosynthetic cellulose fibre dressing with polyhexanide

**Suprasorb X + PHMB dressing** (Lohmann & Rauscher (UK) Ltd) 14cm × 20cm rectangular= £11.64, 2cm × 21cm rope= £7.25, 5cm × 5cm square= £2.57, 5cm × 9cm square= £5.12
Specialised dressings

Protease-modulating matrix dressings
Cadesorb Ointment
Cadesorb (Smith & Nephew Healthcare Ltd) ointment = £9.32

Catrix dressing (Crangane Healthcare Ltd) sachets = £3.80

Promogran
Collagen and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing

Promogran dressing (Systagenix Wound Management Ltd) 123 square cm = £15.62, 28 square cm = £5.19

Promogran Prisma Matrix
Collagen, silver and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing

Promogran Prisma dressing (Systagenix Wound Management Ltd) 123 square cm = £17.98, 28 square cm = £6.31

UrgoStart
Soft adherent polymer matrix containing nano-oligosaccharide factor (NOSF), with polyurethane foam film backing

UrgoStart dressing (Urgo Ltd) 10cm × 10cm = £6.16, 15cm × 20cm = £11.08, 6cm × 6cm = £4.45, 12cm × 19cm heel = £8.49

UrgoStart Contact
Non-adherent soft polymer wound contact dressing containing nano-oligosaccharide factor (NOSF)

UrgoStart (Urgo Ltd) Contact dressing 5cm × 7cm = £3.00

Silicone keloid dressings
Silicone gel and gel sheets are used to reduce or prevent hypertrophic and keloid scarring. They should not be used on open wounds. Application times should be increased gradually. Silicone sheets can be washed and reused.

Silicone gel

Bapscarcare
Silicone gel

Bapscarcare (BAP Medical UK Ltd) gel = £17.00

Clitech
Silicone gel

Clitech (Su-Med International (UK) Ltd) gel = £50.00

Dermatix
Silicone gel

Dermatix gel (Meda Pharmaceuticals Ltd) = £60.53

Kelo-cote UV
Silicone gel with SPF 30 UV protection

Kelo-cote (Sinclair IS Pharma Plc) UV gel = £17.88

Kelo-cote gel
Silicone gel

Kelo-cote (Sinclair IS Pharma Plc) gel = £51.00

Kelo-cote spray
Silicone spray

Kelo-cote (Sinclair IS Pharma Plc) spray = £51.00

NewGel+E
Silicone gel with vitamin E

NewGel+E (Advantedge Surgical Ltd) gel = £17.70

ScarSil
Silicone gel

ScarSil (Jobskin Ltd) gel = £15.19

Silgel STC-SE
Silicone gel

Silgel (Nagor Ltd) STC-SE gel = £19.00

Silicone sheets

Advisal Conform
Self-adhesive silicone gel sheet with polyurethane film backing

Advisal Conform sheet (Advancis Medical) 10cm × 10cm square = £5.20, 15cm × 10cm rectangular = £9.17

Bapscarcare T
Self-adhesive silicone gel sheet

Bapscarcare T sheet (BAP Medical UK Ltd) 10cm × 15cm rectangular = £9.00, 5cm × 30cm rectangular = £9.00, 5cm × 7cm rectangular = £3.15

Cica-Care
Soft, self-adhesive, semi-occlusive silicone gel sheet with backing

Cica-Care sheet (Smith & Nephew Healthcare Ltd) 15cm × 12cm rectangular = £28.82, 5cm × 12cm rectangular = £14.79

Clitech
Silicone gel sheet

Clitech sheet (Su-Med International (UK) Ltd) 10cm × 10cm square = £7.50, 10cm × 20cm rectangular = £12.50, 15cm × 15cm square = £14.00

Dermatix
Self-adhesive silicone gel sheet (clear- or fabric-backed)

Dermatix (Meda Pharmaceuticals Ltd) Clear sheet 13cm × 13cm square = £15.79, 13cm × 25cm rectangular = £28.53, 20cm × 30cm rectangular = £51.97, 4cm × 13cm rectangular = £6.88, Fabric sheet 13cm × 13cm square = £15.79, 13cm × 25cm rectangular = £28.53, 20cm × 30cm rectangular = £51.97, 4cm × 13cm rectangular = £6.88

Mepiform
Self-adhesive silicone gel sheet with polyurethane film backing

Mepiform sheet (Mohlycke Health Care Ltd) 4cm × 31cm rectangular = £11.02, 5cm × 7cm rectangular = £3.49, 9cm × 18cm rectangular = £13.64

Scar FX
Self-adhesive, transparent, silicone gel sheet

Scar FX sheet (Jobskin Ltd) 10cm × 20cm rectangular = £16.00, 22.5cm × 14.5cm shaped = £12.00, 25.5cm × 30.5cm rectangular = £60.00, 3.75cm × 22.5cm rectangular = £12.00, 7.5cm diameter shaped = £8.50

Silgel
Silicone gel sheet

Silgel sheet (Nagor Ltd) 10cm × 10cm square = £13.50, 10cm × 30cm rectangular = £31.50, 10cm × 5cm rectangular = £7.50, 15cm × 10cm rectangular = £19.50, 20cm × 20cm square = £40.00, 25cm × 15cm shaped = £21.12, 30cm × 5cm rectangular = £19.50, 40cm × 40cm square = £144.00, 46cm × 8.5cm shaped = £39.46, 5.5cm diameter shaped = £4.00

Adjunct dressings and appliances

Surgical absorbents
Surgical absorbents applied directly to the wound have many disadvantages—dehydration of and adherence to the wound,
shredding of fibres, and the leakage of exudate ('strike through') with an associated risk of infection. Gauze and cotton absorbent dressings can be used as secondary layers in the management of heavily exuding wounds (but see also Capillary-action dressings). Absorbent cotton gauze fabric can be used for swabbing and cleaning skin. Ribbon gauze can be used post-operatively to pack wound cavities, whereas adherence to the wound bed will cause bleeding and tissue damage on removal of the dressing—an advanced wound dressing (e.g. hydrocolloid-fibrous, foam, or alginate) layered into the cavity is often more suitable.

Cotton

**Absorbent Cotton, BP**
Carded cotton fibres of not less than 10 mm average staple length, available in rolls and balls

**Absorbent** (Robert Bailey & Son Plc) cotton BP 1988

**Absorbent Cotton, Hospital Quality**
As for absorbent cotton but lower quality materials, shorter staple length etc.

**Absorbent** (Robert Bailey & Son Plc) cotton hospital quality

**Gauze and cotton tissue**

**Gamgee Tissue (blue)**
Consists of absorbent cotton enclosed in absorbent cotton gauze type 12 or absorbent cotton and viscose gauze type 2 Gamgee (Robinson Healthcare) tissue blue label

**Gamgee Tissue (pink)**
Consists of absorbent cotton enclosed in absorbent cotton gauze type 12 or absorbent cotton and viscose gauze type 2 Gamgee (Robinson Healthcare) tissue pink label DT

**Gauze and tissue**

**Absorbent Cotton Gauze, BP 1988**
Cotton fabric of plain weave, in rolls and as swabs (see below), usually Type 13 light, sterile

**Absorbent** (Robert Bailey & Son Plc) cotton BP 1988

**Alvita** (Alliance Healthcare (Distribution) Ltd) absorbent cotton BP 1988

**Clini** (CliniSupplies Ltd) absorbent cotton BP 1988

**Vernaid** (Synergy Health Plc) absorbent cotton BP 1988

**Absorbent Cotton and Viscose Ribbon Gauze, BP 1988**
Woven fabric in ribbon form with fast selvedge edges, warp threads of cotton, weft threads of viscose or combined cotton and viscose yarn, sterile

**Vernaid Fast Edge ribbon gauze sterile** (Synergy Health Plc) 1.25cm, 2.5cm

**Lint**

**Absorbent Lint, BPC**
Cotton cloth of plain weave with nap raised on one side from warp yarns

**Absorbent** (Robinson Healthcare) lint

**Alvita** (Alliance Healthcare (Distribution) Ltd) absorbent lint BPC

**Clini** (CliniSupplies Ltd) absorbent lint BPC

**Pads**

**Drisorb**
Absorbent Dressing Pads, Sterile

**Drisorb** (Synergy Health Plc) dressing pad 10cm × 20cm= £0.17

**PremierPad**
Absorbent Dressing Pads, Sterile

**PremierPad dressing pad** (Shermond) 10cm × 20cm= £0.18, 20cm × 20cm= £0.25

**XuPad**
Absorbent Dressing Pads, Sterile

**Xupad dressing pad** (Richardson Healthcare Ltd) 10cm × 20cm= £0.17, 20cm × 20cm= £0.28, 20cm × 40cm= £0.40

**Wound drainage pouches**
Wound drainage pouches can be used in the management of wounds and fistulas with significant levels of exudate.

**Biotrol Draina 5**
Wound drainage pouch

**Biotrol Draina 5 wound drainage bag** (B.Braun Medical Ltd) large (Transparent)= £96.45, medium (Transparent)= £78.43, mini (Transparent)= £78.66

**Biotrol Draina 5 Vision**
Wound drainage pouch

**Draina 5 Vision** (B.Braun Medical Ltd) 100 wound drainage bag= £125, 24, 50 wound drainage bag= £102.17, 75 wound drainage bag= £107.94

**Eakin Access window**
For use with Eakin® pouches

**Eakin** (Pelican Healthcare Ltd) access window large= £38.14

**Eakin Wound pouch, bung closure**
Wound pouch, bung closure

**Eakin wound drainage bag with bung closure** (Pelican Healthcare Ltd) large= £103.52, medium= £76.28, small= £54.49, and access window for horizontal wounds, extra large= £103.52, for horizontal wounds, extra large= £92.63, for vertical incision wounds, extra large= £92.63, wounds, extra large= £92.63

**Eakin Wound pouch, fold and tuck closure**
Wound pouch, fold and tuck closure

**Eakin wound drainage bag with fold and tuck closure** (Pelican Healthcare Ltd) large= £92.63, medium= £70.83, small= £49.04, extra large= £81.73

**Option Wound Manager**
Wound drainage bag

**Option wound manager bag** (Oakmed Ltd) large= £160.22, medium= £134.42, small= £131.50, square= £140.27, extra small= £118.23

**Option Wound Manager with access port**
Wound drainage bag, with access port

**Option wound manager bag with access port** (Oakmed Ltd) large= £171.27, medium= £140.27, small= £137.34, square= £146.11, extra small= £129.28

**Option Wound Manager, cut to fit**
Wound drainage bag, cut to fit

**Option wound manager bag** (Oakmed Ltd) large= £84.23, medium= £80.42, small= £72.59

**Welland Fistula bag**
Wound drainage bag, cut-to-fit

**Welland (Welland Medical Ltd) Fistula wound drainage bag= £82.93**

**Physical debridement pads**
DebiSoft® is a pad that is used for the debridement of superfi cial wounds containing loose slough and debris, and for the removal of hyperkeratosis from the skin. DebiSoft® must be fully moistened with a wound cleansing solution before use and is not appropriate for use as a wound dressing.

**DebiSoft Pad**
Polyester fibres with bound edges and knitted outer surface coated with polyacrylate

DebiSoft (Lohmann & Rauscher (UK) Ltd) pad 10cm × 10cm= £6.45

**Complex adjunct therapies**

**Topical negative pressure therapy**

**Accessories**

**Renasy**
Soft port and connector

**Renasy** (Smith & Nephew Healthcare Ltd) Soft Port= £11.21, connector for use with soft port= £3.29

**V.A.C.**
Drape, gel for canister, Sensa T.R.A.C. Pad

Sensa T.R.A.C.® (KCI Medical Ltd) pad= £10.95

T.R.A.C.® (KCI Medical Ltd) connector= £3.13

V.A.C.® (KCI Medical Ltd) drape= £9.39, gel strips= £3.76

**Venturi**
Gel patches, adhesive, and connector

**Venturi** (Talley Group Ltd) adhesive gel patch= £15.00, connector= £15.00

**WoundASSIST gel strip**
WoundASSIST (Huntleigh Healthcare Ltd) TNP gel strip= £3.37
Vacuum assisted closure products

**Exsu-Fast kit 1**
Dressing Kit
Exsu-Fast (Synergy Health Plc) dressing kit 1= £28.04

**Exsu-Fast kit 2**
Dressing Kit
Exsu-Fast (Synergy Health Plc) dressing kit 2= £35.83

**Exsu-Fast kit 3**
Dressing Kit
Exsu-Fast (Synergy Health Plc) dressing kit 3= £35.83

**Exsu-Fast kit 4**
Dressing Kit
Exsu-Fast (Synergy Health Plc) dressing kit 4= £28.04

**V.A.C. GranuFoam**
Polyurethane foam dressing (with adhesive drapes and pad connector); with or without silver
V.A.C. GranuFoam (KCI Medical Ltd) dressing kit= £32.04, Small/medium= £28.04, medium= £28.79, dressing kit large= £31.70, medium= £27.32, small= £22.95

**V.A.C. Simplace**
Spiral-cut polyurethane foam dressings, vapour-permeable adhesive film dressings (with adhesive drapes and pad connector)
V.A.C. Simplace EX dressing kit (KCI Medical Ltd) medium= £30.58, small= £26.60

**V.A.C. WhiteFoam**
Polyvinyl alcohol foam dressing or dressing kit
V.A.C. WhiteFoam dressing (KCI Medical Ltd) large= £17.04, small= £10.64, kit large= £33.54, small= £25.91

**Venturi**
Wound sealing kit, flat drain; with or without channel drain
Venturi wound sealing kit with (Talley Group Ltd) channel drain= £15.00, flat drain, large= £17.50, standard= £15.00

**WoundASSIST**
Wound pack and channel drain
WoundASSIST TNP dressing pack (Huntleigh Healthcare Ltd) medium= £23.85, small/medium= £20.81, channel drain medium/large= £23.85, small/medium= £20.81, extra large= £34.05

**Wound drainage collection devices**

**ActiV.A.C.**
Canister with gel
ActiV.A.C. (KCI Medical Ltd) canister with gel= £28.42

**S-Canister**
Canister kit
S-Canister (Smith & Nephew Healthcare Ltd) kit= £19.00

**V.A.C. Freedom**
Canister with gel
V.A.C. (KCI Medical Ltd) Freedom Canister with gel= £28.85

**Venturi**
Canister kit with solidifier
Venturi (Talley Group Ltd) Compact canister kit= £12.50, canister kit= £12.50

**WoundASSIST wound pack**
Canister
WoundASSIST (Huntleigh Healthcare Ltd) TNP canister= £20.30

Wound care accessories

**Dressing packs**
The role of dressing packs is very limited. They are used to provide a clean or sterile working surface; some packs shown below include cotton wool balls, which are not recommended for use on wounds.

**Multiple Pack Dressing No. 1**
Contains absorbent cotton, absorbent cotton gauze type 13 light (sterile), open-wove bandages (banded)
Vernaid (Synergy Health Plc) multiple pack dressing

**Non-drug tariff specification sterile dressing packs**

**Dressit**
Vitrex gloves, large apron, disposable bag, paper towel, soft swabs, adsorbent pad, sterile field
Dressit sterile dressing pack (Richardson Healthcare Ltd) with medium/large gloves= £0.60, small/medium gloves= £0.60

**Nurse It**
Contains latex-free, powder-free nitrite gloves, sterile laminated paper sheet, large apron, non-woven swabs, paper towel, disposable bag, compartmented tray, disposable forceps, paper measuring tape
Nurse It sterile dressing pack (Medicareplus International Ltd) with medium/large gloves= £0.55, small/medium gloves= £0.55

**Polyfield Nitrile Patient Pack**
Contains powder-free nitrite gloves, laminated sheet, non-woven swabs, towel, polyethylene disposable bag, apron
Polyfield Nitrile Patient Pack (Shemond) with large gloves= £0.52, medium gloves= £0.52, small gloves= £0.52

**Sterile Dressing Pack with Non-Woven Pads**

**Vernaid**
Vernaid (Synergy Health Plc) sterile dressing pack with non-woven pads

**Sterile dressing packs**

**Vernaid**
(Drug Tariff specification 10). Contains gauze and cotton tissue pad, gauze swabs, absorbent cotton wool balls, absorbent paper towel, water repellent inner wrapper
Vernaid (Synergy Health Plc) sterile dressing pack

Woven and fabric swabs

**Gauze Swab, PB 1988**
Consists of absorbent cotton gauze type 13 light or absorbent cotton and viscose gauze type 1 folded into squares or rectangles of 8-ply with no cut edges exposed, sterile or non-sterile
Alvita gauze swab 8ply (Alliance Healthcare (Distribution) Ltd) non-sterile 10cm × 10cm, sterile 7.5cm × 7.5cm
CS (CliniSupplies Ltd) gauze swab 8ply non-sterile 10cm × 10cm
Clini gauze swab 8ply (CliniSupplies Ltd) non-sterile 10cm × 10cm, sterile 7.5cm × 7.5cm
Gauze (Robert Bailey & Son Plc) swab 8ply non-sterile 10cm × 10cm
MeCoBo gauze swab 8ply (MeCoBo Ltd) non-sterile 10cm × 10cm, sterile 7.5cm × 7.5cm
Propax gauze (BSN medical Ltd) swab 8ply sterile 7.5cm × 7.5cm
Sovereign (Waymade Healthcare Plc) gauze swab 8ply sterile 7.5cm × 7.5cm
Steraid (Robert Bailey & Son Plc) gauze swab 8ply sterile 7.5cm × 7.5cm
Vernaid gauze swab 8ply (Synergy Health Plc) non-sterile 10cm × 10cm, sterile 7.5cm × 7.5cm

**Non-woven Fabric Swab**
(Drug Tariff specification 28). Consists of non-woven fabric folded 4-ply; alternative to gauze swabs, type 13 light, sterile or non-sterile
CS (CliniSupplies Ltd) non-woven fabric swab 4ply non-sterile 10cm × 10cm
Clini non-woven fabric swab 4ply (CliniSupplies Ltd) non-sterile 10cm × 10cm, sterile 7.5cm × 7.5cm
CliniMed (CliniMed Ltd) non-woven fabric swab 4ply non-sterile 10cm × 10cm
MeCoBo (MeCoBo Ltd) non-woven fabric swab 4ply non-sterile 10cm × 10cm
Multisorb (BSN medical Ltd) non-woven fabric swab 4ply sterile 7.5cm × 7.5cm
Sofsort non-woven fabric swab 4ply (Synergy Health Plc) non-sterile 10cm × 10cm
Softswab non-woven fabric swab 4ply (Richardson Healthcare Ltd) non-sterile 10cm × 10cm, sterile 7.5cm × 7.5cm
Topper 8 non-woven fabric swab 4ply (Systagenic Wound Management Ltd) non-sterile 10cm × 10cm, sterile 7.5cm × 7.5cm
Filmed non-woven Fabric Swab

Regal
(Drug Tariff specification 29). Film of viscose fibres enclosed within non-woven viscose fabric folded 8-ply, non-sterile Regal (Systagenix Wound Management Ltd) filmed swab 8ply 10cm x 10cm

Surgical adhesive tapes
Adhesive tapes are useful for retaining dressings on joints or awkward body parts. These tapes, particularly those containing rubber, can cause irritant and allergic reactions in susceptible patients; synthetic adhesives have been developed to overcome this problem, but they, too, may sometimes be associated with reactions. Synthetic adhesive, or silicon adhesive, tapes can be used for patients with skin reactions to plasters and restraining containing rubber, or undergoing prolonged treatment.

Adhesive tapes that are occlusive may cause skin maceration. Care is needed not to apply these tapes under tension, to avoid creating a tourniquet effect. If applied over joints they need to be orientated so that the area of movement of the limb.

Occlusive adhesive tapes
Blenderm
(Impermeable Plastic Adhesive Tape, BP 1988). Extensible water-impermeable plastic film spread with a polymeric adhesive mass
Blenderm tape (3M Health Care Ltd) 2.5cm= £1.77, 5cm= £3.37

Sleek
(Impermeable Plastic Adhesive Tape, BP 1988). Extensible water-impermeable plastic film spread with an adhesive mass
Leukoplast Sleek tape (BSN medical Ltd) 2.5cm, 5cm, 7.5cm

Permeable adhesive tapes
3M Kind Removal Silicone Tape
Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape
3M Micropore Silicone tape (3M Health Care Ltd) 2.5cm= £3.58, 5cm= £6.48

Chemifix
Chemifix tape (Medicareplus International Ltd) 10cm= £2.10, 2.5cm= £0.90, 5cm= £1.40

Chempore
(Permeeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass
Chempore tape (Medicareplus International Ltd) 1.25cm= £0.27, 2.5cm= £0.70, 5cm= £0.95

Clinipore
(Permeeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass
Clinipore tape (CliniSupplies Ltd) 1.25cm= £0.35, 2.5cm= £0.73, 5cm= £0.99

Elastoplast
(Elastic Adhesive Tape, BP 1988). Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads, spread with adhesive mass containing zinc oxide
Tensoplast (BSN medical Ltd) elastic adhesive tape 2.5cm

Hypafix
Hypafix tape (BSN medical Ltd) 10cm= £4.72, 15cm= £6.99, 2.5cm= £1.70, 20cm= £9.28, 30cm= £13.41, 5cm= £2.71

Insil
Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape
Insil tape (Insight Medical Products Ltd) 2cm= £5.77, 4cm= £5.77

Leukofix
(Permeeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass
Leukofix tape (BNF medical Ltd) 1.25cm= £0.56, 2.5cm= £0.91, 5cm= £1.18

Leukopor
(Permeeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass
Leukopor tape (BNF medical Ltd) 1.25cm= £0.50, 2.5cm= £0.78, 5cm= £1.37

Mediplast
(Permeeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass
Mediplast tape (Neomedic Ltd) 1.25cm= £0.30, 2.5cm= £0.50

Mediplast
Fabric, plain weave, warp and weft of cotton and/or viscose, spread with an adhesive containing zinc oxide
Mediplast Zinc Oxide plaster (Neomedic Ltd) 1.25cm= £0.82, 2.5cm= £1.19, 5cm= £1.99, 7.5cm= £2.99

Mefix
Mefix tape (Molnlycke Health Care Ltd) 10cm= £2.90, 15cm= £3.95, 2.5cm= £1.03, 20cm= £5.07, 30cm= £7.25, 5cm= £1.81

Mepitac
Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape
Mepitac tape (Molnlycke Health Care Ltd) 2cm= £6.96, 4cm= £6.96

Micropore
(Permeeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass
Micropore tape (3M Health Care Ltd) 1.25cm= £0.62, 2.5cm= £0.92, 5cm= £1.62

Omnifix
Omnifix tape (Paul Hartmann Ltd) 10cm= £4.08, 15cm= £6.02, 5cm= £2.42

OpSite Flexifix Gentle
Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape
OpSite Flexifix Gentle tape (Smith & Nephew Healthcare Ltd) 2.5cm= £10.41, 5cm= £19.51

Primafix
Primafix tape (Smith & Nephew Healthcare Ltd) 10cm= £2.36, 15cm= £3.48, 20cm= £4.29, 5cm= £1.61

Scanpor
(Permeeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass
Scanpor tape (Bio-Diagnostics Ltd) 1.25cm= £0.55, 2.5cm= £0.92, 5cm= £1.75, 7.5cm= £2.56

Siltape
Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape
Siltape (Advancis Medical) 2cm= £5.60, 4cm= £5.60

1475
Surgical adhesive tapes

BNF 74

Wound management | Appendix 4
Strapal
Fabric, plain weave, warp and weft of cotton and/or viscose, spread with an adhesive containing zinc oxide
*Strapal adhesive tape* (BSN medical Ltd) 2.5cm= £1.40, 5cm= £2.37, 7.5cm= £3.56

Transpore
(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass
*Transpore tape* (3M Health Care Ltd) 2.5cm= £0.84, 5cm= £1.48

Zinc Oxide Adhesive Tape, BP 1988
Fabric, plain weave, warp and weft of cotton and/or viscose, spread with an adhesive containing zinc oxide
*Fast Aid zinc oxide adhesive tape* (Robinson Healthcare) 1.25cm, 2.5cm, 5cm, 7.5cm

Skin closure dressings
Skin closure strips are used as an alternative to sutures for minor cuts and lacerations. Skin tissue adhesive (section 13.10.5) can be used for closure of minor skin wounds and for additional suture support.

*Skin closure strips, sterile*

**Leukostrip**
Drug Tariff specifies that these are specifically for personal administration by the prescriber
*Leukostrip* (Smith & Nephew Healthcare Ltd) skin closure strips 6.4mm × 76mm= £6.38

**Omnistrip**
Drug Tariff specifies that these are specifically for personal administration by the prescriber
*Omnistrip* (Paul Hartmann Ltd) skin closure strips sterile 6mm × 76mm= £24.34

**Steri-strip**
Drug Tariff specifies that these are specifically for personal administration by the prescriber
*Steri-strip* (3M Health Care Ltd) skin closure strips 6mm × 75mm= £8.77

**Bandages**

Non-extensible bandages
Skin closure strips are used as an alternative to sutures for minor cuts and lacerations. Skin tissue adhesive can be used for closure of minor skin wounds and for additional suture support.

**Open-wove Bandage, Type 1 BP 1988**
Cotton cloth, plain weave, warp of cotton, weft of cotton, viscose, or combination, one continuous length
*Clini open wove bandage Type 1 BP 1988* (CliniSupplies Ltd) 10cm × 5m, 2.5cm × 5m, 5cm × 5m, 7.5cm × 5m
*Vernaid white open wove bandage* (Synergy Health Plc) 10cm × 5m, 2.5cm × 5m, 5cm × 5m, 7.5cm × 5m
*White open wove bandage* (Robert Bailey & Son Plc) 10cm × 5m, 2.5cm × 5m, 5cm × 5m, 7.5cm × 5m

**Triangular Calico Bandage, BP 1980**
Unbleached calico right-angled triangle
*Clini* (CliniSupplies Ltd) triangular calico bandage BP 1980 90cm × 127cm
*Triangular* (BSN medical Ltd) calico bandage 90cm × 127cm

Light-weight conforming bandages
Lightweight conforming bandages are used for dressing retention, with the aim of keeping the dressing close to the wound without inhibiting movement or restricting blood flow. The elasticity of conforming-stretch bandages (also termed contour bandages) is greater than that of cotton conforming bandages.

**Acti-Wrap**
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4m stretched (all)
*Acti-Wrap (cohesive/latex free) bandage* (Activa Healthcare Ltd) 10cm × 4m= £0.81, 6cm × 4m= £0.47, 8cm × 4m= £0.69

**Cotton Conforming Bandage, BP 1988**
Cotton fabric, plain weave, treated to impart some elasticity to warp and weft
*Easifix Crinx bandage* (BSN medical Ltd) 10cm × 3.5m= £1.04, 15cm × 3.5m= £1.42, 5cm × 3.5m= £0.69, 7.5cm × 3.5m= £0.84

**Easifix**
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4m stretched (all)
*Easifix bandage* (BSN medical Ltd) 10cm × 4m= £0.51, 15cm × 4m= £0.67, 5cm × 4m= £0.36, 7.5cm × 4m= £0.43

**Easifix K**
Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length. 4m stretched
*Easifix K bandage* (BSN medical Ltd) 10cm × 4m= £0.19, 15cm × 4m= £0.33, 2.5cm × 4m= £0.10, 5cm × 4m= £0.11, 7.5cm × 4m= £0.16

**Hospiform**
Fabric, plain weave, warp of polyamide, weft of viscose
*Hospiform bandage* (Paul Hartmann Ltd) 10cm × 4m= £0.19, 12cm × 4m= £0.59, 7cm × 4m= £0.17

**K-Band**
Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length. 4m stretched
*K-Band bandage* (Urgo Ltd) 10cm × 4m= £0.28, 15cm × 4m= £0.50, 5cm × 4m= £0.20, 7cm × 4m= £0.26

**Knit Fix**
Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length. 4m stretched
*Knit Fix bandage* (Robert Bailey & Son Plc) 10cm × 4m= £0.17, 15cm × 4m= £0.33, 5cm × 4m= £0.12, 7cm × 4m= £0.17

**Knit-Band**
Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length. 4m stretched
*Knit-Band bandage* (CliniSupplies Ltd) 10cm × 4m= £0.17, 15cm × 4m= £0.30, 5cm × 4m= £0.10, 7cm × 4m= £0.15

**Kontour**
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4m stretched (all)
*Kontour bandage* (Easigrip Ltd) 10cm × 4m= £0.40, 15cm × 4m= £0.66, 5cm × 4m= £0.28, 7.5cm × 4m= £0.35

**Mollelast**
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4m stretched (all)
*Mollelast* (Lohmann & Rauscher (UK) Ltd) bandage 4cm × 4m= £0.30

**Peha-haft**
Polyamide and Cellulose Contour Bandage, cohesive, latex-free
*Peha-haft bandage* (Paul Hartmann Ltd) 10cm × 4m= £0.77, 12cm × 4m= £0.91, 2.5cm × 4m= £0.74, 4cm × 4m= £0.48, 6cm × 4m= £0.56, 8cm × 4m= £0.67

**PremierBand**
Polyamide and Cellulose Contour Bandage
PremierBand bandage (Shermond) 10cm × 4m= £0.17, 15cm × 4m= £0.25, 5cm × 4m= £0.12, 7.5cm × 4m= £0.14

**Slinky**
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4m stretched (all)
*Slinky bandage* (Molnlycke Health Care Ltd) 10cm × 4m= £0.72, 15cm × 4m= £1.04, 7.5cm × 4m= £0.59

**Stayform**
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4m stretched (all)
*Stayform bandage* (Robinson Healthcare) 10cm × 4m= £0.40, 15cm × 4m= £0.68, 5cm × 4m= £0.29, 7.5cm × 4m= £0.36
Tubular bandages and garments

Tubular bandages are available in different forms, according to the function required of them. Some are used under orthopaedic casts and some are suitable for protecting areas to which creams or ointments (other than those containing potent corticosteroids) have been applied. The conformability of the elasticated versions makes them particularly suitable for retaining dressings on difficult parts of the body or for soft tissue injury, but their use as the only means of applying pressure to an oedematous limb or to a varicose ulcer is not appropriate, since the pressure they exert is inadequate. Compression hosiery reduces the recurrence of venous leg ulcers and should be considered for use after wound healing. Silk clothing is available as an alternative to elasticated viscose stockinette garments, for use in the management of severe eczema and allergic skin conditions.

Elasticated Surgical Tubular Stockinette, Foam padded is used for relief of pressure and elimination of friction in relevant area; porosity of foam lining allows normal water loss from skin surface.

For Elasticated Tubular Bandage, BP 1993, where no size stated by the prescriber, the 50 cm length should be supplied and widend exposed.

Non-elasticated Cotton Stockinette, Bleached, BP 1988 1m lengths is used as basis (with wadding) for Plaster of Paris bandages etc.; 6 m length, compression bandage. For Non-elasticated Ribbed Cotton and Viscose Surgical Tubular Stockinette, BP 1988, the Drug Tariff specifies various combinations of sizes to provide sufficient material for part or full body coverage. It is used as protective dressings with tar-based and other steroid ointments.

Elasticated Acti-Fast

(Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage

Acti-Fast 2-way stretch stockinette (Activa Healthcare Ltd) 10.75cm= £6.04, 17.5cm= £1.83, 20cm= £3.20, 3.5cm= £0.56, 5cm= £0.58, 7.5cm= £0.77

Clinifast

(Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage; various colours and sizes

Clinifast stockinette (Clinisupplies Ltd) 10.75cm= £6.04, 17.5cm= £1.83, 3.5cm= £0.56, 5cm= £0.58, 7.5cm= £0.77, clava 5-14 years= £6.75, 6 months-5 years= £5.85, cycle shorts large adult= £16.25, medium adult= £14.25, small adult= £12.50, gloves large adult= £4.99, child/small adult= £4.99, gloves medium adult= £4.99, child= £4.99, gloves small child= £4.99, leggings (Blue, Pink, White) 11-14 years= £11.88, 2-5 years= £9.50, 5-8 years= £10.69, 8-11 years= £11.88, mittens 2-8 years= £2.97, 9-14 years= £2.97, up to 24 months= £2.97, socks 8-14 years= £2.97, up to 8 years= £2.97, tights (Blue, Pink, White) 6-24 months= £7.13, vest long sleeve (Blue, Pink, White) 11-14 years= £11.88, 2-5 years= £9.50, 5-8 years= £10.69, 8-11 years= £11.88, mittens 2-8 years= £2.97, 9-14 years= £2.97, up to 24 months= £2.97, socks 8-14 years= £2.97, up to 8 years= £2.97, tights 6-24 months= £7.13, vest long sleeve 11-14 years= £11.88, 2-5 years= £9.50, 5-8 years= £10.69, 6-24 months= £7.13, 8-11 years= £11.88

Comfifast Multistretch (Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage; various colours and sizes

Comfifast Multistretch 2-way stretch stockinette (Synergy Health Plc) 10.75cm= £6.45, 17.5cm= £2.49, 3.5cm= £0.61, 5cm= £0.63, 7.5cm= £0.83

Coverflex

(Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage; various colours and sizes

Coverflex stockinette (Paul Hartmann Ltd) 10.75cm= £9.59, 17.5cm= £2.53, 3.5cm= £0.83, 5cm= £0.86, 7.5cm= £5.68

Easifast

(Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage; various colours and sizes

Easifast stockinette (Easigrip Ltd) 10.75cm= £7.23, 17.5cm= £1.91, 3.5cm= £0.65, 5cm= £0.69, 7.5cm= £0.94

Elasticated Surgical Tubular Stockinette, Foam padded or Tupipad (Drug Tariff specification 25). Fabric as for Elasticated Tubular Bandage with polyurethane foam lining.

Elasticated Tubular Bandage, BP 1993

(Drug Tariff specification 25). Fabric as for Elasticated Tubular Bandage with polyurethane foam lining; lengths 50 cm and 1 m

CliniGrip bandage (Clinisupplies Ltd) 10cm size F= £0.74, 12cm size G= £0.77, 6.25cm size B= £0.61, 6.75cm size C= £0.65, 7.5cm size D= £0.66, 8.75cm size E= £0.74

Skinny (Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage; various colours and sizes

Skinny Stockinette (Dermacea Ltd) body suit (Blue, Ecru, Pink) 3-6 months= £16.18, 6-12 months= £18.21, premature= £16.18, up to 3 months= £16.18, clava (Blue, Ecru, Pink) 5-14 years= £7.73, 6 months-5 years= £6.74, gloves large (Beige, Blue, Ecru, Grey, Pink) adult= £5.34, child= £5.34, gloves medium (Beige, Blue, Ecru, Grey, Pink) adult= £5.34, child= £5.34, gloves small (Blue, Ecru, Grey, Pink) adult= £5.29, child= £5.29, knee socks extra (Black, Natural, White) large adult 11+= £13.94, knee socks large (Black, Natural, White) adult 8-11= £13.94, child 2-4= £13.94, knee socks medium (Black, Natural, White) adult 6-8= £13.94, child 1-2= £13.94, knee socks small (Black, Natural, White) adult 4-6= £13.94, child 0-1= £13.94, leggings (Beige, Blue, Ecru, Grey, Pink) 11-14 years= £17.20, 2-5 years= £13.74, 5-8 years= £15.52, 6-24 months= £10.48, 8-11 years= £17.20, large adult= £25.13, medium adult= £23.20, small adult= £21.27, mittens (Blue, Ecru, Pink) 2-8 years= £3.87, 8-14 years= £3.87, up to 24 months= £3.87, socks (Blue, Ecru, Pink) 6 months-8 years= £4.27, 8-14 years= £4.27, vest long sleeve (Blue, Ecru, Grey, Pink) 11-14 years= £17.20, 2-5 years= £13.74, 5-8 years= £15.52, 6-24 months= £10.48, 8-11 years= £17.20, large adult= £25.13, medium adult= £23.20, small adult= £21.27, vest short sleeve (White) 11-14 years= £17.09, 2-5 years= £13.63, 5-8 years= £15.36, 6-24 months= £10.38, 8-11 years= £17.09, large adult= £25.03, medium adult= £23.10, small adult= £21.16
Tubfast 2-way stretch
(Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage; various colours and sizes
Tubfast 2-way stretch stockinette
(Mohnlycke Health Care Ltd)
10.75cm= £6.45, 20cm= £3.42, 3.5cm= £0.61, 5cm= £0.63, 7.5cm= £0.83, gloves extra small child= £5.69, medium/large adult= £5.69, small child= £5.69, small medium/adult medium/large child= £5.69, leggings 2-5 years= £15.14, 5-8 years= £17.04, 8-11 years= £18.93, socks (one size)= £4.79, tights 6-24 months= £11.36, vest long sleeve 11-14 years= £18.93, 2-5 years= £15.14, 5-8 years= £17.04, 6-24 months= £11.36, 8-11 years= £18.93
Non-elasticated
Cotton Stockinette, Bleached, BP 1988
Knitted fabric, cotton yarn, tubular length, 1m
Cotton stockinette bleached heavyweight (E Sallis Ltd) 10cm, 2.5cm, 5cm, 7.5cm
Silk Clothing
DermaSilk
Knitted silk fabric, hypoallergenic, sericin-free
DermaSilk (Esperance Healthcare Ltd) medium/large= £42.07, medium= £31.30, body suit 0-3 months= £38.53, 12-18 months= £40.82, 18-24 months= £41.85, 24-36 months= £41.93, 3-6 months= £38.61, 6-9 months= £39.72, 9-12 months= £40.74, boxer shorts male adult extra large/XX large= £42.07, small/medium= £42.07, briefs female adult extra large/XX large= £31.30, small/medium= £31.30, facial mask adult= £21.13, child= £16.57, infant= £16.57, teen= £21.13, gloves large adult= £20.89, gloves large adult= £20.94, gloves medium adult= £20.94, child= £14.92, gloves small adult= £20.94, child= £14.92, leggings 0-3 months= £27.51, leggings 12-18 months= £29.78, leggings 18-24 months= £30.83, leggings 3-4 years= £31.99, leggings 3-6 months= £27.57, leggings 6-9 months= £28.67, leggings 9-12 months= £29.72, leggings adult female XX large= £79.14, extra large= £79.14, large= £79.14, medium= £79.14, small= £79.14, leggings adult male XX large= £79.14, extra large= £79.14, large= £79.14, medium= £79.14, small= £79.14, pyjamas 10-12 years= £82.81, 3-4 years= £71.76, 5-6 years= £76.18, 7-8 years= £79.49, roll neck shirt 10-12 years= £54.99, 3-4 years= £47.58, 5-6 years= £50.76, 7-8 years= £52.88, round neck shirt adult female XX large= £78.21, extra large= £78.21, large= £78.21, medium= £78.21, small= £78.21, round neck shirt adult male XX large= £78.21, extra large= £78.21, large= £78.21, medium= £78.21, small= £78.21, tubular sleeves= £34.02, sleeves= £77.57, undersocks adult 11-13= £18.61, 1-2= £18.61, 1-2= £18.61, 9-10= £18.61, undersocks child 2-5= £18.61, 3-8= £18.61, 9-11= £18.61, unisex roll neck shirt adult female XX large= £78.21, extra large= £78.21, large= £78.21, medium= £78.21, small= £78.21
DreamSkin
Knitted silk fabric, hypoallergenic, sericin-free, with methacrylate copolymer and zinc-based antibacterial
DreamSkin (DreamSkin Health Ltd) baby leggings with foldaway feet
3-0 months= £25.45, 12-18 months= £28.37, 18-24 months= £28.85, 3-4 years= £30.47, 3-6 months= £25.96, 6-9 months= £27.31, polo neck shirt small= £7.84, body suit 0-3 months= £35.86, 12-18 months= £38.89, 18-24 months= £39.42, 3-4 years= £40.99, 3-6 months= £36.37, 6-9 months= £37.84, 9-12 months= £38.38, boxer shorts 11-12 years= £21.62, boxer shorts 3-4 years= £21.62, boxer shorts 5-6 years= £21.62, boxer shorts 7-8 years= £21.62, boxer shorts 9-10 years= £21.62, boxer shorts male adult XX large= £34.00, extra large= £34.00, large= £34.00, medium= £34.00, small= £34.00, briefs female adults 11-13= £21.62, briefs 3-4 years= £21.62, briefs 5-6 years= £21.62, briefs 7-8 years= £21.62, briefs 9-10 female adult XX large= £31.94, extra large= £31.94, large= £31.94, medium= £31.94, small= £31.94, eye mask= £10.27, footless leggings 11-12 years= £33.52, footless leggings 3-4 years= £30.47, footless leggings 5-6 years= £31.98, footless leggings 7-8 years= £32.49, footless leggings 9-10 years= £33.01, footless leggings adult female XX large= £77.12, extra large= £77.12, large= £77.12, medium= £77.12, small= £77.12, footless leggings adult male XX large= £77.12, extra large= £77.12, large= £77.12, medium= £77.12, small= £77.12, gloves large adult= £20.24, gloves medium adult= £20.24, child= £14.42, gloves
Elset
Knit fabric, viscose and elastomer yarn. Type 2 (light support bandage)
Elset (Molynex Health Care Ltd) S bandage 15 cm × 12 m = £5.60, bandage 10 cm × 6 m = £2.61, 10 cm × 8 m = £3.34, 15 cm × 6 m = £2.80.

Hospicrepe 233 Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton threads; stretch bandage, lighter than cotton crepe, 4.5 m stretched (all)
Hospicrepe 233 bandage (Paul Hartmann Ltd) 10 cm × 4.5 m= £0.96, 15 cm × 4.5 m= £1.36, 5 cm × 4.5 m= £0.52, 7.5 cm × 4.5 m= £0.72

Hospilite Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)
Hospilite bandage (Paul Hartmann Ltd) 10 cm × 4.5 m= £0.62, 15 cm × 4.5 m= £0.91, 5 cm × 4.5 m= £0.37, 7.5 cm × 4.5 m= £0.51

K-Lite Knit fabric, viscose and elastomer yarn. Type 2 (light support bandage)
K-Lite (Urgo Ltd) Long bandage 10 cm × 5.25 m= £1.16, bandage 10 cm × 4.5 m= £1.01, 15 cm × 4.5 m= £1.46, 5 cm × 4.5 m= £0.55, 7 cm × 4.5 m= £0.77

K-Plus Knit fabric, viscose and elastomer yarn. Type 2 (light support bandage)
K-Plus (Urgo Ltd) Long bandage 10 cm × 10.25 m= £2.65, bandage 10 cm × 8.7 m= £2.29

K-Firm Knit fabric, viscose and elastomer yarn. Type 2 (light support bandage)
K-Firm bandage (Millepedge Healthcare) 10 cm × 4.5 m= £0.66, 15 cm × 4.5 m= £0.96, 5 cm × 4.5 m= £0.36, 7.5 cm × 4.5 m= £0.51

L3 Knit fabric, viscose and elastomer yarn. Type 2 (light support bandage)
L3 (Smith & Nephew Healthcare Ltd) bandage 10 cm × 8.6 m= £2.22

Neosport Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)
Neosport bandage (Neomedic Ltd) 10 cm × 4.5 m= £0.91, 15 cm × 4.5 m= £1.12, 5 cm × 4.5 m= £0.54, 7.5 cm × 4.5 m= £0.73

PremierBand Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton threads; stretch bandage, lighter than cotton crepe, 4.5 m stretched (all)
PremierBand bandage (Shermond) 10 cm × 4.5 m= £0.79, 15 cm × 4.5 m= £1.18, 5 cm × 4.5 m= £0.45, 7.5 cm × 4.5 m= £0.63

Profore #2 Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)
Profore #2 (Smith & Nephew Healthcare Ltd) bandage 10 cm × 4.5 m= £1.36, latex free bandage 10 cm × 4.5 m= £1.44

Profore #3 Knit fabric, viscose and elastomer yarn. Type 2 (light support bandage)
Profore #3 (Smith & Nephew Healthcare Ltd) bandage 10 cm × 8.7 m= £3.96, latex free bandage 10 cm × 8.7 m= £4.31

Setocrepe Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)
Setocrepe (Molynex Health Care Ltd) bandage 10 cm × 4.5 m= £1.20

Soffcrepe Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)
Soffcrepe bandage (BSN medical Ltd) 10 cm × 4.5 m= £1.25, 15 cm × 4.5 m= £1.82, 5 cm × 4.5 m= £0.70, 7.5 cm × 4.5 m= £0.99

Adhesive bandages Elastic adhesive bandages are used to provide compression in the treatment of varicose veins and for the support of injured joints; they should no longer be used for the support of fractured ribs and clavicles. They have also been used with zinc paste bandage in the treatment of venous ulcers, but they can cause skin reactions in susceptible patients and may not produce sufficient pressures for healing (significantly lower than those provided by other compression bandages).

Elastic Adhesive Bandage, BP 1993 Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads spread with adhesive mass containing zinc oxide. 4.5 m stretched

Tensoplast bandage (BSN medical Ltd) 10 cm × 4.5 m, 5 cm × 4.5 m, 7.5 cm × 4.5 m

Cohesive bandages Cohesive bandages adhere to themselves, but not to the skin, and are useful for providing support for sports use where ordinary stretch bandages might become displaced and adhesive bandages are inappropriate. Care is needed in their application, however, since the loss of ability for movement between turns of the bandage to equalise local areas of high tension carries the potential for creating a tourniquet effect. Cohesive bandages can be used to support sprained joints and as an outer layer for multi-layer compression bandaging; they should not be used if arterial disease is suspected.

Cohesive extensible bandages
Coban Bandage Coban (3M Health Care Ltd) self-adherent bandage 10 cm × 6 m= £2.93
K Press Bandage K Press bandage (Urgo Ltd) 10 cm × 6.5 m= £2.93, 10 cm × 7.5 m= £3.42, 12 cm × 7.5 m= £4.31, 8 cm × 7.5 m= £3.22

Profore #4 Bandage Profore #4 (Smith & Nephew Healthcare Ltd) bandage 10 cm × 2.5 m= £3.28, latex free bandage 10 cm × 2.5 m= £3.56

Ultra Fast Bandage Ultra (Robinson Healthcare) Fast cohesive bandage 10 cm × 6.3 m= £2.59

Compression bandages High compression products are used to provide the high compression needed for the management of gross varices, post-thrombotic venous insufficiency, venous leg ulcers, and gross oedema in average-sized limbs. Their use calls for an expert knowledge of the elastic properties of the products and experience in the technique of providing careful graduated compression. Incorrect application can lead to uneven and inadequate pressures or to hazardous levels of pressure. In particular, injudicious use of compression in limbs with arterial disease has been reported to cause severe skin and tissue necrosis (in some instances calling for amputation). Doppler testing is required before treatment with compression. Oral pentoxifylline p. 227 can be used as adjunct therapy if a chronic venous leg ulcer does not respond to compression bandaging [unlicensed indication].

High compression bandages

High Compression Bandage Cotton, viscose, nylon, and Lycra® extensible bandage, 3 m (unstretched)
KThreec (Urgo Ltd) bandage 10 cm × 3 m= £2.85
SurePress (Convatec Ltd) bandage 10 cm × 3 m= £3.65
PEC High Compression Bandages Polyamide, elastane, and cotton compression (high) extensible bandage, 3.5 m unstretched
Setopress (Molynex Health Care Ltd) bandage 10 cm × 3.5 m= £3.55
1480 Bandages

**Viscose, elastane, and cotton compression (high) extensible bandage,** 3 m unstretched (both)

**Tensopress bandage** (BSN medical Ltd) 10cm × 3m = £3.49, 7.5cm × 3m = £2.71

**Short stretch compression bandages**

**Actico** Bandage

**Actico bandage** (Activia Healthcare Ltd) 10cm × 6m = £3.38, 12cm × 6m = £4.31, 4cm × 6m = £2.42, 6cm × 6m = £2.83, 8cm × 6m = £3.25

**Comprilan** Bandage

**Comprilan bandage** (BSN medical Ltd) 10cm × 5m = £3.41, 12cm × 5m = £4.15, 6cm × 5m = £2.70, 8cm × 5m = £3.17

**Rosalid K** Bandage

**Rosalid K bandage** (Lohmann & Rauscher (UK) Ltd) 10cm × 10m = £6.02, 10cm × 5m = £3.46, 12cm × 5m = £4.20, 6cm × 5m = £2.65, 8cm × 5m = £3.17

**Silkolan** Bandage

**Sub-compression wadding bandage**

**Cellona Undercast Padding** Padding

**Cellona Undercast padding bandage** (Lohmann & Rauscher (UK) Ltd) 10cm × 2.75m = £0.47, 15cm × 2.75m = £0.60, 5cm × 2.75m = £0.31, 7.5cm × 2.75m = £0.38

**Flexi-Ban** Padding

**Flexi-Ban** (Activia Healthcare Ltd) bandage 10cm × 3.5m = £0.50

**K Tech Reduced** Padding

**K Tech Reduced bandage 10cm** × (Urgo Ltd) 6m = £4.75, 7.3m = £5.18

**K-Soft** Padding

**K-Soft** (Urgo Ltd) Long bandage 10cm × 4.5m = £0.57, bandage 10cm × 3.5m = £0.46

**K-Tech (K Tech in DMD)** Padding

**K-Tech** (Urgo Ltd) Reduced bandage 10cm × 7.3m = £5.18, bandage 10cm × 5m = £3.96, 10cm × 6m = £4.75, 12cm × 6m = £5.99, 12cm × 7.3m = £6.54, 8cm × 6m = £4.49, 8cm × 7.3m = £4.89

**Ortho-Band Plus** Padding

**Ortho-Band** (Millpledge Healthcare) Plus bandage 10cm × 3.5m = £0.37

**Profore #1** Padding

**Profore #1** (Smith & Nephew Healthcare Ltd) bandage 10cm × 3.5m = £0.71, latex free bandage 10cm × 3.5m = £0.77

**Softexe** Padding

**Softexe** (Molhycke Health Care Ltd) bandage 10cm × 3.5m = £0.62

**SurePres** Padding

**SurePres** (Convatec Ltd) bandage 10cm × 3m = £3.65

**Ultra Soft** Padding

**Ultra** (Robinson Healthcare) Soft wadding bandage 10cm × 3.5m = £0.39

**Velband** Padding

**Velband** (BSN medical Ltd) absorbent padding bandage 10cm × 4.5m = £0.73

**Multi-layer compression bandaging**

Multi-layer compression bandaging systems are an alternative to High Compression Bandages for the treatment of venous leg ulcers. Compression is achieved by the combined effects of two or three extensible bandages applied over a layer of orthopaedic wadding and a wound contact dressing.

**Four layer systems**

**K-Four** Padding

**K-Four** Multi-layer compression bandaging kit, four layer system

**K-Four** (Urgo Ltd) Reduced Compression multi-layer compression bandage kit 18cm ankle circumference = £4.51, multi-layer compression bandage kit 18cm-25cm ankle circumference = £6.90, 25cm-30cm ankle circumference = £6.90, greater than 30cm ankle circumference = £9.50, less than 18cm ankle circumference = £7.21

**Profore** Wound contact layer

**Profore** Multi-layer compression bandaging kit, four layer system

**Profore** (Smith & Nephew Healthcare Ltd) Lite latex free multi-layer compression bandage kit = £6.00, multi-layer compression bandage kit = £5.52, latex free multi-layer compression bandage kit 18cm-25cm ankle circumference = £10.22, multi-layer compression bandage kit 18cm-25cm ankle circumference = £9.57, 25cm-30cm ankle circumference = £7.94, above 30cm ankle circumference = £11.89, up to 18cm ankle circumference = £10.26

**Ultra Four** Wound contact layer

**Ultra Four** Multi-layer compression bandaging kit, four layer system

**Ultra Four** (Robinson Healthcare) Reduced Compression multi-layer compression bandage kit = £4.14, multi-layer compression bandage kit 18cm-25cm ankle circumference = £5.67, up to 18cm ankle circumference = £6.41

**Two layer systems**

**Coban 2** Multi-layer compression bandaging kit, two layer system (latex-free, foam bandage and cohesive compression bandage)

**Coban 2** (3M Health Care Ltd) Lite multi-layer compression bandage kit = £8.24, multi-layer compression bandage kit = £8.24

**K Two** Multi-layer compression bandaging kit, two layer system

**UrgoKTwo** (Urgo Ltd) Reduced latex free multi-layer compression bandage kit (10cm) 18cm-25cm ankle circumference = £8.68, 25cm-32cm ankle circumference = £9.48, Reduced multi-layer compression bandage kit 18cm-25cm ankle circumference = £8.18, 25cm-32cm ankle circumference = £8.93, latex free multi-layer compression bandage kit (10cm) 18cm-25cm ankle circumference = £8.68, 25cm-32cm ankle circumference = £9.48, multi-layer compression bandage kit (10cm) 18cm-25cm ankle circumference = £8.17, 25cm-32cm ankle circumference = £8.93, multi-layer compression bandage kit (12cm) 18cm-25cm ankle circumference = £10.30, 25cm-32cm ankle circumference = £11.26, multi-layer compression bandage kit size 0 short 18cm-25cm ankle circumference = £6.90, with UrgoStart multi-layer compression bandage kit 18cm-25cm ankle circumference = £10.19, 25cm-32cm ankle circumference = £10.96

**Medicated bandages**

Zinc Paste Bandage has been used with compression bandaging for the treatment of venous leg ulcers. However, paste bandages are associated with hypersensitivity reactions and should be used with caution. Zinc paste bandages are also used with coal tar or ichthammol in chronic lichenified skin conditions such as chronic eczema (ichthammol often being preferred since its action is considered to be milder). They are also used with calamine in milder eczematous skin conditions.

Downloaded from www.medicalbr.com
Zipzoc® can be used under appropriate compression bandages or hosiery in chronic venous insufficiency.

**Zinc Paste Bandage, BP 1993**
Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide; requires additional bandaging

*Excipients: may include* cetostearyl alcohol, hydroxybenzoates

**Viscopaste** (Smith & Nephew Healthcare Ltd) PB7 bandage 7.5cm × 6m= £3.69

**Zinc Paste and Ichthammol Bandage, BP 1993**
Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide and ichthammol; requires additional bandaging

*Excipients: may include* cetostearyl alcohol

**Ichthopaste** (Smith & Nephew Healthcare Ltd) bandage 7.5cm × 6m= £3.72

**Medicated stocking**

*Zipzoc*
Sterile rayon stocking impregnated with ointment containing zinc oxide 20%

*Zipzoc* (Smith & Nephew Healthcare Ltd) stockings= £31.26

**Compression hosiery and garments**

Compression (elastic) hosiery is used to treat conditions associated with chronic venous insufficiency, to prevent recurrence of thrombosis, or to reduce the risk of further venous ulceration after treatment with compression bandaging. Doppler testing to confirm arterial sufficiency is required before recommending the use of compression hosiery.

Before elastic hosiery can be dispensed, the quantity (single or pair), article (including accessories), and compression class must be specified by the prescriber. There are different compression values for graduated compression hosiery and lymphoedema garments (see table below). All dispensed elastic hosiery articles must state on the packaging that they conform with Drug Tariff technical specification No. 40, for further details see Drug Tariff.

**Graduated Compression hosiery, Class 1 Light Support** is used for superficial or early varices, varicosis during pregnancy.

**Graduated Compression hosiery, Class 2 Medium Support** is used for varices of medium severity, ulcer treatment and prophylaxis, mild oedema, varicosis during pregnancy.

**Graduated Compression hosiery, Class 3 Strong Support** is used for gross varices, post thrombotic venous insufficiency, gross oedema, ulcer treatment and prophylaxis.

**Compression values for hosiery and lymphoedema garments**

**Class 1:** Compression hosiery (British standard) 14–17 mmHg, lymphoedema garments (European classification) 18–21 mmHg; **Class 2** Compression hosiery (British standard) 18–24 mmHg, lymphoedema garments (European classification) 23–32 mmHg; **Class 3** Compression hosiery (British standard) 25–35 mmHg, lymphoedema garments (European classification) 34–46 mmHg; **Class 4** Compression hosiery (British standard)—not available, lymphoedema garments (European classification) 49–70 mmHg; **Class 4 super** Compression hosiery (British standard)—not available, lymphoedema garments (European classification) 60–90 mmHg.

**Graduated compression hosiery**

**Class 1 Light Support**
Hosiery, compression at ankle 14–17 mmHg, thigh length or below knee with knitted in heel

**Class 2 Light Support**
Hosiery, compression at ankle 14–17 mmHg, thigh length or below knee with knitted in heel

**Accessories**

**Suspender**
Suspender, for thigh stockings

Anklets

**Class 2 Medium Support**
Anklets, compression 18–24 mmHg, circular knit (standard and made-to-measure)

**Class 3 Strong Support**
Anklets, compression 18–24 mmHg, circular knit (standard and made-to-measure)

**Knee caps**

**Class 2 Medium Support**
Kneecaps, compression 18–24 mmHg, circular knit (standard and made-to-measure)

**Class 3 Strong Support**
Kneecaps, compression 18–24 mmHg, circular knit (standard and made-to-measure)

**Lymphoedema garments**

Lymphoedema compression garments are used to maintain limb shape and prevent additional fluid retention. Either flat-bed or circular knitting methods are used in the manufacture of elasticated compression garments. Seamless, circular-knitted garments (in standard sizes) can be used to prevent swelling if the lymphoedema is well controlled and if the limb is in good shape and without skin folds. Flat-knitted garments (usually made-to-measure) with a seam, provide greater rigidity and stiffness to maintain reduction of lymphoedema following treatment with compression bandages. A standard range of light, medium, or high compression garments are available, as well as low compression (12–16 mmHg) arm sleeves, made-to-measure garments up to compression 90 mmHg, and accessories—see Drug Tariff for details. Note There are different compression values for lymphoedema garments and graduated compression hosiery, see Compression hosiery and garments above.
Dental Practitioners’ Formulary

List of Dental Preparations

The following list has been approved by the appropriate Secretaries of State, and the preparations therein may be prescribed by dental practitioners on form FP10D (GP14 in Scotland, WP10D in Wales).

Licensed sugar-free versions, where available, are preferred. Licensed alcohol-free mouthwashes, where available, are preferred.

Amoxicillin Oral Suspension, BP
Amoxicillin Oral Powder, DPF
Amoxicillin Capsules, BP
Aciclovir Tablets, BP, Aciclovir Oral Suspension, BP, Aciclovir Cream, BP
Licensed alcohol-free

Benzydamine Mouthwash, BP
Aspirin Tablets, Dispersible, BP
Artificial Saliva Gel, DPFP
Artificial Saliva Oral Spray, DPFP
Artificial Saliva Pastilles, DPFP
Artificial Saliva Protective Spray, DPFP
Artificial Saliva Substitutes as listed below (to be prescribed only for indications approved by ACBS (patients suffering from dry mouth as a result of having or, having undergone, radiotherapy or sicca syndrome):

BioXtra® Gel Mouthwash
Glandsone® Moisturising Gel
Saliveze®

Artificial Saliva Substitute Spray, DPFP
Aspirin Tablets, Dispersible, BP
Azithromycin Capsules, 250 mg, DPFP
Azithromycin Oral Suspension, 200 mg/5 mL, DPFP
Azithromycin Tablets, 250 mg, DPFP
Azithromycin Tablets, 500 mg, DPFP
Beclomethasone Pressurised Inhalation, BP, 50 micrograms/ metered inhalation, CFC-free, as: Clenil Modulate®
Benzydamine Mouthwash, BP 0.15%
Benzydamine Oromucosal Spray, BP 0.15%
Betamethasone Soluble Tablets, 500 micrograms, DPFP
Carbamazepine Tablets, BP
Cefalexin Capsules, BP
Cefalexin Oral Suspension, BP
Cefalexin Tablets, BP
Cefradine Capsules, BP
Cetirizine Oral Solution, BP, 5 mg/5 mL
Cetirizine Tablets, BP, 10 mg
Chlorhexidine Gluconate Gel, BP
Chlorhexidine Mouthwash, BP
Chlorhexidine Oral Spray, DPFP
Chlorphenamine Tablets, BP
Choline Salicylate Dental Gel, BP
Clarithromycin Oral Suspension, 125 mg/5 mL, DPFP
Clarithromycin Oral Suspension, 250 mg/5 mL, DPFP
Clarithromycin Tablets, BP
Clindamycin Capsules, BP
Co-amoxiclav Tablets, BP, 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt)
Co-amoxiclav Oral Suspension, BP, 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL
Co-amoxiclav Oral Suspension, BP, 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL
Diazepam Oral Solution, BP, 2 mg/5 mL
Diazepam Tablets, BP
Diclofenac Sodium Tablets, Gastro-resistant, BP
Dihydrocodeine Tablets, BP, 30 mg
Doxycycline Tablets, Dispersible, BP
Doxycycline Capsules, BP, 100 mg
Doxycycline Tablets, 20 mg, DPFP
Ephedrine Nasal Drops, BP
Erythromycin Ethyl Succinate Oral Suspension, BP
Erythromycin Ethyl Succinate Tablets, BP
Erythromycin Stearate Tablets, BP
Erythromycin Tablets, Gastro-resistant, BP
Fluconazole Capsules, 50 mg, DPFP
Fluconazole Oral Suspension, 50 mg/5 mL, DPFP
Hydrocortisone Cream, BP, 1%
Hydrocortisone Oromucosal Tablets, BP
Hydrogen Peroxide Mouthwash, BP, 6%
Ibuprofen Oral Suspension, BP, sugar-free
Ibuprofen Tablets, BP
Lansoprazole Capsules, Gastro-resistant, BP
Lidocaine Ointment, BP
Lidocaine Spray 10%, DPFP
Loratadine Syrup, 5 mg/5 mL, DPFP
Loratadine Tablets, BP, 10 mg
Menthol and Eucalyptus Inhalation, BP 1980
Metronidazole Oral Suspension, BP
Metronidazole Tablets, BP
Miconazole Cream, BP
Miconazole Oromucosal Gel, BP
Miconazole and Hydrocortisone Cream, BP
Miconazole and Hydrocortisone Ointment, BP
Nystatin Oral Suspension, BP
Omeprazole Capsules, Gastro-resistant, BP
Oxytetracycline Tablets, BP
Paracetamol Oral Suspension, BP
Paracetamol Tablets, BP
Paracetamol Tablets, Soluble, BP
Phenoxybenzylpenicillin Oral Solution, BP
Phenoxybenzylpenicillin Tablets, BP
Promethazine Hydrochloride Tablets, BP
Promethazine Oral Solution, BP
Saliva Stimulating Tablets, DPFP
Sodium Chloride Mouthwash, Compound, BP
Sodium Fluoride Oral Drops, BP
Sodium Fluoride Tablets, BP
Sodium Fluoride Toothpaste 0.619%, DPFP
Sodium Fluoride Toothpaste 1.1%, DPFP
Sodium Fusidate Ointment, BP
Temazepam Tablets, BP
TMazepam Oral Solution, BP
Temazepam Tablets, BP
Tetracycline Tablets, BP

Preparations in this list which are not included in the BP or BPC are described under Details of DPF preparations.

For details of preparations that can be prescribed, see individual entries under the relevant drug monographs throughout the BNF publications.

Details of DPF preparations

Preparations on the List of Dental Preparations which are specified as DPF are described as follows in the DPF. Although brand names may occur for identification no modifications are required.

Amoxicillin Oral Powder
amoxicillin (as trihydrate) 3 g sachet
Artificial Saliva Gel
(proprietary product: Biotene Oralbalance), lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis

Artificial Saliva Oral Spray
(proprietary product: Xerolin) consists of water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral

Artificial Saliva Pastilles
(proprietary product: Salivix), consists of acacia, malic acid, and other ingredients

Artificial Saliva Protective Spray
(proprietary product: Aquoral) consists of oxidised glycerol triesters, silicon dioxide, flavouring agents, aspartame

Artificial Saliva Substitute Spray
(proprietary product: AS Saliva Orthana Spray) consists of mucin, methylparaben, benzalkonium chloride, EDTA, xylitol, peppermint oil, spearmint oil, mineral salts

Azithromycin Capsules
azithromycin 250 mg

Azithromycin Oral Suspension 200 mg/5 mL
azithromycin 200 mg/5 mL when reconstituted with water

Azithromycin Tablets
azithromycin 250 mg and 500 mg

Betamethasone Soluble Tablets 500 micrograms
betamethasone (as sodium phosphate) 500 micrograms

Chlorhexidine Oral Spray
(proprietary product: Corsodyl Oral Spray), chlorhexidine gluconate 0.2%

Clarithromycin Oral Suspension 125 mg/5 mL
clarithromycin 125 mg/5 mL when reconstituted with water

Clarithromycin Oral Suspension 250 mg/5 mL
clarithromycin 250 mg/5 mL when reconstituted with water

Doxycycline Tablets 20 mg
(proprietary product: Periostat), doxycycline (as hyclate) 20 mg

Fluconazole Capsules 50 mg
fluconazole 50 mg

Fluconazole Oral Suspension 50 mg/5 mL
(proprietary product: Diflucan), fluconazole 50 mg/5 mL when reconstituted with water

Lidocaine Spray 10%
(proprietary product: Xylocaine Spray), lidocaine 10% supplying 10 mg lidocaine/spray

Loratadine Syrup 5 mg/5 mL
loratadine 5 mg/5 mL

Saliva Stimulating Tablets
(proprietary product: SST), citric acid, malic acid and other ingredients in a sorbitol base

Sodium Fluoride Toothpaste 0.619%
(proprietary product: Duraphat '2800 ppm' Toothpaste), sodium fluoride 0.619%

Sodium Fluoride Toothpaste 1.1%
(proprietary product: Duraphat '5000 ppm' Toothpaste), sodium fluoride 1.1%
Nurse Prescribers’ Formulary for Community Practitioners

List of preparations approved by the Secretary of State which may be prescribed on form FP10P (form HS21(N) in Northern Ireland, form GP10(N) in Scotland, forms WP10CN and WP10PN in Wales) by Nurses for National Health Service patients.

Community practitioners who have completed the necessary training may only prescribe items appearing in the nurse prescribers’ list set out below. Community Practitioner Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

Medicinal Preparations

Preparations on this list which are not included in the BP or BPC are described under Details of NPF preparations.

Almond Oil Ear Drops, BP
Arachis Oil Enema, NPF
Aspirin Tablets, Dispersible, 300 mg, BP (max. 96 tablets; max. pack size 32 tablets)
Bisacodyl Suppositories, BP (includes 5-mg and 10-mg strengths)
Bisacodyl Tablets, BP
Catheter Maintenance Solution, Sodium Chloride, NPF
Catheter Maintenance Solution, ‘Solution G’, NPF
Catheter Maintenance Solution, ‘Solution R’, NPF
Chlorhexidine Gluconate Alcoholic Solutions containing at least 0.05%
Chlorhexidine Gluconate Aqueous Solutions containing at least 0.05%
Choline Salicylate Dental Gel, BP
Clotrimazole Cream 1%, BP
Co-danthramer Capsules, NPF
Co-danthramer Capsules, Strong, NPF
Co-danthramer Oral Suspension, NPF
Co-danthramer Oral Suspension, Strong, NPF
Co-danthusate Capsules, BP
Co-danthusate Oral Suspension, NPF
Crotamiton Cream, BP
Crotamiton Lotion, BP
Dimeticone barrier creams containing at least 10%
Dimeticone Lotion, NPF
Docucate Capsules, BP
Docucate Enema, NPF
Docucate Oral Solution, BP
Docucate Oral Solution, Paediatric, BP
Econazole Cream 1%, BP
Emollients as listed below:
Aquadrate ® 10% w/w Cream
Arachis Oil, BP
Balneum ® Plus Cream
Cetramen ® Emollient Cream
Dermamist ®
Diprobase ® Cream
Diprobase ® Ointment
Doublebase
Doublebase ® Dayleve Gel
E45 ® Cream
E45 ® Itch Relief Cream
Emulsifying Ointment, BP
Eucerin ® Intensive 10% w/w Urea Treatment Cream
Eucerin ® Intensive 10% w/w Urea Treatment Lotion
Hydromol ® Cream
Hydromol ® Intensive
Hydrous Ointment, BP
Lipobase ®
Liquid and White Soft Paraffin Ointment, NPF
Neutrogena ® Norwegian Formula Dermatological Cream
Nutraplus ® Cream
Oiatum ® Cream
Oiatum ® Junior Cream
Paraffin, White Soft, BP
Paraffin, Yellow Soft, BP
Ultrabase ®
Unguentum M ®
Emollient Bath and Shower Preparations as listed below:
Aquadream, BP
Balneum ® (except pack sizes that are not to be prescribed under the NHS (see Part XVIII of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff))
Balneum Plus ® Bath Oil (except pack sizes that are not to be prescribed under the NHS (see Part XVIII of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff))
Cetramen ® Emollient Bath Additive
Dermal ® Bath Emollient
Doublebase ® Emollient Bath Additive
Doublebase ® Emollient Shower Gel
Doublebase ® Emollient Wash Gel
Hydromol ® Bath and Shower Emollient
Oiatum ® Emollient
Oiatum ® Gel
Oiatum ® Junior Bath Additive
Zerolatum ® Emollient Medicinal Bath Oil
Folic Acid Tablets 400 micrograms, BP
Glycerol Suppositories, BP
Ibuprofen Oral Suspension, BP (except for indications and doses that are prescription-only)
Ibuprofen Tablets, BP (except for indications and doses that are prescription-only)
Ispaghula Husk Granules, BP
Ispaghula Husk Granules, Effervescent, BP
Ispaghula Husk Oral Powder, BP
Lactulose Solution, BP
Lidocaine Ointment, BP
Lidocaine and Chlorhexidine Gel, BP
Macrogl Oral Liquid, Compound, NPF
Macrogl Oral Powder, Compound, NPF
Macrogl Oral Powder, Compound, Half-strength, NPF
Magnesium Hydroxide Mixture, BP
Magnesium Sulfate Paste, BP
Malathion aqueous lotions containing at least 0.5%
Mebendazole Oral Suspension, NPF
Mebendazole Tablets, NPF
Methylcellulose Tablets, BP
Miconazole Cream 2%, BP
Miconazole Oromucosal Gel, BP
Mouthwash Solution-tablets, NPF
Nicotine Inhalation Cartridge for Oromucosal Use, NPF
Nicotine Lozenge, NPF
Nicotine Medicated Chewing Gum, NPF
Nicotine Nasal Spray, NPF
Nicotine Oral Spray, NPF
Nicotine Sublingual Tablets, NPF
Nicotine Transdermal Patches, NPF
Nystatin Oral Suspension, BP
Paracetamol Oral Suspension, BP (includes 120 mg/5 mL and 250 mg/5 mL strengths—both of which are available as sugar-free formulations)
Paracetamol Tablets, BP (max. 96 tablets; max. pack size 32 tablets)
Paracetamol Tablets, Soluble, BP (includes 120-mg and 500-mg tablets; max. 96 tablets; max. pack size 32 tablets)
Permethrin Cream, NPF
Phosphates Enema, BP
Povidone–Iodine Solution, BP
Senna Oral Solution, NPF
Senna Tablets, BP
Senna and Ispaghula Granules, NPF
Sodium Chloride Solution, Sterile, BP
Sodium Citrate Compound Enema, NPF
Sodium Picosulfate Capsules, NPF
Sodium Picosulfate Elixir, NPF
Spermoidal contraceptives as listed below:
   Gygel® Contraceptive Jelly
Sterculia Granules, NPF
Sterculia and Frangula Granules, NPF
Titanium Ointment, BP
Water for Injections, BP
Zinc and Castor Oil Ointment, BP
Zinc Oxide and Dimeticone Spray, NPF
Zinc Oxide Impregnated Medicated Bandage, NPF
Zinc Oxide Impregnated Medicated Stocking, NPF
Zinc Paste Bandage, BP 1993
Zinc Paste and Ichthammol Bandage, BP 1993

Appliances and Reagents (including Wound Management Products)

Community Practitioner Nurse Prescribers in England, Wales and Northern Ireland can prescribe any appliance or reagent in the relevant Drug Tariff. In the Scottish Drug Tariff, Appliances and Reagents which may not be prescribed by Nurses are annotated Nx.

Appliances (including Contraceptive Devices) as listed in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 (Appliances) and Part 2 (Dressings) of the Scottish Drug Tariff). (Where it is not appropriate for nurse prescribers in family planning clinics to prescribe contraceptive devices using form FP10(P) (forms WP10CN and WP10PN in Wales), they may prescribe using the same system as doctors in the clinic.)

Incontinence Appliances as listed in Part IXB of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 5 of the Scottish Drug Tariff).

Stoma Appliances and Associated Products as listed in Part IXC of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 6 of the Scottish Drug Tariff).

Chemical Reagents as listed in Part IXR of the Drug Tariff (Part II of the Northern Ireland Drug Tariff, Part 9 of the Scottish Drug Tariff).

The Drug Tariffs can be accessed online at:
National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm
Scottish Drug Tariff: www.isdscotland.org/Health-topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

Details of NPF preparations

Preparations on the Nurse Prescribers’ Formulary which are not included in the BP or BPC are described as follows in the Nurse Prescribers’ Formulary. Although brand names have sometimes been included for identification purposes, it is recommended that non–proprietary names should be used for prescribing medicinal preparations in the NPF except where a non–proprietary name is not available.

Arachis Oil Enema
arachis oil 100%

Catheter Maintenance Solution, Sodium Chloride
(proprietary products: OptiFlo S; Uro-Tainer Sodium Chloride; Uriflex-S), sodium chloride 0.9%

Catheter Maintenance Solution, ‘Solution G’
(proprietary products: OptiFlo G; Uro-Tainer Suby G; Uriflex G), citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%

Catheter Maintenance Solution, ‘Solution R’
(proproprietary products: OptiFlo R; Uro-Tainer Solution R; Uriflex R), citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%

Chlorhexidine gluconate alcoholic solutions
(proprietary products: ChloralPrep; Hydrex Solution; Hydrex spray), chlorhexidine gluconate in alcoholic solution

Chlorhexidine gluconate aqueous solutions
(proproprietary product: Unisept), chlorhexidine gluconate in aqueous solution

Co-danthramer Capsules (proprietary product: Codalax), co-danthramer 5/200 mg (dantron 25 mg, poloxamer 188’ 200 mg)

Co-danthramer Capsules, Strong (proprietary product: Codalax), co-danthramer 37.5/500 mg (dantron 37.5 mg, poloxamer 188’ 500 mg)

Co-danthramer Oral Suspension (proprietary product: Codalax Forte), co-danthramer 25/200 in 5 mL (dantron 25 mg, poloxamer 188’ 200 mg/5 mL)

Co-danthrusate Oral Suspension (proprietary product: Normax), co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg/5 mL)

Dimeticone barrier creams
(proproprietary products Conotrane Cream, dimeticone ‘350’ 22%, Slopex Barrier Cream, dimeticone ‘1000’ 10%), dimeticone 10–22%

Dimeticone Lotion
(proproprietary product: Hedrin), dimeticone 4%

Docusate Enema
(proproprietary product: Norgalax Micro-encema), docusate sodium 120 mg in 10 g

Liquid and White Soft Paraffin Ointment
liquid paraffin 50%, white soft paraffin 50%

Macrogol Oral Liquid, Compound
(proproprietary product: Movicol Liquid), macrogol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/25 mL

Macrogol Oral Powder, Compound
(proproprietary products: Laxido Orange, Molaxole, Movicol), macrogol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet; (amount of potassium chloride varies according to flavour of Movicol® as follows: plain-flavour (sugar-free) = 50.2 mg/sachet; lime and lemon flavour = 46.6 mg/sachet; chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K+ 5.4 mmol/litre)

Macrogol Oral Powder, Compound, Half-strength
(proproprietary product: Movicol-Half), macrogol ‘3350’ (polyethylene glycol ‘3350’) 6.563 g, sodium bicarbonate 89.3 g, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet

Melatonian aqueous lotions
(proproprietary products: Derbac-M Liquid), melatonin 0.5% in an aqueous basis

Mebendazole Oral Suspension (proprietary product: Vermox), mebendazole 100 mg/5 mL

Mebendazole Tablets (proprietary products: Ovex, Vermox), mebendazole 100 mg (can be supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show...
a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg)

**Mouthwash Solution-tablets**

consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescent basis to make a mouthwash

**Nicotine Inhalation Cartridge for Oromucosal Use**

(proprietary products: NicAssist Inhalator, Nicorette Inhalator), nicotine 15 mg (for use with inhalation mouthpiece; to be prescribed as either a starter pack (6 cartridges with inhalator device and holder) or refill pack (42 cartridges with inhalator device)

**Nicotine Lozenge**

nicotine (as bitartrate) 1 mg or 2 mg (proprietary product: Nicorette Mint Lozenge, Nicotinell Mint Lozenge), or nicotine (as resinate) 1.5 mg, 2 mg, or 4 mg (proprietary product: NiQuitin Lozenges, NiQuitin Minis, NiQuitin Pre-quit)

**Nicotine Medicated Chewing Gum**

(proprietary products: NicAssist Gum, Nicorette Gum, Nicotinell Gum, NiQuitin Gum), nicotine 2 mg or 4 mg

**Nicotine Nasal Spray**

(proprietary product: NicAssist Nasal Spray, Nicorette Nasal Spray), nicotine 500 micrograms/metered spray

**Nicotine Oral Spray**

(proprietary product: Nicorette Quickmist), nicotine 1 mg/metered spray

**Nicotine Sublingual Tablets**

(proprietary product: NicAssist Microtab, Nicorette Microtab), nicotine (as a cyclodextrin complex) 2 mg (to be prescribed as either a starter pack (2 × 15-tablet discs with dispenser) or refill pack (7 × 15-tablet discs))

**Nicotine Transdermal Patches**

releasing in each 16 hours, nicotine approx. 5 mg, 10 mg, or 15 mg (proprietary products: Boots NicAssist Patch, Nicorette Patch), or releasing in each 16 hours approx. 10 mg, 15 mg, or 25 mg (proprietary products: NicAssist Translucent Patch, Nicorette Invisi Patch), or releasing in each 24 hours nicotine approx. 7 mg, 14 mg, or 21 mg (proprietary products: Nicopatch, Nicotinell TTS, NiQuitin, NiQuitin Clear)

(prescriber should specify the brand to be dispensed)

**Permethrin Cream**

(proprietary product: Lyclear Dermal Cream), permethrin 5%

**Senna Oral Solution**

(proprietary product: Senokot Syrup), sennosides 7.5 mg/5 mL

**Senna and Ispaghula Granules**

(proprietary product: Manevac Granules), senna fruit 12.4%, ispaghula 54.2%

**Sodium Citrate Compound Enema**

(proprietary products: Micolette Micro-enema; Micralax Micro-enema; Relaxit Micro-enema), sodium citrate 450 mg with glycerol, sorbitol and an anionic surfactant

**Sodium Picosulfate Capsules**

(proprietary products: Dulcolax Perles), sodium picosulfate 2.5 mg

**Sodium Picosulfate Elixir**

(proprietary product: Dulcolax Liquid), sodium picosulfate 5 mg/5 mL

**Sterculia Granules**

(proprietary product: Normacol Granules), sterculia 62%

**Sterculia and Frangula Granules**

(proprietary product: Normacol Plus Granules), sterculia 62%, frangula (standardised) 8%

**Zinc Oxide and Dimeticone Spray**

(proprietary product: Sprilon), dimeticone 1.04%, zinc oxide 12.5% in a pressurised aerosol unit

**Zinc Oxide Impregnated Medicated Bandage**

(proprietary product: Steripaste), sterile cotton bandage impregnated with paste containing zinc oxide 15%

**Zinc Oxide Impregnated Medicated Stocking**

(proprietary product: Zipzoc), sterile rayon stocking impregnated with ointment containing zinc oxide 20%
Non-medical prescribing

Overview
A range of non-medical healthcare professionals can prescribe medicines for patients as either Independent or Supplementary Prescribers.

Independent prescribers are practitioners responsible and accountable for the assessment of patients with previously undiagnosed or diagnosed conditions and for decisions about the clinical management required, including prescribing. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Supplementary prescribing is a partnership between an independent prescriber (a doctor or a dentist) and a supplementary prescriber to implement an agreed Clinical Management Plan for an individual patient with that patient’s agreement.

Independent and Supplementary Prescribers are identified by an annotation next to their name in the relevant professional register.

Information and guidance on non-medical prescribing is available on the Department of Health website at www.dh.gov.uk/health/2012/04/prescribing-change.

For information on the supply and administration of medicines to groups of patients using Patient Group Directions see Guidance on prescribing p. 1.

Nurses
Nurse Independent Prescribers (formerly known as Extended Formulary Nurse Prescribers) are able to prescribe any medicine for any medical condition.

Nurse Independent Prescribers are able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Nurse Independent Prescribers must work within their own level of professional competence and expertise.

The Nurse Prescribers’ Formulary p. 1484 for Community Practitioners provides information on prescribing.

Pharmacists
Pharmacist Independent Prescribers can prescribe any medicine for any medical condition.

They are also able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Pharmacist Independent Prescribers must work within their own level of professional competence and expertise.

Optometrists
Optometrist Independent Prescribers can prescribe any licensed medicine for ocular conditions affecting the eye and the tissues surrounding the eye, except Controlled Drugs or medicines for parenteral administration. Optometrist
Index of proprietary manufacturers

The following is an alphabetical list of manufacturers and other companies referenced in the BNF, with their medicines information or general contact details. For information on ‘special-order’ manufacturers and specialist importing companies see ‘Special-order manufacturers’.

Special-order manufacturers

Unlicensed medicines are available from ‘special-order’ manufacturers and specialist-importing companies; the MHRA maintains a register of these companies at tinyurl.com/cdsiks.

Licensed hospital manufacturing units also manufacture ‘special-order’ products as unlicensed medicines, the principal NHS units are listed below. A database (Pro-File; www.pro-file.nhs.uk) provides information on medicines manufactured in the NHS; access is restricted to NHS pharmacy staff.

The Association of Pharmaceutical Specials Manufacturers may also be able to provide further information about commercial companies (www.apsm-uk.com).

The MHRA recommends that an unlicensed medicine should only be used when a patient has special requirements that cannot be met by use of a licensed medicine.

As well as being available direct from the hospital manufacturer(s) concerned, many NHS-manufactured Specials may be bought from the Oxford Pharmacy Store, owned and operated by Oxford Health NHS Foundation Trust.

Date reaction(s) started: ____________  Date reaction(s) stopped: ____________

Do you consider the reactions to be serious?  Yes / No

If yes, please indicate why the reaction is considered to be serious (please tick all that apply):

- Patient died due to reaction
- Life threatening
- Congenital abnormality
- Involved or prolonged inpatient hospitalisation
- Involved persistent or significant disability or incapacity
- Medically significant; please give details: ____________

If the reactions were not serious according to the categories above, how bad was the suspected reaction?

- Mild
- Unpleasant, but did not affect everyday activities
- Bad enough to affect everyday activities
It's easy to report online: www.mhra.gov.uk/yellowcard

OTHER DRUG(S) (including self-medication and complementary remedies)
Did the patient take any other medicines/vaccines/complementary remedies in the last 3 months prior to the reaction? Yes / No
If yes, please give the following information if known:

Adult Advanced Life Support Algorithm

Unresponsive and not breathing normally

- Call resuscitation team

CPR 30:2
Attach defibrillator/monitor
Minimise interruptions

Assess rhythm

Shockable (VF/Pulseless VT)

- 1 Shock
  - Minimise interruptions

Immediate post cardiac arrest treatment
- Use ABCDE approach
- Aim for SpO2 of 94-96%
- Aim for normal PaCO2
- 12-lead ECG
- Treat precipitating cause
- Targeted temperature management

Immediately resume CPR for 2 min
Minimise interruptions

Return of spontaneous circulation

Non-shockable (PEA/Asystole)

- Immediately resume CPR for 2 min
  - Minimise interruptions

During CPR
- Ensure high quality chest compressions
- Minimise interruptions to compressions
- Give oxygen
- Use waveform capnography
- Continuous compressions when advanced airway in place
- Vascular access (intravenous or intraosseous)
- Give adrenaline every 3-5 min
- Give amiodarone after 3 shocks

Treat Reversible Causes
- Hypoxia
- Hypovolaemia
- Hypoa/hyperkalaemia/metabolic
- Hypothermia
- Thrombosis - coronary or pulmonary
- Tension pneumothorax
- Tamponade – cardiac
- Toxins

Consider
- Ultrasound imaging
- Mechanical chest compressions to facilitate transfer/treatment
- Coronary angiography and percutaneous coronary intervention
- Extracorporeal CPR

Reproduced with the kind permission of the Resuscitation Council (UK) from Resuscitation Guidelines, 2015

downloaded from www.medicalbr.com
Medical emergencies in the community

Overview
Drug treatment outlined below is intended for use by appropriately qualified healthcare professionals. Only drugs that are used for immediate relief are shown; advice on supporting care is not given. Where the patient’s condition requires investigation and further treatment, the patient should be transferred to hospital promptly.

Acute coronary syndromes

▶ ANGINA: UNSTABLE
Aspirin dispersible tablets p. 117 (75 mg, 300 mg)
BY MOUTH (DISPERSED IN WATER OR CHEWED)
» Adult: 300 mg

▶ PLUS
▶ EITHER Glyceryl trinitrate aerosol spray p. 212
(400 micrograms/metered dose)
SUBLINGUALLY
» Adult: 1–2 sprays, repeated as required
▶ OR Glyceryl trinitrate tablets (300 micrograms, 500 micrograms, 600 micrograms)
SUBLINGUALLY
» Adult: 0.3–1 mg, repeated as required

▶ MYOCARDIAL INFARCTION: NON-ST-SEGMENT ELEVATION
Treat as for Angina: unstable

▶ MYOCARDIAL INFARCTION: ST-SEGMENT ELEVATION
Aspirin dispersible tablets (75 mg, 300 mg)
BY MOUTH (DISPERSED IN WATER OR CHEWED)
» Adult: 300 mg
Glyceryl trinitrate aerosol spray (400 micrograms/metered dose)
SUBLINGUALLY
» Adult: 1–2 sprays, repeated as required
▶ OR Glyceryl trinitrate tablets (300 micrograms, 500 micrograms, 600 micrograms)
SUBLINGUALLY
» Adult: 0.3–1 mg, repeated as required

Acute asthma

ásthma: acute

Regard each emergency consultation as being for severe acute asthma until shown otherwise; failure to respond adequately at any time requires immediate transfer to hospital

▶ EITHER Salbutamol aerosol inhaler p. 244
(100 micrograms/metered inhalation)
BY AEROSOL INHALATION VIA LARGE-VOLUME SPACER
AND A CLOSE-FITTING FACE MASK IF CHILD UNDER 3 YEARS
» Adult and Child: 2–10 puffs each inhaled separately, repeated every 10–20 minutes or as necessary
▶ OR Salbutamol nebuliser solution (1 mg/mL, 2 mg/mL)
BY INHALATION OF NEBULISED SOLUTION (VIA OXYGEN-DRIVEN NEBULISER IF AVAILABLE)
» Child 4 years and below: 2.5 mg every 20–30 minutes or as necessary
» Child 5–11 years: 2.5–5 mg every 20–30 minutes or as necessary
» Child 12–17 years: 5 mg every 20–30 minutes or as necessary
» Adult: 5 mg every 20–30 minutes or as necessary
▶ OR Terbutaline sulfate nebuliser solution p. 246 (2.5 mg/mL)
BY INHALATION OF NEBULISED SOLUTION (VIA OXYGEN-DRIVEN NEBULISER IF AVAILABLE)
» Child 4 years and below: 5 mg every 20–30 minutes or as necessary
» Child 5–11 years: 5–10 mg every 20–30 minutes or as necessary
» Child 12–17 years: 10 mg every 20–30 minutes or as necessary
» Adult: 10 mg every 20–30 minutes or as necessary

▶ PLUS (in all cases)
▶ EITHER Prednisolone tablets p. 639 (or prednisolone soluble tablets) (5 mg)
BY MOUTH
» Child 11 years and below: 1–2 mg/kg (max. 40 mg) once daily for up to 3 days or longer if necessary; if child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg) once daily
» Child 12–17 years: 40–50 mg once daily for at least 5 days
» Adult: 40–50 mg once daily for at least 5 days
▶ OR Hydrocortisone p. 637 (preferably as sodium succinate)
BY INTRAVENOUS INJECTION
» Child 17 years and below: 4 mg/kg (max. 100 mg) every 6 hours until conversion to oral prednisolone is possible; alternative dose if weight unavailable:
» Child 1 year and below: 25 mg
» Child 2–4 years: 50 mg
» Child 5–17 years: 100 mg
» Adult: 100 mg every 6 hours until conversion to oral prednisolone is possible

High-flow oxygen should be given if available (via face mask in children)
Monitor response 15 to 30 minutes after nebulisation; if any signs of acute asthma persist, arrange hospital admission. While awaiting ambulance, repeat nebulised beta₂ agonist (as above) and give with
Ipratropium bromide nebuliser solution p. 239
(250 micrograms/mL)
BY INHALATION OF NEBULISED SOLUTION (VIA OXYGEN-DRIVEN NEBULISER IF AVAILABLE)
▶ Child 11 years and below: 250 micrograms, repeated every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary
▶ Child 12–17 years: 500 micrograms every 4–6 hours as necessary
▶ Adult: 500 micrograms every 4–6 hours as necessary

▶ CROUP
Dexamethasone oral solution p. 635 (2 mg/5 mL)
BY MOUTH
▶ Child 1 month–2 years: 150 micrograms/kg as a single dose

▶ ANAPHYLAXIS
Adrenaline/epinephrine injection p. 216 (1 mg/mL (1 in 1000))
BY INTRAMUSCULAR INJECTION
▶ Child 5 years and below: 150 micrograms (0.15 mL), repeated every 5 minutes if necessary
▶ Child 6–11 years: 300 micrograms (0.3 mL), repeated every 5 minutes if necessary
▶ Child 12–17 years: 500 micrograms (0.5 mL), repeated every 5 minutes if necessary; 300 micrograms (0.3 mL) should be given if child is small or prepubertal
▶ Adult: 500 micrograms (0.5 mL), repeated every 5 minutes if necessary

High-flow oxygen and intravenous fluids should be given as soon as available.

Chlorphenamine maleate injection p. 272
BY INTRAMUSCULAR OR INTRavenous INJECTION
May help counter histamine-mediated vasodilation and bronchoconstriction.

Hydrocortisone (preferably as sodium succinate)
BY INTRAVENOUS INJECTION
Has delayed action but should be given to severely affected patients to prevent further deterioration.

Bacterial infection
▶ MENINGOCOCCAL DISEASE
Benzylenicillin sodium injection p. 517 (600 mg, 1.2 g)
BY INTRAVENOUS INJECTION (OR BY INTRAMUSCULAR INJECTION IF VENOUS ACCESS NOT AVAILABLE)
▶ Neonate: 300 mg
▶ Child 1 month–11 months: 300 mg
▶ Child 1–9 years: 600 mg
▶ Child 10–17 years: 1.2 g
▶ Adult: 1.2 g

NOTE A single dose should be given before urgent transfer to hospital, so long as this does not delay the transfer.

▶ OR if history of allergy to penicillin
Cefotaxime injection p. 500 (1 g)
BY INTRAVENOUS INJECTION (OR BY INTRAMUSCULAR INJECTION IF VENOUS ACCESS NOT AVAILABLE)
▶ Neonate: 50 mg/kg
▶ Child 1 month–11 years: 50 mg/kg (max. 1 g)
▶ Child 12–17 years: 1 g
▶ Adult: 1 g

NOTE A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer.

▶ OR if history of immediate hypersensitivity reaction (including anaphylaxis, angioedema, urticaria, or rash immediately after administration) to penicillin or to cephalosporins
Chloramphenicol injection p. 537 (1 g)
BY INTRavenous INJECTION
▶ Child: 12.5–25 mg/kg
▶ Adult: 12.5–25 mg/kg

NOTE A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer.
See also Central nervous system infections, bacterial p. 485.

Seizures
▶ CONVULSIVE (INCLUDING FEBRILE) SEIZURES LASTING LONGER THAN 5 MINUTES
▶ EITHER Diazepam rectal solution p. 327 (2 mg/mL, 4 mg/mL)
BY RECTUM
▶ Neonate: 1.25–2.5 mg, repeated once after 10–15 minutes if necessary
▶ Child 1 month–1 year: 5 mg, repeated once after 10–15 minutes if necessary
▶ Child 2–11 years: 5–10 mg, repeated once after 10–15 minutes if necessary
▶ Child 12–17 years: 10–20 mg, repeated once after 10–15 minutes if necessary
▶ Adult: 10–20 mg, repeated once after 10–15 minutes if necessary
▶ Elderly: 10 mg, repeated once after 10–15 minutes if necessary

▶ OR Midazolam oromucosal solution p. 323
BY BUCCAL ADMINISTRATION, REPEATED ONCE AFTER 10 MINUTES IF NECESSARY
▶ Neonate: 300 micrograms/kg [unlicensed]
▶ Child 1–2 months: 300 micrograms/kg (max. 2.5 mg) [unlicensed]
▶ Child 3 months–11 months: 2.5 mg
▶ Child 1–4 years: 5 mg
▶ Child 5–9 years: 7.5 mg
▶ Child 10–17 years: 10 mg
▶ Adult: 10 mg [unlicensed]

Hypoglycaemia
▶ DIABETIC HYPOGLYCAEMIA
Glucose or sucrose
BY MOUTH
▶ Adult and Child over 2 years: approx. 10–20 g (55–110 mL Lucozade ® Energy Original or 100–200 mL Coca-Cola ®—both non-diet versions or 2–4 teaspoonfuls of sugar or 3–6 sugar lumps) repeated after 10–15 minutes if necessary

▶ OR if hypoglycaemia unresponsive or if oral route cannot be used
Glucagon injection p. 681 (1 mg/mL)
BY SUBCUTANEOUS OR INTRAMUSCULAR INJECTION
▶ Child body-weight up to 25 kg: 500 micrograms (0.5 mL)
▶ Child body-weight 25 kg and over: 1 mg (1 mL)
▶ Adult: 1 mg (1 mL)

▶ OR if hypoglycaemia prolonged or unresponsive to glucagon after 10 minutes
Glucose intravenous infusion p. 955 (10%)
BY INTRAVENOUS INJECTION INTO LARGE VEIN
▶ Child: 5 mL/kg (glucose 500 mg/kg)

Glucose intravenous infusion (20%)
BY INTRAVENOUS INJECTION INTO LARGE VEIN
▶ Adult: 50 mL

Length

1 metre (m) = 1000 millimetres (mm)
1 centimetre (cm) = 10 mm
1 inch (in) = 25.4 mm
1 foot (ft) = 12 inches
12 inches = 304.8 mm

Mass

1 kilogram (kg) = 1000 grams (g)
1 gram (g) = 1000 milligrams (mg)
1 milligram (mg) = 1000 micrograms
1 microgram = 1000 nanograms
1 nanogram = 1000 picograms

Volume

1 litre = 1000 millilitres (mL)
1 millilitre (1 mL) = 1000 microlitres
1 pint = 568 mL

Other units

1 kilocalorie (kcal) = 4186.8 joules (J)
1000 kilocalories (kcal) = 4.1868 megajoules (MJ)
1 megajoule (MJ) = 238.8 kilocalories (kcal)
1 millimetre of mercury (mmHg) = 133.3 pascals (Pa)
1 kilopascal (kPa) = 7.5 mmHg (pressure)

Plasma-drug concentrations

Plasma-drug concentrations in BNF publications are expressed in mass units per litre (e.g. mg/litre). The approximate equivalent in terms of amount of substance units (e.g. micromol/litre) is given in brackets.

Prescribing for children: weight, height, and gender

The table below shows the mean values for weight, height, and gender by age; these values have been derived from the UK-WHO growth charts 2009 and UK1990 standard centile charts, by extrapolating the 50th centile, and may be used to calculate doses in the absence of measurements. However, an individual’s weight and height might vary considerably from the values in the table and it is important to ensure that the value chosen is appropriate. In most cases the actual measurement should be obtained as soon as possible and the dose re-calculated.

Recommended wording of cautionary and advisory labels

For details including Welsh Language translation see p. 1454

1. Warning: This medicine may make you sleepy
2. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol
3. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines
4. Warning: Do not drink alcohol
5. Do not take indigestion remedies 2 hours before or after you take this medicine
6. Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
7. Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
8. Warning: Do not stop taking this medicine unless your doctor tells you to stop
9. Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop
10. Warning: Read the additional information given with this medicine
11. Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds
12. Do not take anything containing aspirin while taking this medicine
13. Dissolve or mix with water before taking
14. This medicine may colour your urine. This is harmless
15. Caution: flammable. Keep your body away from fire or flames after you have put on the medicine
16. Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening
17. Do not take more than... in 24 hours
18. Do not take more than... in 24 hours. Also, do not take more than... in any one week
19. Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
20. Take with or just after food, or a meal
21. Take 30 to 60 minutes before food
22. Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
23. Suck or chew this medicine
24. Swallow this medicine whole. Do not chew or crush
25. Dissolve this medicine under your tongue
26. Take with a full glass of water
27. Spread thinly on the affected skin only
28. Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
29. Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well
30. Contains aspirin. Do not take anything else containing aspirin while taking this medicine

### Latin abbreviations

Directions should be in English without abbreviation. However, Latin abbreviations have been used when prescribing.

The following is a list of appropriate abbreviations. It should be noted that the English version is not always an exact translation.

- a. c. = ante cibum (before food)
- b. d. = bis die (twice daily)
- d. v. = omni nocte (every night)
- d. m. = omni die (every day)
- xii
- i. m. = omni mane (every morning)
- q. d. s. = quarta die sumendum (to be taken four times daily)
- q. c. = post cibum (after food)
- p. r. = pro re nata (when required)
- q. d. s. = quarta quaque hora (every four hours)
- stat = immediately
- t. d. s. = ter die sumendum (to be taken three times daily)
- t. i. d. = ter in die (three times daily)

### E numbers

The following is a list of common E numbers and the inactive ingredients to which they correspond.

<table>
<thead>
<tr>
