  - Adult: Initially 2–20 mg once daily, alternatively initially 2–20 mg daily in divided doses; maintenance 1–3 mg 3 times a day, adjusted according to response, daily maximum to be given in divided doses, for debilitated patients, use elderly dose; maximum 20 mg per day
  - Elderly: Initially 1–10 mg once daily, alternatively initially 1–10 mg daily in divided doses; maintenance 1–3 mg 3 times a day, adjusted according to response, daily maximum to be given in divided doses; maximum 20 mg per day
- **BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 2–5 mg, repeated if necessary, repeated dose given according to response and tolerability, for debilitated patients, use elderly dose; maximum 12 mg per day
  - Elderly: Initially 1–2.5 mg, repeated if necessary, repeated dose given according to response and tolerability; maximum 12 mg per day

**Agitation and restlessness in the elderly**

- **BY MOUTH**
  - Elderly: Initially 0.75–1.5 mg 2–3 times a day, adjusted according to response, if necessary

Management of mental or behavioural problems such as aggression, hyperactivity and self-mutilation in patients with intellectual disabilities and in patients with organic brain damage (depending on symptoms) | Gilles de la Tourette syndrome | Severe tics | Intractable hiccup | Adjunct to short-term management of moderate to severe psychomotor agitation, excitement and, violent or dangerously impulsive behaviour

- **BY MOUTH**
  - Adult: Initially 1.5–3 mg 2–3 times a day, alternatively initially 3–5 mg 2–3 times a day, higher dose in severely affected or resistant patients; maintenance 0.5–1 mg 3 times a day, increased if necessary to 2–3 mg 3 times a day, once symptoms are controlled, gradually reduce dose to the lowest effective maintenance dose, for debilitated patients, use elderly dose
  - Elderly: Initially 0.75–1.5 mg 2–3 times a day, alternatively initially 1.5–2.5 mg 2–3 times a day, higher dose in severely affected or resistant patients; maintenance 0.5–1 mg 3 times a day, increased if necessary to 2–3 mg 3 times a day, once symptoms are controlled, gradually reduce dose to the lowest effective maintenance dose

**Restlessness and confusion in palliative care**

- **BY MOUTH**
  - Adult: 2 mg, then 2 mg every 2 hours if required
  - **BY SUBCUTANEOUS INJECTION**
    - Adult: 2.5 mg, then 2.5 mg every 2 hours if required
  - **BY SUBCUTANEOUS INFUSION**
    - Adult: 5–15 mg/24 hours

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose adjustment may be necessary if smoking started or stopped during treatment.

- **UNLICENSED USE** BNF doses for schizophrenia, psychoses, mania, hypomania, and organic brain damage differ from those in product literature.

**IMPORTANT SAFETY INFORMATION**

When prescribing, dispensing or administering, check that this injection is the correct preparation—this preparation is usually used in hospital for the rapid control of an acute episode and should not be confused with depot preparations which are usually used in the community or clinics for maintenance treatment.

**CONTRA-INDICATIONS** Bradycardia · CNS depression · comatose states · lesions of the basal ganglia · Parkinson’s disease · phaeochromocytoma · QT-interval prolongation

**CAUTIONS** Arteriosclerosis · hypocalcaemia · hypokalaemia · hypomagnesaemia · metabolic disturbances · subarachnoid haemorrhage · thyrotoxicosis

**INTERACTIONS** Appendix 1: haloperidol

**SIDE-EFFECTS**

- Common or very common Depressions · weight loss
- Uncommon Dyspnoea · oedema
- Rare Bronchospasm · hypoglycaemia · inappropriate antidiuretic hormone secretion · photosensitivity reactions · pigmentation

- Frequency not known Hypertension · Stevens-Johnson syndrome · sweating · toxic epidermal necrolysis SIDE-EFFECTS, FURTHER INFORMATION

Less sedating and fewer antimuscarinic or hypotensive symptoms.

**PREGNANCY** Avoid unless benefits outweigh risks.

**HEPATIC IMPAIRMENT** Can precipitate coma.

**RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.

**MONITORING REQUIREMENTS** Baseline ECG required before treatment—assess need for further ECGs during treatment on an individual basis.

**PRESCRIBING AND DISPENSING INFORMATION**

Palliative care

For further information on the use of haloperidol in palliative care, see www.palliativedrugs.com/formulary/en/haloperidol.html.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 2

- Haloperidol (Non-proprietary)
  - Haloperidol 500 microgram tablet | 28 tablet | £22.05 DT price = £22.05
  - Haloperidol 1.5 mg tablet | 28 tablet | £5.99 DT price = £1.78
  - Haloperidol 5 mg tablet | 28 tablet | £3.80 DT price = £2.10
  - Haloperidol 10 mg tablet | 28 tablet | £12.99 DT price = £12.96

**Solution for injection**

- Haloperidol (Non-proprietary)
  - Haloperidol 5 mg per 1 ml solution for injection ampoules | 10 ampoule | £35.00 DT price = £35.00

**Oral solution**

CAUTIONARY AND ADVISORY LABELS 2

- Haloperidol (Non-proprietary)
  - Haloperidol 200 microgram per 1 ml | 200 micrograms/ml oral solution sugar free sugar-free | 200 ml | £195.00
  - Haloperidol 1 mg per 1 ml | 100 ml | £35.99 DT price = £6.47 sugar-free | 500 ml | £32.35
  - Haloperidol 2 mg per 1 ml | 100 ml | £46.75 DT price = £7.10 sugar-free | 500 ml | £35.50
  - Haldol (Janssen-Cilag Ltd)
  - Haloperidol 2 mg per 1 ml | 100 ml | £4.45 DT price = £7.10

**Capsule**

CAUTIONARY AND ADVISORY LABELS 2

- Serenace (Teva UK Ltd)
  - Haloperidol 500 microgram capsules | 30 capsule | £1.18 DT price = £1.18
Loxapine

25-Apr-2017

**DRUG ACTION** Loxapine is a dopamine D<sub>2</sub> and serotonin 5-HT<sub>2A</sub> receptor antagonist. It also binds to noradrenergic, histaminergic, and cholinergic receptors.

**INDICATIONS AND DOSE**

Rapid control of mild-to-moderate agitation in patients with schizophrenia or bipolar disorder (specialist supervision in hospital)

- **BY INHALATION**
  - Adult: 9.1 mg as a single dose, followed by 9.1 mg after 2 hours if required, alternatively 4.5 mg as a single dose, followed by 4.5 mg after 2 hours if required, lower dose may be given if more appropriate or if the higher dose not previously tolerated.

**CONTRA-INDICATIONS** Acute respiratory symptoms - asthma - cardiovascular disease - cerebrovascular disease - chronic obstructive pulmonary disease - dehydration - risk of hypotension - elderly patients (especially those with dementia-related psychosis) - hypovolaemia - risk of hypotension

**CAUTIONS** Bronchodilator treatment should be available for treatment of possible severe respiratory side-effects (bronchospasm) - history of extrapyramidal symptoms - risk factors for hyperventilation

**INTERACTIONS** → Appendix 1: loxapine

**SIDE-EFFECTS**

- Common or very common Dysgeusia - malaise - throat irritation
- Uncommon Bronchospasm - oculogyration
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises to avoid for 48 hours after dose (express and discard milk produced during this time) - present in milk in animal studies.
- MONITORING REQUIREMENTS Manufacturer advises to observe patient during the first hour after each dose for signs and symptoms of bronchospasm.
- DIRECTIONS FOR ADMINISTRATION Manufacturer advises remove pull-tab and wait for green light to turn on (product must be used within 15 minutes of pulling tab); instruct patient to inhale through mouthpiece and then hold breath briefly. When green light turns off, this indicates the dose has been delivered.

**PRESCRIBING AND DISPENSING INFORMATION** Educational risk minimisation materials are available for healthcare professionals.

*Adasuve*<sup>®</sup> 4.5 mg inhalation powder may be difficult to obtain.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from specialist-order manufacturers include: oral suspension, oral solution

**Oral solution**

- **CAUTIONARY AND ADVISORY LABELS** 2
  - Pericyazine (Non-proprietary) Pericyazine 2 mg per 1 ml Pericyazine 10mg/5ml oral solution | 100 ml £46.00-£46.01 DT price = £46.01

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS** 2
  - Pericyazine (Non-proprietary) Pericyazine 2.5 mg Pericyazine 2.5mg tablets | 84 tablet £15.87 DT price = £15.87
  - Pericyazine 10 mg Pericyazine 10mg tablets | 84 tablet £40.12 DT price = £40.12

Pericyazine

(Pericazine)

**INDICATIONS AND DOSE**

Schizophrenia | Psychoses

- **BY MOUTH**
  - Adult: Initially 75 mg daily in divided doses, then increased in steps of 25 mg every week, adjusted according to response; maximum 300 mg per day

**INTERACTIONS** → Appendix 1: phenothiazines

**SIDE-EFFECTS**

- Rare Systemic lupus erythematosus
- **FREQUENCY NOT KNOWN** Dystonic reactions

**CONTRA-INDICATIONS** Agitation in the elderly - CNS depression - comatose states - phaeochromocytoma - restlessness in the elderly

**CAUTIONS** Hypothyroidism

**SIDE-EFFECTS, FURTHER INFORMATION**

Less sedating.

Acute dystonic reactions Phenothiazines can all induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls,
young women, and those under 10 kg) are particularly susceptible.

- **Hepatic Impairment** Can precipitate coma; phenothiazines are hepatotoxic.
- **Renal Impairment** Start with small doses in severe renal impairment because of increased cerebral sensitivity.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension

**Pimozide**

- **Indications and Dose**

  **Schizophrenia**
  - **By Mouth**
    - Adult: Initially 4 mg daily, adjusted according to response, then increased in steps of 2–4 mg at intervals of not less than 1 week; maximum 16 mg per day
    - Elderly: Initially 2 mg daily, adjusted according to response, increased in steps of 2–4 mg at intervals of not less than 1 week; usual dose 2–20 mg daily
  
  **Monosymptomatic hypochondriacal psychosis | Paranoid psychoses**
  - **By Mouth**
    - Adult: Initially 4 mg daily, adjusted according to response, then increased in steps of 2–4 mg at intervals of not less than 1 week; maximum 16 mg per day
    - Elderly: Initially 2 mg daily, adjusted according to response, increased in steps of 2–4 mg at intervals of not less than 1 week; maximum 16 mg per day

- **Contra-Indications**

  CNS depression, comatose states, history of arrhythmias, history or family history of congenital QT prolongation, phaeochromocytoma

- **Interactions** → Appendix 1: pimozide

- **Side-Effects**

  - Rare
    - Hyponatraemia
  - Frequency not known
    - Glycosuria, serious arrhythmias

- **Side-Effects, Further Information**

  Less sedating.

- **Hepatic Impairment** Can precipitate coma.
- **Renal Impairment** Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **Monitoring Requirements**

  ECG monitoring

  Following reports of sudden unexplained death, an ECG is recommended before treatment. It is also recommended that patients taking pimozide should have an annual ECG (if the QT interval is prolonged, treatment should be reviewed and either withdrawn or dose reduced under close supervision) and that pimozide should not be given with other antipsychotic drugs (including depot preparations), tricyclic antidepressants or other drugs which prolong the QT interval, such as certain antimalarials, antiarrhythmic drugs and certain antihistamines and should not be given with drugs which cause electrolyte disturbances (especially diuretics).

- **Medicinal Forms**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  **Tablet**

  **CAUTIONARY AND ADVISORY LABELS** 2

  - **Pimozide (Non-proprietary)**
    - Pimozide 4 mg: Pimozide 4mg tablets: 100 tablet £0.40.31
    - Orap (Eumedica Pharmaceuticals)
      - Pimozide 4 mg Orap 4mg tablets: 100 tablet £0.40.31

**Prochlorperazine**

- **Indications and Dose**

  **Schizophrenia and other psychoses | Mania**
  - **By Mouth**
    - Adult: 12.5 mg twice daily for 7 days, dose to be adjusted at intervals of 4–7 days according to response; usual dose 75–100 mg daily
    - **By Deep Intramuscular Injection**
      - Adult: 12.5–25 mg 2–3 times a day
  
  **Short-term adjunctive management of severe anxiety**
  - **By Mouth**
    - Adult: 15–20 mg daily in divided doses; maximum 40 mg per day
  
  **Nausea and vomiting, acute attack**
  - **By Mouth**
    - Adult: Initially 20 mg, then 10 mg after 2 hours
    - **By Deep Intramuscular Injection**
      - Adult: 12.5 mg as required, to be followed if necessary after 6 hours by an oral dose
  
  **Nausea and vomiting, prevention**
  - **By Mouth**
    - Adult: 5–10 mg 2–3 times a day
    - **By Deep Intramuscular Injection**
      - Adult: 12.5 mg as required, to be followed if necessary after 6 hours by an oral dose
  
  **Prevention and treatment of nausea and vomiting**
  - **By Mouth**
    - Child 1–11 years (body-weight 10 kg and above): 250 micrograms/kg 2–3 times a day
    - Child 12–17 years: 5–10 mg up to 3 times a day if required
    - **By Intramuscular Injection**
      - Child 2–4 years: 1.25–2.5 mg up to 3 times a day if required
      - Child 5–11 years: 5–6.25 mg up to 3 times a day if required
      - Child 12–17 years: 12.5 mg up to 3 times a day if required
  
  **Labyrinthine disorders**
  - **By Mouth**
    - Adult: 5 mg 3 times a day, increased if necessary to 30 mg daily in divided doses, dose to be increased gradually, then reduced to 5–10 mg daily, dose is reduced after several weeks
    - **By Intramuscular Injection**
      - Child 12–17 years: 3–6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve
    - Adult: 3–6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve
  
  **Dose Equivalence and Conversion**

  - Doses are expressed as prochlorperazine maleate or mesilate; 1 mg prochlorperazine maleate = 1 mg prochlorperazine mesilate.

- **Unlicensed Use**

- **Contra-Indications**

  Avoid oral route in child under 10 kg
  - children (in psychotic disorders) - CNS depression, comatose states, phaeochromocytoma

- **Caution**

  Elderly - hypotension (more likely after intramuscular injection)

- **Interactions** → Appendix 1: phenothiazines

- **Side-Effects**

  Dystonic reactions - respiratory depression may occur in susceptible patients

  **Side-Effects, Further Information**

  Acute dystonic reactions Phenothiazines can all induce acute dystonic reactions such as facial and skeletal muscle

  [downloaded from www.medicalbr.com]
spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.

- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.
- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **DIRECTIONS FOR ADMINISTRATION** Buccal tablets are placed high between upper lip and gum and left to dissolve.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer prochlorperazine buccal tablets.

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Prochlorperazine (Non-proprietary)**
  - Prochlorperazine maleate 5 mg | 28 tablet | £1.31 DT price = £0.97 | 84 tablet | £3.93
  - Stemetil (Sanofi)
  - Prochlorperazine maleate 5 mg | 28 tablet | £1.98 DT price = £0.97 | 84 tablet | £5.94

**Buccal tablet**
- **Prochlorperazine (Non-proprietary)**
  - Prochlorperazine mesilate 12.5 mg per 1 ml | 10 ampoule | £35.94 DT price = £43.13
  - Stemetil (Sanofi)
  - Prochlorperazine mesilate 12.5 mg per 1 ml | 10 amppoule | £5.23 DT price = £5.23

**Oral solution**
- **Prochlorperazine (Non-proprietary)**
  - Prochlorperazine mesilate 1 mg per 1 ml | 100 ml | £3.34 DT price = £3.34

### Sulpiride
#### INDICATIONS AND DOSE

**Schizophrenia with predominantly negative symptoms**
- **BY MOUTH**
  - Adult: 200–400 mg twice daily; maximum 800 mg per day
  - Elderly: Lower initial dose to be given, increased gradually according to response

**Schizophrenia with mainly positive symptoms**
- **BY MOUTH**
  - Adult: 200–400 mg twice daily; maximum 2.4 g per day
  - Elderly: Lower initial dose to be given, increased gradually according to response

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma
- **CAUTIONS** Aggressive patients (even low doses may aggravate symptoms) · agitated patients (even low doses may aggravate symptoms) · excited patients (even low doses may aggravate symptoms)
- **INTERACTIONS** → Appendix 1: sulpiride
- **SIDE-EFFECTS** Hepatitis
- **HEPATIC IMPAIRMENT** Can precipitate coma.

### Trifluoperazine
#### INDICATIONS AND DOSE

Schizophrenia and other psychoses · Short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerously impulsive behaviour
- **BY MOUTH**
  - Adult: Initially 5 mg twice daily, increased by 5 mg daily after 1 week, then at intervals of 3 days, according to response
  - Elderly: Initially up to 2.5 mg twice daily, increased by 5 mg daily after 1 week, then at intervals of 3 days, according to response

**Short-term adjunctive management of severe anxiety**
- **BY MOUTH**
  - Adult: 2–4 mg daily in divided doses, increased if necessary to 6 mg daily
  - Elderly: Up to 2 mg daily in divided doses, increased if necessary to 6 mg daily

**Severe nausea and vomiting**
- **BY MOUTH**
  - Adult: 2–4 mg daily in divided doses; maximum 6 mg per day

- **CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma
- **INTERACTIONS** → Appendix 1: phenothiazines
- **SIDE-EFFECTS** Anorexia · dystonic reactions · muscle weakness

**SIDE-EFFECTS, FURTHER INFORMATION**
Extrapyramidal symptoms are more frequent, especially at doses exceeding 6 mg daily.

Phenothiazines can all induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises.

- **HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.
- **RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- **MONITORING REQUIREMENTS** Trifluoperazine does not affect blood pressure to the same extent as other
antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

- **Trifluoperazine (Non-proprietary)**
  - Trifluoperazine (as Trifluoperazine hydrochloride) 200 microgram per 1 ml Trifluoperazine 1mg/5ml oral solution sugar free sugar-free | 200 ml Pod | £102.53 DT price = £102.53
  - Trifluoperazine (as Trifluoperazine hydrochloride) 1 mg per 1 ml Trifluoperazine 5mg/5ml oral solution sugar free sugar-free | 150 ml Pod | £25.50 DT price = £25.50

**Tablet**

- **Trifluoperazine (Non-proprietary)**
  - Trifluoperazine (as Trifluoperazine hydrochloride) 1 mg Trifluoperazine 1mg tablets | 112 tablet Pod | £54.00 DT price = £54.00
  - Trifluoperazine (as Trifluoperazine hydrochloride) 5 mg Trifluoperazine 5mg tablets | 112 tablet Pod | £123.20 DT price = £123.20

### Zuclopenthixol

**INDICATIONS AND DOSE**

- **Schizophrenia and other psychoses**
  - **BY MOUTH**
    - Adult: Initially 20–30 mg daily in divided doses, increased if necessary up to 150 mg daily; usual maintenance 20–50 mg daily (max. per dose 40 mg), for debilitated patients, use elderly dose
    - Elderly: Initially 5–15 mg daily in divided doses, increased if necessary up to 150 mg daily; usual maintenance 20–50 mg daily (max. per dose 40 mg)

- **CONTRA-INDICATIONS**
  - Apathetic states
  - CNS depression
  - Comatose states
  - Phaeochromocytoma
  - Withdrawn states

- **CAUTIONS**
  - Avoid in acute porphyrias p. 969

- **INTERACTIONS**
  - Appendix 1: zuclopenthixol

- **SIDE-EFFECTS**
  - Urinary frequency
  - Urinary incontinence
  - Weight loss (less common than weight gain)

- **HEPATIC IMPAIRMENT**

- **RENAL IMPAIRMENT**
  - Halve dose in renal failure; smaller starting doses used in severe renal impairment because of increased cerebral sensitivity.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - **Clopixol (Zuclopenthixol)** (Lundbeck Ltd)
    - Zuclopenthixol (as Zuclopenthixol dihydrochloride) 2 mg Clopixol 2mg tablets | 100 tablet Pod | £3.14 DT price = £3.14
  - Zuclopenthixol (as Zuclopenthixol dihydrochloride) 10 mg Clopixol 10mg tablets | 100 tablet Pod | £8.06 DT price = £8.06
  - Zuclopenthixol (as Zuclopenthixol dihydrochloride) 25 mg Clopixol 25mg tablets | 100 tablet Pod | £16.13 DT price = £16.13

  **Drops**
  - **Zuclopenthixol (Non-proprietary)**
    - Zuclopenthixol (as Zuclopenthixol dihydrochloride) 20 mg per 1 ml Ciatyl-Z 20mg/ml oral drops | 30 ml Pod no price available

### Zuclopenthixol acetate

**INDICATIONS AND DOSE**

- **Short-term management of acute psychosis**
  - **BY DEEP INTRAMUSCULAR INJECTION**
    - Adult: 50–150 mg, then 50–150 mg after 2–3 days if required, (1 additional dose may be needed 1–2 days after the first injection); maximum cumulative dose 400 mg in 2 weeks and maximum 4 injections; maximum duration of treatment 2 weeks—If maintenance treatment necessary change to an oral antipsychotic 2–3 days after last injection, or to a longer acting antipsychotic depot injection given concomitantly with last injection of zuclopenthixol acetate; to be administered into the gluteal muscle or lateral thigh
    - Elderly: 50–100 mg, then 50–100 mg after 2–3 days if required, (1 additional dose may be needed 1–2 days after the first injection); maximum cumulative dose 400 mg in 2 weeks and maximum 4 injections; maximum duration of treatment 2 weeks—if maintenance treatment necessary change to an oral antipsychotic 2–3 days after last injection, or to a longer acting antipsychotic depot injection given concomitantly with last injection of zuclopenthixol acetate; to be administered into the gluteal muscle or lateral thigh

**IMPORTANT SAFETY INFORMATION**

When prescribing, dispensing, or administering, check that this is the correct preparation—this preparation is usually used in hospital for an acute episode and should not be confused with depot preparations which are usually used in the community or clinics for maintenance treatment.

- **CONTRA-INDICATIONS**
  - CNS depression
  - Comatose states
  - Phaeochromocytoma

- **CAUTIONS**
  - Avoid in acute porphyrias p. 969

- **INTERACTIONS**
  - Appendix 1: zuclopenthixol

- **HEPATIC IMPAIRMENT**
  - Can precipitate coma.

- **RENAL IMPAIRMENT**
  - Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Clopixol Acuphase** (Lundbeck Ltd)
  - Zuclopenthixol acetate 50 mg per 1 ml (Clopixol Acuphase) 50mg/1ml solution for injection ampoules | 5 ampoule Pod | £24.21 DT price = £24.21

**ANTIPSYCHOTICS > FIRST-GENERATION (DEPOT INJECTIONS)**

### Flupentixol decanoate

(Flupentixol Decanoate)

**INDICATIONS AND DOSE**

- **Maintenance in schizophrenia and other psychoses**
  - **BY DEEP INTRAMUSCULAR INJECTION**
    - Adult: Test dose 20 mg, dose to be injected into the upper outer buttock or lateral thigh, then 20–40 mg after at least 7 days, then 20–40 mg every 2–4 weeks, adjusted according to response, usual continued →
Fluphenazine decanoate

- **INDICATIONS AND DOSE**
  - **Maintenance in schizophrenia and other psychoses**
    - **BY DEEP INTRAMUSCULAR INJECTION**
      - Adult: Test dose 12.5 mg, dose to be administered into the gluteal muscle, then 12.5–100 mg every 4–7 days, then 12.5–100 mg every 14–35 days, adjusted according to response
      - Elderly: Test dose 6.25 mg, dose to be administered into the gluteal muscle, then 6.25–100 mg after 4–7 days, then 12.5–100 mg every 14–35 days, adjusted according to response
  
- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  Dose adjustment may be necessary if smoking started or stopped during treatment.

- **CONTRA-INDICATIONS**
  - Children
  - CNS depression
  - comatose states
  - excitatory states
  - overactive states
  - phaeochromocytoma

- **CAUTIONS**
  - An alternative antipsychotic may be necessary if symptoms such as aggression or agitation appear - avoid in acute porphyrias p. 969 - when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

- **DIRECTIONS FOR ADMINISTRATION**
  - Test dose first be given a small test-dose as undesirable side-effects, the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Less sedating but extrapyramidal symptoms frequent.
  - Treatment requires careful monitoring for QT-interval prolongation - when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
  - Antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - **Flupentixol decanoate (Non-proprietary)**
      - **Flupentixol decanoate 20 mg per 1 ml**
        - Flupentixol 40mg/2ml solution for injection ampoules | 10 ampoule (POT) £34.34
      - Flupentixol 20mg/1ml solution for injection ampoules | 10 ampoule (POT) £24.74
    - **Flupentixol decanoate 100 mg per 1 ml**
      - Flupentixol 50mg/0.5ml solution for injection ampoules | 10 ampoule (POT) £38.40
      - Flupentixol 100mg/1ml solution for injection ampoules | 10 ampoule (POT) £76.05
    - **Depixol (Flupentixol decanoate)** (Lundbeck Ltd)
      - **Flupentixol decanoate 20 mg per 1 ml**
        - Depixol 40mg/2ml solution for injection ampoules | 10 ampoule (POT) £25.39
      - Depixol 20mg/1ml solution for injection ampoules | 10 ampoule (POT) £15.17
    - **Flupentixol decanoate 100 mg per 1 ml**
      - Depixol Conc 100mg/1ml solution for injection ampoules | 10 ampoule (POT) £62.51
    - **Flupentixol decanoate 200 mg per 1 ml**
      - Depixol Low Volume 200mg/1ml solution for injection ampoules | 5 ampoule (POT) £97.59
    - **Psytixol (Mylan Ltd)**
      - **Flupentixol decanoate 20 mg per 1 ml**
        - Psytixol 40mg/2ml solution for injection ampoules | 10 ampoule (POT) £25.38
      - Psytixol 20mg/1ml solution for injection ampoules | 10 ampoule (POT) £15.16
    - **Flupentixol decanoate 100 mg per 1 ml**
      - Psytixol 50mg/0.5ml solution for injection ampoules | 10 ampoule (POT) £34.12
      - Psytixol 100mg/1ml solution for injection ampoules | 10 ampoule (POT) £62.50
    - **Flupentixol decanoate 200 mg per 1 ml**
      - Psytixol 200mg/1ml solution for injection ampoules | 5 ampoule (POT) £97.58
  - **Fluphenazine decanoate**
  - **CONTRA-INDICATIONS**
    - Children
    - CNS depression
    - comatose states
    - marked cerebral atherosclerosis
    - phaeochromocytoma
  - **CAUTIONS**
    - QT-interval prolongation - when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
  - **INTERACTIONS**
    - Appendix 1: phenothiazines
  - **SIDE-EFFECTS**
    - Erythema
    - inappropriate antidiuretic hormone secretion
    - nodules
    - oedema
    - pain at injection site
    - swelling
    - systemic lupus erythematosus
  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Less sedating and fewer antimuscarinic or hypotensive symptoms, but extrapyramidal symptoms, particularly dystonic reactions and akathisia, more frequent.
    - Extrapyramidal symptoms usually appear a few hours after injection and continue for about 2 days but may be delayed.
    - If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Solution for injection**
      - **Excipients**: May contain Sesame oil
      - **Modicare (Sanofi)**
        - Fluphenazine decanoate 25 mg per 1 ml | 5 ampoule (POT) £22.22
        - Modicare 25mg/1ml solution for injection ampoules | 10 ampoule (POT) £22.55 DT price = £22.55
      - **Fluphenazine decanoate 100 mg per 1 ml**
        - Modicare Concentrate 100mg/1ml solution for injection ampoules | 5 ampoule (POT) £43.73
        - DT price = £43.73
        - Modicare Concentrate 50mg/0.5ml solution for injection ampoules | 10 ampoule (POT) £44.73
Haloperidol decanoate

INDICATIONS AND DOSE

Maintenance in schizophrenia and other psychoses
- BY DEEP INTRAMUSCULAR INJECTION
  - Adult: Initially 50 mg every 4 weeks, increased in steps of 50 mg if required, increased if necessary up to 300 mg every 4 weeks, higher doses may be needed in some patients, dose to be administered into gluteal muscle, if 2-weekly administration preferred, doses should be halved
  - Elderly: Initially 12.5–25 mg every 4 weeks, if 2-weekly administration preferred, doses should be halved

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Dose adjustment may be necessary if smoking started or stopped during treatment.

IMPORTANT SAFETY INFORMATION
When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for maintenance treatment and should not be used for the rapid control of an acute episode.

CONTRA-INDICATIONS
- Bradycardia
- Children
- CNS depression
- Comatose states
- Lesions of the basal ganglia
- Parkinson’s disease
- Phaeochromocytoma
- QT-interval prolongation

CAUTIONS
- Arteriosclerosis
- Hypocalcaemia
- Hypokalaemia
- Hypomagnesaemia
- Metabolic disturbances
- Subarachnoid haemorrhage
- Thyrotoxicosis
- When transferring from oral to depot therapy, the dose by mouth should be reduced gradually

INTERACTIONS
- Appendix 1: haloperidol

SIDE-EFFECTS
- Common or very common: Depression, weight loss
- Uncommon: Dyspnœa, oedema
- Rare: Bronchospasm, hypoglycaemia, inappropriate antidiuretic hormone secretion, photosensitivity reactions, pigmentation
- Frequency not known: Erythema, hypertension, nodules, pain may occur at injection site, Stevens-Johnson syndrome, sweating, swelling, toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION
Less sedating and fewer antimuscarinic or hypotensive symptoms.

PREGNANCY
Avoid unless benefits outweigh risk.

HEPATIC IMPAIRMENT
Can precipitate coma.

RENAL IMPAIRMENT
Start with small doses in severe renal impairment because of increased cerebral sensitivity.

MONITORING REQUIREMENTS
- Treatment requires careful monitoring for optimum effect.
- Baseline ECG required before treatment—assess need for further ECGs during treatment on an individual basis.

DIRECTIONS FOR ADMINISTRATION
In general not more than 2–3 mL of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

Zuclopenthixol decanoate

INDICATIONS AND DOSE

Maintenance in schizophrenia and paranoid psychoses
- BY DEEP INTRAMUSCULAR INJECTION
  - Adult: Test dose 100 mg, dose to be administered into the upper outer buttock or lateral thigh, followed by 200–500 mg after at least 7 days, then 200–500 mg every 1–4 weeks, adjusted according to response, higher doses of more than 500 mg can be used; do not exceed 600 mg weekly
  - Elderly: A quarter to half usual starting dose to be used

IMPORTANT SAFETY INFORMATION
When prescribing, dispensing, or administering, check that this is the correct preparation—this preparation is used for maintenance treatment and should not be used for the short-term management of an acute episode.

CONTRA-INDICATIONS
- Children
- CNS depression
- Comatose states
- Phaeochromocytoma

CAUTIONS
- Avoid in acute porphyrias
- QT interval prolongation
- When transferring from oral to depot therapy, the dose by mouth should be reduced gradually

INTERACTIONS
- Appendix 1: zuclopenthixol

SIDE-EFFECTS
- Erythema, nodules, pain at injection site, swelling

SIDE-EFFECTS, FURTHER INFORMATION
If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

HEPATIC IMPAIRMENT
Can precipitate coma.

RENAL IMPAIRMENT
Start with small doses in severe renal impairment because of increased cerebral sensitivity.

MONITORING REQUIREMENTS
Treatment requires careful monitoring for optimum effect.

DIRECTIONS FOR ADMINISTRATION
In general not more than 2–3 mL of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Clopixol (Zuclopenthixol decanoate) (Lundbeck Ltd)
  - Zuclopenthixol decanoate 200 mg per 1 mL Clopixol 200mg/1ml solution for injection ampoules | 10 ampoule £31.51 DT price = £31.51
  - Zuclopenthixol decanoate 500 mg per 1 mL Clopixol Conc 500mg/1ml solution for injection ampoules | 5 ampoule £37.18 DT price = £37.18
**Antipsychotics** > **Second-generation**

**Amisulpride**

- **Drug Action** Amisulpride is a selective dopamine receptor antagonist with high affinity for mesolimbic D₂ and D₃ receptors.

- **Indications and Dose**
  - **Acute psychotic episode in schizophrenia**
    - **By Mouth**
    - Adult: 400–800 mg daily in 2 divided doses, adjusted according to response; maximum 1.2 g per day
  - **Schizophrenia with predominantly negative symptoms**
    - **By Mouth**
    - Adult: 50–300 mg daily

- **Contra-Indications** CNS depression, comatose states, phaeochromocytoma, prolactin-dependent tumours

- **Side-effects**
  - Common or very common
    - Anxiety
  - Uncommon
    - Bradycardia

- **Pregnancy** Avoid.

- **Breast Feeding** Avoid—no information available.

- **Renal Impairment** Halve dose if eGFR 30–60 mL/minute/1.73 m². Use one-third dose if eGFR 10–30 mL/minute/1.73 m². No information available if eGFR less than 10 mL/minute/1.73 m².

- **Monitoring Requirements** Amisulpride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

- **Prescribing and dispensing information** Flavours of oral liquid formulations may include caramel.

- **Medicinal Forms**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral Solution**

- **Cautionary and Advisory Labels** 2
  - **Amisulpride (Non-proprietary)**
  - **Amisulpride 100 mg per 1 mL** Amisulpride 100mg/ml oral solution sugar-free [60 mL PO(T)] £36.00 DT price = £36.00
  - **Solian (Sanofi)**
  - **Amisulpride 100 mg per 1 mL** Solian 100mg/ml oral solution sugar-free [60 mL PO(T)] £33.76 DT price = £36.00

**Tablet**

- **Cautionary and Advisory Labels** 2
  - **Amisulpride (Non-proprietary)**
  - **Amisulpride 50 mg** Amisulpride 50mg tablets [60 tablet PO(T)] £22.76 DT price = £22.06
  - **Amisulpride 100 mg** Amisulpride 100mg tablets [60 tablet PO(T)] £39.48 DT price = £3.59
  - **Amisulpride 200 mg** Amisulpride 200mg tablets [60 tablet PO(T)] £66.00 DT price = £5.44
  - **Amisulpride 400 mg** Amisulpride 400mg tablets [60 tablet PO(T)] £132.00 DT price = £35.21
  - **Solian (Sanofi)**
  - **Amisulpride 50 mg** Solian 50 tablets [60 Tablet PO(T)] £22.76 DT price = £2.06
  - **Amisulpride 100 mg** Solian 100 tablets [60 tablet PO(T)] £35.29 DT price = £5.59
  - **Amisulpride 200 mg** Solian 200 tablets [60 tablet PO(T)] £58.99 DT price = £5.44
  - **Amisulpride 400 mg** Solian 400 tablets [60 tablet PO(T)] £117.97 DT price = £35.21

**Aripiprazole**

- **Drug Action** Aripiprazole is a dopamine D₃ partial agonist with weak 5-HT₁₉ partial agonism and 5-HT₂₆ receptor antagonism.

- **Indications and Dose**
  - **Maintenance in schizophrenia in patients stabilised with oral aripiprazole**
    - **Initially by intramuscular injection**
    - Adult: 400 mg every month, to be injected into the gluteal muscle, minimum of 26 days between injections, for dose adjustment due to side effects—consult product literature and (by mouth) 10–20 mg daily continued for 14 consecutive days after the first injection, for missed depot doses consult product literature
  - **Schizophrenia**
    - **By Mouth**
    - Adult: 10–15 mg once daily; usual dose 15 mg once daily (max. per dose 30 mg once daily)
  - **Treatment and recurrence prevention of mania**
    - **By Mouth**
    - Adult: 15 mg once daily, increased if necessary up to 30 mg once daily
  - **Control of agitation and disturbed behaviour in schizophrenia**
    - **By Intramuscular Injection**
    - Adult: Initially 5.25–15 mg for 1 dose, alternatively usual dose 9.75 mg for 1 dose, followed by 5.25–15 mg after 2 hours if required, maximum 3 injections daily; maximum daily combined oral and parenteral dose 30 mg
  - **Dose Adjustments Due to Interactions**
    - With oral use
      - Manufacturer advises double the dose with concurrent use of potent inducers of CYP3A4. Manufacturer advises reduce dose by half with concurrent use of potent inhibitors of CYP3A4 or CYP2D6.
    - With intramuscular use
      - For dose adjustments due to concurrent use of interacting drugs—consult product literature.

**Important Safety Information**

When prescribing, dispensing, or administering, check that the correct preparation is used—the preparation usually used in hospital for the rapid control of an acute episode (solution for injection containing aripiprazole 7.5 mg/mL) should not be confused with depot preparations (aripiprazole 400–mg vial with solvent), which are usually used in the community or clinics for maintenance treatment.

- **Contra-Indications** CNS depression, comatose state, phaeochromocytoma

- **Cautions**

**General Cautions**

- Cerebrovascular disease: elderly (reduce initial dose)

**Specific Cautions**

- When transferring from oral to depot therapy, the dose by mouth should be reduced gradually

- **Interactions**
  - **By Mouth**
  - Adult: 15 mg once daily, increased if necessary up to 30 mg once daily

- **Side-effects**
  - **Common or very common** Anxiety, hypersalivation, malaise
  - **Uncommon** Depression, dry mouth
  - **Frequency not known** Alopecia, anorexia, bradycardia, hepatitis, hyponatraemia, infection, laryngospasm,
myalgia • oedema • oropharyngeal spasm • pancreatitis • pathological gambling • respiratory disorders • rhabdomyolysis • suicidal ideation • sweating • urinary disorders

SPECIFIC SIDE-EFFECTS
- With intramuscular use: Erythema • nodules • pain at injection site • swelling

SIDE-EFFECTS, FURTHER INFORMATION
- With intramuscular use: If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma–drug concentration may not fall for some time after reducing the dose of the depot injection, therefore it may be a month or longer before side-effects subside.

- PREGNANCY: Use only if potential benefit outweighs risk.
- BREAST FEEDING: Manufacturer advises avoid—present in milk.
- HEPATIC IMPAIRMENT: Use with caution in severe impairment (oral treatment preferred to intramuscular administration).

- MONITORING REQUIREMENTS
- Aripiprazole does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
- With intramuscular use: Treatment requires careful monitoring for optimum effect.

- DIRECTIONS FOR ADMINISTRATION
- With oral use: Orosuspension tablets should be placed on the tongue and allowed to dissolve, or be dispersed in water and swallowed.
- With intramuscular use: Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.

- PATIENT AND CARER ADVICE: Patients or carers should be given advice on how to administer aripiprazole orosuspension tablets.

- MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Clozapine

- **DRUG ACTION**: Clozapine is a dopamine D2, dopamine D3, 5-HT2A, alpha1, adrenoceptor, and muscarinic-receptor antagonist.

- **INDICATIONS AND DOSE**
Schizophrenia in patients unresponsive to, or intolerant of, conventional antipsychotic drugs

- **BY MOUTH**
- Adult 18–59 years: 12.5 mg 1–2 times a day for day 1, then 25–50 mg for day 2, then increased, if tolerated, in steps of 25–50 mg daily, dose to be increased gradually over 14–21 days, increased to up to 300 mg daily in divided doses, larger dose to be taken at night, up to 200 mg daily may be taken as a single dose at bedtime; increased in steps of 50–100 mg 1–2 times a week if required, it is preferable to increase once a week; usual dose 200–450 mg daily, max. 900 mg per day, if restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing
- Adult 60 years and over: 12.5 mg once daily for day 1, then increased to 25–37.5 mg for day 2, then increased, if tolerated, in steps of up to 25 mg daily, dose to be increased gradually over 14–21 days, increased to up to 300 mg daily in divided doses, larger dose at to be taken night, up to 200 mg daily may be taken as a single dose at bedtime; increased in steps of 50–100 mg 1–2 times a week if required, it is preferable to increase once a week; usual dose 200–450 mg daily, max. 900 mg per day, if restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing
- Psychosis in Parkinson’s disease

- **BY MOUTH**
- Adult: 12.5 mg once daily, dose to be taken at bedtime, then increased in steps of 12.5 mg up to twice weekly, adjusted according to response; usual dose 25–37.5 mg once daily, dose to be taken at bedtime; increased in steps of 12.5 mg once weekly, this applies only in exceptional cases, increased if necessary up to 100 mg daily in 1–2 divided doses; usual maximum 50 mg/24 hours

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose adjustment may be necessary if smoking started or stopped during treatment.
CONTRA-INDICATIONS Alcoholic and toxic psychoses • bone-marrow disorders • coma • drug intoxication • history of agranulocytosis • history of circulatory collapse • history of neutropenia • paralytic ileus • severe cardiac disorders (e.g. myocarditis) • severe CNS depression • uncontrolled epilepsy

CAUTIONS Age over 60 years • prostatic hypertrophy • susceptibility to angle-closure glaucoma • taper off other antipsychotics before starting

CAUTIONS, FURTHER INFORMATION

Agranulocytosis Neutropenia and potentially fatal agranulocytosis reported. Leucocyte and differential blood counts must be normal before starting; monitor counts every week for 18 weeks then at least every 2 weeks and if clozapine continued and blood count stable after 1 year at least every 4 weeks (and 4 weeks after discontinuation); if leucocyte count below 3000/mm³ or if absolute neutrophil count below 1500/mm³ discontinue permanently and refer to haematologist. Patients who have a low white blood cell count because of benign ethnic neutropenia may be started on clozapine with the agreement of a haematologist. Avoid drugs which depress leucopoiesis; patients should report immediately symptoms of infection, especially influenza-like illness.

Myocarditis and cardiomyopathy Fatal myocarditis (most commonly in first 2 months) and cardiomyopathy reported.

Perform physical examination and take full medical history before starting

Specialist examination required if cardiac abnormalities or history of heart disease found—clozapine initiated only in absence of severe heart disease and if benefit outweighs risk

Persistent tachycardia especially in first 2 months should prompt observation for other indicators for myocarditis or cardiomyopathy

If myocarditis or cardiomyopathy suspected clozapine should be stopped and patient evaluated urgently by cardiologist

Discontinue permanently in clozapine–induced myocarditis or cardiomyopathy

Intestinal obstruction Impairment of intestinal peristalsis, including constipation, intestinal obstruction, faecal impaction, and paralytic ileus, (including fatal cases) reported. Clozapine should be used with caution in patients receiving drugs that may cause constipation (e.g. antimuscarinic drugs) or in those with a history of colonic disease or lower abdominal surgery. It is essential that constipation is recognised and actively treated.

INTERACTIONS → Appendix 1: clozapine

SIDE-EFFECTS

Common or very common Anorexia • constipation • hypersalivation • malaise • speech disorders • urinary incontinence

Uncommon Agranulocytosis

Rare Circulatory collapse • dysphagia • hepatitis • myocarditis • pancreatitis • pericarditis • pneumonia • pulmonary aspiration

Very rare Cardiomyopathy • hypercholesterolaemia • hypertriglyceridaemia • interstitial nephritis • intestinal obstruction (including fatal cases) • myocardial infarction • obsessive compulsive disorder • parotid gland enlargement • respiratory depression

Frequency not known Hepatic disorders • hepatic failure • muscle disorders • renal failure

SIDE-EFFECTS, FURTHER INFORMATION

Hypersalivation Hypersalivation associated with clozapine therapy can be treated with hyoscine hydrobromide [unlicensed indication], provided that the patient is not at particular risk from the additive antimuscarinic side-effects of hyoscine and clozapine.

PREGNANCY Use with caution.

BREAST FEEDING Avoid.

RENAL IMPAIRMENT Avoid in severe impairment.

MONITORING REQUIREMENTS

Monitor leucocyte and differential blood counts. Clozapine requires differential white blood cell monitoring weekly for 18 weeks, then fortnightly for up to one year, and then monthly as part of the clozapine patient monitoring service.

Close medical supervision during initiation (risk of collapse because of hypotension and convulsions).

Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotics. Patients taking clozapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.

Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking clozapine should have fasting blood glucose tested at baseline, after one months’ treatment, then every 4–6 months.

Patient, prescriber, and supplying pharmacist must be registered with the appropriate Patient Monitoring Service—it takes several days to do this.

TREATMENT CESSATION On planned withdrawal reduce dose over 1–2 weeks to avoid risk of rebound psychosis. If abrupt withdrawal necessary observe patient carefully.

DIRECTIONS FOR ADMINISTRATION Shake oral suspension well for 90 seconds when dispensing or if visibly settled and stand for 24 hours before use; otherwise shake well for 10 seconds before use. May be diluted with water.

PRESCRIBING AND DISPENSING INFORMATION Clozapine has been used for psychosis in Parkinson’s disease in children aged 16 years and over.

PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer clozapine oral suspension.

MEDIACL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

CAUTIONARY AND ADVISORY LABELS 2, 10

Denzapine (Britannia Pharmaceuticals Ltd)

Clozapine 50 mg per 1 ml Denzapine 50mg/ml oral suspension sugar-free | 100 ml £39.60

Tablet

Lurasidone hydrochloride

**DRUG ACTION** Lurasidone is a dopamine D2, 5-HT2A, 5-HT7, alpha2A- and alpha2C- adrenoceptor antagonist, and is a partial agonist at 5-HT1A receptors.

**INDICATIONS AND DOSE**

**Schizophrenia**
- **BY MOUTH**
  - Adult: Initially 37 mg once daily, increased if necessary up to 148 mg once daily

**Schizophrenia when given with concomitant moderate CYP3A4 inhibitors (e.g. diltiazem, erythromycin, fluconazole, and verapamil)**
- **BY MOUTH**
  - Adult: Initially 18.5 mg once daily (max. per dose 74 mg once daily)

**CAUTIONS** High doses in elderly; susceptibility to QT-interval prolongation

**INTERACTIONS** [Appendix 1: lurasidone]

**SIDE-EFFECTS**
- **Common or very common** Anxiety - musculoskeletal stiffness
- **Uncommon** Catatonia - decreased appetite - dysarthria - dysuria - hot flush - myalgia - nightmares
- **Frequency not known** Angina - AV block - bradycardia - dysphagia - panic attacks - pruritus - suicidal behaviour - vertigo

**PREGNANCY** Use only if potential benefit outweighs risk—limited information available.

**HEPATIC IMPAIRMENT** Initially 18.5 mg once daily, up to max. 74 mg once daily in moderate impairment. Use with caution in severe impairment—initially 18.5 mg once daily, up to max. 37 mg once daily.

**RENAL IMPAIRMENT** Initially 18.5 mg once daily, up to max. 74 mg once daily if eGFR less than 50 mL/minute/1.73 m². Manufacturer advises use only if potential benefit outweighs risk if eGFR less than 15 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION** Patients on doses higher than 111 mg once daily whose treatment is interrupted for longer than 3 days should restart on 111 mg once daily and titrate to usual dose; for all other doses, restart on usual dose.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

Olanzapine

**DRUG ACTION** Olanzapine is a dopamine D1, D2, D4, 5-HT2, histamine-1-, and muscarinic-receptor antagonist.

**INDICATIONS AND DOSE**

**Schizophrenia / Combination therapy for mania**
- **BY MOUTH**
  - Adult: 10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

**Preventing recurrence in bipolar disorder**
- **BY MOUTH**
  - Adult: 10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

**Monotherapy for mania**
- **BY MOUTH**
  - Adult: 15 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 15 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

**Control of agitation and disturbed behaviour in schizophrenia or mania**
- **BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 5–10 mg for 1 dose; usual dose 10 mg for 1 dose, followed by 5–10 mg after 2 hours if required, maximum 3 injections daily for 3 days; maximum daily combined oral and parenteral dose 20 mg, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase
  - Elderly: Initially 2.5–5 mg, followed by 2.5–5 mg after 2 hours if required, maximum 3 injections daily for 3 days; maximum daily combined oral and parenteral dose 20 mg, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose adjustment may be necessary if smoking started or stopped during treatment.

**CONTRA-INDICATIONS**
- With intramuscular use
  - Acute myocardial infarction - bradycardia - recent heart surgery - severe hypotension - sick sinus syndrome - unstable angina

**CAUTIONS**
- Bone-marrow depression - diabetes mellitus (risk of exacerbation or ketoacidosis) - hypereosinophilic disorders - low leucocyte count - low neutrophil count - myeloproliferative disease - paralytic ileus

**CAUTIONS, FURTHER INFORMATION**
- CNS and respiratory depression
- With intramuscular use
  - Blood pressure, pulse and respiratory rate should be monitored for at least 4 hours after intramuscular injection, particularly in those also receiving a benzodiazepine or another antipsychotic (leave at least one hour between administration of olanzapine intramuscular injection and parenteral benzodiazepines).

**INTERACTIONS** [Appendix 1: olanzapine]

**SIDE-EFFECTS**
- **General side-effects**
  - **Common or very common** Arthralgia - hypercholesterolaemia - hypertriglyceridaemia - increased appetite - malaise - oedema
  - **Uncommon** Alopecia - anemia - bradycardia - epistaxis
  - **Rare** Hepatitis - pancreatitis - rhabdomyolysis

**SPECIFIC SIDE-EFFECTS**
- With intramuscular use
  - Hypoventilation - sinus pause
Nervous system

PRESCRIBING AND DISPENSING INFORMATION

TREATMENT INFORMATION

▶ Hepatic impairment

▶ Renal impairment

▶ Monitoring requirements

▶ Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.

▶ Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one month’s treatment, then every 4–6 months.

▶ Directions for administration

Olanzapine orodispersible tablet may be placed on the tongue and allowed to dissolve, or dispersed in water, orange juice, apple juice, milk, or coffee.

▶ Prescribing and dispensing information

When prescribing, dispensing, or administering, check that this injection is the correct preparation—this preparation is usually used in the hospital for the rapid control of an acute episode and should not be confused with depot preparations which are usually used in the community or clinics for maintenance treatment.

▶ Patient and carer advice

Patients or carers should be given advice on how to administer orodispersible tablets.

▶ Medicinal forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

Tablet

Paliperidone

DRUG ACTION

Paliperidone is a metabolite of risperidone.

INDICATIONS AND DOSE

Schizophrenia | Psychotic or manic symptoms of schizoaffective disorder

▶ By mouth

Adult: 6 mg once daily, dose to be taken in the morning, then adjusted in steps of 3 mg if required, dose to be adjusted over at least 5 days; usual dose 3–12 mg daily

TREVICTA® PRE-FILLED SYRINGES

Maintenance of schizophrenia in patients who are clinically stable on once-monthly intramuscular paliperidone

▶ By deep intramuscular injection

Adult: Initially 175–525 mg every 3 months, adjusted according to response, to be administered into the deltoid or gluteal muscle, dose is based on previous once-monthly intramuscular paliperidone and should be initiated in place of the next scheduled dose—consult product literature

XEPLOEN® PRE-FILLED SYRINGES

Maintenance in schizophrenia in patients previously responsive to paliperidone or risperidone

▶ By deep intramuscular injection

Adult: 150 mg for 1 dose on day 1, then 100 mg for 1 dose on day 8, to be injected into the deltoid muscle, dose subsequently adjusted at monthly intervals according to response; maintenance 75 mg once a month, alternatively maintenance 25–150 mg once a month, following the second dose, monthly maintenance doses can be administered into either the deltoid or gluteal muscle

Paliperidone

15-Jun-2017
CAUTIONS

GENERAL CAUTIONS
Cataract surgery (risk of intraoperative floppy iris syndrome) • dementia with Lewy bodies • elderly patients with dementia • elderly patients with risk factors for stroke • predisposition to gastro-intestinal obstruction • prolactin-dependent tumours

SPECIFIC CAUTIONS
When transferring from oral to depot therapy, the dose by mouth should be reduced gradually

INTERACTIONS ➔ Appendix 1: paliperidone

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Common or very common Anxiety • appetite changes • arthralgia • depression • epistaxis • hypertension • infection • malaise • myalgia • oedema • respiratory disorders • sleep disorders • toothache • urinary disorders

Uncommon Alopecia • elevated plasma-cholesterol concentrations • elevated plasma-triglyceride concentrations • hypoaesthesia • paraesthesia • taste disturbances • tinnitus • visual disorders

Rare Inappropriate antidiuretic hormone secretion • intestinal obstruction • intra-operative floppy iris syndrome • pancreatitis • pulmonary embolism • rhabdomyolysis

SPECIFIC SIDE-EFFECTS
With intramuscular use Erythema • nodules • pain at injection site • swelling

SIDE-EFFECTS, FURTHER INFORMATION
With intramuscular use If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

PREGNANCY Use only if potential benefit outweighs risk— toxicity in animal studies; if discontinuation during pregnancy is necessary, withdraw gradually.

TREVICTA ® PRE-FILLED SYRINGES
Manufacturer advises to consider long-acting nature of formulation—paliperidone detected in plasma up to 18 months after single dose.

BREAST FEEDING
Manufacturer advises avoid—present in milk.

TREVICTA ® PRE-FILLED SYRINGES
Manufacturer advises to consider long-acting nature of formulation—paliperidone detected in plasma up to 18 months after single dose.

HEPATIC IMPAIRMENT Caution in severe impairment—no information available.

RENAL IMPAIRMENT
With oral use Manufacturer advises reduce initial dose to 3 mg once daily if creatinine clearance 50–80 mL/minute (max. 6 mg once daily). Manufacturer advises reduce initial dose to 1.5 mg once daily if creatinine clearance 10–50 mL/minute (max. 3 mg once daily). Manufacturer advises avoid if creatinine clearance less than 10 mL/minute.

With intramuscular use Manufacturer advises avoid if creatinine clearance less than 50 mL/minute.

TREVICTA ® PRE-FILLED SYRINGES
Manufacturer advises dose should be adjusted and stabilised using once-monthly injectable paliperidone before switching to three-monthly injectable paliperidone, if creatinine clearance 50–80 mL/minute.

XEPLION ® PRE-FILLED SYRINGES
Manufacturer advises initial dose 100 mg on day 1 and then 75 mg on day 8 if creatinine clearance 50–80 mL/minute; recommended maintenance dose 50 mg (range 25–100 mg) monthly if creatinine clearance 50–80 mL/minute.

MONITORING REQUIREMENTS
With intramuscular use Treatment requires careful monitoring for optimum effect.

DIRECTIONS FOR ADMINISTRATION
With intramuscular use Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.

With oral use Always take with breakfast or always take on an empty stomach.

PATIENT AND CARER ADVICE
With oral use Patients or carers should be given advice on how to administer paliperidone tablets.

Missed doses
With intramuscular use For missed doses see product literature.

NATIONAL FUNDING/ACCESS DECISIONS

SCOTTISH MEDICINES CONSORTIUM (SMC) DECISIONS

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (September 2016) that paliperidone palmitate (Trevicta ®) is accepted for use within NHS Scotland for the maintenance treatment of schizophrenia in patients who are clinically stable on one-monthly paliperidone palmitate injectable product.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Prolonged-release suspension for injection

Trevicta (Janssen-Cilag Ltd)

Paliperidone (as Paliperidone palmitate) 200 mg per 1 ml Trevicta 175mg/0.875ml prolonged-release suspension for injection pre-filled syringes 1 pre-filled disposable injection POM £55.16

Trevicta 263mg/1.315ml prolonged-release suspension for injection pre-filled syringes 1 pre-filled disposable injection POM £73.40

Trevicta 350mg/1.75ml prolonged-release suspension for injection pre-filled syringes 1 pre-filled disposable injection POM £94.21

Trevicta 525mg/2.625ml prolonged-release suspension for injection pre-filled syringes 1 pre-filled disposable injection POM £117.77

Modified-release tablet

Paliperidone (Non-proprietary)

Paliperidone 3 mg Paliperidone 3mg modified-release tablets 28 tablet POM no price available

Paliperidone 6 mg Paliperidone 6mg modified-release tablets 28 tablet POM no price available

Paliperidone 9 mg Paliperidone 9mg modified-release tablets 28 tablet POM no price available

Invega (Janssen-Cilag Ltd)

Paliperidone 3 mg Invega 3mg modified-release tablets 28 tablet POM £92.78

Paliperidone 6 mg Invega 6mg modified-release tablets 28 tablet POM £92.78

Paliperidone 9 mg Invega 9mg modified-release tablets 28 tablet POM £145.92

Suspension for injection

Xeplion (Janssen-Cilag Ltd)

Paliperidone (as Paliperidone palmitate) 100 mg per 1 ml Xeplion 150mg/1.5ml suspension for injection pre-filled syringes 1 pre-filled disposable injection POM £39.59

Xeplion 75mg/0.75ml suspension for injection pre-filled syringes 1 pre-filled disposable injection POM £24.90

Xeplion 100mg/1ml suspension for injection pre-filled syringes 1 pre-filled disposable injection POM £31.07

Xeplion 50mg/0.5ml suspension for injection pre-filled syringes 1 pre-filled disposable injection POM £183.92
Quetiapine

**DRUG ACTION** Quetiapine is a dopamine D₁, dopamine D₂, 5-HT₂, alpha₁-adrenoceptor, and histamine-1 receptor antagonist.

**INDICATIONS AND DOSE**

**Schizophrenia**
- **Adult:** 25 mg twice daily for day 1, then 50 mg twice daily for day 2, then 100 mg twice daily for day 3, then 150 mg twice daily for day 4, then, adjusted according to response, usual dose 300–450 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 750 mg per day
- **Elderly:** Initially 50 mg once daily, adjusted according to response. adjusted in steps of 50 mg daily

**Treatment of mania in bipolar disorder**
- **Adult:** 50 mg twice daily for day 1, then 100 mg twice daily for day 2, then 150 mg twice daily for day 3, then 200 mg twice daily for day 4, then adjusted in steps of up to 200 mg daily, adjusted according to response, usual dose 400–800 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 800 mg per day
- **Elderly:** Initially 50 mg once daily, adjusted according to response, usual dose 400–800 mg once daily

**Treatment of depression in bipolar disorder**
- **Adult:** 50 mg once daily for day 1, then 100 mg once daily for day 2, then 150 mg once daily for day 3, then 200 mg once daily for day 4, then, adjusted according to response, usual dose 300 mg once daily, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 600 mg per day
- **Elderly:** Initially 50 mg once daily, adjusted according to response. adjusted in steps of 50 mg daily

**Prevention of mania and depression in bipolar disorder**
- **Adult:** Continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual dose 300–800 mg daily in 2 divided doses
- **Elderly:** Continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual dose 300–800 mg once daily

**Adjunctive treatment of major depression**
- **Adult:** 50 mg once daily for 2 days, dose to be taken at bedtime, then 150 mg once daily for 2 days, then, adjusted according to response, usual dose 150–300 mg once daily

**DOSE EQUIVALENCE AND CONVERSION**
- Patients can be switched from immediate-release to modified-release tablets at the equivalent daily dose; to maintain clinical response, dose titration may be required.

**CAUTIONS** Cerebrovascular disease · elderly · patients at risk of aspiration pneumonia · treatment of depression in patients under 25 years (increased risk of suicide)

**INTERACTIONS** → Appendix 1: quetiapine

**SIDE-EFFECTS**
- Common or very common
- Angioedema · inappropiate secretion of antidiuretic hormone · rhabdomyolysis · Stevens-Johnson syndrome
- Frequency not known
- Suicidal behaviour (particularly on initiation) · toxic epidermal necrolysis

**PREGNANCY** Use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises avoid.

**HEPATIC IMPAIRMENT** For immediate-release tablets, initially 25 mg daily, increased daily in steps of 25–50 mg. For modified-release tablets, initially 50 mg daily, increased daily in steps of 50 mg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder

**Modified-release tablet**

**Risperidone**

**Drug action**: Risperidone is a dopamine D2, 5-HT2A, alpha1-adrenoceptor, and histamine-1 receptor antagonist.

**Indications and dose**

**Schizophrenia and other psychoses in patients tolerant to risperidone by mouth and taking oral risperidone up to 4 mg daily**

**By deep intramuscular injection**

- **Adult**: Initially 25 mg every 2 weeks, to be administered into the deltoid or gluteal muscle, adjusted in steps of 12.5 mg (max. per dose 50 mg every 2 weeks) at intervals of at least 4 weeks, during initiation risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection.

**Schizophrenia and other psychoses in patients tolerant to risperidone by mouth and taking oral risperidone over 4 mg daily**

**By deep intramuscular injection**

- **Adult**: Initially 37.5 mg every 2 weeks, adjusted in steps of 12.5 mg (max. per dose 50 mg every 2 weeks) at intervals of at least 4 weeks, during initiation risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection.

**Acute and chronic psychoses**

**By mouth**

- **Adult**: 2 mg daily in 1–2 divided doses for day 1, then 4 mg daily in 1–2 divided doses for day 2, slower titration is appropriate in some patients, usual dose 4–6 mg daily, doses above 10 mg daily only if benefit considered to outweigh risk; maximum 16 mg per day.

- **Elderly**: Initially 500 micrograms twice daily, then increased in steps of 500 micrograms twice daily, increased to 1–2 mg twice daily.

**Mania**

**By mouth**

- **Adult**: Initially 2 mg once daily, then increased in steps of 1 mg daily if required; usual dose 1–6 mg daily.

- **Elderly**: Initially 500 micrograms twice daily, then increased in steps of 500 micrograms twice daily, increased to 1–2 mg twice daily.

**Short-term treatment (up to 6 weeks) of persistent aggression in patients with moderate to severe Alzheimer’s dementia unresponsive to non-pharmacological interventions and when there is a risk of harm to self or others**

**By mouth**

- **Adult**: Initially 250 micrograms twice daily, then increased in steps of 250 micrograms twice a day on alternate days, adjusted according to response; usual dose 500 micrograms twice daily (max. per dose 1 mg twice daily).
Olanzapine embonate
(Olanzapine pamoate)

INDICATIONS AND DOSE
Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 10 mg oral olanzapine daily)

BY DEEP INTRAMUSCULAR INJECTION
Adult 18–75 years: Initially 210 mg every 2 weeks, alternatively initially 405 mg every 4 weeks, then maintenance 150 mg every 2 weeks, alternatively maintenance 300 mg every 4 weeks, maintenance dose to be started after 2 months of initial treatment, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required
Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 15 mg oral olanzapine daily)

- **BY DEEP INTRAMUSCULAR INJECTION**
- Adult 18-75 years: Initially 300 mg every 2 weeks, then maintenance 210 mg every 2 weeks, alternatively maintenance 405 mg every 4 weeks, maintenance dose to be started after 2 months of initial treatment, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

**SIDE-EFFECTS**

Dose adjustment may be necessary if smoking started or stopped during treatment.

**IMPORANT SAFETY INFORMATION**

When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for maintenance treatment and should not be used for the rapid control of an acute episode.

**CAUTIONS**

- Bone-marrow depression
- Diabetes mellitus (risk of exacerbation or ketoacidosis)
- Hypereosinophilic disorders
- Low leucocyte count
- Low neutrophil count
- Myeloproliferative disease
- Paralytic ileus
- When transferring from oral to depot therapy, the dose by mouth should be reduced gradually

**INTERACTIONS**

- Common or very common
  - Arthralgia
  - Hypercholesterolaemia
  - Hypertriglyceridaemia
  - Increased appetite
  - Malaise

- Uncommon
  - Alopecia
  - Amnesia
  - Bradycardia
  - Epistaxis

- Rare
  - Hepatitis
  - Pancreatitis
  - Rhabdomyolysis

**SIDE-EFFECTS, FURTHER INFORMATION**

If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

**OVERDOSE**

Post-injection reactions have been reported leading to signs and symptoms of overdose.

**PREGNANCY**

Use only if potential benefit outweighs risk; neonatal lethargy, tremor, and hypertonopia reported when used in third trimester.

**BREAST FEEDING**

Avoid—present in milk.

**HEPATIC IMPAIRMENT**

Initially 150 mg every 4 weeks; increase with caution in moderate impairment.

**RENAL IMPAIRMENT**

Initially 150 mg every 4 weeks.

**MONITORING REQUIREMENTS**

- Observe patient for at least 3 hours after injection.
- Treatment requires careful monitoring for optimum effect.
- Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.
- Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one month’s treatment, then every 4–6 months.

**DIRECTIONS FOR ADMINISTRATION**

Correct injection technique (including use of z-track technique) and rotation of injection sites are essential.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**

- **Olanzapine (as Olanzapine embonate monohydrate)**
  - 210 mg Zypadhera 210mg powder and solvent for suspension for injection vials | 1 vial (Pow) £142.76 (Hospital only)
  - 300 mg Zypadhera 300mg powder and solvent for suspension for injection vials | 1 vial (Pow) £222.64 (Hospital only)
  - 405 mg Zypadhera 405mg powder and solvent for suspension for injection vials | 1 vial (Pow) £285.52 (Hospital only)

**4 Movement disorders**

**Motor neurone disease**

17-May-2017

**Description of condition**

Motor neurone disease is a neurodegenerative condition affecting the brain and spinal cord. Degeneration of motor neurones leads to progressive muscle weakness; resulting symptoms include muscle cramps, wasting and stiffness, loss of dexterity, reduced respiratory function and cognitive dysfunction. The most common form is amyotrophic lateral sclerosis.

Patients suspected of having developed motor neurone disease should be referred to a neurologist without delay.

**Aims of treatment**

As there is no cure, treatment focuses on maintaining functional ability and managing symptoms.

**Non-drug treatment**

Non-drug treatment includes nutrition, psychosocial support, physiotherapy, exercise programmes and use of special equipment or mobility aids.

**Management of symptoms**

**Muscular symptoms**

- Quinine p. 586 [unlicensed indication] is recommended as first line treatment for muscle cramps. If quinine is ineffective, not tolerated or contra-indicated, baclofen p. 1026 [unlicensed indication] should be considered as second line treatment. Subsequent treatment options include tizanidine p. 1027 [unlicensed indication], dantrolene sodium p. 1236 [unlicensed indication] or gabapentin p. 301 [unlicensed indication].
- Symptoms of muscle stiffness, spasticity or increased tone can be managed with baclofen, tizanidine, dantrolene sodium or gabapentin [unlicensed indication]. Treatment of severe spasticity may require specialist referral.

**Saliva problems**

- A trial of an antimuscarinic drug [unlicensed indication] can be considered for excessive drooling of saliva. Glycopyrronium bromide p. 1225 is recommended in patients who have cognitive impairment as it has fewer central nervous system side-effects. If initial treatment is
386 Movement disorders

ineffective, not tolerated or contra-indicated, referral for specialist administration of botulinum toxin type A p. 387 [unlicensed indication] may be required.

Humidification, nebulisers and carbocisteine p. 280 can be used to treat patients with thick, tenacious saliva. 

Respiratory symptoms
Reversible causes of worsening respiratory impairment (such as respiratory tract infections or secretion problems) should be treated before considering other options.

Patients experiencing breathlessness can be treated with opioids [unlicensed indication], or benzodiazepines [unlicensed indication] if the patient’s symptoms are exacerbated by anxiety. Non-invasive ventilation should be considered in patients with respiratory impairment. 

Amyotrophic lateral sclerosis
Riluzole p. 1023 is licensed for use in patients with amyotrophic lateral sclerosis to extend life or to extend the time to mechanical ventilation—see National funding/access decisions under riluzole.

Useful Resources

4.1 Dystonias and other involuntary movements

Other drugs used for Dystonias and other involuntary movements Chlorpromazine hydrochloride, p. 367 · Clonidine hydrochloride, p. 139 · Clozapine, p. 377 · Diazepam, p. 327 · Haloperidol, p. 368 · Orphenadrine hydrochloride, p. 391 · Pericyazine, p. 370 · Pramipexole, p. 402 · Procyclidine, p. 371 · Promazine hydrochloride, p. 504 · Rotigotine, p. 406 · Trifluoperazine, p. 372 · Trihexyphenidyl hydrochloride, p. 392

ANTIPSYCHOTICS > FIRST-GENERATION

Promazine hydrochloride

● INDICATIONS AND DOSE

Short-term adjunctive management of psychomotor agitation
> BY MOUTH
> Adult: 100–200 mg 4 times a day

Agitation and restlessness in elderly
> BY MOUTH
> Elderly: 25–50 mg 4 times a day

● CONTRA-INDICATIONS

CNS depression · comatose states · phaeochromocytoma

● CAUTIONS

Cerebral arteriosclerosis

● INTERACTIONS

→ Appendix 1: phenothiazines

● SIDE-EFFECTS

Haemolytic anaemia

● HEPATIC IMPAIRMENT

Can precipitate coma; phenothiazines are hepatotoxic.

● RENAL IMPAIRMENT

Start with small doses in severe renal impairment because of increased cerebral sensitivity.

● LESS SUITABLE FOR PRESCRIBING

Promazine hydrochloride is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

CAUTIONARY AND ADVISORY LABELS 2

Promazine hydrochloride (Non-proprietary)

Promazine hydrochloride 5 mg per 1 ml Promazine 25mg/5ml syrup | 150 ml [P] £13.00 DT price = £13.06

Promazine 25mg/5ml oral solution | 150 ml [P] £13.06 DT price = £13.06

Promazine hydrochloride 10 mg per 1 ml Promazine 50mg/5ml syrup | 150 ml [P] £15.00 DT price = £15.06

Promazine 50mg/5ml oral solution | 150 ml [P] £15.06 DT price = £15.06

Tablet

CAUTIONARY AND ADVISORY LABELS 2

Promazine hydrochloride (Non-proprietary)

Promazine hydrochloride 25 mg Promazine 25mg tablets | 100 tablet [P] £4.99 DT price = £43.19

Prazine 25mg tablets | 50 tablet [P] no price available

Promazine hydrochloride 50 mg Promazine 50mg tablets | 100 tablet [P] £76.49 DT price = £76.10

CNS STIMULANTS

Piracetam

● INDICATIONS AND DOSE

Adjuvant treatment of cortical myoclonus
> BY MOUTH
> Adult: Initially 7.2 g daily in 2–3 divided doses, then increased in steps of 4.8 g every 3–4 days, adjusted according to response, subsequently, attempts should be made to reduce dose of concurrent therapy; maximum 24 g per day

● CONTRA-INDICATIONS

Cerebral haemorrhage · Huntington’s chorea

● CAUTIONS

Gastric ulcer · history of haemorrhagic stroke · increased risk of bleeding · major surgery · underlying disorders of haemostasis

● SIDE-EFFECTS

> Common or very common Hyperkinesia · nervousness · weight gain

> Uncommon Abdominal pain · anxiety · asthenia · ataxia · confusion · depression · dermatitis · diarrhoea · drowsiness · haemorrhagic disorder · hallucination · headache · insomnia · nausea · pruritus · urticaria · vertigo · vomiting

● PREGNANCY

Avoid.

● BREAST FEEDING

Avoid.

● HEPATIC IMPAIRMENT

Adjust dose if both hepatic and renal impairment.

● RENAL IMPAIRMENT

Use two-thirds of normal dose if eGFR 50–80 mL/minute/1.73 m²; use one-third of normal dose in 2 divided doses if eGFR 30–50 mL/minute/1.73 m²; use one-sixth of normal dose as a single dose if eGFR 20–30 mL/minute/1.73 m². Avoid if eGFR less than 20 mL/minute/1.73 m².

● TREATMENT CESSATION

Avoid abrupt withdrawal.

● DIRECTIONS FOR ADMINISTRATION

Follow the oral solution with a glass of water (or soft drink) to reduce bitter taste.

● PRESCRIBING AND DISPENSING INFORMATION

Piracetam has been used in children 16 years and over as adjuvant treatment for cortical myoclonus.
Tetrabenazine

**INDICATIONS AND DOSE**
Movement disorders due to Huntington's chorea, hemiballismus, senile chorea, and related neurological conditions
- **BY MOUTH**
  - Adult: Initially 25 mg 3 times a day, then increased, if tolerated, in steps of 25 mg every 3–4 days; maximum 200 mg per day
  - Elderly: Lower initial dose may be necessary
  - **Moderate to severe tardive dyskinesia**
    - **BY MOUTH**
      - Adult: Initially 12.5 mg daily, dose to be gradually increased according to response

**CONTRA-INDICATIONS**
- Depression
- Parkinsonism
- Phaeochromocytoma
- Prolactin-dependent tumours

**CAUTIONS**
- Susceptibility to QT-interval prolongation

**INTERACTIONS**
- Appendix 1: tetrabenazine

**SIDE-EFFECTS**
- Common or very common: Anxiety, confusion, constipation, depression, diarrhoea, drowsiness, dysphagia, hypotension, insomnia, nausea, parkinsonism, vomiting
- Uncommon: Altered consciousness level, extrapyramidal disorders, hyperthermia
- Rare: Neuroleptic malignant syndrome
- Very rare: Rhabdomyolysis
- Frequency not known: Agitation, amnesia, ataxia, bradycardia, disorientation, dizziness, dry mouth, dyspepsia

**PREGNANCY**
- Avoid unless essential—toxicity in animal studies.

**BREAST FEEDING**
- Avoid.

**HEPATIC IMPAIRMENT**
- Use half initial dose and slower dose titration in mild to moderate impairment. Use with caution in severe impairment.

**RENAL IMPAIRMENT**
- Use with caution.

**TREATMENT CESSATION**
- Avoid abrupt withdrawal.

**PATIENT AND CARER ADVICE**
- Driving and skilled tasks
- May affect performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**
**CAUTIONARY AND ADVISORY LABELS**
- Piracetam (Non-proprietary)
  - Piracetam 333.3 mg per 1 ml: Piracetam 333.3 mg/ml oral solution sugar-free sugar-free 300 ml [PoM] no price available
- Nootropil (UCB Pharma Ltd)
  - Nootropil 333.3 mg per 1 ml: Nootropil 33% oral solution sugar-free 300 ml [PoM] £16.31

**Tablet**
**CAUTIONARY AND ADVISORY LABELS**
- Nootropil (UCB Pharma Ltd)
  - Piracetam 800 mg: Nootropil 800 mg tablets 90 tablet [PoM] £11.75
  - Piracetam 1.2 gram: Nootropil 1200 mg tablets 60 tablet [PoM] £10.97

**MONOAMINE DEPLETING DRUGS**

**Botulinum toxin type A**

**INDICATIONS AND DOSE**
Treatment of focal spasticity (including hand and wrist disability associated with stroke) (specialist use only)
- Blepharospasm (specialist use only)
- Hemifacial spasm (specialist use only)
- Spasmodic torticollis (specialist use only)
- Severe hyperhidrosis of the axillae (specialist use only)
- Prophylaxis of headaches in adults with chronic migraine (specialist use only)
- Temporary improvement of moderate to severe wrinkles between the eyebrows in adults under 65 years (specialist use only)
- Ankle disability due to lower limb spasticity associated with stroke (specialist use only)
- Management of bladder dysfunctions (specialist use only)
- Temporary improvement of moderate to severe crow's feet (specialist use only)
- **BY SUBCUTANEOUS INJECTION, OR BY INTRADERMAL INJECTION, OR BY INTRAMUSCULAR INJECTION**
- Adult: (consult product literature)

**DOSE EQUIVALENCE AND CONVERSION**
- **Important:** information is specific to each individual preparation.

**CONTRA-INDICATIONS**
- Acute urinary retention (specific to use in bladder disorders only)
- Catheterisation difficulties (specific to use in bladder disorders only)
- Generalised disorders of muscle activity: infection at injection site, myasthenia gravis, presence of bladder calculi (specific to use in bladder disorders only)
- Urinary tract infection (specific to use in bladder disorders only)

**CAUTIONS**
- **GENERAL CAUTIONS**
  - Atrophy in target muscle
  - Chronic respiratory disorder
  - Elderly: excessive weakness in target muscle
  - History of aspiration
  - History of dysphagia
  - Inflammation in target muscle
  - Neurological disorders
  - Neuromuscular disorders
  - Off-label use (fatal adverse events reported)

**SPECIFIC CAUTIONS**
- When used for blepharospasm or hemifacial spasm

**CAUTIONS, FURTHER INFORMATION**
Neuromuscular or neurological disorders can lead to increased sensitivity and exaggerated muscle weakness including dysphagia and respiratory compromise.
- Blepharospasm or hemifacial spasm
- Reduced blinking can lead to corneal exposure, persistent epithelial defect and corneal ulceration (especially in those with VFH nerve disorders)—testing of corneal sensation in previously operated eyes, avoidance of injection in lower lid area to avoid ectropion, and vigorous treatment of epithelial defect needed.

**Tetrabenazine**

**INDICATIONS AND DOSE**

- When used for blepharospasm or hemifacial spasm

**CAUTIONS, FURTHER INFORMATION**
Neuromuscular or neurological disorders can lead to increased sensitivity and exaggerated muscle weakness including dysphagia and respiratory compromise.
- Blepharospasm or hemifacial spasm
- Reduced blinking can lead to corneal exposure, persistent epithelial defect and corneal ulceration (especially in those with VFH nerve disorders)—careful testing of corneal sensation in previously operated eyes, avoidance of injection in lower lid area to avoid ectropion, and vigorous treatment of epithelial defect needed.
INTERACTIONS  → Appendix 1: botulinum toxin type A

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Excessive doses may paralyse distant muscles; increased electrophysiologic jitter in some distant muscles; influenza-like symptoms; misplaced injections may paralyse nearby muscle groups

- **Rare** Antibody formation (substantial deterioration in response), arrhythmias, myocardial infarction, seizures

- **Very rare** Aspiration, dysphagia, dysphonia, exaggerated muscle weakness, respiratory disorders

SPECIFIC SIDE-EFFECTS

- **Common or very common**
  - When used for axillary hyperhidrosis Abnormal skin odour, alopecia, hot flushes, non-axillary sweating, pain in extremities, paraesthesia, pruritus, subcutaneous nodule
  - When used for blepharospasm or hemifacial spasm Dry eye, ecchymosis, facial oedema, irritation, keratitis, lacrimation, lagopthalmos, photophobia, ptosis
  - When used for focal upper-limb spasticity associated with stroke Dysphagia, hypertonia, purpura
  - When used for spasmotic torticollis Back pain, dizziness, drowsiness, dry mouth, dysphagia and pooling of saliva (occurs most frequently after injection into sternomastoid muscle); headache, hypertonia, malaise, nausea, numbness, rhexis, stiffness, weakness
  - When used for temporary improvement of moderate to severe wrinkles between the eyebrows Facial oedema, headache, ptosis

- **Uncommon**
  - When used for axillary hyperhidrosis Joint pain, myalgia
  - When used for blepharospasm or hemifacial spasm Conjunctivitis, dermatitis, diplopia, dizziness, drooping, dry mouth, ectropion, entropion, facial weakness, headache, paraesthesia, tiredness, visual disturbances
  - When used for focal upper-limb spasticity associated with stroke Amnesia, arthralgia, bursitis, cough, depression, dry mouth, dysaesthesia, haematoma, headache, insomnia, malaise, nausea, pain in extremities, paraesthesia, peripheral oedema, vertigo
  - When used for spasmodic torticollis Collitis, diarrhoea, diplopia, dysphoria, eye pain, myalgia, ptosis, skeletal pain, sweating, tremor, voice alteration, vomiting
  - When used for temporary improvement of moderate to severe wrinkles between the eyebrows Anxiety, asthenia, blepharitis, dizziness, dry mouth, dry skin, muscle cramp, nausea, paraesthesia, photosensitivity reactions, tinnitus, visual disturbances

- **Rare**
  - When used for blepharospasm or hemifacial spasm Eyelid bruising and swelling (minimised by applying gentle pressure at injection site immediately after injection)

- **Very rare**
  - When used for blepharospasm or hemifacial spasm Angle-closure glaucoma, corneal epithelial defect, corneal perforation, corneal ulceration

- **Frequency not known**
  - When used for focal lower-limb spasticity associated with stroke Arthralgia, peripheral oedema, rash

CONCEPTION AND CONTRACEPTION  Avoid in women of child-bearing age unless using effective contraception.

PREGNANCY  Avoid unless essential—toxicity in animal studies (manufacturer of Botox® advise avoid).

BREAST FEEDING  Low risk of systemic absorption but avoid unless essential.

PRESCRIBING AND DISPENSING INFORMATION  Preparations are not interchangeable.

PATIENT AND CARER ADVICE  Patients and carers should be warned of the signs and symptoms of toxin spread, such as muscle weakness and breathing difficulties; they should be advised to seek immediate medical attention if swallowing, speech or breathing difficulties occur.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Botulinum toxin type A for the prevention of headaches in adults with chronic migraine (June 2012) NICE TA260

Botulinum toxin type A is recommended as an option for the prophylaxis of headaches in adults with chronic migraine, (defined as headaches on at least 15 days per month, of which at least 8 days are with migraine), that has not responded to at least three prior pharmacological prophylaxis therapies and whose condition is appropriately managed for medication overuse.

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised that Azzalure® and Vistabel® (December 2010), and Bocouture® (February 2011) are not recommended for use within NHS Scotland.

The Scottish Medicines Consortium has advised (February 2017) that botulinum toxin type A (Botox®) is accepted for restricted use within NHS Scotland for the prophylaxis of headaches in adults with chronic migraine, (defined as headaches on at least 15 days per month, of which at least 8 days are with migraine), that has not responded to at least three prior oral pharmacological prophylaxis therapies and whose condition is appropriately managed for medication overuse.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- **Azzalure® (Galdarima (UK) Ltd)**
  - Botulinum toxin type A 125 unit Azzalure 125 unit powder for solution for injection vials | 1 vial (£64.00) | 2 vial (£128.00)

- **Bocouture® (Merz Pharma UK Ltd)**
  - Botulinum toxin type A 50 unit Bocouture 50 unit powder for solution for injection vials | 1 vial (£72.00)
  - Botulinum toxin type A 100 unit Bocouture 100 unit powder for solution for injection vials | 1 vial (£228.90)

- **Botox® (Allergan Ltd)**
  - Botulinum toxin type A 50 unit Botox 50 unit powder for solution for injection vials | 1 vial (£77.50)
  - Botulinum toxin type A 100 unit Botox 100 unit powder for solution for injection vials | 1 vial (£138.20)

- **Dysport® (Ipsen Ltd)**
  - Botulinum toxin type A 300 unit Dysport 300 unit powder for solution for injection vials | 1 vial (£92.40)
  - Botulinum toxin type A 500 unit Dysport 500 unit powder for solution for injection vials | 2 vial (£308.00)

- **Xeomin® (Merz Pharma UK Ltd)**
  - Botulinum toxin type A 50 unit Xeomin 50 unit powder for solution for injection vials | 1 vial (£72.00)

- **Botox® (Allergan Ltd)**
  - Botulinum toxin type A 200 unit Botox 200 unit powder for solution for injection vials | 1 vial (£276.40)

- **Dysport® (Ipsen Ltd)**
  - Botulinum toxin type A 300 unit Dysport 300 unit powder for solution for injection vials | 1 vial (£92.40)
  - Botulinum toxin type A 500 unit Dysport 500 unit powder for solution for injection vials | 2 vial (£308.00)
  - Xeomin® (Merz Pharma UK Ltd)
  - Botulinum toxin type A 50 unit Xeomin 50 unit powder for solution for injection vials | 1 vial (£72.00)
  - Botulinum toxin type A 100 unit Xeomin 100 unit powder for solution for injection vials | 1 vial (£129.90)
  - Botulinum toxin type A 200 unit Xeomin 200 unit powder for solution for injection vials | 1 vial (£259.80) (Hospital only)
### Botulinum toxin type B

**INDICATIONS AND DOSE**

Spasmodic torticollis (cervical dystonia) (specialist use only)

- **BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 5000–10 000 units, adjusted according to response, dose to be divided between 2–4 most affected muscles

**DOSE EQUIVALENCE AND CONVERSION**

- Important: information specific to each individual preparation.

**CONTRA-INDICATIONS**

- Neuromuscular disorders
- Neuromuscular junctional disorders

**CAUTIONS**

- History of dysphagia or aspiration: off-label use (risk of toxin spread) - tolerance may occur

**INTERACTIONS**

- Appendix 1: botulinum toxin type B

**SIDE-EFFECTS**

- Common or very common
  - Dry mouth
  - Dyspepsia
  - Dysphagia
  - Dysphonia
  - Headache
  - Increased electrophysiological jitter in some distant muscles
  - Influenza-like symptoms
  - Malaise
  - Neck pain
  - Nasal irritation
  - Nasal stuffiness
  - Nausea
  - Pharyngitis
  - Pruritus
  - Rhinitis
  - Rash
  - Respiration disorders
  - Respiratory disorders
  - Vertigo
  - Vomiting

**PREGNANCY**

- Low risk of systemic absorption but avoid unless essential.

**BREAST FEEDING**

- Low risk of systemic absorption but avoid unless essential.

**DIRECTIONS FOR ADMINISTRATION**

- Injection may be diluted with sodium chloride 0.9%.

**PRESCRIBING AND DISPENSING INFORMATION**

- Important: not interchangeable with other botulinum toxin preparations.

**PATIENT AND CARER ADVICE**

- Patients should be warned of the signs and symptoms of toxin spread, such as muscle weakness and breathing difficulties; they should be advised to seek immediate medical attention if swallowing, speech or breathing difficulties occur.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **NeuroBloc** (Eisai Ltd)
  - Botulinum toxin type B 5000 unit per 1 ml
  - 5,000 units/1 ml solution for injection vials: 1 vial
  - 10,000 units/2 ml solution for injection vials: 1 vial
  - 20,000 units/4 ml solution for injection vials: 1 vial

**NEUROPROTECTIVE DRUGS**

### Tafamidis

**INDICATIONS AND DOSE**

Treatment of transthyretin familial amyloid polyneuropathy (TTR-FAP) in patients with stage 1 symptomatic polyneuropathy to delay peripheral neurological impairment (initiated under specialist supervision)

- **BY MOUTH**
  - Adult: 20 mg once daily

**SIDE-EFFECTS**

- Abdominal pain
- Diarrhoea
- Urinary tract infection
- Vaginal infection

**CONCEPTION AND CONTRACEPTION**

- Exclude pregnancy before treatment and ensure effective contraception during and for one month after stopping treatment.

**PREGNANCY**

- Avoid (toxicity in animal studies).

**BREAST FEEDING**

- Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

- Caution in severe impairment—no information available.

**PRESCRIBING AND DISPENSING INFORMATION**

- Tafamidis should be prescribed in addition to standard treatment, but before liver transplantation; it should be discontinued in patients who undergo liver transplantation.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**Appendix**

**4.2 Parkinson’s disease**

### Parkinson’s disease and related disorders

#### Parkinson’s disease

In idiopathic Parkinson’s disease, the progressive degeneration of pigmented neurones in the substantia nigra leads to a deficiency of the neurotransmitter dopamine. The resulting neurochemical imbalance in the basal ganglia causes the characteristic signs and symptoms of the illness. Drug therapy does not prevent disease progression, but it improves most patients’ quality of life.

Patients with suspected Parkinson’s disease should be referred to a specialist to confirm the diagnosis; the diagnosis should be reviewed every 6–12 months.

Features resembling those of Parkinson’s disease can occur in diseases such as progressive supranuclear palsy and multiple system atrophy, but they do not normally show a sustained response to the drugs used in the treatment of idiopathic Parkinson’s disease.

When initiating treatment, patients should be advised about its limitations and possible side-effects. About 5–10% of patients with Parkinson’s disease respond poorly to treatment.

Treatment is usually not started until symptoms cause significant disruption of daily activities. Levodopa, non-ergot-derived dopamine-receptor agonists, or monoamine-oxidase-B inhibitors can be prescribed for initial treatment in early Parkinson’s disease. Therapy with two or more antiparkinsonian drugs may be necessary as the disease progresses. Most patients eventually require levodopa and subsequently develop motor complications.

**Elderly**

Antiparkinsonian drugs can cause confusion in the elderly. It is particularly important to initiate treatment with low doses and to increase the dose gradually.

#### Dopaminergic drugs used in Parkinson’s disease

**Dopamine-receptor agonists**

The dopamine-receptor agonists have a direct action on dopamine receptors. Initial treatment of Parkinson’s disease is often with the dopamine-receptor agonists pramipexole p. 402, ropinirole p. 404, and rotigotine p. 406. The ergot-derived dopamine-receptor agonists bromocriptine p. 399, cabergoline p. 400, and pergolide p. 401 are rarely used because of the risk of fibrotic reactions.
When used alone, dopamine-receptor agonists cause fewer motor complications in long-term treatment compared with levodopa treatment but the overall motor performance improves slightly less. The dopamine-receptor agonists are associated with more psychiatric side-effects than levodopa. 

Dopamine-receptor agonists are also used with levodopa in more advanced disease. If a dopamine-receptor agonist is added to levodopa therapy, the dose of levodopa needs to be reduced.

Apomorphine hydrochloride p. 398 is a potent dopamine-receptor agonist that is sometimes helpful in advanced disease for patients experiencing unpredictable 'off' periods with levodopa treatment. Apomorphine hydrochloride should be initiated in a specialist clinic. After an overnight withdrawal of oral antiparkinsonian medication to induce an 'off' episode, the threshold dose of apomorphine hydrochloride is determined. Oral antiparkinsonian medication is then restarted. The patient must be taught to self-administer apomorphine hydrochloride by subcutaneous injection into the lower abdomen or outer thigh at the first sign of an 'off' episode. Once treatment has been established it may be possible to gradually reduce other antiparkinsonian medications.

**Levodopa**

Levodopa, the amino-acid precursor of dopamine, acts by replenishing depleted striatal dopamine. It is given with an extracerebral dopa-decarboxylase inhibitor, which reduces the peripheral conversion of levodopa to dopamine, thereby limiting side-effects such as nausea, vomiting, and cardiovascular effects; additionally, effective brain-dopamine concentrations are achieved with lower doses of levodopa. The extracerebral dopa-decarboxylase inhibitors used with levodopa are benserazide (in co-beneldopa p. 394) and carbidopa (in co-careldopa p. 396).

Levodopa, in combination with a dopa-decarboxylase inhibitor, is useful in the elderly or frail, in patients with other significant illnesses, and in those with more severe symptoms. It is effective and well tolerated in the majority of patients.

Levodopa therapy should be initiated at a low dose and increased in small steps; the final dose should be as low as possible. Intervals between doses should be chosen to suit the needs of the individual patient.

Nausea and vomiting with co-beneldopa or co-careldopa are rarely dose-limiting and domperidone p. 410 can be useful in controlling these effects.

Levodopa treatment is associated with potentially troublesome motor complications including response fluctuations and dyskinesias. Response fluctuations are characterised by large variations in motor performance, with normal function during the 'on' period, and weakness and restricted mobility during the 'off' period. 'End-of-dose' deterioration with progressively shorter duration of benefit also occurs. Modified-release preparations may help with 'end-of-dose' deterioration or nocturnal immobility and rigidity. Motor complications are particularly problematic in young patients treated with levodopa.

**Monoamine-oxidase-B inhibitors**

Rasagiline p. 406 and selegiline hydrochloride p. 407 are monoamine-oxidase-B inhibitors used in Parkinson's disease. Early treatment with selegiline hydrochloride alone can delay the need for levodopa therapy.

**Antimuscarinic drugs used in parkinsonism**

Antimuscarinic drugs can be useful in drug-induced parkinsonism, but they are generally not used in idiopathic Parkinson’s disease because they are less effective than dopaminergic drugs and they are associated with cognitive impairment.

The antimuscarinic drugs orphenadrine hydrochloride p. 391, procyclidine hydrochloride p. 391, and trihexyphenidyl hydrochloride p. 392 reduce the symptoms of parkinsonism induced by antipsychotic drugs, but there is no justification for giving them routinely in the absence of parkinsonian side-effects. Tardive dyskinesia is not improved by antimuscarinic drugs and may be made worse.

In idiopathic Parkinson’s disease, antimuscarinic drugs reduce tremor and rigidity but they have little effect on Bradykinesia. They may be useful in reducing sialorrhoea. There are no important differences between the antimuscarinic drugs, but some patients tolerate one better than another.

Procyclidine hydrochloride can be given parenterally and is effective emergency treatment for acute drug-induced dystonic reactions.

If treatment with an antimuscarinic is ineffective, intravenous diazepam p. 327 can be given for life-threatening acute drug-induced dystonic reactions.

**Drugs used in essential tremor, chorea, tics, and related disorders**

Tetrabenazine p. 387 is mainly used to control movement disorders in Huntington's chorea and related disorders. Tetrabenazine can also be prescribed for the treatment of tardive dyskinesia if switching or withdrawing the causative antipsychotic drug is not effective. It acts by depleting nerve endings of dopamine. It is effective in only a proportion of patients and its use may be limited by the development of depression.

Haloperidol p. 368 [unlicensed indication], olanzapine p. 379 [unlicensed indication], risperidone p. 383 [unlicensed indication], and quetiapine p. 382 [unlicensed indication], can also be used to suppress chorea in Huntington's disease. Haloperidol can also improve motor tics and symptoms of Tourette syndrome and related choras. Other treatments for Tourette syndrome include pimozide p. 371 [unlicensed indication] (important: ECG monitoring required), clonidine hydrochloride p. 139 [unlicensed indication], and sulpiride p. 372 [unlicensed indication]. Trihexyphenidyl hydrochloride in high dosage can also improve some movement disorders; it is sometimes necessary to build the dose up over many weeks. Chlorpromazine hydrochloride p. 367 and haloperidol are used to relieve intractable hiccup.

Propranolol hydrochloride p. 145 or another beta-adrenoceptor blocking drug may be useful in treating essential tremor or tremors associated with anxiety or thyrotoxicosis. Primidone p. 319 in some cases provides relief from benign essential tremor; the dose is increased slowly to reduce side-effects.

Piracetam p. 386 is used as an adjunctive treatment for myoclonus of cortical origin. After an acute episode, attempts should be made every 6 months to decrease or discontinue treatment.

Riluzole p. 1023 is used to extend life in patients with motor neurone disease who have amyotrophic lateral sclerosis.

**Torsion dystonia and other involuntary movements**

Treatment with botulinum toxin type A p. 387 can be considered after an acquired non-progressive brain injury if rapid-onset spasticity causes postural or functional difficulties.
Orphenadrine hydrochloride

**DRUG ACTION** Orphenadrine exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

**INDICATIONS AND DOSE**
- **Parkinsonism | Drug-induced extrapyramidal symptoms (but not tardive dyskinesia)**
  - **BY MOUTH**
    - Adult: Initially 150 mg daily in divided doses, then increased in steps of 50 mg every 2–3 days, adjusted according to response; usual dose 150–300 mg daily in divided doses; maximum 400 mg per day
    - Elderly: Preferably dose at lower end of range

**SIDE-EFFECTS**
- **Common or very common**
  - Hallucinations
  - Restlessness
  - Constipation
  - Seizures
  - Frequency not known
  - Anxiety, blurred vision, confusion, constipation, dizziness, dry mouth, euphoria, hallucinations, impaired memory, nausea, rash, restlessness, tachycardia, vomiting

**PREGNANCY** Caution.

**BREAST FEEDING** Caution.

**HEPATIC IMPAIRMENT** Use with caution.

**RENAI IMPAIRMENT** Use with caution.

**TREATMENT CESSATION** Avoid abrupt withdrawal in patients taking long-term treatment.

**PATIENT AND CARER ADVICE**
- Driving and skilled tasks may affect performance of skills tasks (e.g. driving).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution
  - **Orphenadrine hydrochloride (Non-proprietary)**
    - Orphenadrine hydrochloride 10 mg per 1 ml Orphenadrine 50mg/5ml oral solution sugar-free
      - 150 ml [POM] £37.50
      - DT price = £35.08
  - **Tablet**
    - **EXCIPIENTS:** May contain Tartrazine
      - Orphenadrine hydrochloride 50 mg
        - Orphenadrine 50mg tablets
          - 100 tablet [POM] £80.00
          - 250 tablet [POM] no price available

Procyclidine hydrochloride

**DRUG ACTION** Procyclidine exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

**INDICATIONS AND DOSE**
- **Parkinsonism | Extrapyramidal symptoms (but not tardive dyskinesia)**
  - **BY MOUTH**
    - Adult: 2.5 mg 3 times a day, then increased in steps of 2.5–5 mg daily if required; increased if necessary up to 30 mg daily in 2–4 divided doses, to be increased at 2–3 day intervals. Maximum daily dose only to be used in exceptional circumstances; maximum 60 mg per day
    - Elderly: Lower end of range preferable

  **Acute dystonia**
  - **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
    - Adult: 5–10 mg, occasionally, more than 10 mg, dose usually effective in 5–10 minutes but may need 30 minutes for relief
    - Elderly: Lower end of range preferable

**SIDE-EFFECTS**
- **Common or very common**
  - Urinary retention
  - Uncommon
  - Drowsiness, impaired coordination, insomnia, seizures
  - Very rare
    - Angle-closure glaucoma

**INTERACTIONS**
- **Drug-induced extrapyramidal symptoms**
  - Use only if potential benefit outweighs risk.

**PREGNANCY** Use only if potential benefit outweighs risk.

**BREAST FEEDING** No information available.

**HEPATIC IMPAIRMENT** Use with caution.

**RENAI IMPAIRMENT** Use with caution.

**TREATMENT CESSATION** Avoid abrupt withdrawal in patients taking long-term treatment.

**PATIENT AND CARER ADVICE**
- Driving and skilled tasks may affect performance of skills tasks (e.g. driving).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  **Solution for injection**
  - Procyclidine hydrochloride 5 mg per 1 ml
    - Procyclidine 10mg/2ml solution for injection ampoules
      - 5 ampoule [POM] £60.00–£78.75
      - DT price = £72.50

  **Oral solution**
  - Procyclidine hydrochloride 500 microgram per 1 ml
    - Procyclidine 2.5mg/5ml oral solution sugar-free
      - 150 ml [POM] £7.94–£8.22
      - DT price = £7.08
  - Procyclidine hydrochloride 1 mg per 1 ml
    - Procyclidine 5mg/5ml oral solution sugar-free
      - 150 ml [POM] £14.54–£14.72
      - DT price = £13.13

  **Tablet**
  - Procyclidine hydrochloride (Non-proprietary)
    - Procyclidine hydrochloride 5 mg
      - Procyclidine 5mg tablets
        - 28 tablet [POM] £12.24
        - 100 tablet [POM] £43.71
        - 500 tablet [POM] £218.57
      - Kemadrin (Aspen Pharma Trading Ltd)
        - Procyclidine hydrochloride 5 mg
          - Kemadrin 5mg tablets
            - 100 tablet [POM] £4.72
            - 500 tablet [POM] £23.62
Trihexyphenidyl hydrochloride
(Benzhexol hydrochloride)

- **DRUG ACTION** Trihexyphenidyl exerts its effects by reducing the effects of the relative cholinergic excess that occurs as a result of dopamine deficiency.

- **INDICATIONS AND DOSE**
  Parkinson's disease (if used in combination with co-careldopa or co-beneldopa)
  - BY MOUTH
    - Adult: Maintenance 2–6 mg daily in divided doses, use not recommended because of toxicity in the elderly and the risk of aggravating dementia
  Parkinsonism | Drug-induced extrapyramidal symptoms (but not tardive dyskinesia)
  - BY MOUTH
    - Adult: 1 mg daily, then increased in steps of 2 mg every 3–5 days, adjusted according to response; maintenance 5–15 mg daily in 3–4 divided doses, not recommended for use in Parkinson's disease because of toxicity in the elderly and the risk of aggravating dementia; maximum 20 mg per day
    - Elderly: Lower end of range preferable, not recommended for use in Parkinson's disease because of toxicity in the elderly and the risk of aggravating dementia

- **CONTRA-INDICATIONS** Gastro-intestinal obstruction · myasthenia gravis

- **CAUTIONS** Cardiovascular disease · elderly · hypertension · liable to abuse · prostatic hypertrophy · psychotic disorders · pyrexia · those susceptible to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1: trihexyphenidyl

- **SIDE-EFFECTS**
  - Very rare: Angle-closure glaucoma
  - Frequency not known: Anxiety · blurred vision · confusion · constipation · dizziness · dry mouth · dyskinesia · dystonia · fatigue · hallucinations · impaired memory · nausea · rash · restlessness · tachycardia · urinary retention · vomiting

- **PREGNANCY** Use only if potential benefit outweighs risk.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Use with caution.

- **RENAL IMPAIRMENT** Use with caution.

- **TREATMENT CESSATION** Avoid abrupt withdrawal in patients taking long-term treatment.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken with or after food.

- **PATIENT AND CARER ADVICE** Driving and skilled tasks
  May affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral solution**

**EXCIPIENTS:** May contain Propylene glycol

- Trihexyphenidyl hydrochloride (Non-proprietary)
  - Trihexyphenidyl hydrochloride 1 mg per 1 ml: Trihexyphenidyl 5mg/5ml oral solution | 200 ml [Pres] £22.00–£24.00 DT price = £22.00

**Tablet**

- Trihexyphenidyl hydrochloride (Non-proprietary)
  - Trihexyphenidyl hydrochloride 2 mg: Trihexyphenidyl 2mg tablets | 84 tablet [Pres] £5.56 DT price = £4.20
  - Trihexyphenidyl hydrochloride 5 mg: Trihexyphenidyl 5mg tablets | 84 tablet [Pres] £17.91 DT price = £17.51

**DOPAMINERGIC DRUGS > CATECHOL-O-METHYLTRANSFERASE INHIBITORS**

Entacapone

- **DRUG ACTION** Entacapone prevents the peripheral breakdown of levodopa, by inhibiting catechol-O-methyltransferase, allowing more levodopa to reach the brain.

- **INDICATIONS AND DOSE**
  Adjunct to co-beneldopa or co-careldopa in Parkinson's disease with 'end-of-dose' motor fluctuations (under expert supervision)
  - BY MOUTH
    - Adult: 200 mg, dose to be given with each dose of levodopa with dopa-decarboxylase inhibitor; maximum 2 g per day

- **CONTRA-INDICATIONS** History of neuroleptic malignant syndrome · history of non-traumatic rhabdomyolysis · phaeochromocytoma

- **CAUTIONS** Concurrent levodopa dose may need to be reduced by about 10–30% · ischaemic heart disease

- **INTERACTIONS** → Appendix 1: entacapone

- **SIDE-EFFECTS**
  - Common or very common: Abdominal pain · abnormal dreams · confusion · constipation · diarrhea · dizziness · dry mouth · dyskinesia · dystonia · fatigue · hallucinations · insomnia · ischaemic heart disease · nausea · sweating · urine may be coloured reddish-brown · vomiting
  - Uncommon: Myocardial infarction
  - Rare: Rash
  - Very rare: Agitation · anorexia · urticaria · weight loss
  - Frequency not known: Colitis · hepatitis · neuroleptic malignant syndrome · rhabdomyolysis · skin, hair, and nail discoloration

- **PREGNANCY** Avoid—no information available.

- **BREAST FEEDING** Avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Avoid.

- **TREATMENT CESSATION** Avoid abrupt withdrawal.

- **PATIENT AND CARER ADVICE** Patient counselling is advised (may colour urine reddish-brown, concomitant iron containing products).

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 14**

- Entacapone (Non-proprietary)
  - Entacapone 200 mg: Entacapone 200mg tablets | 30 tablet [Pres] £16.38 DT price = £5.03 | 100 tablet [Pres] £54.58
  - Comtess (Orion Pharma (UK) Ltd)
    - Entacapone 200 mg: Comtess 200mg tablets | 30 tablet [Pres] £17.24 DT price = £5.03 | 100 tablet [Pres] £57.45

**Combinations available:** Carbidopa with entacapone and levodopa, p. 394

downloaded from www.medicalbr.com
Opicapone

**DRUG ACTION** Opicapone prevents the peripheral breakdown of levodopa, by inhibiting catechol-O-methyltransferase, allowing more levodopa to reach the brain.

**INDICATIONS AND DOSE**
Adjunct to co-beneldopa or co-careldopa in Parkinson’s disease with ‘end-of-dose’ motor fluctuations (under expert supervision)
- **BY MOUTH**
  - Adult: 50 mg once daily, dose to be taken at bedtime, at least one hour before or after levodopa combinations

**CONTRA-INDICATIONS**
- Catecholamine-secreting neoplasms
- History of neuroleptic malignant syndrome
- History of non-traumatic rhabdomyolysis
- Paraganglioma
- Phaeochromocytoma

**CAUTIONS**
- Concurrent levodopa dose may need to be reduced - elderly over 85 years (limited information available)

**SIDE-EFFECTS**
- **Common or very common**
  - Abnormal dreams
  - Constipation
  - Dizziness
  - Dry mouth
  - Dyskinesia
  - Hallucination
  - Headache
  - Insomnia
  - Muscle spasms
  - Orthostatic hypotension
  - Raised blood creatine phosphokinase
  - Somnolence
  - Vomiting
- **Uncommon**
  - Abdominal pain
  - Anxiety
  - Blood pressure changes
  - Chromatia
  - Decreased appetite
  - Depression
  - Dry eye
  - Dysgeusia
  - Dyspepsia
  - Dysphonia
  - Hyperkinesia
  - Hypertriglyceridaemia
  - Myalgia
  - Nocturia
  - Pain in extremity
  - Palpitations
  - Sleep disorders
  - Syncope
  - Weight decrease
- **Frequency not known**
  - Raised liver enzymes

**SIDE-EFFECTS, FURTHER INFORMATION**
- Raised liver enzymes
  - Manufacturer advises consider liver function tests in patients who experience progressive anorexia, asthenia and weight decrease within a relatively short period of time.

**PREGNANCY**
- Manufacturer advises avoid - limited information available

**BREAST FEEDING**
- Manufacturer advises avoid - no information available

**HEPATIC IMPAIRMENT**
- Manufacturer advises use with caution in moderate impairment - dose adjustment may be necessary. Manufacturer advises avoid in severe impairment.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Capsule**

---

Tolcapone

**DRUG ACTION** Tolcapone prevents the peripheral breakdown of levodopa, by inhibiting catechol-O-methyltransferase, allowing more levodopa to reach the brain.

**INDICATIONS AND DOSE**
Adjunct to co-beneldopa or co-careldopa in Parkinson’s disease with ‘end-of-dose’ motor fluctuations if another inhibitor of peripheral catechol-O-methyltransferase inappropriate (under expert supervision)
- **BY MOUTH**
  - Adult: 100 mg 3 times a day (max. per dose 200 mg 3 times a day) continuing beyond 3 weeks only if substantial improvement, leave 6 hours between each dose; first daily dose should be taken at the same time as levodopa with dopa-decarboxylase inhibitor, dose maximum only in exceptional circumstances

**CONTRA-INDICATIONS**
- Phaeochromocytoma
- Previous history of hyperthermia
- Previous history of neuroleptic malignant syndrome
- Previous history of rhabdomyolysis
- Severe dyskinesia

**CAUTIONS**
- Most patients receiving more than 600 mg levodopa daily require reduction of levodopa dose by about 30%

**CAUTIONS, FURTHER INFORMATION**
- Hepatotoxicity
  - Potentially life-threatening hepatotoxicity including fulminant hepatitis reported rarely, usually in women and during the first 6 months, but late-onset liver injury also reported; discontinue if abnormal liver function tests or symptoms of liver disorder; do not re-introduce tolcapone once discontinued.

**INTERACTIONS** → Appendix 1: tolcapone

**SIDE-EFFECTS**
- **Common or very common**
  - Abdominal pain
  - Anorexia
  - Chest pain
  - Confusion
  - Constipation
  - Diarrhoea
  - Dizziness
  - Drowsiness
  - Dyskinesia
  - Dyspepsia
  - Dystonia
  - Excessive dreaming
  - Hallucinations
  - Headache
  - Hepatotoxicity
  - Nausea
  - Sleep disturbances
  - Sweating
  - Syncope
  - Urine discoloration
  - Vomiting
  - Xerostomia
- **Frequency not known**
  - Neuroleptic malignant syndrome
  - Reported on dose reduction or withdrawal - rhabdomyolysis reported on dose reduction or withdrawal

**PREGNANCY**
- Toxicity in animal studies - use only if potential benefit outweighs risk.

**BREAST FEEDING**
- Avoid - present in milk in animal studies.

**HEPATIC IMPAIRMENT**
- Avoid.

**RENAL IMPAIRMENT**
- Caution if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**
- Test liver function before treatment, and monitor every 2 weeks for first year, every 4 weeks for next 6 months and then every 8 weeks thereafter (restart monitoring schedule if dose increased).

**TREATMENT CESSION**
- Avoid abrupt withdrawal.

**PATIENT AND CARER ADVICE**
- Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Tablet**

Carbidopa with entacapone and levodopa

The properties listed below are those particular to the combination only. For the properties of the components please consider, co-careldopa p. 396, entacapone p. 392.

- **INDICATIONS AND DOSE**
  
  **STALEVO® 100/25/200**
  
  Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-carboxylase inhibitor treatment
  
  - **BY MOUTH**
  - Adult: 1 tablet for each dose; maximum 10 tablets per day
  
  **STALEVO® 125/31.25/200**
  
  Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-carboxylase inhibitor treatment
  
  - **BY MOUTH**
  - Adult: 1 tablet for each dose; maximum 10 tablets per day
  
  **STALEVO® 150/37.5/200**
  
  Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-carboxylase inhibitor treatment
  
  - **BY MOUTH**
  - Adult: 1 tablet for each dose; maximum 8 tablets per day
  
  **STALEVO® 175/43.75/200**
  
  Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-carboxylase inhibitor treatment
  
  - **BY MOUTH**
  - Adult: 1 tablet for each dose; maximum 7 tablets per day
  
  **STALEVO® 200/50/200**
  
  Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-carboxylase inhibitor treatment
  
  - **BY MOUTH**
  - Adult: 1 tablet for each dose; maximum 10 tablets per day
  
  **STALEVO® 50/12.5/200**
  
  Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-carboxylase inhibitor treatment
  
  - **BY MOUTH**
  - Adult: 1 tablet for each dose; maximum 10 tablets per day
  
  **STALEVO® 75/18.75/200**
  
  Parkinson's disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-carboxylase inhibitor treatment
  
  - **BY MOUTH**
  - Adult: 1 tablet for each dose; maximum 10 tablets per day

- **INTERACTIONS**  →  Appendix 1: carbidopa, entacapone, levodopa

- **PRESCRIBING AND DISPENSING INFORMATION**
  
  Patients receiving standard-release co-careldopa or co-beneldopa alone, initiate Stalevo® at a dose that provides similar (or slightly lower) amount of levodopa.

Patients with dyskinesia or receiving more than 800 mg levodopa daily, introduce entacapone before transferring to Stalevo® (levodopa dose may need to be reduced by 10–30% initially).

Patients receiving entacapone and standard-release co-careldopa or co-beneldopa, initiate Stalevo® at a dose that provides similar (or slightly higher) amount of levodopa.

- **PATIENT AND CARER ADVICE**
  
  **Sudden onset of sleep**  Excessive daytime sleepiness and sudden onset of sleep can occur with carbidopa with entacapone and levodopa.

  Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

  Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

- **Co-beneldopa**

  - **INDICATIONS AND DOSE**
    
    Parkinson's disease
    
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      
      - Adult: Initially 50 mg 3–4 times a day, then increased in steps of 100 mg daily, dose to be increased once or twice weekly according to response; maintenance 400–800 mg daily in divided doses
      
      - Elderly: Initially 50 mg 1–2 times a day, then increased in steps of 50 mg daily, dose to be increased every 3–4 days according to response

    Parkinson's disease (in advanced disease)
    
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      
      - Adult: Initially 100 mg 3 times a day, then increased in steps of 100 mg daily, dose to be increased once or twice weekly according to response; maintenance 400–800 mg daily in divided doses

    Parkinson's disease (patients not taking levodopa/dopa-carboxylase inhibitor therapy)
    
    - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
      
      - Adult: Initially 1 capsule 3 times a day; maximum 6 capsules per day
**Parkinson's disease** (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: Initially 1 capsule substituted for every 100 mg of levodopa and given at the same dosage frequency, increased every 2–3 days according to response; average increase of 50% needed over previous levodopa dose and titration may take up to 4 weeks, supplementary dose of immediate-release Madopar® may be needed with first morning dose; if response still poor to total daily dose of Madopar® CR plus Madopar® corresponding to 1.2 g levodopa—consider alternative therapy.

**DOSE EQUIVALENCE AND CONVERSION**
- Dose is expressed as levodopa.

---

### IMPORTANT SAFETY INFORMATION

**IMPULSE CONTROL DISORDERS**
Treatment with levodopa is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. If the patient develops an impulse control disorder, levodopa should be withdrawn or the dose reduced until the symptoms resolve.

- **CAUTIONS**
  - Cushing’s syndrome · diabetes mellitus · endocrine disorders · history of convulsions · history of myocardial infarction with residual arrhythmia · history of peptic ulcer · hyperthyroidism · osteomalacia · phaeochromocytoma · psychiatric illness (avoid if severe and discontinue if deterioration) · severe cardiovascular disease · severe pulmonary disease · susceptibility to angle-closure glaucoma

- **INTERACTIONS**
  - Appendix 1: levodopa

- **SIDE-EFFECTS**
  - Common or very common
    - Abnormal dreams · anorexia · anxiety · arrhythmias · chorea · confusion · dementia · depression · dizziness · drowsiness · dry mouth · dyskinesia · dystonia · euphoria · fatigue · insomnia · nausea · palpitations · postural hypotension · psychosis · syncope · taste disturbances · vomiting
  - Uncommon
    - Ataxia · chest pain · constipation · diarrhoea · dysphagia · flatulence · hand tremor · hoarseness · hypersalivation · hypertension · malaise · muscle cramps · oedema · reddish discolouration of the urine and other body fluids · weakness · weight changes
  - Rare
    - Abdominal pain · activation of Horner’s syndrome · activation of malignant melanoma · agitation · agranulocytosis · alopecia · blepharospasm · blurred vision · bruxism · convulsions · diplopia · disorientation · duodenal ulcer · dyspepsia · dysphonia · exantheme · flushing · gastro-intestinal bleeding · haemolytic anaemia · headache · Henoch–Schönlein purpura · hiccups · leucopenia · neuroleptic malignant syndrome (associated with abrupt withdrawal) · non-haemolytic anaemia · oculogyric crisis · paraesthesia · phlebitis · priapism · pupil dilatation · reduced mental acuity · sweating · thrombocytopenia · trismus · urinary incontinence · urinary retention
  - Very rare
    - Angle-closure glaucoma · suicidal ideation
  - Frequency not known
    - Compulsive behaviour

- **PREGNANCY**
  - Caution in pregnancy—toxicity has occurred in animal studies.

- **BREAST FEEDING**
  - May suppress lactation; present in milk—avoid.

- **HEPATIC IMPAIRMENT**
  - Use with caution.

- **RENAL IMPAIRMENT**
  - Use with caution.

---

### EFFECT ON LABORATORY TESTS
- False positive tests for urinary ketones have been reported.

### TREATMENT CESSION
- Avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis).

### DIRECTIONS FOR ADMINISTRATION
- The dispersible tablets can be dispersed in water or orange squash (not orange juice) or swallowed whole.

### PRESCRIBING AND DISPENSING INFORMATION
- Co-beneldopa is a mixture of benserazide hydrochloride and levodopa in mass proportions corresponding to 1 part of benserazide and 4 parts of levodopa.
- When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued 12 hours before (although interval can be shorter).
- When switching from modified-release levodopa to dispersible co-beneldopa, reduce dose by approximately 30%.
- When administered as an adjunct to other antiparkinsonian drugs, once therapeutic effect apparent, the other drugs may be reduced or withdrawn.

### PATIENT AND CARER ADVICE

- **Sudden onset of sleep**
  - Excessive daytime sleepiness and sudden onset of sleep can occur with co-beneldopa.

- **Patients**
  - Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

- **Management**
  - Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concurrent medication. Patients should be counselled on improving sleep behaviour.

- **Patients or carers**
  - Should be given advice on how to administer co-beneldopa dispersible tablets.

### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
  - **Dispersible tablet**
    - CAUTIONARY AND ADVISORY LABELS
      - 10, 14, 21
      - Madopar (Roche Products Ltd)
      - Benserazide (as Benserazide hydrochloride) 12.5 mg, Levodopa 50 mg
      - Madopar 50 mg/12.5 mg dispersible tablets sugar-free | 100 tablet (P) £5.90 DT price = £5.90
      - Benserazide (as Benserazide hydrochloride) 25 mg, Levodopa 100 mg
      - Madopar 100 mg/25 mg dispersible tablets sugar-free | 100 tablet (P) £10.45 DT price = £10.45
  - **Modified-release capsule**
    - CAUTIONARY AND ADVISORY LABELS
      - 5, 10, 14, 25
      - Madopar CR (Roche Products Ltd)
      - Benserazide (as Benserazide hydrochloride) 25 mg, Levodopa 100 mg
      - Madopar CR capsules | 100 capsule (P) £12.77 DT price = £12.77
  - **Capsule**
    - CAUTIONARY AND ADVISORY LABELS
      - 10, 14, 21
      - Co-beneldopa (Non-proprietary)
      - Benserazide (as Benserazide hydrochloride) 12.5 mg, Levodopa 50 mg
      - Co-beneldopa 12.5 mg/50 mg capsules | 100 capsule (P) £4.71–£4.96 DT price = £4.96
      - Benserazide (as Benserazide hydrochloride) 25 mg, Levodopa 100 mg
      - Co-beneldopa 25 mg/100 mg capsules | 100 capsule (P) £6.56–£6.91 DT price = £6.91

---

**Costs**

- Cost calculations: 100 capsules = £56.60
- Dose reductions: 100 capsules = £5.90
- DT price: 100 capsules = £5.90

---

**BNF 74 Parkinson’s disease 395**

DT price = £6.91
Benserazide (as Benserazide hydrochloride) 50 mg, Levodopa 200 mg Madopar 200mg/50mg capsules | 100 capsule  
DT price = £11.78

### Co-careldopa

#### INDICATIONS AND DOSE

**Parkinson’s disease**

- **BY MOUTH**
  - Adult: Initially 25/100 mg 3 times a day, then increased in steps of 12.5/50 mg once daily or on alternate days, adjusted according to response, do not exceed a total daily dose of 150 mg of levodopa.

**Parkinson’s disease—alternative regimen**

- **BY MOUTH**
  - Adult: Initially 12.5 mg 3–4 times a day, alternatively increased in steps of 12.5 mg once daily or on alternate days, adjusted according to response, do not exceed a total daily dose of 150 mg of levodopa.

**DOSE EQUIVALENT AND CONVERSION**

- The proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.
  - 2 tablets Sinemet® 12.5 mg/50 mg is equivalent to 1 tablet Sinemet® Plus 25 mg/100 mg.

**Caramet® CR**

**Parkinson’s disease (patients not receiving levodopa/dopa-decarboxylase inhibitor preparations, expressed as levodopa)**

- **BY MOUTH USING MODIFIED-RELEASE TABLETS**
  - Adult: Initially 100–200 mg twice daily, dose to be given at least 6 hours apart; dose adjusted according to response at intervals of at least 2 days.

**Parkinson’s disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)**

- **BY MOUTH USING MODIFIED-RELEASE TABLETS**
  - Adult: Discontinue previous preparation at least 12 hours before first dose of Caramet® CR; substitute Caramet® CR to provide a similar amount of levodopa daily and extend dosing interval by 30–50%; then adjusted according to response at intervals of at least 2 days.

**Dudodopa®**

**Severe Parkinson’s disease inadequately controlled by other preparations**

- Adult: Administered as intestinal gel, for use with enteral tube (consult product literature).

### IMPORTANT SAFETY INFORMATION

#### IMPULSE CONTROL DISORDERS

Treatment with levodopa is associated with impulse control disorders, including pathological gambling, binge eating, hypersexuality, and hypersexual disorder. Patients and their carers should be informed about the risk of impulse control disorders. If the patient develops an impulse control disorder, levodopa should be withdrawn or the dose reduced until the symptoms resolve.

#### CAUTIONS

- Cushing’s syndrome
- Diabetes mellitus
- Endocrine disorders
- History of convulsions
- History of myocardial infarction with residual arrhythmia
- History of peptic ulcer
- Hyperthyroidism
- Osteomalacia
- Phaeochromocytoma
- Psychiatric illness (avoid if severe depression or anxiety)

#### SIDE-EFFECTS

- Common or very common
  - Abnormal dreams
  - Anorexia
  - Anxiety
  - Arrhythmias
  - Chorea
  - Confusion
  - Depression
  - Dizziness
  - Drowsiness
  - Dry mouth
  - Dyskinesia
  - Dysphagia
  - Fatigue
  - Insomnia
  - Nausea
  - Palpitations
  - Postural hypotension
  - Psychosis
  - Syncope
  - Taste disturbances
  - Vomiting

- Uncommon
  - Ataxia
  - Chest pain
  - Constipation
  - Diarrhoea
  - Dizziness
  - Flatulence
  - Hand tremor
  - Hoarseness
  - Hypersalivation
  - Hypertension
  - Malaise
  - Muscle cramps
  - Oedema
  - Reddish discoloration of the urine and other body fluids

#### INTERACTIONS

- **Appendix 1: carbidopa, levodopa**

#### IMPULSE CONTROL DISORDERS

- **Very rare**
  - Angle-closure glaucoma
  - Suicidal ideation

- **Frequency not known**
  - Compulsive behaviour
PREGNANCY Use with caution—toxicity has occurred in animal studies.

 BREAST FEEDING May suppress lactation; present in milk—avoid.

 HEPATIC IMPAIRMENT Use with caution.

 RENAL IMPAIRMENT Use with caution.

 EFFECT ON LABORATORY TESTS False positive tests for urinary ketones have been reported.

 TREATMENT CESSION Avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis).

 PRESCRIBING AND DISPENSING INFORMATION

 Co-careldopa is a mixture of carbidopa and levodopa; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively. When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued at least 12 hours before.

 Co-careldopa 25/100 provides an adequate dose of carbidopa when low doses of levodopa are needed.

 PATIENT AND CARER ADVICE

 Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with co-careldopa. Patients starting treatment with these drugs should be counselled on improving sleep behaviour.

 NATIONAL FUNDING/ACCESS DECISIONS

 **DUODOPA**

 Scottish Medicines Consortium (SMC) Decisions

 The Scottish Medicines Consortium has advised (June 2016) that Duodopa® intestinal gel is accepted for restricted use within NHS Scotland, within its licensed indication, only in patients not eligible for deep brain stimulation. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

 **MEDICINAL FORMS**

 There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

 **Modified-release tablet**

 **CAUTIONARY AND ADVISORY LABELS** 10, 14, 25

 - Caramet CR (Teva UK Ltd) Carbidopa (as Carbidopa monohydrate) 25 mg, Levodopa 100 mg Caramet 25mg/100mg CR tablets | 60 tablet | £11.47 DT price = £11.60
 - Carbidopa (as Carbidopa monohydrate) 50 mg, Levodopa 200 mg Caramet 50mg/200mg CR tablets | 60 tablet | £11.47 DT price = £11.60
 - Half Sinemet CR (Merck Sharp & Dohme Ltd) Carbidopa (as Carbidopa monohydrate) 25 mg, Levodopa 100 mg Half Sinemet CR 25mg/100mg tablets | 60 tablet | £11.60 DT price = £11.60
 - Sinemet CR (Merck Sharp & Dohme Ltd) Carbidopa (as Carbidopa monohydrate) 50 mg, Levodopa 200 mg Sinemet CR 50mg/200mg tablets | 60 tablet | £11.60 DT price = £11.60

 **SCOPA**

 **INDICATIONS AND DOSE**

 Parkinson’s disease

 - Adult: 100 mg daily for 1 week, then increased to 100 mg twice daily, usually administered in conjunction with other treatment. Some patients may require higher doses; maximum 400 mg per day
 - Elderly: 100 mg daily, adjusted according to response

 **Post-herpetic neuralgia**

 - Adult: 100 mg twice daily for 14 days (continued for another 14 days if necessary)

 Treatment of influenza A (but not recommended)

 - Adult: 100 mg twice daily for 14 days

 Prophylaxis of influenza A (but not recommended)

 - Adult: 100 mg daily usually for 6 weeks or with influenza vaccination for 2–3 weeks after vaccination

 **CONTRA-INDICATIONS**

 Epilepsy • history of gastric ulceration

 **CAUTIONS**

 Confused or hallucinatory states • congestive heart disease (may exacerbate oedema) • elderly • tolerance to the effects of amantadine may develop in Parkinson’s disease

 **INTERACTIONS**

 Appendix 1: dopamine receptor agonists

 **SIDE-EFFECTS**

 Common or very common Anorexia • anxiety • dizziness • dry mouth • gastro-intestinal disturbances • hallucinations •
headache · impaired concentration · insomnia · lethargy · livedo reticularis · mood changes · myalgia · palpitation · peripheral oedema · postural hypotension · slurred speech · sweating

- **Uncommon** Confusion · movement disorders · neuroleptic malignant syndrome · psychosis · rash · seizure · tremor · urinary incontinence · urinary retention · visual disturbances

- **Frequency not known** Heart failure · leucopenia · photosensitisation

- **PREGNANCY** Avoid; toxicity in animal studies.
- **BREAST FEEDING** Avoid; present in milk; toxicity in infant reported.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENA L IMPAIRMENT** Reduce dose. Avoid if eGFR less than 15 mL/minute/1.73 m².
- **TREATMENT CESSATION** Avoid abrupt withdrawal in Parkinson’s disease.

- **PAtIENT AND CARER ADVICE**
- Driving and skilled tasks
  May affect performance of skilled tasks (e.g. driving).

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE technology appraisals (TAs)**

    - Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158
      Amantadine is **not** recommended for prophylaxis of influenza.
      www.nice.org.uk/TA158

    - Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2009) NICE TA168
      Amantadine is **not** recommended for treatment of influenza.
      www.nice.org.uk/TA168

- **MEDICINAL FORMS**

  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

  - **Oral solution**

    - Amantadine hydrochloride (Non-proprietary)
      Amantadine hydrochloride 10 mg per 1 ml
      Amantadine 50mg/5ml oral solution sugar free sugar-free
      150 ml [Pax] £138.99–£140.00
      DT price = £139.25

  - **Capsule**

    - Amantadine hydrochloride (Non-proprietary)
      Amantadine hydrochloride 100 mg
      Amantadine 100mg capsules
      14 capsule [Pax] £10.25–£11.39
      56 capsule [Pax] £41.00–£45.54
      DT price = £44.63

**Apomorphine hydrochloride**

- **INDICATIONS AND DOSE**

  **Refractory motor fluctuations in Parkinson’s disease (‘off’ episodes) inadequately controlled by co-beneldopa or co-careldopa or other dopaminergics (for capable and motivated patients) (under expert supervision)**

    - **BY SUBCUTANEOUS INJECTION**

      - Adult: Initially 1 mg, dose to be administered at the first sign of ‘off’ episode, then 2 mg after 30 minutes, dose to be given if inadequate or no response following initial dose, thereafter increase dose at minimum 40-minute intervals until satisfactory response obtained, this determines threshold dose; usual dose 3–30 mg daily in divided doses (max. per dose 10 mg), subcutaneous infusion may be preferable in those requiring division of injections into more than 10 doses; maximum 100 mg per day

**IMPORTANT SAFETY INFORMATION**

**IMPULSE CONTROL DISORDERS**

Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist or levodopa should be withdrawn or the dose reduced until the symptoms resolve.

- **CONTRA-INDICATIONS**
  - Avoid if ‘on’ response to levodopa marred by severe dyskinesia or dystonia · dementia · psychosis · respiratory depression

- **CAUTIONS**

  - Cardiovascular disease · history of postural hypotension (special care on initiation) · neuropsychiatric conditions · pulmonary disease · susceptibility to QT-interval prolongation

- **INTERACTIONS**

  - Appendix 1: dopamine receptor agonists

- **SIDE-EFFECTS**

  - **Common or very common** Confusion · drowsiness · hallucinations · nausea · sudden onset of sleep · vomiting · yawning

  - **Uncommon** Dyskinesia during ‘on’ periods (may require discontinuation) · dyspnœa · haemolytic anaemia (with levodopa) · postural hypotension · rash · thrombocytopenia (with levodopa)

  - **Rare** Eosinophilia

  - **Frequency not known** Compulsive behaviour · dizziness · peripheral oedema

- **ALLERGY AND CROSS-SENSITIVITY**
  - Contra-indicated if history of hypersensitivity to opioids.

- **PREGNANCY**
  - Contra-indicated if history of hypersensitivity to opioids.

- **BREAST FEEDING**
  - No information available; may suppress lactation.

- **HEPATIC IMPAIRMENT**
  - Avoid.

- **RENA L IMPAIRMENT**
  - Use with caution.

- **MONITORING REQUIREMENTS**

  - Monitor hepatic, haemopoietic, renal, and cardiovascular function.

  - With **concomitant levodopa** test initially and every 6 months for haemolytic anaemia and thrombocytopenia (development calls for specialist haematological care with dose reduction and possible discontinuation).
**TREATMENT CESSION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

**PATIENT AND CARER ADVICE**

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Drugs and driving** Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

2015 legislation regarding driving whilst taking certain drugs, may also apply to apomorphine, see Drugs and driving under Guidance on prescribing p. 1.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

**Solution for injection**

**CAUTIONARY AND ADVISORY LABELS 10**

**EXCIPIENTS:** May contain Sulfites

- **APO-go** (Britannia Pharmaceuticals Ltd)
  - Apomorphine hydrochloride 10 mg per 1 ml
  - solution for injection ampoules | 5 ampoule [Pot] £73.11 DT price = £73.11
- **APO-go Pen** (Britannia Pharmaceuticals Ltd)
  - Apomorphine hydrochloride 10 mg per 1 ml
  - solution for injection pre-filled disposable injection [Pot] £123.91 DT price = £123.91

**Solution for infusion**

**CAUTIONARY AND ADVISORY LABELS 10**

**EXCIPIENTS:** May contain Sulfites

- **APO-go PFS** (Britannia Pharmaceuticals Ltd)
  - Apomorphine hydrochloride 5 mg per 1 ml
  - solution for infusion pre-filled syringes | 5 pre-filled disposable injection [Pot] £73.11 DT price = £73.11

**Bromocriptine**

**DRUG ACTION** Bromocriptine is a stimulant of dopamine receptors in the brain; it also inhibits release of prolactin by the pituitary.

**INDICATIONS AND DOSE**

**Prevention of lactation**

- **BY MOUTH**
  - Adult: Initially 2.5 mg daily for 1 day, then 2.5 mg twice daily for 14 days

**Suppression of lactation**

- **BY MOUTH**
  - Adult: Initially 2.5 mg daily for 2–3 days, then 2.5 mg twice daily for 14 days

**Hypogonadism | Galactorrhoea | Infertility**

- **BY MOUTH**
  - Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, increase dose gradually; usual dose 7.5 mg daily in divided doses, increased if necessary up to 30 mg daily, usual dose in infertility without hyperprolactinaemia is 2.5 mg twice daily

**Acromegaly**

- **BY MOUTH**
  - Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, then increased to 5 mg every 6 hours, increase dose gradually

**Prolactinoma**

- **BY MOUTH**
  - Adult: Initially 1–1.25 mg daily for 1 week, dose to be taken at night, then 2–2.5 mg daily for 1 week, dose to be taken at night, then 2.5 mg twice daily for 1 week, then 2.5 mg 3 times a day for 1 week, then increased in steps of 2.5 mg every 3–14 days, adjusted according to response; maintenance 10–30 mg daily

**IMPORTANT SAFETY INFORMATION**

**FIBROTIC REACTIONS**

Bromocriptine has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions.

Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson’s disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful.

**IMPULSE CONTROL DISORDERS**

Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

**CONTRA-INDICATIONS**

Avoid in pre-eclampsia·cardiac valvulopathy (exclude before treatment)-hypertension in postpartum women or in puerperium

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- Postpartum or puerperium Should not be used postpartum or in puerperium in women with high blood pressure, coronary artery disease, or symptoms (or history) of serious mental disorder; monitor blood pressure carefully (especially during first few days) in postpartum women.

Very rarely hypertension, myocardial infarction, seizures or stroke (both sometimes preceded by severe headache or visual disturbances), and mental disorders have been reported in postpartum women given bromocriptine for lactation suppression—caution with antihypertensive...
therapy and avoid other ergot alkaloids. Discontinue immediately if hypertension, unremitting headache, or signs of CNS toxicity develop.

- **CAUTIONS** Acute porphyrias p. 969 - cardiovascular disease - history of peptic ulcer (particularly in acromegalic patients) - history of serious mental disorders (especially psychotic disorders) - Raynaud’s syndrome

**CAUTIONS, FURTHER INFORMATION**

- Hyperprolactinemic patients In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).

- **INTERACTIONS** Appendix 1: dopamine receptor agonists

- **SIDE-EFFECTS**
  - **Common or very common** Constipation - headache - nasal congestion - nausea
  - **Uncommon** Confusion (particularly with high doses) - dizziness - dry mouth - fatigue - hallucinations (particularly with high doses) - postural hypotension - psychomotor excitation (particularly with high doses) - vomiting
  - **Rare** Abdominal pain - arrhythmia - bradycardia - diarrhea - gastric ulcer - gastro-intestinal bleeding - insomnia - paraesthesia - psychosis - tachycardia - tinnitus - visual disturbances
  - **Very rare** Neuroleptic malignant syndrome on withdrawal - vasospasm of fingers and toes (particularly in patients with Raynaud’s syndrome)
  - **Frequency not known** Allergic skin reactions - alopecia - cardiac valvulopathy - constrictive pericarditis - drowsiness - dyskinesia - hypersexuality - hyponatraemia - hypotension - increased libido - leg cramps - leukopenia - pathological gambling - pericardial effusion - peripheral oedema - pleural effusion - pleural effusion - pleuritis - pulmonary fibrosis - retroperitoneal fibrosis - reversible hearing loss - thrombocytopenia - urinary incontinence

**SIDE-EFFECTS, FURTHER INFORMATION**

- Gastro-intestinal bleeding Treatment should be withdrawn if gastro-intestinal bleeding occurs.

- **ALLERGY AND CROSS-SENSITIVITY** Bromocriptine should not be used in patients with hypersensitivity to ergot alkaloids.

- **CONCEPTION AND CONTRACEPTION** Caution — provide contraceptive advice if appropriate (oral contraceptives may increase prolactin concentration).

- **BREAST FEEDING** Suppresses lactation; avoid breast feeding for about 5 days if lactation prevention fails.

- **HEPATIC IMPAIRMENT** Dose reduction may be necessary.

- **MONITORING REQUIREMENTS**
  - Specialist evaluation — monitor for pituitary enlargement, particularly during pregnancy; monitor visual field to detect secondary field loss in macroprolactinoma.
  - Monitor for fibrotic disease.
  - Monitor blood pressure for a few days after starting treatment and following dosage increase.

- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

- **PATIENT AND CARER ADVICE**
  - **Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

  Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 10, 21**

- **Bromocriptine (Non-proprietary)**
  - Bromocriptine (as Bromocriptine mesilate) 1 mg Bromocriptine 1mg tablets | 100 tablet [Pos] £67.62 DT price = £67.62
  - Bromocriptine (as Bromocriptine mesilate) 2.5 mg Bromocriptine 2.5mg tablets | 30 tablet [Pos] £75.00 DT price = £74.54 | 100 tablet [Pos] no price available

**Capsule**

**CAUTIONARY AND ADVISORY LABELS 10, 21**

- **Parlodol** (Meda Pharmaceuticals Ltd)
  - Bromocriptine (as Bromocriptine mesilate) 5 mg Parlodol 5mg capsules | 100 capsule [Pos] £37.57 DT price = £37.57
  - Bromocriptine (as Bromocriptine mesilate) 10 mg Parlodol 10mg capsules | 100 capsule [Pos] £69.50 DT price = £69.50

---

**Cabergoline**

- **DRUG ACTION** Cabergoline is a stimulant of dopamine receptors in the brain and it also inhibits release of prolactin by the pituitary.

- **INDICATIONS AND DOSE**
  - **Prevention of lactation**
    - BY MOUTH
      - Adult: 1 mg, to be taken as a single dose on the first day postpartum
  - **Suppression of established lactation**
    - BY MOUTH
      - Adult: 250 micrograms every 12 hours for 2 days
  - **Hyperprolactinaemic disorders**
    - BY MOUTH
      - Adult: Initially 500 micrograms once weekly, dose may be taken as a single dose or as 2 divided doses on separate days, then increased in steps of 500 micrograms every month until optimal therapeutic response reached, increase dose following monthly monitoring of serum prolactin levels; usual dose 0.25 – 2 mg once weekly, usually 1 mg weekly; reduce initial dose and increase more gradually if patient intolerant, doses over 1 mg weekly to be given as divided dose; maximum 4.5 mg per week

**Alone or as adjunct to co-beneldopa or co-careldopa in Parkinson’s disease where dopamine-receptor agonists other than ergot derivative not appropriate**

- BY MOUTH
  - Adult: Initially 1 mg daily, then increased in steps of 0.5–1 mg every 7–14 days, concurrent dose of levodopa may be decreased gradually while dose of cabergoline is increased; maximum 3 mg per day

---

**Downloaded from www.medicalbr.com**
**FIBROTIC REACTIONS**
Cabergoline has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson’s disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

**IMPULSE CONTROL DISORDERS**
Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- **CONTRA-INDICATIONS** Avoid in pre-eclampsia · cardiac valvulopathy (exclude before treatment) · history of pericardial fibrotic disorders · history of puerperal psychosis · history of pulmonary fibrotic disorders · history of retroperitoneal fibrotic disorders
- **CAUTIONS** Acute porphrias p. 969 · cardiovascular disease · history of peptic ulcer (particularly in acromegalic patients) · history of serious mental disorders (especially psychotic disorders) · Raynaud’s syndrome

**INTERACTIONS** → Appendix 1: dopamine receptor agonists

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain · angina · breast pain · confusion · constipation · depression · dyspepsia · epigastric pain · gastritis · hallucinations · headache · nausea · syncope
- **Rare** Digital vasospasm · epistaxis · hot flushes · muscle weakness · palpitation · paraesthesia · transient hemianopia · vomiting
- **Frequency not known** Allergic skin reactions · alopecia · cardiac valvulopathy · constrictive pericarditis · drowsiness · dyskinesia · erythromelalgia · hypersexuality · hypotension · increased libido · leg cramps · pathological gambling · pericardial effusion · peripheral oedema · pleural effusion · pleural fibrosis · pleuritis · pulmonary fibrosis · retroperitoneal fibrosis

**SIDE-EFFECTS, FURTHER INFORMATION**
Gastro-intestinal bleeding. Treatment should be withdrawn if gastro-intestinal bleeding occurs.

**ALLERGY AND CROSS-SENSITIVITY** Cabergoline should not be used in patients with hypersensitivity to ergot alkaloids.

**CONCEPTION AND CONTRACEPTION**
Exclude pregnancy before starting and perform monthly pregnancy tests during the amenorrhoeic period. Caution—advise non-hormonal contraception if pregnancy not desired. Discontinue 1 month before intended conception (ovulatory cycles persist for 6 months).

- **PREGNANCY** Discontinue if pregnancy occurs during treatment (specialist advice needed).
- **BREAST FEEDING** Suppresses lactation; avoid breast-feeding if lactation prevention fails.
- **HEPATIC IMPAIRMENT** Reduce dose in severe hepatic impairment.
- **MONITORING REQUIREMENTS**
  - Monitor for fibrotic disease.
  - Monitor blood pressure for a few days after starting treatment and following dosage increase.

**TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

**PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

**PATIENT AND CARER ADVICE**

- **Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.
  - Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.
  - Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Pergolide**

- **INDICATIONS AND DOSE**
  - Monotherapy in Parkinson’s disease where dopamine-receptor agonists other than ergot derivative not appropriate
    - **BY MOUTH**
    - Adult: Initially 50 micrograms once daily for day 1, dose to be taken at bedtime, then 50 micrograms twice daily for days 2–4, then increased in steps of 100–250 micrograms daily, dose to be continued →
increased at intervals of 3–4 days, increased to 1.5 mg daily in 3 divided doses at day 28, then increased in steps of up to 250 micrograms every 3–4 days, this increase to be started after day 30; maintenance 2.1–2.5 mg daily; maximum 3 mg per day

Adjuvant therapy with co-beneldopa or co-careldopa in Parkinson’s disease where dopamine-receptor agonists other than ergot derivative not appropriate

- **BY MOUTH**
  - Adult: Initially 50 micrograms daily for 2 days, then increased in steps of 100–150 micrograms every 3 days, dose to be adjusted over next 12 days following initial dose and usually given in 3 divided doses, then increased in steps of 250 micrograms every 3 days, during pergolide titration, levodopa dose may be reduced cautiously; maximum 3 mg per day

**IMPORTANT SAFETY INFORMATION**

**FIBROTIC REACTIONS**
Pergolide has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions.

Exclude cardiac valvulopathy with echocardiography before starting treatment with pergolide; it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking pergolide should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

**IMPELLER CONTROL DISORDERS**
Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist or levodopa should be withdrawn or the dose reduced until the symptoms resolve.

- **CONTRA-INDICATIONS** Cardiac valvulopathy (exclude before treatment) - history of fibrotic disorders
- **CAUTIONS** Acute porphyrias p. 969 - arrhythmias - dyskinesia (may exacerbate) - hallucinations - history of confusion - psychosis - underlying cardiac disease
- **INTERACTIONS** → Appendix 1: dopamine receptor agonists
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** May suppress lactation.
- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.
- **PATIENT AND CARER ADVICE**
  - Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

- **Pergolide (Non-proprietary)**
  - Pergolide (as Pergolide mesilate) 50 microgram
    - Pergolide 50microgram tablets | 100 tablet | £32.01 DT price = £32.01
  - Pergolide (as Pergolide mesilate) 250 microgram
    - Pergolide 250microgram tablets | 100 tablet | £56.00–£58.00 DT price = £38.00
  - Pergolide (as Pergolide mesilate) 1 mg
    - Pergolide 1mg tablets | 100 tablet | £125.00–£135.00 DT price = £131.66

**Pramipexole**

**INDICATIONS AND DOSE**
Parkinson’s disease, used alone or as an adjunct to co-beneldopa or co-careldopa

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 88 micrograms 3 times a day, if tolerated dose to be increased by doubling dose every 5–7 days, increased to 350 micrograms 3 times a day, then increased in steps of 180 micrograms 3 times a day if required, dose to be increased at weekly intervals, during dose titration and maintenance, levodopa dose may be reduced, maximum daily dose to be given in 3 divided doses; maximum 3.3 mg per day

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: Initially 260 micrograms once daily, dose to be increased by doubling dose every 5–7 days, increased to 1.05 mg once daily, then increased in steps of 520 micrograms every week if required, during dose titration and maintenance, levodopa dose may be reduced according to response; maximum 3.15 mg per day

**Moderate to severe restless legs syndrome**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 88 micrograms once daily, dose to be taken 2–3 hours before bedtime, dose to be increased by doubling dose every 4–7 days if necessary, repeat dose titration if restarting treatment after an interval of more than a few days; maximum 540 micrograms per day

**DOSE EQUIVALENCE AND CONVERSION**

- Doses and strengths are stated in terms of pramipexole (base).
- Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for immediate-release preparations are as follows:
  - 88 micrograms base = 125 micrograms salt;
  - 180 micrograms base = 250 micrograms salt;
  - 350 micrograms base = 500 micrograms salt;
  - 700 micrograms base = 1 mg salt.
**IMPULSE CONTROL DISORDERS**

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

**CAUTIONS**

- Psychotic disorders - risk of visual disorders (ophthalmological testing recommended) - severe cardiovascular disease

**INTERACTIONS**

- Amnesia - binge eating - cardiac failure - compulsive behaviour - delusion - dysphoria - hiccups - paranoia - pneumonia - pruritus - rash - syncope

**SIDE-EFFECTS**

- Confusion - constipation - decreased appetite - dizziness - drowsiness - dyskinesia - hallucinations - headache - hyperkinesia - hypotension - nausea - peripheral oedema - postural hypotension - restlessness - sudden onset of sleep - visual disturbances - vomiting - weight changes

- Amnesia - binge eating - cardiac failure - compulsive behaviour - delusion - dysphoria - hiccups - paranoia - pneumonia - pruritus - rash - syncope

- Paroxysmal worsening of restless legs syndrome

**PREGNANCY**

Use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING**

May suppress lactation; avoid—present in milk in animal studies.

**RENAI IMPAIRMENT**

For immediate-release tablets in Parkinson’s disease, initially 88 micrograms twice daily (max. 1.57 mg daily in 2 divided doses) if eGFR 20–50 mL/minute/1.73 m²; initially 88 micrograms once daily (max. 1.1 mg once daily) if eGFR less than 20 mL/minute/1.73 m². If renal function declines during treatment, reduce dose by the same percentage as the decline in eGFR. For immediate-release tablets in restless legs syndrome, reduce dose if eGFR less than 20 mL/minute/1.73 m². For modified-release tablets, initially 260 micrograms on alternate days if eGFR 30–50 mL/minute/1.73 m², increased to 260 micrograms once daily after 1 week, further increased if necessary by 260 micrograms daily at weekly intervals to max. 1.57 mg daily. For modified-release tablets, avoid if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

Risk of postural hypotension (especially on initiation)—monitor blood pressure.

**TREATMENT CESSATION**

Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

**PATIENT AND CARER ADVICE**

**Sudden onset of sleep**

Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions**

Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

### Pramipexole

#### INDICATIONS AND DOSE

**Parkinson's disease, either used alone or as adjunct to co-beneldopa or co-careldopa**

- **By Mouth Using Immediate-Release Medicines**
  - **Adult:** Initially 750 micrograms daily in 3 divided doses, then increased in steps of 750 micrograms daily, dose to be increased at weekly intervals, increased to 3 mg daily in 3 divided doses, then increased in steps of 1.5–3 mg daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 9–16 mg daily in 3 divided doses, higher doses may be required if used with levodopa, when administered as adjunct to levodopa, concurrent dose of levodopa may be reduced by approx. 20%, daily maximum dose to be given in 3 divided doses; maximum 24 mg per day

- **By Mouth Using Modified-Release Medicines**
  - **Adult:** Initially 2 mg once daily for 1 week, then 4 mg once daily, increased in steps of 2 mg at intervals of at least 1 week, adjusted according to response, increased to up to 8 mg once daily, dose to be increased further if still no response; increased in steps of 2–4 mg at intervals of at least 2 weeks if required; maximum 24 mg per day

**Parkinson's disease in patients transferring from ropinirole immediate-release tablets**

- **By Mouth Using Modified-Release Medicines**
  - **Adult:** Initially ropinirole modified-release once daily substituted for total daily dose equivalent of ropinirole immediate-release tablets; if control not maintained after switching, titrate dose, consider slower titration in patients over 75 years, when administered as adjunct to levodopa, concurrent dose of levodopa may gradually be reduced by approx. 30%, if treatment interrupted for 1 day or more, consider re-initiation with immediate-release tablets

#### Moderate to Severe Restless Legs Syndrome

- **By Mouth Using Immediate-Release Medicines**
  - **Adult:** Initially 250 micrograms once daily for 2 days, increased if tolerated to 500 micrograms once daily for 5 days, then increased if tolerated to 1 mg once daily for 7 days, then increased in steps of 500 micrograms daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 2 mg once daily, doses to be taken at night, repeat dose titration if restarting after interval of more than a few days; maximum 4 mg per day

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose adjustment may be necessary if smoking started or stopped during treatment.

#### UNLICENSED USE

Doses in the BNF may differ from those in product literature.

---

**Ropinirole**

**INDICATIONS AND DOSE**

**Parkinson's disease, either used alone or as adjunct to co-beneldopa or co-careldopa**

- **By Mouth Using Immediate-Release Medicines**
  - **Adult:** Initially 750 micrograms daily in 3 divided doses, then increased in steps of 750 micrograms daily, dose to be increased at weekly intervals, increased to 3 mg daily in 3 divided doses, then increased in steps of 1.5–3 mg daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 9–16 mg daily in 3 divided doses, higher doses may be required if used with levodopa, when administered as adjunct to levodopa, concurrent dose of levodopa may be reduced by approx. 20%, daily maximum dose to be given in 3 divided doses; maximum 24 mg per day

**IMPORTANT SAFETY INFORMATION**

**IMPULSE CONTROL DISORDERS**

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.
Compulsive behaviour - treatment and care should be exercised when driving or operating machinery. These effects have stopped occurring.

Hypotensive reactions - Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

National Funding/Access Decisions

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2006) that Adartrel® should be restricted for use in patients with a baseline score of 24 points or more on the International Restless Legs Scale.

Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

Ropinirole (as Ropinirole hydrochloride) 8 mg tablets | 28 tablet (Pom) £35.79 DT price = £42.11

Rapiner XL (Actavis UK Ltd)

Ropinirole (as Ropinirole hydrochloride) 2 mg tablets | 28 tablet (Pom) £12.54 DT price = £15.24

Rotigotine

**INDICATIONS AND DOSE**

**MONIT ORING REQUIREMENTS**

- **BY TRANSDERMAL APPLICATION USING PATCHES**
  - Adult: Initially 2 mg/24 hours, then increased in steps of 2 mg/24 hours every week if required; maximum 8 mg/24 hours per day
  - Adjunctive therapy with co-beneldopa or co-careldopa in Parkinson’s disease
    - **BY TRANSDERMAL APPLICATION USING PATCHES**
      - Adult: Initially 4 mg/24 hours, then increased in steps of 2 mg/24 hours every week if required; maximum 16 mg/24 hours per day

**INTERACTIONS**

- Common or very common
  - confusion
  - hallucinations
  - hypotension
  - sleep disturbances
  - sudden onset of sleep
  - sweating

- Uncommon
  - agitation
  - delusions
  - depression
  - dizziness
  - dyskinesia
  - dyspnea
  - hallucinations
  - headache
  - hiccups
  - hypotension
  - palpitations
  - paresthesia
  - pruritus
  - psychosis
  - rash
  - restlessness
  - sedation
  - syncope
  - vomiting
  - weight changes

**SIDE-EFFECTS**

- Common or very common: Abnormal behaviour - abnormal thinking - aggression - application site reactions - confusion - constipation - dizziness - dry mouth - dyskinesia - dystonia - hallucinations - headache - hiccups - hypotension - malaise - nausea - palpitations - paranoid - peripheral oedema - postural hypotension - pruritus - psychosis - rash - sleep disturbances - sudden onset of sleep - sweating - syncope - vomiting - weight changes

- Uncommon: Abdominal pain - atrial fibrillation - erectile dysfunction - hypotension - impulse control disorders - visual disturbances

- Rare: Irritability - obsessive compulsive disorder - seizures - tachycardia

**INFORMATION AVAILABLE**

- **PATIENT AND CARER ADVICE**
  - Sudden onset of sleep: Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.
  - Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.
  - Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions**

- Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised that Neupro® is accepted for restricted use for the treatment of advanced Parkinson’s disease in combination with levodopa where the transdermal route would facilitate treatment (July 2007).

The Scottish Medicines Consortium has advised that Neupro® is accepted as monotherapy for the treatment of early-stage idiopathic Parkinson’s disease (June 2007).

The Scottish Medicines Consortium has advised (April 2009) that rotigotine (Neupro®) is accepted for restricted use within NHS Scotland for the symptomatic treatment of moderate to severe idiopathic restless legs syndrome in adults with a baseline score of 15 points or more on the International Restless Legs Scale.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Transdermal patch**

- Neupro (UCB Pharma Ltd)
  - Rotigotine 1 mg per 24 hour: Neupro 1mg/24hours transdermal patches | 28 patch [Pom] £77.24
  - Rotigotine 2 mg per 24 hour: Neupro 2mg/24hours transdermal patches | 7 patch [Pom] no price available | 28 patch [Pom] £81.10
  - Rotigotine 3 mg per 24 hour: Neupro 3mg/24hours transdermal patches | 28 patch [Pom] £102.35
  - Rotigotine 4 mg per 24 hour: Neupro 4mg/24hours transdermal patches | 7 patch [Pom] no price available | 28 patch [Pom] £123.60
  - Rotigotine 6 mg per 24 hour: Neupro 6mg/24hours transdermal patches | 7 patch [Pom] no price available | 28 patch [Pom] £149.93
  - Rotigotine 8 mg per 24 hour: Neupro 8mg/24hours transdermal patches | 7 patch [Pom] no price available | 28 patch [Pom] £149.93

**DOPAMINERGIC DRUGS** > **monoamine-oxidase B inhibitors**

**Rasagiline**

- **DRUG ACTION**
  - Rasagiline is a monoamine-oxidase B inhibitor.

- **INDICATIONS AND DOSE**
  - Parkinson’s disease, used alone or as adjunct to co-beneldopa or co-careldopa for ‘end-of-dose’ fluctuations
    - **BY MOUTH**
    - Adult: 1 mg daily

- **INTERACTIONS**
  - Appendix 1: monoamine-oxidase B inhibitors

**IMPORTANT SAFETY INFORMATION**

**IMPULSE CONTROL DISORDERS**

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- **CAUTIONS**
  - Avoid exposure of patch to heat - remove patch (aluminium-containing) before magnetic resonance imaging or cardioversion

- **INTERACTIONS**
  - Appendix 1: dopamine receptor agonists

- **SIDE-EFFECTS**
  - Common or very common: Abnormal behaviour - abnormal thinking - aggression - application site reactions - confusion - constipation - dizziness - dry mouth - dyskinesia - dyspnea - hallucinations - headache - hiccups - hypotension - malaise - nausea - palpitations - paranoia - peripheral oedema - postural hypotension - pruritus - psychosis - rash - sleep disturbances - sudden onset of sleep - sweating - syncope - vomiting - weight changes

- **UNCOMMON**
  - Abdominal pain - atrial fibrillation - erectile dysfunction - hypotension - impulse control disorders - visual disturbances

- **RARE**
  - Irritability - obsessive compulsive disorder - seizures - tachycardia

- **PREGNANCY**
  - Avoid—no information available.

- **BREAST FEEDING**
  - May suppress lactation; avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT**
  - Caution in severe impairment—no information available.

- **MONITORING REQUIREMENTS**
  - Ophthalmic testing recommended.

- **TREATMENT CESSATION**
  - Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

- **DIRECTIONS FOR ADMINISTRATION**
  - Apply patch to dry, non-irritated skin on torso, thigh, or upper arm, removing after 24 hours and siting replacement patch on a different area (avoid using the same area for 14 days).
Selegiline hydrochloride

**DRUG ACTION** Selegiline is a monoamine-oxidase-B inhibitor.

**INDICATIONS AND DOSE**

- **Parkinson’s disease**, as an adjunct to levodopa alone or in combination with other antiparkinsonian drugs, for mid-to late-stage fluctuations
  - **BY MOUTH**
  - Adult: 50 mg once daily, increased if necessary to 100 mg once daily

**CONTRA-INDICATIONS** Active retinopathy · albinism · family history of hereditary retinal disease · retinal degeneration · uveitis

**CAUTIONS** Hypertension (may raise blood pressure) · may exacerbate pre-existing dyskinesia (requiring levodopa dose reduction)

**INTERACTIONS** → Appendix 1: monoamine-oxidase B inhibitors

**SIDE-EFFECTS**

- **Common or very common** Abnormal dreams · angina · anorexia · arthralgia · conjunctivitis · constipation · depression · dry mouth · dyspepsia · flatulence · hallucinations · headache · influenza-like symptoms · leucopenia · rash · rhinitis · skin carcinoma · urinary urgency · vertigo · weight loss
- **Uncommon** Cerebrovascular accident · myocardial infarction

**PREGNANCY** Use with caution.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises max. daily dose should not exceed 50 mg daily in moderate impairment. Manufacturer advises caution in moderate impairment; avoid in severe impairment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Xadago (Profile Pharma Ltd)
  - **Safinamide (as Safinamide methanesulfonate) 50 mg** Xadago 50 mg tablets | 30 tablet (Profile) £69.00 DT price = £69.00
  - **Safinamide (as Safinamide methanesulfonate) 100 mg** Xadago 100 mg tablets | 30 tablet (Profile) £69.00 DT price = £69.00

---

**Safinamide**

31-May-2017

**DRUG ACTION** Safinamide is a monoamine-oxidase-B inhibitor.

**INDICATIONS AND DOSE**

- Parkinson’s disease, used alone or as adjunct to co-beneldopa or co-careldopa to reduce ‘end of dose’ deterioration | Symptomatic parkinsonism
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
    - Adult: Initially 5 mg once daily for 2–4 weeks, then increased if tolerated to 10 mg daily, dose to be taken in the morning
  - **BY MOUTH USING ORAL LYPHILISATE**
    - Adult: 1.25 mg once daily, dose to be taken before breakfast

**DOSE EQUIVALENCE AND CONVERSION**

- 1.25-mg oral lypihilisate is equivalent to 10-mg tablet.
- Patients receiving 10 mg conventional selegeline hydrochloride tablets can be switched to oral lypihilisates (Zelapar®) 1.25 mg.

**CONTRA-INDICATIONS** Active duodenal ulceration · active gastric ulceration · avoid or use with great caution in postural hypotension (when used in combination with levodopa)

**CAUTIONS** Angina · arrhythmias · avoid in acute porphyrias p. 969 · duodenal ulceration · gastric ulceration · history of hepatic dysfunction · patients predisposed to confusion and psychosis · psychosis · uncontrolled hypertension

**INTERACTIONS** → Appendix 1: monoamine-oxidase B inhibitors

**SIDE-EFFECTS**

- **Common or very common** Arthralgia · bradycardia · confusion · constipation · depression · diarrhoea · dizziness · dry mouth · fatigue · hair loss · headache · hypertension · hyponatraemia · impairepd balance · mouth ulcers · movement disorders · muscle cramps · myalgia · myopathy · nasal congestion · nausea · psychosis · sleeping disorders · stomatitis · sweating · tremor
- **Uncommon** Agitation · angina · ankle oedema · anxiety · arrhythmias · blurred vision · dyspnoea · leucocytopenia · loss of appetite · micturition difficulties · palpitation · postural hypotension · skin reactions · supraventricular tachycardia · thrombocytopenia

**Frequency not known** Hypersexuality

**SIDE-EFFECTS, FURTHER INFORMATION**

Side-effects of levodopa may be increased—concurrent levodopa dosage can be reduced by 10–30% in steps of 10% every 3–4 days.

**PREGNANCY** Avoid—no information available.

**BREAST FEEDING** Avoid—no information available.

**HEPATIC IMPAIRMENT** Use with caution in severe impairment.
Nausea and labyrinth disorders

Drug treatment

Antiemetics should be prescribed only when the cause of vomiting is known because otherwise they may delay diagnosis, particularly in children. Antiemetics are unnecessary and sometimes harmful when the cause can be treated, such as in diabetic ketoacidosis, or in digoxin p. 106 or antiepileptic overdose.

If antiemetic drug treatment is indicated, the drug is chosen according to the aetiology of vomiting. Antiemetics are effective against nausea and vomiting resulting from many underlying conditions. There is no evidence that any one antiemetic is superior to another but their duration of action and incidence of adverse effects (drowsiness and antiemetic effects) differ.

The phenothiazines are dopamine antagonists and act centrally by blocking the chemoreceptor trigger zone. They are of considerable value for the prophylaxis and treatment of nausea and vomiting associated with diffuse neoplastic disease, radiation sickness, and the emesis caused by drugs such as opioids, general anaesthetics, and cytotoxics. Prochlorperazine p. 371, perhexazine p. 370, and trimelaurazine p. 372 are less sedating than chlorpromazine hydrochloride p. 367; severe dystonic reactions sometimes occur with phenothiazines, especially in children. Some phenothiazines are available as rectal suppositories, which can be useful in patients with persistent vomiting or with severe nausea; prochlorperazine can also be administered as a buccal tablet which is placed between the upper lip and the gum.

Other antipsychotic drugs including haloperidol p. 368 and levomepromazine p. 419 are used for the relief of nausea and vomiting in terminal illness.

Metoclopramide hydrochloride p. 411 is an effective antiemetic and its activity closely resembles that of the phenothiazines. Metoclopramide hydrochloride also acts directly on the gastrointestinal tract and it may be superior to the phenothiazines for emesis associated with gastroduodenal, hepatic, and biliary disease.

Domperidone p. 410 acts at the chemoreceptor trigger zone; it is licensed only for the relief of nausea and vomiting. It has the advantage over metoclopramide hydrochloride and the phenothiazines of being less likely to cause central effects such as sedation and dystonic reactions because it does not readily cross the blood-brain barrier. In Parkinson’s disease, it can be used to treat nausea caused by dopaminergic drugs.

Granisetron p. 413 and ondansetron p. 414 are of value in the management of nausea and vomiting in patients receiving cytotoxics and in postoperative nausea and vomiting. Palonosetron p. 415 is licensed for prevention of nausea and vomiting associated with moderately or highly emetogenic cytotoxic chemotherapy. Palonosetron is also available in combination with netupitant, a neurokinin 1-receptor antagonist, for the prevention of acute and delayed nausea and vomiting associated with moderately emetogenic chemotherapy and highly emetogenic cisplatin-based chemotherapy.

Dexamethasone p. 635 has antiemetic effects and it is used in vomiting associated with cancer chemotherapy. It can be used alone or with metoclopramide hydrochloride, prochlorperazine, lorazepam p. 322, or a 5HT3-receptor antagonist.

Aprepitant p. 412 and fosaprepitant p. 413 are neurokinin 1-receptor antagonists licensed for the prevention of acute and delayed nausea and vomiting associated with cisplatin-based cytotoxic chemotherapy; they are given with dexamethasone and a 5HT3-receptor antagonist.

Nabilone p. 410 is a synthetic cannabinoid with antiemetic properties. It may be used for nausea and vomiting caused by cytotoxic chemotherapy that is unresponsive to conventional antiemetics.

Vomiting during pregnancy

Nausea in the first trimester of pregnancy is generally mild and does not require drug therapy. On rare occasions if vomiting is severe, short-term treatment with an antiemetic, such as promethazine, may be required. Prochlorperazine or metoclopramide hydrochloride are alternatives. If symptoms do not settle in 24 to 48 hours then specialist opinion should be sought. Hyperemesis gravidarum is a more serious condition, which requires regular antiemetic therapy, intravenous fluid and electrolyte replacement and sometimes nutritional support. Supplementation with thiamine p. 989 must be considered in order to reduce the risk of Wernicke’s encephalopathy.

Postoperative nausea and vomiting

The incidence of postoperative nausea and vomiting depends on many factors including the anaesthetic used, and the type and duration of surgery. Other risk factors include female sex, non-smokers, a history of postoperative nausea and vomiting or motion sickness, and intraoperative and postoperative use of opioids. Therapy to prevent postoperative nausea and vomiting should be based on the
assessed risk of postoperative nausea and vomiting in each patient. Drugs used include 5HT3-receptor antagonists, droperidol p. 418, dexamethasone, some phenothiazines (e.g. prochlorperazine), and antihistamines (e.g. cyclizine below). A combination of two or more antiemetic drugs that have different mechanisms of action is often indicated in those at high risk of postoperative nausea and vomiting or where postoperative vomiting presents a particular danger (e.g. in some types of surgery). When a prophylactic antiemetic drug has failed, postoperative nausea and vomiting should be treated with one or more drugs from a different class.

**Motion sickness**
Antiemetics should be given to prevent motion sickness rather than after nausea or vomiting develop. The most effective drug for the prevention of motion sickness is hyoscine hydrobromide p. 417. The sedating antihistamines are slightly less effective against motion sickness, but are generally better tolerated than hyoscine. If a sedative effect is desired promethazine is useful, but generally a slightly less sedating antihistamine such as cyclizine or cinnarizine p. 416 is preferred. Domperidone, metoclopramide hydrochloride, 5HT3-receptor antagonists, and the phenothiazines (except the antihistamine phenothiazine promethazine) are ineffective in motion sickness.

**Other vestibular disorders**
Management of vestibular diseases is aimed at treating the underlying cause as well as treating symptoms of the balance disturbance and associated nausea and vomiting. Vertigo and nausea associated with Ménière’s disease and middle-ear surgery can be difficult to treat. Betahistine dihydrochloride p. 419 is an analogue of histamine and is claimed to reduce endolymphatic pressure by improving the microcirculation. Betahistine dihydrochloride is licensed for vertigo, tinnitus, and hearing loss associated with Ménière’s disease.

A diuretic alone or combined with salt restriction may provide some benefit in vertigo associated with Ménière’s disease; antihistamines (such as cinnarizine), and phenothiazines (such as prochlorperazine) are also used. Where possible, prochlorperazine should be reserved for the treatment of acute symptoms.

**Cytotoxic chemotherapy, palliative care, and migraine**
Antiemetics have a role in the management of nausea and vomiting induced by cytotoxic chemotherapy, in palliative care, and associated with migraine.

**Nausea and vomiting associated with palliative care**

- **By Subcutaneous Infusion**
  - Adult: 150 mg, dose to be given over 24 hours
  - By Mouth
    - Adult: 50 mg up to 3 times a day

#### UNLICENSED USE

#### CONTRA-INDICATIONS

Avoid in acute porphyrias p. 969 (some antihistamines are thought to be safe)

#### CAUTIONS

Epilepsy · glaucoma (in children) · may counteract haemodynamic benefits of opioids · neuromuscular disorders· increased risk of transient paralysis with intravenous use · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · severe heart failure—may cause fall in cardiac output and associated increase in heart rate, mean arterial pressure and pulmonary wedge pressure · susceptibility to angle-closure glaucoma (in adults) · urinary retention

#### INTERACTIONS

Appendix 1: antihistamines (sedating)

#### SIDE-EFFECTS

**GENERAL SIDE-EFFECTS**

- **Common or very common** Drowsiness
- **Rare** Anaphylaxis · angioedema · angle-closure glaucoma · arrhythmias · blood disorders · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · liver dysfunction · palpitation · paradoxical stimulation (especially with high doses in children) · paradoxical stimulation (especially with high doses in the elderly) ·

---

Other drugs used for Nausea and labyrinth disorders

Paracetamol with metoclopramide, p. 451 · Promethazine hydrochloride, p. 275
photosensitivity reactions • rashes • sleep disturbances • tremor

- **Frequency not known** Antimuscarinic effects • blurred vision • dry mouth • gastro-intestinal disturbances • hallucinations • headache • hypertension • movement disorders • oculargia crisis • paraesthesia • psychomotor impairment • tachycardia • transient speech disorders • twitching • urinaiy retention

**SPECIFIC SIDE-EFFECTS**

- Rare
- With intravenous use Transient paralysis
- With subcutaneous use Local irritation

**SIDE-EFFECTS, FURTHER INFORMATION**

Children and the elderly are more susceptible to side-effects. Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- **PREGNANCY** Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitation, and tremor.

- **BREAST FEEDING** No information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.

- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth, tablets may be crushed. Mixing and compatibility for the use of syringe drivers in palliative care Cyclizine may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.

- **PATIENT AND CARER ADVICE**

  Driving and skilled tasks

  Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); effects of alcohol enhanced.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

**Tablet**

| CAUTIONARY AND ADVISORY LABELS | 2 |
| Cyclizine (Non-proprietary) |
| Cyclizine hydrochloride 50 mg | Cyclizine 50mg tablets | 30 tablet [D] £2.19–5.00 |
| Cyclizine lactate 50 mg per 1 ml | Cyclizine 50mg/1ml solution for injection ampoules | 5 ampoule [POM] £13.54 DT price = £7.29 |

**Solution for injection**

| Cyclizine (Non-proprietary) |
| Cyclizine lactate 50 mg per 1 ml | Cyclizine 50mg/1ml solution for injection ampoules | 5 ampoule [POM] £13.54 DT price = £13.54 |

**ANTIEMETICS AND ANTINAUSEANTS**

**CANNABINIODS**

**Nabilone**

- **INDICATIONS AND DOSE**

  Nausea and vomiting caused by cytotoxic chemotherapy, unresponsive to conventional antiemetics (preferably in hospital setting) (under close medical supervision)

  - **BY MOUTH**

    Adult: Initially 1 mg twice daily, increased if necessary to 2 mg twice daily throughout each cycle of cytotoxic therapy and, if necessary, for 48 hours after the last dose of each cycle, the first dose should be taken the night before initiation of cytotoxic treatment and the second dose 1–3 hours before the first dose of cytotoxic drug, daily dose maximum should be given in 3 divided doses; maximum 6 mg per day.

- **CAUTIONS** Adverse effects on mental state can persist for 48–72 hours after stopping. Elderly, heart disease, history of psychiatric disorder • Hypertension

- **INTERACTIONS** → Appendix 1: nabilone

- **SIDE-EFFECTS**

  - **Common or very common** Ataxia • concentration difficulties • drowsiness • dry mouth • dysphoria • euphoria • headache • hypotension • nausea • sleep disturbance • vertigo • visual disturbance

  - **Frequency not known** Abdominal pain • confusion • decreased appetite • decreased coordination • depression • disorientation • hallucinations • psychosis • tachycardia • tremors

**SIDE-EFFECTS, FURTHER INFORMATION**

Drowsiness and dizziness occur frequently with standard doses.

- **PREGNANCY** Avoid unless essential.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

- **PATIENT AND CARER ADVICE**

  Driving and skilled tasks

  Drowsiness may affect performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

  For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including nabilone, see Drugs and driving under Guidance on prescribing p. 1. Behavioural effects Patients should be made aware of possible changes of mood and other adverse behavioural effects.

**MEDICINAL FORMS**

Nausea and labyrinth disorders 411

**DOMPERIDONE** 22

**INDICATIONS AND DOSE** Symptomatic treatment of nausea and vomiting including that associated with acute migraine | Delayed (but not acute) chemotherapy-induced nausea and vomiting | Radiotherapy-induced nausea and vomiting | Prevention of postoperative nausea and vomiting

- **BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
- **Adult** (body-weight up to 60 kg): Up to 500 micrograms/kg daily in 3 divided doses, when administered by slow intravenous injection, to be given over at least 3 minutes
- **Adult** (body-weight 60 kg and above): 10 mg up to 3 times a day, when administered by slow intravenous injection, to be given over at least 3 minutes

**Hiccup in palliative care**

- **BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
- **Adult**: 10 mg every 6–8 hours

**Nausea and vomiting in palliative care**

- **BY MOUTH**
- **Adult**: 10 mg 3 times a day
- **BY SUBCUTANEOUS INFUSION**
- **Adult**: 30–100 mg/24 hours

**PATIENT AND CARER ADVICE**

Arrhythmia Patients and their carers should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop.

Medicines for Children leaflet: Domperidone for gastro-oesophageal reflux www.medicinesforchildren.org.uk/domperidone-for-gastro-oesophageal-reflux

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE—DOMPERIDONE: RISK OF CARDIAC SIDE-EFFECTS—RESTRICTED INDICATION, NEW CONTRA-INDICATIONS, REDUCED DOSE AND DURATION OF USE**

The benefits and risks of domperidone have been reviewed. As domperidone is associated with a small increased risk of serious cardiac side-effects, the following restrictions to indication, dose and duration of treatment have been made, and new contra-indications added:

- Domperidone should only be used for the relief of the symptoms of nausea and vomiting;
- Domperidone should be used at the lowest effective dose for the shortest possible duration (max. treatment duration should not normally exceed 1 week);
- Domperidone is contra-indicated for use in conditions where cardiac conduction is, or could be, impaired, or where there is underlying cardiac disease, when administered concomitantly with drugs that prolong the QT interval or potent CYP3A4 inhibitors, and in severe hepatic impairment;
- The recommended dose in adults and adolescents over 12 years and over 35 kg is 10 mg up to 3 times daily;
- The recommended dose in children under 35 kg is 250 micrograms/kg up to 3 times daily;
- Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy.

This advice does not apply to unlicensed uses of domperidone (e.g. palliative care).

**CONTRA-INDICATIONS** Cardiac disease - conditions where cardiac conduction is, or could be, impaired (in adults) - gastrointestinal haemorrhage (in children) - if increased gastrointestinal motility harmful (in adults) - mechanical obstruction (in children) - mechanical perforation (in children) - predisposition to cardiac conduction disorders (in children) - prolactinoma

**CAUTIONS** Children - if there are cardiac concerns, obtain ECG before and during treatment (in children) - patients over 60 years—increased risk of ventricular arrhythmias

**INTERACTIONS** → Appendix 1: domperidone

**SIDE-EFFECTS**

- **Common or very common** Drowsiness - dry mouth - malaise
- **Uncommon** Anxiety - breast pain - decreased libido - diarrhoea - galactorrhoea - headache - pruritus - rash
- **Frequency not known** Agitation - amnorrhoea - convulsions - extrapyramidal disorders - gynaecomastia - nervousness - oculogyric crisis - QT-interval prolongation - sudden cardiac death - urinary retention - ventricular arrhythmias

**PREGNANCY** Use only if potential benefit outweighs risk.

**BREAST FEEDING** Amount too small to be harmful.

**HEPATIC IMPAIRMENT** Avoid in moderate or severe impairment.

**RENAL IMPAIRMENT** Reduce frequency.

**PRESCRIBING AND DISPENSING INFORMATION**

**Palliative care** For further information on the use of domperidone in palliative care, see www.palliativefeeds.com/formulary/en/domperidone.html.
vomiting, radiotherapy-induced nausea and vomiting, delayed (but not acute) chemotherapy-induced nausea and vomiting, and symptomatic treatment of nausea and vomiting, including that associated with acute migraine (where it may also be used to improve absorption of oral analgesics);

- Metoclopramide should only be prescribed for short-term use (up to 5 days);
- Usual dose is 10 mg, repeated up to 3 times daily; max. daily dose is 500 micrograms/kg;
- Intravenous doses should be administered as a slow bolus over at least 3 minutes;
- Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy.

This advice does not apply to unlicensed uses of metoclopramide (e.g. palliative care).

- CONTRA-INDICATIONS 3–4 days after gastrointestinal surgery – gastro-intestinal haemorrhage – gastro-intestinal obstruction – gastro-intestinal perforation – phaeochromocytoma
- CAUTIONS Asthma – atopic allergy – bradycardia – cardiac conduction disturbances – children – elderly – epilepsy – may mask underlying disorders such as cerebral irritation – Parkinson’s disease – uncorrected electrolyte imbalance – young adults (15–19 years old)
- INTERACTIONS ➔ Appendix 1: metoclopramide
- SIDE-EFFECTS

GENERAL SIDE-EFFECTS
- Common or very common Extrapyramidal effects (especially in children and young adults (15–19 years old)) – galactorrhoea – gynaecomastia – hyperprolactinaemia – menstrual changes
- Very rare Depression – methaemoglobinaemia (more severe in G6PD deficiency) – neuroleptic malignant syndrome

SPECIFIC SIDE-EFFECTS
- Very rare
  - With intravenous use Cardiac conduction abnormalities

SIDE-EFFECTS, FURTHER INFORMATION
Metoclopramide can induce acute dystonic reactions involving facial and skeletal muscle spasms and oculogyric crises. These dystonic effects are more common in the young (especially girls and young women) and the very old; they usually occur shortly after starting treatment with metoclopramide and subside within 24 hours of stopping it. Injection of an antiparkinsonian drug such as procyclidine will abort dystonic attacks.

- PREGNANCY Not known to be harmful.
- BREAST FEEDING Small amount present in milk; avoid.
- HEPATIC IMPAIRMENT Reduce dose.
- RENAL IMPAIRMENT Avoid or use small dose in severe impairment; increased risk of extrapyramidal reactions.
- DIRECTIONS FOR ADMINISTRATION Oral liquid preparation to be given via a graduated oral dosing syringe.
- PRESCRIBING AND DISPENSING INFORMATION
Palliative care
For further information on the use of metoclopramide hydrochloride in palliative care, see www.palliativedrugs.com/formulary/en/metoclopramide.html.
- PATIENT AND CARER ADVICE Counselling on use of pipette advised with oral solution.

- MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Solution for injection
- Metoclopramide hydrochloride (Non-proprietary)
  - Metoclopramide hydrochloride 5 mg per 1 ml Metoclopramide 10mg/2ml solution for injection ampoules | 5 ampoule (£) £1.31 | 10 ampoule (£) £3.30
  - Maxolon (AMCo)
  - Metoclopramide hydrochloride 5 mg per 1 ml Maxolon 10mg/2ml solution for injection ampoules | 12 ampoule (£) £3.21 Maxolon High Dose 100mg/20ml solution for injection ampoules | 10 ampoule (£) £26.68

Oral solution
- Metoclopramide hydrochloride (Non-proprietary)
  - Metoclopramide hydrochloride 1 mg per 1 ml Metoclopramide 5mg/5ml oral solution sugar free sugar-free | 150 ml (£) £19.77 DT price = £19.77

Tablet
- Metoclopramide hydrochloride (Non-proprietary)
  - Metoclopramide hydrochloride 10 mg Metoclopramide 10mg tablets | 28 tablet (£) £1.40 DT price = £0.72
  - Maxolon (AMCo)
  - Metoclopramide hydrochloride 10 mg Maxolon 10mg tablets | 84 tablet (£) £5.24

Combinations available: Paracetamol with metoclopramide, p. 451

ANTIEMETICS AND ANTINAUSEANTS ➔ NEUROKININ RECEPTOR ANTAGONISTS

Aprepitant

- INDICATIONS AND DOSE
Adjunct to dexamethasone and a 5HT3-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy
  ➔ BY MOUTH
  - Adult: Initially 125 mg, dose to be taken 1 hour before chemotherapy, then 80 mg once daily for 2 days, consult product literature for dose of concomitant corticosteroid and 5HT3-antagonist

- CONTRA-INDICATIONS Acute porphyrias p. 969
- INTERACTIONS ➔ Appendix 1: aprepitant
- SIDE-EFFECTS
  - Common or very common Anorexia – asthenia – constipation – diarrhoea – dizziness – dyspepsia – headache – hiccups
  - Frequency not known Dysarthria – dysphonia – insomnia – Stevens-Johnson syndrome – urticaria – visual disturbances

- CONCEPTION AND CONCEPTION
Effectiveness of hormonal contraceptives reduced—effective non-hormonal methods of contraception necessary during treatment and for 2 months after stopping aprepitant.
- PREGNANCY Avoid unless potential benefit outweighs risk—no information available.
- BREAST FEEDING Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Caution in moderate to severe impairment.
**ANTIEMETICS AND ANTINAUSEANTS**

**SEROTONIN (5HT3) RECEPTOR ANTAGONISTS**

**Granisetron**

- **DRUG ACTION** Granisetron is a specific 5HT3-receptor antagonist which blocks 5HT3 receptors in the gastrointestinal tract and in the CNS.

- **INDICATIONS AND DOSE**
  - Nausea and vomiting induced by cytotoxic chemotherapy for planned duration of 3–5 days where oral antiemetics cannot be used
  - **BY TRANSDERMAL APPLICATION USING PATCHES**
    - Adult: Apply 3.1 mg/24 hours, apply patch to clean, dry, non-irritated, non-hairy skin on upper arm (or abdomen if upper arm cannot be used) 24–48 hours before treatment, patch may be worn for up to 7 days; remove at least 24 hours after completing chemotherapy
  - Prevention of postoperative nausea and vomiting
    - **BY INTRAVENOUS INJECTION**
      - Adult: 1 mg, to be administered before induction of anaesthesia, dose to be diluted to 5 mL and given over 30 seconds
    - Treatment of postoperative nausea and vomiting
      - **BY INTRAVENOUS INJECTION**
        - Adult: 1 mg, dose to be diluted to 5 mL and given over 30 seconds; maximum 3 mg per day
    - Management of nausea and vomiting induced by cytotoxic chemotherapy or radiotherapy
      - **BY MOUTH**
        - Adult: 1–2 mg, to be taken within 1 hour before start of treatment, then 2 mg daily in 1–2 divided doses for up to 1 week following treatment, when intravenous route was also used, maximum combined total dose 9 mg in 24 hours
      - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
        - Adult: 10–40 micrograms/kg (max. per dose 3 mg), to be given 5 minutes before start of treatment, dose may be repeated if necessary, further maintenance doses must not be given less than 10 minutes apart, for intravenous injection, each 1 mg granisetron diluted to 5 mL and given over not less than 30 seconds, for intravenous infusion, to be given over 5 minutes; maximum 9 mg per day

- **CAUTIONS** Subacute intestinal obstruction - susceptibility to QT-interval prolongation (including electrolyte disturbances)

- **INTERACTIONS**
  - **Appendix 1: granisetron**

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - **Common or very common** Constipation - diarrhoea - headache - insomnia
    - **Uncommon** Extrapyramidal reactions - QT-interval prolongation - rash

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) Decisions**
    - The Scottish Medicines Consortium has advised (January 2011) that fosaprepitant (Ivemend®) is accepted for restricted use within NHS Scotland for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based chemotherapy.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder for solution for infusion**
    - **Ivemend** (Merck Sharp & Dohme Ltd)
      - Fosaprepitant (as Fosaprepitant dimeglumine) 150 mg
      - Ivemend 150mg powder for solution for infusion vials | 1 vial [PDM] £47.42

---

**Fosaprepitant**

- **DRUG ACTION** Fosaprepitant is a prodrug of aprepitant.

- **INDICATIONS AND DOSE**
  - Adjunct to dexamethasone and a 5HT3-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy
  - **BY INTRAVENOUS INFUSION**
    - Adult: 150 mg, dose to be administered over 20–30 minutes and given 30 minutes before chemotherapy on day 1 of cycle only, consult product literature for dose of concomitant corticosteroid and 5HT3-receptor antagonist

- **CONTRA-INDICATIONS** Acute porphyrias p. 969

- **INTERACTIONS**
  - **Appendix 1: fosaprepitant**

- **SIDE-EFFECTS**
  - **Common or very common** Anorexia - asthenia - constipation - diarrhoea - dizziness - dyspepsia - headache - hiccups

- **Frequency not known** Dysarthria - dysphonia - insomnia - Stevens-Johnson syndrome - urticaria - visual disturbances

- **CONCEPTION AND CONCEPTION** Effectiveness of hormonal contraceptives reduced—effective non-hormonal methods of contraception necessary during treatment and for 2 months after stopping fosaprepitant.

- **PREGNANCY** Avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Caution in moderate to severe impairment.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Ivemend®), give intermittently in Sodium chloride 0.9%; reconstitute each 150-mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 145 mL infusion fluid; give over 20–30 minutes.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) Decisions**
    - The Scottish Medicines Consortium has advised (January 2011) that fosaprepitant (Ivemend®) is accepted for restricted use within NHS Scotland for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based chemotherapy.

  - Granisetron 3.1 mg per 24 hour Sancuso 3.1mg/24hours transdermal patches | 1 patch (PO) £56.00

---

**Ondansetron**

**DRUG ACTION**

Ondansetron is a specific 5HT3-receptor antagonist which blocks 5HT3 receptors in the gastrointestinal tract and in the CNS.

**INDICATIONS AND DOSE**

- **Moderately emetogenic chemotherapy or radiotherapy**
  - **BY MOUTH**
    - Adult: Initially 8 mg, dose to be taken 1–2 hours before treatment, then 8 mg every 12 hours for up to 5 days
  - **BY RECTUM**
    - Adult: Initially 16 mg, dose to be taken 1–2 hours before treatment, then 16 mg daily for up to 5 days
  - **INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
    - Adult: Initially 8 mg, dose to be administered immediately before treatment, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
  - **INITIALLY BY INTRAVENOUS INFUSION**
    - Elderly: Initially 8 mg, dose to be administered immediately before treatment, intravenous infusion to be given over at least 15 minutes, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days
  - **Severely emetogenic chemotherapy (consult product literature for dose of concomitant corticosteroid)**
    - **BY MOUTH**
      - Adult: 24 mg, dose to be taken 1–2 hours before treatment, then 8 mg every 12 hours for up to 5 days
    - **BY RECTUM**
      - Adult: 16 mg, dose to be administered 1–2 hours before treatment, then 16 mg daily for up to 5 days
    - **INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
      - Adult: Initially 8 mg, dose to be administered immediately before treatment, followed by (by intramuscular injection or by slow intravenous injection) 8 mg every 4 hours if required for 2 doses, alternatively, followed by (by continuous intravenous infusion) 1 mg/hour for up to 24 hours, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

**CONTRA-INDICATIONS**

- Congenital long QT syndrome

**CAUTIONS**

- Adenotonsillar surgery - subacute intestinal obstruction - susceptibility to QT-interval prolongation (including electrolyte disturbances)

**INTERACTIONS**

- Appendix 1: ondansetron

**SIDE-EFFECTS**

- **GENERAL SIDE-EFFECTS**
  - **Common or very common**
    - Constipation - flushing - headache - injection site-reactions
  - **Uncommon**
    - Arrhythmias - bradycardia - chest pain - hiccups - hypotension - movement disorders - seizures
  - **SPECIFIC SIDE-EFFECTS**
    - Rare
      - With intravenous use
        - Dizziness - transient visual disturbances
      - With intravenous use
        - Transient blindness
      - Frequency not known
        - With rectal use
      - Rectal irritation
  - **PREGNANCY**
    - No information available; avoid unless potential benefit outweighs risk.
  - **BREAST FEEDING**
    - Present in milk in animal studies—avoid.
  - **HEPATIC IMPAIRMENT**
    - Maximum 8 mg daily in moderate or severe impairment.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use
  - For intravenous infusion (Zofran®), give continuously or intermittently in glucose 5% or glucose 5% with potassium chloride 0.3% or sodium chloride 0.9% or sodium chloride 0.9% with potassium chloride 0.3% or
With oral use Orodispersible films and lyophilisates should be placed on the tongue, allowed to disperse and swallowed.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer orodispersible films and lyophilisates.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **Ondansetron (Non-proprietary)**

Palonosetron with netupitant 20-Jun-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, palonosetron p. 415.

● **INDICATIONS AND DOSE**
  
  Moderately emetogenic chemotherapy | Highly emetogenic cisplatin-based chemotherapy
  
  ▶ By mouth
  
  ▶ Adult: 1 capsule, to be taken approximately 1 hour before the start of each chemotherapy cycle

● **CAUTIONS**
  
  Patients over 75 years

● **INTERACTIONS**
  
  → Appendix 1: netupitant, palonosetron

● **SIDE-EFFECTS**
  
  ▶ Common or very common Fatigue
  
  ▶ Uncommon Alopecia, blood disorders, cardiomyopathy, conduction disorder, decreased appetite, urticaria, vertigo
  
  ▶ Rare Back pain, blurred vision, conjunctivitis, cystitis, dysphagia, hypoaesthesia, hypokalaemia, non-cardiac chest pain, psychosis (acute), sleep disorder

● **CONCEPTION AND CONTRACEPTION**
  
  Manufacturer recommends exclude pregnancy before treatment in females of childbearing age; ensure effective contraception during treatment and for one month after treatment.

● **PREGNANCY**
  
  Manufacturer advises avoid—毒性 in animal studies.

● **BREAST FEEDING**
  
  Manufacturer advises avoid during treatment and for one month after last dose—no information available.

● **HEPATIC IMPAIRMENT**
  
  Manufacturer advises caution in severe impairment.

● **NATIONAL FUNDING/ACCESS DECISIONS**
  
  Scottish Medicines Consortium (SMC) Decisions
  
  The Scottish Medicines Consortium (December 2015) has advised that palonosetron in combination with netupitant (Akynzeo®) is accepted for restricted use within NHS Scotland for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based cancer chemotherapy.

● **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**
  
  CAUTIONARY AND ADVISORY LABELS 25

**ANTIHISTAMINES** ➔ **SEDATING ANTIHISTAMINES**

Cinnarizine

● **INDICATIONS AND DOSE**
  
  Relief of symptoms of vestibular disorders, such as vertigo, tinnitus, nausea, and vomiting in Ménière’s disease
  
  ▶ By mouth
  
  ▶ Child 5–11 years: 15 mg 3 times a day
  
  ▶ Child 12–17 years: 30 mg 3 times a day
  
  ▶ Adult: 30 mg 3 times a day

  **Motion sickness**
  
  ▶ By mouth
  
  ▶ Child 5–11 years: Initially 15 mg, dose to be taken 2 hours before travel, then 7.5 mg every 8 hours if required, dose to be taken during journey

  ▶ Child 12–17 years: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey

  ▶ Adult: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey

  ▶ **CONTRA-INDICATIONS**
    
    Avoid in acute porphyrias p. 969 (some antihistamines are thought to be safe)

  ▶ **CAUTIONS**
    
    Epilepsy, glaucoma (in children), Parkinson’s disease (in adults), prostatic hypertrophy (in adults), pyloroduodenal obstruction, susceptibility to angle-closure glaucoma (in adults), urinary retention

  ▶ **INTERACTIONS**
    
    → Appendix 1: antihistamines (sedating)

  ▶ **SIDE-EFFECTS**
    
    ▶ Common or very common Drowsiness
    
    ▶ Rare Anaphylaxis, angioedema, angle-closure glaucoma, arrhythmias, blood disorders, bronchospasm, confusion, convulsions, depression, dizziness, extrapyramidal effects, hypersensitivity reactions, hypotension, lichen planus, liver dysfunction, lupus-like skin reactions, palpitation, paradoxic stimulation (especially with high doses in children) in children, paradoxic stimulation (especially with high doses in the elderly) in adults, photosensitivity reactions, rashes, sleep disturbances, sweating, tremor, weight gain

    ▶ **Frequency not known**
      
      Antimuscarinic effects, blurred vision, dry mouth, gastrointestinal disturbances, headache, psychomotor impairment, urinary retention

  **SIDE-EFFECTS, FURTHER INFORMATION**
  
  Children and the elderly are more susceptible to side-effects. Drowsiness is a significant side-effect with most of the older antihistamines although paradoxic stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

  ▶ **PREGNANCY**
    
    Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxic excitability, and tremor.

  ▶ **BREAST FEEDING**
    
    Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

  ▶ **HEPATIC IMPAIRMENT**
    
    Avoid in severe liver disease—increased risk of coma.

  ▶ **RENAL IMPAIRMENT**
    
    Use with caution—no information available.

  ▶ **PATIENT AND CARER ADVICE**
    
    Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); sedating effects enhanced by alcohol.

  **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  **Tablet**

ANTIMUSCARINICS

Hyoscine hydrobromide

(Scopolamine hydrobromide)

- **INDICATIONS AND DOSE**
  - **Motion sickness**
    - **BY MOUTH**
      - Child 4–9 years: 75–150 micrograms, dose to be taken up to 30 minutes before the start of journey, then 75–150 micrograms every 6 hours if required; maximum 450 micrograms per day
      - Child 10–17 years: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day
      - Adult: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day
    - **BY TRANSDERMAL APPLICATION**
      - Child 10–17 years: Apply 1 patch, apply behind ear 5–6 hours before journey, then apply **continued →**
1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear
- Adult: Apply 1 patch, apply behind ear 5–6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear

**Hypersalivation associated with clozapine therapy**
- **BY MOUTH**
- Adult: 300 micrograms up to 3 times a day; maximum 900 micrograms per day

**Excessive respiratory secretion (in palliative care)**
- **BY SUBCUTANEOUS INJECTION**
- Adult: 400 micrograms every 4 hours as required, hourly use is occasionally necessary, particularly in excessive respiratory secretions
- **BY CONTINUOUS SUBCUTANEOUS INFUSION**
- Adult: 1.2–2 mg/24 hours

**Bowel colic in palliative care**
- **BY SUBCUTANEOUS INJECTION**
- Adult: 400 micrograms every 4 hours as required, hourly use is occasionally necessary
- **BY SUBCUTANEOUS INFUSION**
- Adult: 1.2–2 mg/24 hours

**Bowel colic pain in palliative care**
- **BY MOUTH USING SUBLINGUAL TABLETS**
- Adult: 300 micrograms 3 times a day, as Kwells®.

**Premedication**
- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
- Adult: 200–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia

**Drug Action**
- **Droperidol**
  - **DRUG ACTION** Droperidol is a butyrophenone, structurally related to haloperidol, which blocks dopamine receptors in the chemoreceptor trigger zone.

**Indications and Dose**
- **Prevention and treatment of postoperative nausea and vomiting**
  - **BY INTRAVENOUS INJECTION**
    - Adult: 0.625–1.25 mg, dose to be given 30 minutes before end of surgery, then 0.625–1.25 mg every 6 hours as required
    - Elderly: 625 micrograms, dose to be given 30 minutes before end of surgery, then 625 micrograms every 6 hours as required

**Prevention of nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia (PCA)**
- **BY INTRAVENOUS INJECTION**
  - Adult: 15–50 micrograms of droperidol for every 1 mg of morphine in PCA, reduce dose in elderly; maximum 5 mg per day
## Levomepromazine

*(Methotrimeprazine)*

### INDICATIONS AND DOSE

- **Pain in palliative care (reserved for distressed patients with severe pain unresponsive to other measures)**
  - By continuous subcutaneous infusion, or by intramuscular injection, or by intravenous injection
  - Adult: Seek specialist advice

- **Restlessness and confusion in palliative care**
  - By continuous subcutaneous infusion
  - Child 1-11 years: 0.35–3 mg/kg, to be administered over 24 hours
  - Child 12-17 years: 12.5–200 mg, to be administered over 24 hours
  - By mouth
  - Adult: 6 mg every 2 hours as required
  - By subcutaneous injection
  - Adult: 6.25 mg every 2 hours as required
  - By subcutaneous infusion
  - Adult: Initially 12.5–50 mg/24 hours, titrated according to response (doses greater than 100 mg/24 hours should be given under specialist supervision)

- **Nausea and vomiting in palliative care**
  - By continuous intravenous infusion, or by subcutaneous infusion
  - Child 1 month–11 years: 100–400 micrograms/kg, to be administered over 24 hours
  - Child 12–17 years: 5–25 mg, to be administered over 24 hours
  - By mouth
  - Adult: 6 mg once daily, dose to be taken at bedtime, increased if necessary to 12.5–25 mg twice daily

### Medicinal Forms

| Formulation | Strength | Price
|-------------|----------|--------|
| Xomolix | 10 ampoules | £39.40
| Levomepromazine hydrochloride | 25 mg/ml solution for injection ampoules | £20.13
| Nozinan | 200 mg tablets | £20.26
| Levomepromazine maleate | 25 mg | £20.26

### CONTRA-INDICATIONS

- CNS depression
- Coma
- Hypophysial infarction
- Hypomagnesaemia
- Phaeochromocytoma
- QT-interval prolongation

### CAUTIONS

- Patients receiving large initial doses should remain supine

### PRESCRIBING AND DISPENSING INFORMATION

Pain

Analgesics

Drugs used for pain

The non-opioid drugs, paracetamol p. 422 and aspirin p. 117 (and other NSAIDs), are particularly suitable for pain in musculoskeletal conditions, whereas the opioid analgesics are more suitable for moderate to severe pain, particularly of visceral origin.

Pain in sickle-cell disease

The pain of mild sickle-cell crises is managed with paracetamol, a NSAID, codeine phosphate p. 431, or dihydrocodeine tartrate p. 434. Severe crises may require the use of morphine p. 439 or diamorphine hydrochloride p. 433; concomitant use of a NSAID may potentiate analgesia and allow lower doses of the opioid to be used. Pethidine hydrochloride p. 445 should be avoided if possible because accumulation of a neurotoxic metabolite can precipitate seizures; the relatively short half-life of pethidine hydrochloride necessitates frequent injections.

Dental and orofacial pain

Analgesics should be used judiciously in dental care as a temporary measure until the cause of the pain has been dealt with.

Dental pain of inflammatory origin, such as that associated with pulpitis, apical infection, localised osteitis or pericoronitis is usually best managed by treating the infection, providing drainage, restorative procedures, and other local measures. Analgesics provide temporary relief of pain (usually for about 1 to 7 days) until the causative factors have been brought under control. In the case of pulpitis, intra-osseous infection or abscess, reliance on analgesics alone is usually inappropriate.

Similarly the pain and discomfort associated with acute problems of the oral mucosa (e.g. acute herpetic gingivostomatitis, erythema multiforme) may be relieved by benzylamine hydrochloride mouthwash or spray p. 1112 until the cause of the mucosal disorder has been dealt with. However, where a patient is febrile, the antipyretic action of paracetamol or ibuprofen p. 1041 is often helpful.

The choice of an analgesic for dental purposes should be based on its suitability for the patient. Most dental pain is relieved effectively by non-steroidal anti-inflammatory drugs (NSAIDs). NSAIDs that are used for dental pain include ibuprofen, diclofenac sodium p. 1034, and aspirin. Paracetamol has analgesic and antipyretic effects but no anti-inflammatory effect.

Opioid analgesics such as dihydrocodeine tartrate act on the central nervous system and are traditionally used for moderate to severe pain. However, opioid analgesics are relatively ineffective in dental pain and their side-effects can be unpleasant. Paracetamol, ibuprofen, or aspirin are adequate for most cases of dental pain and an opioid is rarely required.

Combining a non-opioid with an opioid analgesic can provide greater relief of pain than either analgesic given alone. However, this applies only when an adequate dose of each analgesic is used. Most combination analgesic preparations have not been shown to provide greater relief of pain than an adequate dose of the non-opioid component given alone. Moreover, combination preparations have the disadvantage of an increased number of side-effects.

Any analgesic given before a dental procedure should have a low risk of increasing postoperative bleeding. In the case of pain after the dental procedure, taking an analgesic before the effect of the local anaesthetic has worn off can improve control. Postoperative analgesia with ibuprofen or aspirin is usually continued for about 24 to 72 hours.

Temporomandibular dysfunction can be related to anxiety in some patients who may clench or grind their teeth (bruxism) during the day or night. The muscle spasm (which appears to be the main source of pain) may be treated empirically with an overlay appliance which provides a free sliding occlusion and may also interfere with grinding. In addition, diazepam p. 327, which has muscle relaxant as well as anxiolytic properties, may be helpful but it should only be prescribed on a short-term basis during the acute phase. Analgesics such as aspirin or ibuprofen may also be required.

Dysmenorrhoea

Use of an oral contraceptive prevents the pain of dysmenorrhoea which is generally associated with ovulatory cycles. If treatment is necessary paracetamol or a NSAID will generally provide adequate relief of pain. The vomiting and severe pain associated with dysmenorrhoea in women with endometriosis may call for an antiemetic (in addition to an analgesic). Antispasmodics (such as alverine citrate p. 84) have been advocated for dysmenorrhoea but the antispasmodic action does not generally provide significant relief.

Non-opioid analgesics and compound analgesic preparations

Aspirin is indicated for headache, transient musculoskeletal pain, dysmenorrhoea, and pyrexia. In inflammatory conditions, most physicians prefer anti-inflammatory treatment with another NSAID which may be better tolerated and more convenient for the patient. Aspirin is used increasingly for its antiplatelet properties. Aspirin tablets or dispersible aspirin tablets are adequate for most purposes as they act rapidly.

Gastric irritation may be a problem; it is minimised by taking the dose after food. Enteric-coated preparations are available, but have a slow onset of action and are therefore unsuitable for single-dose analgesic use (though their prolonged action may be useful for night pain).

Aspirin interacts significantly with a number of other drugs and its interaction with warfarin sodium p. 135 is a special hazard.

Paracetamol is similar in efficacy to aspirin, but has no demonstrable anti-inflammatory activity; it is less irritant to the stomach and for that reason is now generally preferred to aspirin, particularly in the elderly. Overdosage with
paracetamol is particularly dangerous as it may cause hepatic damage which is sometimes not apparent for 4 to 6 days.

Nefopam hydrochloride p. 424 may have a place in the relief of persistent pain unresponsive to other non-opioid analgesics. It causes little or no respiratory depression, but sympathomimetic and antimuscarinic side-effects may be troublesome.

Non-steroidal anti-inflammatory analgesics (NSAIDs) are particularly useful for the treatment of patients with chronic disease accompanied by pain and inflammation. Some of them are also used in the short-term treatment of mild to moderate pain including transient musculoskeletal pain but paracetamol is now often preferred, particularly in the elderly. They are also suitable for the relief of pain in dysmenorrhea and to treat pain caused by secondary bone tumours, many of which produce lysis of bone and release prostaglandins. Selective inhibitors of cyclo-oxygenase-2 may be used in preference to non-selective NSAIDs for patients at high risk of developing serious gastro-intestinal side-effects. Several NSAIDs are also used for postoperative analgesia. A non-opioid analgesic administered by intrathecal infusion (ziconotide (Prialt®), available from Eisai) is licensed for the treatment of chronic severe pain; ziconotide can be used by a hospital specialist as an adjunct to opioid analgesics.

Compound analgesic preparations

Compound analgesic preparations that contain a simple analgesic (such as aspirin or paracetamol) with an opioid component reduce the scope for effective titration of the individual components in the management of pain of varying intensity. Compound analgesic preparations containing paracetamol or aspirin with a low dose of an opioid analgesic (e.g. 8 mg of codeine phosphate per compound tablet) are commonly used, but the advantages have not been substantiated. The low dose of the opioid may be enough to cause opioid side-effects (in particular, constipation) and can complicate the treatment of overdosage yet may not provide significant additional relief of pain. A full dose of the opioid component (e.g. 60 mg codeine phosphate) in compound analgesic preparations effectively augments the analgesic activity but is associated with the full range of opioid side-effects (including nausea, vomiting, severe constipation, drowsiness, respiratory depression, and risk of dependence on long-term administration). Important: the elderly are particularly susceptible to opioid side-effects and should receive lower doses. In general, when assessing pain, it is necessary to weigh up carefully whether there is a need for a non-opioid and an opioid analgesic to be taken simultaneously.

Caffeine is a weak stimulant that is often included, in small doses, in analgesic preparations. It is claimed that the addition of caffeine may enhance the analgesic effect, but the alerting effect, mild habit-forming effect and possible provocation of headache may not always be desirable. Moreover, in excessive dosage or on withdrawal caffeine may itself induce headache.

Co-proxamol tablets (dextropropoxyphene in combination with paracetamol) are no longer licensed because of safety concerns, particularly toxicity in overdose. Co-proxamol tablets [unlicensed] may still be prescribed for patients who find it difficult to change, because alternatives are not effective or suitable.

Opioid analgesics

Opioid analgesics are usually used to relieve moderate to severe pain particularly of visceral origin. Repeated administration may cause dependence and tolerance, but this is no deterrent in the control of pain in terminal illness. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain; treatment should be supervised by a specialist and the patient should be assessed at regular intervals.

Strong opioids

Morphine p. 439 remains the most valuable opioid analgesic for severe pain although it frequently causes nausea and vomiting. It is the standard against which other opioid analgesics are compared. In addition to relief of pain, morphine also confers a state of euphoria and mental detachment.

Morphine is the opioid of choice for the oral treatment of severe pain in palliative care. It is given regularly every 4 hours (or every 12 or 24 hours as modified-release preparations).

Buprenorphine p. 425 has both opioid agonist and antagonist properties and may precipitate withdrawal symptoms, including pain, in patients dependent on other opioids. It has abuse potential and may itself cause dependence. It has a much longer duration of action than morphine and sublingually is an effective analgesic for 6 to 8 hours. Unlike most opioid analgesics, the effects of buprenorphine are only partially reversed by naloxone hydrochloride p. 1259.

Dipipanone hydrochloride used alone is less sedating than morphine but the only preparation available contains an antiemetic and is therefore not suitable for regular regimens in palliative care.

Diamorphine hydrochloride (heroin) p. 433 is a powerful opioid analgesic. It may cause less nausea and hypotension than morphine. In palliative care the greater solubility of diamorphine hydrochloride allows effective doses to be injected in smaller volumes and this is important in the emaciated patient.

Alfentanil p. 1232, fentanyl p. 434 and remifentanil p. 1233 are used by injection for intra-operative analgesia; fentanyl is available in a transdermal drug delivery system as a self-adhesive patch which is changed every 72 hours. Methadone hydrochloride p. 476 is less sedating than morphine and acts for longer periods. In prolonged use, methadone hydrochloride should not be administered more often than twice daily to avoid the risk of accumulation and opioid overdosage. Methadone hydrochloride may be used instead of morphine in the occasional patient who experiences excitation (or exacerbation of pain) with morphine.

Oxycodone hydrochloride p. 442 has an efficacy and side-effect profile similar to that of morphine. It is used primarily for control of pain in palliative care.

Papaveretum p. 445 is rarely used; morphine is easier to prescribe and less prone to error with regard to the strength and dose.

Pentazocine p. 445 has both agonist and antagonist properties and precipitates withdrawal symptoms, including pain in patients dependent on other opioids. By injection it is more potent than dihydrocodeine tartrate p. 434 or codeine phosphate, but hallucinations and thought disturbances may occur. It is not recommended and, in particular, should be avoided after myocardial infarction as it may increase pulmonary and aortic blood pressure as well as cardiac work.

Pethidine hydrochloride p. 445 produces prompt but short-lasting analgesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. It is not suitable for severe continuing pain. It is used for analgesia in labour; however, other opioids, such as morphine or diamorphine hydrochloride, are often preferred for obstetric pain.

Tapentadol p. 446 produces analgesia by two mechanisms. It is an opioid-receptor agonist and it also inhibits noradrenaline reuptake. Nausea, vomiting, and constipation are less likely to occur with tapentadol than with other strong opioid analgesics.
Tramadol hydrochloride p. 447 produces analgesia by two mechanisms: an opioid effect and an enhancement of serotoninergic and adrenergic pathways. It has fewer of the typical opioid side-effects (notably, less respiratory depression, less constipation and less addiction potential); psychiatric reactions have been reported.

**Weak opioids**

Codeine phosphate can be used for the relief of mild to moderate pain where other painkillers such as paracetamol or ibuprofen p. 1041 have proved ineffective.

Dihydrocodeine tartrate has an analgesic efficacy similar to that of codeine phosphate. Higher doses may provide some additional pain relief but this may be at the cost of more nausea and vomiting.

Meptazinol p. 439 is claimed to have a low incidence of respiratory depression. It has a reported length of action of 2 to 7 hours with onset within 15 minutes.

**Postoperative analgesia**

A combination of opioid and non-opioid analgesics is used to treat postoperative pain. The use of intra-operative opioids affects the prescribing of postoperative analgesics. A postoperative opioid analgesic should be given with care since it may potentiate any residual respiratory depression.

Morphine is used most widely. Tramadol hydrochloride is not as effective in severe pain as other opioid analgesics. Postoperative opioid analgesic should be given with care

**Pain management and opioid dependence**

Although caution is necessary, patients who are dependent on opioids or have a history of drug dependence may be treated with opioid analgesics when there is a clinical need. Treatment with opioid analgesics in this patient group should normally be carried out with the advice of specialists. However, doctors do not require a special licence to prescribe opioid analgesics to patients with opioid dependence for relief of pain due to organic disease or injury.

---

**ANALGESICS › NON-OPIOID**

**Paracetamol (Acetaminophen)**

*INDICATIONS AND DOSE*

**Mild to moderate pain**

- **BY MOUTH**
  - Adult: 0.5–1 g every 4–6 hours; maximum 4 g per day
  - Adult: 1 g up to 4 times a day, dose not to be taken more often than every 4 hours
  - Adult: 0.5–1 g every 4–6 hours; maximum 4 g per day

**Mild to moderate pain**

- **BY INTRAVENOUS INFUSION**
  - Adult (body-weight up to 50 kg): 15 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 60 mg/kg per day
  - Adult (body-weight 50 kg and above): 1 g every 4–6 hours, dose to be administered over 15 minutes; maximum 3 g per day

**PANADOL OA®**

**Mild to moderate pain**

- **BY MOUTH**
  - Adult: 1 g up to 4 times a day, dose not to be taken more often than every 4 hours

**UNLICENSED USE**

Paracetamol oral suspension 500 mg/5 mL not licensed for use in children under 16 years. Not licensed for use as prophylaxis of post-immunisation pyrexia following immunisation with meningococcal group B vaccine.

**CAUTIONS**

Before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours, body-weight under 50 kg, chronic alcohol consumption, chronic dehydration, chronic
malnutition · hepatocellular insufficiency · long-term use (especially in those who are malnourished)

**CAUTIONS, FURTHER INFORMATION**

Some patients may be at increased risk of experiencing toxicity at therapeutic doses, particularly those with a body-weight under 50 kg and those with risk factors for hepatotoxicity. Clinical judgement should be used to adjust the dose of oral and intravenous paracetamol in these patients.

Co-administration of enzyme-inducing antiepileptic medications may increase toxicity; doses should be reduced.

**INTERACTIONS** → Appendix 1: paracetamol

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Rare** Acute generalised exanthematous pustulosis · malaise · skin reactions · Stevens-Johnson syndrome · toxic epidermal necrolysis
- **Frequency not known** Blood disorders · leucopenia · neutropenia · thrombocytopenia

**SPECIFIC SIDE-EFFECTS**

- **Rare**
  - With intravenous use Flushing · tachycardia
  - Frequency not known
  - With intravenous use Hypotension

**Overdose**

**Important**: liver damage and less frequently renal damage can occur following overdose. Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis.

For specific details on the management of poisoning, see Paracetamol, under Emergency treatment of poisoning p. 1249

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Amount too small to be harmful.

**HEPATIC IMPAIRMENT** Dose-related toxicity—avoid large doses.

**RENAL IMPAIRMENT**

- In adults Increase infusion dose interval to every 6 hours if eGFR less than 30 mL/minute/1.73 m².
- In children Increase infusion dose interval to every 6 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Perfalgan®), give in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of not less than 1 mg/mL and use within an hour; may also be given undiluted. For children under 33 kg, use 50 mL-vial.

**PRESCRIBING AND DISPENSING INFORMATION** BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed Paracetamol Oral Suspension 120 mg/5 mL should be dispensed.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Paracetamol for mild-to-moderate pain www.medicinesforchildren.org.uk/paracetamol-for-mildtomentorade-pain

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary Paracetamol Tablets may be prescribed. Paracetamol Soluble Tablets 500 mg may be prescribed. Paracetamol Oral Suspension may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY** Paracetamol capsules or tablets can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 29 (does not apply to 1 g tablet), 30

- **Paracetamol (Non-proprietary)**
  - Paracetamol 500 mg Paracetamol 500 mg caplets | 32 tablet [P] £0.32 DT price = £0.70 | 100 tablet [Pom] £3.18 DT price = £2.19
  - Paracetamol 500 mg tablets | 32 tablet [P] £1.24 DT price = £0.70 | 100 tablet [Pom] £2.56 DT price = £2.19 | 1000 tablet [Pom] £21.90 | 5000 tablet [Pom] no price available
- **Mandanol (M & A Pharmachem Ltd)**
  - Paracetamol 500 mg Mandanol 500 mg caplets | 32 tablet [P] £0.20 DT price = £0.70
  - Mandanol 500 mg tablets | 32 tablet [P] £0.15 DT price = £0.70
- **Panadol (GlaxoSmithKline Consumer Healthcare)**
  - Paracetamol 500 mg Paranol Advance 500 mg tablets | 32 tablet [P] £1.74 DT price = £0.70
- **Paravict (Ecogen Europe Ltd)**
  - Paracetamol 500 mg Paravict 500 mg tablets | 100 tablet [Pom] £1.62 DT price = £2.19

**Suppository**

**CAUTIONARY AND ADVISORY LABELS** 30

- **Paracetamol (Non-proprietary)**
  - Paracetamol 80 mg Paracetamol 80 mg suppositories | 10 suppository [P] £10.00
  - Paracetamol 120 mg Paracetamol 120 mg suppositories | 10 suppository [P] £11.26 DT price = £11.26
  - Paracetamol 125 mg Paracetamol 125 mg suppositories | 10 suppository [P] £15.00 DT price = £13.80
  - Paracetamol 240 mg Paracetamol 240 mg suppositories | 10 suppository [P] £22.01 DT price = £22.01
  - Paracetamol 250 mg Paracetamol 250 mg suppositories | 10 suppository [P] £24.15 DT price = £27.60
  - Paracetamol 500 mg Paracetamol 500 mg suppositories | 10 suppository [P] £36.50 DT price = £36.50
  - Paracetamol 1 gram Paracetamol 1 g suppositories | 10 suppository [P] £59.50 | 12 suppository [P] no price available
- **Alvedon (Intrapharm Laboratories Ltd)**
  - Paracetamol 60 mg Alvedon 60 mg suppositories | 10 suppository [P] £11.95 DT price = £11.95
  - Paracetamol 125 mg Alvedon 125 mg suppositories | 10 suppository [P] £13.80 DT price = £13.80
  - Paracetamol 250 mg Alvedon 250 mg suppositories | 10 suppository [P] £27.80 DT price = £27.80

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS** 30

- **Paracetamol (Non-proprietary)**
  - Paracetamol 24 mg per 1 ml Paracetamol 120 mg/5 mL oral suspension paediatric | 100 ml [P] £0.72 | 500 ml [P] £3.11 DT price = £3.11
  - Paracetamol 120 mg/5 mL oral suspension paediatric sugar free sugar-free | 100 ml [P] £1.29 DT price = £1.29 sugar-free | 200 ml [P] £2.58 sugar-free | 500 ml [P] £6.45 sugar-free | 1000 ml [P] £12.90
  - Paracetamol 50 mg per 1 ml Paracetamol 250 mg/5 mL oral suspension | 100 ml [P] £1.12 DT price = £1.12 | 500 ml [P] £5.60
  - Paracetamol 250 mg/5 mL oral suspension sugar free sugar-free | 100 ml [P] £1.10 sugar-free | 200 ml [P] £2.00 DT price = £2.02 sugar-free | 500 ml [P] £5.18 sugar-free | 1000 ml [P] £9.85
  - Paracetamol 100 mg per 1 ml Paracetamol 500 mg/5 mL oral suspension sugar free sugar-free | 150 ml [Pom] £24.00 DT price = £24.00
- **Calpol (McNeil Products Ltd)**
  - Paracetamol 24 mg per 1 ml Calpol Infant 120 mg/5 mL oral suspension | 200 ml [P] £3.35
  - Calpol Infant 120 mg/5 mL oral suspension sugar free-sugar-free | 200 ml [P] £3.35
  - Paracetamol 50 mg per 1 ml Calpol Six Plus 250 mg/5 mL oral suspension | 200 ml [P] £3.88
  - Calpol Six Plus 250 mg/5 mL oral suspension sugar free-sugar-free | 100 ml [P] £2.40 sugar-free | 200 ml [P] £3.88 DT price = £2.02
Paracetamol with tramadol

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 422, tramadol hydrochloride p. 447.

- **INDICATIONS AND DOSE**
  - **Moderate to severe pain**
    - **BY MOUTH**
      - Child 12-17 years: 2 tablets up to every 6 hours; maximum 8 tablets per day
      - Adult: 2 tablets up to every 6 hours; maximum 8 tablets per day
  - **INTERACTIONS** → Appendix 1: opioids, paracetamol
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.

Paracetamol with tramadol (Non-proprietary)

- **Tramadol hydrochloride 37.5 mg, Paracetamol 325 mg** Tramacet
- **Tramadol hydrochloride 75 mg, Paracetamol 650 mg** Tramacet

---

Nefopam hydrochloride

- **INDICATIONS AND DOSE**
  - **Moderate pain**
    - **BY MOUTH**
      - Adult: Initially 60 mg 3 times a day, adjusted according to response; usual dose 30–90 mg 3 times a day
      - Elderly: Initially 30 mg 3 times a day, adjusted according to response; usual dose 30–90 mg 3 times a day
  - **SIDE-EFFECTS**
    - Common or very common: Dry mouth, lightheadedness, nausea, nervousness, urinary retention
    - Uncommon: Blurred vision, confusion, drowsiness, hallucinations, headache, insomnia, sweating, tachycardia, vomiting
  - **FREQUENCY NOT KNOWN**
    - May colour urine (pink)
  - **PREGNANCY**
    - No information available—avoid unless no safer treatment.
  - **HEPATIC IMPAIRMENT**
    - Caution.
  - **RENAL IMPAIRMENT**
    - Caution.

---

Aspirin with codeine

- **INDICATIONS AND DOSE**
  - **Mild to moderate pain**
    - **BY MOUTH**
      - Adult: 1–2 tablets every 4–6 hours as required, dose to be dispersed in water; maximum 8 tablets per day
      - **INTERACTIONS** → Appendix 1: aspirin, codeine
      - **PRESCRIBING AND DISPENSING INFORMATION**
        - When codeine phosphate or dispersible tablets are prescribed and no strength is stated, tablets or dispersible tablets, respectfully, containing codeine phosphate 8 mg and aspirin 400 mg should be dispensed.
      - **LESS SUITABLE FOR PRESCRIBING**
        - Aspirin with codeine is less suitable for prescribing.
      - **EXCEPTIONS TO LEGAL CATEGORY**
        - Aspirin with codeine can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs
up to a total quantity of 100 capsules or tablets in justifiable circumstances.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Dispersible tablet**
*CAUTIONARY AND ADVISORY LABELS 13, 21, 32*

- **Aspirin with codeine (Non-proprietary)**
  - Codeine phosphate 8 mg, Aspirin 400 mg. Co-codaprin 8mg/400mg dispersible tablets | 100 tablet (BNF) £97.55 DT price = £52.19 (GHS)
- **Codis** (Reckitt Benckiser Healthcare (UK) Ltd)
  - Codeine phosphate 8 mg, Aspirin 500 mg. Codis 500 dispersible tablets sugar-free | 32 tablet (P) £3.23 (GHS)

### Tablet

- **Aspirin with codeine (Non-proprietary)**
  - Codeine phosphate 8 mg, Aspirin 400 mg. Aspirin and Codeine tablets | 32 tablet (P) no price available (GHS)

### ANALGESICS > OPIOIDS

**Opioids**

- **CONTRA-INDICATIONS** Acute respiratory depression - comatose patients - head injury (opioid analgesics interfere with pupillary responses vital for neurological assessment) - raised intracranial pressure (opioid analgesics interfere with pupillary responses vital for neurological assessment) - risk of paralytic ileus

- **CAUTIONS** Adrenocortical insufficiency (reduced dose is recommended) - asthma (avoid during an acute attack) - convulsive disorders - debilitated patients (reduced dose is recommended) (in adults) - diseases of the biliary tract - elderly (reduced dose is recommended) - hypotension - hypothryoidism (reduced dose is recommended) - impaired respiratory function (avoid in chronic obstructive pulmonary disease) - inflammatory bowel disorders - myasthenia gravis - obstructive bowel disorders - prostatic hypertrophy (in adults) - shock - urethral stenosis (in adults)

- **CAUTIONS, FURTHER INFORMATION**
  - Dependence Repeated use of opioid analgesics is associated with the development of psychological and physical dependence; although this is rarely a problem with therapeutic use, caution is advised if prescribing for patients with a history of drug dependence.
  - Palliative care In the control of pain in terminal illness, the cautions listed should not necessarily be a deterrent to the use of opioid analgesics.

- **SIDE-EFFECTS**
  - Common or very common Biliary spasm - bradycardia - confusion - constipation - dependence - difficulty with micturition - dizziness - drowsiness - dry mouth - dysphoria - euphoria - flushing - hallucinations - headache - hypotension (larger doses) - miosis - mood changes - muscle rigidity (larger doses) - nausea (particularly in initial stages) - oedema - palpitation - postural hypotension - pruritus - rash - respiratory depression (larger doses) - sexual dysfunction - sleep disturbances - sweating - tachycardia - ureteric spasm - urinary retention - urticaria - vertigo - visual disturbances - vomiting (particularly in initial stages)
  - Frequency not known Adrenal insufficiency (long-term use) - hyperalgesia (long-term use) - hypogonadism (long-term use)

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Hypogonadism and adrenal insufficiency Long-term use of opioid analgesics can cause hypogonadism and adrenal insufficiency in both males and females. This is thought to be dose related and can lead to amenorrhoea, reduced libido, infertility, depression, and erectile dysfunction.

- **Hyperalgesia** Long-term use of opioid analgesics has also been associated with a state of abnormal pain sensitivity (hyperalgesia). Pain associated with hyperalgesia is usually distinct from pain associated with disease progression or breakthrough pain, and is often more diffuse and less defined. Treatment of hyperalgesia involves reducing the dose of opioid medication or switching therapy; cases of suspected hyperalgesia should be referred to a specialist pain team.
  - Respiratory depression Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naltroxone.
  - Dependence and withdrawal Psychological dependence rarely occurs when opioids are used therapeutically (e.g. for pain relief) but tolerance can develop during long-term treatment.

**Overdose**
Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. For details on the management of poisoning, see Opioids, under Emergency treatment of poisoning p. 1249 and consider the specific antidote, naltroxone hydrochloride p. 1259.

- **PREGNANCY** Respiratory depression and withdrawal symptoms can occur in the neonate if opioid analgesics are used during delivery; also gastric stasis and inhalation pneumonia has been reported in the mother if opioid analgesics are used during labour.
  - **HEPATIC IMPAIRMENT** Avoid use or reduce dose; may precipitate coma in patients with hepatic impairment.
  - **TREATMENT CESSATION** Avoid abrupt withdrawal after long-term treatment; they should be withdrawn gradually to avoid abstinence symptoms.
  - **PATIENT AND CARER ADVICE**
    - Driving and skilled tasks
      - Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced. Driving at the start of therapy with opioid analgesics, and following dose changes, should be avoided.
      - For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including opioids, see Drugs and driving under Guidance on prescribing p. 1.

**Buprenorphine**

- **DRUG ACTION** Buprenorphine is an opioid-receptor partial agonist (it has opioid agonist and antagonist properties).

### INDICATIONS AND DOSE

- **Moderate to severe pain**
  - **BY SUBLINGUAL ADMINISTRATION**
    - Child (body-weight 16–25 kg): 100 micrograms every 6–8 hours
    - Child (body-weight 25–37.5 kg): 100–200 micrograms every 6–8 hours
    - Child (body-weight 37.5–50 kg): 200–300 micrograms every 6–8 hours
    - Child (body-weight 50 kg and above): 200–400 micrograms every 6–8 hours
    - Adult: 200–400 micrograms every 6–8 hours
  - **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
    - Child 6 months–11 years: 3–6 micrograms/kg every 6–8 hours (max. per dose 9 micrograms/kg)
    - Child 12–17 years: 300–600 micrograms every 6–8 hours
    - Adult: 300–600 micrograms every 6–8 hours

- **Premedication**
  - **BY SUBLINGUAL ADMINISTRATION**
    - Adult: 400 micrograms
  - **BY INTRAMUSCULAR INJECTION**
    - Adult: 300 micrograms

*BNF 74 Pain 425*
BUPEAZE

DOSE EQUIVALENCE AND CONVERSION

▶ Adjunct in the treatment of opioid dependence
▶ BY SUBLINGUAL ADMINISTRATION
▶ Adult: Initially 0.8–4 mg for 1 dose on the first day, adjusted in steps of 2–4 mg daily if required; usual dose 12–24 mg daily; maximum 32 mg per day

DOSE EQUIVALENCE AND CONVERSION

▶ For opioid substitution therapy, in patients taking methadone who want to switch to buprenorphine, the dose of methadone should be reduced to a maximum of 30 mg daily before starting buprenorphine treatment. If the dose of methadone is over 10 mg daily, buprenorphine can be started at a dose of 4 mg daily and titrated according to requirements; if the methadone dose is below 10 mg daily, buprenorphine can be started at a dose of 2 mg daily.

BUTRANS ®

Moderate, non-malignant pain unresponsive to non-opioid analgesics
▶ BY TRANSDERMAL APPLICATION USING PATCHES
▶ Adult: Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time

BUPEAZE ®

Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic
▶ BY TRANSDERMAL APPLICATION USING PATCHES
▶ Adult: Initially 35 micrograms/hour up to every 96 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time

BUPLAST ®

Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic
▶ BY TRANSDERMAL APPLICATION USING PATCHES
▶ Adult: Initially 35 micrograms/hour up to every 96 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time

BUPLAST ®

Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic
▶ BY TRANSDERMAL APPLICATION USING PATCHES
▶ Adult: The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time

BUTRANS ®

PHARMACOKINETICS
It may take approximately 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

BUTEC ®

PHARMACOKINETICS
It may take approximately 12 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

HAPOCTASIN ®

PHARMACOKINETICS
It may take approximately 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

BUPEAZE ®

PHARMACOKINETICS
It may take approximately 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.
avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

**Moderate to severe chronic cancer pain in patients who have previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic**

- **BY TRANSDERMAL APPLICATION USING PATCHES**
- **Adult:** The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

**PHARMACOKINETICS**

It may take approximately 25 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

**PANITAZ®**

**Moderate, non-malignant pain unresponsive to non-opioid analgesics**

- **BY TRANSDERMAL APPLICATION USING PATCHES**
- **Adult:** Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

**PHARMACOKINETICS**

It may take approximately 12 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

**PRENOTRIX®**

**Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic**

- **BY TRANSDERMAL APPLICATION USING PATCHES**
- **Adult:** Initially 35 micrograms/hour up to every 72 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

**PHARMACOKINETICS**

It may take approximately 25 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

**RELETRANS®**

**Moderate, non-malignant pain unresponsive to non-opioid analgesics**

- **BY TRANSDERMAL APPLICATION USING PATCHES**
- **Adult:** Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time

**PHARMACOKINETICS**

It may take approximately 12 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

**RELEVTEC®**

**Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic | Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic**

- **BY TRANSDERMAL APPLICATION USING PATCHES**
- **Adult:** Initially 35 micrograms/hour up to every 96 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at *same time* to avoid confusion). Maximum 2 patches can be used at any one time
SEVODYNE®

Moderate, non-malignant pain unresponsive to non-opioid analgesics
▶ BY TRANSDERMAL APPLICATION USING PATCHES
Adult: Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time.

TRANSTEC®

Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic
Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic
▶ BY TRANSDERMAL APPLICATION USING PATCHES
Adult: Initially 35 micrograms/hour up to every 96 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually.

Moderate to severe chronic cancer pain in patients who have previously received strong opioid analgesic
Severe pain unresponsive to non-opioid analgesics in patients who have previously received strong opioid analgesic
▶ BY TRANSDERMAL APPLICATION USING PATCHES
Adult: The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually.

PHARMACOKINETICS

It may take approximately 12 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

TRANSTEC®, SEVODYNE

Unlicensed use Sublingual tablets not licensed for use in children under 6 years. Injection not licensed for use in children under 6 months.

IMPORTANT SAFETY INFORMATION
Do not confuse the formulations of transdermal patches which are available as 72-hourly, 96-hourly and 7-day patches, see Prescribing and dispensing information.

SPECIFIC CAUTIONS
- With transdermal use Other opioids should not be administered within 24 hours of patch removal (long duration of action)
- When used for adjunct in the treatment of opioid dependence
  - Hepatitis B infection
  - Hepatitis C infection
  - Pre-existing liver enzyme abnormalities

INTERACTIONS → Appendix 1: opioids

SIDE-EFFECTS
- Common or very common
  - Abdominal pain
  - Agitation
  - Anorexia
  - Anxiety
  - Asthenia
  - Diarrhoea
  - Dyspepsia
  - Dysphonia
  - Fatigue
  - Mild withdrawal symptoms in patients dependent on opioids
  - Paraesthesia
  - Vasodilatation
- Uncommon
  - Angina (in adults)
  - Cough
  - Depersonalisation
  - Dry eye
  - Dry skin
  - Dysarthria
  - Flatulence
  - Hypertension
  - Hypoaesthesia
  - Hypoxia
  - Impaired memory
  - Influenza-like symptoms
  - Muscle cramp
  - Myalgia
  - Pyrexia
  - Restlessness
  - Rhinitis
  - Rigors
  - Syncope
  - Taste disturbance
  - Tinnitus
  - Tremor
  - Wheezing
- Rare
  - Diverticulitis (in children)
  - Dysphagia
  - Impaired concentration
  - Paralytic ileus
  - Psychosis

VERY RARE
- Hiccups
- Hyperventilation
- Muscle fasciculation
- Retching

FREQUENCY NOT KNOWN
- Hepatic necrosis
- Hepatitis

SIDE-EFFECTS, FURTHER INFORMATION
- Fever or external heat
  - Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat (may also increase absorption). In view of the long duration of action, side-effects can persist for many hours after removing patch.
- Overdose
  - The effects of buprenorphine are only partially reversed by naloxone.

BREAST FEEDING
- Present in low levels in breast milk. Neonates should be monitored for drowsiness, adequate weight gain, and developmental milestones.

RENAL IMPAIRMENT
- Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

PRE-TREATMENT SCREENING
- Documentation of viral hepatitis status is recommended before commencing therapy for opioid dependence.

MONITORING REQUIREMENTS
- Monitor liver function; when used in opioid dependence baseline liver function test is recommended before commencing therapy, and regular liver function tests should be performed throughout treatment.

DIRECTIONS FOR ADMINISTRATION
- With sublingual use in children For administration by mouth, tablets may be halved.

PRENORTIX® HAPOTASIN®
Manufacturer advises apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 72 hours and siting replacement patch on a different area (avoid same area for at least 7 days).

TRANSTEC®
Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 96 hours and siting replacement patch on a different area (avoid same area for at least 6 days).

RELETRAN® BUTEC® PANITAZ® SEVODYNE®
Manufacturer advises apply patch to dry, non-irritated, non-hairy skin on upper torso or upper outer arm, removing after 7 days and siting replacement patch on a different area (avoid same area for at least 3 weeks).

BUPEAZ® BUPLAST® RELEVTEC®
Manufacturer advises apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 96 hours and siting replacement patch on a different area (avoid same area for at least 7 days).

CAUTIONS

GENERAL CAUTIONS
Impaired consciousness
**BUTEC®** Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after 7 days and sitting replacement patch on a different area (avoid same area for at least 3 weeks).

- **PRESCRIBING AND DISPENSING INFORMATION**
  Transdermal buprenorphine patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Transdermal patches are available as 72-hourly, 96-hourly and 7-day formulations; prescribers and dispensers must ensure that the correct preparation is prescribed and dispensed. Preparations that should be applied up to every 72 hours include Naloxodol® and Prenalin®. Preparations that should be applied up to every 96 hours include Bupeaze®, Bupeast®, Relevtec®, and Transept®. Preparations that should be applied up to every 7 days include Butec®, BuTrans®, Panitaz®, Reletrans®, and Sevodine®.

- **PATIENT AND CARER ADVICE**
  Patients or carers should be given advice on how to administer buprenorphine transdermal patches.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  **NICE technology appraisals (TAs)**
  - Methadone and buprenorphine for the management of opioid dependence (January 2007) NICE TA114
  Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable.
  [www.nice.org.uk/TA114](http://www.nice.org.uk/TA114)

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (January 2017) that buprenorphine transdermal patches (Butec®) are accepted for restricted use within NHS Scotland for the treatment of chronic non-malignant pain of moderate intensity when an opioid is necessary for obtaining adequate analgesia in elderly patients (over 65 years).

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Temgesic® (RB Pharmaceuticals Ltd)**
  Buprenorphine (as Buprenorphine hydrochloride) 100 microgram/1 ml solution for injection ampoules | 5 ampoule [POM] £2.46 [CD]

- **Buprenorphine (as Buprenorphine hydrochloride)**
  - **Sublingual tablet**
    CAUTIONARY AND ADVISORY LABELS 2, 26
    - **Buprenorphine (Non-NProprietary)**
      - 2 mg Buprenorphine 2mg sublingual tablets sugar free | 10 tablet [POM] £6.35 DT price | £1.33 [CD]
      - 8 mg Buprenorphine 8mg sublingual tablets sugar free | 10 tablet [POM] £22.50 DT price | £2.21 [CD]
    - **Natzon® (Morningside Healthcare Ltd)**
      - 0.4mg Natzon 0.4mg sublingual tablets sugar-free | 7 tablet [POM] £1.60 DT price | £1.60 [CD]
      - 1 mg Natzon 1mg sublingual tablets sugar-free | 7 tablet [POM] £6.35 DT price | £1.33 [CD]
    - **Butec® (Qmed Pharmaceuticals Ltd)**
      - 5 mg Butec 5mg sublingual tablets sugar-free | 7 tablet [POM] £6.35 DT price | £1.33 [CD]

**Transdermal patch**

CAUTIONARY AND ADVISORY LABELS 2

- **BuTrans® (Napp Pharmaceuticals Ltd)**
  - Buprenorphine 0.5 microgram per hour BuTrans 5micrograms/hour transdermal patches | 4 patch [POM] £17.60 DT price | £17.60 [CD]
  - Buprenorphine 2.5 microgram per hour BuTrans 10micrograms/hour transdermal patches | 4 patch [POM] £31.55 DT price | £31.55 [CD]
  - Buprenorphine 5 microgram per hour BuTrans 15micrograms/hour transdermal patches | 4 patch [POM] £49.15 DT price | £49.15 [CD]
  - Buprenorphine 10 microgram per hour BuTrans 20micrograms/hour transdermal patches | 4 patch [POM] £57.46 DT price | £57.46 [CD]

- **Buprenorphine 5 microgram per hour Bupeaze® (Dr Reddy’s Laboratories (UK) Ltd)**
  - 5.25micrograms/hour transdermal patches | 4 patch [POM] £15.80 [CD]
  - 10micrograms/hour transdermal patches | 4 patch [POM] £31.60 [CD]
  - Buprenorphine 25 microgram per hour Bupeaze® (Mylan Ltd)
  - 25micrograms/hour transdermal patches | 4 patch [POM] £55.30 [CD]
  - 50micrograms/hour transdermal patches | 4 patch [POM] £88.50 [CD]

Buprenorphine 5 microgram per 1 hour Reletrans 5micrograms/hour transdermal patches | 4 patch £8.80 DT price = £17.60 (D3)

Buprenorphine 10 microgram per 1 hour Reletrans 10micrograms/hour transdermal patches | 4 patch £15.78 DT price = £31.55 (D3)

Buprenorphine 15 microgram per 1 hour Reletrans 15micrograms/hour transdermal patches | 4 patch £24.58 DT price = £49.15 (D3)

Buprenorphine 20 microgram per 1 hour Reletrans 20micrograms/hour transdermal patches | 4 patch £28.73 DT price = £57.46 (D3)

Relevec (Sandoz Ltd)
Buprenorphine 35 microgram per 1 hour Relevec 35micrograms/hour transdermal patches | 4 patch £11.06 DT price = £15.80 (D3)

Buprenorphine 52.5 microgram per 1 hour Relevec 52.5micrograms/hour transdermal patches | 4 patch £16.60 DT price = £31.55 (D3)

Buprenorphine 70 microgram per 1 hour Relevec 70micrograms/hour transdermal patches | 4 patch £22.12 DT price = £31.60 (D3)

Sevodyne (Aspire Pharma Ltd)
Buprenorphine 5 microgram per 1 hour Sevodyne 5micrograms/hour transdermal patches | 4 patch £7.92 DT price = £17.60 (D3)

Buprenorphine 10 microgram per 1 hour Sevodyne 10micrograms/hour transdermal patches | 4 patch £14.20 DT price = £31.55 (D3)

Buprenorphine 20 microgram per 1 hour Sevodyne 20micrograms/hour transdermal patches | 4 patch £25.86 DT price = £57.46 (D3)

Transect (Napp Pharmaceuticals Ltd)
Buprenorphine 35 microgram per 1 hour Transect 35micrograms/hour transdermal patches | 4 patch £15.80 DT price = £31.60 (D3)

Buprenorphine 52.5 microgram per 1 hour Transect 52.5micrograms/hour transdermal patches | 4 patch £23.71 DT price = £49.15 (D3)

Buprenorphine 70 microgram per 1 hour Transect 70micrograms/hour transdermal patches | 4 patch £31.60 DT price = £31.60 (D3)

Co-codamol

- **INDICATIONS AND DOSE**

  **Mild to moderate pain (using co-codamol 8/500 preparations only)**
  - **BY MOUTH**
  - Adult: 8/500–16/1000 mg every 4–6 hours as required; maximum 64/4000 mg per day

  **Mild to moderate pain (using co-codamol 15/500 preparations only)**
  - **BY MOUTH**
  - Adult: 15/500–30/1000 mg every 4–6 hours as required; maximum 120/4000 mg per day

  **Severe pain (using co-codamol 30/500 preparations only)**
  - **BY MOUTH**
  - Adult: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day

  **KAPAKE® 15/500**
  - **Mild to moderate pain**
  - **BY MOUTH**
  - Adult: 2 tablets every 4–6 hours as required; maximum 8 tablets per day

  **SOLPADOL® CAPLETS**
  - **Severe pain**
  - **BY MOUTH**
  - Adult: 2 capsules every 4–6 hours as required; maximum 8 capsules per day

  **SOLPADOL® CAPSULES**
  - **Severe pain**
  - **BY MOUTH USING EFFERVESCENT TABLETS**
  - Adult: 2 tablets every 4–6 hours as required, tablets to be dispersed in water; maximum 8 tablets per day

- **CONTRA-INDICATIONS**
  - Acute ulcerative colitis - antibiotic-associated colitis - conditions where abdominal distension develops - conditions where inhibition of peristalsis should be avoided - known ultra-rapid codeine metabolisers

- **CAUTIONS**
  - Acute abdomen - alcohol dependence - avoid abrupt withdrawal after long-term treatment - cardiac arrhythmias - chronic alcoholism - chronic dehydration - chronic malnutrition - convulsive disorders - gallstones - hepatocellular insufficiency

  **CAUTIONS, FURTHER INFORMATION**
  - Variation in metabolism The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.

- **INTERACTIONS**
  - Appendix 1: opioids, paracetamol

- **SIDE-EFFECTS**
  - Abdominal pain - anorexia - blood disorders - depression (with larger doses) - hypothermia - leucopenia - malaise - muscle fasciculation - neutropenia - pancreatitis - seizures - thrombocytopenia

- **Overdose**
  - Important: liver damage (and less frequently renal damage) following overdosage with paracetamol.

- **BREAST Feeding**
  - Avoid—although amount of codeine usually too small to be harmful, mothers vary considerably...
in their capacity to metabolise codeine—risk of morphine overdose in infant.

- **HEPATIC IMPAIRMENT** Dose-related toxicity with paracetamol—avoid large doses.
- **RENAL IMPAIRMENT** Reduce dose or avoid codeine; increased and prolonged effect; increased cerebral sensitivity.

- **PRESCRIBING AND DISPENSING INFORMATION** Co-codamol is a mixture of codeine phosphate and paracetamol; the proportions are expressed in the form x/y, where x and y are the strengths in milligrams of codeine phosphate and paracetamol respectively.

  When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and no strength is stated, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed.

  The Drug Tariff allows tablets of co-codamol labelled ‘dispersible’ to be dispensed against an order for ‘effervescent’ and vice versa.

- **LESS SUITABLE FOR PRESCRIBING** Co-codamol is less suitable for prescribing.

- **EXCEPTIONS TO LEGAL CATEGORY** Co-codamol 8/500 can be sold to the public in certain circumstances; for exemptions see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

**Codeine phosphate**

- **INDICATIONS AND DOSE**
  - **Acute diarrhoea**
    - **BY MOUTH**
      - Child 12-17 years: 30 mg 3–4 times a day; usual dose 15–60 mg 3–4 times a day
      - Adult: 30 mg 3–4 times a day; usual dose 15–60 mg 3–4 times a day
  - **Mild to moderate pain**
    - **BY MOUTH**
      - Adult: 30–60 mg every 4 hours if required; maximum 240 mg per day

  continued →
**Nervous system**

**CAUTION**

- Contra-indications: Acute ulcerative colitis - antibiotic-associated colitis - children under 18 years who undergo removal of tonsils or adenoids for the treatment of obstructive sleep apnoea - conditions where abdominal distension develops - conditions where inhibition of peristalsis should be avoided - known ultra-rapid codeine metabolisers

- **Cautions** Acute abdomen - cardiac arrhythmias - gallstones - not recommended for adolescents aged 12–18 years with breathing problems

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE (JULY 2013) CODEINE FOR ANALGESIA:**

- **RESTRICTED USE IN CHILDREN DUE TO REPORTS OF MORPHINE TOXICITY**
- Codeine should only be used to relieve acute moderate pain in children older than 12 years and only if it cannot be relieved by other painkillers such as paracetamol or ibuprofen alone. A significant risk of serious and life-threatening adverse reactions has been identified in children with obstructive sleep apnoea who received codeine after tonsillectomy or adenoidectomy:
  - in children aged 12–18 years, the maximum daily dose of codeine should not exceed 240 mg. Doses may be taken up to four times a day at intervals of no less than 6 hours. The lowest effective dose should be used and duration of treatment should be limited to 3 days
  - codeine is contra-indicated in all children (under 18 years) who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea
  - codeine is not recommended for use in children whose breathing may be compromised, including those with neuromuscular disorders, severe cardiac or respiratory conditions, respiratory infections, multiple trauma or extensive surgical procedures
  - codeine is contra-indicated in patients of any age who are known to be ultra-rapid metabolisers of codeine (CYP2D6 ultra-rapid metabolisers)
  - codeine should not be used in breast-feeding mothers because it can pass to the baby through breast milk
  - parents and carers should be advised on how to recognise signs and symptoms of morphine toxicity, and to stop treatment and seek medical attention if signs or symptoms of toxicity occur (including reduced consciousness, lack of appetite, somnolence, constipation, respiratory depression, ‘pin-point’ pupils, nausea, vomiting)

**MHRA/CHM ADVICE (APRIL 2015) CODEINE FOR COUGH AND COLD: RESTRICTED USE IN CHILDREN**

Do not use codeine in children under 12 years as it is associated with a risk of respiratory side effects. Codeine is not recommended for adolescents (12–18 years) who have problems with breathing. When prescribing or dispensing codeine-containing medicines for cough and cold, consider that codeine is contra-indicated in:

- children younger than 12 years old
- patients of any age known to be CYP2D6 ultra-rapid metabolisers
- breastfeeding mothers

**CAUTIONS, FURTHER INFORMATION**

- Variation in metabolism The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS** Abdominal pain - anorexia - antidiuretic effect - hypothermia - malaise - muscle fasciculation - pancreatitis - seizures

**BREAST FEEDING** Avoid—although amount usually too small to be harmful, mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant.

**RENAI IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**PRESCRIBING AND DISPENSING INFORMATION** BP directs that when Diabetic Codeine Linctus is prescribed, Codeine Linctus formulated with a vehicle appropriate for administration to diabetics, whether or not labelled 'Diabetic Codeine Linctus', shall be dispensed or supplied.

**PATIENT AND CARER ADVICE**

Co-dydramol

- **INDICATIONS AND DOSE**
  - **Mild to moderate pain (using co-dydramol 10/500 preparations only)**
    - **BY MOUTH**
      - Adult: 10/500–20/1000 mg every 4–6 hours as required; maximum 80/4000 mg per day
  - **Severe pain (using co-dydramol 20/500 preparations only)**
    - **BY MOUTH**
      - Adult: 20/500–40/1000 mg every 4–6 hours as required; maximum 160/4000 mg per day
  - **Severe pain (using co-dydramol 30/500 preparations only)**
    - **BY MOUTH**
      - Adult: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day
  - **DOSE EQUIVALENCE AND CONVERSION**
    - A mixture of dihydrocodeine tartrate and paracetamol; the proportions are expressed in the form x/y, where x and y are the strengths in milligrams of dihydrocodeine and paracetamol respectively.

- **CAUTIONS**
  - Alcohol dependence: before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours; chronic alcoholism: chronic dehhydration; chronic malnutrition; hepatocellular insufficiency; pancreatitis; severe cor pulmonale

- **INTERACTIONS**
  - Appendix 1: opioids, paracetamol

- **SIDE-EFFECTS**
  - Abdominal pain; acute generalised exanthematous pustulosis; blood disorders; leucopenia; malaise; neutropenia; pancreatitis; paraesthesia; paralytic ileus; skin reactions; Stevens-Johnson syndrome; thrombocytopenia; toxic epidermal necrolysis

- **Overdose**
  - **Important:** liver damage (and less frequently renal damage) following overdosage with paracetamol.

- **BREAST FEEDING**
  - Amount of dihydrocodeine too small to be harmful but use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT**
  - Dose-related toxicity with paracetamol—avoid large doses.

- **RENAL IMPAIRMENT**
  - Reduce dose or avoid dihydrocodeine; increased and prolonged effect; increased cerebral sensitivity.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - When co-dydramol tablets are prescribed and no strength is stated, tablets containing dihydrocodeine tartrate 10 mg and paracetamol 500 mg should be dispensed.

- **LESS SUITABLE FOR PRESCRIBING**
  - Co-dydramol is less suitable for prescribing.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  - **Tablet**

    - **Co-dydramol (Non-proprietary)**
      - Dihydrocodeine tartrate 10 mg, Paracetamol 500 mg
        - Co-dydramol 10mg/500mg tablets: 30 tablet (Pod) £1.14
        - Co-dydramol 10mg/500mg tablets: 100 tablet (Pod) £3.27
        - Co-dydramol 5mg/500mg tablets: 500 tablet (Pod) £11.65

Diamorphine hydrochloride (Heroin hydrochloride)

- **INDICATIONS AND DOSE**
  - **Acute pain**
    - **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
      - Adult: 5 mg every 4 hours if required
    - **BY SLOW INTRAVENOUS INJECTION**
      - Adult: 1.25–2.5 mg every 4 hours if required
  - **Acute pain (heavier, well-muscled patients)**
    - **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
      - Adult: Up to 10 mg every 4 hours if required
    - **BY SLOW INTRAVENOUS INJECTION**
      - Adult: 2.5–5 mg every 4 hours if required
  - **Chronic pain not currently treated with a strong opioid analgesic**
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
      - Adult: Initially 2.5–5 mg every 4 hours, adjusted according to response
    - **BY SUBCUTANEOUS INFUSION**
      - Adult: Initially 5–10 mg, adjusted according to response, dose to be administered over 24 hours
  - **Acute pulmonary oedema**
    - **BY SLOW INTRAVENOUS INJECTION**
      - Adult: 2.5–5 mg, dose to be administered at a rate of 1 mg/minute
  - **Myocardial infarction**
    - **BY SLOW INTRAVENOUS INJECTION**
      - Adult: 5 mg, followed by 2.5–5 mg if required, dose to be administered at a rate of 1–2 mg/minute
      - Elderly: 2.5 mg, followed by 1.25–2.5 mg if required, dose to be administered at a rate of 1–2 mg/minute
  - **Myocardial infarction (frail patients)**
    - **BY SLOW INTRAVENOUS INJECTION**
      - Adult: 2.5 mg, followed by 1.25–2.5 mg if required, dose to be administered at a rate of 1–2 mg/minute

- **CONTRA-INDICATIONS**
  - Delayed gastric emptying; phaeochromocytoma

- **CAUTIONS**
  - CNS depression; severe cor pulmonale; severe diarrhoea; toxic psychosis

- **INTERACTIONS**
  - Appendix 1: opioids

- **SIDE-EFFECTS**
  - Anorexia; asthenia; myocardial infarction; raised intracranial pressure; syncope; taste disturbance

- **BREAST FEEDING**
  - Therapeutic doses unlikely to affect infant; withdrawal symptoms in infants of dependent mothers; breast-feeding not best method of treating dependence in offspring.

- **RENAL IMPAIRMENT**
  - Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection, powder for solution for injection

  - **Powder for solution for injection**
    - **Diamorphine hydrochloride (Non-proprietary)**
      - Diamorphine hydrochloride 5 mg: Diamorphine 5mg powder for solution for injection vials | 5 vial (Pom) £15.00
      - Diamorphine 5mg powder for solution for injection ampoules | 5 ampoule (Pom) £11.36
      - Diamorphine hydrochloride 10 mg: Diamorphine 10mg powder for solution for injection ampoules | 5 ampoule (Pom) £15.06-£16.56
      - Diamorphine hydrochloride 10 mg: Diamorphine 10mg powder for solution for injection ampoules | 5 ampoule (Pom) £15.06-£16.56 DT price = £13.56
Dihydrocodeine tartrate

**INDICATIONS AND DOSE**

**Moderate to severe pain**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 4–11 years: 0.5–1 mg/kg every 4–6 hours (max. per dose 30 mg)
  - Child 12–17 years: 30 mg every 4–6 hours
  - Adult: 30 mg every 4–6 hours as required
- **BY DEEP SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: Up to 50 mg every 4–6 hours if required

**Chronic severe pain**
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 12–17 years: 60–120 mg every 12 hours
  - Adult: 60–120 mg every 12 hours

**DF118 FORTE**

**Severe pain**
- **BY MOUTH**
  - Child 12–17 years: 40–80 mg 3 times a day; maximum 240 mg per day
  - Adult: 40–80 mg 3 times a day; maximum 240 mg per day

**UNLICENSED USE**
Most preparations not licensed for use in children under 4 years.

**CAUTIONS**
- Pancreatitis, severe cor pulmonale
- **INTERACTIONS**
  - Appendix 1: opioids
- **SIDE-EFFECTS**
  - Abdominal pain, diarrhoea, paraesthesia, paralytic ileus, seizures
- **BREAST FEEDING**
  - Use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT**
  - Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**PROFESSION SPECIFIC INFORMATION**
Dental practitioners’ formulary

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Modified-release tablet**

**Fentanyl**

**INDICATIONS AND DOSE**

**Chronic intractable pain not currently treated with a strong opioid analgesic**
- **BY TRANSDERMAL APPLICATION**
  - Child 16–17 years: Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds...
300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually)

- Adult: Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually)

**Chronic intractable pain currently treated with a strong opioid analgesic**

- **BY TRANSDERMAL APPLICATION**
- Child 2–17 years: Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see under Chronic intractable pain not currently treated with a strong opioid analgesic, for conversion from long term oral morphine to transdermal fentanyl, see Pain management with opioids under p. 23.
- Adult: Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see under Chronic intractable pain not currently treated with a strong opioid analgesic, for conversion from long term oral morphine to transdermal fentanyl, see Pain management with opioids under p. 23.

**Spontaneous respiration: analgesia and enhancement of anaesthesia, during operation**

- **BY SLOW INTRAVENOUS INJECTION**
- Adult: Initially 50–100 micrograms (max. per dose 200 micrograms), dose maximum on specialist advice, then 25–50 micrograms as required
- **BY INTRAVENOUS INFUSION**
- Adult: 3–4.8 micrograms/kg/hour, adjusted according to response

**Assisted ventilation: analgesia and enhancement of anaesthesia during operation**

- **BY SLOW INTRAVENOUS INJECTION**
- Adult: Initially 300–3500 micrograms, then 100–200 micrograms as required
- **BY INTRAVENOUS INFUSION**
- Adult: Initially 10 micrograms/kg, dose to be given over 10 minutes, then 6 micrograms/kg/hour, adjusted according to response, may require up to 180 micrograms/kg/hour during cardiac surgery

**Assisted ventilation: analgesia and respiratory depression in intensive care**

- **BY SLOW INTRAVENOUS INJECTION**
- Adult: Initially 300–3500 micrograms, then 100–200 micrograms as required
- **BY INTRAVENOUS INFUSION**
- Adult: Initially 10 micrograms/kg, dose to be given over 10 minutes, then 6 micrograms/kg/hour, adjusted according to response, may require up to 180 micrograms/kg/hour during cardiac surgery

**Breakthrough pain in patients receiving opioid therapy for chronic cancer pain**

- **BY BUCAL ADMINISTRATION USING LOZENGES**
- Child 16–17 years: Initially 200 micrograms, dose to be given over 15 minutes, then 200 micrograms after 15 minutes if required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia
- Adult: Initially 200 micrograms, dose to be given over 15 minutes, then 200 micrograms after 15 minutes if required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

- **BY BUCAL ADMINISTRATION USING BUCAL FILMS**
- Adult: Initially 200 micrograms, adjusted according to response, consult product literature for information on dose adjustments, maximum 1.2 mg per episode of breakthrough pain; leave at least 4 hours between treatment of episodes of breakthrough pain, if more than 4 episodes of breakthrough pain each day occur on more than 4 consecutive days, adjust background analgesia

**DOSE EQUIVALENCE AND CONVERSION**

- Fentanyl films are not bioequivalent to other fentanyl preparations.
- Fentanyl preparations for the treatment of breakthrough pain are not interchangeable; if patients are switched from another fentanyl-containing preparation, a new dose titration is required.

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, weight-based doses may need to be calculated on the basis of ideal body weight.

**ABSTRAL®**

**Breakthrough pain in patients receiving opioid therapy for chronic cancer pain**

- **BY MOUTH USING SUBLINGUAL TABLETS**
- Adult: Initially 100 micrograms, then 100 micrograms after 15–30 minutes if required, dose to be adjusted according to response—consult product literature, no more than 2 dose units 15–30 minutes apart, for each pain episode; max. 800 micrograms per episode of breakthrough pain; leave at least 2 hours between treatment of episodes of breakthrough pain, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

**EFFENTORA®**

**Breakthrough pain in patients receiving opioid therapy for chronic cancer pain**

- **BY MOUTH USING SUBLINGUAL TABLETS**
- Adult: Initially 100 micrograms, then 100 micrograms after 30 minutes if required, dose to be adjusted according to response—consult product literature, no more than 2 dose units for each pain episode; max. 800 micrograms per episode of breakthrough pain; leave at least 2 hours between treatment of episodes of breakthrough pain, if more than 4 episodes of breakthrough pain during titration...
INSTANYL®
Breakthrough pain in patients receiving opioid therapy for chronic cancer pain
► BY INTRanasAL ADMINISTRATION
► Adult: Initially 50 micrograms, dose to be administered into one nostril, then 50 micrograms after 10 minutes if required, dose to be adjusted according to response, maximum 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode, if more than 4 breakthrough pain episodes daily, adjust background analgesia

PECFENT®
Breakthrough pain in patients receiving opioid therapy for chronic cancer pain
► BY INTRanasAL ADMINISTRATION
► Adult: Initially 100 micrograms, adjusted according to response, dose to be administered into one nostril only, maximum 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode, if more than 4 breakthrough pain episodes daily, adjust background analgesia

RECIVIT® SUBLINGUAL TABLETS
Breakthrough pain in patients receiving opioid therapy for chronic cancer pain
► BY MOUTH
► Adult: Initially 133 micrograms, then 133 micrograms after 15–30 minutes (max. per dose 800 micrograms), dose to be repeated only if necessary. Consult product literature for dose adjustments, no more than 2 dose units, 15–30 minutes apart, for each pain episode, maximum of 800 micrograms per episode of breakthrough pain, if more than 4 episodes of breakthrough pain each day, adjust background analgesia; maximum 4 doses per day

● CAUTIONS
GENERAL CAUTIONS
Cerebral tumour · diabetes mellitus (with Actiq® lozenges) · impaired consciousness

SPECIFIC CAUTIONS
► With buccal use Mucositis—absorption from oral preparations may be increased, caution during dose titration (in adults)
CAUTIONS, FURTHER INFORMATION
► With transdermal use Transdermal fentanyl patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Risk of fatal respiratory depression, particularly in patients not previously treated with a strong opioid analgesic; manufacturer recommends use only in opioid tolerant patients.
► With intravenous use Repeated intra-operative doses should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

● INTERACTIONS ➔ Appendix 1: opioids
● SIDE-EFFECTS
GENERAL SIDE-EFFECTS
► Common or very common Abdominal pain · aethesia · anorexia · anxiety · appetite changes · application site reactions · diarrhoea · dyspepsia · dyspnoea · gastro-oesophageal reflux disease · hypertension · myoclonus · paraesthesia · pharyngitis · rhinitis · stomatitis · tremor · vasodilation
► Uncommon · Amnesia · arthralgia · blood disorders · chills · depressed level of consciousness · dysgeusia · flatulence · hyperventilation · ileus · impaired concentration · impaired coordination · loss of consciousness · malaise · parosmia · pyrexia · seizures · speech disorder · thirst · thrombocytopenia
► Rare · Hiccups
► Very rare · Apnoea · arrhythmia · ataxia · bladder pain · delusions · haemoptysis

SPECIFIC SIDE-EFFECTS
► Common or very common
► With intravenous use Myoclonic movements
► Uncommon
► With intravenous use Laryngospasm
► Rare
► With intravenous use Asystole · insomnia

SIDE-EFFECTS, FURTHER INFORMATION
► Fever or external heat Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat, for example a hot bath or sauna (may also increase absorption).
► Muscle rigidity Intravenous administration of fentanyl can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

● BREAST FEEDING
Monitor infant for opioid-induced side-effects.

● RENAL IMPAIRMENT
Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

● DIRECTIONS FOR ADMINISTRATION
► With transdermal use For patches, apply to dry, non-irritated, non-hairy skin on torso or upper arm, removing after 72 hours and siting replacement patch on a different area (avoid using the same area for several days).
► With intravenous use For intravenous infusion (Sublimaze), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%.
► With buccal use in adults For buccal films, moisten mouth, place film on inner lining of cheek (pink side to cheek), hold for at least 5 seconds until it sticks, and leave to dissolve (15–30 minutes); if more than 1 film required do not overlap, but use another area of the mouth. Avoid liquids for 5 minutes after application; avoid food until the film has dissolved.
► With buccal use Patients should be advised to place the lozenge in the mouth against the cheek and move it around the mouth using the applicator; each lozenge should be sucked over a 15 minute period. In patients with a dry mouth, water may be used to moisten the buccal mucosa. Patients with diabetes should be advised each lozenge contains approximately 2 g glucose.

INSTANYL®
Patient should sit or stand during administration.

EFFENTORA®
Place tablet between cheek and gum and leave to dissolve; if more than 1 tablet required, place second tablet on the other side of the mouth; tablet may alternatively be placed under the tongue (sublingually).

● PRESCRIBING AND DISPENSING INFORMATION
Prescriptions for fentanyl patches can be written to show the strength in terms of the release rate and it is acceptable to write ‘Fentanyl 25 micrograms per hour’.

● PATIENT AND CARER ADVICE
Medicines for Children leaflet: Fentanyl lozenges for pain
www.medicinesforchildren.org.uk/fentanyl-lozenges-for-pain
Medicines for Children leaflet: Fentanyl patches for pain
www.medicinesforchildren.org.uk/fentanyl-patches-for-pain
With transdermal use Patients and carers should be informed about safe use, including correct administration and disposal, strict adherence to dosage instructions, and the symptoms and signs of opioid overdosage. Patches should be removed immediately in case of breathing difficulties, marked drowsiness, confusion, dizziness, or impaired speech, and patients and carers should seek prompt medical attention.

In adults Patients or carers should be given advice on how to administer fentanyl buccal films or fentanyl lozenges. Patients or carers should be given advice on how to administer fentanyl nasal spray.

**INSTANYL** Avoid concomitant use of other nasal preparations. Patients or carers should be given advice on how to administer Instanyl® spray.

**PECFENT** Avoid concomitant use of other nasal preparations. Patients or carers should be given advice on how to administer PecFent® spray.

**EFFENTORA** Patients or carers should be given advice on how to administer Effentora® buccal tablets.

Patients should be advised not to eat or drink until the tablet is completely dissolved; after 30 minutes, if any remnants remain, they may be swallowed with a glass of water. Patients with a dry mouth should be advised to drink water to moisten the buccal mucosa before administration of the tablets; if appropriate effervescence does not occur, a switch of therapy may be advised.

**ABSTRAL** Patients should be advised not to eat or drink until the tablet is completely dissolved. In patients with a dry mouth, the buccal mucosa may be moistened with water before administration of tablet.

**RECIVIT® SUBLINGUAL TABLETS** Patients should be advised not to eat or drink until the tablet is completely dissolved; after 30 minutes, if any remnants remain, they may be swallowed. In patients with a dry mouth, the buccal mucosa may be moistened with water before administration of tablet.

### NATIONAL FUNDING/ACCESS DECISIONS

#### INSTANYL®

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised that Instanyl® nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

#### PECFENT®

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2008) that PecFent® nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

#### EFFENTORA®

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised that Effentora® buccal tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

#### ABSTRAL®

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (January 2009) that Abstral® sublingual tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

#### Solution for injection

- **Fentanyl (Non-proprietary)**
  - Fentanyl (as Fentanyl citrate) 50 microgram per 1 ml Fentanyl 100micrograms/2ml solution for injection ampoules | 10 ampoule (Pt) £13.95 (C02)
  - Fentanyl 500micrograms/10ml solution for injection ampoules | 10 ampoule (Pt) £13.95 (C02)

- **Sublimaze** (Janssen-Cilag Ltd)
  - Fentanyl (as Fentanyl citrate) 50 microgram per 1 ml Sublimaze 500micrograms/10ml solution for injection ampoules | 5 ampoule (Pt) £6.53 (C02)

## Hydromorphone hydrochloride

### INDICATIONS AND DOSE

#### Severe pain in cancer
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain
  - Adult: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 12-17 years: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain
  - Adult: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain

#### CONTRA-INDICATIONS
- Acute abdomen
- Pancreatitis - toxic psychosis

#### SIDE-EFFECTS
- Common or very common Abdominal pain - anorexia - anxiety
- Uncommon Agitation - diarrhoea - dysgeusia - dyskinesia - myoclonus - paraesthesia - paralytic ileus - peripheral oedema - seizures - tremor

#### BREAST FEEDING
- Avoid—no information available.

#### RENAL IMPAIRMENT
- Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

#### DIRECTIONS FOR ADMINISTRATION
- For immediate-release capsules, swallow whole capsule or sprinkle contents on soft food. For modified-release capsules, swallow whole or open capsule and sprinkle contents on soft cold food (swallow the pellets within the capsule whole; do not crush or chew).

#### PATIENT AND CARER ADVICE
- Patients or carers should be given advice on how to administer hydromorphone hydrochloride capsules and modified-release capsules.

#### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

#### Modified-release capsule
- **CAUTIONARY AND ADVISORY LABELS 2**
- **Palladone SR** (Napp Pharmaceuticals Ltd)
  - Hydromorphone hydrochloride 2 mg Palladone SR 2mg capsules | 56 capsule  Price £20.98 CD2
  - Hydromorphone hydrochloride 4 mg Palladone SR 4mg capsules | 56 capsule  Price £28.75 CD2
  - Hydromorphone hydrochloride 8 mg Palladone SR 8mg capsules | 56 capsule  Price £56.08 CD2
  - Hydromorphone hydrochloride 16 mg Palladone SR 16mg capsules | 156 capsule  Price £106.53 CD2
  - Hydromorphone hydrochloride 24 mg Palladone SR 24mg capsules | 56 capsule  Price £159.82 CD2

### Capsule
- **CAUTIONARY AND ADVISORY LABELS 2**
- **Palladone** (Napp Pharmaceuticals Ltd)
  - Hydromorphone hydrochloride 1.3 mg Palladone 1.3mg capsules | 56 capsule  Price £8.82 CD2
  - Hydromorphone hydrochloride 2.6 mg Palladone 2.6mg capsules | 56 capsule  Price £17.64 CD2

### Meptazinol

#### INDICATIONS AND DOSE
- Moderate to severe pain, including post-operative pain and renal colic
  - **BY MOUTH**
    - Adult: 200 mg every 3–6 hours as required
  - **BY INTRAMUSCULAR INJECTION**
    - Adult: 75–100 mg every 2–4 hours if required
  - **BY SLOW INTRAVENOUS INJECTION**
    - Adult: 50–100 mg every 2–4 hours if required
  - **Obstetric analgesia**
    - **BY INTRAMUSCULAR INJECTION**
      - Adult: 2 mg/kg, usual dose 100–150 mg

#### CONTRA-INDICATIONS
- Myocardial infarction - phaeochromocytoma

#### INTERACTIONS
- **Appendix 1: opioids**

#### SIDE-EFFECTS
- Abdominal pain - can induce withdrawal symptoms in patients dependent on opioids - diarrhoea - dyspepsia - hypothermia

#### OVERDOSE
- Effects only partially reversed by naloxone.

#### BREAST FEEDING
- Use only if potential benefit outweighs risk.

#### RENAL IMPAIRMENT
- Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

#### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection
- **Meptazinol** (as Meptazinol hydrochloride) 100 mg per
- 1 ml Meptazin 100mg/1ml solution for injection ampoules | 10 ampoule  Price £18.21

#### Tablet
- **CAUTIONARY AND ADVISORY LABELS 2**
- **Meptazinol** (Almirall Ltd)
  - Meptazinol (as Meptazinol hydrochloride) 200 mg Meptazin 200mg tablets | 112 tablet  Price £22.11 DT price = £22.11

### Morphine

#### INDICATIONS AND DOSE

#### Pain
- **BY SUBCUTANEOUS INJECTION**
  - Child 1–5 months: Initially 100–200 micrograms/kg every 6 hours, adjusted according to response
  - Child 6 months-1 year: Initially 100–200 micrograms/kg every 4 hours, adjusted according to response
  - Child 2-11 years: Initially 200 micrograms/kg every 4 hours, adjusted according to response
  - Child 12-17 years: Initially 2.5–10 mg every 4 hours, adjusted according to response
- **INITIALLY BY INTRavenous INJECTION**
  - Child 1-5 months: 100 micrograms/kg every 6 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least continued
5 minutes, followed by (by continuous intravenous infusion) 10–30 micrograms/kg/hour, adjusted according to response
- Child 6 months–11 years: 100 micrograms/kg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response
- Child 12–17 years: 5 mg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 5 mg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response
- By mouth, or by rectum
- Child 1–2 months: Initially 50–100 micrograms/kg every 4 hours, adjusted according to response
- Child 3–5 months: 100–150 micrograms/kg every 4 hours, adjusted according to response
- Child 6–11 months: 200 micrograms/kg every 4 hours, adjusted according to response
- Child 1 year: Initially 200–300 micrograms/kg every 4 hours, adjusted according to response
- Child 2–11 years: Initially 200–300 micrograms/kg every 4 hours (max. per dose 10 mg), adjusted according to response
- Child 12–17 years: Initially 5–10 mg every 4 hours, adjusted according to response

Acute pain
- By subcutaneous injection, or by intramuscular injection
- Adult: Initially 10 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be given more frequently during titration, use dose for elderly in frail patients
- Elderly: Initially 5 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be given more frequently during titration
- By slow intravenous injection
- Adult: Initially 5 mg every 4 hours, adjusted according to response, dose can be adjusted more frequently during titration, reduced dose recommended in frail and elderly patients

Chronic pain
- By mouth, or by subcutaneous injection, or by intramuscular injection
- Adult: Initially 5–10 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients
- By rectum
- Adult: Initially 15–30 mg every 4 hours, adjusted according to response

Pain (with modified-release 12-hourly preparations)
- By mouth using modified-release medicines
- Adult: Every 12 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

Pain (with modified-release 24-hourly preparations)
- By mouth using modified-release medicines
- Adult: Every 24 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

Pain management in palliative care (starting dose for opioid-naïve patients)
- By mouth
- Adult: 20–30 mg daily in divided doses, using immediate-release preparation 4-hourly or a 12-hourly modified-release preparation, for management of breakthrough pain and other general advice, see Pain management with opioids under p. 23.

Pain management in palliative care (starting dose for patients being switched from a regular weak opioid)
- By mouth
- Adult: 40–60 mg daily in divided doses, using immediate-release preparation 4-hourly or 12-hourly modified-release preparation, for management of breakthrough pain and other general advice, see Pain management with opioids under p. 23.

Pain in palliative care (following initial titration)
- By mouth using immediate-release medicines
- Adult: Usual dose 30 mg every 4 hours; up to 200 mg every 4 hours, higher dose may be required for some patients (occasionally more is needed); for management of breakthrough pain and other general advice, see Pain management with opioids under p. 23.

Pain in palliative care
- By intravenous infusion
- Adult: (consult local protocol)

Myocardial infarction
- By slow intravenous injection
- Adult: 5–10 mg, followed by 5–10 mg if required, dose to be administered at a rate of 1–2 mg/minute, use dose for elderly in frail patients
- Elderly: 2.5–5 mg, followed by 2.5–5 mg if required, dose to be administered at a rate of 1–2 mg/minute

Acute pulmonary oedema
- By slow intravenous injection
- Adult: 5–10 mg, dose to be administered at a rate of 2 mg/minute, use dose for elderly in frail patients
- Elderly: 2.5–5 mg, dose to be administered at a rate of 2 mg/minute

Dyspnoea at rest in palliative care
- By mouth
- Adult: Initially 5 mg every 4 hours, to be given in carefully titrated doses

Dose equivalence and conversion
- The doses stated refer equally to morphine hydrochloride and sulfate.

Unlicensed use
IMPORTANT SAFETY INFORMATION
Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see Prescribing and dispensing information.

- CONTRA-INDICATIONS Acute abdomen • delayed gastric emptying • heart failure secondary to chronic lung disease • phaeochromocytoma
- CAUTIONS Cardiac arrhythmias • pancreatitis • severe cor pulmonale
- INTERACTIONS ▶ Appendix 1: opioids
- SIDE-EFFECTS Abdominal pain • agitation • amenorrhoea • anorexia • asthenia • bronchospasm • delirium • disorientation • dyspepsia • exacerbation of pancreatitis • excitation • hyperventilation • hypothermia • inhibition of cough reflex • malaise • muscle fasciculation • myoclonus • nystagmus • paraesthesia • paralytic ileus • raised intracranial pressure • restlessness • rhabdomyolysis • seizures • syncope • taste disturbance
- BREAST FEEDING Therapeutic doses unlikely to affect infant.
- RENAL IMPAIRMENT Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.
- DIRECTIONS FOR ADMINISTRATION ▶ With intravenous use in children For continuous intravenous infusion, dilute with Glucose 5% or 10% or Sodium Chloride 0.9%.
▶ With oral use For modified release capsules—swallow whole or open capsule and sprinkle contents on soft food.
- PRESCRIBING AND DISPENSING INFORMATION Modified-release preparations are available as 12-hourly or 24-hourly formulations; prescribers must ensure that the correct preparation is prescribed. Preparations that should be given 12-hourly include Filmarine® SR, MST Continus® Morphgesic® SR and Zomorph®. Preparations that should be given 24-hourly include MXL®. Prescriptions must specify the ‘form’.
▶ With rectal use Both the strength of the suppositories and the morphine salt contained in them must be specified by the prescriber.

Palliative care For further information on the use of morphine in palliative care, see www.palliativedrugs.com/formulary/en/morphine.html.

- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer morphine modified-release capsules.

Medicines for Children leaflet: Morphine for pain www.medicinesforchildren.org.uk/morphine-for-pain

- EXCEPTIONS TO LEGAL CATEGORY Morphine Oral Solutions Prescription-only medicines or schedule 2 controlled drug. The proportion of morphine hydrochloride may be altered when specified by the prescriber; if above 13 mg per 5 mL the solution becomes a schedule 2 controlled drug. It is usual to adjust the strength so that the dose volume is 5 or 10 mL.
Oral solutions of morphine can be prescribed by writing the formula:
Morphine hydrochloride 5 mg Chloroform water to 5 mL.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection, infusion, solution for infusion, suppository

Modified-release tablet

Morphine with cyclizine

The properties listed below are those particular to the combination only. For the properties of the components please consider, morphine p. 439, cyclizine p. 409.

- **INDICATIONS AND DOSE**
  
  CYCLIMORPH-10®
  
  Moderate to severe pain (short-term use only)
  
  ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
  
  Adult: 1 mL, do not repeat dose more often than every 4 hours; maximum 3 doses per day

  CYCLIMORPH-15®
  
  Moderate to severe pain (short-term use only)
  
  ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
  
  Adult: 1 mL, do not repeat dose more often than every 4 hours; maximum 3 doses per day

- **CAUTIONS** Myocardial infarction (cyclizine may aggravate severe heart failure and counteract the haemodynamic benefits of opioids) - not recommended in palliative care

- **INTERACTIONS** → Appendix 1: antihistamines (sedating), opioids

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  Solution for injection
  
  ▶ Cyclimorph (AMCo)
    
    Morphine tartrate 15 mg per 1 mL, Cyclizine tartrate 50 mg per 1 mL
    
    Cyclomorph 15 solution for injection 1 mL ampoules | 5 ampoules | £9.12 (C02)
    
    Morphine tartrate 10 mg per 1 mL, Cyclizine tartrate 50 mg per 1 mL
    
    Cyclomorph 10 solution for injection 1 mL ampoules | 5 ampoules | £8.77 (C02)

- **INDICATIONS AND DOSE**

  Postoperative pain | Severe pain | Moderate to severe pain in palliative care

  ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

  Adult: Initially 5 mg every 4–6 hours, dose to be increased if necessary according to severity of pain, some patients may require higher doses than the maximum daily dose; maximum 400 mg per day

  ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

  Adult: Initially 10 mg every 12 hours (max. per dose 200 mg every 12 hours), dose to be increased if necessary according to severity of pain, some patients might require higher doses than the maximum daily dose

  ▶ BY SLOW INTRAVENOUS INJECTION

  Adult: 1–10 mg every 4 hours as required

  ▶ BY INTRAVENOUS INFUSION

  Adult: Initially 2 mg/hour, adjusted according to response

  ▶ BY SUBCUTANEOUS INJECTION

  Adult: Initially 5 mg every 4 hours as required

  Adult: Initially 7.5 mg/24 hours, adjusted according to response

Patient controlled analgesia (PCA)

▶ BY INTRAVENOUS INFUSION

Adult: (consult local protocol)

DOSE EQUIVALENCE AND CONVERSION

2 mg oral oxycodone is approximately equivalent to 1 mg parenteral oxycodone.

**Oxycodone hydrochloride**

19-May-2017

Severe pain

▶ BY MOUTH

Adult: Initially 10 mg every 24 hours, dose to be increased if necessary according to severity of pain, some patients may require higher doses than the maximum daily dose; maximum 400 mg per day

**IMPORTANT SAFETY INFORMATION**

Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see Prescribing and dispensing information.

**CONTRA-INDICATIONS** Acute abdomen • chronic constipation • cor pulmonale • delayed gastric emptying

**CAUTIONS** Pancreatitis • toxic psychosis

**INTERACTIONS** → Appendix 1: opioids

**SIDE-EFFECTS**

▶ Common or very common

  Abdominal pain • anorexia • anxiety • asthenia • bronchospasm • chills • diarrhoea • dyspepsia • dysphonia • impaired cough reflex

▶ Uncommon

  Agitation • amnorrhea • anemia • belching • cholestasis • dehydration • disorientation • dry skin • dysphagia • flatulence • gastritis • hiccups • hypoesthesia • hypotonia • malaise • muscle fasciculation • paraesthesia • paralytic ileus • pyrexia • restlessnes • seizures • speech
There can be variation in the licensing of different medicines for pain disorders, such as in the treatment of chronic pain. It is important to follow the guidance of the national regulatory bodies, such as the Scottish Medicines Consortium (SMC), which advises on the licensing of different medicines. For example, Oxycodone hydrochloride 80 mg Oxycodone 80mg modified-release tablets are available in the UK, with different presentations and dosages. The pharmacist should be consulted for specific advice on the appropriate dose and regimen.

Oxycodone hydrochloride 80 mg Oxycodone 80mg modified-release tablets are available in several presentations, including tablets with different strengths and dosages. The pharmacist should be consulted for specific advice on the appropriate dose and regimen. The cost of the tablets can vary depending on the pharmacy and location. It is important to follow the guidance of the national regulatory bodies, such as the Scottish Medicines Consortium (SMC), which advises on the licensing of different medicines. For example, Oxycodone hydrochloride 80 mg Oxycodone 80mg modified-release tablets are available in the UK, with different presentations and dosages. The pharmacist should be consulted for specific advice on the appropriate dose and regimen.

### Conclusion

In summary, Oxycodone hydrochloride 80 mg Oxycodone 80mg modified-release tablets are available in several presentations, including tablets with different strengths and dosages. The pharmacist should be consulted for specific advice on the appropriate dose and regimen. The cost of the tablets can vary depending on the pharmacy and location. It is important to follow the guidance of the national regulatory bodies, such as the Scottish Medicines Consortium (SMC), which advises on the licensing of different medicines. For example, Oxycodone hydrochloride 80 mg Oxycodone 80mg modified-release tablets are available in the UK, with different presentations and dosages. The pharmacist should be consulted for specific advice on the appropriate dose and regimen.

Oxycodone with naloxone

The properties listed below are those particular to the combination only. For the properties of the components please consider, oxycodone hydrochloride p. 442, naloxone hydrochloride p. 1259.

**Indications and dose**

Severe pain requiring opioid analgesia in patients not currently treated with opioid analgesics

- **By mouth**
  - Adult: Initially 10/5 mg every 12 hours (max. per dose 40/20 mg every 12 hours), dose to be increased according to response; patients already receiving opioid analgesics can start with a higher dose.

Second-line treatment of symptomatic severe to very severe idiopathic restless legs syndrome after failure of dopaminergic therapy

- **By mouth**
  - Adult: Initially 5/2.5 mg every 12 hours, adjusted weekly according to response, usual dose 10/5 mg every 12 hours; maximum 60/30 mg per day.

Dose equivalence and conversion

Dose quantities are expressed in the form x/y where x and y are the strengths in milligrams of oxycodone and naloxone respectively.

**Interactions**

Appendix 1: naloxone, opioids
**Pentazocine**

### INDICATIONS AND DOSE

**Moderate to severe pain**

- **By mouth**
  - Adult: 50 mg every 3–4 hours, dose to be taken preferably after food, usual dose 25–100 mg every 3–4 hours; maximum 600 mg per day

**Moderate pain**

- **By subcutaneous injection, or by intramuscular injection, or by intravenous injection**
  - Adult: 30 mg every 3–4 hours as required; maximum 360 mg per day

**Severe pain**

- **By subcutaneous injection, or by intramuscular injection, or by intravenous injection**
  - Adult: 45–60 mg every 3–4 hours as required; maximum 360 mg per day

### CONTRA-INDICATIONS

Acute porphyrias p. 969 · heart failure secondary to chronic lung disease · patients dependent on opioids (can precipitate withdrawal)

### CAUTIONS

Arterial hypertension · cardiac arrhythmias · myocardial infarction · pancreatitis · phaeochromocytoma · pulmonary hypertension

### INTERACTIONS

Appendix 1: opioids

### SIDE-EFFECTS

Abdominal pain · blood disorders · chills · disorientation · hypertension · hypothermia · myalgia · paraesthesia · raised intracranial pressure · seizures · syncope · toxic epidermal necrolysis · tremor

### OVERDOSE

Effects only partially reversed by naloxone.

### BREAST FEEDING

Use with caution—limited information available.

### RENAL IMPAIRMENT

Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

### LESS SUITABLE FOR PRESCRIBING

Pentazocine is less suitable for prescribing.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- **Pentazocine (Non-proprietary)**
  - Pentazocine hydrochloride 25 mg │ 25 mg tablets | 28 tablet [PO] £24.27 DT price = £24.27 [CD]

#### Capsule

- **Pentazocine (Non-proprietary)**
  - Pentazocine hydrochloride 50 mg │ 50 mg capsules | 28 capsule [PO] £28.50 DT price = £28.50 [CD]
### BY SLOW INTRAVENOUS INJECTION
- Adult: 25–50 mg, then 25–50 mg after 4 hours, for debilitated patients use dose described for elderly patients
- Elderly: Initially 25 mg, then 25–50 mg after 4 hours

### Obstetric analgesia
- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 50–100 mg, then 50–100 mg after 1–3 hours if required; maximum 400 mg per day

### Premedication
- BY INTRAMUSCULAR INJECTION
- Adult: 25–100 mg, dose to be given 1 hour before operation, for debilitated patients use dose described for elderly patients
- Elderly, 25 mg, dose to be given 1 hour before operation

### Postoperative pain
- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 25–100 mg every 2–3 hours if required, for debilitated patients use dose described for elderly patients
- Elderly: Initially 25 mg every 2–3 hours if required

#### CONTRA-INDICATIONS
- Phaeochromocytoma

#### CAUTIONS
- Accumulation of metabolites may result in neurotoxicity • cardiac arrhythmias • not suitable for severe continuing pain • severe cor pulmonale
- **INTERACTIONS** → Appendix 1: opioids
- **SIDE-EFFECTS**
  - Hypothermia • restlessness • tremor
- **OVERDOSE**
  - Convulsions reported in overdosage.

#### BREAST FEEDING
- Present in milk but not known to be harmful.

#### RENAL IMPAIRMENT
- Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

#### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection

#### Tablet
- **CAUTIONARY AND ADVISORY LABELS** 2
  - Pethidine hydrochloride (Non-proprietary)
    
    | Brand name | Concentration | Price (Cost per item) |
    |------------|---------------|-----------------------|
    | Pethidine hydrochloride 10 mg | | |

#### Solution for injection

#### Tapentadol
- **INDICATIONS AND DOSE**
  - Moderate to severe acute pain which can be managed only with opioid analgesics
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Adult: Initially 50 mg every 4–6 hours, adjusted according to response, maximum 700 mg in the first 24 hours, during the first 24 hours of treatment, an additional dose of 50 mg may be taken 1 hour after the initial dose, if pain control not achieved; maximum 600 mg per day
  - **Severe chronic pain**
    - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
      - Adult: Initially 50 mg every 12 hours, adjusted according to response; maximum 500 mg per day

#### INTERACTIONS
- → Appendix 1: opioids

#### SIDE-EFFECTS
- Abdominal discomfort • anxiety • ataxia • decreased appetite • diarrhoea • dystarthis • dyspepsia • hypoaesthesia • malaise • muscle spasms • paraesthesia • seizures • tremor • weight loss

#### BREAST FEEDING
- Avoid—no information available.
**Postoperative pain**

- **BY INTRAVENOUS INJECTION**
  - Adult: Initially 100 mg, then 50 mg every 10–20 minutes if required up to total maximum 250 mg (including initial dose) in first hour, then 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes; maximum 600 mg per day

**Moderate to severe pain (with modified-release 12-hourly preparations)**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 12-17 years: 50–100 mg twice daily, increased if necessary to 150–200 mg twice daily, doses exceeding the usual maximum not generally required; Usual maximum 400 mg/24 hours
  - Adult: 50–100 mg twice daily, increased if necessary to 150–200 mg twice daily, doses exceeding the usual maximum not generally required; Usual maximum 400 mg/24 hours

**Moderate to severe pain (with modified-release 24-hourly preparations)**

- **BY MOUTH USING MODIFIED-RELEASE TABLETS**
  - Child 12-17 years: Initially 150 mg once daily; Usual maximum 400 mg/24 hours
  - Adult: Initially 150 mg once daily, increased if necessary up to 400 mg once daily; Usual maximum 400 mg/24 hours

**ZYDOLO XL**

**Moderate to severe pain**

- **BY MOUTH USING MODIFIED-RELEASE TABLETS**
  - Child 12-17 years: Initially 150 mg once daily, increased if necessary up to 400 mg once daily
  - Adult: Initially 150 mg once daily, increased if necessary up to 400 mg once daily

---

**IMPORTANT SAFETY INFORMATION**

Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see *Prescribing and dispensing information*.

---

**CONTRA-INDICATIONS**

Acute intoxication with alcohol - acute intoxication with analgesics - acute intoxication with hypnotics - acute intoxication with opioids - not suitable for narcotic withdrawal treatment - uncontrolled epilepsy

**CAUTIONS**

Excessive bronchial secretions - history of epilepsy - use tramadol only if compelling reasons - impaired consciousness - not suitable as a substitute in opioid-dependent patients - not suitable in some types of general anaesthesia - susceptibility to seizures - use tramadol only if compelling reasons

**CAUTIONS, FURTHER INFORMATION**

General anaesthesia - Not recommended for analgesia during potentially light planes of general anaesthesia (possibly increased intra-operative recall reported).

**INTERACTIONS**

Appendix 1: opioids

**SIDE-EFFECTS**

Common or very common - Malaise

Uncommon - Diarrhoea - flatulence - gastritis - retching

Rare - Abnormal coordination - anorexia - anxiety - bronchospasm - changes in appetite - delirium - dyspnœa - hypertension - muscle weakness - nightmares - paraesthesia - seizures - syncope - tremor - wheezing

Frequency not known - Blood disorders - hypoglycaemia - speech disorders

**PREGNANCY**

Embryotoxic in animal studies - manufacturers advise avoid.

**BREAST FEEDING**

Amount probably too small to be harmful, but manufacturer advises avoid.

---

**Tramadol hydrochloride**

**INDICATIONS AND DOSE**

**Moderate to severe pain**

- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes

**Moderate to severe acute pain**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; Usual maximum 400 mg/24 hours
  - Adult: Initially 100 mg, then 50–100 mg every 4–6 hours; Usual maximum 400 mg/24 hours

**Moderate to severe chronic pain**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: Initially 50 mg, then, adjusted according to response; Usual maximum 400 mg/24 hours
  - Adult: Initially 50 mg, then, adjusted according to response; Usual maximum 400 mg/24 hours
**HEPATIC IMPAIRMENT** Caution (avoid for oral drops) in severe impairment.

**RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs. Caution (avoid for oral drops) in severe impairment.

**DIRECTIONS FOR ADMINISTRATION** Tramadol hydrochloride orodispersible tablets should be sucked and then swallowed. May also be dispersed in water. Some tramadol hydrochloride modified-release capsule preparations may be opened and the contents swallowed immediately without chewing—check individual preparations.

For intravenous infusion, dilute in Glucose 5% or Sodium Chloride 0.9%.

**PRESCRIBING AND DISPENSING INFORMATION** Modified-release preparations are available as 12-hourly or 24-hourly formulations. Non-proprietary preparations of modified-release tramadol may be available as either 12-hourly or 24-hourly formulations; prescribers and dispensers must ensure that the correct formulation is prescribed and dispensed. Branded preparations that should be given 12-hourly include Invodol SR®, Malron®, Maneo®, Marol®, Maxitram SR®, Oldaram®, Tilodol SR®, Tradorec XL SR®, Tramulief SR®, Zamadol SR®, Zeridame SR® and Zydol SR®. Preparations that should be given 24-hourly include Tradorec XL®, Zamadol® 24 hr, and Zydol XL®.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tramadol hydrochloride orodispersible tablets.

ANTIHISTAMINES ▶ SEDATING ANTIHISTAMINES

Pizotifen

- INDICATIONS AND DOSE
  - Prevention of vascular headache | Prevention of classical migraine | Prevention of common migraine | Prevention of cluster headache
  - BY MOUTH
    - Adult: Initially 500 micrograms once daily, then increased to 1.5 mg once daily, dose to be increased gradually and taken at night, alternatively increased to 1.5 mg daily in 3 divided doses, doses to be increased gradually; increased if necessary up to 4.5 mg daily (max. per dose 3 mg), this dose is rarely necessary
  - Prophylaxis of migraine
    - BY MOUTH
      - Child 5-17 years: Initially 500 micrograms once daily, dose to be taken at night, then increased to up to 1.5 mg daily in divided doses, dose to be increased gradually, max. single dose (at night) 1 mg

- UNLICENSED USE
  - 1.5 mg tablets not licensed for use in children.
  - CAUTIONS
    - Avoid abrupt withdrawal - history of epilepsy - susceptibility to angle-closure glaucoma - urinary retention
  - INTERACTIONS ▶ Appendix 1: antihistamines (sedating)
  - SIDE-EFFECTS
    - Common or very common: Dizziness - drowsiness - dry mouth - increased appetite - weight gain
    - Uncommon: Constipation
    - Rare: Agitation - anxiety - arthralgia - depression - hallucination - insomnia - myalgia - paraesthesia
    - Very rare: Rash (in adults) - seizures - urticaria (in adults)
    - Frequency not known: Hepatitis - jaundice - muscle cramps
    - PREGNANCY
      - Avoid unless potential benefit outweighs risk.
    - BREAST FEEDING
      - Amount probably too small to be harmful, but manufacturer advises avoid.
    - HEPATIC IMPAIRMENT
      - Use with caution.
    - RENAL IMPAIRMENT
      - Use with caution.

- PATIENT AND CARER ADVICE
  - Driving and skilled tasks
    - Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
  - Medicines for Children leaflet: Pizotifen to prevent migraine headaches www.medicinesforchildren.org.uk/pizotifen-to-prevent-migraine-headaches

        - Zamadol Melt 50mg tablets sugar-free | 60 tablet packs [Pom] £7.12 [CD]

Combinations available: Paracetamol with tramadol, p. 424
Migraine

Treatment of acute migraine

Treatment of a migraine attack should be guided by response to previous treatment and the severity of the attacks. A simple analgesic such as aspirin p. 117, paracetamol p. 422 (preferably in a soluble or dispersible form) or a NSAID is often effective; concomitant antiemetic treatment may be required. If treatment with an analgesic is inadequate, an NSAID is often effective; concomitant (preferably in a soluble or dispersible form) or a NSAID is therefore preferred.

Prophylaxis of migraine

Where migraine attacks are frequent, possible provoking factors such as stress, irregular life-style (e.g. lack of sleep), or chemical triggers (e.g. alcohol and nitrates) should be sought; combined oral contraceptives may also provoke migraine.

Preventive treatment for migraine should be considered for patients who:

- suffer at least two attacks a month;
- suffer an increasing frequency of headaches;
- suffer significant disability despite suitable treatment for migraine attacks;
- cannot take suitable treatment for migraine attacks.

Prophylaxis is also necessary in some rare migraine subtypes and those at risk of migrainean infarction.

The beta-blockers propranolol hydrochloride p. 145, atenolol p. 147, metoprolol tartrate p. 149, nadolol p. 144, and timolol maleate p. 146 are all effective. Propranolol hydrochloride is the most commonly used. Tricyclic antidepressants [unlicensed indication], topiramate p. 315, sodium valproate p. 312 [unlicensed indication], valproic acid p. 337 [unlicensed indication], and gabapentin p. 301 [unlicensed indication] are also effective for preventing migraine.

Botulinum toxin type A is licensed for the prophylaxis of headaches in adults with chronic migraine.

Cluster headache and the trigeminal autonomic cephalalgias

Cluster headache rarely responds to standard analgesics. Sumatriptan given by subcutaneous injection is the drug of choice for the treatment of cluster headache. If an injection is unsuitable, sumatriptan nasal spray or zolmitriptan nasal spray [both unlicensed use] may be used. Alternatively, 100% oxygen at a rate of 10–15 litres/minute for 10–20 minutes is useful in aborting an attack.

Prophylaxis of cluster headache is considered if the attacks are frequent, last over 3 weeks, or if they cannot be treated effectively. Verapamil hydrochloride p. 159 or lithium [both unlicensed use] are used for prophylaxis.

Prednisolone p. 639 can be used for short-term prophylaxis of episodic cluster headache [unlicensed use] either as monotherapy, or in combination with verapamil hydrochloride during verapamil titration.

Ergotamine tartrate, used on an intermittent basis is an alternative for patients with short bouts, but it should not be used for prolonged periods.

The other trigeminal autonomic cephalalgias, paroxysmal hemicrania (sensitive to indometacin p. 1043), and short-lasting unilateral neuralgiform headache attacks with conjunctival injection and tearing, are seen rarely and are best managed by a specialist.

Other drugs used for Migraine

- Amitriptyline hydrochloride, p. 355
- Botulinum toxin type A, p. 387
- Clonidine hydrochloride, p. 139
- Flurphenazine, p. 372
**ANALGESICS > NON-OPIOID**

### Paracetamol with isometheptene

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 422.

#### INDICATIONS AND DOSE

**Treatment of acute attacks of migraine**

- **BY MOUTH**
  - Adult: 2 capsules, dose to be taken at onset of attack, followed by 1 capsule every 1 hour if required, maximum of 5 capsules in 12 hours

#### INTERACTIONS

- **Appendix 1: isometheptene, paracetamol**

#### PATIENT AND CARER ADVICE

Patient counselling is advised (dosage).

#### LESS SUITABLE FOR PRESCRIBING

Isometheptene with paracetamol is less suitable for prescribing (more effective treatments available).

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - CAUTIONARY AND ADVISORY LABELS 30
    - Midrid (DHP Healthcare Ltd)
      - Isometheptene mucate 65 mg, Paracetamol 325 mg
      
  - **Powder**
    - CAUTIONARY AND ADVISORY LABELS 13, 21, 32
      - Migramax (Zentiva)
        - Metoclopramide hydrochloride 10 mg, Aspirin DL-Lysine
        - 900 mg
        
#### IMPORTANT SAFETY INFORMATION

Metoclopramide can cause severe extrapyramidal effects, particularly in children and young adults.

### Paracetamol with metoclopramide

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 422, metoclopramide hydrochloride p. 411.

#### INDICATIONS AND DOSE

**Acute migraine**

- **BY MOUTH USING TABLETS**
  - Adult: 2 tablets, to be taken at the onset of attack, followed by 2 tablets every 4 hours if required; maximum 6 tablets per day

- **BY MOUTH USING EFFERVESCENT POWDER SACHETS**
  - Adult: 2 sachets, to be taken at the onset of attack, followed by 2 sachets every 4 hours if required, sachets to be dissolved in a quarter tumblerful of water; maximum 6 sachets per day

#### IMPORTANT SAFETY INFORMATION

Metoclopramide can cause severe extrapyramidal effects, particularly in young adults.

- **CAUTIONS**
  - Treatment should not exceed 3 months due to risk of tardive dyskinesia

- **INTERACTIONS**
  - **Appendix 1**: metoclopramide, paracetamol

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- **Powder**
  - CAUTIONARY AND ADVISORY LABELS 13, 21, 32
    - Migramax (Zentiva)
      - Metoclopramide hydrochloride 10 mg, Aspirin DL-Lysine
        - 900 mg
        
#### IMPORTANT SAFETY INFORMATION

Metoclopramide can cause severe extrapyramidal effects, particularly in children and young adults.

- **CAUTIONS**
  - Treatment should not exceed 3 months due to risk of tardive dyskinesia

- **INTERACTIONS**
  - **Appendix 1**: aspirin, metoclopramide

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Flavours of oral powder formulations may include lemon.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- **Powder**
  - CAUTIONARY AND ADVISORY LABELS 13, 21, 32
    - Migramax (Zentiva)
      - Metoclopramide hydrochloride 10 mg, Aspirin DL-Lysine
        - 900 mg
        
#### Tolfenamic acid

#### INDICATIONS AND DOSE

**Treatment of acute migraine**

- **BY MOUTH**
  - Adult: 200 mg, dose to be taken at onset, then 200 mg after 1–2 hours if required

- **CONTRA-INDICATIONS**
  - Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal haemorrhage (two or more distinct episodes) · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

- **CAUTIONS**
  - Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn’s disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **INTERACTIONS**
  - **Appendix 1**: NSAIDs

- **SIDE-EFFECTS**
  - Rare: Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure ·

Downloaded from www.medicalbr.com
pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis

- **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · confusion · Crohn’s disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · dysuria (most commonly in men) · euphoria · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · hallucination · headache · hearing disturbances · hypersensitivity reactions · insomnia · malaise · nausea · nervousness · paraesthesia · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · tremor · vertigo · visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

- Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Amount too small to be harmful. Use with caution during breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 21**
- **Tolfenamic acid (Non-proprietary)**
  - Tolfenamic acid 200 mg Tolfenamic acid 200mg tablets 10 tablet [PoM] £19.25 DT price = £19.25
  - Clotam Rapid (Galen Ltd)
    - Tolfenamic acid 200 mg Clotam Rapid 200mg tablets 10 tablet [PoM] £12.75 DT price = £12.75

**ANTIHISTAMINES › SEDATING ANTIHISTAMINES**

- **Paracetamol with buclizine hydrochloride and codeine phosphate**

  The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 422, codeine phosphate p. 431.

**INDICATIONS AND DOSE**

**MIGRALEVE ®**

**Acute migraine**

- **BY MOUTH**
  - Child 12-14 years: Initially 1 tablet, (pink tablet) to be taken at onset of attack, or if it is imminent, followed by 1 tablet every 4 hours if required, (yellow tablet) to be taken following initial dose; maximum 1 pink and 3 yellow tablets in 24 hours
  - Child 15-17 years: Initially 2 tablets, (pink tablets) to be taken at onset of attack or if it is imminent, followed by 2 tablets every 4 hours if required, (yellow tablets) to be taken following initial dose; maximum 2 pink and 6 yellow tablets in 24 hours
  - Adult: Initially 2 tablets, (pink tablets) to be taken at onset of attack or if it is imminent, followed by 2 tablets every 4 hours if required, (yellow tablets) to be taken following initial dose; maximum 2 pink and 6 yellow tablets in 24 hours

**INTERACTIONS** → Appendix 1: antihistamines (sedating), opioids, paracetamol

**LESS SUITABLE FOR PRESCRIBING**

**MIGRALEVE ®** Migrave ® is less suitable for prescribing.

**ERGOT ALKALOIDS**

**Ergotamine tartrate**

- **INDICATIONS AND DOSE**

  Management of cluster headache

  - **BY MOUTH USING TABLETS**
    - Adult: 1 mg once daily for 6 nights in 7; occasionally given for 1–2 weeks, dose to be taken at night

- **UNLICENSED USE** Not licensed for the management of cluster headache.

- **CONTRA-INDICATIONS** Acute porphyrias p. 969 · coronary heart disease · hyperthyroidism · inadequately controlled hypertension · oblitative vascular disease · peripheral vascular disease · Raynaud’s syndrome · sepsis · severe hypertension · temporal arteritis

- **CAUTIONS** Anaemia · cardiac disease · dependence · elderly · risk of peripheral vasospasm

- **INTERACTIONS** → Appendix 1: ergotamine

- **SIDE-EFFECTS**

  - **Common or very common** Abdominal pain · dizziness · nausea · vomiting
  - **Uncommon** Cyanosis · diarrhoea · hypoaesthesia · pain in extremities · paraesthesia · peripheral vasoconstriction · weakness in extremities
  - **Rare** Arrhythmias · bradycardia · dyspnoea · ergotism (including absence of pulse and numbness in extremities) · increased blood pressure · intestinal ischaemia · myalgia · rash · tachycardia · urticaria
  - **Very rare** Gangrene · heart-valve fibrosis · myocardial infarction · myocardial ischaemia
Ergotamine tartrate with caffeine hydrate and cyclizine hydrochloride

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergotamine tartrate p. 452, cyclizine p. 409.

- **INDICATIONS AND DOSE**
  - **Treatment of acute migraine and migraine variants unresponsive to analgesics**
    - **BY MOUTH**
    - Adult: 1 tablet, to be taken at onset, followed by 0.5–1 tablet after 30 minutes, then 0.5–1 tablet every 30 minutes if required, max. 3 tablets in 24 hours, max. 4 tablets per attack, max. 6 tablets in one week
  - **INTERACTIONS** → Appendix 1: antihistamines (sedating), ergotamine
  - **PATIENT AND CARER ADVICE** Patient counselling is advised for cyclizine hydrochloride with caffeine hydrate and ergotamine tartrate tablets (dosage).
  - **LESS SUITABLE FOR PRESCRIBING** Cyclizine hydrochloride with caffeine hydrate and ergotamine tartrate (Migrel®) is less suitable for prescribing.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

**INDICATIONS AND DOSE**

**Treatment of acute migraine and migraine variants unresponsive to analgesics**

**BY MOUTH**

- Adult: 12.5 mg, dose to be taken as soon as possible after onset, followed by 12.5 mg after 2 hours if required, dose to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 25 mg per day

**Unlicensed Use**

- Not licensed for use in elderly.

**Contra-Indications**

- Coronary vasospasm - ischaemic heart disease - peripheral vascular disease - previous cerebrovascular accident - previous myocardial infarction - previous transient ischaemic attack - Prinzmetal’s angina - severe hypertension - uncontrolled hypertension

**CAUTIONS**

- Conditions which predispose to coronary artery disease - elderly

**INTERACTIONS** → Appendix 1: almotriptan

**SIDE-EFFECTS**

- Very rare Myocardial infarction - tachycardia

**FURTHER INFORMATION**

- Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest — discontinue if intense, may be due to coronary vasocstriction or to anaphylaxis).

Rizatriptan

INDICATIONS AND DOSE

Treatment of acute migraine

BY MOUTH

Adult: 10 mg, dose to be taken as soon as possible after onset, followed by 10 mg after 2 hours if required, dose to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 20 mg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises reduce dose to 5 mg with concurrent use of propranolol.

UNLICENSED USE

Not licensed for use in elderly.

CONTRA-INDICATIONS

Coronary vasospasm · ischaemic heart disease · peripheral vascular disease · previous cerebrovascular accident · previous myocardial infarction · previous transient ischaemic attack · Prinzmetal’s angina · severe hypertension · uncontrolled hypertension

CAUTIONS

Conditions which predispose to coronary artery disease · elderly

INTERACTIONS → Appendix 1: rizatriptan

SIDE-EFFECTS

Common or very common · Decreased alertness · diarrhoea · drowsiness · dry mouth · dyspepsia · headache · palpitation · paraesthesia · pharyngeal discomfort · sweating · tachycardia · tremor

Uncommon · Arrhythmias · ataxia · blurred vision · confusion · dyspepsia · hypertension · insomnia · muscle weakness · myalgia · nervousness · pruritus · taste disturbances · thirst · urticaria · vertigo

Rare · Bradycardia · syncope

Sumatriptan

INDICATIONS AND DOSE

Treatment of acute migraine

BY MOUTH

Adult: Initially 50–100 mg for 1 dose, followed by 50–100 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 300 mg per day

SIDE-EFFECTS, FURTHER INFORMATION

Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—discontinue if intense, may be due to coronary vasocostriction or to anaphylaxis).

ALLERGY AND CROSS-SENSITIVITY

Caution in patients with sensitivity to sulphonamides.

PREGNANCY

There is limited experience of using 5HT₁-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

BREAST FEEDING

Withhold breast-feeding for 24 hours.

HEPATIC IMPAIRMENT

Max. 2.5 mg in 24 hours in moderate impairment. Avoid if severe.

RENAL IMPAIRMENT

Max. 2.5 mg in 24 hours. Avoid if eGFR less than 15 mL/minute/1.73 m².

PATIENT AND CARER ADVICE

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving).

Zolmitriptan

INDICATIONS AND DOSE

Treatment of acute migraine

By mouth

Adult: 2.5 mg, followed by 2.5 mg after at least 2 hours if required, dose to be taken only if migraine recurs, then increased if necessary to 5 mg, dose to be taken only for subsequent attacks in patients not achieving satisfactory relief with 2.5 mg dose; maximum 10 mg per day

By intranasal administration

Adult: 5 mg, dose to be administered as soon as possible after onset into one nostril only, followed by 5 mg after at least 2 hours if required, dose to be administered only if migraine recurs; maximum 10 mg per day

Breast feeding

Present in milk but amount probably too small to be harmful; withhold breast-feeding for 12 hours after treatment.

Hepatic impairment

Reduce oral dose to 25–50 mg. Avoid in severe impairment.

Renal impairment

Use with caution.

Patient and carer advice

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving).

Exceptions to legal category

Sumatriptan 50 mg tablets can be sold to the public to treat previously diagnosed migraine; max. daily dose 100 mg.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Unlicensed use

Not licensed for use in elderly.

Contra-indications

Coronary vasospasm · ischaemic heart disease · mild uncontrolled hypertension · moderate and severe hypertension · peripheral vascular disease · previous cerebrovascular accident · previous myocardial infarction · previous transient ischaemic attack · Prinzmetal’s angina

Cautions

Conditions which predispose to coronary artery disease · elderly · history of seizures · mild, controlled hypertension · pre-existing cardiac disease · risk factors for seizures

Interactions

Appendix 1: sumatriptan

Side-effects

General side-effects

Common or very common

Dizziness · drowsiness · dyspnoea · fatigue · flushing · myalgia · nausea · sensory disturbances · transient increase in blood pressure · vomiting · weakness

Frequency not known

Arrhythmias · angina · anxiety · arthralgia · Bradycardia · diarrhoea · dystonia · hypersensitivity reactions · hypotension · ischaemic colitis · myocardial infarction · neck stiffness · nystagmus · palpitation · Raynaud’s syndrome · seizures · sweating · tachycardia · transient ischaemic ECG changes · tremor · visual disturbances

Specific side-effects

Common or very common

With intranasal use

Dysgeusia · epistaxis

Side-effects, further information

Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis).

Allergy and cross-sensitivity

Caution in patients with sensitivity to sulfonamides.

Pregnancy

There is limited experience of using 5HT1 receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

By subcutaneous injection

Adult: Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using an auto-injector; not for intravenous injection which may cause coronary vasospasm and angina; maximum 12 mg per day

By intranasal administration

Adult 18–65 years: Initially 10–20 mg, to be administered into one nostril, followed by 10–20 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 40 mg per day

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 3, 10

Sumatriptan (as Sumatriptan succinate) 12 mg per 1 ml

Imigran Subject 6mg/0.5ml solution for injection | 2 pre-filled disposable injection | £48.00 DT price = £39.50

Imigran Subject (GlaxoSmithKline UK Ltd)

Sumatriptan (as Sumatriptan succinate) 12 mg per 1 ml

Imigran Subject 6mg/0.5ml solution for injection syringe refill pack | 2 pre-filled disposable injection PT | £40.41 DT price = £40.41

Imigran Subject 6mg/0.5ml solution for injection syringe with device | 2 pre-filled disposable injection PT | £50.96 DT price = £50.96

Spray

CAUTIONARY AND ADVISORY LABELS 3, 10

Imigran (GlaxoSmithKline UK Ltd)

Sumatriptan 100 mg per 1 ml

Imigran 10mg nas al spray | 2 unit dose PT | 2 pre-filled disposable injection | £11.80 DT price = £11.80

Imigran 200 mg per 1 ml

Imigran 20mg nas al spray | 2 unit dose PT | £14.16 | 6 unit dose PT | £42.47 DT price = £42.47

Tablet

CAUTIONARY AND ADVISORY LABELS 3, 10

Sumatriptan (as Sumatriptan succinate) 50 mg

Imigran Radis 50mg tablets | 6 tablet PT | £23.90 DT price = £1.25

Imigran 50mg tablets | 6 tablet PT | £31.85 DT price = £1.25

Imigran Recovery 50mg tablets | 2 tablet PT | £4.76

Possible after onset into one nostril only, followed by 5 mg after at least 2 hours if required, dose to be administered only if migraine recurs; maximum 10 mg per day

Migraitan (Bristol Laboratories Ltd)

Sumatriptan (as Sumatriptan succinate) 50 mg

Migraitan 50mg tablets | 2 tablet PT | £4.24

Zolmitriptan

Indications and dose

Treatment of acute migraine

By mouth

Adult: 2.5 mg, followed by 2.5 mg after at least 2 hours if required, dose to be taken only if migraine recurs, then increased if necessary to 5 mg, dose to be taken only for subsequent attacks in patients not achieving satisfactory relief with 2.5 mg dose; maximum 10 mg per day

By intranasal administration

Adult: 5 mg, dose to be administered as soon as possible after onset into one nostril only, followed by 5 mg after at least 2 hours if required, dose to be administered only if migraine recurs; maximum 10 mg per day
6.2 Neuropathic pain

Neuropathic pain

Overview and management

Neuropathic pain, which occurs as a result of damage to neural tissue, includes phantom limb pain, compression neuropathies, peripheral neuropathies (e.g., due to Diabetic complications p. 648, chronic excessive alcohol intake, HIV infection p. 604, chemotherapy, idiopathic neuropathy), trauma, central pain (e.g., pain following stroke, spinal cord injury, and syringomyelia), and postherpetic neuralgia (peripheral nerve damage following acute herpes zoster infection (shingles)). The pain may occur in an area of sensory deficit and is sometimes accompanied by pain that is evoked by a non-noxious stimulus (allodynia).

Trigeminal neuralgia is also caused by dysfunction of neural tissue, but its management is distinct from other forms of neuropathic pain.

Neuropathic pain is generally managed with a tricyclic antidepressant or with certain antiepileptic drugs.

Amitriptyline hydrochloride p. 355 [unlicensed indication] and pregabalin p. 310 are effective treatments for neuropathic pain. Amitriptyline hydrochloride and pregabalin can be used in combination if the patient has an inadequate response to either drug at the maximum tolerated dose.

Nortriptyline p. 361 [unlicensed indication] may be better tolerated than amitriptyline hydrochloride.

Gabapentin p. 301 is also effective for the treatment of neuropathic pain.

Neuropathic pain may respond to opioid analgesics. There is evidence of efficacy for tramadol hydrochloride p. 447, morphine p. 439, and oxycodone hydrochloride p. 442; however, treatment with morphine or oxycodone hydrochloride should be initiated only under specialist supervision. Tramadol hydrochloride can be prescribed when other treatments have been unsuccessful, while the patient is waiting for assessment by a specialist.

Patients with localised pain who are unable to take oral medicines may benefit from topical local anaesthetic preparations, such as lidocaine hydrochloride medicated plasters p. 1242, while awaiting specialist review.

Capsaicin p. 458 is licensed for neuropathic pain (but the intense burning sensation during initial treatment may limit use). Capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia. A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients. It should be used under specialist supervision.

### Orodispersible tablet

**EXCIPIENTS:** May contain Aspartame

**Zolmitriptan (Non-proprietary)**

Zolmitriptan 2.5 mg | Zolmitriptan 2.5mg orodispersible tablets sugar free - sugar free | 6 tablet (POM) | £20.35 DT price = £12.70

Zolmitriptan 5 mg | Zolmitriptan 5mg orodispersible tablets sugar free - sugar free | 6 tablet (POM) | £20.35 DT price = £12.70

**Zomig Rapimelt** (AstraZeneca UK Ltd)

Zolmitriptan 2.5 mg | Zomig Rapimelt 2.5mg orodispersible tablets sugar-free - sugar-free | 6 tablet (POM) | £23.99 DT price = £16.99

Zolmitriptan 5 mg | Zomig Rapimelt 5mg orodispersible tablets sugar-free - sugar-free | 6 tablet (POM) | £23.94 DT price = £17.20

**Tablet**

**Zolmitriptan (Non-proprietary)**

Zolmitriptan 2.5 mg | Zolmitriptan 2.5mg tablets | 6 tablet (POM) | £18.36 DT price = £1.48 | 12 tablet (POM) | £30.60

Zolmitriptan 5 mg | Zolmitriptan 5mg tablets | 6 tablet (POM) | £3.60 | 12 tablet (POM) | £7.20

**Zomig** (AstraZeneca UK Ltd)

Zolmitriptan 2.5 mg | Zomig 2.5mg tablets | 6 tablet (POM) | £23.94 DT price = £1.48
A corticosteroid may help to relieve pressure in compression neuropathy and thereby reduce pain.

Neuromodulation by spinal cord stimulation may be of benefit in some patients. Many patients with chronic neuropathic pain require multidisciplinary management, including physiotherapy and psychological support.

**Trigeminal neuralgia**

Surgery may be the treatment of choice in many patients; a neurological assessment will identify those who stand to benefit. Carbamazepine p. 297 taken during the acute stages of trigeminal neuralgia, reduces the frequency and severity of attacks. It is very effective for the severe pain associated with trigeminal neuralgia (and less commonly) glossopharyngeal neuralgia. Blood counts and electrolytes should be monitored when high doses are given. Small doses should be used initially to reduce the incidence of side-effects e.g. dizziness. Some cases respond to phenytoin p. 308; the drug may be given by intravenous infusion (possibly as fosphenytoin sodium p. 300) in a crisis (specialist use only).

**Chronic facial pain**

Chronic oral and facial pain including persistent idiopathic facial pain (also termed ‘atypical facial pain’) and temporomandibular dysfunction (previously termed temporomandibular joint pain dysfunction syndrome) may call for prolonged use of analgesics or for other drugs. **Tricyclic antidepressants** may be useful for facial pain (unlicensed indication), but are not on the Dental Practitioners’ List. Disorders of this type require specialist referral and psychological support to accompany drug treatment. Patients on long-term therapy need to be monitored both for progress and for side-effects.

**Other drugs used for Neuropathic pain**

Amanadine hydrochloride, p. 397

### ANALGESICS > PLANT ALKALOIDS

**Capsaicin**

**INDICATIONS AND DOSE**

**AXSAIN ®**

**Post-herpetic neuralgia**

▶ TO THE SKIN

Adult: Apply 3–4 times a day, dose to be applied sparingly; important; after lesions have healed, not more often than every 4 hours

**Painful diabetic neuropathy (under expert supervision)**

▶ TO THE SKIN

Adult: Apply 3–4 times a day for 8 weeks then review, dose to be applied sparingly, not more often than every 4 hours

**QUTENZA ®**

**Peripheral neuropathic pain in non-diabetic patients (under the supervision of a physician)**

▶ BY TRANSDERMAL APPLICATION USING PATCHES

Adult: (consult product literature)

**ZACIN ®**

**Symptomatic relief in osteoarthritis**

▶ TO THE SKIN

Adult: Apply 4 times a day, dose to be applied sparingly, not more often than every 4 hours

**CAUTIONS**

**GENERAL CAUTIONS**

Avoid contact with broken skin · avoid contact with inflamed skin

**SPECIFIC CAUTIONS**

▶ With topical use Avoid contact with eyes · avoid hot shower or bath just before or after application (burning sensation enhanced) · avoid inhalation of vapours · not to be used under tight bandages

▶ With transdermal use Avoid contact with the face, scalp or in proximity to mucous membranes · avoid holding near eyes or mucous membranes · recent cardiovascular events · uncontrolled hypertension

**SIDE-EFFECTS**

▶ Common or very common

- With topical use Transient burning sensation during initial treatment (particularly if too much used or if administered less than 3–4 times daily)

- With transdermal use Application site reactions · erythema · pruritus · transient burning

▶ Uncommon

- With transdermal use Burning sensation · cough · dysgeusia · eye irritation · first degree AV block · hypertension · hypoaesthesia · muscle spasm · nausea · pain in extremities · palpitations · peripheral oedema · pruritus · tachycardia · throat irritation

▶ Rare

- With topical use Cough · eye irritation · sneezing

- Frequency not known

- With topical use Dyspnoea · exacerbation of asthma

**MONITORING REQUIREMENTS**

- With transdermal use Monitor blood pressure during treatment procedure

**HANDLING AND STORAGE**

- With topical use Wash hands immediately after use (or wash hands 30 minutes after application if hands treated).

- With transdermal use Nitrile gloves to be worn while handling patches and cleaning treatment areas (latex gloves do not provide adequate protection).

**NATIONAL FUNDING/ACCESS DECISIONS**

**QUTENZA ®**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (January 2011) that capsaicin 179 mg (8%) patch (Qutenza®) is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who have not achieved adequate pain relief from, or who have not tolerated conventional first and second line treatments. Treatment should be under the supervision of a specialist in pain management.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream

**Cutaneous patch**

EXCIPIENTS: May contain Butylated hydroxyanisole

▶ Qutenza (Astellas Pharma Ltd)

Capsaicin 179 mg (Qutenza 179mg cutaneous patches) 1 patch £210.00

**Cream**

EXCIPIENTS: May contain Benzyl alcohol, cetylstearyl alcohol (including cetyl and stearyl alcohol)

▶ Axsain (Teva UK Ltd)

Capsaicin 750 microgram per 1 gram Axsain 0.075% cream | 45 gram £14.58 DT price = £14.58

▶ Zacin (Teva UK Ltd)

Capsaicin 250 microgram per 1 gram Zacin 0.025% cream | 45 gram £17.71 DT price = £17.71
7 Sleep disorders

7.1 Insomnia

Hypnotics and anxiolytics

Overview

Most anxiolytics (‘sedatives’) will induce sleep when given at night and most hypnotics will sedate when given during the day. Prescribing of these drugs is widespread but dependence (both physical and psychological) and tolerance occur. This may lead to difficulty in withdrawing the drug after the patient has been taking it regularly for more than a few weeks. Hypnotics and anxiolytics should therefore be reserved for short courses to alleviate acute conditions after causal factors have been established.

Benzodiazepines are the most commonly used anxiolytics and hypnotics; they act at benzodiazepine receptors which are associated with gamma-aminobutyric acid (GABA) receptors. Older drugs such as meprobamate p. 330 and barbiturates are not recommended—they have more side-effects and interactions than benzodiazepines and are much more dangerous in overdosage.

Benzodiazepine indications

- Benzodiazepines are indicated for the short-term relief (two to four weeks only) of anxiety that is severe, disabling, or causing the patient unacceptable distress, occurring alone or in association with insomnia or short-term psychosomatic, organic, or psychotic illness.
- The use of benzodiazepines to treat short-term ‘mild’ anxiety is inappropriate.
- Benzodiazepines should be used to treat insomnia only when it is severe, disabling, or causing the patient extreme distress.

Dependence and withdrawal

Withdrawal of a benzodiazepine should be gradual because abrupt withdrawal may produce confusion, toxic psychosis, convulsions, or a condition resembling delirium tremens. The benzodiazepine withdrawal syndrome may develop at any time up to 3 weeks after stopping a long-acting benzodiazepine, but may occur within a day in the case of a short-acting one. It is characterised by insomnia, anxiety, loss of appetite and of body-weight, tremor, perspiration, tinnitus, and perceptual disturbances. Some symptoms may be similar to the original complaint and encourage further prescribing; some symptoms may continue for weeks or months after stopping benzodiazepines.

Benzodiazepine withdrawal should be flexible and carried out at a reduction rate that is tolerable for the patient. The rate should depend on the initial dose of benzodiazepine, duration of use, and the patient’s clinical response. Short-term users of benzodiazepines (2–4 weeks only) can usually taper off within 2–4 weeks. However, long-term users should be withdrawn over a much longer period of several months or more.

A suggested protocol for withdrawal for prescribed long-term benzodiazepine patients is as follows:

- Transfer patient stepwise, one dose at a time over about a week, to an equivalent daily dose of diazepam preferably taken at night.
- Reduce diazepam dose, usually by 1–2 mg every 2–4 weeks (in patients taking high doses of benzodiazepines, initially it may be appropriate to reduce the dose by up to one-tenth every 1–2 weeks). If uncomfortable withdrawal symptoms occur, maintain this dose until symptoms lessen.

- Reduce diazepam dose further, if necessary in smaller steps; steps of 500 micrograms may be appropriate towards the end of withdrawal. Then stop completely.
- For long-term patients, the period needed for complete withdrawal may vary from several months to a year or more.

Approximate equivalent doses, diazepam 5 mg

- alprazolam 250 micrograms
- clobazam 10 mg
- clonazepam 250 micrograms
- flurazepam 7.5–15 mg
- cloridiazepoxide 12.5 mg
- loprazolam 0.5–1 mg
- lorazepam 500 micrograms
- lormetazepam 0.5–1 mg
- nitrazepam 5 mg
- oxazepam 10 mg
- temazepam 10 mg

Withdrawal symptoms for long-term users usually resolve within 6–18 months of the last dose. Some patients will recover more quickly, others may take longer. The addition of beta-blockers, antidepressants and antipsychotics should be avoided where possible.

Counselling can be of considerable help both during and after the taper.

Hypnotics

Before a hypnotic is prescribed the cause of the insomnia should be established and, where possible, underlying factors should be treated. However, it should be noted that some patients have unrealistic sleep expectations, and others underestimate their alcohol consumption which is often the cause of the insomnia. Short-acting hypnotics are preferable in patients with sleep onset insomnia, when sedation the following day is undesirable, or when prescribing for elderly patients. Long-acting hypnotics are indicated in patients with poor sleep maintenance (e.g. early morning waking) that causes daytime effects, when an anxiolytic effect is needed during the day, or when sedation the following day is acceptable.

Transient insomnia may occur in those who normally sleep well and may be due to extraneous factors such as noise, shift work, and jet lag. If a hypnotic is indicated one that is rapidly eliminated should be chosen, and only one or two doses should be given.

Short-term insomnia is usually related to an emotional problem or serious medical illness. It may last for a few weeks and may recur; a hypnotic can be useful but should not be given for more than three weeks (preferably only one week). Intermittent use is desirable with omission of some doses. A short-acting drug is usually appropriate.

Chronic insomnia is rarely benefited by hypnotics and is sometimes due to mild dependence caused by injudicious prescribing of hypnotics. Psychiatric disorders such as anxiety, depression, and abuse of drugs and alcohol are common causes. Sleep disturbance is very common in depressive illness and early wakening is often a useful pointer. The underlying psychiatric complaint should be treated, adapting the drug regimen to alleviate insomnia. For example, clomipramine hydrochloride p. 356 or mirtazapine p. 354 prescribed for depression will also help to promote sleep if taken at night. Other causes of insomnia include daytime cat-napping and physical causes such as pain, pruritus, and dyspnoea.

Hypnotics should not be prescribed indiscriminately and routine prescribing is undesirable. They should be reserved for short courses in the acutely distressed. Tolerance to their effects develops within 3 to 14 days of continuous use and long-term efficacy cannot be assured. A major drawback of long-term use is that withdrawal can cause rebound insomnia and a withdrawal syndrome.
Where prolonged administration is unavoidable hypnotics should be discontinued as soon as feasible and the patient warned that sleep may be disturbed for a few days before normal rhythm is re-established; broken sleep with vivid dreams may persist for several weeks.

**Elderly**

Benzodiazepines and the Z-drugs should be avoided in the elderly, because the elderly are at greater risk of becoming ataxic and confused, leading to falls and injury.

**Dental patients**

Some anxious patients may benefit from the use of hypnotics during dental procedures such as temazepam p. 463 or diazepam p. 327. Temazepam is preferred when it is important to minimise any residual effect the following day.

**Benzodiazepines**

Benzodiazepines used as hypnotics include nitrazepam p. 462 and flurazepam p. 461 which have a prolonged action and may give rise to residual effects on the following day; repeated doses tend to be cumulative.

Lorazepam p. 461, lormetazepam p. 462, and temazepam act for a shorter time and they have little or no hangover effect. Withdrawal phenomena are more common with the short-acting benzodiazepines.

If insomnia is associated with daytime anxiety then the use of a long-acting benzodiazepine anxiolytic such as diazepam given as a single dose at night may effectively treat both symptoms.

Zaleplon, zolpidem, and zopiclone

Zaleplon p. 465, zolpidem tartrate p. 465 and zopiclone p. 466 are non-benzodiazepine hypnotics (sometimes referred to as Z-drugs), but they act at the benzodiazepine receptor. They are not licensed for long-term use; dependence has been reported in a small number of patients. Zolpidem tartrate and zopiclone have a short duration of action; zaleplon is very short acting.

**Chloral and derivatives**

There is no convincing evidence that they are particularly useful in the elderly and their role as hypnotics is now very limited.

Clomethiazole

Clomethiazole p. 464 may be a useful hypnotic for elderly patients because of its freedom from hangover but, as with all hypnotics, routine administration is undesirable and dependence occurs.

**Antihistamines**

Some antihistamines such as promethazine hydrochloride p. 275 are on sale to the public for occasional insomnia; their prolonged duration of action can often cause drowsiness the following day. The sedative effect of antihistamines may diminish after a few days of continued treatment; antihistamines are associated with headache, psychomotor impairment and antimuscarinic effects.

**Alcohol**

Alcohol is a poor hypnotic because the diuretic action interferes with sleep during the latter part of the night. Alcohol also disturbs sleep patterns, and so can worsen sleep disorders.

**Melatonin**

Melatonin p. 464 is a pineal hormone; it is licensed for the short-term treatment of insomnia in adults over 55 years.

**Anxiolytics**

Benzodiazepine anxiolytics can be effective in alleviating anxiety states. Although these drugs are sometimes prescribed for stress-related symptoms, unhappiness, or minor physical disease, their use in such conditions is inappropriate. Benzodiazepine anxiolytics should not be used as sole treatment for chronic anxiety, and they are not appropriate for treating depression or chronic psychosis. In bereavement, psychological adjustment may be inhibited by benzodiazepines.

Anxiolytic benzodiazepine treatment should be limited to the lowest possible dose for the shortest possible time. Dependence is particularly likely in patients with a history of alcohol or drug abuse and in patients with marked personality disorders.

Some antidepressant drugs are licenced for use in anxiety and related disorders. Some antipsychotic drugs, in low doses, are also sometimes used in severe anxiety for their sedative action, but long-term use should be avoided because of the risk of adverse effects. The use of antihistamines (e.g. hydroxyzine hydrochloride p. 274) for their sedative effect in anxiety is not appropriate.

**Beta-adrenoceptor blocking drugs** do not affect psychological symptoms of anxiety, such as worry, tension, and fear, but they do reduce autonomic symptoms, such as palpitation and tremor; they do not reduce non-autonomic symptoms, such as muscle tension. Beta-blockers are therefore indicated for patients with predominantly somatic symptoms; this, in turn, may prevent the onset of worry and fear.

**Benzodiazepines**

Benzodiazepines are indicated for the short-term relief of severe anxiety; long-term use should be avoided. Diazepam, alprazolam p. 326, chlordiazepoxide hydrochloride p. 326, and clonazepam p. 320 have a sustained action. Shorter-acting compounds such as lorazepam p. 322 and oxazepam p. 329 may be preferred in patients with hepatic impairment but they carry a greater risk of withdrawal symptoms.

In panic disorders (with or without agoraphobia) resistant to antidepressant therapy, a benzodiazepine may be used; alternatively, a benzodiazepine may be used as short-term adjunctive therapy at the start of antidepressant treatment to prevent the initial worsening of symptoms. Diazepam or lorazepam are very occasionally administered intravenously for the control of panic attacks. This route is the most rapid but the procedure is not without risk and should be used only when alternative measures have failed. The intramuscular route has no advantage over the oral route.

**Buspirone**

Buspirone hydrochloride p. 325 is thought to act at specific serotonin (5HT1A) receptors. Response to treatment may take up to 2 weeks. It does not alleviate the symptoms of benzodiazepine withdrawal. Therefore a patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting buspirone hydrochloride. The dependence and abuse potential of buspirone hydrochloride is low; it is, however, licensed for short-term use only (but specialists occasionally use it for several months).

**Meprobamate**

Meprobamate p. 330 is less effective than the benzodiazepines, more hazardous in overdosage, and can also induce dependence. It is not recommended.

**Barbiturates**

The intermediate-acting barbiturates have a place only in the treatment of severe intractable insomnia in patients already taking barbiturates; they should be avoided in the elderly. Intermediate-acting barbiturate preparations containing amobarbital sodium, butobarbital, and secobarbital sodium are available on a named patient basis.

The long-acting barbiturate phenobarbital is still sometimes of value in epilepsy but its use as a sedative is unjustified.

The very short-acting barbiturate thiopental sodium p. 322 is used in anaesthesia.

Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.
HYPNOTICS, SEDATIVES AND ANXIOLYTICS > BENZODIAZEPINES

Flurazepam

**INDICATIONS AND DOSE**

**Insomnia (short-term use)**

- **BY MOUTH**
  - Adult: 15–30 mg once daily, dose to be taken at bedtime, for debilitated patients, use elderly dose
  - Elderly: 15 mg once daily, dose to be taken at bedtime

**CONTRA-INDICATIONS** Not for use alone to treat chronic psychosis · not for use alone to treat depression (or anxiety associated with depression) · respiratory depression

**CAUTIONS** Acute porphyrias p. 969 · hypoalbuminaemia · marked personality disorder · muscle weakness

**INTERACTIONS** Appendix 1: flurazepam

**SIDE-EFFECTS**

- **Common or very common** Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression

- **Uncommon** Changes in libido · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache · hypotension · incontinence · salivation changes · slurred speech · tremor · urinary retention · vertigo · visual disturbances

- **Rare** Apnoea · blood disorders · jaundice · respiratory depression · skin reactions

**BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

**HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer. Avoid in severe impairment.

**RENAL IMPAIRMENT** Start with small doses in severe impairment.

**PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NHS restrictions** Flurazepam capsules are not prescribable under the NHS.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**CAUTIONARY AND ADVISORY LABELS**

- **Dalmane (Meda Pharmaceuticals Ltd)**
  - Flurazepam (as Flurazepam hydrochloride) 15 mg Dalmane 15mg capsules | 30 capsule [POM] £6.73 [CD4-I]

**CAUTIONARY AND ADVISORY LABELS**

- **Loprazolam (Non-proprietary)**
  - Loprazolam (as Loprazolam mesilate) 1 mg Loprazolam 1mg tablets | 28 tablet [POM] £18.00 DT price = £18.00 [CD4-I]
Lormetazepam

**INDICATIONS AND DOSE**

**Insomnia (short-term use)**

- **BY MOUTH**
  - Adult: 0.5–1.5 mg once daily, dose to be taken at bedtime, for debilitated patients, use elderly dose
  - Elderly: 500 micrograms once daily, dose to be taken at bedtime

**CONTRA-INDICATIONS**

- Not for use alone to treat chronic psychosis, not for use alone to treat depression (or anxiety associated with depression) - respiratory depression

**CAUTIONS**

- Acute porphyrias p. 969 - hypoalbuminaemia - marked personality disorder - muscle weakness

**CAUTIONS, FURTHER INFORMATION**

- **Paradoxical effects**
  - A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

**INTERACTIONS** → Appendix 1: lormetazepam

**SIDE-EFFECTS**

**PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

- May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

- **CAUTIONARY AND ADVISORY LABELS** 19

- **Lormetazepam (Non-proprietary)**
  - Lormetazepam 500 microgram | 30 tablet | £0.64 | 1.17 DT price = £11.66 [CD-1]
  - Lormetazepam 1 mg | 30 tablet | £12.38 | 1.07 DT price = £8.07 [CD-1]

---

Nitrazepam

**INDICATIONS AND DOSE**

**Insomnia (short-term use)**

- **BY MOUTH**
  - Adult: 5–10 mg daily, dose to be taken at bedtime, for debilitated patients, use elderly dose
  - Elderly: 2.5–5 mg daily, dose to be taken at bedtime

**CONTRA-INDICATIONS**

- Not for use alone to treat chronic psychosis, not for use alone to treat depression (or anxiety associated with depression) - respiratory depression

**CAUTIONS**

- Acute porphyrias p. 969 - hypoalbuminaemia - marked personality disorder - muscle weakness

**CAUTIONS, FURTHER INFORMATION**

- **Paradoxical effects**
  - A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

**INTERACTIONS** → Appendix 1: nitrazepam

**SIDE-EFFECTS**

- **Common or very common**
  - Amnesia - ataxia (especially in the elderly) - confusion (especially in the elderly) - dependence - drowsiness the next day - lightheadedness the next day - muscle weakness - paradoxical increase in aggression

- **Uncommon**
  - Changes in libido - dizziness - dysarthria - gastro-intestinal disturbances - gynaecomastia - headache - hypotension - incontinence - salivation changes - slurred speech - tremor - urinary retention - vertigo - visual disturbances

- **Rare**
  - Apnoea - blood disorders - jaundice - respiratory depression - skin reactions

**BREAST FEEDING**

- Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

**HEPATIC IMPAIRMENT**

- Start with smaller initial doses or reduce dose. Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer. Avoid in severe impairment.

**RENAL IMPAIRMENT**

- Start with small doses in severe impairment.

**PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

- May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Oral suspension**

- **CAUTIONARY AND ADVISORY LABELS** 19

- **Nitrazepam (Non-proprietary)**
  - Nitrazepam 500 microgram per 1 ml | 70 ml | £114.00 DT price = £114.00 [CD-1]

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS** 19

- **Nitrazepam (Non-proprietary)**
  - Nitrazepam 5 mg | 28 tablet | £5.00 DT price = £5.00 [CD-1]
  - Mogadon (Meda Pharmaceuticals Ltd) | 500 tablet | £20.00 [CD-1]

- **Mogadon (Meda Pharmaceuticals Ltd)**
  - Nitrazepam 5 mg | 30 tablet | £5.76 [CD-1]
Temazepam

INDICATIONS AND DOSE

Insomnia (short-term use)

- **By mouth**
  - Adult: 10–20 mg once daily, alternatively 30–40 mg once daily, higher dose range only to be administered in exceptional circumstances, dose to be taken at bedtime, for debilitated patients, use elderly doses
  - Elderly: 10 mg once daily, alternatively 20 mg once daily, higher dose only to be administered in exceptional circumstances, dose to be taken at bedtime

Conscious sedation for dental procedures

- **By mouth**
  - Adult: 15–30 mg, to be administered 30–60 minutes before procedure

Premedication before surgery or investigatory procedures

- **By mouth**
  - Adult: 10–20 mg, to be taken 1–2 hours before procedure, alternatively 30 mg, to be taken 1–2 hours before procedure, higher alternate dose only administered in exceptional circumstances
  - Elderly: 10 mg, to be taken 1–2 hours before procedure, alternatively 20 mg, to be taken 1–2 hours before procedure, higher alternate dose only administered in exceptional circumstances

UNLICENSED USE

Temazepam doses in BNF may differ from those in product literature. Not licensed for conscious sedation for dental procedures.

CONTRA-INDICATIONS

CNS depression - compromised airway - hyperkinesia - not for use alone to treat chronic psychosis - not for use alone to treat depression (or anxiety associated with depression) - obsessional state - phobic states - respiratory depression

CAUTIONS

Hypoaalbuminaemia - muscle weakness - organic brain changes - personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive)—may increase risk of dependence

CAUTIONS, FURTHER INFORMATION

Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

INTERACTIONS

1. Appendix 1: temazepam

SIDE-EFFECTS

1. Common or very common Amnesia - ataxia (especially in the elderly) - confusion (especially in the elderly) - dependence - drowsiness the next day - lightheadedness the next day - muscle weakness - paradoxical increase in aggression
3. Rare Apnoea - blood disorders - jaundice - skin reactions
4. Frequency not known Respiratory depression (may be marked when used for sedation; facilities for its treatment are essential)

BREAST FEEDING

Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

HEPATIC IMPAIRMENT

Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment. If treatment is necessary, benzodiazepines with shorter half-lives are safer.

RENAL IMPAIRMENT

Start with small doses in severe impairment.

PATIENT AND CARER ADVICE

Driving and skilled tasks

May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

PROFESSION SPECIFIC INFORMATION

Dental practitioners’ formulary

Temazepam Tablets and Oral Solution may be prescribed.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

- **Cautionary and Advisory labels 19**
  - Temazepam (Non-proprietary)
    - **Tablet**
      - Temazepam 2 mg per 1 ml Temazepam 10 mg/5 ml oral solution sugar free sugar-free | 300 ml [PoM] £121.08 DT price = £121.08 [CD3]
      - **Tablet**
      - Temazepam (Non-proprietary)
        - Temazepam 10 mg Temazepam 10 mg tablets | 28 tablet [PoM] £35.00 DT price = £1.89 [CD3] | 500 tablet [PoM] £524.82 [CD3]
        - Temazepam 20 mg Temazepam 20 mg tablets | 28 tablet [PoM] £35.00 DT price = £1.91 [CD3] | 250 mg tablets [PoM] £307.94 [CD3]

HYPNOTICS, SEDATIVES AND ANXIOLYTICS

NON-BENZODIAZEPINE HYPNOTICS AND SEDATIVES

Chloral hydrate

INDICATIONS AND DOSE

Insomnia (short-term use) using Chloral Mixture, BP 2000

- **By mouth using oral solution**
  - Adult: 0.5–2 g daily, dose to be taken at bedtime

Insomnia (short-term use), using chloral hydrate 143.3 mg/5 ml oral solution

- **By mouth using oral solution**
  - Adult: 15–30 mL, alternatively 430–860 mg once daily, dose to be taken with water or milk at bedtime; maximum 70 mL per day; maximum 2 g per day

Insomnia (short-term use), using chloral betaine 707 mg (= 414 mg chloral hydrate) tablets

- **By mouth using tablets**
  - Adult: 1–2 tablets, alternatively 414–828 mg once daily, dose to be taken with water or milk at bedtime; maximum 4 tablets per day; maximum 2 g per day

CONTRA-INDICATIONS

Acute porphyrias p. 969 - gastritis - severe cardiac disease

CAUTIONS

Avoid contact with mucous membranes - avoid contact with skin - avoid prolonged use (and abrupt withdrawal thereafter) - reduce dose in debilitated - reduce dose in elderly

INTERACTIONS

1. Appendix 1: chloral hydrate

SIDE-EFFECTS

Abdominal distension - delirium (especially on abrupt withdrawal) - dependence - excitement - flatulence - gastric irritation - headache - ketonuria - nausea - rash - tolerance - vomiting

PREGNANCY

Avoid.

BREAST FEEDING

Risk of sedation in infant—avoid.
Nervous system

DIRECTIONS FOR ADMINISTRATION

RENAL IMPAIRMENT

MEDICINAL FORMS

▶ LESS SUITABLE FOR PRESCRIBING

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 19, 27

▶ Chloral hydrate (Non-proprietary)

Chloral betaine 707 mg

Oral solution

CAUTIONARY AND ADVISORY LABELS 1 (paediatric solution only), 19

▶ Chloral hydrate (Non-proprietary)

Chloral hydrate 28.66 mg per 1 ml

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 19, 27

▶ Chloral hydrate (Non-proprietary)

Cloral betaine 707 mg

Oral solution

CAUTIONARY AND ADVISORY LABELS 1 (paediatric solution only), 19

▶ Chloral hydrate (Non-proprietary)

Cloral hydrate 28.66 mg per 1 ml

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 19

Excipients: May contain Alcohol

▶ Clormethiazole (Non-proprietary)

Clormethiazole (as Clormethiazole edisilate) 50 mg per 1 ml Clormethiazole 31.5 mg/ml oral solution sugar free sugar-free

Capsule

CAUTIONARY AND ADVISORY LABELS 19

▶ Clormethiazole (Non-proprietary)

Clormethiazole 192 mg

INDICATIONS AND DOSE

Severe insomnia (short-term use)

BY MOUTH USING CAPSULES

Elderly: 192–384 mg once daily, dose to be taken at bedtime

BY MOUTH USING ORAL SOLUTION

Elderly: 5–10 mL once daily, dose to be taken at bedtime

Restlessness and agitation

BY MOUTH USING CAPSULES

Elderly: 192 mg 3 times a day

BY MOUTH USING ORAL SOLUTION

Elderly: 5 mL 3 times a day

Alcohol withdrawal

BY MOUTH USING CAPSULES

Adult: Initially 2–4 capsules, to be repeated if necessary after some hours. 9–12 capsules daily in 3–4 divided doses on day 1 (first 24 hours), then 6–8 capsules daily in 3–4 divided doses on day 2, then 4–6 capsules daily in 3–4 divided doses on day 3, dose then to be gradually reduced over days 4–6, total duration of treatment for no more than 9 days

BY MOUTH USING ORAL SOLUTION

Adult: Initially 10–20 mL, to be repeated if necessary after some hours, then 45–60 mL daily in 3–4 divided doses on day 1 (first 24 hours), then 30–40 mL daily in 3–4 divided doses on day 2, then 20–30 mL daily in 3–4 divided doses on day 3, dose then to be gradually reduced over days 4–6, total duration of treatment for no more than 9 days

DIVERSIONS FOR ADMINISTRATION

RENAL IMPAIRMENT

Avoid prolonged use (and abrupt withdrawal thereafter) - cardiac disease (confusional state may indicate hypoxia) - chronic pulmonary insufficiency - elderly - excessive sedation may occur (particularly with higher doses); - history of drug abuse - marked personality disorder - respiratory disease (confusional state may indicate hypoxia) - sleep apnoea syndrome

INTERACTIONS

Appendix 1: clormethiazole

SIDE-EFFECTS

▶ Common or very common

Conjunctival irritation - headache - increased bronchial secretions - increased nasopharyngeal secretions - nasal congestion - nasal irritation

▶ Rare

Alterations in liver enzymes - anaphylaxis - bullous eruption - confusion - dependence - gastro-intestinal disturbances - paradoxical excitement - rash - urticaria

PREGNANCY

Avoid if possible—especially during the first and third trimesters.

BREAST FEEDING

Use only if benefit outweighs risk—present in breast milk but effects unknown.

HEPATIC IMPAIRMENT

Reduce dose. Can precipitate coma.

RENAL IMPAIRMENT

Start with small doses in severe impairment. Increased cerebral sensitivity.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

Certifine

(Chlormethiazole)

INDICATIONS AND DOSE

Severe insomnia (short-term use)

BY MOUTH USING CAPSULES

Elderly: 192–384 mg once daily, dose to be taken at bedtime

BY MOUTH USING ORAL SOLUTION

Elderly: 5–10 mL once daily, dose to be taken at bedtime

Restlessness and agitation

BY MOUTH USING CAPSULES

Elderly: 192 mg 3 times a day

BY MOUTH USING ORAL SOLUTION

Elderly: 5 mL 3 times a day

Alcohol withdrawal

BY MOUTH USING CAPSULES

Adult: Initially 2–4 capsules, to be repeated if necessary after some hours. 9–12 capsules daily in 3–4 divided doses on day 1 (first 24 hours), then 6–8 capsules daily in 3–4 divided doses on day 2, then 4–6 capsules daily in 3–4 divided doses on day 3, dose then to be gradually reduced over days 4–6, total duration of treatment for no more than 9 days

BY MOUTH USING ORAL SOLUTION

Adult: Initially 10–20 mL, to be repeated if necessary after some hours, then 45–60 mL daily in 3–4 divided doses on day 1 (first 24 hours), then 30–40 mL daily in 3–4 divided doses on day 2, then 20–30 mL daily in 3–4 divided doses on day 3, dose then to be gradually reduced over days 4–6, total duration of treatment for no more than 9 days

CONTRA-INDICATIONS

Acute pulmonary insufficiency - alcohol-dependent patients who continue to drink

CAUTIONS

Avoid prolonged use (and abrupt withdrawal thereafter) - cardiac disease (confusional state may indicate hypoxia) - chronic pulmonary insufficiency - elderly - excessive sedation may occur (particularly with higher doses); - history of drug abuse - marked personality disorder - respiratory disease (confusional state may indicate hypoxia) - sleep apnoea syndrome

INTERACTIONS

Appendix 1: clormethiazole

SIDE-EFFECTS

Zaleplon

**INDICATIONS AND DOSE**

**Insomnia (short-term use)**

- **BY MOUTH**
  - Adult: 10 mg daily for up to 4 weeks, dose to be taken at bedtime, for debilitated patients, use elderly dose
  - Elderly: 5 mg daily for up to 4 weeks, dose to be taken at bedtime

- **Common or very common** Amnesia, drowsiness, dysmenorrhea, paraesthesia
- **Uncommon** Anorexia, asthenia, confusion, depersonalisation, depression, disturbances of hearing, disturbances of smell, disturbances of speech, disturbances of vision, dizziness, hallucinations, impaired concentration, incoordination, nausea, photosensitivity
- **Frequency not known** Paradoxical effects, sleep-walking

**SIDE-EFFECTS, FURTHER INFORMATION**

- Paradoxical effects A paradoxical increase in hostility and aggression may be reported. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.
- **PREGNANCY** Avoid regular use (risk of neonatal withdrawal symptoms); high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.
- **BREAST FEEDING** Small amounts present in milk—avoid.
- **HEPATIC IMPAIRMENT** Reduce dose to 5 mg. Can precipitate coma. Avoid if severe impairment.
- **RENAL IMPAIRMENT** Use with caution.

**PATIENT AND CARER ADVICE**

Patients should be advised not to take a second dose during a single night.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- Zaleplon, zolpidem, and zopiclone for the short-term management of insomnia (April 2004) NICE TA77

Zaleplon is recommended for the short-term management of severe insomnia that interferes with normal daily life, and should be prescribed for short periods of time only. www.nice.org.uk/TA77

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

- **Melatonin (Non-proprietary)**
  - Melatonin 3 mg Melatonin 3mg modified-release tablets | 120 tablet | no price available
  - **Circadin** (Flynn Pharma Ltd)
    - Melatonin 2 mg Circadin 2mg modified-release tablets | 30 tablet | £15.39 B7 price + £15.39

**Zolpidem tartrate**

**INDICATIONS AND DOSE**

**Insomnia (short-term use)**

- **BY MOUTH**
  - Adult: 10 mg daily for up to 4 weeks, dose to be taken at bedtime, for debilitated patients, use elderly dose
  - Elderly: 5 mg daily for up to 4 weeks, dose to be taken at bedtime

- **CONTRA-INDICATIONS** Acute respiratory depression, marked neuromuscular respiratory weakness, obstructive sleep apnoea, psychotic illness, severe respiratory depression, unstable myasthenia gravis
- **CAUTIONS** Avoid prolonged use (and abrupt withdrawal thereafter), depression, elderly, history of alcohol abuse, history of drug abuse, muscle weakness, myasthenia gravis
- **INTERACTIONS** Appendix 1: zolpidem
- **SIDE-EFFECTS** Agitation, amnesia, asthenia, ataxia, changes in libido, confusion, dependence, depression, diarrhoea, diplopia, dizziness, drowsiness, falls, hallucination, headache, memory disturbances, muscular weakness, nausea, nightmares, paradoxical effects, perceptual disturbances, skin reactions, sleep-walking, tremor, vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Paradoxical effects A paradoxical increase in hostility and aggression may be reported. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.
- **PREGNANCY** Avoid regular use (risk of neonatal withdrawal symptoms); high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.
- **BREAST FEEDING** Small amounts present in milk—avoid.
- **HEPATIC IMPAIRMENT** Reduce dose to 5 mg. Can precipitate coma. Avoid if severe impairment.
- **RENAL IMPAIRMENT** Use with caution.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks

Drowsiness may persist the next day—leave at least 8 hours between taking zolpidem and performing skilled tasks (e.g., driving, or operating machinery); effects of alcohol and other CNS depressants enhanced.
Zopiclone

- **INDICATIONS AND DOSE**
  - **Insomnia (short-term use)**
    - **BY MOUTH**
    - Adult: 7.5 mg once daily for up to 4 weeks, dose to be taken at bedtime.
    - Elderly: Initially 3.75 mg once daily for up to 4 weeks, dose to be taken at bedtime, increased if necessary to 7.5 mg daily.
  - **Insomnia (short-term use) in patients with chronic pulmonary insufficiency**
    - **BY MOUTH**
    - Adult: Initially 3.75 mg once daily for up to 4 weeks, dose to be taken at bedtime, increased if necessary to 7.5 mg daily.

- **CONTRA-INDICATIONS**
  - Marked neuromuscular respiratory weakness.
  - Respiratory failure.
  - Severe sleep apnoea syndrome.
  - Unstable myasthenia gravis.

- **CAUTIONS**
  - Avoid prolonged use (risk of tolerance and withdrawal symptoms).
  - Chronic pulmonary insufficiency.
  - Increased risk of respiratory depression.
  - Elderly: history of drug abuse.
  - Muscle weakness.
  - Myasthenia gravis (avoid if unstable).
  - Psychiatric illness.

- **INTERACTIONS**
  - Appendix 1: zopiclone

- **SIDE-EFFECTS**
  - **Common or very common**
    - Taste disturbance.
  - **Uncommon**
    - Dizziness.
    - Dry mouth.
    - Headache.
    - Nausea.
    - Vomiting.
  - **Rare**
    - Amnesia.
    - Confusion.
    - Depression.
    - Hallucinations.
    - Nightmares.
  - **Very rare**
    - Incoordination.
    - Light headedness.
  - **Frequency not known**
    - Paradoxical effects.
    - Sleep-walking.

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Paradoxical effects.
    - A paradoxical increase in hostility and aggression may be reported. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses.
    - Increased anxiety and perceptual disorders are other paradoxical effects.
    - Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

- **PREGNANCY**
  - Not recommended (risk of neonatal withdrawal symptoms). Use during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

- **BREAST FEEDING**
  - Present in milk—avoid.

- **HEPATIC IMPAIRMENT**
  - Reduce dose to 3.75 mg in mild to moderate impairment, dose can be increased with caution if necessary. Avoid in severe impairment—can precipitate encephalopathy.

- **RENAL IMPAIRMENT**
  - Start with reduced dose of 3.75 mg. Increased cerebral sensitivity.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks.
    - Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Zaleplon, zolpidem, and zopiclone for the short-term management of insomnia (April 2004) NICE TA77

    - www.nice.org.uk/TA77

### CENTRAL NERVOUS SYSTEM DEPRESSANTS

#### Sodium oxybate

- **DRUG ACTION**
  - A central nervous system depressant.

- **INDICATIONS AND DOSE**
  - **Narcolepsy with cataplexy (under expert supervision)**
    - **BY MOUTH**
    - Adult: Initially 2.25 g daily, dose to be taken on retiring and 2.25 g after 2.5–4 hours, then increased in steps of 1.5 g daily in 2 divided doses, dose adjusted according to response at intervals of 1–2 weeks; dose titration should be repeated if restarting after interval of more than 14 days, maximum 9 g daily in 2 divided doses.

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose by 20% with concurrent use of sodium valproate or valproic acid.

- **CONTRA-INDICATIONS**
  - Major depression.
  - Succinic semialdehyde dehydrogenase deficiency.

- **CAUTIONS**
  - Body mass index of 40 kg/m² or greater (higher risk of sleep apnoea).
  - Elderly.
  - Epilepsy.
  - Heart failure (high sodium content).
  - History of depression.
  - History of drug dependence.
abuse · hypertension (high sodium content) · respiratory disorders · risk of discontinuation effects including rebound cataplexy and withdrawal symptoms

**INTERACTIONS → Appendix 1: sodium oxybate**

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain · anorexia · anxiety · arthralgia · asthenia · back pain · blurred vision · confusion · depression · diarrhoea · disorientation · dizziness · drowsiness · dyspnoea · headache · hypertension · hypoamasthesia · impaired attention · muscle spasm · nasal congestion · nausea · nocturnal enuresis · palpitation · paraesthesia · peripheral oedema · rash · sleep disorders · sleep paralysis · sleep walking · sweating · taste disturbance · tremor · urinary incontinence · vertigo · vomiting

- **Uncommon** Agitation · amnesia · faecal incontinence · hallucination · myoclonus · paranoia · psychosis · restless legs syndrome · suicidal behaviour

- **Frequency not known** Dependence · euphoria · respiratory depression · seizures · sleep apnoea · suicidal ideation · urticaria

- **PREGNANCY** Avoid.

- **BREAST FEEDING** No information available.

- **HEPATIC IMPAIRMENT** Halve initial dose.

- **RENAL IMPAIRMENT** Caution—contains 3.96 mmol Na⁺ per mL.

- **DIRECTIONS FOR ADMINISTRATION** Dilute each dose with 60 mL water; prepare both doses before retiring. Observe the same time interval (2–3 hours) each night between the last meal and the first dose.

- **PATIENT AND CARER ADVICE**

Driving and skilled tasks
Leave at least 6 hours between taking sodium oxybate and performing skilled tasks (e.g. driving or operating machinery); effects of alcohol and other CNS depressants enhanced.

Patients or carers should be given advice on how to administer sodium oxybate oral solution.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS 13, 19**

**ELECTROLYTES:** May contain Sodium

- **Xyrem** (UCB Pharma Ltd)

Sodium oxybate 500 mg per 1 mL Xyrem 500 mg/mL oral solution sugar-free 380 mL [Pod] £360.00 DT price = £360.00 [62]

**CNS STIMULANTS ▶ CENTRALLY ACTING SYMPATHOMIMETICS**

**Modafinil**

**INDICATIONS AND DOSE**

**Excessive sleepiness associated with narcolepsy with or without cataplexy**

- **BY MOUTH**

  - Adult: Initially 200 mg daily in 2 divided doses, dose to be taken in the morning and at noon, alternatively initially 200 mg once daily, dose to be taken in the morning, adjusted according to response to 200–400 mg daily in 2 divided doses, alternatively adjusted according to response to 200–400 mg once daily

  - Elderly: Initially 100 mg daily

**CONTRA-INDICATIONS**

Arrhythmia · history of clinically significant signs of CNS stimulant-induced mitral valve prolapse (including ischaemic ECG changes, chest pain and arrhythmias) · history of cor pulmonale · history of left ventricular hypertrophy · moderate uncontrolled hypertension · severe uncontrolled hypertension

**CAUTIONS**

History of alcohol abuse · history of depression · history of drug abuse · history of mania · history of psychosis · possibility of dependence

**SIDE-EFFECTS**

- **Common or very common** Anxiety · dizziness · dyspepsia · insomnia · irritability · nausea · tremor · vertigo · vomiting

- **Uncommon** Abdominal pain · appetite changes · blepharospasm · bradycardia · changes in blood pressure · changes in libido · chest pain · constipation · diarrhoea · dry mouth · dysomnia · epilepsy · erythema · extrasystoles · fluid retention · gastritis · gastro-oesophageal reflux disease · hot flush · hyperhidrosis · metorrhagia · migraine · movement disorders · musculoskeletal disorders · paraesthesia · pollakiuria · pruritus · psychiatric disturbances · QT prolongation · rash · restless legs syndrome · restlessness · tinnitus · visual disturbances · weight changes (review treatment if significant)

- **Rare** Dysphagia · enterocolitis · flatulence · photosensitivity · spontaneous abortion · toxic skin eruption

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises effective contraception in women of childbearing potential for at least 21 days after treatment discontinuation—pitolisant may reduce the effectiveness of hormonal contraceptives.

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises initial dose may be increased after two weeks in moderate impairment—maximum daily dose should not exceed 18 mg. Manufacturer advises caution in moderate impairment; avoid in severe impairment.

**RENAL IMPAIRMENT** Manufacturer advises use with caution; maximum daily dose should not exceed 18 mg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Wakix** (Lincoln Medical Ltd) ▷

  - Pitolisant (as Pitolisant hydrochloride) 4.5 mg Wakix 4.5mg tablets 30 tablet [Pod] £310.00

  - Pitolisant (as Pitolisant hydrochloride) 18 mg Wakix 18mg tablets 30 tablet [Pod] £310.00

**Pitolisant (as Pitolisant hydrochloride) 18 mg**

**11-Apr-2017**

**DRUG ACTION**

Pitolisant is a histamine H₃-receptor antagonist which enhances the activity of brain histaminergic neurons.

**INDICATIONS AND DOSE**

**Narcolepsy with or without cataplexy (initiated by a specialist)**

- **BY MOUTH**

  - Adult: Initially 9 mg once daily for 1 week, then increased if necessary to 18 mg once daily for 1 week, then increased if necessary to 36 mg once daily, dose to be taken in the morning with breakfast, dose can be decreased (down to 4.5 mg per day) or increased (up to 36 mg per day) according to response and tolerance

**CAUTIONS**

Acid-related gastric disorders · epilepsy · history of psychiatric disorders · severe anorexia · severe obesity

**INTERACTIONS → Appendix 1: pitolisant**
Substance dependence

Guidance on treatment of drug misuse

Alcohol dependence

Excessive drinking of alcoholic beverages over a prolonged period of time can result in an alcohol withdrawal syndrome on abrupt cessation of, or marked reduction in, drinking. The presence and severity of alcohol dependence can be assessed by The Severity of Alcohol Dependence Questionnaire (SADQ); other assessment questionnaires are also available.

Acute alcohol withdrawal

People with moderate dependence can generally be treated in a community setting unless they are under 18 years of age, or are at high-risk of severe reactions or treatment failure. People with severe dependence should undergo withdrawal in an inpatient setting; withdrawal in severely dependent patients without medical support may lead to seizures, delirium tremens, and death. Long-acting benzodiazepines, usually chloridazepoxide hydrochloride p. 326, are used to attenuate alcohol withdrawal symptoms. In primary care, fixed-dose reducing regimens are usually used, while a symptom-triggered flexible regimen is used in hospital or other settings where continued assessment and monitoring is carried out for 24–48 hours, usually followed by a fixed 5-day reducing dose schedule (sometimes it may be necessary to continue treatment for up to 10 days). Patients with uncomplicated liver disease should be treated under specialist supervision.

Carbamazepine p. 297 [unlicensed indication] is sometimes used as an alternative treatment in acute alcohol withdrawal when benzodiazepines are contra-indicated or not tolerated. Clomethiazole p. 464 is licensed for use in acute alcohol withdrawal, but benzodiazepines are preferred. It should only be used in an inpatient setting and should not be prescribed if the patient is liable to continue drinking alcohol.

Patients with marked agitation or hallucinations and those at risk of delirium tremens (characterised by delirium, hallucinations, tremor, and disorientation) may be prescribed antipsychotic drugs, such as haloperidol p. 368 or olanzapine p. 379 [unlicensed indication], as adjunctive therapy to benzodiazepines; antipsychotics should not be used alone because they do not treat alcohol withdrawal and may lower the seizure threshold. Delirium tremens is a medical emergency that requires specialist inpatient care.

If a patient taking a benzodiazepine as part of a withdrawal regimen develops alcohol withdrawal seizures, a fast-acting benzodiazepine (such as intravenous lorazepam p. 322 [unlicensed indication]) or rectal diazepam p. 327 should be prescribed; thereafter an increase in the dose of oral benzodiazepine should be considered to prevent further seizures from occurring.

Alcohol dependence

Acamprosate calcium p. 471 and naltrexone hydrochloride p. 472 are effective treatments for relapse prevention in patients with alcohol dependence; disulfiram p. 471 is an alternative. Disulfiram should only be used in patients in whom acamprosate calcium and naltrexone hydrochloride are not suitable, or if the patient prefers disulfiram. Nalmefene p. 472 is licensed for the reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level, without physical withdrawal symptoms, and who do not require immediate detoxification.

Patients with alcohol dependence are at risk of developing Wernicke’s encephalopathy; patients at high-risk are those who are malnourished, at risk of malnourishment, or have decompensated liver disease. Parenteral thiamine p. 989 (as Pabrinex®) should be prescribed for treatment of suspected or confirmed Wernicke’s encephalopathy, and for prophylaxis in alcohol dependent patients attending hospital for acute treatment (including treatment unrelated to alcohol dependence); parenteral prophylaxis may also be considered for high-risk patients being treated in primary care. High-dose oral thiamine should be prescribed following parenteral treatment until cognitive function is maximised. In primary care, prophylactic high-dose oral thiamine should be prescribed during acute withdrawal of alcohol, before planned withdrawal, and for patients not undergoing
withdrawal but who are at high-risk of developing Wernicke's encephalopathy.

Patients with chronic alcohol-related pancreatitis who have symptoms of steatorrhea or who have poor nutritional status due to exocrine pancreatic insufficiency should be prescribed pancreatic enzyme supplements; supplements are not indicated when pain is the only symptom.

Corticosteroids are used in patients with severe acute alcohol-related hepatitis.

**Drugs used in alcohol dependence**

**Acamprosate**
Acamprosate calcium, in combination with counselling, may be helpful for maintaining abstinence in alcohol-dependent patients. It is useful for patients who are concerned that strong cravings will result in relapse. It should be initiated as soon as possible after abstinence has been achieved and continued for 1 year; treatment should be maintained if the patient has a temporary relapse but stopped if the patient returns to regular or excessive drinking that persists 4–6 weeks after starting treatment. Acamprosate calcium is not effective in all patients, so efficacy should be regularly assessed.

**Disulfiram**
Disulfiram gives rise to an extremely unpleasant systemic reaction after the ingestion of even a small amount of alcohol because it causes accumulation of acetaldehyde in the body; it is only effective if taken daily. Symptoms can occur within 10 minutes of ingesting alcohol and include flushing of the face, throbbing headache, palpitation, tachycardia, nausea, vomiting, and, with large doses of alcohol, arrhythmias, hypotension, and collapse; these reactions can last several hours. Small amounts of alcohol such as those included in many oral medicines may be sufficient to precipitate a reaction—even toiletries and mouthwashes that contain alcohol should be avoided.

**Nalmefene**
Nalmefene should only be prescribed in conjunction with continuous psychosocial support focused on treatment adherence and reducing alcohol consumption. Nalmefene is not recommended for patients aiming to achieve immediate abstinence.

**Naltrexone**
Naltrexone hydrochloride is an opioid-receptor antagonist, but is useful as an adjunct in the treatment of alcohol dependence after a successful withdrawal. Treatment should be initiated by a specialist and continued under specialist supervision. Naltrexone hydrochloride should be stopped if drinking continues for 4–6 weeks after starting treatment. Naltrexone is only effective if taken daily. Symptoms can cause chest pain. The oral spray can cause increased salivation, and patches can cause minor skin irritation. The nasal spray commonly causes coughing, nasal irritation, epistaxis, sneezing, and watery eyes; the oral spray can cause labile blood pressure and headache.

**Nicotine replacement therapy**
Bupropion hydrochloride has been used as an antidepressant. Its mode of action in smoking cessation is not clear and may involve an effect on noradrenaline and dopamine neurotransmission.

**Nicotine replacement therapy**
Nicotine replacement therapy can be used in place of cigarettes after abrupt cessation of smoking, or alternatively to reduce the amount of cigarettes used in advance of making a quit attempt. Nicotine replacement therapy can also be used to minimise passive smoking, and to treat craving and reduce compensatory smoking after enforced abstinence in smoke-free environments. Smokers who find it difficult to achieve abstinence should consult a healthcare professional for advice.

**Choice**
Nicotine patches p. 473 are a prolonged-release formulation and are applied for 16 hours (with the patch removed overnight) or for 24 hours. If patients experience strong cravings for cigarettes on waking, a 24-hour patch may be more suitable. Immediate-release nicotine preparations (gum, lozenges, sublingual tablets, inhalator, nasal spray, and oral spray) are used whenever the urge to smoke occurs or to prevent cravings.

The choice of nicotine replacement preparation depends largely on patient preference, and should take into account what preparations, if any, have been tried before. Patients with a high level of nicotine dependence, or who have failed with nicotine replacement therapy previously, may benefit from using a combination of an immediate-release preparation and patches to achieve abstinence.

**Side-effects of specific nicotine preparations**
Mild local reactions at the beginning of treatment are common because of the irritant effect of nicotine. Oral preparations and inhalation cartridges can cause irritation of the throat, gum, lozenges, and oral spray can cause increased salivation, and patches can cause minor skin irritation. The nasal spray commonly causes coughing, nasal irritation, epistaxis, sneezing, and watery eyes; the oral spray can cause watery eyes and blurred vision.

Gastro-intestinal disturbances are common and may be caused by swallowed nicotine. Nausea, vomiting, dyspepsia, and hiccup occur most frequently. Ulcerative stomatitis has also been reported. Dry mouth is a common side-effect of lozenges, patches, oral spray, and sublingual tablets. Lozenges cause diaphoresis, constipation, dysphagia, oesophagitis, gastritis, mouth ulcers, bloating, flatulence, and less commonly, taste disturbance, thirst, gingival bleeding, and halitosis. The oral spray may also cause abdominal pain, flatulence, and taste disturbance.

Palpitations may occur with nicotine replacement therapy and rarely patches and oral spray can cause arrhythmia. Patches, lozenges, and oral spray can cause chest pain. The inhalator can very rarely cause reversible atrial fibrillation. Paraesthesia is a common side-effect of oral spray. Abnormal dreams can occur with patches; removal of the patch before bed may help. Lozenges and oral spray may cause rash and hot flushes. Sweating and myalgia can occur with patches and oral spray; the patches can also cause arthralgia.
Opioid dependence
The management of opioid dependence requires medical, social, and psychological treatment; access to a multidisciplinary team is recommended. Treatment for opioid dependence should be initiated under the supervision of an appropriately qualified prescriber.

Untreated heroin dependence shows early withdrawal symptoms within 8 hours, with peak symptoms at 36–72 hours; symptoms subside substantially after 5 days. Methadone hydrochloride p. 476 or buprenorphine p. 425 withdrawal occurs later, with longer-lasting symptoms.

Opioid substitution therapy
Methadone hydrochloride and buprenorphine are used as substitution therapy in opioid dependence. Substitute medication should be commenced with a short period of stabilisation, followed by either a withdrawal regimen or by maintenance treatment. Maintenance treatment enables patients to achieve stability, reduces drug use and crime, and improves health; it should be regularly reviewed to ensure the patient continues to derive benefit. The prescriber should monitor for signs of toxicity, and the patient should be told to be aware of warning signs of toxicity on initiation and during titration.

A withdrawal regimen after stabilisation with methadone hydrochloride or buprenorphine should be attempted only after careful consideration. Enforced withdrawal is ineffective for sustained abstinence, and it increases the risk of patients relapsing and subsequently overdosing because of loss of tolerance. Complete withdrawal from opioids usually takes up to 4 weeks in an inpatient or residential setting, and up to 12 weeks in a community setting. If abstinence is not achieved, illicit drug use is resumed, or the patient cannot tolerate withdrawal, the withdrawal regimen should be stopped and maintenance therapy should be resumed at the optimal dose. Following successful withdrawal treatment, further support and monitoring to maintain abstinence should be provided for a period of at least 6 months.

Missed doses
Patients who miss 3 days or more of their regular prescribed dose of opioid maintenance therapy are at risk of overdose because of loss of tolerance. Consider reducing the dose in these patients.

If the patient misses 5 or more days of treatment, an assessment of illicit drug use is also recommended before restarting substitution therapy; this is particularly important for patients taking buprenorphine because of the risk of precipitated withdrawal.

Buprenorphine
Buprenorphine is preferred by some patients because it is less sedating than methadone hydrochloride; for this reason it may be more suitable for employed patients or those undertaking other skilled tasks such as driving. Buprenorphine is safer than methadone hydrochloride when used in conjunction with other sedating drugs, and has fewer drug interactions. Dose reductions may be easier than with methadone hydrochloride because the withdrawal symptoms are milder, and patients generally require fewer adjunctive medications; there is also a lower risk of overdose. Buprenorphine can be given on alternate days in higher doses and it requires a shorter drug-free period than methadone hydrochloride before induction with naltrexone hydrochloride p. 472 for prevention of relapse.

Patients dependent on high doses of opioids may be at increased risk of precipitated withdrawal. Precipitated withdrawal can occur in any patient if buprenorphine p. 425 is administered when other opioid agonist drugs are in circulation. Precipitated opioid withdrawal, if it occurs, starts within 1–3 hours of the first buprenorphine dose and peaks at around 6 hours. Non-opioid adjunctive therapy, such as lofexidine hydrochloride p. 478, may be required if symptoms are severe.

To reduce the risk of precipitated withdrawal, the first dose of buprenorphine should be given when the patient is exhibiting signs of withdrawal, or 6–12 hours after the last use of heroin (or other short-acting opioid), or 24–48 hours after the last dose of methadone hydrochloride p. 476. It is possible to titrate the dose of buprenorphine within one week—more rapidly than with methadone hydrochloride therapy—but care is still needed to avoid toxicity or precipitated withdrawal; dividing the dose on the first day may be useful.

A combination preparation containing buprenorphine with naloxone (Suboxone®) p. 477 can be prescribed for patients when there is a risk of dose diversion for parenteral administration; the naloxone hydrochloride p. 1259 component precipitates withdrawal if the preparation is injected, but it has little effect when the preparation is taken sublingually.

Methadone
Methadone hydrochloride, a long-acting opioid agonist, is usually administered in a single daily dose as methadone hydrochloride oral solution 1 mg/mL. Patients with a long history of opioid misuse, those who typically abuse a variety of sedative drugs and alcohol, and those who experience increased anxiety during withdrawal of opioids may prefer methadone hydrochloride to buprenorphine because it has a more pronounced sedative effect.

Methadone hydrochloride is initiated at least 8 hours after the last heroin dose, provided that there is objective evidence of withdrawal symptoms. A supplementary dose on the first day may be considered if there is evidence of persistent opioid withdrawal symptoms. Because of the long half-life, plasma concentrations progressively rise during initial treatment even if the patient remains on the same daily dose (it takes 3–10 days for plasma concentrations to reach steady-state in patients on a stable dose); a dose tolerated on the first day of treatment may become a toxic dose on the third day as cumulative toxicity develops. Thus, titration to the optimal dose in methadone hydrochloride maintenance treatment may take several weeks.

Opioid substitution during pregnancy
Acute withdrawal of opioids should be avoided in pregnancy because it can cause fetal death. Opioid substitution therapy is recommended during pregnancy because it carries a lower risk to the fetus than continued use of illicit drugs. If a woman who is stabilised on methadone hydrochloride or buprenorphine for treatment of opioid dependence becomes pregnant, therapy should be continued [buprenorphine is not licensed for use in pregnancy]. Many pregnant patients choose a withdrawal regimen, but withdrawal during the first trimester should be avoided because it is associated with an increased risk of spontaneous miscarriage. Withdrawal of methadone hydrochloride or buprenorphine should be undertaken gradually during the second trimester, with dose reductions made every 3–5 days. If illicit drug use occurs, the patient should be re-stabilised at the optimal maintenance dose and consideration should be given to stopping the withdrawal regimen.

Further withdrawal of methadone hydrochloride or buprenorphine in the third trimester is not recommended because maternal withdrawal, even if mild, is associated with fetal distress, stillbirth, and the risk of neonatal mortality. Drug metabolism can be increased in the third trimester; it may be necessary to either increase the dose of methadone hydrochloride or change to twice-daily consumption (or a combination of both strategies) to prevent withdrawal symptoms from developing.

The neonate should be monitored for respiratory depression and signs of withdrawal if the mother is prescribed high doses of opioid substitute.
Signs of neonatal withdrawal from opioids usually develop 24–72 hours after delivery but symptoms may be delayed for up to 14 days, so monitoring may be required for several weeks. Symptoms include a high-pitched cry, rapid breathing, hungry but ineffective suckling, and excessive wakefulness; severe, but rare symptoms include hypertonicity and convulsions.

Opioid substitution during breastfeeding
Doses of methadone and buprenorphine should be kept as low as possible in breast-feeding mothers. Increased sleepiness, breathing difficulties, or limbness in breast-fed babies of mothers taking opioid substitutes should be reported urgently to a healthcare professional.

Adjunctive therapy and symptomatic treatment
Adjunctive therapy may be required for the management of opioid withdrawal symptoms. Loperamide hydrochloride p. 65 may be used for the control of diarrhoea; mebeverine hydrochloride p. 84 for controlling stomach cramps; paracetamol p. 422 and non-steroidal anti-inflammatory drugs for muscular pains and headaches; metoclopramide hydrochloride p. 411 or prochlorperazine p. 371 may be useful for nausea or vomiting. Topical rubefacients can be helpful for relieving muscle pain associated with methadone hydrochloride withdrawal. If a patient is suffering from insomnia, short-acting benzodiazepines or zopiclone p. 466 may be prescribed, but because of the potential for abuse, prescriptions should be limited to a short course of a few days only. If anxiety or agitation is severe, specialist advice should be sought.

Lofexidine
Lofexidine hydrochloride may alleviate some of the physical symptoms of opioid withdrawal by attenuating the increase in adrenergic neurotransmission that occurs during opioid withdrawal. Lofexidine hydrochloride can be prescribed as an adjuvant to opioid substitution therapy, initiated either at the same time as the opioid substitute or during withdrawal of the opioid substitute. Alternatively, lofexidine hydrochloride may be prescribed instead of an opioid substitute in patients who have mild or uncertain dependence (including young people), and those with a short history of illicit drug use.

Opioid-receptor antagonists
Patients dependent on opioids can be given a supply of naloxone hydrochloride to be used in case of accidental overdose.

Naltrexone hydrochloride p. 472 precipitates withdrawal symptoms in opioid-dependent subjects. Because the effects of opioid-receptor antagonists are blocked by naltrexone hydrochloride, it is prescribed as an aid to prevent relapse in formerly opioid-dependent patients.

Opioid dependence in children
In younger patients (under 18 years), the harmful effects of drug misuse are more often related to acute intoxication than to dependence, so substitution therapy is usually inappropriate. Maintenance treatment with opioid substitution therapy is therefore controversial in young people; however, it may be useful for the older adolescent who has a history of opioid use to undergo a period of stabilisation with buprenorphine or methadone hydrochloride before starting a withdrawal regimen.

ALDEHYDE DEHYDROGENASE INHIBITORS

Disulfiram

- INDICATIONS AND DOSE
  Adjunct in the treatment of alcohol dependence (under expert supervision)
  - BY MOUTH
    - Adult: 200 mg daily, increased if necessary up to 500 mg daily

- UNLICENSED USE
  Disulfiram doses in BNF may differ from those in product literature.

- CONTRA-INDICATIONS
  Cardiac failure - coronary artery disease - history of cerebrovascular accident - hypertension - psychosis - severe personality disorder - suicide risk

- CAUTIONS
  Alcohol challenge not recommended on routine basis (if considered essential—specialist units only with resuscitation facilities) - avoid in acute porphyrias p. 969 - diabetes mellitus - epilepsy - respiratory disease

- INTERACTIONS
  - Appendix 1: disulfiram

- SIDE-EFFECTS
  - Common or very common Drowsiness - fatigue - halitosis - nausea - reduced libido - vomiting
  - Rare Allergic dermatitis - depression - hepatic cell damage - mania - paranoia - peripheral neuritis - psychotic reactions - schizophrenia

- PREGNANCY
  High concentrations of acetaldehyde which occur in presence of alcohol may be teratogenic; avoid in first trimester.

- BREAST FEEDING
  Avoid—no information available.

- HEPATIC IMPAIRMENT
  Use with caution.

- RENAL IMPAIRMENT
  Use with caution.

- PRE-TREATMENT SCREENING
  Before initiating disulfiram, prescribers should evaluate the patient’s suitability for treatment, because some patient factors, for example memory impairment or social circumstances, make compliance to treatment or abstinence from alcohol difficult.

- MONITORING REQUIREMENTS
  During treatment with disulfiram, patients should be monitored at least every 2 weeks for the first 2 months, then each month for the following 4 months, and at least every 6 months thereafter.

- PATIENT AND CARER ADVICE
  Patient counselling is advised (alcohol reaction).

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

Tablet
  CAUTIONARY AND ADVISORY LABELS 2
  - Disulfiram (Non-proprietary)
    Disulfiram 200 mg
    Disulfiram 200 mg tablets | 50 tablet (POM)
    £91.73 DT price = £91.73

GAMMA-AMINOBUTYRIC ACID ANALOGUES AND DERIVATIVES

Acamprosate calcium

- INDICATIONS AND DOSE
  Maintenance of abstinence in alcohol-dependent patients
  - BY MOUTH
    - Adult 18–65 years (body-weight up to 60 kg): 666 mg once daily at breakfast and 333 mg twice daily at midday and at night
    - Adult 18–65 years (body-weight 60 kg and above): 666 mg 3 times a day

8.1 Alcohol dependence
CAUTIONS Continued alcohol abuse (risk of treatment failure)

INTERACTIONS → Appendix 1: acamprosate

SIDE-EFFECTS
- Common or very common Abdominal pain, diarrhoea, flatulence, frigidity, impotence, maculopapular rash, nausea, pruritus, vomiting
- Very rare Angioedema, hypersensitivity reactions, urticaria
- Frequency not known Fluctuation in libido, vesiculo-bullous skin reactions

PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk.

BREAST FEEDING Avoid.

HEPATIC IMPAIRMENT Avoid if serum-creatinine greater than 120 micromol/litre.

PRESCRIBING AND DISPENSING INFORMATION
Acamprosate calcium has been used for the maintenance of abstinence in alcohol dependence in children aged 16 years and over.

OPSIIONAL FORMS

Gastro-resistant tablet

ELECTROLYTES: May contain Calcium
- Acamprosate calcium (Non-proprietary) Acamprosate calcium 333 mg gastro-resistant tablets | 168 tablet (PO) £33.68
- Campral EC (Merck Serono Ltd) Acamprosate calcium 333 mg Campral EC 333mg tablets | 168 tablet (PO) £28.80

OPIOID RECEPTOR ANTAGONISTS

Nalmefene

INDICATIONS AND DOSE
Reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level without physical withdrawal symptoms, and who do not require immediate detoxification
- BY MOUTH
  - Adult: 18 mg daily if required, taken on each day there is a risk of drinking alcohol, preferably taken 1–2 hours before the anticipated time of drinking, if a dose has not been taken before drinking alcohol, 1 dose should be taken as soon as possible; maximum 18 mg per day

CONTRA-INDICATIONS Recent history of acute alcohol withdrawal syndrome — recent or current opioid use

CAUTIONS Continued treatment for more than 1-year history of seizure disorders (including alcohol withdrawal seizures) — psychiatric illness

INTERACTIONS → Appendix 1: nalmefene

SIDE-EFFECTS
- Common or very common Confusion, decreased appetite, decreased libido, disturbance in attention, dizziness, dry mouth, headache, hyperhidrosis, hypoaesthesia, malaise, muscle spasms, nausea, palpitation, paraesthesia, restlessness, sleep disorders, somnolence, tachycardia, tremor, vomiting, weight loss
- Frequency not known Dissociation, hallucinations

PREGNANCY Manufacturer advises avoid—toxicity in animal studies.

BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT Use with caution—avoid in severe impairment.

RENAL IMPAIRMENT Use with caution—avoid in severe impairment.

PRE-TREATMENT SCREENING Before initiating treatment, prescribers should evaluate the patient’s clinical status, alcohol dependence, and level of alcohol consumption. Nalmefene should only be prescribed for patients who continue to have a high drinking risk level two weeks after the initial assessment.

MONITORING REQUIREMENTS During treatment, patients should be monitored regularly and the need for continued treatment assessed.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
- Nalmefene for reducing alcohol consumption in people with alcohol dependence (November 2014) NICE TA325

Nalmefene is recommended within its marketing authorisation, as an option for reducing alcohol consumption, for patients with alcohol dependence:
- who have a high drinking risk level (defined as alcohol consumption of more than 60 g per day for men and more than 40 g per day for women, according to the World Health Organization’s drinking risk levels) without physical withdrawal symptoms, and
- who do not require immediate detoxification.

The marketing authorisation states that nalmefene should:
- only be prescribed in conjunction with continuous psychosocial support focused on treatment adherence and reducing alcohol consumption, and
- be initiated only in patients who continue to have a high drinking risk level 2 weeks after initial assessment.

Tablet

CAUTIONARY AND ADVISORY LABELS 25
- Selincro (Lundbeck Ltd) Nalmefene (as Nalmefene hydrochloride) 18 mg Selincro 18 mg tablets | 14 tablet (PO) £42.42 DT price = £42.42 | 28 tablet (PO) £84.84

Naltrexone hydrochloride

INDICATIONS AND DOSE
Adjuvant to prevent relapse in formerly opioid-dependent patients (who have remained opioid-free for at least 7–10 days) (initiated under specialist supervision)
- BY MOUTH
  - Adult: Initially 25 mg daily, then increased to 50 mg daily, total weekly dose may be divided and given on 3 days of the week for improved compliance (e.g. 100 mg on Monday and Wednesday, and 150 mg on Friday); maximum 350 mg per week

Adjunct to prevent relapse in formerly alcohol-dependent patients (initiated under specialist supervision)
- BY MOUTH
  - Adult: 25 mg once daily on the first day, then increased if tolerated to 50 mg daily

UNLICENSED USE 25 mg dose for adjunct to prevent relapse in formerly alcohol-dependent patients is an unlicensed dose.

CONTRA-INDICATIONS Patients currently dependent on opioids

INTERACTIONS → Appendix 1: naltrexone
8.2 Nicotine dependence

ANTIDEPRESSANTS > SEROTONIN AND NORADRENALINE RE-UPTAKE INHIBITORS

Bupropion hydrochloride
(Amfebutamone hydrochloride)

- INDICATIONS AND DOSE
  To aid smoking cessation in combination with motivational support in nicotine-dependent patients
    - BY MOUTH
    - Adult: Initially 150 mg daily for 6 days, then 150 mg twice daily (max. per dose 150 mg), minimum 8 hours between doses; period of treatment 7–9 weeks, start treatment 1–2 weeks before target stop date, discontinue if abstinence not achieved at 7 weeks, consider maximum 150 mg daily in patients with risk factors for seizures; maximum 300 mg per day
    - Elderly: 150 mg daily for 7–9 weeks, start treatment 1–2 weeks before target stop date, discontinue if abstinence not achieved at 7 weeks; maximum 150 mg per day

- CONTRA-INDICATIONS
  Acute alcohol withdrawal • acute benzodiazepine withdrawal • bipolar disorder • CNS tumour • eating disorders • history of seizures • severe hepatic cirrhosis

- CAUTIONS
  Alcohol abuse • diabetes • elderly • history of head trauma • predisposition to seizures (prescribe only if benefit clearly outweighs risk)

- INTERACTIONS
  ▶ Appendix 1: bupropion

- SIDE-EFFECTS
  ▶ Common or very common
    - Agitation • anxiety • depression • dizziness • dry mouth • fever • gastrointestinal disturbances • headache • impaired concentration • insomnia (reduced by avoiding dose at bedtime) • pruritus • rash • sweating • taste disturbance • tremor
  ▶ Uncommon
    - Anorexia • asthenia • chest pain • confusion • flushing • hypertension • tachycardia • tinnitus • visual disturbances
  ▶ Rare
    - Abnormal dreams • ataxia • blood-glucose changes • depersonalisation • dystonia • exacerbation of psoriasis • hallucinations • hepatitis • hostility • impaired memory • incoordination • irritability • jaundice • palpitation • paraesthesia • postural hypotension • seizures • Stevens-Johnson syndrome • twitching • urinary frequency • urinary retention • vasodilatation
  ▶ Very rare
    - Aggression • delusions • paranoid ideation • restlessness
  ▶ Frequency not known
    - Suicidal ideation

- PREGNANCY
  Avoid—no information available.

- BREAST FEEDING
  Present in milk—avoid.

- HEPATIC IMPAIRMENT
  Reduce dose to 150 mg daily. Avoid in severe hepatic cirrhosis.

- RENAL IMPAIRMENT
  Reduce dose to 150 mg daily.

- MONITORING REQUIREMENTS
  Measure blood pressure before and during treatment.

- PATIENT AND CARER ADVICE
  Driving and skilled tasks
  May impair performance of skilled tasks (e.g. driving).

NICOTINIC RECEPTOR AGONISTS

Nicotine

- INDICATIONS AND DOSE
  Nicotine replacement therapy in individuals who smoke fewer than 20 cigarettes each day
    ▶ BY MOUTH USING CHEWING GUM
    ▶ Adult: 2 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose
Nervous system

▶ BY TRANSDERMAL APPLICATION USING PATCHES
▶ BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS
▶ BY INHALATION USING INHALATOR

Adult: 4 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings.

Cases should not exceed 15 pieces of 4-mg strength gum daily, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day or who require more than 15 pieces of 2-mg strength gum each day

▶ BY MOUTH USING CHEWING GUM
▶ BY MOUTH USING LOZENGE
▶ BY MOUTH USING OROMUCOSAL SPRAY
▶ BY INHALATION USING INHALATOR
▶ BY INTRANASAL ADMINISTRATION USING NASAL SPRAY
▶ BY TRANSDERMAL APPLICATION USING PATCHES

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day

Adult: 2 tablets every 1 hour, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose; maximum 40 tablets per day

Nicotine replacement therapy

▶ BY INHALATION USING INHALATOR
▶ Adult: As required, the cartridges can be used when the urge to smoke occurs or to prevent cravings, individuals should not exceed 12 cartridges of the 10-mg strength daily, or 6 cartridges of the 15-mg strength daily
▶ BY MOUTH USING LOZENGE
▶ Adult: 1 lozenge every 1–2 hours as required, one lozenge should be used when the urge to smoke occurs, individuals who smoke less than 20 cigarettes each day should usually use the lower-strength lozenges; individuals who smoke more than 20 cigarettes each day and those who fail to stop smoking with the lower-strength lozenges should use the higher-strength lozenges; If attempting smoking cessation, treatment should continue for 6–12 weeks before attempting a reduction in dose; maximum 15 lozenges per day
▶ BY MOUTH USING OROMUCOSAL SPRAY
▶ Adult: 1–2 sprays as required, individuals can spray in the mouth when the urge to smoke occurs or to prevent cravings, individuals should not exceed 2 sprays per episode (up to 4 sprays every hour); maximum 64 sprays per day
▶ BY INTRANASAL ADMINISTRATION USING NASAL SPRAY
▶ Adult: 1 spray as required, individuals can spray into each nostril when the urge to smoke occurs, up to twice every hour for 16 hours daily, if attempting smoking cessation, treatment should continue for 8 weeks before reducing the dose; maximum 64 sprays per day
▶ BY TRANSDERMAL APPLICATION USING PATCHES
▶ Adult: Individuals who smoke more than 10 cigarettes daily should apply a high-strength patch daily for 6–8 weeks, followed by the medium-strength patch for 2 weeks, and then the low-strength patch for the final 2 weeks; Individuals who smoke fewer than 10 cigarettes daily can usually start with the medium-strength patch for 6–8 weeks, followed by the low-strength patch for 2–4 weeks; a slower titration schedule can be used in individuals who are not ready to quit but want to reduce cigarette consumption before a quit attempt; if abstinence is not achieved, or if withdrawal symptoms are experienced, the strength of the patch used should be maintained or increased until the patient is stabilised; individuals using the high-strength patch who experience excessive side-effects, that do not resolve within a few days, should change to a medium-strength patch for the remainder of the initial period and then use the low-strength patch for 2–4 weeks

▶ CAUTIONS

GENERAL CAUTIONS
Diabetes mellitus—blood-glucose concentration should be monitored closely when initiating treatment. haemodynamically unstable patients hospitalised with cerebrovascular accident. haemodynamically unstable patients hospitalised with myocardial infarction. haemodynamically unstable patients hospitalised with severe arrhythmias. phaeochromocytoma. uncontrolled hyperthyroidism

SPECIFIC CAUTIONS
- When used by inhalation Bronchospastic disease. chronic throat disease. obstructive lung disease
- With intransal use Bronchial asthma (may exacerbate)
- With oral (topical) use Gum may also stick to and damage dentures
- With oral use Gastritis (can be aggravated by swallowed nicotine). oesophagitis (can be aggravated by swallowed nicotine). peptic ulcers (can be aggravated by swallowed nicotine)
- With transdermal use Patches should not be placed on broken skin. patients with skin disorders

CAUTIONS, FURTHER INFORMATION
Most warnings for nicotine replacement therapy also apply to continued cigarette smoking, but the risk of continued smoking outweighs any risks of using nicotine preparations.

Specific cautions for individual preparations are usually related to the local effect of nicotine.

SIDE-EFFECTS

▶ Common or very common Bloating. blurred vision. constipation. coughing. diarrhoea. dry mouth. dyspepsia. dysphagia. epistaxis. flatulence. gastritis. gastrointestinal disturbances (may be caused by swallowed nicotine). hiccup. increased salivation. irritation of the throat. mild local reactions at the beginning of treatment are common because of the irritant effect of nicotine. minor skin irritation. mouth ulcers. nasal irritation. nausea. oesophagitis. paraesthesia. sneezing. vomiting. watery eyes
▶ Uncommon Gingival bleeding. halitosis. thirst
▶ Rare Arrhythmia
▶ Very rare Reversible atrial fibrillation
▶ Frequency not known Abdominal pain. abnormal dreams (may occur with patches. removal of the patch before bed may help). arthralgia. chest pain. flatulence. hot flushes. myalgia. palpitations. rash. sweating. taste disturbance. ulcerative stomatitis

SIDE-EFFECTS, FURTHER INFORMATION
Side-effects listed have been reported with use of various nicotine replacement therapy preparations. See Nicotine replacement therapy, under Substance dependence p. 468 for further details on individual preparations.

Nicotine withdrawal Some systemic effects occur on initiation of therapy, particularly if the patient is using high-strength preparations; however, the patient may confuse side-effects of the nicotine-replacement preparation with nicotine withdrawal symptoms.

Common symptoms of nicotine withdrawal include malaise, headache, dizziness, sleep disturbance, coughing, influenza—like symptoms. depression. irritability. increased appetite. weight gain. restlessness. anxiety. drowsiness. aphthous ulcers. decreased heart rate. and impaired concentration

PREGNANCY
The use of nicotine replacement therapy in pregnancy is preferable to the continuation of smoking, but should be used only if smoking cessation without nicotine replacement fails. Intermittent therapy is preferable to patches but avoid liquorice-flavoured nicotine products. Patches are useful, however, if the patient is experiencing pregnancy-related nausea and
vomiting. If patches are used, they should be removed before bed.

- **BREAST FEEDING** Nicotine is present in milk; however, the amount to which the infant is exposed is small and less hazardous than second-hand smoke. Intermittent therapy is preferred.

- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe hepatic impairment.

- **RENAL IMPAIRMENT** Use with caution in severe renal impairment.

- **DIRECTIONS FOR ADMINISTRATION** Acids and other beverages, such as coffee or fruit juice, may decrease the absorption of nicotine through the buccal mucosa and should be avoided for 15 minutes before the use of oral nicotine replacement therapy.

Administration by transdermal patch: Patches should be applied on waking to dry, non-hairy skin on the hip, trunk, or upper arm and held in position for 10–20 seconds to ensure adhesion; place next patch on a different area and avoid using the same site for several days.

Administration by nasal spray: Initially 1 spray should be used in both nostrils but when withdrawing from therapy, the dose can be gradually reduced to 1 spray in 1 nostril.

Administration by oral spray: The oral spray should be released into the mouth, holding the spray as close to the mouth as possible and avoiding the lips. The patient should not inhale while spraying and avoid swallowing for a few seconds after use. If using the oral spray for the first time, or if not used for 2 or more days, prime the unit before administration.

Administration by sublingual tablet: Each tablet should be placed under the tongue and allowed to dissolve. Slowly allow each lozenge to dissolve in the mouth, holding the lozenge from one side of the mouth to the other. Lozenges last for 10–30 minutes, depending on their size.

Administration by inhalation: Insert the cartridge into the device and draw in air through the mouthpiece; each session can last for approximately 5 minutes. The amount of nicotine from 1 puff of the cartridge is less than that from a cigarette, therefore it is necessary to inhale more often than when smoking a cigarette. A single 10 mg cartridge lasts for approximately 20 minutes of intense use; a single 15 mg cartridge lasts for approximately 40 minutes of intense use.

Administration by medicated chewing gum: Chew the gum until the taste becomes strong; then rest it between the cheek and gum; when the taste starts to fade, repeat this process. One piece of gum lasts for approximately 30 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of chewing gum and lozenges may include mint, freshfruit, freshmint, icy white, or cherry.

- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer nicotine chewing gum, inhalators, lozenges, sublingual tablets, oral spray, nasal spray and patches.

- **MEDICINAL FORMS**

**Transdermal patch**

- **Nicotine (Non-proprietary)**

  - Nicotine 7 mg per 24 hour | 7 mg/24 hours transdermal patches | 7 patch [GSL] no price available
  - Nicotine 7 mg/24 hours transdermal patches | 7 patch [GSL] no price available

- **Nicotine 14 mg per 24 hour | 14 mg/24 hours transdermal patches | 7 patch [GSL] no price available

- **Nicotine 10 mg per 16 hour | 10 mg/16 hours patches | 7 patch [GSL] no price available

- **Nicotine 21 mg per 24 hour | 21 mg/24 hours transdermal patches | 7 patch [GSL] no price available

**Medicated chewing-gum**

- **Nicotine (Non-proprietary)**

  - Nicotine 2 mg | 2 mg medicated chewing gum sugar-free | 105 piece [GSL] no price available
  - Nicotine 4 mg | 4 mg medicated chewing gum sugar-free | 105 piece [GSL] no price available

  - Brands may include NiQuitin, NiQuitin Clear, Nicorette invisi, Nicotinell TTS

- **Nicotine (as Nicotine cyclodextrin complex) 2 mg | 2 mg sublingual tablets sugar-free | 100 tablet [GSL] no price available

  - Brands may include Nicorette Microtab

**Varenicline**

- **DRUG ACTION** Varenicline is a selective nicotine-receptor partial agonist.

- **INDICATIONS AND DOSE**

**To aid smoking cessation**

- **BY MOUTH**

  - Adult: Initially 500 micrograms once daily for 3 days, increased to 500 micrograms twice daily for 4 days, then 1 mg twice daily for 11 weeks; reduced if not tolerated to 500 micrograms twice daily, usually to be started 1–2 weeks before target stop date but can be started up to a maximum of 5 weeks before target stop date, 12-week course can be repeated in abstinent individuals to reduce risk of relapse

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: SUICIDAL BEHAVIOUR AND VARENICLINE**

Patients should be advised to discontinue treatment and seek prompt medical advice if they develop agitation, depressed mood, or suicidal thoughts. Patients with a history of psychiatric illness should be monitored closely while taking varenicline.

- **CAUTIONS**

  - Conditions that may lower seizure threshold: history of cardiovascular disease; history of psychiatric illness (may exacerbate underlying illness including depression); predisposition to seizures

- **SIDE-EFFECTS**

  - Common or very common: Taste disturbance; abnormal dreams; appetite changes; dizziness; drowsiness; dry mouth; gastro-intestinal disturbances; headache; sleep disorders
8.3 Opioid dependence

Other drugs used for Opioid dependence
Naltrexone hydrochloride, p. 472

**Analgesics > Opioids**

**Methadone hydrochloride**

- **INDICATIONS AND DOSE**
  - **Severe pain**
    - **BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
    - Adult: 5–10 mg every 6–8 hours, adjusted according to response, on prolonged use not to be given more frequently than every 12 hours
  - **Adjunct in treatment of opioid dependence**
    - **BY MOUTH USING ORAL SOLUTION**
    - Adult: Initially 10–30 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal

- **ADJUNCT IN TREATMENT CESSATION**
  - Frequency not known
  - Rare

- **PREGNANCY**
  - Methadone hydrochloride doses for opioid dependence in the BNF may differ from those in the product literature.

- **OTHER**
  - Unlicensed use: Methadone hydrochloride doses for opioid dependence in the BNF may differ from those in the product literature.

**Important safety information**

Methadone oral solution 1 mg/mL is 2½ times the strength of Methadone Linctus (2 mg/5 mL). Many preparations of Methadone oral solution are licensed for opioid drug addiction only but some are also licensed for analgesia in severe pain.

- **CONTRA-INDICATIONS**
  - Phaeochromocytoma

- **CAUTIONS**
  - Family history of sudden death (ECG monitoring recommended) - history of cardiac conduction abnormalities

- **FURTHER INFORMATION**
  - QT interval prolongation
  - Patients with the following risk factors for QT interval prolongation should be carefully monitored while taking methadone: heart or liver disease, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval; patients requiring more than 100 mg daily should also be monitored.

- **INTERACTIONS**
  - Appendix 1 - opioids

- **SIDE-EFFECTS**
  - Dry eyes • dysmenorrhoea • hyperprolactinaemia • hypothermia • QT-interval prolongation • raised intracranial pressure • restlessness • torsade de points

**Side-effects, further information**

Methadone is a long-acting opioid therefore effects may be cumulative.

Methadone, even in low doses, is a special hazard for children; non-dependent adults are also at risk of toxicity; dependent adults are at risk if tolerance is incorrectly assessed during induction.

**Overdose**

Methadone has a very long duration of action; patients may need to be monitored for long periods following large overdoses.
Methadone hydrochloride 25 mg per 1 ml Physeptone 50mg/2ml solution for injection ampoules | 10 ampoule (Pha) £15.06 (CD2)
Methadone hydrochloride 50 mg per 1 ml Physeptone 50mg/1ml solution for injection ampoules | 10 ampoule (Pha) £15.06 (CD2)

Opioid receptor antagonists

**Buprenorphine with naloxone**

The properties listed below are those particular to the combination only. For the properties of the components please consider, buprenorphine p. 425, naloxone hydrochloride p. 1259.

**INDICATIONS AND DOSE**

Adjunct in the treatment of opioid dependence (dose expressed as buprenorphine)

- **BY SUBLINGUAL ADMINISTRATION**
  - Adult: Initially 2–4 mg once daily, an additional dose of 2–4 mg may be administered on day 1 depending on the individual patient’s requirement, increased in steps of 2–8 mg, adjusted according to response, total weekly dose may be divided and given on alternate days or 3 times weekly; maximum 24 mg per day

**INTERACTIONS**

Appendix 1: naloxone, opioids

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2007) that Suboxone® should be restricted for use in patients in whom methadone is not suitable.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection

**Tablet**

CAUTIONARY AND ADVISORY LABELS 2

  - Physeptone 10mg/1ml solution for injection ampoules | 10 ampoule (Pha) £6.49 DT price = £6.49 CD2 | 100 ampoule (Pha) £62.10 CD2
  - Physeptone 20mg/2ml solution for injection ampoules | 10 ampoule (Pha) £11.17 DT price = £11.17 CD2

**OPIOID RECEPTOR ANTAGONISTS**

Buprenorphine with naloxone

- There can be variation in the licensing of different medicines containing the same drug.

Sublingual tablet

CAUTIONARY AND ADVISORY LABELS 2, 26

- Suboxone (Indivior UK Ltd) Naloxone (as Naloxone hydrochloride) 500 microgram, Buprenorphine (as Buprenorphine hydrochloride) 2 mg Suboxone 2mg/500microgram sublingual tablets sugar-free | 28 tablet (Pha) £25.40 DT price = £25.40 CD2
  - Naloxone (as Naloxone hydrochloride) 2 mg, Buprenorphine (as Buprenorphine hydrochloride) 8 mg Suboxone 8mg/2mg sublingual tablets sugar-free | 28 tablet (Pha) £76.19 DT price = £76.19 CD2
  - Naloxone (as Naloxone hydrochloride) 4 mg, Buprenorphine (as Buprenorphine hydrochloride) 16 mg Suboxone 16mg/4mg sublingual tablets sugar-free | 28 tablet (Pha) £152.38 CD3
**Lofexidine hydrochloride**

**DRUG ACTION** Lofexidine is an alpha₂-adrenergic agonist.

**INDICATIONS AND DOSE**

**Management of symptoms of opioid withdrawal**

- **BY MOUTH**
  - **Adult:** Initially 800 micrograms daily in divided doses, increased in steps of 400–800 micrograms daily (max. per dose 800 micrograms) as required recommended duration of treatment 7–10 days if no opioid use (but longer may be required); maximum 2.4 mg per day

**CAUTIONS** Bradycardia, cerebrovascular disease, depression, history of QT prolongation, hypotension (monitor pulse rate and blood pressure), metabolic disturbances, recent myocardial infarction, severe coronary insufficiency

**INTERACTIONS** → Appendix 1: lofexidine

**SIDE-EFFECTS** Bradycardia, dizziness, drowsiness, dry mucous membranes, hypotension, QT-interval prolongation

**PREGNANCY** Use only if benefit outweighs risk—no information available.

**BREAST FEEDING** Use only if benefit outweighs risk—no information available.

**RENAL IMPAIRMENT** Caution in chronic impairment.

**MONITORING REQUIREMENTS** Monitoring of blood pressure and pulse rate is recommended on initiation, for at least 72 hours or until a stable dose is achieved, and on discontinuation.

**TREATMENT CESSATION** Treatment should be withdrawn gradually over 2–4 days (or longer) to reduce the risk of rebound hypertension and associated symptoms.

**PRESCRIBING AND DISPENSING INFORMATION** Lofexidine has been used in children over 12 years in the management of symptoms of opioid withdrawal.

**PATIENT AND CARER ADVICE** The patient should take part of the dose at bedtime to offset insomnia associated with opioid withdrawal.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

1 Amoebic infection

Other drugs used for Amoebic infection Metronidazole, p. 512 • Tinidazole, p. 514

ANTIPROTOZOALS

Diloxanide furoate

- INDICATIONS AND DOSE
  Chronic amoebiasis • Acute amoebiasis as adjunct to metronidazole or tinidazole
    ▶ BY MOUTH
    • Child 12-17 years: 500 mg 3 times a day for 10 days
    • Adult: 500 mg 3 times a day for 10 days

- UNLICENSED USE Not licensed for use in children under 25 kg body-weight.
- SIDE-EFFECTS Flatulence • pruritus • urticaria • vomiting
- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Manufacturer advises avoid.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Mepacrine hydrochloride

- INDICATIONS AND DOSE
  Giardiasis
    ▶ BY MOUTH
    • Adult: 100 mg every 8 hours for 5–7 days

- UNLICENSED USE Not licensed for use in giardiasis.

- CAUTIONS Avoid in psoriasis • elderly • history of psychosis
- INTERACTIONS ➔ Appendix 1: mepacrine
- SIDE-EFFECTS Yellow discoloration of skin (on prolonged treatment) • aplastic anaemia (on prolonged treatment) • blue/black discoloration of nails • blue/black discoloration of palate • chronic dermatoses (on prolonged treatment) • CNS stimulation (with large doses) • corneal deposits with visual disturbances • dizziness • gastro-intestinal disturbances • headache • hepatitis (on prolonged treatment) • nausea (with large doses) • severe exfoliative dermatitis (on prolonged treatment) • transient acute toxic psychosis (with large doses) • vomiting (with large doses) • yellow discoloration of urine (on prolonged treatment)

- HEPATIC IMPAIRMENT Use with caution.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

2 Bacterial infection

Antibacterials, principles of therapy

Choice of a suitable drug

Before selecting an antibacterial the clinician must first consider two factors—the patient and the known or likely causative organism. Factors related to the patient which must be considered include history of allergy, renal and hepatic function, susceptibility to infection (i.e. whether immunocompromised), ability to tolerate drugs by mouth, severity of illness, ethnic origin, age, whether taking other medication and, if female, whether pregnant, breast-feeding or taking an oral contraceptive.

The known or likely organism and its antibacterial sensitivity, in association with the above factors, will suggest one or more antibacterials, the final choice depending on the microbiological, pharmacological, and toxicological properties.
An example of a rational approach to the selection of an antibacterial is treatment of a urinary-tract infection in a patient complaining of nausea and symptoms of a urinary-tract infection in early pregnancy. The organism is reported as being resistant to ampicillin p. 520 but sensitive to nitrofurantoin p. 557 (can cause nausea), gentamicin p. 491 (can be given only by injection and best avoided in pregnancy), tetracycline p. 536 (causes dental discoloration) and trimethoprim p. 542 (folate antagonist therefore theoretical teratogenic risk), and cefalexin p. 497. The safest antibiotics in pregnancy are the penicillins and cephalosporins; therefore, cefalexin would be indicated for this patient.

The principles involved in selection of an antibacterial must allow for a number of variables including changing renal and hepatic function, increasing bacterial resistance, and information on side-effects. Duration of therapy, dosage, and route of administration depend on site, type and severity of infection and response.

Antibacterial policies
Local policies often limit the antibacterials that may be used to achieve reasonable economy consistent with adequate cover, and to reduce the development of resistant organisms. A policy may indicate a range of drugs for general use, and permit other drugs only on the advice of the microbiologist or physician responsible for the control of infectious diseases.

Before starting therapy
The following precepts should be considered before starting:

- **Viral infections should not be treated with antibacterials.** However, antibacterials may be used to treat secondary bacterial infection (e.g. bacterial pneumonia secondary to influenza);
- **Samples should be taken for culture and sensitivity testing;** ‘blind’ antibacterial prescribing for unexplained pyrexia usually leads to further difficulty in establishing the diagnosis;
- **Knowledge of prevalent organisms and their current sensitivity is of great help in choosing an antibacterial before bacteriological confirmation is available.** Generally, narrow-spectrum antibacterials are preferred to broad-spectrum antibacterials unless there is a clear clinical indication (e.g. life-threatening sepsis);
- **The dose of an antibacterial varies according to a number of factors including age, weight, hepatic function, renal function, and severity of infection.** The prescribing of the so-called ‘standard’ dose in serious infections may result in failure of treatment or even death of the patient; therefore it is important to prescribe a dose appropriate to the condition. An inadequate dose may also increase the likelihood of antibacterial resistance. On the other hand, for an antibacterial with a narrow margin between the toxic and therapeutic dose (e.g. an aminoglycoside) it is also important to avoid an excessive dose and the concentration of the drug in the plasma may need to be monitored;
- **The route of administration of an antibacterial often depends on the severity of the infection.** Life-threatening infections require intravenous therapy. Antibacterials that are well absorbed may be given by mouth even for some serious infections. Parenteral administration is also appropriate when the oral route cannot be used (e.g. because of vomiting) or if absorption is inadequate. Whenever possible, painful intramuscular injections should be avoided in children;
- **Duration of therapy depends on the nature of the infection and the response to treatment.** Courses should not be unduly prolonged because they encourage resistance, they may lead to side-effects and they are costly. However, in certain infections such as tuberculosis or osteomyelitis it may be necessary to treat for prolonged periods. Conversely a single dose of an antibacterial may cure uncomplicated urinary-tract infections. The prescription for an antibacterial should specify the duration of treatment or the date when treatment is to be reviewed.

Superinfection
In general, broad-spectrum antibacterial drugs such as the cephalosporins are more likely to be associated with adverse reactions related to the selection of resistant organisms e.g. *fungal infections or antibiotic-associated colitis* (pseudomembranous colitis); other problems associated with superinfection include vaginitis and pruritus ani.

**Therapy**
When the pathogen has been isolated treatment may be changed to a more appropriate antibacterial if necessary. If no bacterium is cultured the antibacterial can be continued or stopped on clinical grounds.

Notifiable diseases
Doctors must notify the Proper Officer of the local authority (usually the consultant in communicable disease control) when attending a patient suspected of suffering from any of the diseases listed below; a form is available from the Proper Officer.

**Antibacterial prescribing for unexplained fever**

**Note** It is good practice for doctors to also inform the consultant in communicable disease control of instances of other infections (e.g. psittacosis) where there could be a public health risk.
death. Patients at high risk should be monitored continuously if possible, and no less than every 30 minutes.

Patients with suspected sepsis who are not immediately deemed to be at high risk of severe illness or death, should be re-assessed regularly for the need for empirical treatment, taking into consideration all risk factors including lactate concentration and evidence of acute kidney injury.

Prevention of recurrence of rheumatic fever
- Phenoxymethylpenicillin p. 518 or sulfadiazine p. 532.

Prevention of secondary case of invasive group A streptococcal infection
- Phenoxymethylpenicillin.

Patients who are penicillin allergic, either erythromycin p. 510 or azithromycin p. 507 [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England Laboratory).

Prevention of secondary case of meningococcal meningitis
- Ciprofloxacin p. 527 or rifampicin p. 549 or i/m ceftriaxone p. 501 [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

Prevention of secondary case of *Haemophilus influenzae* type b disease
- Rifampicin or (if rifampicin cannot be used) i/m or i/v ceftriaxone [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

Within 4 weeks of illness onset in an index case with confirmed or suspected invasive *Haemophilus influenzae* type b disease, give antibacterial prophylaxis to all household contacts if there is a vulnerable individual in the household. Also, give antibacterial prophylaxis to the index case if they are in contact with vulnerable household contacts or if they are under 10 years of age. Vulnerable individuals include the immunocompromised, those with asplenia, or children under 10 years of age. If there are 2 or more cases of invasive *Haemophilus influenzae* type b disease within 120 days in a pre-school or primary school, antibacterial prophylaxis should also be given to all room contacts (including staff). Also see immunisation against *Haemophilus influenzae* type b disease.

Prevention of secondary case of diphtheria in non-immune patient
- Erythromycin (or another macrolide e.g. azithromycin or clarithromycin p. 508).

Treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment.

Prevention of pertussis
- Clarithromycin (or azithromycin or erythromycin).

Within 3 weeks of onset of cough in the index case, give antibacterial prophylaxis to all close contacts if amongst them there is at least one unimmunised or partially immunised child under 1 year of age, or if there is at least one individual who has not received a pertussis-containing vaccine more than 1 week and less than 5 years ago (so long as that individual lives or works with children under 4 months of age, is pregnant at over 32 weeks gestation, or is a healthcare worker who works with children under 1 year of age or with pregnant women).

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease
- Phenoxymethylpenicillin.

If penicillin-allergic, erythromycin.

Antibacterial prophylaxis is not fully reliable. Antibacterial prophylaxis may be discontinued in children over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection.

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive

Prevention of infection from animal and human bites
- Co-amoxiclav p. 521 alone (or doxycycline p. 534 + metronidazole p. 512 if penicillin-allergic).

Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 1188 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection).

Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.

Antibacterial prophylaxis recommended for wounds less than 48–72 hours old when the risk of infection is high (e.g. bites from humans or cats; bites to the hand, foot, face, or genital area; bites involving oedema, crush or puncture injury, or other moderate to severe injury; wounds that cannot be debrided adequately; patients with diabetes mellitus, cirrhosis, asplenia, prosthetic joints or valves, or those who are immunocompromised). Give antibacterial prophylaxis for up to 5 days.

Prevention of early-onset neonatal infection
- i/v benzylpenicillin sodium p. 517 (or i/v clindamycin p. 506 if history of allergy to penicillins).

Give intrapartum prophylaxis to women with group B streptococcal colonisation, bacteriuria, or infection in the current pregnancy, or to women who had a previous baby with an invasive group B streptococcal infection. Consider prophylaxis for women in preterm labour if there is prelabour rupture of membranes or if intrapartum rupture of membranes lasting more than 18 hours is suspected.
Prevention of infection in gastro-intestinal procedures

Operations on stomach or oesophagus
- Single dose of i/v gentamicin p. 491 or i/v cefuroxime p. 498 or i/v co-amoxiclav (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v teicoplanin p. 504 (or vancomycin p. 505) if high risk of meticillin-resistant Staphylococcus aureus.

Open biliary surgery
- Single dose of i/v cefuroxime + i/v metronidazole or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant Staphylococcus aureus.

Resections of colon and rectum for carcinoma, and resections in inflammatory bowel disease, and appendicectomy
- Single dose of i/v gentamicin + i/v metronidazole or i/v cefuroxime + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin p. 504 (or vancomycin p. 505) if high risk of meticillin-resistant Staphylococcus aureus.

Endoscopic retrograde cholangiopancreatography
- Single dose of i/v gentamicin p. 491 or oral or i/v ciprofloxacin p. 527.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Prophylaxis recommended if pancreatic pseudocyst, immunocompromised, history of liver transplantation, or risk of incomplete biliary drainage. For biliary complications following liver transplantation, add i/v amoxicillin p. 518 or i/v teicoplanin (or vancomycin).

Percutaneous endoscopic gastrostomy or jejunostomy
- Single dose of i/v co-amoxiclav p. 521 or i/v cefuroxime p. 498.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v teicoplanin (or vancomycin) if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant Staphylococcus aureus.

Prevention of infection in orthopaedic surgery

Joint replacement including hip and knee
- Single dose of i/v cefuroxime alone or i/v flucloxacillin p. 523+ i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant Staphylococcus aureus, use single dose of i/v teicoplanin (or vancomycin) + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Closed fractures
- Single dose of i/v cefuroxime or i/v flucloxacillin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant Staphylococcus aureus, use single dose of i/v teicoplanin (or vancomycin) (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Open fractures
- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole p. 512 (or i/v clindamycin p. 506 alone if history of allergy to penicillins or to cephalosporins).

Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant Staphylococcus aureus. Start prophylaxis within 3 hours of injury and continue until soft tissue closure (max. 72 hours).

At first debridement also use a single dose of i/v cefuroxime + i/v metronidazole + i/v gentamicin or i/v co-amoxiclav + i/v gentamicin (or i/v clindamycin + i/v gentamicin if history of allergy to penicillins or to cephalosporins).

At time of skeletal stabilisation and definitive soft tissue closure use a single dose of i/v gentamicin + i/v teicoplanin (or vancomycin) (intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure).

High lower-limb amputation
- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Continue antibacterial prophylaxis for at least 2 doses after procedure (max. duration of prophylaxis 5 days). If history of allergy to penicillins or to cephalosporins, or if high risk of meticillin-resistant Staphylococcus aureus, use i/v teicoplanin (or vancomycin) + i/v gentamicin + i/v metronidazole.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Prevention of infection in urological procedures

Transrectal prostate biopsy
- Single dose of oral ciprofloxacin + oral metronidazole or i/v gentamicin + i/v metronidazole (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin + i/v metronidazole if high risk of meticillin-resistant Staphylococcus aureus (additional intra-operative or postoperative doses of antibacterial may be given for prolonged procedures or if there is major blood loss).

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Transurethral resection of prostate
- Single dose of oral ciprofloxacin or i/v gentamicin or i/v cefuroxime (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).
Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra- or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Prevention of infection in obstetric and gynaecological surgery**

**Caesarean section**
- Single dose of i/v cefuroxime (additional intra- or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Substitute i/v clindamycin if history of allergy to penicillins or cephalosporins. Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant *Staphylococcus aureus*.

**Hysteroscopy**
- Single dose of i/v cefuroxime + i/v metronidazole or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone (additional intra- or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin + i/v metronidazole or add i/v teicoplanin (or vancomycin) to other regimens if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra- or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

**Termination of pregnancy**
- Single dose of oral metronidazole (additional intra- or postoperative doses may be given for prolonged procedures or if there is major blood loss).

If genital chlamydial infection cannot be ruled out, give doxycycline p. 534 postoperatively.

**Prevention of infection in cardiology procedures**

**Cardiac pacemaker insertion**
- Single dose of i/v cefuroxime alone or i/v flucloxacillin + i/v gentamicin or i/v teicoplanin (or vancomycin) + i/v gentamicin (additional intra- or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v teicoplanin (or vancomycin) + i/v cefuroxime or i/v teicoplanin (or vancomycin) + i/v gentamicin if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra- or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Prevention of infection in vascular surgery**

**Reconstructive arterial surgery of abdomen, pelvis or legs**
- Single dose of i/v cefuroxime p. 498 alone or i/v flucloxacillin p. 523 + i/v gentamicin p. 491 (additional intra- or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v metronidazole p. 512 for patients at risk from anaerobic infections including those with diabetes, gangrene, or undergoing amputation. Use single dose of i/v teicoplanin p. 504 (or vancomycin p. 505) + i/v gentamicin if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra- or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Prevention of infective endocarditis**

- Chlorhexidine mouthwash is not recommended for the prevention of infective endocarditis in at risk patients undergoing dental procedures.

Antibacterial prophylaxis is not routinely recommended for the prevention of infective endocarditis in patients undergoing the following procedures:
- dental;
- upper and lower respiratory tract (including ear, nose, and throat procedures and bronchoscopy);
- genito-urinary tract (including urological, gynaecological, and obstetric procedures);
- upper and lower gastro-intestinal tract.

Whilst these procedures can cause bacteraemia, there is no clear association with the development of infective endocarditis. Prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

If patients at risk of endocarditis are undergoing a gastro-intestinal or genito-urinary tract procedure at a site where infection is suspected, they should receive appropriate antibacterial therapy that includes cover against organisms that cause infective endocarditis.

Patients at risk of infective endocarditis should be:
- advised to maintain good oral hygiene;
- told how to recognise signs of infective endocarditis, and advised when to seek expert advice.

Patients at risk of infective endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.

**Dermatological procedures**

- Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures do not require antibacterial prophylaxis against endocarditis.

The British Association of Dermatologists Therapy Guidelines and Audit Subcommittee advise that such dermatological procedures include skin biopsies and excision of moles or of malignant lesions.

**Joint prostheses and dental treatment**

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intermittent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.
Immunosuppression and indwelling intraperitoneal catheters

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis. The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

Blood infections, bacterial

Antibacterial therapy for septicaemia: community-acquired

- A broad-spectrum antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 516, ticarcillin with clavulanic acid p. 516) or a broad-spectrum cephalosporin (e.g. cefuroxime p. 498)
- If meticillin-resistant Staphylococcus aureus suspected, add vancomycin p. 505 (or teicoplanin p. 504).
- If anaerobic infection suspected, add metronidazole p. 512 to broad-spectrum cephalosporin.
- If other resistant micro-organisms suspected, use a more broad-spectrum beta-lactam antibacterial (e.g. meropenem p. 495).

Antibacterial therapy for septicaemia: hospital-acquired

- A broad-spectrum antipseudomonal beta-lactam antibacterial (e.g. piperacillin with tazobactam, ticarcillin with clavulanic acid, ceftazidime p. 500, imipenem with cilastatin p. 495, or meropenem)
- If meticillin-resistant Staphylococcus aureus suspected, add vancomycin (or teicoplanin).
- If anaerobic infection suspected, add metronidazole to broad-spectrum cephalosporin

Septicaemia related to vascular catheter

- Vancomycin (or teicoplanin)
- If Gram-negative sepsis suspected, especially in the immunocompromised, add a broad-spectrum antipseudomonal beta-lactam.
- Consider removing vascular catheter, particularly if infection caused by Staphylococcus aureus, pseudomonas, or Candida species.

Meningococcal septicaemia

If meningococcal disease suspected, a single dose of benzylpenicillin sodium p. 517 should be given before urgent transfer to hospital, so long as this does not delay the transfer; cefotaxime p. 500 may be an alternative in penicillin allergy; chloramphenicol p. 537 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.

- Benzylpenicillin sodium or cefotaxime (or ceftriaxone p. 501)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol

To eliminate nasopharyngeal carriage, ciprofloxacin p. 527, or rifampicin p. 549, or ceftriaxone may be used.

Cardiovascular system infections, bacterial

Antibacterial therapy for endocarditis: initial ‘blind’ therapy

- Native valve endocarditis, amoxicillin p. 518 (or ampicillin p. 520)
- Consider adding low-dose gentamicin p. 491
- If penicillin-allergic, or if meticillin-resistant Staphylococcus aureus suspected, or if severe sepsis, use vancomycin p. 505 + low-dose gentamicin
- If severe sepsis with risk factors for Gram-negative infection, use vancomycin + meropenem p. 495
- If prosthetic valve endocarditis, vancomycin + rifampicin p. 549 + low-dose gentamicin

Antibacterial therapy for native-valve endocarditis caused by staphylococci

- Flucloxacillin p. 523
- Suggested duration of treatment 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)
- If penicillin-allergic or if meticillin-resistant Staphylococcus aureus, vancomycin + rifampicin
- Suggested duration of treatment 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)

Antibacterial therapy for prosthetic valve endocarditis caused by staphylococci

- Flucloxacillin + rifampicin + low-dose gentamicin
- Suggested duration of treatment at least 6 weeks; review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- If penicillin-allergic or if meticillin-resistant Staphylococcus aureus, vancomycin + rifampicin + low-dose gentamicin
- Suggested duration of treatment at least 6 weeks; review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks

Antibacterial therapy for endocarditis caused by fully-sensitive streptococci

- Benzylpenicillin sodium p. 517
- Suggested duration of treatment 4–6 weeks (6 weeks for prosthetic valve endocarditis)
- If penicillin-allergic, vancomycin (or teicoplanin p. 504) + low-dose gentamicin
- Suggested duration of treatment 4–6 weeks (stop gentamicin after 2 weeks)

Antibacterial therapy for endocarditis caused by less-sensitive streptococci

- Benzylpenicillin sodium + low-dose gentamicin
- Suggested duration of treatment 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin
- If penicillin-allergic or highly penicillin-resistant, vancomycin (or teicoplanin) + low-dose gentamicin
- Suggested duration of treatment 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin
Antibacterial therapy for endocarditis caused by enterococci
- Amoxicillin (or ampicillin) + low dose gentamicin or benzylpenicillin sodium + low-dose gentamicin
  - Suggested duration of treatment: 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- If penicillin-allergic or penicillin-resistant, vancomycin (or teicoplanin) + low-dose gentamicin
  - Suggested duration of treatment: 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- If gentamicin resistant, amoxicillin (or ampicillin)
  - Add streptomycin p.
  - Suggested duration of treatment: at least 6 weeks

Antibacterial therapy for endocarditis caused by Haemophilus, Actinobacillus, Cardiobacterium, Eikenella, and Kingella species (‘HACEK’ micro-organisms)
- Amoxicillin (or ampicillin) + low-dose gentamicin
  - Suggested duration of treatment: 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks
- If amoxicillin-resistant, ceftriaxone p. 501 (or cefotaxime p. 500) + low-dose gentamicin
  - Suggested duration of treatment: 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

Central nervous system infections, bacterial

Antibacterial therapy for meningitis: initial empirical therapy
- Transfer patient to hospital urgently.
- If meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) suspected, benzylpenicillin sodium p. 517 should be given before transfer to hospital, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently, benzylpenicillin sodium should be given before the transfer. Cefotaxime p. 500 may be an alternative in penicillin allergy; chloramphenicol p. 537 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.
- In hospital, consider adjunctive treatment with dexamethasone p. 635 (particularly if pneumococcal meningitis suspected in adults), preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial; avoid dexamethasone in septic shock, meningococcal septicaemia, or if immunocompromised, or in meningitis following surgery. In hospital, if aetiology unknown:
  - Adult and child 3 months–50 years, cefotaxime (or ceftriaxone p. 501)
    - Consider adding vancomycin p. 505 if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
    - Suggested duration of treatment: at least 10 days
  - Adult over 50 years cefotaxime (or ceftriaxone) + amoxicillin p. 518 (or ampicillin p. 520)
    - Consider adding vancomycin if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
    - Suggested duration of treatment: at least 10 days

Antibacterial therapy for meningitis caused by meningococci
- Benzylpenicillin sodium or cefotaxime (or ceftriaxone)
  - Suggested duration of treatment: 7 days.
  - If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol
  - Suggested duration of treatment: 7 days.

Antibacterial therapy for meningitis caused by pneumococci
- Cefotaxime (or ceftriaxone)
  - Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial (may reduce penetration of vancomycin into cerebrospinal fluid).
  - If micro-organism penicillin-sensitive, replace cefotaxime with benzylpenicillin sodium.
  - If micro-organism highly penicillin- and cephalosporin-resistant, add vancomycin and if necessary rifampicin p. 549.
  - Suggested duration of antibacterial treatment: 14 days

Antibacterial therapy for meningitis caused by Haemophilus influenzae
- Cefotaxime (or ceftriaxone)
  - Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
  - Suggested duration of antibacterial treatment: 10 days.
  - For H. influenzae type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts
  - If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, or if micro-organism resistant to cefotaxime, chloramphenicol
  - Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
  - Suggested duration of antibacterial treatment: 10 days.
  - For H. influenzae type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts

Antibacterial therapy for meningitis caused by Listeria
- Amoxicillin (or ampicillin) + gentamicin p. 491
  - Suggested duration of treatment: 21 days.
  - Consider stopping gentamicin after 7 days.
  - If history of immediate hypersensitivity reaction to penicillin, co-trimoxazole p. 531
  - Suggested duration of treatment: 21 days.

Ear infections, bacterial

Antibacterial therapy for otitis externa
For topical treatments, consider Otitis externa, under Ear p. 1093.
Consider systemic antibacterial if spreading cellulitis or patient systemically unwell.
- Flucloxacillin p. 523
  - If *penicillin-allergic*, clarithromycin p. 508 (or azithromycin p. 507 or erythromycin p. 510)
  - If *pseudomonas suspected*, ciprofloxacin p. 527 (or an aminoglycoside)

**Antibacterial therapy for otitis media**

Many infections are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment. In children without systemic features, antibacterial treatment may be started after 72 hours if no improvement. Consider earlier treatment if deterioration, if systemically unwell, if at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis present, or in children under 2 years of age with bilateral otitis media.
- Amoxicillin p. 518 (or ampicillin p. 520)
  - Consider co-amoxiclav p. 521 if no improvement after 48 hours.
  - In severe infection, initial parenteral therapy with co-amoxiclav or cefuroxime p. 498.
  - **Suggested duration of treatment 5 days** (longer if severely ill).
- If *penicillin-allergic*, clarithromycin (or azithromycin or erythromycin)
  - **Suggested duration of treatment 5 days** (longer if severely ill)

**Eye infections, bacterial**

**Antibacterial therapy for purulent conjunctivitis**
- Chloramphenicol eye drops p. 1072.

**Gastro-intestinal system infections, bacterial**

**Antibacterial therapy for gastro-enteritis**

Frequently self-limiting and may not be bacterial.
- Antibacterial not usually indicated

**Antibacterial therapy for campylobacter enteritis**

Frequently self-limiting; treat if immunocompromised or if severe infection.
- Clarithromycin p. 508 (or azithromycin p. 507 or erythromycin p. 510)
- *Alternative*, ciprofloxacin p. 527
- Strains with decreased sensitivity to ciprofloxacin isolated frequently

**Antibacterial therapy for salmonella (non-typhoid)**

Treat invasive or severe infection. Do not treat less severe infection unless there is a risk of developing invasive infection (e.g. immunocompromised patients, those with haemoglobinopathy, or children under 6 months of age).
- Ciprofloxacin or cefotaxime p. 500

**Antibacterial therapy for shigellosis**

Antibacterial not indicated for mild cases.
- Ciprofloxacin or azithromycin
  - *Alternatives if micro-organism sensitive*, amoxicillin p. 518 or trimethoprim p. 542

**Antibacterial therapy for typhoid fever**

Infections from Middle-East, South Asia, and South-East Asia may be multiple-antibacterial-resistant and sensitivity should be tested.
- Cefotaxime (or ceftriaxone p. 501)
  - azithromycin may be an alternative in mild or moderate disease caused by multiple-antibacterial-resistant organisms.
  - *Alternative if micro-organism sensitive*, ciprofloxacin

**Antibacterial therapy for Clostridium difficile infection**

- For first episode of mild to moderate infection, oral metronidazole p. 512
- **Suggested duration of treatment 10–14 days**
- For second or subsequent episode of infection, for severe infection, for infection not responding to metronidazole, or in patients intolerant of metronidazole, oral vancomycin p. 505
- For severe infection in patients with multiple co-morbidities who are receiving treatment with other antibacterials, or for second or subsequent episode of infection, fidaxomicin p. 538 can replace vancomycin
  - **Suggested duration of treatment 10–14 days**
- For infection not responding to vancomycin or fidaxomicin, for life-threatening infection, or in patients with ileus, oral vancomycin + i/v metronidazole
- For infection not responding to vancomycin in patients without life-threatening infection or ileus, fidaxomicin can be used instead of vancomycin + metronidazole
  - **Suggested duration of treatment 10–14 days**

**Antibacterial therapy for biliary-tract infection**
- Ciprofloxacin or gentamicin p. 491 or a cephalosporin

**Antibacterial therapy for peritonitis**
- A cephalosporin + metronidazole or gentamicin + metronidazole or gentamicin + clindamycin p. 506 or piperacillin with tazobactam p. 516 alone

**Antibacterial therapy for peritonitis: peritoneal dialysis-associated**
- Vancomycin (or teicoplanin p. 504) + ceftazidime p. 500 added to dialysis fluid or vancomycin added to dialysis fluid + ciprofloxacin by mouth
  - **Suggested duration of treatment 14 days or longer**

**Genital system infections, bacterial**

**Antibacterial therapy for bacterial vaginosis**
- Oral metronidazole p. 512
  - **Suggested duration of treatment 5–7 days** (or high-dose metronidazole as a single dose)
  - *Alternatively*, topical metronidazole for 5 days or topical clindamycin p. 506 for 7 days

**Antibacterial therapy for uncomplicated genital chlamydial infection, non-gonococcal urethritis, and non-specific genital infection**

Contact tracing recommended.
- Azithromycin p. 507 or doxycycline p. 534
  - **Suggested duration of treatment azithromycin as a single dose or doxycycline for 7 days**
  - **Suggested duration of treatment 14 days**
Antibacterial therapy for gonorrhoea: uncomplicated
Contact tracing recommended. Consider chlamydia co-infection. Choice of alternative antibacterial regimen depends on locality where infection acquired.

- Azithromycin + i/m ceftriaxone p. 501
- **Suggested duration of treatment** is a single-dose of each antibacterial
- Alternatively, when parenteral administration is not possible, cefixime p. 499+ azithromycin
- **Suggested duration of treatment** is a single-dose of each antibacterial
- Alternatively, if micro-organism is sensitive to a quinolone, ciprofloxacin p. 527+ azithromycin
- **Suggested duration of treatment** is a single-dose of each antibacterial
- Pharyngeal infection, azithromycin + i/m ceftriaxone
- **Suggested duration of treatment** is a single-dose of each antibacterial

Antibacterial therapy for pelvic inflammatory disease
Contact tracing recommended.

- Doxycycline + metronidazole + single-dose of i/m ceftriaxone or ofloxacin p. 530 + metronidazole
- **Suggested duration of treatment** 14 days (except i/m ceftriaxone).
- In severely ill patients initial treatment with doxycycline + i/v ceftriaxone + i/v metronidazole, then switch to oral treatment with doxycycline + metronidazole to complete 14 days’ treatment

Antibacterial therapy for early syphilis (infection of less than 2 years)
Contact tracing recommended.

- Benzathine benzylpenicillin [unlicensed]
- **Suggested duration of treatment** single-dose (repeat dose after 7 days for women in the third trimester of pregnancy)
- Alternatively, doxycycline or erythromycin
- **Suggested duration of treatment** 14 days

Antibacterial therapy for late latent syphilis (asymptomatic infection of more than 2 years)
Contact tracing recommended.

- Benzathine benzylpenicillin [unlicensed]
- **Suggested duration of treatment** once weekly for 2 weeks
- Alternatively, doxycycline
- **Suggested duration of treatment** 28 days

Asymptomatic contacts of patients with infectious syphilis
- Doxycycline
- **Suggested duration of treatment** 14 days

Musculoskeletal system infections, bacterial

Antibacterial therapy for osteomyelitis
Seek specialist advice if chronic infection or prostheses present.

- Flucloxacillin p. 523
- Consider adding fusidic acid p. 539 or rifampicin p. 549 for initial 2 weeks.
- **Suggested duration of treatment** 6 weeks for acute infection
- If penicillin-allergic, clindamycin p. 506
- Consider adding fusidic acid or rifampicin for initial 2 weeks.
- **Suggested duration of treatment** 6 weeks for acute infection
- If meticillin-resistant Staphylococcus aureus suspected, vancomycin p. 505 (or teicoplanin p. 504)
- Consider adding fusidic acid or rifampicin for initial 2 weeks.
- **Suggested duration of treatment** 6 weeks for acute infection

Antibacterial therapy for septic arthritis
Seek specialist advice if prostheses present.

- Flucloxacillin
- **Suggested duration of treatment** 4–6 weeks (longer if infection complicated).
- If penicillin-allergic, clindamycin
- **Suggested duration of treatment** 4–6 weeks (longer if infection complicated).
- If meticillin-resistant Staphylococcus aureus suspected, vancomycin (or teicoplanin)
- **Suggested duration of treatment** 4–6 weeks (longer if infection complicated).
- If gonococcal arthritis or Gram-negative infection suspected, cefotaxime p. 500 (or ceftriaxone p. 501)
- **Suggested duration of treatment** 4–6 weeks (longer if infection complicated; treat gonococcal infection for 2 weeks).

Nose infections, bacterial

Antibacterial therapy for sinusitis
Antibacterial therapy should usually be used only for persistent symptoms and purulent discharge lasting at least 7 days or if severe symptoms. Also, consider antibacterial for those at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis).

- Amoxicillin p. 518 (or amoxicillin p. 520) or doxycycline p. 534 or clarithromycin p. 508 (or azithromycin p. 507 or erythromycin p. 510)
- **Suggested duration of treatment** 7 days.
- Consider oral co-amoxiclav p. 521 if no improvement after 48 hours.
- In severe infection, initial parenteral therapy with co-amoxiclav or cefuroxime p. 498 may be required.

Oral bacterial infections

Antibacterial drugs
Antibacterial drugs should only be prescribed for the treatment of oral infections on the basis of defined need. They may be used in conjunction with (but not as an alternative to) other appropriate measures, such as providing drainage or extracting a tooth.

The ‘blind’ prescribing of an antibacterial for unexplained pyrexia, cervical lymphadenopathy, or facial swelling can lead to difficulty in establishing the diagnosis. In severe oral infections, a sample should always be taken for bacteriology.

Oral infections which may require antibacterial treatment include acute periapical or periodontal abscess, cellulitis, acutely created oral-antral communication (and acute sinusitis), severe pericoronitis, localised osteitis, acute necrotising ulcerative gingivitis, and destructive forms of chronic periodontal disease. Most of these infections are readily resolved by the early establishment of drainage and removal of the cause (typically an infected necrotic pulp). Antibacterials may be required if treatment has to be
delayed, in immunocompromised patients, or in those with conditions such as diabetes or Paget’s disease. Certain rarer infections including bacterial sialadenitis, osteomyelitis, actinomycosis, and infections involving fascial spaces such as Ludwig’s angina, require antibiotics and specialist hospital care.

Antibacterial drugs may also be useful after dental surgery in some cases of spreading infection. Infection may spread to involve local lymph nodes, to fascial spaces (where it can cause airway obstruction), or into the bloodstream (where it can lead to cavernous sinus thrombosis and other serious complications). Extension of an infection can also lead to maxillary sinusitis; osteomyelitis is a complication, which usually arises when host resistance is reduced.

If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be changed, preferably on the basis of bacteriological investigation. Failure to respond may also suggest an incorrect diagnosis, lack of essential additional measures (such as drainage), poor host resistance, or poor patient compliance.

Combination of a penicillin (or a macrolide) with metronidazole p. 512 may sometimes be helpful for the treatment of severe oral infections or oral infections that have not responded to initial antibacterial treatment.

Penicillins
Phenoxyethylpenicillin p. 518 is effective for dentoalveolar abscess.

Broad-spectrum penicillins
Amoxicillin p. 518 is as effective as phenoxyethylpenicillin but is better absorbed; however, it may encourage emergence of resistant organisms.

Like phenoxyethylpenicillin, amoxicillin is ineffective against bacteria that produce beta-lactamases.

Amoxicillin may be useful for short course oral regimens.

Co-amoxiclav p. 521 is active against beta-lactamase-producing bacteria that are resistant to amoxicillin. Co-amoxiclav may be used for severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial treatment.

Cephalosporins
The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) which become resistant to penicillin are usually also resistant to cephalosporins. This is of importance in the case of patients who have had rheumatic fever and are on long-term penicillin therapy. Cefalexin p. 497 and cefradine p. 497 have been used in the treatment of oral infections.

Tetracyclines
In adults, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline p. 534 has a longer duration of action than tetracycline p. 536 or oxytetracycline p. 536 and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

Doxycycline may have a role in the treatment of recurrent aphthous ulceration, or as an adjunct to gingival scaling and root planing for periodontitis.

Macrolides
The macrolides are an alternative for oral infections in penicillin-allergic patients or where a beta-lactamase producing organism is involved. However, many organisms are now resistant to macrolides or rapidly develop resistance; their use should therefore be limited to short courses.

Clindamycin
Clindamycin p. 506 should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin-resistant bacteria p. 510. Clindamycin can be used for the treatment of dentoalveolar abscess that has not responded to penicillin or to metronidazole.

Metronidazole and tinidazole
Metronidazole is an alternative to a penicillin for the treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes. It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent’s infection) and pericoronitis; amoxicillin is a suitable alternative. For these purposes metronidazole for 3 days is sufficient, but the duration of treatment may need to be longer in pericoronitis. Tinidazole p. 514 is licensed for the treatment of acute ulcerative gingivitis.

Respiratory system infections, bacterial

Antibacterial therapy for Haemophilus influenzae epiglottitis
- Cefotaxime p. 500 (or ceftriaxone p. 501)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol p. 537

Antibacterial therapy for chronic bronchitis: acute exacerbations
Treat if increase in sputum purulence accompanied by an increase in sputum volume or increase in dyspnoea.

- Amoxicillin p. 518 (or ampicillin p. 520) or a tetracycline p. 536
- Some pneumococci and Haemophilus influenzae strains tetracycline-resistant; approx. 20% H. influenzae strains amoxicillin-resistant
- Suggested duration of treatment 5 days; longer treatment may be necessary in severely ill patients
- Alternative, clarithromycin p. 508 (or azithromycin p. 507 or erythromycin p. 510)
- Suggested duration of treatment 5 days; longer treatment may be necessary in severely ill patients

Antibacterial therapy for pneumonia: low-severity community-acquired
- Amoxicillin (or ampicillin)
- Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
- If atypical pathogens suspected, add clarithromycin (or azithromycin or erythromycin).
- If staphylococci suspected (e.g. in influenza or measles), add flucloxacillin p. 523.
- Suggested duration of treatment 7 days (14–21 days for infections caused by staphylococci)
- Alternatives, doxycycline p. 534 or clarithromycin (or azithromycin or erythromycin)
- Suggested duration of treatment 7 days (14–21 days for infections caused by staphylococci)
Antibacterial therapy for pneumonia: moderate-severity community-acquired

- Amoxicillin (or ampicillin) + clarithromycin (or azithromycin or erythromycin) or doxycline alone
- Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
- If meticillin-resistant Staphylococcus aureus suspected, add vancomycin (or teicoplanin).
- Suggested duration of treatment 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci suspected)
- If life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home, co-amoxiclav p. 521 + clarithromycin (or azithromycin or erythromycin)
- If meticillin-resistant Staphylococcus aureus suspected, add vancomycin (or teicoplanin).
- Suggested duration of treatment 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)
- Alternatives if life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home, cefuroxime p. 498 + clarithromycin (or azithromycin or erythromycin) or cefotaxime (or ceftriaxone) + clarithromycin (or azithromycin or erythromycin)
- If meticillin-resistant Staphylococcus aureus suspected, add vancomycin (or teicoplanin).
- Suggested duration of treatment 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)

Antibacterial therapy for pneumonia possibly caused by atypical pathogens

- Clarithromycin (or azithromycin or erythromycin)
- If high-severity Legionella infection, add rifampicin p. 549 for the first few days.
- Suggested duration of treatment 14 days (usually 7–10 days for Legionella)
- Alternative if Legionella infection suspected, a quinolone
- If high-severity Legionella infection, add clarithromycin (or azithromycin or erythromycin) or rifampicin for the first few days.
- Suggested duration of treatment usually 7–10 days
- Alternative for chlamydial or mycoplasma infections, doxycline
- Suggested duration of treatment 14 days

Antibacterial therapy for pneumonia: hospital-acquired

- Early-onset infection less than 5 days after admission to hospital, co-amoxiclav or cefuroxime
- If life-threatening infection, or if history of antibacterial treatment in the last 3 months, or if resistant microorganisms suspected, treat as for late-onset hospital-acquired pneumonia.
- Suggested duration of treatment 7 days
- Late-onset infection (more than 5 days after admission to hospital), an antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 516) or a broad-spectrum cephalosporin (e.g. ceftazidime p. 500) or another antipseudomonal beta-lactam or a quinolone (e.g. ciprofloxacin p. 527)
- If meticillin-resistant Staphylococcus aureus suspected, add vancomycin.
- For severe illness caused by Pseudomonas aeruginosa, consider adding an aminoglycoside.
- Suggested duration of treatment 7 days (longer if Pseudomonas aeruginosa confirmed)

Skin infections, bacterial

Antibacterial therapy for impetigo: small areas of skin infected

Seek local microbiology advice before using topical treatment in hospital.

- Topical fusidic acid p. 539
  - Suggested duration of treatment 7 days is usually adequate (max. 10 days).
  - Alternatively, if meticillin-resistant Staphylococcus aureus, topical mupirocin p. 1129
  - Suggested duration of treatment 7 days is usually adequate (max. 10 days).

Impetigo: widespread infection

- Oral flucloxacillin p. 523
  - If streptococci suspected in severe infection, add phenoxymerpenicillin p. 518.
  - Suggested duration of treatment 7 days.
  - If penicillin-allergic, oral clarithromycin p. 508 (or azithromycin p. 507 or erythromycin p. 510)
  - Suggested duration of treatment 7 days.

Antibacterial therapy for erysipelas

- Phenoxymerpenicillin or benzylpenicillin sodium p. 517
  - If severe infection, replace phenoxymerpenicillin or benzylpenicillin sodium with high-dose flucloxacillin
  - Suggested duration of treatment at least 7 days.
  - If penicillin-allergic, clindamycin p. 506 or clarithromycin (or azithromycin or erythromycin)
  - Suggested duration of treatment at least 7 days

Antibacterial therapy for cellulitis

- Flucloxacillin (high-dose)
  - If streptococcal infection confirmed, replace flucloxacillin with phenoxymerpenicillin or benzylpenicillin sodium
  - If Gram-negative bacteria or anaerobes suspected, use broad-spectrum antibiotics.
  - If penicillin-allergic, clindamycin or clarithromycin (or azithromycin or erythromycin) or vancomycin p. 505 (or teicoplanin p. 504)
  - If Gram-negative bacteria suspected, use broad-spectrum antibiotics.

Antibacterial therapy for animal and human bites

Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 1188 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection). Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and
give appropriate prophylaxis to prevent viral spread.
- Co-amoxiclav p. 521
- If penicillin-allergic, doxycycline p. 534 + metronidazole p. 512

Antibacterial therapy for mastitis during breast-feeding
Treat if severe, if systemically unwell, if nipple fissure present, if symptoms do not improve after 12–24 hours of effective milk removal, or if culture indicates infection.
- Flucloxacillin, if penicillin-allergic, erythromycin
- Continue breast-feeding or expressing milk during treatment.
- Suggested duration of treatment 10–14 days.

ANTIBACTERIALS>AMINOGLYCOSIDES

Aminoglycosides
Overview
These include amikacin p. 491, gentamicin p. 491, neomycin sulfate p. 492, streptomycin p. 492, and tobramycin p. 493. All are bactericidal and active against many Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against Pseudomonas aeruginosa; streptomycin is active against Mycobacterium tuberculosis and is now almost entirely reserved for tuberculosis.

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections.

Gentamicin is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the ‘blind’ therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole p. 512 (or both). Gentamicin is used together with another antibiotic for the treatment of endocarditis. Streptomycin may be used as an alternative in gentamicin-resistant enterococcal endocarditis.

Loading and maintenance doses of gentamicin may be calculated on the basis of the patient’s weight and renal function (e.g. using a nomogram); adjustments are then made according to serum-gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, in the patient with cystic fibrosis, or in the immunocompromised patient. Whenever possible treatment should not exceed 7 days.

Amikacin is more stable than gentamicin to enzyme inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin-resistant Gram-negative bacilli.

Tobramycin has similar activity to gentamicin. It is slightly more active against Ps. aeruginosa but shows less activity against certain other Gram-negative bacteria. Tobramycin can be administered by nebuliser or by inhalation of powder on a cyclical basis (28 days of tobramycin followed by a 28-day tobramycin-free interval) for the treatment of chronic pulmonary Ps. aeruginosa infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

Neomycin sulfate is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin sulfate may be absorbed from the gut in patients with hepatic failure and, as these patients may also be uremic, cumulation may occur with resultant ototoxicity.

Once daily dosage
Once daily administration of aminoglycosides is more convenient, provides adequate serum concentrations, and in many cases has largely superseded multiple daily dose regimens (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with endocarditis due to Gram-positive bacteria, HACEK endocarditis, burns of more than 20% of the total body surface area, or creatinine clearance less than 20 mL/minute. There is insufficient evidence to recommend a once daily, high-dose regimen of an aminoglycoside in pregnancy.

Serum concentrations
Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations should be monitored in patients receiving parenteral aminoglycosides and must be determined in the elderly, in obesity, and in cystic fibrosis, or if high doses are being given, or if there is renal impairment.

Aminoglycosides (by injection)
- CONTRA-INDICATIONS Myasthenia gravis (aminoglycosides may impair neuromuscular transmission)
- CAUTIONS Care must be taken with dosage (the main side-effects of the aminoglycosides are dose-related) - conditions characterised by muscular weakness (aminoglycosides may impair neuromuscular transmission). If possible, dehydration should be corrected before starting an aminoglycoside - whenever possible, parenteral treatment should not exceed 7 days
- SIDE-EFFECTS
  - Rare Antibiotic-associated colitis - electrolyte disturbances - hypocalcaemia - hypokalaemia - hypomagnesaemia on prolonged therapy - nausea - peripheral neuropathy - stomatitis - vomiting
  - Very rare Blood disorders - CNS effects - convulsions - encephalopathy - headache
  - Frequency not known Auditory damage - impaired neuromuscular transmission - irreversible ototoxicity - nephrotoxicity - transient myasthenic syndrome in patients with normal neuromuscular function with large doses given during surgery - vestibular damage
- SIDE-EFFECTS, FURTHER INFORMATION
  - Nephrotoxicity
    - In adults Occurs most commonly in the elderly; therefore, monitoring is particularly important in these patients, who may require reduced doses.
    - In children Occurs most commonly in children with renal failure.
- PREGNANCY There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy. The risk is greatest with streptomycin. The risk is probably very small with gentamicin and tobramycin, but their use should be avoided unless essential. If given during pregnancy, serum-aminoglycoside concentration monitoring is essential.
- RENAL IMPAIRMENT If there is impairment of renal function, the interval between doses must be increased; if the renal impairment is severe, the dose itself should be reduced as well. Excretion of aminoglycosides is principally via the kidney and accumulation occurs in renal impairment.
In adults  A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with a creatinine clearance less than 20 mL/minute.

In children  A once-daily, high-dose regimen of an aminoglycoside should be avoided in children over 1 month of age with a creatinine clearance less than 20 mL/minute/1.73 m². Ototoxicity and nephrotoxicity occur commonly in patients with renal failure. Serum-aminoglycoside concentrations must be monitored in patients with renal impairment; earlier and more frequent measurement of aminoglycoside concentration may be required.

**MONITORING REQUIREMENTS**

- Serum concentrations  Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations should be measured in all patients receiving parenteral aminoglycosides and must be determined in obesity, if high doses are being given and in cystic fibrosis.

- In adults  Serum aminoglycoside concentrations must be determined in the elderly. In patients with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen and after a dose change. For multiple daily dose regimens, blood samples should be taken approximately 1 hour after intramuscular or intravenous administration (‘peak’ concentration) and also just before the next dose (‘trough’ concentration). If the pre-dose (‘trough’) concentration is high, the interval between doses must be increased. If the post-dose (‘peak’) concentration is high, the dose must be decreased. For once daily dose regimens, consult local guidelines on serum concentration monitoring.

- In children  In children with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen. Blood samples should be taken just before the next dose is administered (‘trough’ concentration). If the pre-dose (‘trough’) concentration is high, the interval between doses must be increased. For multiple daily dose regimens, blood samples should also be taken approximately 1 hour after intramuscular or intravenous administration (‘peak’ concentration). If the post-dose (‘peak’) concentration is high, the dose must be decreased.

- Renal function should be assessed before starting an aminoglycoside and during treatment.

- Auditory and vestibular function should also be monitored during treatment.

---

**Amikacin**

**INDICATIONS AND DOSE**

**Serious Gram-negative infections resistant to gentamicin (multiple daily dose regimen)**
- **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 15 mg/kg daily in 2 divided doses, increased to 22.5 mg/kg daily in 3 divided doses for up to 10 days, higher dose to be used in severe infections; maximum 1.5 g per day; maximum 15 g per course

**Serious Gram-negative infections resistant to gentamicin (once daily dose regimen)**
- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 15 mg/kg (max. per dose 1.5 g once daily), dose to be adjusted according to serum-amikacin concentration; maximum 15 g per course

**DOSES AT EXTREMES OF BODY-WEIGHT**
To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-amikacin concentration closely.

---

**INTERACTIONS**  Appendix 1: aminoglycosides

**SIDE-EFFECTS**
- Uncommon  Rash

**MONITORING REQUIREMENTS**

- **Multiple daily dose regimen:** one-hour (‘peak’) serum concentration should not exceed 30 mg/litre; pre-dose (‘trough’) concentration should be less than 10 mg/litre.

- **Once daily dose regimen:** pre-dose (‘trough’) concentration should be less than 5 mg/litre.

**DIRECTIONS FOR ADMINISTRATION**  For intravenous infusion (Amikin®); intermittent in Glucose 5% or Sodium chloride 0.9%. To be given over 30 minutes.

**PRESCRIBING AND DISPENSING INFORMATION**  Once daily dose regime not to be used for endocarditis, febrile neutropenia, or meningitis. Consult local guidelines.

---

**Gentamicin**

**INDICATIONS AND DOSE**

**Gram-positive bacterial endocarditis or HACEK endocarditis (in combination with other antibacterials)**
- **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- Adult: 1 mg/kg every 12 hours, intravenous injection to be administered over at least 3 minutes, to be given in a multiple daily dose regimen

**Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis | Endocarditis | Pneumonia in hospital patients | Adjunct in listerial meningitis | Prostatitis**
- **BY INTRAVENOUS INFUSION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
- Adult: 3–5 mg/kg daily in 3 divided doses, to be given in a multiple daily dose regimen, divided doses to be given every 8 hours, intravenous injection to be administered over at least 3 minutes

**Surgical prophylaxis**
- **BY SLOW INTRAVENOUS INJECTION**
- Adult: 1.5 mg/kg, intravenous injection to be administered over at least 3 minutes, administer dose up to 30 minutes before the procedure, dose may be repeated every 8 hours for high-risk procedures; up to 3 further doses may be given

**Surgical prophylaxis (including joint replacement surgery)**
- **BY INTRAVENOUS INFUSION**
- Adult: 5 mg/kg for 1 dose, administer dose up to 30 minutes before the procedure

**DOSES AT EXTREMES OF BODY-WEIGHT**
To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-gentamicin concentration closely.
Infection

PRESCRIBING AND DISPENSING INFORMATION

▶ For once-daily dose regimen, consult local guidelines on monitoring serum-gentamicin concentration.

INTERACTIONS

▶ With intravenous use (Cidomycin®; Gentamicin paediatric injection, Beacon; Gentamicin injection Hospira), give intermittently or via drip tubing in Glucose 5% or Sodium Chloride 0.9%. Suggested volume for intermittent infusion 50–100 ml given over 20–30 minutes (given over 60 minutes for once daily dose regimen).

MEDICINAL FORMS

▶ There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Gentamicin (Non-proprietary)

- Gentamicin (as Gentamicin sulfate) 5 mg per 1 ml Gentamicin Intrathecal 5mg/1ml solution for injection ampoules | 5 ampoule POM £36.28 (Hospital only)
- Gentamicin (as Gentamicin sulfate) 10 mg per 1 ml Gentamicin 20mg/2ml solution for injection ampoules | 5 ampoule POM £11.25 Gentamicin Paediatric 20mg/2ml solution for injection vials | 5 vial POM £11.25 DT price + £11.25
- Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Gentamicin 80mg/2ml solution for injection vials | 5 vial POM £20.00 Gentamicin 80mg/2ml solution for injection ampoules | 5 ampoule POM £6.88 | 10 ampoule POM £10.00

▶ Cidomycin (Sanofi)

- Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Cidomycin Adult Injectable 80mg/2ml solution for injection vials | 5 vial POM £6.88
- Cidomycin Adult Injectable 80mg/2ml solution for injection ampoules | 5 ampoule POM £6.88

Infusion

▶ Gentamicin (Non-proprietary)

- Gentamicin (as Gentamicin sulfate) 1 mg per 1 ml Gentamicin 80mg/80ml infusion bags | 20 bag POM £39.00
- Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml Gentamicin 240mg/80ml infusion bags | 20 bag POM £119.00 Gentamicin 360mg/120ml infusion bags | 20 bag POM £169.00

SIDE-EFFECTS

▶ Uncommon Rash

INTERACTIONS

▶ Appendix 1: aminoglycosides

CONTRA-INDICATIONS

⇒ Intestinal obstruction · myasthenia gravis (aminoglycosides may impair neuromuscular transmission)

CAUTIONS

⇒ Avoid prolonged use

INTERACTIONS

⇒ Appendix 1: neomycin

SIDE-EFFECTS

⇒ Common or very common Rash

UNLICENSED USE

⇒ Use in tuberculosis is an unlicensed indication.

Streptomycin

INDICATIONS AND DOSE

Tuberculosis, resistant to other treatment, in combination with other drugs

⇒ BY DEEP INTRAMUSCULAR INJECTION

Adult: 15 mg/kg daily (max. per dose 1 g), reduce dose in those under 50 kg and those over 40 years

Adjuvant to doxycycline in brucellosis (administered on expert advice)

⇒ BY DEEP INTRAMUSCULAR INJECTION

Adult: (consult local protocol)

Enterococcal endocarditis

Adult: (consult local protocol)

Neomycin sulfate

INDICATIONS AND DOSE

Bowel sterilisation before surgery

⇒ BY MOUTH

Adult: 1 g every 1 hour for 4 hours, then 1 g every 4 hours for 2–3 days

Hepatic coma

⇒ BY MOUTH

Adult: Up to 4 g daily in divided doses usually for 5–7 days

CONTRA-INDICATIONS

⇒ Intestinal obstruction · myasthenia gravis (aminoglycosides may impair neuromuscular transmission)

CAUTIONS

⇒ Avoid prolonged use

INTERACTIONS

⇒ Appendix 1: neomycin

SIDE-EFFECTS

⇒ Common or very common Rash

UNLICENSED USE

⇒ Use in tuberculosis is an unlicensed indication.

IMPORTANT SAFETY INFORMATION

Side-effects increase after a cumulative dose of 100 g, which should only be exceeded in exceptional circumstances.
Tobramycin

INDICATIONS AND DOSE

Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis or prostatis | Pneumonia in hospital patients

- **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 3 mg/kg daily in 3 divided doses; increased if necessary up to 5 mg/kg daily in 3–4 divided doses, increased dose used in severe infection; dose to be reduced back to 3 mg/kg daily as soon as clinically indicated

Urinary-tract infection

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 2–3 mg/kg for 1 dose

Chronic *Pseudomonas aeruginosa* infection in patients with cystic fibrosis

- **BY INHALATION OF NEBULISED SOLUTION**
  - Adult: 300 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution
  - **BY INHALATION OF POWDER**
  - Adult: 112 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin inhalation powder

DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum tobramycin concentration closely.

VANTOBRA® NEBULISER SOLUTION

Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis

- **BY INHALATION OF NEBULISED SOLUTION**
  - Adult: 170 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution

CAUTIONS

- When used by inhalation Conditions characterised by muscular weakness—may impair neuromuscular transmission • history of prolonged previous or concomitant intravenous aminoglycosides—increased risk of ototoxicity • renal impairment—limited information available • severe haemoptysis—risk of further haemorrhage

INTERACTIONS

- Appendix 1: aminoglycosides

SIDE-EFFECTS

- Common or very common
  - When used by inhalation Malaise • rhinitis • tinnitus
  - Uncommon
  - With systemic use Rash
  - Rare
  - When used by inhalation Aphony • hearing loss

Rare

- When used by inhalation Bronchospasm • cough (more frequent by inhalation of powder) • dysphonia • epistaxis • haemoptysis • laryngitis • mouth ulcers • pharyngitis • salivary hypersecretion • taste disturbances

SIDE-EFFECTS, FURTHER INFORMATION

- Ear effects
  - When used by inhalation Manufacturer advises monitor serum tobramycin concentration in patients with known or suspected signs of auditory dysfunction; if ototoxicity develops—discontinue treatment until serum concentration falls below 2 mg/litre.

VANTOBRA® NEBULISER SOLUTION

- Uncommon Dyspnoea
  - Rare Anorexia • asthenia • asthma • chest discomfort • dizziness • headache • nausea • pyrexia • vomiting
  - Very rare Abdominal pain • back pain • diarhoea • ear pain • fungal infection • hyperventilation • hypoxia • lymphadenopathy • sinusitis • somnolence

RENAL IMPAIRMENT

- When used by inhalation Manufacturer advises monitor serum tobramycin concentration; if nephrotoxicity develops—discontinue treatment until serum concentration falls below 2 mg/litre.

MONITORING REQUIREMENTS

- With intramuscular use or intravenous use One-hour (‘peak’) serum concentration should not exceed 10 mg/litre; pre-dose (‘trough’) concentration should be less than 2 mg/litre.
  - When used by inhalation Measure lung function before and after initial dose of tobramycin and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using bronchodilator. Manufacturer advises monitor renal function before treatment and then annually.

DIRECTIONS FOR ADMINISTRATION

- With intravenous use For intravenous infusion (Nebcin®); intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%. For adult intermittent infusion suggested volume 50–100 mL given over 20–60 minutes.
  - When used by inhalation Other inhaled drugs should be administered before tobramycin.

PATIENT AND CARER ADVICE

- When used by inhalation Patient counselling is advised for Tobramycin dry powder for inhalation (administration).

VANTOBRA® NEBULISER SOLUTION

Missed doses

Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TaS)

- Tobramycin by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013) NICE TA276

Tobramycin dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis only if there is an inadequate response to colistimethate sodium, or if colistimethate sodium cannot be used because of contraindications or intolerance. The manufacturer must provide tobramycin dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving tobramycin dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.

Infection

Bacterial infection

493
**Antibacterials**

### Carbapenems

#### Overview

The carbapenems are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; *imipenem* (imipenem with cilastatin p. 495) and meropenem p. 495 have good activity against *Pseudomonas aeruginosa*. The carbapenems are not active against metillin-resistant *Staphylococcus aureus* and *Enterococcus faecium*.

*Imipenem* (imipenem with cilastatin) and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections including sepsicaemia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary-tract infections.

Ertapenem below is licensed for treating abdominal and gynaecological infections and for community-acquired pneumonias, but it is not active against atypical respiratory pathogens and it has limited activity against penicillin-resistant pneumococci. It is also licensed for treating foot infections of the skin and soft tissue in patients with diabetes. Unlike the other carbapenems, ertapenem is not active against *Pseudomonas* or against *Acinetobacter spp*.

*Imipenem* is partially inactivated in the kidney by enzymatic activity and is therefore administered in combination with *cilastatin* (imipenem with cilastatin), a specific enzyme inhibitor, which blocks its renal metabolism. Meropenem and ertapenem are stable to the renal enzyme which inactivates imipenem and therefore can be given without cilastatin.

Side-effects of imipenem with cilastatin are similar to those of other beta-lactam antibacterials. Meropenem has less seizure-inducing potential and can be used to treat central nervous system infection.

#### Indications and dosage

- **Abdominal infections**
- **Acute gynaecological infections**
- **Community-acquired pneumonia**
- **Diabetic foot infections of the skin and soft-tissue**
- **Surgical prophylaxis, colorectal surgery**

#### Precautions

- **CNS disorders**—risk of seizures.
- **Elderly**

#### Interactions

- **Appendix 1: carbapenems**

#### Side-effects

- **Common or very common** Diarrhoea, headache, injection-site reactions, nausea, pruritus, raised platelet count, rash (also reported with eosinophilia and systemic symptoms), vomiting.
- **Uncommon** Abdominal pain, anorexia, antibiotic-associated colitis, asthma, bradycardia, chest pain, confusion, constipation, dizziness, dry mouth, dyspepsia, dysphonia, hypotension, melaena, oedema, petechiae, pharyngeal discomfort, raised glucose, seizures, sleep disturbances, taste disturbances.
- **Rare** Agitation, anxiety, arrhythmia, blood disorders, cholecystitis, cough, depression, dysphagia, electrolyte disturbances, haemorrhage, hypoglycaemia, increase in blood pressure, jaundice, liver disorder, muscle cramp, nasal congestion, neutropenia, pelvic peritonitis, renal impairment, scleral disorder, syncope, thrombocytopenia, tremor, wheezing.
- **Frequency not known** Dyskinesia, hallucinations.

#### Allergy and cross-sensitivity

Avoid if history of immediate hypersensitivity reaction to beta-lactam antibacterials.

#### Pregnancy

Manufacturer advises avoid unless potential benefit outweighs risk.

#### Breastfeeding

Present in milk—manufacturer advises avoid.

#### Renal impairment

Risk of seizures; max. 500 mg daily if eGFR less than 30 mL/minute/1.73 m².

#### Directions for administration

For intravenous infusion (*Invanz*®), give intermittently in Sodium chloride 0.9%. Reconstitute 1 g with 10 mL. Water for injections or Sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions.

#### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

### Powder for solution for infusion

**Electrolytes:** May contain Sodium

- **Invanz** (Merck Sharp & Dohme Ltd)
  - **Ertapenem (as Ertapenem sodium)** 1 gram Invanz 1g powder for solution for infusion vials | 1 vial (PoM) £31.65
**Indications and Dose**

Aerobic and anaerobic Gram-positive and Gram-negative infections (not indicated for CNS infections) | Hospital-acquired septicaemia

- **By Intravenous infusion**
  - Adult: 500 mg every 6 hours, alternatively 1 g every 8 hours

Infection caused by *Pseudomonas* or other less sensitive organisms | Empirical treatment of infection in febrile patients with neutropenia | Life-threatening infection

- **By Intravenous infusion**
  - Adult: 1 g every 6 hours

**Dose Equivalence and Conversion**

- Dose expressed in terms of imipenem.

**Cautions**

CNS disorders - epilepsy

**Interactions**

Appendix 1: carbapenems

**Side-effects**

Common or very common | Diarrhoea | eosinophilia | nausea (may reduce rate of infusion) | rash | vomiting

Uncommon | Confusion | dizziness | drowsiness | hallucinations | hypotension | leucopenia | myoclonic activity | seizures | thrombocytopenia | thrombocytosis

Rare | Acute renal failure | anaphylactic reactions | antibiotic-associated colitis | encephalopathy | hearing loss | hepatitis | paraesthesia | polyuria | Stevens-Johnson syndrome | taste disturbances | tooth, tongue or urinary discolouration | toxic epidermal necrolysis | tremor

Very rare | Abdominal pain | aggravation of myasthenia gravis | asthenia | cyanosis | dyspnoea | flushing | glossitis | haemolytic anaemia | headache | heartbeat | hyperhidrosis | hypersalivation | hyperventilation | palpitation | polyarthralgia | tachycardia | tinnitus

Frequency not known | Neurotoxicity (at high dose, renal failure, CNS disease)

**Allergy and Cross-sensitivity**

Avoid if history of immediate hypersensitivity reaction to beta-lactam antibacterials.

Use with caution in patients with sensitivity to beta-lactam antibacterials.

**Pregnancy**

Use only if potential benefit outweighs risk — no information available.

**Breast Feeding**

Unlikely to be absorbed (however, manufacturer advises avoid).

**Renal Impairment**

Monitor liver function in hepatic impairment.

**Effect on Laboratory Tests**

Positive Coombs’ test.

**Directions for Administration**

*Intravenous injection* to be administered over 5 minutes.

For *intravenous infusion* (Meronem®), give intermittently in Glucose 5% or Sodium chloride 0.9%.

Dilute dose in infusion fluid to a final concentration of 1–20 mg/mL; give over 15–30 minutes.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

**Electrolytes:** May contain Sodium

- Imipenem with cilastatin (Non-proprietary)
  - Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg
  - Imipenem 500mg / Cilastatin 500mg powder for solution for infusion vials | 1 vial (£12.00 (Hospital only)) | 5 vials (£50.00 (Hospital only)) | 10 vials (£75.45)

- Primaxin IV. (Merk Sharp & Dohme Ltd)
  - Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg
  - Primaxin IV 500mg powder for solution for infusion vials | 1 vial (£12.00)

**Meropenem**

**Indications and Dose**

Aerobic and anaerobic Gram-positive and Gram-negative infections | Hospital-acquired septicaemia

- **By Intravenous infusion, or by Intravenous injection**
  - Adult: 0.5–1 g every 8 hours

Exacerbations of chronic lower respiratory-tract infection in cystic fibrosis

- **By Intravenous infusion, or by Intravenous injection**
  - Adult: 2 g every 8 hours

Meningitis

- **By Intravenous infusion, or by Intravenous injection**
  - Adult: 2 g every 8 hours

Endocarditis (in combination with another antibacterial)

- **By Intravenous infusion, or by Intravenous injection**
  - Adult: 2 g every 8 hours

**Unlicensed Use**

Not licensed for use in endocarditis.

**Interactions**

Appendix 1: carbapenems

**Side-effects**

Common or very common | Abdominal pain | diarrhoea | disturbances in liver function tests | headache | nausea | pruritus | rash | thrombocytopenia | vomiting

Uncommon | Eosinophilia | leucopenia | paraesthesia | thrombocytopenia

Rare | Convulsions

Frequency not known | Antibiotic-associated colitis | haemolytic anaemia | Stevens-Johnson syndrome | toxic epidermal necrolysis

**Allergy and Cross-Sensitivity**

Avoid if history of immediate hypersensitivity reaction to beta-lactam antibacterials.

Use with caution in patients with sensitivity to beta-lactam antibacterials.

**Pregnancy**

Use only if potential benefit outweighs risk — no information available.

**Breast Feeding**

Unlike to be absorbed (however, manufacturer advises avoid).

**Hepatic Impairment**

Monitor liver function in hepatic impairment.

**Renal Impairment**

Use normal dose every 12 hours if eGFR 26–50 mL/minute/1.73 m². Use half normal dose every 12 hours if eGFR 10–25 mL/minute/1.73 m². Use half normal dose every 24 hours if eGFR less than 10 mL/minute/1.73 m².

**Effect on Laboratory Tests**

Positive Coombs’ test.

**Directions for Administration**

*Intravenous injection* to be administered over 5 minutes.

For *intravenous infusion* (Meronem®), give intermittently in Glucose 5% or Sodium chloride 0.9%.

Dilute dose in infusion fluid to a final concentration of 1–20 mg/mL; give over 15–30 minutes.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

**Electrolytes:** May contain Sodium

- **Meropenem (Non-proprietary)**
  - Meropenem (as Meropenem trihydrate) 500 mg | Meropenem 500mg powder for solution for injection vials | 10 vial (£80.75–£103.10 DT price = £80.75)
  - Meropenem (as Meropenem trihydrate) 1 gram | Meropenem 1g powder for solution for injection vials | 10 vial (£161.18–£190.00 DT price = £161.18)
Infection

Cephalosporins

Overview
The cephalosporins are broad-spectrum antibiotics which are used for the treatment of septicaemia, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excepting in patients with a history of immediate hypersensitivity to penicillin, because a suitable alternative antibacterial is not available, then cefixime p. 499, cefotaxime, cefazidime p. 500, ceftriaxone, or cefuroxime p. 498 can be used with caution; cefaclor p. 498, cefadroxil below, cefalexin p. 497, cefadroxil p. 497, and ceftriaxone p. 503 should be avoided.

The orally active 'first generation' cephalosporins, cefalexin, cefadrine, and cefadroxil and the 'second generation' cephalosporins, cefaclor has a similar duration of action and can be given twice daily; it has poor absorption.

Cefixime is an orally active 'third generation' cephalosporin. It has a longer duration of action than the other cephalosporins that are active by mouth. It is only licensed for acute infections.

Cefuroxime is a 'second generation' cephalosporin that is less susceptible than the earlier cephalosporins to inactivation by beta-lactamases. It is, therefore, active against certain bacteria which are resistant to the other drugs and has greater activity against Haemophilus influenzae. Cefotaxime, cefazidime and ceftriaxone are 'third generation' cephalosporins with greater activity than the 'second generation' cephalosporins against certain Gram-negative bacteria. However, they are less active than cefuroxime against Gram-positive bacteria, most notably Staphylococcus aureus. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Cefazidime has good activity against pseudomonas. It is also active against other Gram-negative bacteria.

Cefadroxil has a longer half-life and therefore needs to be given once daily. Indications include serious infections such as septicemia, pneumonia, and meningitis. The calcium salt of cefadroxil forms a precipitate in the gall bladder which may rarely cause symptoms but these usually resolve when the antibiotic is stopped.

Cefotaxime, cefuroxime and cefazidime are suitable cephalosporins for infections which do not respond to other drugs or which are resistant to the other cephalosporins. If a cephalosporin is essential in patients with a history of sensitivity and about infections of the CNS (e.g. meningitis).

Side-effects, further information
Antibiotic-associated colitis. Antibiotic-associated colitis may occur more commonly with second- and third-generation cephalosporins.

Allergy and cross-sensitivity
Contra-indicated in patients with cephalosporin hypersensitivity.

Cross-sensitivity with other beta-lactam antibacterials. About 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. Patients with a history of immediate hypersensitivity to penicillin and other beta-lactams should not receive a cephalosporin.

Cephalosporins should be used with caution in patients with sensitivity to penicillin and other beta-lactams.

Effect on laboratory tests
False positive urinary glucose (if tested for reducing substances), false positive Coombs’ test.

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria
- By mouth
  - Child 6–17 years (body-weight up to 40 kg): 0.5 g twice daily
  - Child 6–17 years (body-weight 40 kg and above): 0.5–1 g twice daily
  - Adult: 0.5–1 g twice daily

Skin infections. Soft-tissue infections. Uncomplicated urinary-tract infections
- By mouth
  - Child 6–17 years (body-weight 40 kg and above): 1 g once daily
  - Adult: 1 g daily

Interactions
Appendix 1: cephalosporins

Pregnancy
Not known to be harmful.
**Breastfeeding** Present in milk in low concentration, but appropriate to use.

**Renal Impairment**
- In adults: 1 g initially, then 500 mg every 12 hours if eGFR 26–50 mL/minute/1.73 m². 1 g initially, then 500 mg every 24 hours if eGFR 11–26 mL/minute/1.73 m². 1 g initially, then 500 mg every 36 hours if eGFR less than 11 mL/minute/1.73 m².
- In children: Reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **Cefalexin (Non-proprietary)**
  - Cefadroxil (as Cefadroxil monohydrate) 500 mg Cefadroxil 500mg capsules: 20 capsule £22.38 DT price = £22.38 | 100 capsule £111.90

**Cefalexin**

(Cephalexin)

**Indications and Dose**

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- **By mouth**
  - Child 1-11 months: 12.5 mg/kg twice daily, alternatively 125 mg twice daily
  - Child 1-4 years: 12.5 mg/kg twice daily, alternatively 125 mg 3 times a day
  - Child 5-11 years: 12.5 mg/kg twice daily, alternatively 250 mg 3 times a day
  - Child 12-17 years: 500 mg 2–3 times a day
  - Adult: 250 mg every 6 hours, alternatively 500 mg every 8–12 hours; increased to 1–1.5 g every 6–8 hours, increased dose to be used for severe infections

Serious susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- **By mouth**
  - Child 1 month-11 years: 25 mg/kg 2–4 times a day (max. per dose 1 g 4 times a day)
  - Child 12-17 years: 1–1.5 g 3–4 times a day

**Prophylaxis of recurrent urinary-tract infection**

- **By mouth**
  - Child: 12.5 mg/kg once daily (max. per dose 125 mg), dose to be taken at night
  - Adult: 125 mg once daily, dose to be taken at night

**Interactions**

- **Appendix 1: cephalexin**

**Pregnancy** Not known to be harmful.

**Breastfeeding** Present in milk in low concentration, but appropriate to use.

**Renal Impairment**
- In adults: Max. 3 g daily if eGFR 40–50 mL/minute/1.73 m². Max. 1.5 g daily if eGFR 10–40 mL/minute/1.73 m². Max. 750 mg daily if eGFR less than 10 mL/minute/1.73 m².
- In children: Reduce dose in moderate impairment.

ANTIBACTERIALS ➤ CEPHALOSPORINS, SECOND-GENERATION

Cefaclor

INDICATIONS AND DOSE
Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria
- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Child 1-11 months: 20 mg/kg daily in 3 divided doses, alternatively 62.5 mg 3 times a day
  - Child 1-4 years: 20 mg/kg daily in 3 divided doses, alternatively 125 mg 3 times a day
  - Child 5-11 years: 20 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 250 mg 3 times a day
  - Child 12-17 years: 250 mg 3 times a day; maximum 4 g per day
- Adult: 250 mg 3 times a day; maximum 4 g per day
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - Child 12-17 years: 375 mg every 12 hours, dose to be taken with food
- Adult: 375 mg every 12 hours, dose to be taken with food

Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria
- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Child 1-11 months: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 125 mg 3 times a day
  - Child 1-4 years: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 250 mg 3 times a day
  - Child 5-11 years: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily
  - Child 12-17 years: 500 mg 3 times a day; maximum 4 g per day
- Adult: 500 mg 3 times a day; maximum 4 g per day

Pneumonia
- BY MOUTH USING MODIFIED-RELEASE TABLETS
  - Child 12-17 years: 750 mg every 12 hours, dose to be taken with food
  - Adult: 750 mg every 12 hours, dose to be taken with food

Lower urinary-tract infections
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - Child 12-17 years: 375 mg every 12 hours, dose to be taken with food
  - Adult: 375 mg every 12 hours, dose to be taken with food

INTERACTIONS ➤ Appendix 1: cephalosporins

SIDE-EFFECTS
SIDE-EFFECTS, FURTHER INFORMATION
- Skin reactions Cefaclor is associated with protracted skin reactions, especially in children.

PREGNANCY
Not known to be harmful.

BREAST FEEDING
Present in milk in low concentration, but appropriate to use.

RENAL IMPAIRMENT
No dose adjustment required. Manufacturer advises caution.

  - Cefuroxime (as Cefuroxime sodium) 1.5 gram Cefuroxime 1.5g powder for injection vials | 1 vial | £5.05 P | 10 vial | £50.50
  - Zinacef (GlaxoSmithKline UK Ltd)
    - Cefuroxime (as Cefuroxime sodium) 250 mg Zinacef 250mg powder for injection vials | 5 vial | £4.70
  - Cefuroxime (as Cefuroxime sodium) 750 mg Zinacef 750mg powder for injection vials | 5 vial | £11.72 (Hospital only)
  - Cefuroxime (as Cefuroxime sodium) 1.5 gram Zinacef 1.5g powder for injection vials | 1 vial | £4.70

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9, 21

EXCIPIENTS: May contain Aspartame, sucrose

- Zinacef (GlaxoSmithKline UK Ltd)
  - Cefuroxime (as Cefuroxime axetil) 25 mg per 1 ml Zinnat 25mg/5ml oral suspension | 70 ml P | £5.20

ANTIBACTERIALS > CEPHALOSPORINS, THIRD-GENERATION

**Cefixime**

INDICATIONS AND DOSE

Acute infections due to sensitive Gram-positive and Gram-negative bacteria

- **BY MOUTH**
  - Child 6–11 months: 75 mg daily
  - Child 1–4 years: 100 mg daily
  - Child 5–9 years: 200 mg daily
  - Child 10–17 years: 200–400 mg daily, alternatively 100–200 mg twice daily
  - Adult: 200–400 mg daily in 1–2 divided doses

Uncomplicated gonorrhoea

- **BY MOUTH**
  - Adult: 400 mg for 1 dose

UNLICENSED USE

Use of cefixime for uncomplicated gonorrhoea is an unlicensed indication.

INTERACTIONS

Appendix 1: cephalosporins

PREGNANCY

Not known to be harmful.

BREAST FEEDING

Manufacturer advises avoid unless essential—no information available.

RENAL IMPAIRMENT

- In adults Reduce dose if eGFR less than 20 mL/minute/1.73 m² (max. 200 mg once daily).
  - In children Reduce dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9

- **Suprax** (Sanofi)
  - Cefixime 200 mg Suprax 200mg tablets | 7 tablet P | £13.23 DT price = £13.23

- Manufacturer advises avoid unless essential—no information available.

- **Renal impairment**
  - In adults Reduce dose if eGFR less than 20 mL/minute/1.73 m² (max. 200 mg once daily).
  - In children Reduce dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².
Cefotaxime

- **INDICATIONS AND DOSE**
  - *Uncomplicated gonorrhoea*
    - By intramuscular injection
      - Adult: 500 mg for 1 dose
  - *Infections due to sensitive Gram-positive and Gram-negative bacteria* | Surgical prophylaxis | Haemophilus epiglottitis
    - By intramuscular injection, or by intravenous injection, or by intravenous infusion
      - Adult: 1 g every 12 hours
  - *Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria* | Meningitis
    - By intramuscular injection, or by intravenous injection, or by intravenous infusion
      - Adult: 8 g daily in 4 divided doses, increased if necessary to 12 g daily in 3–4 divided doses, intramuscular doses over 1 g should be divided between more than one site
  - *Emergency treatment of suspected bacterial meningitis or meningococcal disease, before urgent transfer to hospital, in patients who cannot be given benzylpenicillin* (e.g. because of an allergy)
    - By intravenous injection, or by intramuscular injection
      - Child 1 month–11 years: 50 mg/kg for 1 dose
      - Child 12–17 years: 1 g for 1 dose
      - Adult: 1 g for 1 dose

- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS**
  - Rare | Arrhythmias (following rapid injection)
  - Pregnancy Not known to be harmful
  - Breast feeding Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT**
  - In adults: If eGFR less than 5 mL/minute/1.73 m², initial dose of 1 g then use half normal dose.
  - In children: usual initial dose, then use half normal dose if estimated glomerular filtration rate less than 5 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use in children: Displacement value may be significant, consult local guidelines. For intermittent intravenous infusion dilute in glucose 5% or sodium chloride 0.9%; administer over 20–60 minutes; incompatible with alkaline solutions.
  - With intravenous use in adults: For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride 0.9%. Suggested volume 40–100 mL given over 20–60 minutes; incompatible with alkaline solutions.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder for solution for injection**
    - Cefotaxime (as Cefotaxime sodium) 500 mg
      - Cefotaxime 500mg powder for solution for injection vials | 1 vial (£1.50 | 10 vial (£25.50–£30.00
    - Cefotaxime (as Cefotaxime sodium) 1 gram
      - Cefotaxime 1g powder for solution for injection vials | 1 vial (£3.00 | 10 vial (£35.00
    - Cefotaxime (as Cefotaxime sodium) 2 gram
      - Cefotaxime 2g powder for solution for injection vials | 1 vial (£8.00 | 10 vial (£75.00

Ceftazidime

- **INDICATIONS AND DOSE**
  - *Prophylaxis for transurethral resection of prostate*
    - By intravenous injection, or by intravenous infusion, or by deep intramuscular injection
      - Adult: 1 g, single dose to be administered up to 30 minutes before procedure and may be repeated if necessary when catheter removed
  - *Pseudomonal lung infection in cystic fibrosis*
    - By intravenous injection, or by intravenous infusion, or by deep intramuscular injection
      - Adult: 100–150 mg/kg daily in 3 divided doses; maximum 9 g per day
  - *Complicated urinary-tract infection*
    - By intravenous injection, or by intravenous infusion, or by deep intramuscular injection
      - Adult 18–79 years: 1–2 g every 8–12 hours
      - Adult 80 years and over: 1–2 g every 8–12 hours; maximum 3 g per day
  - *Septicaemia* | Hospital-acquired pneumonia
    - By intravenous infusion, or by intravenous injection, or by deep intramuscular injection
      - Adult 18–79 years: 2 g every 8 hours
      - Adult 80 years and over: 2 g every 8 hours; maximum 3 g per day
  - *Febrile neutropaenia*
    - By intravenous infusion, or by intravenous injection, or by deep intramuscular injection
      - Adult 18–79 years: 2 g every 8 hours
      - Adult 80 years and over: 2 g every 8 hours; maximum 3 g per day
  - *Meningitis*
    - By intravenous infusion, or by intravenous injection, or by deep intramuscular injection
      - Adult 18–79 years: 2 g every 8 hours
      - Adult 80 years and over: 2 g every 8 hours; maximum 3 g per day
  - *Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria*
    - By intravenous infusion, or by intravenous injection, or by deep intramuscular injection
      - Adult 18–79 years: 1–2 g every 8 hours
      - Adult 80 years and over: 1–2 g every 8 hours; maximum 3 g per day

- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS**
  - Paraesthesia • taste disturbances
- **PREGNANCY** Not known to be harmful
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Reduce dose if eGFR less than 50 mL/minute/1.73 m²—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Intramuscular administration used when intravenous administration not possible; single doses over 1 g by intravenous route only.
  - With intravenous use: For intravenous infusion give intermittently or via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%. Dissolve 2 g initially in 10 mL (3 g in 15 mL) infusion fluid. For Fortum dilute further to a concentration of 40 mg/mL. For Kefadim dilute further to a concentration of 20 mg/mL. Give over up to 30 minutes.
Bacterial infection 501

Ceftaxone

15-Jun-2016

F 496

INDICATIONS AND DOSE

Community-acquired pneumonia | Hospital-acquired pneumonia | Intra-abdominal infections | Complicated urinary-tract infections | Acute exacerbations of chronic obstructive pulmonary disease

- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- Adult: 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases

Complicated skin and soft tissue infections | Infections of bones and joints

- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- Adult: 2 g once daily

Suspected bacterial infection in neutropenic patients

- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- Adult: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases

Bacterial meningitis | Bacterial endocarditis

- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- Adult: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases

- BY INTRAVENOUS INFUSION
- Child 1 month–11 years (body-weight up to 50 kg): 80–100 mg/kg once daily, 100 mg/kg once daily dose should be used for bacterial endocarditis; maximum 4 g per day
- Child 9–11 years (body-weight 50 kg and above): 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
- Child 12–17 years: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases

- BY INTRAVENOUS INJECTION
- Child 9–11 years (body-weight 50 kg and above): 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
- Child 12–17 years: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases

UNLICENSED USE

CAUTIONS

GENERAL CAUTIONS

History of hypercalciuria | history of kidney stones

SPECIFIC CAUTIONS

- With intravenous use Concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium) (in adults)

INTERACTIONS

- Appendix 1: cephalosporins

SIDE-EFFECTS

- Common or very common Calcium ceftaxone precipitates in gall bladder—consider discontinuation if symptomatic - calcium ceftaxone precipitates in urine (particularly in very young, dehydrated or those who are immobilised)— consider discontinuation if symptomatic

- Uncommon | Gential fungal infection

- Rare

- Bronchospasm | glycosuria | haematuria | prolongation of prothrombin time

- Frequency not known Convulsion | glossitis | oliguria | pancreatitis | stomatitis | toxic epidermal necrolysis | vertigo

PREGNANCY

Manufacturer advises use only if benefit outweighs risk—limited data available but not known to be
502  Bacterial infection

harmful in animal studies. Specialist sources indicate suitable for use in pregnancy. 

- **BREAST FEEDING**  Specialist sources advise ceftriaxone is compatible with breastfeeding—present in milk in low concentration but limited effects to breast-fed infant. 

- **RENA L IMPAIRMENT**  Manufacturer advises reduce dose and monitor efficacy in patients with severe renal impairment in combination with hepatic impairment—no information available.
  - in adults  Manufacturer advises reduce dose if eGFR less than 10 mL/minute/1.73 m² (max. 2 g daily).
  - in children  Manufacturer advises reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m² max. 50 mg/kg daily or max. 2 g daily.

- **MONITORING REQUIREMENTS**  Manufacturer advises to monitor full blood count regularly during prolonged treatment.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intramuscular use or intravenous use  Twice daily dosing may be considered for doses greater than 2 g daily.
  - With intravenous use in children  For intravenous infusion (preferred route), dilute reconstituted solution with Glucose 5% or Sodium Chloride 0.9%; give over at least 30 minutes. Not to be given simultaneously with parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; in children, may be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites. Displacement value may be significant, consult local guidelines.
  - For intravenous injection, give over 5 minutes; intravenous doses of 50 mg/kg or more in children under 12 years should be given by infusion.
  - With intramuscular use in children  For intramuscular injection, may be mixed with 1% Lidocaine Hydrochloride Injection to reduce pain at intramuscular injection site. Intramuscular injection should only be considered when the intravenous route is not possible or less appropriate. If administered by intramuscular injection, the lower end of the dose range should be used for the shortest time possible; volume depends on the age and size of the child, but doses over 1 g must be divided between more than one site. The maximum intramuscular dose is 2 g, doses greater than 2 g must be given by intravenous infusion or intravenous injection (see above). Displacement value may be significant, consult local guidelines.
  - With intravenous use in adults  For intravenous infusion (preferred route) (Rocephin®; Ceftriaxone Injection, Genus), give intermittently or via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%. Reconstitute 2-g vial with 40 mL infusion fluid. Give by intermittent infusion over at least 30 minutes. Not to be given simultaneously with total parenteral nutrition or infusion fluids containing calcium, even by different infusion lines. May be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites.
  - For intravenous injection, give over 5 minutes.
  - With intramuscular use in adults  For intramuscular injection, doses over 1 g must be divided between more than one site. The maximum intramuscular dose is 2 g, doses greater than 2 g must be given by intravenous administration. Displacement value may be significant, consult local guidelines.

- **MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

  - **Powder for solution for injection**
    - **ELECTROLYTES:**  May contain Sodium
      - Ceftriaxone (Non-proprietary)
        - Ceftriaxone (as Ceftriaxone sodium) 250 mg  Ceftriaxone 250mg powder for solution for injection vials | 1 vial (£0.80 DT price = £2.40
        - Ceftriaxone (as Ceftriaxone sodium) 1 gram  Ceftriaxone 1g powder for solution for injection vials | 1 vial (£0 price no available DT price = £9.58 | 10 vial (£95.80
        - Ceftriaxone (as Ceftriaxone sodium) 2 gram  Ceftriaxone 2g powder for solution for injection vials | 1 vial (£19.18 | 10 vial (£191.80
        - Ceftriaxone 2g powder for solution for infusion vials | 1 vial (£17.70 DT price = £19.18
      - Rocephin (Roche Products Ltd)
        - Ceftriaxone (as Ceftriaxone sodium) 250 mg  Rocephin 250mg powder for solution for injection vials | 1 vial (£2.40 DT price = £2.40
        - Ceftriaxone (as Ceftriaxone sodium) 1 gram  Rocephin 1g powder for solution for injection vials | 1 vial (£9.58 DT price = £9.58
        - Ceftriaxone (as Ceftriaxone sodium) 2 gram  Rocephin 2g powder for solution for injection vials | 1 vial (£19.18 DT price = £19.18

  - **ANTIBACTERIALS**  CEPHALOSPORINS, THIRD-GENERATION WITH BETA-LACTAMASE INHIBITOR

I Ceftriaxone with tazobactam

- **INDICATIONS AND DOSE**  Complicated intra-abdominal infection (in combination with metronidazole when anaerobic pathogens suspected)
  - BY INTRAVENOUS INFUSION
    - Adult: 1/0.5 g every 8 hours for 4–14 days
  - Complicated urinary tract infection | Acute pyelonephritis
  - BY INTRAVENOUS INFUSION
    - Adult: 1/0.5 g every 8 hours for 7 days

- **DOSE EQUIVALENCE AND CONVERSION**
  - Dose expressed as x/y g where x and y are ceftriaxone and tazobactam respectively.

- **INTERACTIONS**  → Appendix 1: cephalosporins

- **SIDE-EFFECTS**
  - Common or very common  Anxiety - constipation - hypotension

- **PREGNANCY**  Manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies with tazobactam.

- **BREAST FEEDING**  Manufacturer advises avoid—no information available.

- **RENA L IMPAIRMENT**  Manufacturer advises reduce dose to 500/250 mg every 8 hours if eGFR 30–50 mL/minute/1.73 m² and 250/125 mg every 8 hours if eGFR 15–29 mL/minute/1.73 m². Manufacturer advises monitor for changes in renal function.

- **DIRECTIONS FOR ADMINISTRATION**  For intravenous infusion (Zerbaxa®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute initially each vial with 10 mL. Water for Injections or Sodium chloride 0.9% to give a final volume of 11.4 mL; dilute requisite dose in 100 mL of Glucose 5% or Sodium chloride 0.9%; give over 1 hour.
HANDLING AND STORAGE  Manufacturer advises store in a refrigerator at 2°C–8°C.

PATIENT AND CARER ADVICE
Driving and skilled tasks
Manufacturer advises ceftolozane with tazobactam may influence driving and performance of skilled tasks—increased risk of dizziness.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (Dec 2012) that ceftolozane with tazobactam (Zerbaxa®) is not recommended for use within NHS Scotland for the treatment of complicated intra-abdominal infections, complicated urinary tract infections, and acute pyelonephritis.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion
- Zinforo (Pfizer Ltd) ▼
- Ceftaroline fosamil (as Ceftaroline fosamil acetic acid solvate monohydrate) 600 mg Zinforo 600mg powder for concentrate for solution for infusion vials | 10 vial (Pom) £375.00

ANTIBACTERIALS  > CECAKOSPORINS, OTHER

Ceftobiprole

INDICATIONS AND DOSE
Hospital-acquired pneumonia (excluding ventilator-associated pneumonia) / Community-acquired pneumonia
- BY INTRAVENOUS INFUSION
- Adult: 500 mg every 8 hours

CAUTIONS
- Pre-existing seizure disorder—increased risk of seizures, supra-normal creatinine clearance

CAUTIONS, FURTHER INFORMATION
- Supra-normal creatinine clearance  Manufacturer advises to measure baseline renal function and increase duration of infusion if creatinine clearance greater than 150 mL/minute.

INTERACTIONS
- Appendix 1: cephalosporins

SIDE-EFFECTS
- Common or very common
  - Dysgeusia, dyspepsia
  - Agitation, asthma, dyspnoea, muscle spasm, pharyngolaryngeal pain, renal failure
- Frequency not known
  - Convulsions
- PREGNANCY  Manufacturer advises avoid unless essential—no information available.
- BREAST FEEDING  Manufacturer advises avoid—present in milk in animal studies.
- RENAL IMPAIRMENT  Reduce dose to 500 mg every 12 hours in moderate impairment and 250 mg every 12 hours in severe impairment. Manufacturer advises use with caution in severe impairment—limited information available.

DIRECTIONS FOR ADMINISTRATION
- Manufacturer advises for intravenous infusion (Zevtera®), give intermittently in Glucose 5%, or Sodium Chloride 0.9%, or Lactated Ringer’s solution; reconstitute each 500 mg with 10 mL. Water for injections or Glucose 5%; dilute in 250 mL infusion fluid and give over 2 hours (increased to 4 hours if creatinine clearance greater than 150 mL/minute). Do not mix with calcium-containing solutions (except Lactated Ringer’s solution) in the same intravenous line—precipitation may occur.

HANDLING AND STORAGE  Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage after reconstitution and dilution.

PATIENT AND CARER ADVICE
Driving and skilled tasks
Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion
- Zevtera (Basilea Pharmaceutica International Ltd) ▼
- Ceftobiprole (as Ceftobiprole medocaril sodium) 500 mg Zevtera 500mg powder for concentrate for solution for infusion vials | 10 vial (Pom) £396.30 (Hospital only)
Teicoplanin

**Drug action** The glycopeptide antibiotic teicoplanin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides and increasing reports of glycopeptide-resistant enterococci. Teicoplanin is similar to vancomycin, but has a significantly longer duration of action, allowing once daily administration after the loading dose.

**Indications and dose**

**Clostridium difficile infection**
- **By mouth**
  - Adult: 100–200 mg twice daily for 10–14 days

**Serious infections caused by Gram-positive bacteria (e.g. complicated skin and soft-tissue infections, pneumonia)**
- **By intravenous injection, or by intravenous infusion, or by intramuscular injection**
  - Adult (body-weight up to 70 kg): Initially 400 mg every 12 hours for 3 doses, followed by 400 mg once daily
  - Adult (body-weight 70 kg and above): Initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily

**Streptococcal or enterococcal endocarditis (in combination with another antibiotic)**
- **By intravenous injection, or by intravenous infusion**
  - Adult: Initially 10 mg/kg every 12 hours for 3–5 doses, then 10 mg/kg once daily, subsequent doses can be given by intramuscular injection

**Bone and joint infections**
- **By intravenous infusion, or by intravenous injection**
  - Adult: Initially 12 mg/kg every 12 hours for 3–5 doses, then 12 mg/kg once daily subsequent doses can be given by intramuscular injection, increased risk of fever and rash with doses of 12 mg/kg

**Surgical prophylaxis**
- **By intravenous injection**
  - Adult: 400 mg, to be administered up to 30 minutes before the procedure

**Surgical prophylaxis in open fractures**
- **By intravenous infusion**
  - Adult: 800 mg, to be administered up to 30 minutes before skeletal stabilisation and definitive soft-tissue closure

**Peritonitis associated with peritoneal dialysis (added to dialysis fluid)**
- **By intraperitoneal infusion**
  - Adult: (consult local protocol)

**Pharmacokinetics**
Teicoplanin should not be given by mouth for systemic infections because it is not absorbed significantly.

**Unlicensed use** Not licensed for surgical prophylaxis. Teicoplanin doses in BNF may differ from those in product literature.

**Side-effects**
- **Common or very common** Pruritus • rash
- **Uncommon** Bronchospasm • diarrhoea • dizziness • eosinophilia • fever • headache • leucopenia • mild hearing loss • nausea • thrombocytopenia • thrombophlebitis • tinnitus • vestibular disorders • vomiting
- **Frequency not known** Exfoliative dermatitis • nephrotoxicity • renal failure • Stevens-Johnson syndrome • toxic epidermal necrolysis

**Side-effects, further information**
- **Nephrotoxicity** Teicoplanin is associated with a lower incidence of nephrotoxicity than vancomycin.
- **Allergy and cross-sensitivity** Caution if history of vancomycin sensitivity.
- **Pregnancy** Manufacturer advises use only if potential benefit outweighs risk.
- **Breast feeding** No information available.
- **Renal impairment** Use normal dose regimen on days 1–4, then use normal maintenance dose every 48 hours if eGFR 30–80 mL/minute/1.73 m² and use normal maintenance dose every 72 hours if eGFR less than 30 mL/minute/1.73 m². Plasma-teicoplanin concentration should be monitored during parenteral maintenance treatment. Also monitor renal and auditory function during prolonged treatment in renal impairment.

**Monitoring requirements**
- With intramuscular use or intravenous use Plasma-teicoplanin concentration is not measured routinely because a relationship between plasma concentration and toxicity has not been established. However, the plasma-teicoplanin concentration can be used to optimise parenteral treatment in severe sepsis or burns, deep-seated staphylococcal infection (including bone and joint infection), endocarditis and in intravenous drug abusers. Pre-dose (‘trough’) concentrations should be greater than 15 mg/litre (greater than 20 mg/litre in endocarditis or deep-seated infection such as bone and joint infection), but less than 60 mg/litre.

**Plasma-teicoplanin concentration should be measured in elderly patients.**
- **Blood counts and liver and kidney function tests required.**
- **Directions for administration**
  - With intravenous use For intravenous infusion (Targocid®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute initially with water for injections provided; infuse over 30 minutes. Continuous infusion not usually recommended.
  - With oral use Injection can be used to prepare solution for oral administration.

**Medicinal forms**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

- **Powder and solvent for solution for injection**
  - **Electrolytes:** May contain Sodium
  - **Targocid** (Sanofi) ▼
    - Teicoplanin 200 mg Targocid 200mg powder and solvent for solution for injection vials | 1 vial £3.93
    - Teicoplanin 400 mg Targocid 400mg powder and solvent for solution for injection vials | 1 vial £7.32

Telavancin

**Drug action** Telavancin is a glycopeptide antibacterial; it has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci.

**Indications and dose**
- **Hospital-acquired pneumonia, known or suspected to be caused by meticillin-resistant *Staphylococcus aureus* when other antibiotics cannot be used**
  - **By intravenous infusion**
  - Adult: 10 mg/kg once daily for 7–21 days

**Cautions** Conditions that predispose to renal impairment • predisposition to QT interval prolongation (including
electrolyte disturbances, congenital long QT syndrome, uncompensated heart failure, severe left ventricular hypertrophy

- **INTERACTIONS** → Appendix 1: telavancin

- **SIDE-EFFECTS**
  - **Common or very common** Acute renal failure • chills • constipation • diarrhea • dizziness • fungal infection • headache • insomnia • malaise • nausea • pruritus • rash • taste disturbances • vomiting
  - **Uncommon** Abdominal pain • agitation • altered sense of smell • angina • antibiotic-associated colitis • anxiety • arthralgia • atrial fibrillation • back pain • blood disorders • blurred vision • bradycardia • confusion • congestive cardiac failure • decreased appetite • depression • dry mouth • dyspepsia • dysphonia • dysuria • electrolyte disturbances • erythema • eye irritation • flatulence • flushing • haematuria • hepatitis • hiccup • hypokidrosis • hypertension • hypotension • increased INR • microalbuminuria • myalgia • nasal congestion • oedema • oliguria • oral hypoesthesia • palpitation • paraesthesia • pharyngolaryngeal pain • phlebitis • pollikiuria • pyrexia • QT interval prolongation • sinus tachycardia • somnolence • supraventricular extrasystoles • tinnitus • tremor • urinary tract infection • urticaria • ventricular extrasystoles
  - **Rare** Deafness
  - **Frequency not known** Flushing of the upper body (‘red man’ syndrome) • non-cardiac chest pain

- **ALLERGY AND CROSS-SENSITIVITY** Use with caution in patients with vancomycin or teicoplanin sensitivity.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Avoid (teratogenic in animal studies).

- **BREAST FEEDING** Manufacturer advises caution unless potential benefit outweighs risk—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

- **RENAL IMPAIRMENT** In chronic renal failure, use 7.5 mg/kg once daily if eGFR 30–50 mL/minute/1.73 m². Avoid in acute renal failure—risk of mortality increased. In chronic renal failure, avoid if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor renal function daily for at least the first 3–5 days, then every 2–3 days thereafter.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Vibativ®). Avoid rapid infusion (can cause ‘red man’ syndrome). Give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute each 750 mg with 45 mL. Glucose 5%, sodium chloride 0.9%, or water for injections to produce a 15 mg/mL solution; for doses of 150–800 mg, dilute requisite dose in 100 to 250 mL infusion fluid; for doses outside this range, dilute to a final concentration of 0.6–8 mg/mL; give over at least 60 minutes.

- **MECHANICAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - **Powder for solution for infusion**
    - **Vibativ** (Cilag Corporation Limited) ▼
      - **Telavancin (as Telavancin hydrochloride) 750 mg** *Vibativ* 750mg powder for solution for infusion vials | 1 vial [Pack] £645.00 (Hospital only)

- **Vancocycin**

  - **DRUG ACTION** The glycopeptide antibiotic vancomycin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of Staphylococcus aureus with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci. Penetration into cerebrospinal fluid is poor.
  - **With intravenous use** Vancomycin has a long duration of action and can therefore be given every 12 hours.

- **INDICATIONS AND DOSE**
  - **Clostridium difficile infection**
    - **BY MOUTH**
      - Adult: 125 mg 4 times a day for 10–14 days, dose may be increased if infection fails to respond or is life-threatening, increased if necessary up to 500 mg 4 times a day

  - **Infections due to Gram-positive bacteria including endocarditis, osteomyelitis, septicemia and soft-tissue infections**
    - **BY INTRAVENOUS INFUSION**
      - Adult: 1–1.5 g every 12 hours
      - Elderly: 500 mg every 12 hours, alternatively 1 g once daily

- **Surgical prophylaxis (when high risk of MRSA)**
  - **BY INTRAVENOUS INFUSION**
  - Adult: 1 g for 1 dose

- **Peritonitis associated with peritoneal dialysis**
  - **BY INTRAPERITONEAL ADMINISTRATION**
  - Adult: (consult local protocol)

- **PHARMACOKINETICS**
  - Vancomycin should not be given by mouth for systemic infections because it is not absorbed significantly.

- **UNLICENSED USE** Vancomycin doses in BNF publications may differ from those in product literature. Use of vancomycin (added to dialysis fluid) for the treatment of peritonitis associated with peritoneal dialysis is an unlicensed route.

- **CAUTIONS**
  - **GENERAL CAUTIONS**
    - Avoid if history of deafness • elderly
  - **SPECIFIC CAUTIONS**
    - Systemic absorption may follow oral administration especially in inflammatory bowel disorders or following multiple doses

- **INTERACTIONS** → Appendix 1: vancomycin

- **SIDE-EFFECTS**
  - **Common or very common**
    - **With intravenous use** Blood disorders, including neutropenia (usually after 1 week or cumulative dose of 25 g) • interstitial nephritis • nephrotoxicity • ototoxicity (discontinue if tinnitus occurs) • renal failure
  - **Rare**
    - **With intravenous use** Agranulocytosis • thrombocytopenia
  - **Frequency not known**
    - **With intravenous use** Anaphylaxis • cardiac arrest on rapid infusion • chills • dysphonia • eosinophilia • exfoliative dermatitis • fever • flushing of the upper body (‘red man’ syndrome) • nausea • pain and muscle spasm of back and chest • phlebitis (irritant to tissue) • pruritus • rashes • severe hypotension on rapid infusion • shock on rapid infusion • Stevens-Johnson syndrome • toxic epidermal necrolysis • urticaria • vulva • wheezing

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **Nephrotoxicity** Vancomycin is associated with a higher incidence of nephrotoxicity than teicoplanin.

- **ALLERGY AND CROSS-SENSITIVITY** Caution if teicoplanin sensitivity.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Present in milk—significant absorption following oral administration unlikely.
• RENAL IMPAIRMENT Reduce dose. In renal impairment monitor plasma–vancomycin concentration and renal function regularly. Also monitor auditory function.

• MONITORING REQUIREMENTS
  ▶ All patients require plasma–vancomycin measurement (after 3 or 4 doses if renal function normal, earlier if renal impairment).
  ▶ All patients require blood counts, urinalysis, and renal function tests.
  ▶ Monitor auditory function in elderly.
  ▶ With intravenous use Pre-dose (‘trough’) concentration should be 10–15 mg/litre (15–20 mg/litre for endocarditis or less sensitive strains of meticillin-resistant Staphylococcus aureus or for complicated infections caused by S. aureus). An initial loading dose, by intravenous infusion, may be considered—consult local guidelines.

• DIRECTIONS FOR ADMINISTRATION
  ▶ With intravenous use Avoid rapid infusion (risk of anaphylactoid reactions) and rotate infusion sites.
  ▶ For intravenous infusion (Vancocin®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute each 500 mg with 10 mL water for injections and dilute with infusion fluid to a concentration of up to 5 mg/mL (10 mg/mL in fluid restriction but increased risk of infusion-related effects); give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not feasible.
  ▶ With oral use Injection can be used to prepare solution for oral administration; flavouring syrups may be added to the solution at the time of administration.

• MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, pastille, powder for solution for infusion vials; reconstitute each dose if necessary to prepare solution for infusion.

Powder for solution for infusion

  ▶ Vancomycin (Non-proprietary)
    Vancomycin (as Vancomycin hydrochloride) 500 mg Vancomycin 500 mg powder for solution for infusion vials | 1 vial (Pom) £7.25 | 10 vial (Pom) £62.50

    Vancomycin (as Vancomycin hydrochloride) 1 gram Vancomycin 1 g powder for solution for infusion vials | 1 vial (Pom) £14.50 | 10 vial (Pom) £125.00
    Vancomycin 1 g powder for concentrate for solution for infusion vials | 1 vial (Pom) £17.25 | 10 vial (Pom) £120.50
    Vancomycin (Flynn Pharma Ltd) Vancomycin (as Vancomycin hydrochloride) 500 mg Vancomycin 500 mg powder for solution for infusion vials | 1 vial (Pom) £6.25
    Vancomycin (as Vancomycin hydrochloride) 1 gram Vancomycin 1 g powder for solution for infusion vials | 1 vial (Pom) £12.50

Capsule
  CAUTIONARY AND ADVISORY LABELS 9
  ▶ Vancomycin (Non-proprietary)
    Vancomycin (as Vancomycin hydrochloride) 125 mg Vancomycin 125 mg capsules | 28 capsule (Pom) £32.47 DT price = £32.47
    Vancomycin (as Vancomycin hydrochloride) 250 mg Vancomycin 250 mg capsules | 28 capsule (Pom) £64.08 DT price = £64.08
    Vancomycin Matrigel (Flynn Pharma Ltd) Vancomycin (as Vancomycin hydrochloride) 125 mg Vancomycin Matrigel 125 mg capsules | 28 capsule (Pom) £88.31 DT price = £132.47

ANTIBACTERIALS > LINCOSAMIDES

Clindamycin

• DRUG ACTION Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially Bacteroides fragilis. It is well concentrated in bone and excreted in bile and urine.

• INDICATIONS AND DOSE
  Staphylococcal bone and joint infections such as osteomyelitis | Peritonitis | Intra-abdominal sepsis | Meticillin-resistant Staphylococcus aureus (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections | Erysipelas or cellulitis in penicillin-allergic patients (alternative to macrolides)
  ▶ BY MOUTH
    Child: 3–6 mg/kg 4 times a day (max. per dose 450 mg)
    Adult: 0.5–1 g every 12 hours (max. per dose 450 mg)
  ▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION
    Adult: 0.6–2.7 g daily in 2–4 divided doses; increased if necessary up to 4.8 g daily, increased dose used in life-threatening infection, single doses above 600 mg to be administered by intravenous infusion only, single doses by intravenous infusion not to exceed 1.2 g

Treatment of mild to moderate pneumocystis pneumonia (in combination with primaquine)
  ▶ BY MOUTH
    Adult: 600 mg every 8 hours

Treatment of falciparum malaria (to be given with or following quinine)
  ▶ BY MOUTH
    Child: 7–13 mg/kg every 8 hours (max. per dose 450 mg) for 7 days
    Adult: 450 mg every 8 hours for 7 days

• UNLICENSED USE Not licensed for treatment of mild to moderate pneumocystis infection. Not licensed for treatment of falciparum malaria.

• CONTRA-INDICATIONS Diarrhoeal states

• CAUTIONS Avoid in acute porphyrias p. 969 · middle-aged and elderly women, especially after an operation (antibiotic-associated colitis more common)

• INTERACTIONS → Appendix 1: clindamycin

SIDE-EFFECTS Abdominal discomfort · anaphylactoid reactions · antibiotic-associated colitis · diarrhoea (discontinue treatment) · eosinophilia · exfoliative dermatitis · jaundice · leucopenia · nausea · oesophageal ulcers · oesophagitis · polyarthritides · pruritus · rash · Stevens-Johnson syndrome · taste disturbances · thrombocytopenia · toxic epidermal necrolysis · urticaria · vesiculobullous dermatitis · vomiting

With intramuscular use Abscess · induration · pain

With intravenous use Thrombophlebitis

SIDE-EFFECTS, FURTHER INFORMATION

Antibiotic-associated colitis Clindamycin has been associated with antibiotic-associated colitis, which may be fatal. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. Patients should therefore discontinue treatment immediately if diarrhea develops.

PREGNANCY Not known to be harmful.

• BREAST FEEDING Amount probably too small to be harmful but bloody diarrhoea reported in 1 infant.

• MONITORING REQUIREMENTS
  ▶ Monitor liver and renal function if treatment exceeds 10 days.
  ▶ In children Monitor liver and renal function in infants.

• DIRECTIONS FOR ADMINISTRATION Avoid rapid intravenous administration.

  For intravenous infusion (Dalacin® C Phosphate), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute to not more than 18 mg/mL and give over 10–60 minutes at a rate not exceeding 30 mg/minute (1.2 g over at least 60 minutes; higher doses by continuous infusion).
**PATIENT AND CARER ADVICE** Capsules should be swallowed with a glass of water. Patients and their carers should be advised to discontinue immediately and contact doctor if diarrhoea develops.

**PROFESSION SPECIFIC INFORMATION**

**Dental practitioners’ formulary**

Clindamycin capsules may be prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**

  - Dalacin C Phosphate 600 mg/4ml solution for injection ampoules | 5 ampoule [POD] £61.75

**ANTIBACTERIALS > MACROLIDES**

**Macrolides**

**Overview**

The macrolides have an antibacterial spectrum that is similar but not identical to that of penicillin; they are thus an alternative in penicillin-allergic patients. They are active against many penicillin-resistant staphylococci, but some are now also resistant to the macrolides.

Indications for the macrolides include campylobacter enteritis, respiratory infections (including pneumonia, whooping cough, Legionella, chlamydia, and mycoplasma infection), and skin infections.

Erythromycin p. 510 is also used in the treatment of early syphilis, uncomplicated genital chlamydial infection, and non-gonococcal urethritis. Erythromycin has poor activity against *Haemophilus influenzae*. Erythromycin causes nausea, vomiting, and diarrhoea in some patients; in mild to moderate infections this can be avoided by giving a lower dose, but if a more serious infection, such as Legionella pneumonia, is suspected higher doses are needed.

Azithromycin below is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria, but enhanced activity against some Gram-negative organisms including *H. influenzae*. Plasma concentrations are very low, but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. Azithromycin is also used in the treatment of uncomplicated genital chlamydial infection, non-gonococcal urethritis, uncomplicated gonorrhoea, typhoid [unlicensed indication], and trachoma [unlicensed indication].

Clarithromycin p. 508 is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. It is given twice daily. Clarithromycin is also used in regimens for *Helicobacter pylori* eradication.

Erythromycin, azithromycin, and clarithromycin have a role in the treatment of Lyme disease p. 545.

Spiramycin is also a macrolide which is used for the treatment of toxoplasmosis.

**Macrolides**

**CAUTIONS** Electrolyte disturbances (predisposition to QT interval prolongation) - may aggravate myasthenia gravis - predisposition to QT interval prolongation

**SIDE-EFFECTS**

- Common or very common Abdominal discomfort - diarrhoea - nausea - vomiting
- Uncommon Cholestatic jaundice - hepatotoxicity - rash
- Rare Antibiotic-associated colitis - arthralgias - pancreatitis - QT interval prolongation - Stevens-Johnson syndrome - toxic epidermal necrolysis
- Frequency not known Reversible hearing loss (sometimes with tinnitus) can occur after large doses
- With intravenous use Local tenderness - phlebitis

**SIDE-EFFECTS, FURTHER INFORMATION**

Gastro-intestinal side-effects are mild and less frequent with azithromycin and clarithromycin than with erythromycin.

**Azithromycin**

**INDICATIONS AND DOSE**

**Prevention of secondary case of invasive group A streptococcal infection in patients who are allergic to penicillin**

- **BY MOUTH**
  - Child 6 months–11 years: 12 mg/kg once daily (max. per dose 500 mg) for 5 days
  - Child 12-17 years: 500 mg once daily for 5 days
  - Adult: 500 mg once daily for 5 days

**Respiratory-tract infections, otitis media, skin and soft-tissue infections**

- **BY MOUTH**
  - Child 6 months–17 years: 10 mg/kg once daily (max. per dose 500 mg) for 3 days
  - Child 6 months–17 years (body-weight 15–25 kg): 200 mg once daily for 3 days
  - Child 6 months–17 years (body-weight 26–35 kg): 300 mg once daily for 3 days
  - Child 6 months–17 years (body-weight 36–45 kg): 400 mg once daily for 3 days
  - Child 6 months–17 years (body-weight 46 kg and above): 500 mg once daily for 3 days
  - Adult: 500 mg once daily for 3 days, alternatively initially 500 mg once daily for 1 day, then 250 mg once daily for 4 days

**Uncomplicated genital chlamydial infections | Non-gonococcal urethritis**

- **BY MOUTH**
  - Child 12–17 years: 1 g for 1 dose
  - Adult: 1 g for 1 dose

**Uncomplicated gonorrhoea**

- **BY MOUTH**
  - Adult: 1 g for 1 dose

**Lyme disease (under expert supervision)**

- **BY MOUTH**
  - Adult: 500 mg once daily for 7–10 days
508  Bacterial infection

Mild to moderate typhoid due to multiple-antibacterial resistant organisms

▶ BY MOUTH
▶ Adult: 500 mg once daily for 7 days

Community-acquired pneumonia, low to moderate severity

▶ BY MOUTH
▶ Adult: 500 mg once daily for 3 days, alternatively initially 500 mg once daily for 1 day, then 250 mg once daily for 4 days

Community-acquired pneumonia, high severity

▶ INITIALLY BY INTRAVENOUS INFUSION
▶ Adult: Initially 500 mg once daily for at least 2 days, then (by mouth) 500 mg once daily for a total duration of 7–10 days

Antibacterial prophylaxis for insertion of intra-uterine device

▶ BY MOUTH
▶ Adult: 1 g for 1 dose

UNLICENSED USE

In children  Not licensed for typhoid fever, Lyme disease, chronic Pseudomonas aeruginosa infection in cystic fibrosis, or prophylaxis of group A streptococcal infection.

In adults  Oral azithromycin not licensed for trachoma which results from chronic infection with Chlamydia trachomatis. Not licensed for uncomplicated gonorrhoea, mild or moderate typhoid due to multiple-antibacterial-resistant organisms, Lyme disease, or prophylaxis of group A streptococcal infection. Not licensed for community-acquired pneumonia (high severity) when oral treatment continues for more than 3 days.

INTERACTIONS  → Appendix 1: macrolides

SIDE-EFFECTS

▶ Common or very common  Anorexia · arthralgia · disturbances in taste · disturbances in vision · dizziness · dyspepsia · flatulence · headache · malaise · paraesthesia · reversible hearing loss (sometimes with tinnitus) after long-term therapy

▶ Uncommon  Anxiety · chest pain · constipation · gastritis · hypoaesthesia · leucopenia · oedema · photosensitivity · sleep disturbances

▶ Rare  Agitation

▶ Frequency not known  Acute renal failure · convulsions · haemolytic anaemia · interstitial nephritis · smell disturbances · syncope · thrombocytopenia · tongue discoloration

PREGNANCY  Manufacturers advise use only if adequate alternatives not available.

BREAST FEEDING  Present in milk; use only if no suitable alternatives.

HEPATIC IMPAIRMENT  Manufacturers advise avoid in severe liver disease—no information available.

RENAL IMPAIRMENT

▶ In adults  Use with caution if eGFR less than 10 mL/minute/1.73 m².

▶ In children  Use with caution if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION  For intravenous infusion (Zedbac®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute 500 mg with 4.8 mL water for injections to produce a 100 mg/mL solution, then dilute 5 mL of solution with infusion fluid to a final concentration of 1 or 2 mg/mL; give the 1 mg/mL solution over 3 hours or give the 2 mg/mL solution over 1 hour.

PRESCRIBING AND DISPENSING INFORMATION  Flavours of oral liquid formulations may include cherry or banana.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Azithromycin for bacterial infections  www.medicinesforchildren.org.uk/azithromycin-bacterial-infections-0

PROFESSION SPECIFIC INFORMATION

Dental practitioners’ formulary

Azithromycin Capsules may be prescribed. Azithromycin Tablets may be prescribed. Azithromycin Oral Suspension 200 mg/5 mL may be prescribed.

EXCEPTIONS TO LEGAL CATEGORY  Azithromycin tablets can be sold to the public for the treatment of confirmed, asymptomatic Chlamydia trachomatis genital infection in those over 16 years of age, and for the epidemiological treatment of their sexual partners, subject to maximum single dose of 1 g, maximum daily dose 1 g, and a pack size of 1 g.

Erythromycin

**INDICATIONS AND DOSE**

Susceptible infections in patients with penicillin hypersensitivity (e.g. respiratory-tract infections (including Legionella infection), skin and oral infections, and campylobacter enteritis)

- **BY MOUTH**
  - Child 1 month–1 year: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections
  - Child 2–7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections

- **BY INTRAVENOUS INFUSION**
  - Child: 12.5 mg/kg every 6 hours (max. per dose 1 g)
  - Adult: 6.25 mg/kg every 6 hours, for mild infections when oral treatment not possible. Increased to 12.5 mg/kg every 6 hours, dose increase may be used in severe infections

Lyme disease (under expert supervision)

- **BY MOUTH**
  - Adult: 500 mg 4 times a day for 14–21 days

Early syphilis

- **BY MOUTH**
  - Adult: 500 mg 4 times a day for 14 days

Uncomplicated genital chlamydia | Non-gonococcal urethritis

- **BY MOUTH**
  - Adult: 500 mg twice daily for 14 days

Chronic prostatitis

- **BY MOUTH**
  - Adult: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 4 g daily in divided doses, dose increase may be used in severe infections

- **BY INTRAVENOUS INFUSION**
  - Adult: 6.25 mg/kg every 6 hours, for mild infections when oral treatment is not possible, increased to 12.5 mg/kg every 6 hours, dose increase may be used in severe infections

Prevention and treatment of pertussis

- **BY MOUTH**
  - Child 1 month–1 year: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections
  - Child 2–7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections
  - Child 8–17 years: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500–1000 mg 4 times a day, dose increase may be used in severe infections
  - Adult: (consult local protocol)

Prevention of secondary case of diphtheria in non-immune patient

- **BY MOUTH**
  - Child 1 month–1 year: 125 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment
  - Child 2–7 years: 250 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment
  - Child 8–17 years: 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment
  - Adult: 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment

Prevention of secondary case of invasive group A streptococcal infection in penicillin allergic patients

- **BY MOUTH**
  - Child 1 month–1 year: 125 mg every 6 hours for 10 days
  - Child 2–7 years: 250 mg every 6 hours for 10 days
  - Child 8–17 years: 250–500 mg every 6 hours for 10 days
  - Adult: 250–500 mg every 6 hours for 10 days

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease (if penicillin-allergic)

- **BY MOUTH**
  - Child 1 month–1 year: 125 mg twice daily, antibiotic prophylaxis is not fully reliable
  - Child 2–7 years: 250 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection
  - Child 8–17 years: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection
  - Adult: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

Prevention of recurrence of rheumatic fever

- **BY MOUTH**
  - Child 1 month–1 year: 125 mg twice daily
  - Child 2–7 years: 250 mg twice daily

Rosacea

- **BY MOUTH**
  - Adult: 500 mg twice daily courses usually last 6–12 weeks and are repeated intermittently

Acne

- **BY MOUTH**
  - Adult: 500 mg twice daily

- **CAUTIONS** Avoid in acute porphyrias p. 969
- **INTERACTIONS** → Appendix 1: macrolides
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Only small amounts in milk—not known to be harmful.
- **HEPATIC IMPAIRMENT** May cause idiosyncratic hepatotoxicity.
- **RENAL IMPAIRMENT** In adults Max. 1.5 g daily in severe renal impairment (ototoxicity). In children Reduce dose in severe renal impairment (ototoxicity).
- **DIRECTIONS FOR ADMINISTRATION** With intravenous use in children Dilute reconstituted solution further in glucose 5% (neutralised with Sodium bicarbonate) or sodium chloride 0.9% to a concentration of
1–5 mg/mL; give over 20–60 minutes. Concentration of up to 10 mg/mL may be used in fluid-restriction if administered via a central venous catheter.

- With intravenous use For intravenous infusion (as lactobionate), give intermittently in Glucose 5% (neutralised with sodium bicarbonate) or Sodium chloride 0.9%; dissolve initially in water for injections (1 g in 20 mL) then dilute to a concentration of 1–5 mg/mL; give over 20–60 minutes.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Erythromycin for bacterial infections www.medicinesforchildren.org.uk/erythromycin-for-bacterial-infections

**PROFESSIONAL INFORMATION**

Dental practitioners’ formulary

Erythromycin tablets e/c m may be prescribed. Erythromycin ethyl succinate may be prescribed. Erythromycin stearate tablets may be prescribed. Erythromycin ethyl succinate tablets may be prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant capsule**

**CAUTIONARY AND ADVISORY LABELS 5, 9, 25**

- **Erythromycin (Non-proprietary)**
  - Erythromycin 250 mg Erythromycin 250mg gastro-resistant capsules 28 capsule £ no price available DT price = £5.61 | 30 capsule £ no price available
  - Erymax (Teva UK Ltd)
  - Erythromycin 250 mg Erymax 250mg gastro-resistant capsules 28 capsule £5.61 DT price = £5.61 | 112 capsule £22.44
  - Tiloryth (Tilomed Laboratories Ltd)
  - Erythromycin 250 mg Tiloryth 250mg gastro-resistant capsules 30 capsule £5.65 | 100 capsule £18.66

**Gastro-resistant tablet**

**CAUTIONARY AND ADVISORY LABELS 5, 9, 25**

- **Erythromycin (Non-proprietary)**
  - Erythromycin 250 mg Erythromycin 250mg gastro-resistant tablets 28 tablet £2.25 DT price = £1.45 | 500 tablet £27.20

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 9**

- **Erythromycin (Non-proprietary)**
  - Erythromycin (as Erythromycin ethyl succinate) 500 mg Erythromycin ethyl succinate 500mg tablets 28 tablet £11.95 | 500 tablet £10.78
  - Erythromycin (as Erythromycin ethyl succinate) 250 mg Erythromycin ethyl succinate 250mg tablets 100 tablet £18.20 | 500 tablet £36.40
  - Erythromycin (as Erythromycin stearate) 250 mg Erythromycin stearate 250mg tablets 100 tablet £18.20 | 500 tablet £36.40
  - Erythromycin (as Erythromycin stearate) 500 mg Erythromycin stearate 500mg tablets 100 tablet £36.40 | 500 tablet £72.60
  - Erythromycin (as Erythromycin ethyl succinate) 500 mg Erythromycin ethyl succinate 500mg tablets 28 tablet £10.78 DT price = £10.78

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS 9**

- **Erythromycin (Non-proprietary)**
  - Erythromycin (as Erythromycin ethyl succinate) 25 mg per 1 ml Erythromycin ethyl succinate 25mg/5ml oral suspension 100 ml £4.05 DT price = £4.05 | 200 ml £8.10 DT price = £8.10
  - Erythromycin (as Erythromycin ethyl succinate) 50 mg per 1 ml Erythromycin ethyl succinate 50mg/5ml oral suspension 100 ml £6.38 DT price = £6.38 | 200 ml £12.76 DT price = £12.76

**Erythromycin (as Erythromycin ethyl succinate) 100 mg per 1 ml Erythromycin ethyl succinate 100mg/5ml oral suspension 100 ml £11.24 DT price = £11.24

- Erythromycin (as Erythromycin ethyl succinate) 500 mg/5ml oral suspension sugar free sugar-free 100 ml £0.00 DT price = £0.00

- **Erythromycin (AMCo)**
  - Erythromycin (as Erythromycin ethyl succinate) 25 mg per 1 ml Erythromycin PI SF 125mg/5ml oral suspension sugar-free 140 ml £3.06
  - Erythromycin (as Erythromycin ethyl succinate) 50 mg per 1 ml Erythromycin SF 250mg/5ml oral suspension sugar-free 140 ml £5.95
  - Erythromycin (as Erythromycin ethyl succinate) 100 mg per 1 ml Erythromycin Forte SF 500mg/5ml oral suspension sugar-free 140 ml £10.56 DT price = £10.56

**Powder for solution for infusion**

- **Erythromycin (Non-proprietary)**
  - Erythromycin (as Erythromycin lactobionate) 1 gram Erythromycin 1g powder for solution for infusion vials 1 vial £18.45–£22.92

**ANTIBACTERIALS > MONOBACTAMS**

**Aztreonam**

- **DRUG ACTION** Aztreonam is a monocyclic beta-lactam (‘monobactam’) antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including Pseudomonas aeruginosa, Neisseria meningitidis, and Haemophilus influenzae; it should not be used alone for ‘blind’ treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against Neisseria gonorrhoeae (but not against concurrent chlamydial infection).

- **INDICATIONS AND DOSE**
  - **Gram-negative infections including Pseudomonas aeruginosa, Haemophilus influenzae, and Neisseria meningitidis**
    - **BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
    - Adult: 1 g every 8 hours, alternatively 2 g every 12 hours, single doses over 1 g intravenous route only
  - **Severe gram-negative infections including Pseudomonas aeruginosa, Haemophilus influenzae, Neisseria meningitidis, and lung infections in cystic fibrosis**
    - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
    - Adult: 2 g every 6–8 hours
  - **Gonorrhoea | Cystitis**
    - **BY INTRAMUSCULAR INJECTION**
    - Adult: 1 g for 1 single dose
  - **Urinary-tract infections**
    - **BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
    - Adult: 0.5–1 g every 8–12 hours
  - **Chronic pulmonary Pseudomonas aeruginosa infection in patients with cystic fibrosis**
    - **BY INHALATION OF NEBULISED SOLUTION**
    - Adult: 75 mg 3 times a day for 28 days, doses to be administered at least 4 hours apart, subsequent courses repeated after 28-day interval without aztreonam nebuliser solution

- **CAUTIONS**
  - When used by inhalation Haemoptysis—risk of further haemorrhage
  - **SIDE-EFFECTS**
    - **GENERAL SIDE-EFFECTS** Bronchospasm • rash
    - **SPECIFIC SIDE-EFFECTS**
      - Rare
      - With systemic use Antibiotic-associated colitis • asthenia • blood disorders • breast tenderness • chest pain • confusion
- diplopia - dizziness - dyspnoea - gastro-intestinal bleeding
- Frequency not known
- When used by inhalation Arthralgia - cough - haemoptysis - pharyngolaryngeal pain - pyrexia - rhinorrhea - wheezing
- With systemic use Abdominal pain - diarrhoea - erythema multiforme - flushing - mouth ulcers - nausea - taste disturbances - toxic epidermal necrolysis - vomiting

ALLERGY AND CROSS-SENSITIVITY Contra-indicated in aztreonam hypersensitivity.

Use with caution in patients with hypersensitivity to other beta-lactam antibiotics (although aztreonam may be less likely than other beta-lactams to cause hypersensitivity in penicillin-sensitive patients).

PREGNANCY
- With systemic use No information available; manufacturer of injection advises avoid.
- When used by inhalation No information available; manufacturer of powder for nebuliser solution advises avoid unless essential.

BREAST FEEDING Amount in milk probably too small to be harmful.

HEPATIC IMPAIRMENT
- With systemic use Use injection with caution. Monitor liver function.

RENAL IMPAIRMENT
- With systemic use If eGFR 10–30 mL/minute/1.73 m², usual initial dose of injection, then half normal dose. If eGFR less than 10 mL/minute/1.73 m², usual initial dose of injection, then one-quarter normal dose.

MONITORING REQUIREMENTS
- When used by inhalation Measure lung function before and after initial dose of aztreonam and monitor for bronchospasm.

DIRECTIONS FOR ADMINISTRATION
- With intravenous use For intravenous infusion (Azactam®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Dissolve initially in water for injections (1 g per 3 mL) then dilute to a concentration of less than 20 mg/mL; to be given over 20–60 minutes. For intravenous injection, give over 3–5 minutes.
- When used by inhalation Other inhaled drugs should be administered before aztreonam; a bronchodilator should be administered before each dose.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2014) that aztreonam powder for nebuliser solution (Cayston®) is accepted for restricted use within NHS Scotland when inhaled colistimethate sodium and inhaled tobramycin are not tolerated or are not providing satisfactory therapeutic benefit (measured as ≥2% decline in forced expiratory volume in 1 second).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for nebuliser solution
- Cayston (Gilead Sciences International Ltd)
  - Aztreonam (as Aztreonam Hycline) 75 mg
  - Cayston 75mg powder and solvent for nebuliser solution vials with Altera Nebuliser Handset | £84 vial (Pod) | £2,181.53

Powder for solution for injection
- Azactam (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Aztreonam 1 gram
    - Azactam 1g powder for solution for injection vials | 1 vial (Pod) | £94.40 (Hospital only)
  - Aztreonam 2 gram
    - Azactam 2g powder for solution for injection vials | 1 vial (Pod) | £185.82 (Hospital only)

ANTIBACTERIALS > NITROIMIDAZOLE DERIVATIVES

Metronidazole

DRUG ACTION Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

INDICATIONS AND DOSE

Anaerobic infections
- BY MOUTH
  - Child 1 month: 7.5 mg/kg every 12 hours usually treated for 7 days (for 10–14 days in Clostridium difficile infection)
  - Child 2 months–11 years: 7.5 mg/kg every 8 hours (max. per dose 400 mg) usually treated for 7 days (for 10–14 days in Clostridium difficile infection)
  - Child 12–17 years: 400 mg every 8 hours usually treated for 7 days (for 10–14 days in Clostridium difficile infection)
  - Adult: 400 mg every 8 hours, alternatively 500 mg every 8 hours usually treated for 7 days (for 10–14 days in Clostridium difficile infection)
- BY RECTUM
  - Child 1–11 months: 125 mg 3 times a day for 3 days, then 125 mg twice daily, for usual total treatment duration of 7 days
  - Child 1–4 years: 250 mg 3 times a day for 3 days, then 250 mg twice daily, for usual total treatment duration of 7 days
  - Child 5–9 years: 500 mg 3 times a day for 3 days, then 500 mg twice daily, for usual total treatment duration of 7 days
  - Child 10–17 years: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days
- BY INTRAVENOUS INFUSION
  - Adult: 500 mg every 8 hours usually treated for 7 days (for 10–14 days in Clostridium difficile infection), to be given over 20 minutes

Helicobacter pylori eradication; in combination with clarithromycin and esomeprazole; or in combination with clarithromycin and lansoprazole; or in combination with amoxicillin and lansoprazole; or in combination with clarithromycin and omeprazole; or in combination with clarithromycin and pantoprazole; or in combination with clarithromycin and rabeprazole
- BY MOUTH
  - Adult: 400 mg twice daily

Helicobacter pylori eradication; in combination with amoxicillin and omeprazole
- BY MOUTH
  - Adult: 400 mg 3 times a day

Helicobacter pylori eradication failure (two-week regimen comprising a proton pump inhibitor plus tripotassium dicitratobismuthate plus tetracycline)
- BY MOUTH
  - Adult: 400–500 mg 3 times a day for 2 weeks

Fistulating Crohn’s disease
- BY MOUTH
  - Adult: 10–20 mg/kg daily in divided doses, usual dose 400–500 mg 3 times a day usually given for 1 month but no longer than 3 months because of concerns about peripheral neuropathy

Leg ulcers and pressure sores
- BY MOUTH
  - Adult: 400 mg every 8 hours for 7 days

downloaded from www.medicalbr.com
Bacterial vaginosis (notably *Gardnerella vaginalis* infection)
- **BY MOUTH**
  - Adult: 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

Bacterial vaginosis
- **BY VAGINA USING VAGINAL GEL**
  - Adult: 1 applicatorful daily for 5 days, dose to be administered at night

**DOSE EQUIVALENCE AND CONVERSION**
- 1 applicatorful delivers a 5g dose of metronidazole 0.75%.

Pelvic inflammatory disease
- **BY MOUTH**
  - Adult: 400 mg twice daily for 14 days

**Acute ulcerative gingivitis**
- **BY MOUTH**
  - Child 1-2 years: 50 mg every 8 hours for 3 days
  - Child 3-6 years: 100 mg every 12 hours for 3 days
  - Child 7-9 years: 100 mg every 8 hours for 3 days
  - Child 10-17 years: 200–250 mg every 8 hours for 3 days
  - Adult: 400 mg every 8 hours for 3 days

**Acute oral infections**
- **BY MOUTH**
  - Child 1-2 years: 50 mg every 8 hours for 3–7 days
  - Child 3-6 years: 100 mg every 12 hours for 3–7 days
  - Child 7-9 years: 100 mg every 8 hours for 3–7 days
  - Child 10-17 years: 200–250 mg every 8 hours for 3–7 days
  - Adult: 400 mg every 8 hours for 3–7 days

Surgical prophylaxis
- **BY MOUTH**
  - Adult: 400–500 mg, to be administered 2 hours before surgery, then 400–500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)
  - **BY RECTUM**
  - Adult: 1 g, to be administered 2 hours before surgery, then 1 g every 8 hours if required for up to 3 doses (in high-risk procedures)
  - **BY INTRAVENOUS INFUSION**
  - Adult: 500 mg, to be administered up to 30 minutes before the procedure (if rectal administration inappropriate), then 500 mg every 8 hours if required for up to 3 further doses (in high-risk procedures)

**Invasive intestinal amoebiasis | Extra-intestinal amoebiasis (including liver abscess)**
- **BY MOUTH**
  - Child 1-2 years: 200 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - Child 3-6 years: 200 mg 4 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - Child 7-9 years: 400 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - Child 10-17 years: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - Adult: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)

**Urogenital trichomoniasis**
- **BY MOUTH**
  - Child 1-2 years: 50 mg 3 times a day for 7 days
  - Child 3-6 years: 100 mg twice daily for 7 days
  - Child 7-9 years: 100 mg 3 times a day for 7 days
  - Child 10-17 years: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

- **Adult:** 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

**Giardiasis**
- **BY MOUTH**
  - Child 1-2 years: 500 mg once daily for 3 days
  - Child 3-6 years: 600–800 mg once daily for 3 days
  - Child 7-9 years: 1 g once daily for 3 days
  - Child 10-17 years: 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days
  - Adult: 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days

**Established case of tetanus**
- **BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature)

**Unlicensed use**
- With systemic use in adults Metronidazole doses in the BNF may differ from those in product literature.

**Caution**
- With vaginal use Not recommended during menstruation - some systemic absorption may occur with vaginal gel

**Interactions**
- Appendix 1: metronidazole

**Side-effects**
- Very rare
  - With systemic use Arthralgia - ataxia - darkening of urine - dizziness - drowsiness - erythema multiforme - headache - hepatitis - jaundice - leukopenia (on prolonged or intensive therapy) - myalgia - pancreatitis - pancytopenia - peripheral neuropathy (on prolonged or intensive therapy) - pruritus - psychotic disorders - rash - thrombocytopenia - transient epileptiform seizures (on prolonged or intensive therapy) - visual disturbances
  - Frequency not known
  - With systemic use Anorexia - aseptic meningitis - furred tongue - gastro-intestinal disturbances - nausea - optic neuropathy - oral mucusitis - taste disturbances - vomiting
  - With vaginal use Abnormal vaginal discharge - local irritation - pelvic discomfort - vaginal candidiasis

**Pregnancy**
- With systemic use Manufacturer advises avoidance of high-dose regimens; use only if potential benefit outweighs risk.

**Breast feeding**
- With systemic use Significant amount in milk; manufacturer advises avoid large single doses though otherwise compatible; may give milk a bitter taste.

**Hepatic impairment**
- With systemic use In severe liver disease reduce total daily dose to one-third, and give once daily. Use with caution in hepatic encephalopathy.

**Monitoring requirements**
- With systemic use Clinical and laboratory monitoring advised if treatment exceeds 10 days.

**Directions for administration**
- For intravenous infusion, give over 20–30 minutes.

**Prescribing and dispensing information**
Metronidazole is well absorbed orally and the intravenous route is normally reserved for severe infections. Metronidazole by the rectal route is an effective alternative to the intravenous route when oral administration is not possible.

**Patient and carer advice**
514 Bacterial infection

PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Metronidazole Tablets may be prescribed. Metronidazole Oral suspension may be prescribed.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 4, 9, 21, 25, 27

Metronidazole (Non-proprietary)

Metronidazole 200 mg Metronidazole 200mg tablets | 21 tablet [POM] £4.99 DT price = £2.12 | 250 tablet [POM] £13.69

Metronidazole 400 mg Metronidazole 400mg tablets | 21 tablet [POM] £8.10 DT price = £1.47

Metronidazole 500 mg Metronidazole 500mg tablets | 21 tablet [POM] £3.72 DT price = £0.74

Flagyl (Zentiva)

Metronidazole 200 mg Flagyl 200mg tablets | 21 tablet [POM] £4.49 DT price = £2.12

Metronidazole 400 mg Flagyl 400mg tablets | 14 tablet [POM] £6.34

Oral suspension

CAUTIONARY AND ADVISORY LABELS 4, 9

Metronidazole (Non-proprietary)

Metronidazole (as Metronidazole benzoate) 40 mg per 1 ml Metronidazole 200mg/5ml oral suspension | 100 ml [POM] £3.03 DT price = £3.03

Infusion

ELECTROLYTES: May contain Sodium

Metronidazole (Non-proprietary)

Metronidazole 5 mg per 1 ml Metronidazole 500mg/100ml infusion 100ml bags | 20 bag [POM] £62.00

Metronidazole 500mg/100ml infusion 100ml Macoflex bags | 1 bag [POM] no price available | 60 bag [POM] no price available

Suppository

CAUTIONARY AND ADVISORY LABELS 4, 9

Flagyl (Zentiva)

Metronidazole 1 gram Flagyl 1g suppositories | 10 suppository [POM] £3.06

Metronidazole 500 mg Flagyl 500mg suppositories | 10 suppository [POM] £1.58

Vaginal gel

EXCIPIENTS: May contain Disodium edetate, hydroxybenzoates (parabens), propylene glycol

Metronidazole (Non-proprietary)

Metronidazole 7.5 mg per 1 gram Metronidazole 0.75% vaginal gel | 40 gram [POM] no price available DT price = £4.31

Zidoval (Meda Pharmaceuticals Ltd)

Metronidazole 7.5 mg per 1 gram Zidoval 0.75% vaginal gel | 40 gram [POM] £4.31 DT price = £4.31

Tinidazole

DRUG ACTION

Tinidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; it has a longer duration of action than metronidazole.

INDICATIONS AND DOSE

Anaerobic infections

BY MOUTH

Adult: Initially 2 g, followed by 1 g daily usually for 5–6 days, alternatively 500 mg twice daily usually for 5–6 days

Bacterial vaginosis | Acute ulcerative gingivitis

BY MOUTH

Adult: 2 g for 1 single dose

Abdominal surgery prophylaxis

BY MOUTH

Adult: 2 g for 1 single dose, to be administered approximately 12 hours before surgery

Intestinal amoebiasis

BY MOUTH

Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 3 days

Child 12–17 years: 2 g once daily for 2–3 days

Amebic involvement of liver

BY MOUTH

Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 5 days

Child 12–17 years: 1.5–2 g once daily for 3–6 days

Urogenital trichomoniasis | Giardiasis

BY MOUTH

Child 1 month–11 years: 50–75 mg/kg (max. per dose 2 g) for 1 single dose, dose may be repeated once if necessary

Child 12–17 years: 2 g for 1 single dose, dose may be repeated once if necessary

Adult: 2 g for 1 single dose

Helicobacter pylori eradication

BY MOUTH

Adult: (consult local protocol)

CAUTIONS

Avoid in acute porphyrias p. 969

INTERACTIONS → Appendix 1: tinidazole

SIDE-EFFECTS

Common or very common

Anorexia · furred tongue · gastrointestinal disturbances · nausea · oral mucositis · taste disturbances · vomiting

Very rare

Arthralgia · ataxia · darkening of urine · dizziness · drowsiness · erythema multiforme · headache · hepatitis · jaundice · leucopenia (on prolonged or intensive therapy) · myalgia · pancreatitis · pancytopenia · peripheral neuropathy (on prolonged or intensive therapy) · pruritus · psychotic disorders · rash · thrombocytopenia · transient epileptiform seizures (on prolonged or intensive therapy) · visual disturbances

Frequency not known

Aseptic meningitis · optic neuropathy

PREGNANCY

Manufacturer advises avoid in first trimester.

BREAST FEEDING

Present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment.

MONITORING REQUIREMENTS

Clinical and laboratory monitoring advised if treatment exceeds 10 days.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

ANTIBACTERIALS → PENICILLINS

Penicillins

Benzylpenicillin and phenoxymethylpenicillin

Benzylpenicillin sodium p. 517 (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamas. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax, diphtheria, gas-gangrene, leptospirosis, and treatment of Lyme disease. Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylpenicillin sodium is no longer the drug of first choice.
for pneumococcal meningitis. Although benzylpenicillin sodium is effective in the treatment of tetanus, metronidazole p. 512 is preferred. Benzylpenicillin is inactivated by gastric acid and absorption from the gastrointestinal tract is low; therefore it must be given by injection.

**Benzathine benzylpenicillin** is used for the treatment of early syphilis and late latent syphilis; broad-spectrum penicillins should not therefore be used for glandular fever; broad-spectrum penicillins should not be used for the treatment of meningococcal meningitis when clinical response has begun. It should not be used for meningococcal or gonococcal infections. Phenoxymethylpenicillin is used for prophylaxis against streptococcal infections following rheumatic fever and against pneumococcal infections following splenectomy or in sickle-cell disease.

### Penicillinase-resistant penicillins

Most staphylococci are now resistant to benzylpenicillin because they produce penicillinases. Flucloxacillin p. 523, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the sole indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection. Flucloxacillin is well absorbed from the gut.

Temocillin p. 524 is active against Gram-negative bacteria and is stable against a wide range of beta-lactamases. It should be reserved for the treatment of infections caused by beta-lactamase-producing strains of Gram-negative bacteria, including those resistant to third-generation cephalosporins. Temocillin is not active against *Pseudomonas aeruginosa* or *Acinetobacter* spp.

### Broad-spectrum penicillins

Ampicillin p. 520 is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by *Staphylococcus aureus* and by common Gram-negative bacilli such as *Escherichia coli*. Almost all staphylococci, approx. 60% of *E. coli* strains and approx. 20% of *Haemophilus influenzae* strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the 'blind' treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

Ampicillin is well excreted in the bile and urine. It is principally indicated for the treatment of exacerbations of chronic bronchitis and middle ear infections, both of which may be due to *Streptococcus pneumoniae* and *H. influenzae*, and for urinary-tract infections. Ampicillin can be given by mouth but less than half the dose is absorbed, and absorption is further decreased by the presence of food in the gut.

Maculopapular rashes commonly occur with ampicillin (and amoxicillin p. 518) but are not usually related to true penicillin allergy. They almost always occur in patients with glandular fever; broad-spectrum penicillins should not therefore be used for 'blind' treatment of a sore throat. The risk of rash is also increased in patients with acute or chronic lymphocytic leukaemia or in cytomegalovirus infection.

Ampicillin is a derivative of amoxicillin and has a similar antibacterial spectrum. It is better absorbed than ampicillin when given by mouth, producing higher plasma and tissue concentrations; unlike amoxicillin, absorption is not affected by the presence of food in the stomach. Amoxicillin may also be used for the treatment of Lyme disease (not licensed).

Co-amoxiclav p. 521 consists of amoxicillin with the beta-lactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating beta-lactamases, it makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of *Staph. aureus*, *E. coli*, and *H. influenzae*, as well as many *Bacteroides* and *Klebsiella* spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains.

A combination of ampicillin with flucloxacillin (as co-fluampicil p. 520) is available to treat infections involving either streptococci or staphylococci (e.g. cellulitis).

### Antipseudomonal penicillins

**Piperacillin**, a ureidopenicillin, is only available in combination with the beta-lactamase inhibitor tazobactam. **Ticarcillin**, a carboxypenicillin, is only available in combination with the beta-lactamase inhibitor clavulanic acid. Both preparations have a broad spectrum of activity against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Piperacillin with tazobactam p. 516 has activity against a wider range of Gram-negative organisms than ticarcillin with clavulanic acid p. 516 and it is more active against *Pseudomonas aeruginosa*. These antibacterials are not active against MRSA. They are used in the treatment of septicaemia, hospital-acquired pneumonia, and complicated infections involving the urinary tract, skin and soft tissues, or intra-abdomen. For severe pseudomonas infections these antipseudomonal penicillins can be given with an aminoglycoside (e.g. gentamicin p. 491) since they have a synergistic effect.

### Mecillinams

Pivmecillinam hydrochloride p. 523 has significant activity against many Gram-negative bacteria including *Escherichia coli*, *Klebsiella*, enterobacter, and salmonellae. It is not active against *Pseudomonas aeruginosa* or enterococci. Pivmecillinam hydrochloride is hydrolysed to mecillinam, which is the active drug.

### Penicillins

**DRUG ACTION** The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.

**CAUTIONS** History of allergy

**SIDE-EFFECTS**

- Common or very common
  - Anaphylaxis
  - angioedema
  - diarrhoea
  - fever
  - hypersensitivity reactions
  - joint pains
  - rashes
  - serum sickness-like reaction
  - urticaria

- Rare
  - Cerebral irritation
  - CNS toxicity (including convulsions)
  - coagulation disorders
  - encephalopathy
  - haemolytic anaemia
  - interstitial nephritis
  - leucopenia
  - thrombocytopenia

- Frequency not known
  - Antibiotic-associated colitis

**SIDE-EFFECTS, FURTHER INFORMATION**

- CNS toxicity A rare but serious toxic effect of the penicillins is encephalopathy due to cerebral irritation. This may result from excessively high doses or in patients with severe renal failure. The penicillins should not be given by intrathecal injection because they can cause encephalopathy which may be fatal.

- Diarrhoea Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can also cause antibiotic-associated colitis.
**Uncommon**

Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactoid reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactoid reactions to penicillins. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients.

Patients who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. Patients with a history of immediate hypersensitivity to penicillins may also react to the cephalosporins and other beta-lactam antibiotics, they should not receive these antibiotics. If a penicillin (or another beta-lactam antibiotic) is essential in an individual with immediate hypersensitivity to penicillin then specialist advice should be sought on hypersensitivity testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity.

### Antibacterials > Penicillins, Antipseudomonal with Beta-lactamase Inhibitor

**Piperacillin with tazobactam**

**Indications and Dose**

- **Hospital-acquired pneumonia** | **Septicaemia** | **Complicated infections involving the urinary-tract** | **Complicated infections involving the skin** | **Complicated infections involving the soft-tissues**

  - **By intravenous infusion**
  - Adult: 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections

**Infections in neutropenic patients**

  - **By intravenous infusion**
  - Adult: 4.5 g every 6 hours

**Caution**

High doses may lead to hypernatraemia (owing to sodium content of preparations)

**Interactions**

- Appendix 1: penicillins

**Side-effects**

- Common or very common: Nausea, vomiting
- Uncommon: Constipation, dyspepsia, headache, hypotension, injection-site reactions, insomnia, jaundice, stomatitis
- Rare: Abdominal pain, eosinophilia, hepatitis
- Very rare: Hypoglycaemia, hypokalaemia, pancreatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis

**Pregnancy**

Manufacturers advise use only if potential benefit outweighs risks.

**Breastfeeding**

Trace amount in milk, but appropriate to use.

**Renal impairment**

Max. 4.5 g every 8 hours if eGFR 20–40 mL/minute/1.73 m². Max. 4.5 g every 12 hours if eGFR less than 20 mL/minute/1.73 m².

**Effect on laboratory tests**

False-positive urinary glucose (if tested for reducing substances).

**Directions for administration**

For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially (2.25 g in 10 mL, 4.5 g in 20 mL) with water for injections, or glucose 5% (Tazocin® brand only), or sodium chloride 0.9%, then dilute to 50–150 mL with infusion fluid; give over 30 minutes.

**Prescribing and dispensing information**

Dose expressed as a combination of piperacillin and tazobactam (both as sodium salts) in a ratio of 8:1.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

- **Piperacillin with tazobactam (non-proprietary)**
  - Tazobactam (as Tazobactam sodium) 250 mg, Piperacillin (as Piperacillin sodium) 2 gram
  - Piperacillin 2g / Tazobactam 250mg powder for solution for injection vials 1 vial (Pom) £19.97 (Hospital only) | 10 vial (Pom) £50.80

- **Tazobactam (as Tazobactam sodium) 500 mg, Piperacillin (as Piperacillin sodium) 4 gram**
  - Piperacillin 4g / Tazobactam 500mg powder for solution for injection vials 1 vial (Pom) £12.90

- **Tazocin (Pfizer Ltd)**
  - Tazobactam (as Tazobactam sodium) 250 mg, Piperacillin (as Piperacillin sodium) 2 gram
  - Tazocin 2.25g powder for solution for injection vials 1 vial (Pom) £7.65 DT price = £8.70
  - Tazobactam (as Tazobactam sodium) 500 mg, Piperacillin (as Piperacillin sodium) 4 gram
  - Tazocin 4.5g powder for solution for injection vials 1 vial (Pom) £15.17 (Hospital only)

**Ticarcillin with clavulanic acid**

**Indications and Dose**

Infections due to Pseudomonas and Proteus spp.

- **By intravenous infusion**
  - Adult: 3.2 g every 6–8 hours; increased if necessary to 3.2 g every 4 hours, increased frequency used for more severe infections

**Caution**

High doses may lead to hypernatraemia (owing to sodium content of preparations)

**Caution, Further Information**

- Cholestatic jaundice: Cholestatic jaundice is possibly associated with clavulanic acid. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav (amoxicillin, clavulanic acid) than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

**Interactions**

- Appendix 1: penicillins

**Side-effects**

- Eosinophilia, haemorrhagic cystitis (more frequent in children), hypokalaemia, injection-site reactions, nausea, Stevens-Johnson syndrome, toxic epidermal necrolysis, vomiting

**Pregnancy**

Not known to be harmful.

**Breastfeeding**

Trace amounts in milk, but appropriate to use.

**Hepatic impairment**

Manufacturer advises caution in severe impairment.

**Renal impairment**

Accumulation of electrolytes contained in preparation can occur in patients with renal failure.

Note: The information provided is a summary and may not cover all aspects. Always consult a healthcare professional for the latest advice and guidelines.
Benzylpenicillin sodium
(Penicillin G)

**INDICATIONS AND DOSE**

- **Mild to moderate susceptible infections** | **Throat infections** | **Otitis media** | **Cellulitis** | **Pneumonia**
  - By **intramuscular injection**, or by **slow intravenous infusion**
  - Adult: 0.6–1.2 g every 6 hours, dose may be increased if necessary in more serious infections (consult product literature), single doses over 1.2 g to be given by intravenous route only

- **Endocarditis (in combination with other antibacterials if necessary)**
  - By **slow intravenous injection**, or by **intravenous infusion**
  - Adult: 1.2 g every 4 hours, increased if necessary to 2.4 g every 4 hours, dose may be increased in infections such as enterococcal endocarditis

- **Anthrax (in combination with other antibacterials)**
  - By **slow intravenous injection**, or by **intravenous infusion**
  - Adult: 2.4 g every 4 hours

- **Intrapartum prophylaxis against group B streptococcal infection**
  - By **slow intravenous injection**, or by **intravenous infusion**
  - Adult: Initially 3 g for 1 dose, then 1.5 g every 4 hours until delivery

- **Meningitis** | **Meningococcal disease**
  - By **slow intravenous injection**, or by **intravenous infusion**
  - Adult: 2.4 g every 4 hours
  - By **intravenous infusion**
  - Child: 50 mg/kg every 4–6 hours (max. per dose 2.4 g every 4 hours)

**EFFECT ON LABORATORY TESTS**

- False-positive urinary glucose (if tested for reducing substances).

**PRESCRIBING AND DISPENSING INFORMATION**

Dose is expressed as a combination of ticarcillin (as sodium salt) and clavulanic acid (as potassium salt) in a ratio of 15:1.

**MECHANICAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

**ELECTROLYTES:** May contain Potassium, sodium

- Timentin (GlaxoSmithKline UK Ltd)
- Clavulanic acid (as Potassium clavulanate) 200 mg, Ticarcillin (as Ticarcillin sodium) 3 gram Timentin 3.2g powder for solution for infusion vials | 4 vial 21.32

**ANTIBACTERIALS | PENICILLINS, BETA-LACTAMASE SENSITIVE**

**Suspected meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) prior to urgent transfer to hospital**

- By **intravenous injection**, or by **intramuscular injection**
  - Child 1-11 months: 300 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
  - Child 1-9 years: 600 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
  - Child 10-17 years: 1.2 g, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
  - Adult: 1.2 g, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer

**Suspected bacterial meningitis without non-blanching rash where patient cannot be transferred to hospital urgently**

- By **intravenous injection**, or by **intramuscular injection**
  - Child 1-11 months: 300 mg, administer as single dose prior to transfer to hospital
  - Child 1-9 years: 600 mg, administer as single dose prior to transfer to hospital
  - Child 10-17 years: 1.2 g, administer as single dose prior to transfer to hospital
  - Adult: 1.2 g, administer as single dose prior to transfer to hospital

**UNLICENSED USE**

Benzylpenicillin doses in the BNF may differ from those in product literature.

**IMPORTANT SAFETY INFORMATION**

Intrathecal injection of benzylpenicillin is not recommended.

**CAUTIONS**

- Accumulation of sodium from injection can occur with high doses

**INTERACTIONS**

→ Appendix 1: penicillins

**PREGNANCY**

Not known to be harmful.

**BREAST FEEDING**

Trace amounts in milk, but appropriate to use.

**RENAL IMPAIRMENT**

Accumulation of sodium from injection can occur in renal failure. High doses may cause neurotoxicity, including cerebral irritation, convulsions, or coma.

- In adults Reduce dose—consult product literature.
  - In children Estimated glomerular filtration rate 10–50 mL/minute/1.73 m², use normal dose every 8–12 hours. Estimated glomerular filtration rate less than 10 mL/minute/1.73 m² use normal dose every 12 hours.

**EFFECT ON LABORATORY TESTS**

False-positive urinary glucose (if tested for reducing substances).

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children Intravenous route recommended in infants. For **intravenous infusion**, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–30 minutes. Longer administration time is particularly important when using doses of 50 mg/kg (or greater) to avoid CNS toxicity.

  - With intravenous use in adults For **intravenous infusion** (Crystapen®), give intermittently in Glucose 5% or Sodium chloride 0.9%; suggested volume 100 mL given over 30–60 minutes. Continuous infusion not usually recommended.

Reduce dose to 3.2 g every eight hours if eGFR 30–60 mL/minute/1.73 m²; 1.6 g every eight hours if eGFR 10–30 mL/minute/1.73 m²; 1.6 g every twelve hours if eGFR less than 10 mL/minute/1.73 m².
Phenoxymethylpenicillin
(Penicillin V)

**INDICATIONS AND DOSE**

**Oral infections** | Tonsillitis | Otitis media | Erysipelas | Cellulitis

- **BY MOUTH**
  - Child 1–11 months: 62.5 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
  - Child 1–5 years: 125 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
  - Child 6–11 years: 250 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
  - Child 12–17 years: 500 mg 4 times a day; increased if necessary up to 1 g 4 times a day
  - Adult: 500 mg every 6 hours, increased if necessary up to 1 g every 6 hours

**Prevention of recurrence of rheumatic fever**

- **BY MOUTH**
  - Child 1 month–5 years: 125 mg twice daily
  - Child 6–17 years: 250 mg twice daily
  - Adult: 250 mg twice daily

**Prevention of secondary case of invasive group A streptococcal infection**

- **BY MOUTH**
  - Child 1–11 months: 62.5 mg every 6 hours for 10 days
  - Child 1–5 years: 125 mg every 6 hours for 10 days
  - Child 6–11 years: 250 mg every 6 hours for 10 days
  - Child 12–17 years: 500 mg every 6 hours for 10 days
  - Adult: 250–500 mg every 6 hours for 10 days

**Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease**

- **BY MOUTH**
  - Child 1–11 months: 62.5 mg twice daily
  - Child 1–4 years: 125 mg twice daily
  - Child 5–17 years: 250 mg twice daily
  - Adult: 250 mg twice daily

**UNLICENSED USE**

Phenoxymethylpenicillin doses in the BNF may differ from product literature.

**INTERACTIONS** → Appendix 1: penicillins

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Trace amounts in milk, but appropriate to use.

**EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

**Amoxicillin**

(Amoxyccillin)

**INDICATIONS AND DOSE**

Susceptible infections (including urinary-tract infections, otitis media, sinusitis, uncomplicated community acquired pneumonia, salmonellosis, oral infections)

- **BY MOUTH**
  - Child 1–11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
  - Child 1–4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
  - Child 5–11 years: 500 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g)
  - Child 12–17 years: 500 mg 3 times a day; increased if necessary up to 1 g 3 times a day, use increased dose in severe infections
  - Adult: 500 mg every 8 hours, increased if necessary up to 1 g every 8 hours, increased dose used in severe infections

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 500 mg every 8 hours

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 500 mg every 8 hours, increased to 1 g every 6 hours, use increased dose in severe infections

**Lyme disease (under expert supervision)**

- **BY MOUTH**
  - Child 5–17 years: 500 mg 3 times a day for 14–21 days (for 28 days in Lyme arthritis)
  - Adult: 500 mg 3 times a day for 14–21 days (for 28 days in Lyme arthritis)

**Anthrax (treatment and post-exposure prophylaxis)**

- **BY MOUTH**
  - Child (body-weight up to 20 kg): 80 mg/kg daily in 3 divided doses
  - Child (body-weight 20 kg and above): 500 mg 3 times a day

- **Dental abscess (short course)**

- **BY MOUTH**
  - Adult: 3 g, then 3 g after 8 hours

**Urinary-tract infections (short course)**

- **BY MOUTH**
  - Adult: 3 g, then 3 g after 10–12 hours
**Listeral meningitis (in combination with another antibiotic)**

- **BY INTRAVENOUS INFUSION**
  - Adult: 2 g every 4 hours

**Endocarditis (in combination with another antibiotic if necessary)**

- **BY INTRAVENOUS INFUSION**
  - Adult: 2 g every 4 hours

**Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease—if cover also needed for Haemophilus influenzae**

- **BY MOUTH**
  - Child 1 month–4 years: 125 mg twice daily
  - Child 5–11 years: 250 mg twice daily
  - Child 12–17 years: 500 mg twice daily

**Helicobacter pylori eradication in combination with metronidazole and omeprazole**

- **BY MOUTH**
  - Adult: 500 mg 3 times a day

**Helicobacter pylori eradication in combination with clarithromycin and esomeprazole; or in combination with clarithromycin and lansoprazole; or in combination with clarithromycin and pantoprazole; or in combination with clarithromycin and rabeprazole**

- **BY MOUTH**
  - Adult: 1 g twice daily

- **UNLICENSED USE** Amoxicillin doses in BNF Publications may differ from those in product literature.

- **CAUTIONS**

  **GENERAL CAUTIONS**
  Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common) · maintain adequate hydration with high doses (particularly during parenteral therapy)

  **SPECIFIC CAUTIONS**
  - With intravenous use Accumulation of sodium can occur with high parenteral doses
  - **INTERACTIONS** ▶ Appendix 1: penicillins
  - **SIDE-EFFECTS**
  - **Common or very common** Nausea · vomiting
  - **SIDE-EFFECTS, FURTHER INFORMATION**
  - Rash If rash occurs, discontinue treatment.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Trace amount in milk, but appropriate to use.

- **RENAI IMPAIRMENT** Reduce dose in severe impairment; rashes more common. Risk of crystalluria with high doses (particularly during parenteral therapy).
  - With intravenous use Accumulation of sodium from injection can occur in patients with renal failure.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Amoxil®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 ml given over 30–60 minutes or give via drip tubing in Glucose 5% or Sodium chloride 0.9%; continuous infusion not usually recommended.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations and sachets may include peach, strawberry, or lemon.

- **PATIENT AND CARER ADVICE**
  Patient counselling is advised for Amoxicillin (Amoxil®) paediatric suspension (use of pipette).

**Bacterial infection** 519

**Medicines for Children leaflet: Amoxicillin for bacterial infections**

**Combinations available:** Co-amoxiclav, p. 521
Ampicillin

**INDICATIONS AND DOSE**

Susceptible infections (including bronchitis, urinary-tract infections, otitis media, sinusitis, uncomplicated community-acquired pneumonia, salmonellosis)

- **BY MOUTH**
  - Child 1-11 months: 125 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day
  - Child 1-4 years: 250 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day
  - Child 5-11 years: 500 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day (max. per dose 1 g)

- **Child 12-17 years:** 500 mg 4 times a day; increased if necessary to 1 g 4 times a day, use increased dose in severe infection
  - **Adult:** 0.5–1 g every 6 hours
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 500 mg every 4–6 hours
  - **BY INTRAMUSCULAR INJECTION**
  - Adult: 500 mg every 4–6 hours

**Endocarditis (in combination with another antibiotic if necessary)**

**Lobar pneumonia (in combination with another antibiotic)**

- **BY INTRAVENOUS INJECTION**
- **Adult:** 2 g every 4 hours

**UNLICENSED USE** Ampicillin doses in BNF may differ from those in product literature.

**CAUTIONS**

**GENERAL CAUTIONS**

Acute lymphocytic leukaemia (increased risk of erythematous rashes) – chronic lymphocytic leukaemia (increased risk of erythematous rashes) – cytomegalovirus infection (increased risk of erythematous rashes) – glandular fever (erythematous rashes common)

**SPECIFIC CAUTIONS**

- With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses

**INTERACTIONS** → Appendix 1: penicillins

**SIDE-EFFECTS**

- Common or very common Nausea, vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Rash If rash occurs, discontinue treatment.

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Trace amounts in milk, but appropriate to use.

**RENAL IMPAIRMENT**

- In adults: Reduce dose if eGFR less than 10 mL/minute/1.73 m²; rash more common.
- In children: If estimated glomerular filtration rate less than 10 mL/minute/1.73 m² reduce dose or frequency; rash more common.

- With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use: Administer at least 30 minutes before food.

- With intravenous use: For intravenous infusion (Penbritin®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%. Continuous infusion not usually recommended.

**INDICATIONS AND DOSE**

Mixed infections involving beta-lactamase-producing staphylococci

- **BY MOUTH**
  - Child 1 month–9 years: 125/125 mg every 6 hours
  - Child 10–17 years: 250/250 mg every 6 hours
  - Adult: 250/250 mg every 6 hours

- **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 250/250 mg every 6 hours

**Severe mixed infections involving beta-lactamase-producing staphylococci**

- **BY MOUTH**
  - Child 1 month–9 years: 250/250 mg every 6 hours
  - Adult: 500/500 mg every 6 hours
  - **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 500/500 mg every 6 hours

**IMPORTANT SAFETY INFORMATION**

**HEPATIC DISORDERS**

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with fluclaxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:

- fluclaxacillin should not be used in patients with a history of hepatic dysfunction associated with fluclaxacillin;

- fluclaxacillin should be used with caution in patients with hepatic impairment;

- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.

**CAUTIONS**

**GENERAL CAUTIONS**

Acute lymphocytic leukaemia (increased risk of erythematous rashes) – chronic lymphocytic leukaemia (increased risk of erythematous rashes) – cytomegalovirus infection (increased risk of erythematous rashes) – glandular fever (erythematous rashes common)

Infection

With intravenous use

▶ Rare

With oral use

▶ Common or very common

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

▶ Common or very common

Cholestatic jaundice. Cholestatic jaundice can occur either during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

INTERACTIONS

SID-EFFECTS

CONTRA-INDICATIONS

History of co-amoxiclav-associated jaundice or hepatic dysfunction. History of penicillin-associated jaundice or hepatic dysfunction.

CAUTIONS

GENERAL CAUTIONS

Acute lymphocytic leukaemia (increased risk of erythematous rashes). Chronic lymphocytic leukaemia (increased risk of erythematous rashes). Cytomegalovirus infection (increased risk of erythematous rashes). Glandular fever (erythematous rashes common). Infection (increased risk of erythematous rashes). Jaundice is usually self-limiting and very rarely fatal. The epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

INTERACTIONS

Appendix 1: penicillins

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

▶ Common or very common

▶ Rare

SPECIFIC CAUTIONS

With intravenous use

Accumulation of electrolytes contained in parenteral preparations can occur with high doses.

CAUTIONS, FURTHER INFORMATION

With oral use in children

For intravenous infusion, dilute reconstituted solution to a concentration of 10 mg/mL with Sodium Chloride 0.9%; give intermittently over 30–40 minutes. For intravenous injection, administer over 3–4 minutes.

With oral use in adults

For intravenous infusion (Augmentin®), give intermittently in Sodium chloride 0.9%. Reconstitute 600 mg initially with 10 mL water for injections, then dilute with 50 mL infusion fluid; reconstitute 1.2 g initially with 20 mL water for injections, then dilute with 100 mL infusion fluid; give over 30–40 minutes. For intravenous injection, administer over 3–4 minutes. Via drip tubing in Sodium chloride 0.9%.

DIRECTIONS FOR ADMINISTRATION

Prescribing and dispensing information

Doses are expressed as co-amoxiclav: a mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

Flavours of oral liquid formulations may include raspberry and orange.

▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
▶ Adult: 0.25–2 g every 6 hourscontinued
### 524 Bacterial infection

#### Endocarditis (in combination with other antibacterial if necessary)
- By slow intravenous injection, or by intravenous infusion
  - Adult (body-weight up to 85 kg): 8 g daily in 4 divided doses
  - Adult (body-weight 85 kg and above): 12 g daily in 6 divided doses

#### Osteomyelitis
- By slow intravenous injection, or by intravenous infusion
  - Adult: Up to 8 g daily in 3–4 divided doses

#### Surgical prophylaxis
- Initially by slow intravenous injection, or by intravenous infusion
  - Adult: 1–2 g, to be administered up to 30 minutes before the procedure, then (by mouth or by intramuscular injection or by slow intravenous injection or by intravenous infusion) 500 mg every 6 hours if required for up to 4 further doses in high risk procedures

#### Staphylococcal lung infection in cystic fibrosis
- By mouth
  - Child: 25 mg/kg 4 times a day (max. per dose 1 g), alternatively 100 mg/kg daily in 3 divided doses; maximum 4 g per day

#### Prevention of Staphylococcus aureus lung infection in cystic fibrosis—primary prevention
- By mouth
  - Child 1 month–3 years: 125 mg twice daily

#### Prevention of Staphylococcus aureus lung infection in cystic fibrosis—secondary prevention
- By mouth
  - Child: 50 mg/kg twice daily (max. per dose 1 g twice daily)

**UNLICENSED USE** Flucloxacillin doses in the BNF may differ from those in product literature.

### IMPORTANT SAFETY INFORMATION

#### HEPATIC DISORDERS

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:
- Flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin
- Flucloxacillin should be used with caution in patients with hepatic impairment
- Careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials

#### CAUTIONS
- With intravenous use Accumulation of electrolytes can occur with high doses
- INTERACTIONS → Appendix 1: penicillins
- SIDE-EFFECTS
  - Common or very common Gastrointestinal disturbances
  - Very rare Cholestatic jaundice · hepatitis
- PREGNANCY Not known to be harmful.
- BREAST FEEDING Trace amounts in milk, but appropriate to use.
- HEPATIC IMPAIRMENT Use with caution.
- RENAL IMPAIRMENT
  - In adults Reduce dose if eGFR less than 10 mL/minute/1.73 m².
  - In children Use normal dose every 8 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- With intravenous use Accumulation of electrolytes can occur in patients with renal failure.
- EFFECT ON LABORATORY TESTS False-positive urinary glucose (if tested for reducing substances).
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (FloxaPen®), give intermittently in Glucose 5% or Sodium chloride 0.9%; suggested volume 100 mL given over 30–60 minutes. ViG drip tubing in Glucose 5% or Sodium chloride 0.9%; continuous infusion not usually recommended.

      - Flucloxacillin 250mg/5ml oral solution | 100 ml | £26.04 DT price + £26.04

#### Powder for solution for injection

- **Flucloxacillin (Non-proprietary)**
  - Flucloxacillin (as Flucloxacillin sodium) 250 mg Flucloxacillin 250mg powder for solution for injection vials | 10 vial | £10.43–£12.25
  - Flucloxacillin (as Flucloxacillin sodium) 500 mg Flucloxacillin 500mg powder for solution for injection vials | 10 vial | £20.85–£24.50

#### Capsule

CAUTIONARY AND ADVISORY LABELS 9, 23

- **Flucloxacillin (Non-proprietary)**
  - Flucloxacillin (as Flucloxacillin sodium) 250 mg Flucloxacillin 250mg capsules | 20 capsule | £3.58 | 28 capsule | £5.00
    - DT price = £1.31 | 100 capsule | £17.80
  - Flucloxacillin (as Flucloxacillin sodium) 500 mg Flucloxacillin 500mg capsules | 20 capsule | £7.50 | 28 capsule | £10.50
    - DT price = £2.17 | 100 capsule | £37.50

Combinations available: **Co-fluampicil**, p. 520

### Temocillin

#### INDICATIONS AND DOSE

- Septicaemia | Urinary-tract infections | Lower respiratory-tract infections caused by susceptible Gram-negative bacteria
  - By intramuscular injection, or by intravenous injection, or by intravenous infusion
  - Adult: 1–2 g every 12 hours, give over 3–4 minutes when administered by intravenous injection

#### CAUTIONS

Accumulation of sodium from injection can occur with high doses

- INTERACTIONS → Appendix 1: penicillins
- PREGNANCY Not known to be harmful.
- BREAST FEEDING Trace amounts in milk.

- RENAL IMPAIRMENT 1 g every 12 hours if eGFR 30–60 mL/minute/1.73 m², 1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m², 1 g every 48 hours or 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m².
**ANTIBACTERIALS**

**DIRECTIONS FOR ADMINISTRATION**

**DIRECTIONS FOR ADMINISTRATION**

**Antibacterials, including**

**Gram-negative infections resistant to other antibacterials, including those caused by**

**Pseudomonas aeruginosa, Acinetobacter baumanii, and Klebsiella pneumoniae**

- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult (body-weight up to 60 kg): 50 000–75 000 units/kg daily in 3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection
  - Adult (body-weight 60 kg and above): 1–2 million units every 8 hours, to be administered into a totally implantable venous access device when giving via slow intravenous injection; maximum 6 million units per day

Adjunct to standard antibacterial therapy for

**Pseudomonas aeruginosa infection in cystic fibrosis**

- **BY INHALATION OF NEBULISED SOLUTION**
  - Adult: 1–2 million units twice daily, adjusted according to response, increased to 2 million units 3 times daily for subsequent respiratory isolates of **Pseudomonas aeruginosa**

- **BY INHALATION OF POWDER**
  - Adult: 1.66 million units twice daily

**PROMIXIN® INJECTION**

Gram-negative infections resistant to other antibacterials, including those caused by **Pseudomonas aeruginosa, Acinetobacter baumanii, Klebsiella pneumoniae**

- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 9 million units daily in 2–3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection, an initial loading dose of 9 million units (up to max. 12 million units, if adequate renal function) should be used in those who are critically ill, consult product literature for details

**CONTRA-INDICATIONS**

- **Myasthenia gravis**

**CAUTIONS**

**GENERAL CAUTIONS**

- **Acute porphyrias p. 969**

**SPECIFIC CAUTIONS**

- When used by inhalation: Severe haemoptysis—risk of further haemorrhage

- **INTERACTIONS**
  - Appendix 1: colistimethate sodium

**SIDE-EFFECTS**

- **Dose-related side-effects**
  - The major adverse effects are dose-related neurotoxicity and nephrotoxicity.

- **PREGNANCY**
  - When used by inhalation: Clinical use suggests probably safe.
  - With intravenous use: Use only if potential benefit outweighs risk.

- **BREAST FEEDING**
  - Present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk).

- **RENAL IMPAIRMENT**
  - With intravenous use: Reduce dose.
  - With intravenous use: In renal impairment, monitor plasma colistimethate sodium concentration during parenteral treatment—consult product literature. Recommended ‘peak’ plasma colistimethate sodium concentration (approx. 1 hour after intravenous injection or infusion) 5–15 mg/litre; pre-dose (‘trough’) concentration 2–6 mg/litre.

**MONITORING REQUIREMENTS**

- With intravenous use: Monitor renal function.

- When used by inhalation: Measure lung function before and after initial dose of colistimethate sodium and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using a bronchodilator before the dose of colistimethate sodium.

**DIRECTIONS FOR ADMINISTRATION**

- When used by inhalation: Other inhaled drugs should be administered before colistimethate sodium. For **nebulisation** administer required dose in 2–4 mL of sodium chloride 0.9% (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection.

- With intravenous use: For **intravenous infusion** (Colomycin®, Promixin®), give intermittently in Sodium chloride 0.9%
Colistimethate sodium is included in some preparations for topical application.

**Patient and carer advice**

**Driving and skilled tasks**
Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness, confusion and visual disturbances.

**When used by inhalation**
Patient should be advised to rinse mouth with water after each dose of dry powder inhalation. Patients or carers should be given advice on how to administer colistimethate sodium; first dose should be given under medical supervision.

**National funding/access decisions**

**NICE technology appraisals (TAs)**

- **Colistimethate sodium by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013)**

  Colistimethate sodium dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis who would benefit from continued treatment, but do not tolerate the drug in its nebulised form. The manufacturer must provide colistimethate sodium dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving colistimethate sodium dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.

**Antibacterials > Quinolones**

**Quinolones**

**Overview**

Nalidixic acid p. 530 and norfloxacin p. 530 are effective in uncomplicated urinary-tract infections.

Ciprofloxacin p. 527 is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including salmonella, shigella, campylobacter, neisseria, and pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as *Streptococcus pneumoniae* and *Enterococcus faecalis*; it should not be used for pneumococcal pneumonia. It is active against chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin can be used for respiratory tract infections (but not for pneumococcal pneumonia), urinary-tract infections, infections of the gastro-intestinal system (including typhoid fever), bone and joint infections, gonorrhoea and septicemia caused by sensitive organisms.

Ofloxacin p. 530 is used for urinary-tract infections, lower respiratory-tract infections, gonorrhoea, and non-gonococcal urethritis and cervicitis.

Levofloxacin p. 528 is active against Gram-positive and Gram-negative organisms. It has greater activity against pneumococci than ciprofloxacin. Levofloxacin is licensed for the treatment of acute sinusitis, acute exacerbations of chronic bronchitis, and community-acquired pneumonia, but it should only be considered for these infections when first-line treatment cannot be used or is ineffective. Levofloxacin is also licensed for the treatment of urinary-tract infections.

Although ciprofloxacin, levofloxacin, moxifloxacin p. 529, and ofloxacin are licensed for skin and soft-tissue infections, many staphylococci are resistant to the quinolones and their use should be avoided in MRSA infections.

Moxifloxacin should be reserved for the treatment of sinusitis, community-acquired pneumonia, exacerbations of chronic bronchitis, mild to moderate pelvic inflammatory disease, or complicated skin and soft-tissue infections which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials. It has been associated with QT interval prolongation and life-threatening hepatotoxicity. Moxifloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against Gram-positive organisms, including pneumococci, than ciprofloxacin. Moxifloxacin is not active against *Pseudomonas aeruginosa* or meticillin-resistant *Staphylococcus aureus* (MRSA).

**Quinolones**

**Important safety information**

The CSM has warned that quinolones may induce convulsions in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them.

**Tendon damage**

Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:
Ciprofloxacin

**INDICATIONS AND DOSE**

**Fistulating Crohn's disease**
- **BY MOUTH**
  - Adult: 500 mg twice daily

**Respiratory-tract infections**
- **BY MOUTH**
  - Adult: 500–750 mg twice daily
- **BY INTRAVENOUS INFUSION**
  - Adult: 400 mg every 8–12 hours, to be given over 60 minutes

**Pseudomonal lower respiratory-tract infection in cystic fibrosis**
- **BY MOUTH**
  - Adult: 750 mg twice daily

- **Urinary-tract infections**
  - **BY MOUTH**
    - Adult: 250–750 mg twice daily
  - **BY INTRAVENOUS INFUSION**
    - Adult: 400 mg every 8–12 hours, to be given over 60 minutes

**Acute uncomplicated cystitis in women**
- **BY MOUTH**
  - Adult: 250 mg twice daily for 3 days

**Acute or chronic prostatitis**
- **BY MOUTH**
  - Adult: 500 mg twice daily for 28 days
- **BY INTRAVENOUS INFUSION**
  - Adult: 400 mg every 8–12 hours, to be given over 60 minutes

**Gonorrhoea**
- **BY MOUTH**
  - Adult: 500 mg for 1 dose

**Most other infections**
- **BY MOUTH**
  - Adult: Initially 500 mg twice daily; increased to 750 mg twice daily, in severe or deep-seated infection
- **BY INTRAVENOUS INFUSION**
  - Adult: 400 mg every 8–12 hours, to be given over 60 minutes

**Surgical prophylaxis**
- **BY MOUTH**
  - Adult: 750 mg, to be taken 60 minutes before procedure

**Anthrax (treatment and post-exposure prophylaxis)**
- **BY MOUTH**
  - Adult: 500 mg twice daily
- **BY INTRAVENOUS INFUSION**
  - Adult: 400 mg every 12 hours, to be given over 60 minutes

**Prevention of secondary case of meningococcal meningitis**
- **BY MOUTH**
  - Child 1 month–4 years: 30 mg/kg (max. per dose 125 mg) for 1 dose
  - Child 5–11 years: 250 mg for 1 dose
  - Child 12–17 years: 500 mg for 1 dose
  - Adult: 500 mg for 1 dose

**UNLICENSED USE**

**CAUTIONS**
- Acute myocardial infarction (risk factor for QT interval prolongation) • avoid excessive alkalinity of urine (risk of crystalluria) • bradycardia (risk factor for QT interval prolongation) • congenital long QT syndrome (risk factor for QT interval prolongation) • electrolyte disturbances (risk factor for QT interval prolongation) • ensure adequate fluid intake (risk of crystalluria) • heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) • history of symptomatic arrhythmias (risk factor for QT interval prolongation)

**INTERACTIONS**
- **Appendix 1: quinolones**

**SIDE-EFFECTS**
- **Common or very common**
  - Flatulence
- **Rare**
  - Abnormal dreams • chest pain • dysphagia • dysphonia • erythema nodosum • hot flushes • hyperglycaemia • hypoglycaemia • oedema • pancreatitis • sweating • syncope • tachycardia

**ALERTS AND INTERACTIONS**
- **Contra-indicated** in patients with a history of tendon disorders related to quinolone use;
- patients over 60 years of age are more prone to tendon damage;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

**SIDE-EFFECTS**
- **Common or very common**
  - Diarrhoea • dizziness • headache • nausea • vomiting
- **Uncommon**
  - Abdominal pain • anorexia • anxiety • arthralgia • asthenia • blood disorders • confusion • depression • disturbances in taste • disturbances in vision • dyspepsia • eosinophilia • hallucinations • leucopenia • myalgia • rash • sleep disturbances • thrombocytopenia • tremor
- **Rare**
  - Antibiotic-associated colitis • convulsions • disturbances in hearing • disturbances in smell • dysphonia • hepatic dysfunction • hepatitis • hypotension • interstitial nephritis • jaundice • photosensitivity • psychosis • renal failure • symptoms of peripheral neuropathy (sometimes irreversible) • tendon damage • tendon inflammation • vasculitis
- **Very rare**
  - Stevens-Johnson syndrome • toxic epidermal necrolysis

**ALLERGY AND CROSS-SENSITIVITY**
- Use of quinolones contra-indicated in quinolone hypersensitivity.

**PREGNANCY**
- Avoid in pregnancy—shown to cause arthropathy in animal studies; safer alternatives are available.

**CONTRA-INDICATIONS**
- History of tendon disorders related to quinolone use

**CAUTIONS**
- Can prolong the QT interval - children or adolescents (arthropathy has developed in weight-bearing joints in young animals) - conditions that predispose to seizures - diabetes (may affect blood glucose) - exposure to excessive sunlight should be avoided (discontinue if photosensitivity occurs) • G6PD deficiency • history of epilepsy • myasthenia gravis (risk of exacerbation)

**CAUTIONS, FURTHER INFORMATION**
- In children Quinolones cause arthropathy in the weight-bearing joints of immature animals and are therefore generally not recommended in children and growing adolescents. However, the significance of this effect in humans is uncertain and in some specific circumstances short-term use of either ciprofloxacin or nalidixic acid may be justified in children.

**SIDE-EFFECTS, FURTHER INFORMATION**
- The drug should be discontinued if psychiatric, neurological, or hypersensitivity reactions (including severe rash) occur.

**INTERACTIONS**
- **Appendix 1: quinolones**

**SIDE-EFFECTS**
- **Common or very common**
  - Flatulence
- **Rare**
  - Abnormal dreams • chest pain • dysphagia • dysphonia • erythema nodosum • hot flushes • hyperglycaemia • hypoglycaemia • oedema • pancreatitis • sweating • syncope • tachycardia
- **Very rare**
  - Intracranial hypertension • movement disorders • tenosynovitis • tinnitus • vasculitis (in children)
- **Frequency not known**
  - Peripheral neuropathy • polyneuropathy

**REPRODUCTION**
- **Pregnancy**
  - Avoid in pregnancy—shown to cause arthropathy in animal studies; safer alternatives are available.

Adult: 400 mg once daily for 7–21 days, to be given over 60 minutes

CONTRA-INDICATIONS

Acute myocardial infarction (risk factor for QT interval prolongation) - bradycardia (risk factor for QT interval prolongation) - congenital long QT syndrome (risk factor for QT interval prolongation) - electrolyte disturbances (risk factor for QT interval prolongation) - heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) - history of symptomatic arrhythmias (risk factor for QT interval prolongation)

INTERACTIONS

Appendix 1: quinolones

SIDE-EFFECTS

Common or very common Angina - arrhythmias - constipation - flatulence - gastritis - hyperlipidaemia - palpitation - sweating - vasodilatation

Uncommon Dyspnoea

Rare Abnormal dreams - amnesia - dysphagia - hyperglycaemia - hypertension - hyperuricaemia - incoordination - myopathy - oedema - peripheral neuropathy - stomatitis - syncope

Very rare Potentially life-threatening hepatic failure - rhabdomyolysis

Frequency not known

With intravenous use Pain at injection site - phlebitis at injection site

BR EAST FEEDING

Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT

Manufacturer advises avoid in severe impairment.

PATIENT AND CARER ADVICE

Driving and skilled tasks May impair performance of skilled tasks (e.g. driving).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 6, 9

Moxifloxacin (as Moxifloxacin hydrochloride) 400 mg

Moxifloxacin 400mg tablets | 5 tablet (Po) £13.15 DT price = £10.05

Avelox (Bayer Plc)

Moxifloxacin (as Moxifloxacin hydrochloride) 400 mg

Avelox 400mg tablets | 5 tablet (Po) £12.43 DT price = £10.05

Solution for infusion

ELECTROLYTES: May contain Sodium

Avelox (Bayer Plc)

Moxifloxacin (as Moxifloxacin hydrochloride) 1.6 mg per

1 ml Avelox 400mg/250ml solution for infusion bottles | 1 bottle (Po) £39.95 (Hospital only) | 5 bottle (Po) £199.75 (Hospital only)

Infusion

Moxifloxacin (Non-proprietary)

Moxifloxacin (as Moxifloxacin hydrochloride) 1.6 mg per

1 ml Avelox IV. 400mg/250ml infusion bags | 1 bag (Po) no price available

Moxifloxacin

INDICATIONS AND DOSE

Sinusitis

BY MOUTH

Adult: 400 mg once daily for 7 days

Community-acquired pneumonia

BY MOUTH

Adult: 400 mg once daily for 7–14 days

BY INTRAVENOUS INFUSION

Adult: 400 mg once daily for 7–14 days, to be given over 60 minutes

Exacerbations of chronic bronchitis

BY MOUTH

Adult: 400 mg once daily for 5–10 days

Mild to moderate pelvic inflammatory disease

BY MOUTH

Adult: 400 mg once daily for 14 days
**Nalidixic acid**

**INDICATIONS AND DOSE**

**Urinary-tract infections**
- **BY MOUTH**
  - Adult: 900 mg every 6 hours for 7 days, then reduced to 600 mg every 6 hours for prolonged therapy in chronic infections

**CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) - avoid in acute porphyrias p. 969 - bradycardia (risk factor for QT interval prolongation) - congenital long QT syndrome (risk factor for QT interval prolongation) - electrolyte disturbances (risk factor for QT interval prolongation) - heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) - history of symptomatic arrhythmias (risk factor for QT interval prolongation)

**INTERACTIONS** → Appendix 1: quinolones

**SIDE-EFFECTS** Cranial nerve palsy - increased intracranial pressure - metabolic acidosis - peripheral neuropathy - toxic psychosis

**BREAST FEEDING** Risk to infant very small but one case of haemolytic anaemia reported.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in liver disease.

**RENAL IMPAIRMENT** Use with caution; avoid if eGFR less than 20 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Monitor blood counts, renal and liver function if treatment exceeds 2 weeks.

**EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances).

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry and strawberry.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

No licensed medicines listed.

---

**Norfloxacin**

**INDICATIONS AND DOSE**

**Urinary-tract infections**
- **BY MOUTH**
  - Adult: 400 mg twice daily for 7–10 days (for 3 days for uncomplicated infections in women)

**Chronic relapsing lower urinary-tract infections**
- **BY MOUTH**
  - Adult: 400 mg twice daily for up to 12 weeks; reduced to 400 mg once daily, if adequate suppression within first 4 weeks

**Chronic prostatitis**
- **BY MOUTH**
  - Adult: 400 mg twice daily for 28 days

**CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) - bradycardia (risk factor for QT interval prolongation) - congenital long QT syndrome (risk factor for QT interval prolongation) - electrolyte disturbances (risk factor for QT interval prolongation) - heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) - history of symptomatic arrhythmias (risk factor for QT interval prolongation)

**INTERACTIONS** → Appendix 1: quinolones

---

**Ofloxacin**

**INDICATIONS AND DOSE**

**Urinary-tract infections**
- **BY MOUTH**
  - Adult: 200–400 mg daily, preferably taken in the morning; increased if necessary to 400 mg twice daily, in upper urinary tract infections

**Complicated urinary-tract infection**
- **BY INTRAVENOUS INFUSION**
  - Adult: 400 mg daily, increased if necessary to 400 mg twice daily, dose increased for severe or complicated infections, to be given over at least 30 minutes for each 200 mg

**Acute or chronic prostatitis**
- **BY MOUTH**
  - Adult: 200 mg twice daily for 28 days

**Lower respiratory-tract infections**
- **BY MOUTH**
  - Adult: 400 mg daily, dose preferably taken in the morning, then increased if necessary to 400 mg twice daily

**BY INTRAVENOUS INFUSION**
- Adult: 200 mg twice daily, increased to 400 mg twice daily, dose to be increased for severe or complicated infections, to be given over at least 30 minutes for each 200 mg

**Skin and soft-tissue infections**
- **BY MOUTH**
  - Adult: 400 mg twice daily

**Uncomplicated gonorrhoea**
- **BY MOUTH**
  - Adult: 400 mg as a single dose

**Uncomplicated genital chlamydial infection | Non-gonococcal urethritis**
- **BY MOUTH**
  - Adult: 400 mg daily for 7 days, dose may be taken as a single daily dose or in divided doses

**Pelvic inflammatory disease**
- **BY MOUTH**
  - Adult: 400 mg twice daily for 14 days
Septicaemia

- BY INTRAVENOUS INFUSION
- Adult: 200 mg twice daily, increased if necessary to 400 mg twice daily, dose to be increased for severe or complicated infections, to be given over at least 30 minutes for each 200 mg

- CAUTIONS
  - Acute myocardial infarction (risk factor for QT interval prolongation) - bradycardia (risk factor for QT interval prolongation) - congenital long QT syndrome (risk factor for QT interval prolongation) - electrolyte disturbances (risk factor for QT interval prolongation) - heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) - history of psychiatric illness - history of symptomatic arrhythmias (risk factor for QT interval prolongation)

- INTERACTIONS
  - Appendix 1: quinolones

- SIDE-EFFECTS
  - Common or very common: Cough - eye irritation - nasopharyngitis
  - Rare: Abnormal dreams - arrhythmias - bronchospasm - dyspnoea - hot flushes - hyperhidrosis
  - Very rare: Extrapyramidal symptoms - neuropathy - tinnitus
  - Frequency not known: Changes in blood sugar - myopathy - pneumonitis - rhabdomyolysis
  - With intravenous use: Hypotension - local reactions - thrombophlebitis

- BREAST FEEDING: Amount probably too small to be harmful but manufacturer advises avoid.

- HEPATIC IMPAIRMENT: Use with caution; elimination may be reduced in severe impairment.

- RENAL IMPAIRMENT: Usual initial dose, then use half normal dose if eGFR 20–50 mL/minute/1.73 m²; 100 mg every 24 hours if eGFR less than 20 mL/minute/1.73 m²

- PATIENT AND CARER ADVICE
  - Driving and skilled tasks: May affect performance of skilled tasks (e.g. driving); effects enhanced by alcohol.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

### Tablet

**CAUTIONARY AND ADVISORY LABELS** 6, 9, 11

- **Ofloxacin (Non-proprietary)**
  - Ofloxacin 200 mg: 200 mg tablets | 10 tablet POM £6.75
  - Ofloxacin 400 mg: 400 mg tablets | 5 tablet POM £12.80

- **Tarivid (Sanofi)**
  - Ofloxacin 200 mg: 200 mg tablets | 10 tablet POM £7.53 DT price = £6.71
  - Ofloxacin 400 mg: 400 mg tablets | 5 tablet POM £15.05

- **Solution for infusion**
  - **Tarivid (Sanofi)**
    - Ofloxacin (as Ofloxacin hydrochloride) 2 mg per 1 ml: Tarivid 200mg/100ml solution for infusion bottles | 1 bottle POM £16.16

### ANTIBACTERIALS > SULFONAMIDES

#### Co-trimoxazole

- **DRUG ACTION**: Sulfamethoxazole and trimethoprim are used in combination (as co-trimoxazole) because of their synergistic activity (the importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic).

- **INDICATIONS AND DOSE**

  **Treatment of susceptible infections**

  - **BY MOUTH**
    - Child 6 weeks–5 months: 120 mg twice daily, alternatively 24 mg/kg twice daily
    - Child 6 months–5 years: 240 mg twice daily, alternatively 24 mg/kg twice daily
    - Child 6–11 years: 480 mg twice daily, alternatively 24 mg/kg twice daily
    - Child 12–17 years: 960 mg twice daily
    - Adult: 960 mg twice daily

  - **BY INTRAVENOUS INFUSION**
    - Adult: 960 mg every 12 hours, increased to 1.44 g every 12 hours, increased dose used in severe infection

  **Treatment of Pneumocystis jirovecii (Pneumocystis carinii) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature)**

  - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
    - Child: 120 mg/kg daily in 2–4 divided doses for 14–21 days, oral route preferred for children
    - Adult: 120 mg/kg daily in 2–4 divided doses for 14–21 days

  **Prophylaxis of Pneumocystis jirovecii (Pneumocystis carinii) infections**

  - **BY MOUTH**
    - Child: 450 mg/m² twice daily (max. per dose 960 mg twice daily) for 3 days of the week (either consecutively or on alternate days), dose regimens may vary, consult local guidelines
    - Adult: 960 mg once daily, reduced if not tolerated to 480 mg once daily, alternatively 960 mg once daily on alternate days, alternate day dose to be given 3 times weekly, alternatively 960 mg twice a day on alternate days, alternate day dose to be given 3 times weekly

  **DOSE EQUIVALENCE AND CONVERSION**

  - 480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg.

### IMPORTANT SAFETY INFORMATION

**RESTRICTIONS ON THE USE OF CO-TRIMOXAZOLE**

Co-trimoxazole is the drug of choice in the prophylaxis and treatment of *Pneumocystis jirovecii (Pneumocystis carinii)* pneumonia; it is also indicated for nocardiosis, *Stenotrophomonas maltophilia* infection [unlicensed indication], and toxoplasmosis. It should only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it. Co-trimoxazole is also used for the treatment of infections caused by *Burkholderia cepacia* in cystic fibrosis [unlicensed indication].
Sulfadiazine (Septrin)

**CONTRA-INDICATIONS** Acute porphyrias p. 969

**CAUTIONS** Asthma - avoid in blood disorders (unless under specialist supervision) - avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus - elderly (increased risk of serious side-effects) - G6PD deficiency (risk of haemolytic anaemia) - maintain adequate fluid intake - predisposition to folate deficiency - predisposition to hyperkalaemia (in adults)

**INTERACTIONS** → Appendix 1: sulfamethoxazole, trimethoprim

**SIDE-EFFECTS**

- **Common or very common** Diarrhoea, headache, hyperkalaemia, nausea, rash
- **Uncommon** Vomiting
- **Rare** Agranulocytosis - bone marrow depression
- **Frequency not known** Rhabdomyolysis reported in HIV-infected patients

**SIDE-EFFECTS, FURTHER INFORMATION**

- Blood disorders or rash
- **Co-trimoxazole** is associated with rare but serious side effects. Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity) develop.

**PREGNANCY** Teratogenic risk in first trimester (trimethoprim a folate antagonist). Neonatal haemolysis and mechaemoglobinemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.

**BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole).

**HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe liver disease.

**RENAL IMPAIRMENT**

- In adults Use half normal dose if eGFR 15–30 mL/minute/1.73 m². Avoid if eGFR less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored.
- In children Use half normal dose if estimated glomerular filtration rate 15–30 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored.

**MONITORING REQUIREMENTS**

- In children Plasma concentration monitoring may be required with high doses; seek expert advice.
- Monitor blood counts on prolonged treatment.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children For intermittent *intravenous infusion*, may be further diluted in glucose 5% and 10% or sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and the required dose infused over max. 60 minutes; check container for haze or precipitant during administration. In severe fluid restriction may be given undiluted via a central venous line.
- With intravenous use in adults For *intravenous infusion* (Septrin® for infusion), give intermittently in Glucose 5% or 10% or Sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and infused over max. 60 minutes.

**PRESCRIBING AND DISPENSING INFORMATION**

Co-trimoxazole is a mixture of trimethoprim and sulfamethoxazole (sulphamethoxazole) in the proportions of 1 part to 5 parts.

Flavours of oral liquid formulations may include banana, or vanilla.

**MEDICINAL FORMS**

**Solution for infusion**

**EXCIPIENTS:** May contain Alcohol, propylene glycol, sulfates

**ELECTROLYTES:** May contain Sodium

- **Co-trimoxazole (Non-proprietary)**
  - Trimethoprim 16 mg per 1 mL, Sulfamethoxazole 80 mg per 1 mL Co-trimoxazole 80 mg/400 mg/5 ml solution for infusion ampoules | 10 ampoules (PMS) £35.00
  - Septrin (Aspen Pharma Trading Ltd) Trimethoprim 16 mg per 1 mL, Sulfamethoxazole 80 mg per 1 mL Septrin for Infusion 80 mg/400 mg/5 ml solution for infusion ampoules | 10 ampoule (PMS) £11.76

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS 9**

- **Co-trimoxazole (Non-proprietary)**
  - Trimethoprim 8 mg per 1 mL, Sulfamethoxazole 40 mg per 1 mL Co-trimoxazole 40 mg/200 mg/5 ml oral suspension sugar free sugar-free | 100 ml (PMS) £9.95 DT price + £9.95
  - Trimethoprim 16 mg per 1 mL, Sulfamethoxazole 80 mg per 1 mL Co-trimoxazole 80 mg/400 mg/5 ml oral suspension | 100 ml (PMS) £10.95 DT price + £10.95

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 9**

- **Co-trimoxazole (Non-proprietary)**
  - Trimethoprim 80 mg, Sulfamethoxazole 400 mg Co-trimoxazole 80 mg/400 mg tablets | 28 tablet (PMS) £15.50 DT price + £2.51 | 100 tablet (PMS) £8.96–£10.91
  - Trimethoprim 160 mg, Sulfamethoxazole 800 mg Co-trimoxazole 160 mg/800 mg tablets | 100 tablet (PMS) £23.40–£24.00 DT price = £23.46

**Sulfadiazine**

**DRUG ACTION** Sulfadiazine is a short-acting sulphonamide with bacteriostatic activity against a broad spectrum of organisms. The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

**INDICATIONS AND DOSE**

**Prevention of rheumatic fever recurrence**

- **BY MOUTH**
  - Adult (body-weight up to 30 kg): 500 mg daily
  - Adult (body-weight 30 kg and above): 1 g daily

**UNLICENSED USE** Not licensed for use in toxoplasmosis.

**CONTRA-INDICATIONS** Acute porphyrias p. 969

**CAUTIONS** Asthma - avoid in blood disorders (unless under specialist supervision) - avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus - elderly (increased risk of serious side effects) - G6PD deficiency (risk of haemolytic anaemia) - maintain adequate fluid intake - predisposition to folate deficiency - predisposition to hyperkalaemia (in adults)
pneumonia) because of the risk of kernicterus, elderly, G6PD deficiency (risk of haemolytic anaemia), maintain adequate fluid intake, predisposition to folate deficiency, predisposition to hyperkalaemia

- **INTERACTIONS** → Appendix 1: sulfonamides

- **SIDE-EFFECTS**
  - **Common or very common** Diarrhoea, headache, hyperkalaemia, nausea, rash
  - **Uncommon** Vomiting
  - **Rare** Agranulocytosis, bone marrow depression
  - **Very rare** Anorexia, antibiotic-associated colitis, arthralgia, septic meningitis, ataxia, blood disorders, convulsions, cough, depression, eosinophilia, glossitis, hallucinations, hepatic necrosis, hypoglycaemia, hypertension (discontinue), interstitial nephritis, jaundice, leucopenia, liver damage, megaloblastic anaemia, myalgia, myocarditis, pancreatitis, peripheral neuropathy, photosensitivity, pulmonary infiltrates, renal disorders, shortness of breath, Stevens-Johnson syndrome, stomatitis, systemic lupus erythematosus, thrombocytopenia, tinnitus, toxic epidermal necrolysis, uveitis, vasculitis, vertigo
  - **Frequency not known** Benign intracranial hypertension, hypothyroidism, optic neuropathy, rhabdomyolysis reported in HIV-infected patients

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Blood disorders or rash Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity, depression) develop.

- **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.

- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.

- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment.

- **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria.

- **MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
  - **Tablet**
    - Sulfadiazine (Non-proprietary) Sulfadiazine 500 mg | 56 tablet [POM] £139.62 DT price = £114.27

- **ANTIBACTERIALS** → Tetracyclines and related drugs

## Tetracyclines

### Overview
The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. They remain, however, the treatment of choice for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline p. 534 with either streptomycin p. 492 or rifampicin p. 549), and the spirochaete, Borrelia burgdorferi (See Lyme disease). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic bronchitis (because of their activity against Haemophilus influenzae), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin p. 510).

Tetracyclines have a role in the management of meticillin-resistant Staphylococcus aureus (MRSA) infection.

Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline p. 535 which has a broader spectrum; it is active against Neisseria meningitidis and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo. Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

## Tetracyclines

- **CONTRA-INDICATIONS** Children under 12 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)

- **CAUTIONS** Myasthenia gravis (muscle weakness may be increased) - systemic lupus erythematosus may be exacerbated

- **SIDE-EFFECTS**
  - **Rare** Anaphylaxis, angioedema, blood disorders, exfoliative dermatitis, hepatotoxicity, hypersensitivity reactions, pancreatitis, pericarditis, photosensitivity (particularly with demeclocycline), rash, Stevens-Johnson syndrome, urticaria
  - **Frequency not known** Antibiotic-associated colitis, benign intracranial hypertension, bulging fontanelles (in infants) (in children), diarrhoea, dysphagia, headache, nausea, oesophageal irritation, visual disturbances, vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Benzodiazepines during pregnancy may cause sedation. The use of benzodiazepines in the second trimester may increase the risk of congenital malformations.
  - Cough may occur with demeclocycline and may also occur with doxycycline in very rare cases. Doxycycline should not be used in children under 6 months of age.
  - Electrolyte disturbances may indicate benign intracranial hypertension.
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
  - **Tablet CAUTIONARY AND ADVISORY LABELS** 9, 27
    - Sulfadiazine (Non-proprietary) Sulfadiazine 500 mg | 56 tablet [POM] £139.62 DT price = £114.27

## Demeclocycline hydrochloride

- **INDICATIONS AND DOSE**
  - **Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)**
    - **BY MOUTH**
      - Adult: 150 mg 4 times a day, alternatively 300 mg twice daily

  - **Treatment of hypotension resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable**
    - **BY MOUTH**
      - Adult: Initially 0.9–1.2 g daily in divided doses, maintenance 600–900 mg daily

- **CAUTIONS** Photosensitivity more common than with other tetracyclines

- **INTERACTIONS** → Appendix 1: tetracyclines
Doxycycline

**INDICATIONS AND DOSE**

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily
  - Adult: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily

Severe infections (including refractory urinary-tract infections)
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 200 mg daily
  - Adult: 200 mg once daily

**Acne**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg once daily
  - Adult: 100 mg once daily

**Rosacea**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 100 mg once daily

**Papulopustular facial rosacea (without ocular involvement)**
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 40 mg once daily for 16 weeks, dose to be taken in the morning, consider discontinuing treatment if no response after 6 weeks

**Early syphilis**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg twice daily for 14 days
  - Adult: 100 mg twice daily for 14 days

**Late latent syphilis**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg twice daily for 28 days
  - Adult: 100 mg twice daily for 28 days

**Neurosyphilis**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 200 mg twice daily for 28 days

**Uncomplicated genital chlamydia | Non-gonococcal urethritis**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg twice daily for 7 days
  - Adult: 100 mg twice daily for 7 days

**Pelvic inflammatory disease**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg twice daily for 14 days

**Prophylaxis of malaria**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years
  - Adult: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years

**Adjunct to quinine in treatment of Plasmodium falciparum malaria**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 200 mg daily for 7 days
  - Adult: 200 mg daily for 7 days

**Periodontitis (as an adjunct to gingival scaling and root planing)**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 20 mg twice daily for 3 months
  - Adult: 20 mg twice daily for 3 months

**UNLICENSED USE**

**CAUTIONS**
- Alcohol dependence

**INTERACTIONS**
- → Appendix 1: tetracyclines

**SIDE-EFFECTS**
- Alcohol dependence

**PREGNANCY**
- When travel to malarious areas is unavoidable during pregnancy, doxycycline can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks’ gestation.

**RENAL IMPAIRMENT**
- Use with caution (avoid excessive doses).

**MONITORING REQUIREMENTS**
- When used for periodontitis, monitor for superficial fungal infection, particularly if predisposition to oral candidiasis.

**DIRECTIONS FOR ADMINISTRATION**
- Capsules and Tablets should be swallowed whole with plenty of fluid, while sitting or standing. Capsules should be taken during meals.

**PATIENT AND CARER ADVICE**
- Counselling on administration advised (posture). Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.

**PROFESSION SPECIFIC INFORMATION**
- **Dental practitioners’ formulary**
  - Doxycycline Capsules 100 mg may be prescribed. Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets. Tablets may be prescribed as Doxycycline Tablets 20 mg.
### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet
Cautory and Advisory Labels 6, 11, 27
- **Periostat** (Alliance Pharmaceuticals Ltd)
  - Doxycycline (as Doxycycline hyclate) 20 mg  | 56 tablet [PO][M] £17.30 DT price = £17.30

#### Dispersible tablet
Cautory and Advisory Labels 6, 9, 11, 13
- **Vibramycin-D** (Pfizer Ltd)
  - Doxycycline (as Doxycycline monohydrate) 100 mg  | 8 tablet [PO][M] £4.91 DT price = £4.91

#### Modified-release capsule
Cautory and Advisory Labels 6, 11, 27
- **Efracea** (Galderma (UK) Ltd)
  - Doxycycline (as Doxycycline monohydrate) 40 mg  | 14 capsule [PO][M] £7.99 DT price = £7.99  | 56 capsule [PO][M] £21.71

#### Capsule
Cautory and Advisory Labels 6, 9, 11, 27
- **Doxycycline (Non-proprietary)**
  - Doxycycline (as Doxycycline hyclate) 50 mg  | 28 capsule [PO][M] £2.26 DT price = £1.29
  - Doxycycline (as Doxycycline hyclate) 100 mg  | 8 capsule [PO][M] £1.44 DT price = £0.87  | 50 capsule [PO][M] £5.44

### Lymecycline

#### INDICATIONS AND DOSE
Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)
- **BY MOUTH**
  - Child 12–17 years: 408 mg twice daily, increased to 1.224–1.632 g daily, (in severe infection)
  - Adult: 408 mg twice daily, increased to 1.224–1.632 g daily, (in severe infection)

#### Acne
- **BY MOUTH**
  - Child 12–17 years: 408 mg daily for at least 8 weeks
  - Adult: 408 mg daily for at least 8 weeks

#### INTERACTIONS
Appendix 1: tetracyclines

#### MEDICATIONS
May exacerbate renal failure and should not be given to patients with renal impairment.

#### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

#### Capsule
Cautory and Advisory Labels 6, 9
- **Lymecycline (Non-proprietary)**
  - Lymecycline 408 mg  | 28 capsule [PO][M] £6.95 DT price = £5.14  | 56 capsule [PO][M] £11.66
  - Tetralysal (Galderma (UK) Ltd)
  - Lymecycline 408 mg  | 28 capsule [PO][M] £6.95 DT price = £5.14  | 56 capsule [PO][M] £11.53

### Minocycline

#### INDICATIONS AND DOSE
Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12–17 years: 100 mg once daily, alternatively 50 mg twice daily
  - Adult: 100 mg once daily, alternatively 50 mg twice daily
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 12–17 years: 100 mg daily
  - Adult: 100 mg daily

#### Prophylaxis of asymptomatic meningococcal carrier state (but no longer recommended)
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 100 mg twice daily for 5 days, minocycline treatment is usually followed by administration of rifampicin

### CAUTIONS
Systemic lupus erythematosus

### SIDE-EFFECTS
- **Rare**
  - Acute renal failure · alopecia · anorexia · hypoaesthesia · impaired hearing · paraesthesia · pigmentation (sometimes irreversible) · tinnitus
  - **Very rare**
    - Discoloration of conjunctiva · discoloration of sweat · discoloration of tears · systemic lupus erythematosus

### FREQUENCY NOT KNOWN
Dizziness (more common in women) · vertigo (more common in women)

### RENAL IMPAIRMENT
Use with caution (avoid excessive doses).

### MONITORING REQUIREMENTS
If treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if develop or if pre-existing systemic lupus erythematosus worsens.

### DIRECTIONS FOR ADMINISTRATION
Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing.

### PATIENT AND CARER ADVICE
Counselling on administration advised (posture).

### LESS SUITABLE FOR PRESCRIBING
Less suitable for prescribing (compared with other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome; it sometimes causes irreversible pigmentation).

#### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet
Cautory and Advisory Labels 6, 9
- **Minocycline (Non-proprietary)**
  - Minocycline (as Minocycline hydrochloride) 50 mg  | 28 tablet [PO][M] £8.50 DT price = £6.19
  - Minocycline (as Minocycline hydrochloride) 100 mg  | 28 tablet [PO][M] £14.50 DT price = £14.01

#### Modified-release capsule
Cautory and Advisory Labels 6, 25
- **Minocycline (Non-proprietary)**
  - Minocycline (as Minocycline hydrochloride) 100 mg  | 56 capsule [PO][M] £24.75 DT price = £20.08
  - Acnamino MR (Dexcel-Pharma Ltd)
  - Minocycline (as Minocycline hydrochloride) 100 mg  | 56 capsule [PO][M] £21.14 DT price = £20.08
  - Minocin MR (Meda Pharmaceuticals Ltd)
  - Minocycline (as Minocycline hydrochloride) 100 mg  | 56 capsule [PO][M] £20.08 DT price = £20.08

#### Capsule
Cautory and Advisory Labels 6, 9
- **Aknemin (Almirall Ltd)**
  - Minocycline (as Minocycline hydrochloride) 50 mg  | 56 capsule [PO][M] £15.27 DT price = £15.27
Oxytetracycline

- **INDICATIONS AND DOSE**
  - Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)
    - **BY MOUTH**
      - Child 12–17 years: 250–500 mg 4 times a day
      - Adult: 250–500 mg 4 times a day
  - Rosacea
    - **BY MOUTH**
      - Adult: 500 mg twice daily usually for 6–12 weeks (course may be repeated intermittently)
  - Acne
    - **BY MOUTH**
      - Child 12–17 years: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

- **INTERACTIONS** → Appendix 1: tetracyclines
- **RENAL IMPAIRMENT** May exacerbate renal failure and should not be given to patients with renal impairment.
- **PROFESSION SPECIFIC INFORMATION**
  - **Dental practitioners’ formulary**
    - Oxytetracycline Tablets may be prescribed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension
  - **Tablet**
    - CAUTIONARY AND ADVISORY LABELS 7, 9, 23
    - **Oxytetracycline (Non-proprietary)**
      - Oxytetracycline (as Oxytetracycline dihydrate) 250 mg Oxytetracycline 250mg tablets | 28 tablet POM £3.45 DT price = £1.07
      - 1000 tablet POM no price available

Tigecycline

- **DRUG ACTION** Tigecycline is a glycylcyclic antibacterial structurally related to the tetracyclines. Tigecycline is active against Gram-positive and Gram-negative bacteria, including tetracycline-resistant organisms, and some anaerobes. It is also active against meticillin-resistant Staphylococcus aureus and vancomycin-resistant enterococci, but *Pseudomonas aeruginosa* and many strains of *Proteus spp* are resistant to tigecycline.

- **INDICATIONS AND DOSE**
  - Treatment of complicated skin and soft-tissue infections and complicated abdominal infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used
    - **BY INTRAVENOUS INFUSION**
      - Adult: Initially 100 mg, then 50 mg every 12 hours for 5–14 days, not recommended for the treatment of foot infections in patients with diabetes

- **CAUTIONS** Cholestasis
- **INTERACTIONS** → Appendix 1: tetracyclines
- **SIDE-EFFECTS**
  - Common or very common Abdominal pain · anorexia · bilirubinaemia · diarrhoea · dizziness · dyspepsia · headache · hypoglycaemia · injection-site reactions ·
nausea • prolonged activated partial thromboplastin time • prolonged prothrombin time • pruritus • rash • vomiting

- **Uncommon** Cholestatic jaundice • hypoprothrombinaemia • pancreatitis
- **Frequency not known** Antibiotic-associated colitis • hepatic failure • Stevens-Johnson syndrome • thrombocytopenia

**SIDE-EFFECTS, FURTHER INFORMATION**
Side-effects similar to those of the tetracyclines can potentially occur.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to tetracyclines.
- **PREGNANCY** Tetracyclines should not be given to pregnant women; effects on skeletal development have been documented in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child’s teeth, and maternal hepatotoxicity has been reported with large parenteral doses.
- **BREAST FEEDING** Manufacturer advises caution—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Initially 100 mg then 25 mg every 12 hours in severe hepatic impairment.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Tygacil®), give intermittently in Glucose 5% and Sodium Chloride 0.9%. Reconstitute each vial with 5.3 mL infusion fluid to produce a 10 mg/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 30–60 minutes.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for injection**
  - Tygacil (Pfizer Ltd)
  - Tigecycline 50 mg Tygacil 50mg powder for solution for infusion vials | 10 vial (Pos) £323.10 (Hospital only)

**OTHER**

**ANTIBACTERIALS**

**Chloramphenicol**

- **DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

- **INDICATIONS AND DOSE**
  
  Life threatening infections particularly those caused by
  *Haemophilus influenzae* | Typhoid fever
  - By mouth, or by intravenous injection, or by intravenous infusion
  - Adult: 12.5 mg/kg every 6 hours, in exceptional cases dose can be doubled for severe infections such as septicaemia and meningitis, providing high doses reduced as soon as clinically indicated

- **CONTRA-INDICATIONS** Acute porphyrias p. 969
- **CAUTIONS** Avoid repeated courses and prolonged treatment
- **INTERACTIONS** Appendix 1: chloramphenicol
- **SIDE-EFFECTS** Blood disorders • depression • diarrhoea • dry mouth • erythema multiforme • glossitis • headache • nausea • nocturnal haemoglobinuria • optic neuritis • peripheral neuritis • reversible and irreversible aplastic anaemia (with reports of resulting leukaemia) • stomatitis • urticaria • vomiting

  **SIDE-EFFECTS, FURTHER INFORMATION**
  Associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections.

- **PREGNANCY** Manufacturer advises avoid; neonatal ‘grey-baby syndrome’ if used in third trimester.
- **BREAST FEEDING** Manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant;

concentration in milk usually insufficient to cause ‘grey syndrome’.

- **HEPATIC IMPAIRMENT** Reduce dose. Avoid if possible—increased risk of bone-marrow depression. Monitor plasma-chloramphenicol concentration in hepatic impairment.

- **RENAL IMPAIRMENT** Avoid in severe renal impairment unless no alternative; dose-related depression of haematopoesis.

- **MONITORING REQUIREMENTS**
  - Plasma concentration monitoring preferred in the elderly.
  - Recommended peak plasma concentration (approx. 2 hours after administration by mouth, intravenous injection or infusion) 10–25 mg/litre; pre-dose (‘trough’) concentration should not exceed 15 mg/litre.
  - Blood counts required before and periodically during treatment.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Kemicetine®), give intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for injection**
  - **ELECTROLYTES:** May contain Sodium
  - **Chloramphenicol (Non-proprietary)**
    - Chloramphenicol (as Chloramphenicol sodium succinate)
      - 1 gram Chloramphenicol 1g powder for solution for infusion vials | 1 vial (Pos) £22.00

- **Capsule**
  - **Chloramphenicol (Non-proprietary)**
    - Chloramphenicol 250 mg Chloramphenicol 250mg capsules | 60 capsule (Pos) £377.00 D7 price = £377.00

**Daptomycin**

- **DRUG ACTION** Daptomycin is a lipopeptide antibacterial with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. It needs to be given with other antibacterials for mixed infections involving Gram-negative bacteria and some anaerobes.

- **INDICATIONS AND DOSE**
  Complicated skin and soft-tissue infections caused by Gram-positive bacteria, including meticillin-resistant *Staphylococcus aureus* (MRSA)
  - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Adult: 4 mg/kg once daily; increased to 6 mg/kg once daily, increase dose only if associated with *Staphylococcus aureus* bacteraemia

- **Staphylococcal endocarditis caused by organisms resistant to vancomycin or in patients intolerant of vancomycin (in combination with other antibacterials)**
  - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Adult: 6 mg/kg once daily

- **UNLICENCED USE** Not licensed for use in left-sided endocarditis.

- **INTERACTIONS** Appendix 1: daptomycin
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain • anaemia • anxiety • arthralgia • asthenia • constipation • diarrhoea • dizziness • flatulence • headache • hypertension • hypotension • injection-site reactions • insomnia • nausea • pruritus • rash • vomiting
  - **Uncommon** Anorexia • arrhythmias • dyspepsia • electrolyte disturbances • eosinophilia • flushing • glossitis • hyperglycaemia • muscle effects • muscle weakness •
Fidaxomicin

**DRUG ACTION** Fidaxomicin is a macrocyclic antibacterial that is poorly absorbed from the gastro-intestinal tract, and, therefore, it should not be used to treat systemic infections.

**INDICATIONS AND DOSE**

**Clostridium difficile infection**

- **By mouth**
  - Adult: 200 mg every 12 hours for 10 days. Limited clinical data is available on the use of fidaxomicin in severe or life-threatening *Clostridium difficile* infection

**CAUTIONS** Inflammatory bowel disease · severe or life-threatening *C. difficile* infection

**INTERACTIONS** → Appendix 1: fidaxomicin

**SIDE-EFFECTS**

- **Common or very common** Constipation · nausea · vomiting
- **Uncommon** Abdominal distension · decreased appetite · dizziness · dry mouth · flatulence · headache · taste disturbance

**ALLERGY AND CROSS-SENSITIVITY** Use with caution in macrolide hypersensitivity.

**PREGNANCY** Manufacturer advises avoid—no information available.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—no information available.

**RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2012) that fidaxomicin (*Dificlir®*) is accepted for restricted use within NHS Scotland to treat the first recurrence of *C. difficile* infection, on the advice of a microbiologist or specialist in infectious diseases.

**MEDICINAL FORMS**

Fosfomycin

**DRUG ACTION** Fosfomycin, a phosphonic acid antibacterial, is active against a range of Gram-positive and Gram-negative bacteria including *Staphylococcus aureus* and *Enterobacteriaceae*.

**INDICATIONS AND DOSE**

**Acute uncomplicated lower urinary-tract infections**

- **By mouth using granules**
  - Adult: 3 g for 1 dose

**Prophylaxis of urinary-tract infections in transurethral surgical procedures**

- **By mouth using granules**
  - Adult: 3 g, to be given 3 hours before surgery. Dose may be repeated once, 24 hours after surgery

**Osteomyelitis when first-line treatments are inappropriate or ineffective | Hospital-acquired lower respiratory-tract infections when first-line treatments are inappropriate or ineffective**

- **By intravenous infusion**
  - Adult: 12–24 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

**Complicated urinary-tract infections when first-line treatment ineffective or inappropriate**

- **By intravenous infusion**
  - Adult: 12–16 g daily in 2–3 divided doses (max. per dose 8 g)

**Bacterial meningitis when first-line treatment ineffective or inappropriate**

- **By intravenous infusion**
  - Adult: 16–24 g daily in 3–4 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

---

**SIDE-EFFECTS**

**PREGNANCY** Manufacturer advises avoid—no information available.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—no information available.

**RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2008) that daptomycin (*Cubicin®*) is accepted for restricted use within NHS Scotland for the treatment of MRSA bacteraemia associated with right-sided endocarditis or with complicated skin and soft-tissue infections.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- **Cubicin** (Merck Sharp & Dohme Ltd)
  - Daptomycin 350 mg Cubicin 350mg powder for concentrate for solution for infusion vials | 1 vial [PPh] £52.00
  - Daptomycin 500 mg Cubicin 500mg powder for concentrate for solution for infusion vials | 1 vial [PPh] £88.57 (Hospital only)

---

**INDICATIONS AND DOSE**

**Acute uncomplicated lower urinary-tract infections**

- **By mouth using granules**
  - Adult: 3 g for 1 dose

**Prophylaxis of urinary-tract infections in transurethral surgical procedures**

- **By mouth using granules**
  - Adult: 3 g, to be given 3 hours before surgery. Dose may be repeated once, 24 hours after surgery

**Osteomyelitis when first-line treatments are inappropriate or ineffective | Hospital-acquired lower respiratory-tract infections when first-line treatments are inappropriate or ineffective**

- **By intravenous infusion**
  - Adult: 12–24 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

**Complicated urinary-tract infections when first-line treatment ineffective or inappropriate**

- **By intravenous infusion**
  - Adult: 12–16 g daily in 2–3 divided doses (max. per dose 8 g)

**Bacterial meningitis when first-line treatment ineffective or inappropriate**

- **By intravenous infusion**
  - Adult: 16–24 g daily in 3–4 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms
### Fusidic acid

**16-Jun-2017**

**DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

### Indications and Dose

**Staphylococcal skin infection**
- **By mouth using tablets**
  - Child 12–17 years: 250 mg every 12 hours for 5–10 days, dose expressed as sodium fusidate
  - Adult: 250 mg every 12 hours, dose expressed as sodium fusidate
- **By mouth using oral suspension**
  - Child: Apply 3–4 times a day usually for 7 days
  - Adult: Apply 3–4 times a day

**Penicillin-resistant staphylococcal infection including osteomyelitis**
- **Staphylococcal endocarditis in combination with other antibacterials**
  - **By mouth using oral suspension**
    - Child 1–11 months: 15 mg/kg/3 times a day
    - Child 1–4 years: 250 mg 3 times a day
    - Child 5–11 years: 500 mg 3 times a day
    - Child 12–17 years: 750 mg 3 times a day
    - Adult: 750 mg 3 times a day

**Staphylococcal infections due to susceptible organisms**
- **By intravenous infusion**
  - Child (body-weight up to 50 kg): 6–7 mg/kg 3 times a day, dose expressed as sodium fusidate
  - Child (body-weight 50 kg and above): 500 mg 3 times a day, dose expressed as sodium fusidate
  - Adult (body-weight up to 50 kg): 6–7 mg/kg 3 times a day, dose expressed as sodium fusidate
  - Adult (body-weight 50 kg and above): 500 mg 3 times a day, dose expressed as sodium fusidate

**Dose equivalence and conversion**
- **With oral use**
  - Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets. 500 mg of sodium fusidate is equivalent to 480 mg fusidic acid.

### Dosage

**With oral use**
- Fusidic acid may be administered as a single daily dose or divided doses every 8 hours. It is usually given for 5–10 days.

**With intravenous use**
- Fusidic acid is given as an intravenous infusion over 1–2 hours followed by 4–6 hours of continuous infusion. Maximum dose is 750 mg/24 hours.

### Contraindications

- **Hypersensitivity to fusidic acid or any component of the formulation.
- Pre-existing hepatic impairment.
- Pregnancy and breastfeeding.

### Warnings

- **Impaired transport and metabolism of bilirubin**
  - Avoid contact of cream or ointment with eyes.

### Medicinal forms

- **Powder for solution for infusion**
  - Fomicyt (Nordic Pharma Ltd)
    - Fosfomycin (as Fosfomycin sodium) 2 gram: Fomicyt 2g powder for solution for infusion vials | 10 vial (POD) £150.00

### Side-effects

- **Common or very common**
  - Gastro-intestinal disturbances (diarrhoea, nausea, rash, vomiting).

### precautions

- **Renal impairment**
  - With oral use: Avoid oral treatment if eGFR less than 10 mL/minute/1.73 m².
  - With intravenous use: Use intravenous treatment with caution if eGFR 40–80 mL/minute/1.73 m² and consult product literature for dose if eGFR less than 40 mL/minute/1.73 m².

### Monitoring requirements

- With intravenous use: Monitor electrolytes and fluid balance.

### Directions for administration

- **With intravenous use**
  - For intravenous infusion (Fomicyt®), give intermittently in Glucose 5% or 10% or Water for Injections; reconstitute each 2-g vial with 50 mL infusion fluid; give 2 g over 15 minutes.
  - With oral use: Manufacturer advises granules should be taken on an empty stomach (about 2–3 hours before or after a meal), preferably before bedtime and after emptying the bladder. The granules should be dissolved into a glass of water and taken immediately.

### Prescribing and dispensing information

- Doses expressed as fosfomycin base.

### National funding/access decisions

- **Scottish Medicines Consortium (SMC) Decisions**
  - The Scottish Medicines Consortium has advised (February 2015) that fosfomycin (Fomicyt®) is accepted for restricted use within NHS Scotland; initiation should be restricted to microbiologists or infectious disease specialists.
  - The Scottish Medicines Consortium has advised (September 2016) that fosfomycin trometamol (Monuril®) is accepted for use within NHS Scotland for the treatment of acute lower uncomplicated urinary tract infections, caused by pathogens sensitive to fosfomycin in adult and adolescent females and for prophylaxis in diagnostic and surgical transurethral procedures.

### Medicinal forms

- There can be variation in the licensing of different medicines containing the same drug.

### Powder for solution for infusion

- **Electrolytes:** May contain Sodium
  - Fomicyt (Nordic Pharma Ltd)
    - Fosfomycin (as Fosfomycin sodium) 2 gram: Fomicyt 2g powder for solution for infusion vials | 10 vial (POD) £150.00

### Granules

- **CAUTIONARY AND ADVISORY LABELS**
  - May contain Sucrose
    - Fosfomycin (Non-proprietary)
      - Fosfomycin (as Fosfomycin trometamol) 3 gram: Fosfomycin 3g granules sachets | 1 sachet (POD): £75.45
      - Monuril (Zambon S.p.A.)
        - Fosfomycin (as Fosfomycin trometamol) 3 gram: Monuril 3g granules sachets | 1 sachet (POD): £4.86

### Interactions

16-Jun-2017

**INDICATIONS AND DOSE**

**Staphylococcal skin infection**
- **By mouth using tablets**
  - Child 12–17 years: 250 mg every 12 hours for 5–10 days, dose expressed as sodium fusidate
  - Adult: 250 mg every 12 hours for 5–10 days, dose expressed as sodium fusidate
- **By mouth using oral suspension**
  - Child: Apply 3–4 times a day usually for 7 days
  - Adult: Apply 3–4 times a day

**Penicillin-resistant staphylococcal infection including osteomyelitis**
- **Staphylococcal endocarditis in combination with other antibacterials**
  - **By mouth using oral suspension**
    - Child 1–11 months: 15 mg/kg/3 times a day
    - Child 1–4 years: 250 mg 3 times a day
    - Child 5–11 years: 500 mg 3 times a day
    - Child 12–17 years: 750 mg 3 times a day
    - Adult: 750 mg 3 times a day
  - **By mouth using tablets**
    - Child 12–17 years: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections, dose expressed as sodium fusidate
    - Adult: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections, dose expressed as sodium fusidate

**Staphylococcal infections due to susceptible organisms**
- **By intravenous infusion**
  - Child (body-weight up to 50 kg): 6–7 mg/kg 3 times a day, dose expressed as sodium fusidate
  - Child (body-weight 50 kg and above): 500 mg 3 times a day, dose expressed as sodium fusidate
  - Adult (body-weight up to 50 kg): 6–7 mg/kg 3 times a day, dose expressed as sodium fusidate
  - Adult (body-weight 50 kg and above): 500 mg 3 times a day, dose expressed as sodium fusidate

**Dose equivalence and conversion**
- **With oral use**
  - Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets. 500 mg of sodium fusidate is equivalent to 480 mg fusidic acid.

**CAUTIONS**

- **With systemic use**
  - Impaired transport and metabolism of bilirubin
- **With topical use**
  - Avoid contact of cream or ointment with eyes

**CAUTIONS, FURTHER INFORMATION**

**Avoiding resistance**
- **With topical use**
  - To avoid the development of resistance, fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital.

**INTERACTIONS**

- **Appendix 1: fusidic acid**
**SIDE-EFFECTS**
- **Common or very common**
  - With intravenous use: Hepatic disorders - venous intolerance (reduced if given via central vein)
  - With oral use: Abdominal pain - diarrhoea - dyspepsia - nausea - vomiting
  - With systemic use: Dizziness - drowsiness
- **Uncommon**
  - With systemic use: Anorexia - headache - malaise - pruritus - rash - urticaria
- **Rare**
  - With topical use: Hypersensitivity reactions
- **Frequency not known**
  - With intravenous use: Rash

**SIDE-EFFECTS, FURTHER INFORMATION**
- **Hepatic disorders**
  - With systemic use: Elevated liver enzymes, hyperbilirubinaemia and jaundice can occur — these effects are usually reversible following withdrawal of therapy.
- **PREGNANCY**
  - With systemic use: Not known to be harmful; manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING**
  - With systemic use: Present in milk — manufacturer advises caution.
- **HEPATIC IMPAIRMENT**
  - With systemic use: Manufacturer advises caution — monitor liver function periodically during treatment.
- **MONITORING REQUIREMENTS**
  - With systemic use: Manufacturer advises monitor liver function with high doses or on prolonged therapy; monitoring also advised for patients with biliary tract obstruction, those taking potentially hepatotoxic medication, or those taking concurrent medication with a similar excretion pathway.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use: Manufacturer advises for intravenous infusion, give intermittently in Sodium chloride 0.9% or Glucose 5%; reconstitute each vial with 10 mL buffer solution, then add contents of vial to 500 mL infusion fluid to give a solution containing approximately 1 mg/mL. Give requisite dose via a central line over 2 hours (give over at least 6 hours if administered via a large peripheral vein).
- **PRESCRIBING AND DISPENSING INFORMATION**
  - Flavours of oral liquid formulations may include banana and orange.
- **PROFESSIONAL SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
  - May be prescribed as Sodium Fusidate ointment.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - CAUTIONARY AND ADVISORY LABELS 9

        - Price: £3.59 DT price = £3.60

**Ointment**
- **EXCIPIENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), wool fat and related substances including lanolin
  - Fusidin (Sodium fusidate) (LEO Pharma)
    - Sodium fusidate 20 mg per 1 gram: Fusidin 20mg/g ointment | 15 gram
      - Dosage: £2.68 DT price = £2.68 | 30 gram
        - Price: £4.55 DT price = £4.55

### Linezolid

**DRUG ACTION**
- Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including meticillin-resistant *Staphylococcus aureus* (MRSA), and glycopeptide-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is **not** active against common Gram-negative organisms; it must be given in combination with other antibacterials for mixed infections that also involve Gram-negative organisms.

**INDICATIONS AND DOSE**
- **Pneumonia (when other antibacterials e.g. a glycopeptide, such as vancomycin, cannot be used) (initiated under specialist supervision) Complicated skin and soft-tissue infections caused by Gram-positive bacteria, when other antibacterials cannot be used (initiated under specialist supervision)**
  - **BY MOUTH**
    - Adult: 600 mg every 12 hours usually for 10–14 days (maximum duration of treatment 28 days)
  - **BY INTRAVENOUS INFUSION**
    - Adult: 600 mg every 12 hours

**IMPORTANT SAFETY INFORMATION**
- **CHM ADVICE (OPTIC NEUROPATHY)**
  - Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:
    - patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
    - patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
    - visual function should be monitored regularly if treatment is required for longer than 28 days.

**BLOOD DISORDERS**
- Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:
  - receive treatment for more than 10–14 days;
  - have pre-existing myelosuppression;
  - are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
  - have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which...
case intensive monitoring of blood counts and appropriate management should be implemented.

- **CAUTIONS**
  - Acute confusional states - bipolar depression - carcinoid tumour - elderly (increased risk of blood disorders) - history of seizures - phaeochromocytoma - schizophrenia - thyrotoxicosis - uncontrolled hypertension

  - **FURTHER INFORMATION**
    - Close observation 
      - Unless close observation and blood pressure monitoring possible, linezolid should be avoided in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states.

- **INTERACTIONS** ➔ Appendix 1: linezolid

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - **Common or very common** 
      - Diarrhoea - eosinophilia - headache - nausea - taste disturbances - vomiting
    - **Uncommon** 
    - **Rare** 
      - Renal failure - tachycardia - transient ischaemic attacks
    - **Frequency not known** 
      - Anaemia - antibiotic-associated colitis - convulsions - hypotension - lactic acidosis - optic neuropathy reported on prolonged therapy - pancytopenia - peripheral neuropathy reported on prolonged therapy - Stevens-Johnson syndrome - tooth discoloration - toxic epidermal necrolysis

  - **SPECIFIC SIDE-EFFECTS**
    - **Uncommon**
      - With intravenous use 
        - Injection-site reactions
    - **PREGNANCY** 
      - Manufacturer advises use only if potential benefit outweighs risks—no information available.
    - **BREAST FEEDING** 
      - Manufacturer advises avoid—present in milk in animal studies.
    - **HEPATIC IMPAIRMENT** 
      - In severe hepatic impairment manufacturer advises use only if potential benefit outweighs risk.
    - **RENAL IMPAIRMENT** 
      - Manufacturer advises metabolites may accumulate if eGFR less than 30 mL/minute/1.73 m².
    - **MONITORING REQUIREMENTS** 
      - Monitor full blood count (including platelet count) weekly.
    - **DIRECTIONS FOR ADMINISTRATION**
      - With intravenous use 
        - Infusion to be administered over 30–120 minutes.
    - **PRESCRIBING AND DISPENSING INFORMATION** 
      - Flavours of oral liquid formulations may include orange.
    - **PATIENT AND CARER ADVICE** 
      - Patients should be advised to read the patient information leaflet given with linezolid.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Infusion**
    - **EXCIPIENTS:** May contain Asparagine
    - **ELECTROLYTES:** May contain Sodium
    - **Linezolid (Non-proprietary)**
      - Linezolid 2 mg per 1 ml Linezolid 600mg/300ml infusion bags | 10 bag (Pom) £445.00 (Hospital only)
    - **Zyvox (Pfizer Ltd)**
      - Linezolid 2 mg per 1 ml Zyvox 600mg/300ml infusion bags | 10 bag (Pom) £445.00

- **DRUG ACTION**
  - Tedizolid is an oxazolidinone antibacterial, which inhibits bacterial protein synthesis.

- **INDICATIONS AND DOSE**
  - **Treatment of acute bacterial skin and skin structure infections**
    - By intravenous infusion, or by mouth
    - Adult: 200 mg once daily for 6 days, patients should be switched from the intravenous to the oral route when clinically appropriate

- **PRECAUTIONS**
  - Neutropenia—limited clinical experience - patients aged 75 years and over—limited clinical experience

  - **INTERACTIONS** ➔ Appendix 1: tedizolid

- **SIDE-EFFECTS**
  - **Common or very common** 
    - Diarrhoea - dizziness - headache - nausea - pruritis - vomiting
  - **Uncommon**
  - **Frequency not known** 
    - Myelosuppression (reversible on discontinuation of treatment)

- **CONCEPTION AND CONTRACEPTION**
  - Manufacturer recommends effective contraception in women of childbearing potential; an additional method of contraception is advised in women taking hormonal contraceptives—effectiveness may be reduced.

- **PREGNANCY**
  - Manufacturer advises avoid—foetal developmental toxicity in animal studies.

- **BREAST FEEDING**
  - Manufacturer advises avoid—present in milk in animal studies.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion (Sivextro®) give intermittently in Sodium Chloride 0.9%; reconstitute each 200 mg vial with 4 mL Water for Injections, then dilute reconstituted solution in 250 mL sodium chloride 0.9%; give over approx. 1 hour.

- **PATIENT AND CARER ADVICE**
  - Optic neuropathy 
    - Although neuropathy (peripheral and optic) has not been reported in patients treated with tedizolid, manufacturer advises patients and carers are warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately; patients should be evaluated promptly, and referred to an ophthalmologist if necessary.
Missed doses
Manufacturer advises that if a dose is more than 16 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks
Patients and carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness and fatigue.

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (August 2015) that tedizolid (Sivextro®) is accepted for restricted use within NHS Scotland as an alternative oxazolidinone antibacterial for the treatment of acute bacterial skin and skin structure infections caused by Gram-positive *Staphylococcus aureus* (specifically methicillin-resistant *Staphylococcus aureus* [MRSA] isolates), on the specific advice of local microbiologists or specialists in infectious disease.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion
- Sivextro (Merck Sharp & Dohme Ltd) ▼
  - Tedizolid phosphate 200 mg Sivextro 200mg powder for concentrate for solution for infusion vials | 6 vial [Link] £862.00

Tablet
- Sivextro (Merck Sharp & Dohme Ltd) ▼

Trimethoprim

INDICATIONS AND DOSE
Urinary-tract infections | Respiratory tract infections
- **BY MOUTH**
  - Child 4–5 weeks: 4 mg/kg twice daily (max. per dose 200 mg)
  - Child 6 weeks–5 months: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 25 mg twice daily
  - Child 6 months–5 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 50 mg twice daily
  - Child 6–11 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 100 mg twice daily
  - Child 12–17 years: 200 mg twice daily
  - Adult: 200 mg twice daily

Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)
- **BY MOUTH**
  - Child 4–5 weeks: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night
  - Child 6 weeks–5 months: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 12.5 mg once daily, dose to be taken at night
  - Child 6 months–5 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 25 mg once daily, dose to be taken at night
  - Child 6–11 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 50 mg once daily, dose to be taken at night
  - Child 12–17 years: 100 mg once daily, dose to be taken at night
  - Adult: 100 mg once daily, dose to be taken at night

Treatment of mild to moderate *Pneumocystis jirovecii* (Pneumocystis carinii) pneumonia in patients who cannot tolerate co-trimoxazole (in combination with dapsone)
- **BY MOUTH**
  - Child: 5 mg/kg every 6–8 hours
  - Adult: 5 mg/kg every 6–8 hours

Acne resistant to other antibacterials
- **BY MOUTH**
  - Adult: 300 mg twice daily

Prostatitis
- **BY MOUTH**
  - Adult: (consult product literature)

**SHigellosis** | **Invasive salmonella infection**
- **BY MOUTH**
  - Adult: (consult product literature)

CONTRA-INDICATIONS Blood dyscrasias

CAUTIONS Elderly · acute porphyrias p. 969 · predisposition to folate deficiency

INTERACTIONS → Appendix 1: trimethoprim

SIDE-EFFECTS
- Rare Allergic reactions · anaphylaxis · angioedema · erythema multiforme · photosensitivity · toxic epidermal necrolysis
- Frequency not known Aseptic meningitis · depression of haematopoiesis · gastro-intestinal disturbances · hyperkalaemia · nausea · pruritus · rashes · uveitis (in adults) · vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Trimethoprim has side-effects similar to co-trimoxazole but they are less severe and occur less frequently.

PREGNANCY Teratogenic risk in first trimester (folate antagonist). Manufacturers advise avoid during pregnancy.

BREAST FEEDING Present in milk—short-term use not known to be harmful.

RENAL IMPAIRMENT
- In adults Use half normal dose after 3 days if eGFR 15–30 mL/minute/1.73 m². Use half normal dose if eGFR less than 15 mL/minute/1.73 m².
- In children Use half normal dose after 3 days if estimated glomerular filtration rate 15–30 mL/minute/1.73 m². Use half normal dose if estimated glomerular filtration rate less than 15 mL/minute/1.73 m². Monitor plasma-trimethoprim concentration if eGFR less than 10 mL/minute/1.73 m².

MONITORING REQUIREMENTS Manufacturer recommends blood counts on long-term therapy (but evidence of practical value unsatisfactory).

PATIENT AND CARER ADVICE
Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

Medicines for Children leaflet: Trimethoprim for bacterial infections www.medicinesforchildren.org.uk/trimethoprim-for-bacterial-infections

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral suspension**

CAUTIONARY AND ADVISORY LABELS 9
- **Trimethoprim (Non-proprietary)**
  - Trimethoprim 10 mg per 1 mL Trimethoprim 50mg/5ml oral suspension sugar free sugar-free | 100 mL [Link] £2.69 DT price = £2.12
- **Monotrim** (Chemidex Pharma Ltd)
  - Trimethoprim 10 mg per 1 mL Monotrim 50mg/5ml oral suspension sugar-free | 100 mL [Link] £1.77 DT price = £2.12
Rifabutin

- **INDICATIONS AND DOSE**
  
  **Prophylaxis of Mycobacterium avium complex infections in immunosuppressed patients with low CD4 count**
  
  - **BY MOUTH**
  - Adult: 300 mg once daily, also consult product literature

- **Treatment of non-tuberculous mycobacterial disease, in combination with other drugs**
  
  - **BY MOUTH**
  - Adult: 450–600 mg once daily for up to 6 months after cultures negative

- **Treatment of pulmonary tuberculosis, in combination with other drugs**
  
  - **BY MOUTH**
  - Adult: 150–450 mg once daily for at least 6 months

- **CAUTIONS**
  
  Acute porphyrias p. 969 · discolours soft contact lenses

- **INTERACTIONS** → Appendix 1: rifabutin

- **SIDE-EFFECTS**
  
  - **Common or very common** Anaemia · blood disorders · leucopenia · myalgia · nausea · pyrexia · rash · thrombocytopenia
  
  - **Uncommon** Arthralgia · body secretions coloured orange-red · bronchospasmy · corneal deposits · eosinophilia · hypersensitivity reactions · jaundice · raised liver enzymes · saliva coloured orange-red · skin coloured orange-red · urine coloured orange-red · uveitis · vomiting

- **Rare** Haemolysis · Frequency not known Chest pain · dyspnoea · hepatitis · influenza-like symptoms

- **SIDE-EFFECTS, FURTHER INFORMATION**
  
  Discontinue permanently if serious side-effects develop.

- **ALLERGY AND CROSS-SENSITIVITY**
  
  Contra-indicated in patients with rifamycin hypersensitivity.

- **CONCEPTION AND CONTRACEPTION**
  
  Important Rifabutin induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced; alternative family planning advice should be offered.

- **PREGNANCY**
  
  Manufacturer advises avoid—no information available.

- **BREAST FEEDING**
  
  Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT**
  
  Reduce dose in severe impairment. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.

- **RENAL IMPAIRMENT**
  
  Use half normal dose if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  
  Renal function should be checked before treatment. Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, hepatic function should be monitored on prolonged therapy.

  - Blood counts should be monitored on prolonged therapy.
  - Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months. Blood counts should also be monitored in these patients.

- **PRESCRIBING AND DISPENSING INFORMATION**
  
  If treatment interruption occurs, re-introduce with low dosage and increase gradually.

- **PATIENT AND CARER ADVICE**
  
  Soft contact lenses. Patients or their carers should be advised that rifabutin discolours soft contact lenses.

  Hepatic disorders. Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  **Capsule**
  
  **CAUTIONARY AND ADVISORY LABELS 8, 14**
  
  - **Rifabutin (Pfizer Ltd)**
    - Rifabutin 150 mg Mycobutin 150 mg capsules | 30 capsule £9.08

Rifaximin

- **DRUG ACTION**
  
  Rifaximin is a rifamycin that is poorly absorbed from the gastro-intestinal tract, and, therefore, should not be used to treat systemic infections.

- **INDICATIONS AND DOSE**
  
  **Travellers’ diarrhoea that is not associated with fever, bloody diarrhoea, blood or leucocytes in the stool, or 8 or more unformed stools in the previous 24 hours**
  
  - **BY MOUTH**
    - Adult: 200 mg every 8 hours for 3 days

  - **Reduction in recurrence of hepatic encephalopathy**
    - **BY MOUTH**
      - Adult: 550 mg twice daily

- **CONTRA-INDICATIONS**
  
  Intestinal obstruction

- **INTERACTIONS** → Appendix 1: rifaximin

- **SIDE-EFFECTS**
  
  - **Common or very common** Abdominal pain · depression · diarroea · dizziness · dysphoria · flatulence · headache · muscle spasm · nausea · pruritis · rash · vomiting
  
  - **Uncommon** Anorexia · antibiotic-associated colitis · anxiety · blood disorders · convulsions · dry mouth · dysuria · glcosuria · hyperkalaemia · hypoaesthesia · influenza-like symptoms · memory impairment · paraesthesia · peripheral oedema · polymenorrhoea · polyuria · sleep disturbances · taste disturbances

- **Rare** Blood pressure changes · constipation

- **Frequency not known**
  
  Syncope

- **ALLERGY AND CROSS-SENSITIVITY**
  
  Contra-indicated if history of rifamycin hypersensitivity.

- **PREGNANCY**
  
  Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING**
  
  Unlikely to be present in milk in significant amounts, but manufacturer advises avoid.

- **HEPATIC IMPAIRMENT**
  
  Manufacturer advises caution when used for hepatic encephalopathy in patients with severe hepatic impairment.
**PRESCRIBING AND DISPENSING INFORMATION** Not recommended for diarrhea associated with invasive organisms such as Campylobacter and Shigella.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Rifaximin for preventing episodes of overt hepatic encephalopathy (March 2015) NICE TA337

Rifaximin is recommended, within its marketing authorisation, as an option for reducing the recurrence of episodes of overt hepatic encephalopathy in adults. www.nice.org.uk/TA337

### 2.1 Anthrax

**Anthrax**

**Treatment and post-exposure prophylaxis**

*Inhalation or gastro-intestinal anthrax* should be treated initially with either ciprofloxacin p. 527 or, in patients over 12 years, doxycycline p. 534 [unlicensed indication] combined with one or two other antibacterials (such as amoxicillin p. 518, benzylpenicillin sodium p. 517, chloramphenicol p. 537, clarithromycin p. 508, clindamycin p. 506, imipenem with cilastatin p. 495, rifampicin p. 549 [unlicensed indication], and vancomycin p. 505). When the condition improves and the sensitivity of the *Bacillus anthracis* strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

*Cutaneous anthrax* should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] for 7 days. Treatment may be switched to amoxicillin if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for *post-exposure prophylaxis*. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against anthrax may allow the duration of antibacterial prophylaxis to be shortened.

---

### 2.2 Leprosy

**Leprosy**

**Management**

Advice from a member of the Panel of Leprosy Opinion is essential for the treatment of leprosy (Hansen’s disease).

Details can be obtained from the Hospital for Tropical Diseases, London (telephone (020) 3456 7890).

The World Health Organization has made recommendations to overcome the problem of dapsone p. 545 resistance and to prevent the emergence of resistance to other antileprotic drugs. Drugs recommended are dapsone, rifampicin p. 549, and clofazimine below. Other drugs with significant activity against *Mycobacterium leprae* include doxycycline p. 536, minocycline p. 535 and clarithromycin p. 508, but none of these are as active as rifampicin; at present they should be reserved as second-line drugs for leprosy.

A three-drug regimen is recommended for *multibacillary leprosy* (lepromatous, borderline-lepromatous, and borderline leprosy) and a two-drug regimen for *paucibacillary leprosy* (borderline-tuberculoid, tuberculoid, and indeterminate).

Multibacillary leprosy should be treated with a combination of rifampicin, dapsone and clofazimine for at least 2 years. Treatment should be continued unchanged during both type I (reversal) or type II (erythema nodosum leprosum) reactions. During reversal reactions neuritic pain or weakness can herald the rapid onset of permanent nerve damage. Treatment with prednisolone p. 639 should be instituted at once. Mild type II reactions may respond to aspirin. Severe type II reactions may require corticosteroids; thalidomide p. 887 [unlicensed] is also useful in patients who have become corticosteroid dependent, but it should be used only under *specialist supervision*. Thalidomide is teratogenic and, therefore, contra-indicated in pregnancy; it must not be given to women of child-bearing potential unless they comply with a pregnancy prevention programme. Increased doses of clofazimine are also useful.

Paucibacillary leprosy should be treated with rifampicin and dapsone for 6 months. If treatment is interrupted the regimen should be recommenced where it was left off to complete the full course.

Neither the multibacillary nor the paucibacillary antileprosy regimen is sufficient to treat tuberculosis.

**ANTIMYCOBACTERIALS**

**Clofazimine**

**INDICATIONS AND DOSE**

*Multibacillary leprosy in combination with rifampicin and dapsone (3-drug regimen) (administered on expert advice)*

- **BY MOUTH**
  - Adult: 300 mg once a month, to be administered under supervision and 50 mg daily, to be self-administered, alternatively 300 mg once a month, to be administered under supervision and 100 mg once daily on alternate days, to be self-administered

*Lepromatous lepra reactions (administered on expert advice)*

- **BY MOUTH**
  - Adult: 300 mg daily for max. 3 months

*Severe type II (erythema nodosum leprosum) reactions (administered on expert advice)*

- **BY MOUTH**
  - Adult: 100 mg 3 times a day for one month, subsequent dose reductions are required, may take 4–6 weeks to attain full effect

**CAUTIONS** Avoid if persistent abdominal pain and diarrhea - may discolor soft contact lenses

**INTERACTIONS** → Appendix 1: clofazimine

**SIDE-EFFECTS** Abdominal pain - acne-like eruptions - anorexia - bowel obstruction - brownish-black discoloration of lesions and skin including areas exposed...
to light • dimmed vision • dry eyes • dry skin • elevation of
blood sugar • eosinophilic enteropathy • headache •
lymphadenopathy • macular corneal pigmentation •
nausea • photosensitivity • pruritus • rash • red discoloration of
body fluids • red discoloration of faeces • red
discoloration of urine • reversible hair discoloration •
splenic infarction • subepithelial corneal pigmentation •
tiredness • vomiting (hospitalise if persistent) • weight loss

- PREGNANCY Use with caution.
- BREAST FEEDING May alter colour of milk; skin
discoloration of infant.
- HEPATIC IMPAIRMENT Use with caution.
- RENAL IMPAIRMENT Use with caution.

- MEDICINAL FORMS
There can be variation in the licensing of different medicines
containing the same drug. Forms available from special-order
manufacturers include: capsule

Capsule

Dapsone

- INDICATIONS AND DOSE
Multibacillary leprosy in combination with rifampicin and
clofazimine (3-drug regimen) | Paucibacillary leprosy in
combination with rifampicin (2-drug regimen)
  • BY MOUTH
  • Adult (body-weight up to 35 kg): 50 mg daily,
    alternatively 1–2 mg/kg daily, may be self-
    administered
  • Adult (body-weight 35 kg and above): 100 mg daily, may be
    self-administered

Dermatitis herpetiformis
  • BY MOUTH
  • Adult: (consult product literature or local protocols)

Treatment of mild to moderate Pneumocystis jirovecii
(Pneumocystis carinii) pneumonia (in combination with
trimethoprim)
  • BY MOUTH
  • Adult: 100 mg once daily

Prophylaxis of Pneumocystis jirovecii (Pneumocystis
carinii) pneumonia
  • BY MOUTH
  • Adult: 100 mg daily

- UNLICENSED USE Not licensed for treatment of
  pneumocystis (P. jirovecii) pneumonia.
- CAUTIONS Anaemia (treat severe anaemia before starting)
  • Avoid in acute porphyrinas p. 969 • cardiac disease • G6PD
deficiency • pulmonary disease • susceptibility to
  haemolysis
- INTERACTIONS ➔ Appendix 1: dapsone
- SIDE-EFFECTS
  • Rare Stevens-Johnson syndrome • toxic epidermal
    necrolysis
  • Frequency not known Agranulocytosis • allergic dermatitis
    • anorexia • dapsone syndrome • haemolysis • headache •
    hepatitis • insomnia • methaemoglobinaemia • nausea •
    neuropathy • psychosis • tachycardia • vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Side-effects are dose-related and uncommon at doses used
for leprosy.

- Dapsone syndrome If dapsone syndrome occurs (rash with
  fever and eosinophilia)—discontinue immediately (may
  progress to exfoliative dermatitis, hepatitis,
  hypoalbuminaemia, psychosis and death).

- PREGNANCY Folic acid p. 937 (higher dose) should be
given to mother throughout pregnancy; neonatal
  haemolysis and methaemoglobinaemia reported in third
  trimester.
- BREAST FEEDING Haemolytic anaemia; although
  significant amount in milk, risk to infant very small unless
  infant is G6PD deficient.
- PATIENT AND CARER ADVICE
  Blood disorders On long-term treatment, patients and their
  carers should be told how to recognise signs of blood
  disorders and advised to seek immediate medical attention
  if symptoms such as fever, sore throat, rash, mouth ulcers,
  purpura, bruising or bleeding develop.

- MEDICINAL FORMS
There can be variation in the licensing of different medicines
containing the same drug. Forms available from special-order
manufacturers include: oral suspension, oral solution

2.3 Lyme disease

Lyme disease

Treatment
Doxycycline p. 534, amoxicillin p. 518 [unlicensed
indication] or cefuroxime p. 498 (as cefuroxime axetil) are
the antibacterials of choice for early Lyme disease or Lyme
arthritis. If these antibacterials are contra-indicated, a
macrolide (e.g. clarithromycin p. 508) can be used for early
Lyme disease. Intravenous administration of ceftriaxone
p. 501, cefotaxime p. 500, or benzylpenicillin sodium p. 517
is recommended for Lyme disease associated with cardiac or
neurological complications. The duration of treatment is
usually 2–4 weeks; Lyme arthritis may require further
treatment.

2.4 Methicillin-resistant staphylococcus aureus

MRSA

Management
Infection from Staphylococcus aureus strains resistant to
meticillin [now discontinued] (meticillin-resistant Staph.
aureus, MRSA) and to flucloxacillin p. 523 can be difficult
to manage. Treatment is guided by the sensitivity of the
infecting strain.

Rifampicin p. 549 or fusidic acid p. 539 should not be used
alone because resistance may develop rapidly. A
tetracycline alone or a combination of rifampicin and
fusidic acid can be used for skin and soft-tissue infections
caused by MRSA; clindamycin p. 506 alone is an alternative.
A glycopeptide (e.g. vancomycin p. 505) can be used for
severe skin and soft-tissue infections associated with MRSA;
if a glycopeptide is unsuitable, linezolid p. 540 can be used
on expert advice. As linezolid is not active against Gram-
negative organisms, it can be used for mixed skin and soft-
tissue infections only when other treatments are not
available; linezolid must be given with other antibacterials if
the infection also involves Gram-negative organisms. A
combination of a glycopeptide and fusidic acid or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial. Tigecycline p. 536 and daptomycin p. 537 are licensed for the treatment of complicated skin and soft-tissue infections involving MRSA.

A tetracycline or clindamycin can be used for bronchiectasis caused by MRSA. A glycopeptide can be used for pneumonia associated with MRSA; if a glycopeptide is unsuitable, linezolid can be used on expert advice. Linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms. A tetracycline can be used for urinary-tract infections caused by MRSA; trimethoprim p. 542 or nitrofurantoin p. 557 are alternatives. A glycopeptide can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A glycopeptide can be used for septicaemia associated with MRSA. See the management of endocarditis, osteomyelitis, or septic arthritis associated with MRSA.

Prophylaxis with vancomycin or teicoplanin p. 504 (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient’s MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

See eradication of nasal carriage of MRSA in Nose p. 1098.

## 2.5 Tuberculosis

### Tuberculosis

#### Treatment phases, overview

Active tuberculosis is treated in two phases—an initial phase using four drugs and a continuation phase using two drugs in fully sensitive cases. Treatment requires specialised knowledge and supervision, particularly where the disease involves resistant organisms or non-respiratory organs.

There are two regimens recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen should be used; the two regimens should not be used concurrently. Compliance with therapy is a major determinant of its success.

#### Initial phase

The concurrent use of four drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as fixed-dose, combination preparations unless one of the components cannot be given because of resistance or intolerance. The treatment of choice for the initial phase is the daily use of rifampicin p. 549, ethambutol hydrochloride p. 554, pyrazinamide p. 555 and isoniazid p. 556 with pyridoxine hydrochloride p. 988 for prophylaxis of isoniazid-induced neuropathy; modified according to drug susceptibility testing. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for two months. Where a positive culture for M. tuberculosis has been obtained, but susceptibility results are not available after two months, treatment with rifampicin, ethambutol hydrochloride, isoniazid and pyrazinamide (with pyridoxine hydrochloride) should be continued until full susceptibility is confirmed, even if this is for longer than two months.

Streptomycin p. 492 is rarely used in the UK but it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced, or when patients cannot tolerate standard treatment.

#### Continuation phase

After the initial phase, daily treatment is continued for a further four months with rifampicin and isoniazid (preferably given as a combination preparation) with pyridoxine hydrochloride. Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

#### Unsupervised treatment

The unsupervised treatment regimen should be used for patients who are likely to take antituberculosis drugs reliably without supervision. Patients who are unable or unlikely to comply with daily administration of therapy should be treated with the regimen described under Supervised Treatment.

#### Pregnancy and breast-feeding

The standard unsupervised six month treatment regimen may be used during pregnancy. Streptomycin should not be given in pregnancy. The standard unsupervised six month treatment regimen may be used during breast-feeding.

#### Supervised treatment

Drug administration should be fully supervised (directly observed therapy, DOT) in patients who cannot comply reliably with the treatment regimen. If daily directly observed therapy is not possible, a supervised dosing schedule of three times a week should be considered. Regimens with a dosing schedule of fewer than three times a week should not be used.

Directly observed therapy should be offered to patients who:

- have a history of non-adherence;
- have previously been treated for tuberculosis;
- are in denial of the tuberculosis diagnosis;
- have multidrug-resistant tuberculosis;
- have a major psychiatric or cognitive disorder;
- have a history of homelessness, drug or alcohol misuse;
- are in prison, or have been in the past 5 years;
- are too ill to self-administer treatment;
- request directly observed therapy.

#### Immunocompromised patients

Multi-resistant Mycobacterium tuberculosis may be present in immunocompromised patients. The organism should always be cultured to confirm its type and drug sensitivity. Confirmed M. tuberculosis infection sensitive to first-line drugs should be treated with a standard six month regimen; after completing treatment, patients should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed.

Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis for patients who are HIV-positive (see also Latent tuberculosis below); care is required in choosing the regimen and in avoiding potentially serious interactions. Starting antiretroviral treatment in the first two months of antituberculosis treatment increases the risk of immune reconstitution syndrome. Treatment for tuberculosis should not routinely exceed six months in patients who are HIV-positive, unless the tuberculosis has central nervous system involvement (in which case
### Recommended dosage for standard unsupervised 6-month treatment

Downloaded from www.medicalbr.com
treatment should not routinely extend beyond twelve months). Infection may also be caused by other mycobacteria e.g. M. avium complex, in which case specialist advice on management is needed.

**Extrapulmonary tuberculosis**

**Central nervous system tuberculosis**

Patients with active central nervous system tuberculosis should be offered treatment with rifampicin, ethambutol hydrochloride, isoniazid and pyrazinamide (with pyridoxine hydrochloride for prophylaxis of isoniazid-induced neuropathy) for two months. After completion of the initial treatment phase, rifampicin and isoniazid (with pyridoxine hydrochloride) should be continued for a further ten months. Treatment for tuberculosis meningitis should be offered if clinical signs and laboratory findings are consistent with the diagnosis, even if a rapid diagnostic test is negative.

An initial high dose of dexamethasone p. 635 or prednisolone p. 639 should be started at the same time as antituberculosis therapy, and then slowly withdrawn over 4–8 weeks.

Referral for surgery should be considered only in patients who have raised intracranial pressure.

**Pericardial tuberculosis**

An initial high dose of oral prednisolone should be offered to patients with active pericardial tuberculosis at the same time as initiation of antituberculosis therapy; it should then be slowly withdrawn over 2–3 weeks.

**Latent tuberculosis**

Clinicians should be aware that some patients with latent tuberculosis are at increased risk of developing active tuberculosis (such as patients who are HIV-positive, diabetic or receiving treatment with a tumour necrosis factor alpha inhibitor). These patients should be advised of the risks and symptoms of active tuberculosis.

Note: the risk of adverse events to chemoprophylaxis in patients aged over 35 years with a risk of hepatotoxicity is likely to be greater than the potential benefit of treating latent disease. When indicated, drug treatment should only be offered to patients aged 35–65 years if hepatotoxicity is not a concern. Treatment for latent tuberculosis is not usually indicated in patients over 65 years.

**Close contacts**

Anyone aged under 65 years who is a close contact (prolonged, frequent or intense contact, e.g. household contacts or partners) of a person with pulmonary or laryngeal tuberculosis should be tested for latent tuberculosis. Chemoprophylaxis should be offered to all patients aged younger than 65 years, with evidence of latent tuberculosis if the close contact has suspected-infectious or confirmed-active pulmonary or laryngeal drug-sensitive tuberculosis.

**Immunocompromised**

Patients who are immunocompromised, such as those with HIV or who have had a solid organ or allogeneic stem cell transplant, should be tested for latent tuberculosis using an appropriate method. Patients who test positive should then be assessed for active disease, and if negative, offered treatment for latent tuberculosis.

**Healthcare workers**

New NHS employees who are new entrants from a high incidence country should be offered appropriate testing for latent tuberculosis; those who are not new entrants from a high incidence country, but who will be in contact with patients or clinical materials should be offered appropriate testing for latent tuberculosis if prior BCG vaccination cannot be verified (see also BCG vaccine under Vaccines p. 1190). Those who test positive should then be assessed for active disease, and if negative, offered treatment for latent tuberculosis.

For healthcare workers who are immunocompromised, follow standard advice for testing and treatment (see Immunocompromised above).

**Chemoprophylaxis for latent tuberculosis**

Chemoprophylaxis involves use of either isoniazid p. 554 (with pyridoxine hydrochloride p. 988) alone for six months (recommended if interactions with rifamycins are a concern) or rifampicin p. 549 and isoniazid (with pyridoxine hydrochloride) for three months (recommended when hepatotoxicity is a concern).

Choice of regimen is dependent on clinical factors, including age, risk of hepatotoxicity and possible drug interactions. Testing for HIV, hepatitis B and hepatitis C should be offered before starting antituberculosis treatment as this may affect choice of therapy.

Patients with severe liver disease should be treated under the care of a specialist team; careful monitoring of liver function is necessary in patients with non-severe liver disease, abnormal liver function, or who misuse alcohol or drugs.

See advice on immunisation against tuberculosis under Vaccines p. 1190.

**Treatment failure**

Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the patient. Monthly tablet counts and urine examination (rifampicin imparts an orange-red coloration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be supervised by a specialist physician.

**Treatment interruptions**

A break in antituberculosis treatment of at least two weeks (during the initial phase) or missing more than 20% of prescribed doses is classified as treatment interruption. Re-establishing treatment appropriately following interruptions is key to ensuring treatment success without relapse, drug resistance or further adverse events. If an adverse reaction recurs upon re-introducing a particular drug, do not give that drug in future regimens and consider extending the total regimen accordingly.

**Treatment interruptions due to drug-induced hepatotoxicity**

Following treatment interruption due to drug-induced hepatotoxicity, all potential causes of hepatotoxicity should be investigated. Once hepatic function has recovered, antituberculosis therapy should be sequentially reintroduced at previous full doses over a period of no more than ten days, initially with ethambutol hydrochloride p. 554 and either isoniazid (with pyridoxine hydrochloride) or rifampicin.

In patients with severe or highly infectious tuberculosis who need to interrupt the standard regimen, consider continuing treatment with at least two drugs with low risk of hepatotoxicity, such as ethambutol hydrochloride and streptomycin p. 492 (with or without a quinolone, such as levofloxacin p. 528 or moxifloxacin p. 529), with ongoing monitoring by a liver specialist.

**Treatment interruptions due to cutaneous reactions**

If a patient with severe or highly infectious tuberculosis has a cutaneous reaction, consider continuing treatment with a combination of at least two drugs with low risk for causing cutaneous reactions, such as ethambutol hydrochloride and streptomycin, with monitoring by a dermatologist.
Antituberculosis drugs
Isoniazid is cheap and highly effective. Like rifampicin it should always be included in any antituberculosis regimen unless there is a specific contra-indication.
Rifampicin, a rifamycin, is a key component of any antituberculosis regimen. Like isoniazid it should always be included unless there is a specific contra-indication.
During the first two months ('initial phase') of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease.
On intermittent treatment six toxicity syndromes have been recognised—influenza-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20–30% of patients.
Rifabutin p. 543, another rifamycin, is indicated for prophylaxis against M. avium complex infections in patients with a low CD4 count; it is also licensed for the treatment of non-tuberculous mycobacterial disease and pulmonary tuberculosis.
Pyrazinamide p. 555 is a bactericidal drug only active against intracellular dividing forms of Mycobacterium tuberculosis; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against M. bovis.
Ethambutol hydrochloride is included in a treatment regimen if isoniazid resistance is suspected; it can be omitted if the risk of resistance is low.
Streptomycin [unlicensed] is now rarely used in the UK except for resistant organisms.
Drug-resistant tuberculosis
Drug-resistant tuberculosis should be treated by a specialist physician with experience in such cases, and where appropriate facilities for infection-control exist. Multidrug-resistant tuberculosis (resistance to isoniazid and rifampicin, with or without any other resistance) requires treatment with at least six antituberculosis drugs to which the mycobacterium is likely to be sensitive. Testing for resistance to second-line drugs is recommended and treatment should be modified according to susceptibility. The risk of resistance is minimised by ensuring therapy is administered in the correct dose and combination for the prescribed duration.
Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include aminosalicylic acid p. 552, amikacin p. 491, capreomycin p. 553, cycloserine p. 553, newer macrolides (e.g. azithromycin p. 507 and clarithromycin p. 508), moxifloxacin and prothionamide (prothionamide; no longer on UK market). Bedaquiline p. 552 and delamanid p. 553 are licensed for the treatment of multiple-drug resistant pulmonary tuberculosis. Bedaquiline has a long half-life.
Single drug-resistant tuberculosis
For single drug-resistance the following treatment regimens are recommended:

Resistance to isoniazid:
- First two months (initial phase): rifampicin, pyrazinamide and ethambutol hydrochloride
- Continue with (continuation phase): rifampicin and ethambutol hydrochloride for seven months (up to ten months for extensive disease)

Resistance to pyrazinamide:
- First two months (initial phase): rifampicin, ethambutol hydrochloride and isoniazid (with pyridoxine hydrochloride)
- Continue with (continuation phase): rifampicin and isoniazid (with pyridoxine hydrochloride) for seven months

Resistance to ethambutol hydrochloride:
- First two months (initial phase): rifampicin, pyrazinamide and isoniazid (with pyridoxine hydrochloride)
- Continue with (continuation phase): rifampicin and isoniazid (with pyridoxine hydrochloride) for four months

Resistance to rifampicin below:
- Offer treatment with at least six antituberculosis drugs to which the mycobacterium is likely to be sensitive.

Management of tuberculosis in children
Children are given isoniazid p. 554, rifampicin, pyrazinamide p. 555, and ethambutol hydrochloride p. 554 for the first two months followed by isoniazid and rifampicin during the next four months. However, care is needed in young children receiving ethambutol hydrochloride because of the difficulty in testing eyesight and in obtaining reports of visual symptoms.

ANTIMYCOBACTERIALS › RIFAMYCINS

Rifampicin

- INDICATIONS AND DOSE
  - Brucellosis in combination with other antibiotics | Legionnaires disease in combination with other antibiotics | Serious staphylococcal infections in combination with other antibiotics
    - BY MOUTH, OR BY INTRAVENOUS INFUSION
      - Child 1–11 months: 5–10 mg/kg twice daily
      - Child 1–7 years: 10 mg/kg twice daily (max. per dose 600 mg)
      - Adult: 0.6–1.2 g daily in 2–4 divided doses
  - Endocarditis in combination with other drugs
    - BY MOUTH, OR BY INTRAVENOUS INFUSION
      - Adult: 0.6–1.2 g daily in 2–4 divided doses
  - Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)
    - BY MOUTH
      - Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
      - Adult: 600–900 mg 3 times a week for 6 months (initial and continuation phases)
  - Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)
    - BY MOUTH
      - Child (body-weight up to 50 kg): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day
      - Child (body-weight 50 kg and above): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day
      - Adult (body-weight up to 50 kg): 450 mg once daily for 6 months (initial and continuation phases)
      - Adult (body-weight 50 kg and above): 600 mg once daily for 6 months (initial and continuation phases)
  - Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, in combination with isoniazid
    - BY MOUTH
      - Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg daily for 3 months; maximum 450 mg per day
      - Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg daily for 3 months; maximum 600 mg per day

continued →
 Child 12-17 years (body-weight up to 50 kg): 450 mg daily for 3 months  
 Child 12-17 years (body-weight 50 kg and above): 600 mg daily for 3 months  
 Adult (body-weight up to 50 kg): 450 mg daily for 3 months  
 Adult (body-weight 50 kg and above): 600 mg daily for 3 months

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant

**BY MOUTH**
- Child 1 month-11 years (body-weight up to 50 kg): 15 mg/kg daily for 6 months; maximum 450 mg per day  
- Child 1 month-11 years (body-weight 50 kg and above): 15 mg/kg daily for 6 months; maximum 600 mg per day  
- Child 12-17 years (body-weight up to 50 kg): 450 mg daily for 6 months  
- Child 12-17 years (body-weight 50 kg and above): 600 mg daily for 6 months

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant and under 35 years

**BY MOUTH**
- Adult 18-34 years (body-weight up to 50 kg): 450 mg daily for 6 months  
- Adult 18-34 years (body-weight 50 kg and above): 600 mg daily for 6 months

Prevention of secondary case of Haemophilus influenzae type b disease

**BY MOUTH**
- Child 1-2 months: 10 mg/kg once daily for 4 days  
- Child 3 months-11 years: 20 mg/kg once daily (max. per dose 600 mg) for 4 days  
- Child 12-17 years: 600 mg once daily for 4 days  
- Adult: 600 mg once daily for 4 days

Prevention of secondary case of meningococcal meningitis

**BY MOUTH**
- Child 1-11 months: 5 mg/kg every 12 hours for 2 days  
- Child 1-11 years: 10 mg/kg every 12 hours (max. per dose 600 mg), for 2 days  
- Child 12-17 years: 600 mg every 12 hours for 2 days  
- Adult: 600 mg every 12 hours for 2 days

Multibacillary leprosy in combination with dapsone and clofazimine (3-drug regimen) Paucibacillary leprosy in combination with dapsone (2-drug regimen)

**BY MOUTH**
- Adult (body-weight up to 35 kg): 450 mg once a month, supervised administration  
- Adult (body-weight 35 kg and above): 600 mg once a month, supervised administration

**UNLICENSED USE** Not licensed for use in children for pruritus due to cholestasis.

**CONTRA-INDICATIONS** Acute porphyrias p. 969 · jaundice

**CAUTIONS** Discourages soft contact lenses

**INTERACTIONS** → Appendix 1: rifampicin

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Acute renal failure · adrenal insufficiency · alterations of liver function · anorexia · antibiotic-associated colitis · body secretions coloured orange-red · collapse and shock · diarrhoea · disseminated intravascular coagulation · drowsiness · eosinophilia · exfoliative dermatitis · flushing · gastro-intestinal symptoms · haemolytic anaemia · headache · influenza-like symptoms (with chill, fever, dizziness, bone pain) · jaundice · leucopenia · menstrual disturbances · muscular weakness · myopathy · nausea · oedema · pemphigoid reactions · psychoses · rashes · respiratory symptoms · saliva coloured orange-red · shortness of breath · Stevens-Johnson syndrome · thrombocytopenic purpura · toxic epidermal necrolysis · urine coloured orange-red · urticaria · vomiting

**SPECIFIC SIDE-EFFECTS**
- With intravenous use Thrombophlebitis reported if infusion used for prolonged period

**SIDE-EFFECTS, FURTHER INFORMATION**
- Discontinue permanently if serious side-effects develop.
- Intermittent therapy Side-effects that mainly occur with intermittent therapy include influenza-like symptoms (with chill, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifampicin hypersensitivity.

**CONCEPTION AND CONTRACTION**
- Important Effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered.

**PREGNANCY**
- Manufacturers advise very high doses teratogenic in animal studies in first trimester; risk of neonatal bleeding may be increased in third trimester.

** BREAST FEEDING**
- Amount too small to be harmful.

**HEPATIC IMPAIRMENT**
- Avoid or do not exceed 8 mg/kg daily. Impaired elimination. In patients with pre-existing liver disease or hepatic impairment, monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.

**RENAL IMPAIRMENT**
- In children Use with caution if doses above 10 mg/kg daily.  
- In adults Use with caution if dose above 600 mg daily.

**MONITORING REQUIREMENTS**
- Renal function should be checked before treatment.

**HEPATIC FUNCTION**
- Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, liver function should be monitored on prolonged therapy.
- Blood counts should be monitored in patients on prolonged therapy.
- In adults Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months. Blood counts should also be monitored in these patients.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use in adults For intravenous infusion (Rifadin®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute with solvent provided then dilute with 500 mL infusion fluid; give over 2–3 hours.
- With intravenous use in children Displacement value may be significant, consult local reconstitution guidelines; reconstitute with solvent provided. May be further diluted with Glucose 5% or Sodium chloride 0.9% to a final concentration of 1.2 mg/mL. Infuse over 2–3 hours.

**PRESCRIBING AND DISPENSING INFORMATION**
- If treatment interruption occurs, re-introduce with low dosage and increase gradually. Flavours of syrup may include raspberry.
- With oral use in children In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children.

**PATIENT AND CARER ADVICE**
- Soft contact lenses Patients or their carers should be advised that rifampicin discourages soft contact lenses.
Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

Medicines for Children leaflet: Rifampicin for meningococcal prophylaxis www.medicinesforchildren.org.uk/ rifampicin-for-meningococcal-prophylaxis

**CAUTIONS**

There can be variation in the licensing of different medicines containing the same drug. Please consider rifampicin p. 549, isoniazid p. 554, ethambutol hydrochloride p. 554, pyrazinamide p. 555.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **Oral suspension**
  - rifampicin-for-treatment-of-tuberculosis

**CAUTIONARY AND ADVISORY LABELS**

- **Oral suspension**
  - rifampicin-for-treatment-of-tuberculosis

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS**
  - rifampicin-for-treatment-of-tuberculosis

**INDICATIONS AND DOSE**

**Treatment of tuberculosis (continuation phase)**

- **BY MOUTH**
  - Adult (body-weight up to 50 kg): 450/300 mg daily for 4 months (continuation phase after 2-month initial phase), use Rifater® 150/100 Tablets, preferably taken before breakfast.
  - Adult (body-weight 50 kg and above): 600/300 mg daily for 4 months (continuation phase after 2-month initial phase), use Rifater® 300/150 Tablets, preferably taken before breakfast.

**DOSE EQUIVALENCE AND CONVERSION**

- Each Rifater® 150/100 Tablet contains rifampicin 150 mg and isoniazid 100 mg.
  - Each Rifater® 300/150 Tablet contains rifampicin 300 mg and isoniazid 150 mg.

**INTERACTIONS**

- Appendix 1: ethambutol, isoniazid, pyrazinamide, rifampicin

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS**
  - rifampicin-for-treatment-of-tuberculosis

**Rifampicin with isoniazid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, rifampicin p. 549, isoniazid p. 554.

**INDICATIONS AND DOSE**

**Treatment of tuberculosis (continuation phase)**

- **BY MOUTH**
  - Adult (body-weight up to 50 kg): 450/300 mg daily for 4 months (continuation phase after 2-month initial phase), use Rifater® 150/100 Tablets, preferably taken before breakfast.
  - Adult (body-weight 50 kg and above): 600/300 mg daily for 4 months (continuation phase after 2-month initial phase), use Rifater® 300/150 Tablets, preferably taken before breakfast.

**DOSE EQUIVALENCE AND CONVERSION**

- Each Rifater® 150/100 Tablet contains rifampicin 150 mg and isoniazid 100 mg.
  - Each Rifater® 300/150 Tablet contains rifampicin 300 mg and isoniazid 150 mg.

**INTERACTIONS**

- Appendix 1: isoniazid, rifampicin

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS**
  - rifampicin-for-treatment-of-tuberculosis

**Rifampicin with isoniazid and pyrazinamide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, rifampicin p. 549, ethambutol hydrochloride p. 554, isoniazid p. 554, pyrazinamide p. 555.

**INDICATIONS AND DOSE**

**Initial treatment of tuberculosis**

- **BY MOUTH**
  - Adult (body-weight 30–39 kg): 2 tablets daily for 2 months (initial phase)
  - Adult (body-weight 40–54 kg): 3 tablets daily for 2 months (initial phase)
  - Adult (body-weight 55–69 kg): 4 tablets daily for 2 months (initial phase)
  - Adult (body-weight 70 kg and above): 5 tablets daily for 2 months (initial phase)

**DOSE EQUIVALENCE AND CONVERSION**

- Tablet quantities refer to the number of Voractiv® Tablets which should be taken. Each Voractiv® Tablet contains ethambutol hydrochloride 275 mg, isoniazid 75 mg, pyrazinamide 400 mg and rifampicin 150 mg.

**INTERACTIONS**

- Appendix 1: ethambutol, isoniazid, pyrazinamide, rifampicin

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS**
  - rifampicin-for-treatment-of-tuberculosis

**Rifampicin with isoniazid and pyrazinamide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, rifampicin p. 549, isoniazid p. 554, pyrazinamide p. 555.

**INDICATIONS AND DOSE**

**Initial unsupervised treatment of tuberculosis (in combination with ethambutol)**

- **BY MOUTH**
  - Adult (body-weight up to 40 kg): 3 tablets daily for 2 months (initial phase), use Rifater® Tablets, preferably taken before breakfast.
  - Adult (body-weight 40–49 kg): 4 tablets daily for 2 months (initial phase), use Rifater® Tablets, preferably taken before breakfast.

**INTERACTIONS**

- Appendix 1: isoniazid, rifampicin

**INDICATIONS AND DOSE**

**Initial unsupervised treatment of tuberculosis (in combination with ethambutol)**

- **BY MOUTH**
  - Adult (body-weight up to 40 kg): 3 tablets daily for 2 months (initial phase), use Rifater® Tablets, preferably taken before breakfast.
  - Adult (body-weight 40–49 kg): 4 tablets daily for 2 months (initial phase), use Rifater® Tablets, preferably taken before breakfast.
**Aminosalicylic acid**

**INDICATIONS AND DOSE**

**Multiple-drug resistant tuberculosis, in combination with other drugs**

- **BY MOUTH**
  - Adult: 4 g every 8 hours for a usual treatment duration of 24 months; maximum 12 g per day

**Desensitisation regimen**

- **BY MOUTH**
  - Adult: (consult product literature)

**CAUTIONS**

- Peptic ulcer

**INTERACTIONS**

- Appendix 1: aminosalicylic acid

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, bloating, diarrhea, nausea, rash, vestibular syndrome, vomiting

- **Uncommon** Anorexia

- **Rare** Gastrointestinal bleeding, hypothyroidism, jaundice, malabsorption syndrome, metallic taste, peptic ulcer, uryctaria

- **Very rare** Agranulocytosis, anemia, crystalluria, dizziness, headache, hypoglycaemia, leucopenia, methemoglobinemia, peripheral neuropathy, purpura, tendon pain, thrombocytopenia, visual abnormalities, weight loss

- **Frequency not known** Hepatitis, hypersensitivity

**PREGNANCY**

- Manufacturer advises avoid unless essential—toxicity in animal studies (highest risk during first trimester).

**BREAST FEEDING**

- Present in milk—manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

- Use with caution.

**RENAL IMPAIRMENT**

- Use with caution in mild to moderate impairment. Avoid in severe impairment due to accumulation of inactive metabolites.

**MONITORING REQUIREMENTS**

- Monitor for hypersensitivity reaction during the first 3 months of treatment—for desensitisation dosing regimen consult product literature.

- Monitor liver function—discontinue immediately if signs or symptoms of hepatic toxicity (including rash, fever and gastrointestinal disturbance).

**DIRECTIONS FOR ADMINISTRATION**

- Disperse granules in orange or tomato juice and take immediately (granules will not dissolve, ensure all granules are swallowed). Granules can be sprinkled on apple sauce or yoghurt for administration.

**MEDICAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Cautionary and Advisory Labels 8, 14, 22
- rifater® tablets: 100 tablet (POM) £26.34

**ANTIMYCOBACTERIALS**

**Bedaquiline**

**INDICATIONS AND DOSE**

**Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs**

- **BY MOUTH**
  - Adult: Initially 400 mg once daily for 2 weeks, then 200 mg 3 times a week for 22 weeks, intervals of at least 48 hours between each dose, continue appropriate combination therapy after bedaquiline

**CONTRA-INDICATIONS**

- QTc interval more than 500 milliseconds (derived using Fridericia’s formula) • ventricular arrhythmia

**CAUTIONS**

- Hypothyroidism • QTc interval (derived using Fridericia’s formula) 450–500 milliseconds—discontinue if QTc interval more than 500 milliseconds • risk factors for QT interval prolongation (e.g. electrolyte disturbances, heart failure with reduced left ventricular ejection fraction, history of symptomatic arrhythmias (avoid if ventricular arrhythmia present), bradycardia, congenital long QT syndrome)

**INTERACTIONS**

- Appendix 1: bedaquiline

**SIDE-EFFECTS**

- Arthralgia, diarrhea, dizziness, headache, myalgia, nausea, QT interval prolongation • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Syncope If syncope occurs, obtain ECG.

- PREGNANCY

- Manufacturer advises avoid unless potential benefit outweighs risk.

- BREAST FEEDING

- Manufacturer advises avoid—present in milk in animal studies.

- HEPATIC IMPAIRMENT

- Manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available. Avoid concomitant use of hepatotoxic drugs unless essential.

- RENAL IMPAIRMENT

- Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Determine serum potassium, calcium, and magnesium before starting treatment (correct if abnormal)—remeasure if QT prolongation occurs during treatment.

- Obtain ECG before starting treatment, and then at least monthly during treatment or more frequently if concomitant use with other drugs known to prolong the QT interval.

- Monitor liver function before starting treatment and then at least monthly during treatment—discontinue treatment if severe abnormalities in liver function tests.

**PATIENT AND CARER ADVICE**

**Missed doses**

- If a dose is missed during the first two weeks of treatment, the missed dose should not be taken and the next dose should be taken at the usual time; if a dose is missed during weeks 3–24 of treatment, the missed dose should...
be taken as soon as possible and then the usual regimen resumed.

Driving and skilled tasks
Dizziness may affect performance of skilled tasks (e.g. driving)

**Cycloserine**

**INDICATIONS AND DOSE**
Tuberculosis resistant to first-line drugs, in combination with other drugs

- **BY MOUTH**
  - Adult: Initially 250 mg every 12 hours for 2 weeks, then increased if necessary up to 500 mg every 12 hours, dose to be increased according to blood concentration and response

**PHARMACOKINETICS**
Cycloserine penetrates the CNS.

**CONTRA-INDICATIONS** Alcohol dependence - depression - epilepsy - psychotic states - severe anxiety

**INTERACTIONS** ▶ Appendix 1: cycloserine

**SIDE-EFFECTS** Allergic dermatitis - changes in liver function tests - confusion - convulsions - depression - dizziness - drowsiness - headache - heart failure at high doses - megaloblastic anaemia - psychosis - rashes - tremor - vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**
- CNS toxicity Discontinue or reduce dose if symptoms of CNS toxicity occur.
- Rashes or allergic dermatitis Discontinue or reduce dose if rashes or allergic dermatitis develops.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk - crosses the placenta.
- **BREAST FEEDING** Present in milk - amount too small to be harmful.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Delamanid**

**INDICATIONS AND DOSE**
Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs

- **BY MOUTH**
- Adult: 100 mg twice daily for 24 weeks, continue appropriate combination therapy after delamanid

**CONTRA-INDICATIONS** QTc interval more than 500 milliseconds (derived using Fridericia’s formula) - serum albumin less than 28 g/litre

**CAUTIONS** Risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, heart failure with reduced left ventricular ejection fraction, severe hypertension, left ventricular hypertrophy, bradycardia, congenital long QT syndrome, history of symptomatic arrhythmias)

**INTERACTIONS** ▶ Appendix 1: delamanid

**SIDE-EFFECTS**
- Uncommon Arrhythmias - balance disorder - dehydration - dysphagia - herpes zoster - hypocalcaemia - leucopenia - nocturia - rash - thrombocytopenia - urinary retention

**CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

**PREGNANCY** Manufacturer advises avoid - toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid - present in milk in animal studies.
Infection

RENAL IMPAIRMENT

Manufacturer advises avoid in severe impairment.

Rifampicin with ethambutol, isoniazid and pyrazinamide, p. 551

Hepatic Impairment

Manufacturer advises avoid in moderate to severe impairment.

RENAL IMPAIRMENT

Manufacturer advises avoid in severe impairment—no information available.

MONITORING REQUIREMENTS

- Monitor serum albumin and electrolytes before starting treatment and then during treatment—discontinue treatment if serum albumin less than 28 g/litre.
- Obtain ECG before starting treatment and then monthly during treatment (more frequently if serum albumin 28–34 g/litre, or if concomitant use of potent CYP3A4 inhibitors, or if risk factors for QT interval prolongation, or if QTc interval 450–500 milliseconds in men or 470–500 milliseconds in women)—discontinue treatment if QTc interval more than 500 milliseconds (derived using Fridericia’s formula).

HANDLING AND STORAGE

Dispense in original container (contains desiccant).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 8, 21

- Delamanid 50 mg Deltyba 50 mg tablets | 48 tablet

Dispense in original container

€1,250.00

Ethambutol hydrochloride

INDICATIONS AND DOSE

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

- BY MOUTH
  - Child: 20 mg/kg once daily for 2 months (initial phase)
  - Adult: 15 mg/kg once daily for 2 months (initial phase)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

- BY MOUTH
  - Child: 30 mg/kg 3 times a week for 2 months (initial phase)
  - Adult: 30 mg/kg 3 times a week for 2 months (initial phase)

CONTRA-INDICATIONS

Optic neuritis · poor vision

CAUTIONS

Elderly · young children

CAUTIONS, FURTHER INFORMATION

Understanding warnings. Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

INTERACTIONS

Appendix 1: ethambutol

SIDE-EFFECTS

- Rare
  - Pruritus · rash · thrombocytopenia · urticaria
- Frequency not known
  - Colour blindness · loss of visual acuity · optic neuritis · peripheral neuritis · red/green colour blindness · restriction of visual fields · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Ocular toxicity. Ocular toxicity is more common where excessive dosage is used or if the patient’s renal function is impaired. Early discontinuation of the drug is almost always followed by recovery of eyesight.

PREGNANCY

Not known to be harmful.

BREAST FEEDING

Amount too small to be harmful.

RENAL IMPAIRMENT

Risk of optic nerve damage. Should preferably be avoided in patients with renal impairment. If creatinine clearance less than 30 mL/minute, monitor plasma-ethambutol concentration.

- In adults If creatinine clearance less than 30 mL/minute, use 15–25 mg/kg (max. 2.5 g) 3 times a week.
- In children If creatinine clearance less than 30 mL/minute/1.73 m², use 15–25 mg/kg (max. 2.5 g) 3 times a week.

MONITORING REQUIREMENTS

- ‘Peak’ concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); ‘trough’ (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre).
- Renal function should be checked before treatment.
- Visual acuity should be tested by Snellen chart before treatment with ethambutol.
- In children In young children, routine ophthalmological monitoring recommended.

PATIENT AND CARER ADVICE

Ocular toxicity. The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Isoniazid

INDICATIONS AND DOSE

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

- BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
  - Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)
  - Adult: 300 mg daily for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

- BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
  - Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
  - Adult: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive

- BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
  - Child 1 month–11 years: 10 mg/kg daily (max. per dose 300 mg) for 6 months, alternatively 10 mg/kg daily (max. per dose 300 mg) for 3 months, to be taken in combination with rifampicin
  - Child 12–17 years: 300 mg daily for 6 months, alternatively 300 mg daily for 3 months, to be taken in combination with rifampicin
Pyrazinamide

**INDICATIONS AND DOSE**

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

- **BY MOUTH**
  - Child (body-weight up to 50 kg): 35 mg/kg once daily for 2 months (initial phase); maximum 1.5 g per day
  - Child (body-weight 50 kg and above): 35 mg/kg once daily for 2 months (initial phase); maximum 2 g per day
  - Adult (body-weight up to 50 kg): 1.5 g once daily for 2 months (initial phase)
  - Adult (body-weight 50 kg and above): 2 g once daily for 2 months (initial phase)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

- **BY MOUTH**
  - Child (body-weight up to 50 kg): 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase)
  - Child (body-weight 50 kg and above): 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase)
  - Adult (body-weight up to 50 kg): 2 g 3 times a week for 2 months (initial phase)
  - Adult (body-weight 50 kg and above): 2.5 g 3 times a week for 2 months (initial phase)

**CONTRA-INDICATIONS**

- Acute attack of gout (in adults)
- Diabetes · gout (in adults)
- **INTERACTIONS**
  - Appendix 1: pyrazinamide

**SIDE-EFFECTS**

- Anorexia · arthralgia · dysuria · fever · flushing (in adults) · hepatomegaly · hepatotoxicity · jaundice · liver failure · nausea · photosensitivity · rash · sideroblastic anaemia · splenomegaly · thrombocytopenia · vomiting
- **PREGNANCY**
  - Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING**
  - Amount too small to be harmful.
- **HEPATIC IMPAIRMENT**
  - Idiosyncratic hepatotoxicity more common; avoid in severe hepatic impairment. In patients with pre-existing liver disease or
2.6 Urinary tract infections

Urinary-tract infections

Overview
Urinary-tract infection is more common in women than in men; when it occurs in men there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage.

Escherichia coli is the most common cause of urinary-tract infection; Staphylococcus saprophyticus is also common in sexually active young women. Less common causes include Proteus and Klebsiella spp. Pseudomonas aeruginosa infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. Staphylococcus epidermidis and Enterococcus faecalis infection may complicate catheterisation or instrumentation.

A specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy;
- in men;
- in pregnant women;
- in children under 3 years of age;
- in patients with suspected upper urinary-tract infection;
- complicated infection, or recurrent infection;
- if resistant organisms are suspected;
- if urine dipstick testing gives a single positive result for leucocyte esterase or nitrite;
- if clinical symptoms are not consistent with results of dipstick testing.

Treatment should not be delayed while waiting for results. The antibacterial chosen should reflect current local bacterial sensitivity to antibiotics.

Antibacterial therapy for lower urinary-tract infections

Uncomplicated lower urinary-tract infections often respond to trimethoprim p. 542 or nitrofurantoin p. 557, or alternatively, amoxicillin p. 518, ampicillin p. 520 or oral cefalosporin.

Suggested duration of treatment is 7 days, but a short course (e.g. 3 days) is usually adequate for uncomplicated urinary-tract infections in women.

Infections caused by fully sensitive bacteria respond to amoxicillin.

Widespread bacterial resistance to ampicillin, amoxicillin, and trimethoprim has been reported. Alternatives for resistant organisms include co-amoxiclav p. 521 (amoxicillin with clavulanic acid), an oral cefalosporin, nitrofurantoin, pivmecillinam hydrochloride p. 523, or a quinolone.

Fosfomycin p. 538 can be used, on the advice of a microbiologist, for the treatment of acute uncomplicated lower urinary-tract infections caused by organisms sensitive to fosfomycin.

Long-term low dose therapy may be required in selected patients to prevent recurrence of infection; indications include frequent relapses and significant kidney damage. Trimethoprim, nitrofurantoin and cefalexin p. 497 have been recommended for long-term therapy.

Methenamine hippurate p. 557 (hexamine hippurate) should not generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections.

Antibacterial therapy for upper urinary-tract infections

Acute pyelonephritis can lead to sepsicaemia and is treated initially by injection of a broad-spectrum antibacterial such as a cefalosporin (e.g. cefuroxime p. 498) or a quinolone if the patient is severely ill; gentamicin p. 491 can also be used.

Suggested duration of treatment is 10–14 days (longer treatment may be necessary in complicated pyelonephritis).

Prostatitis can be difficult to cure and requires treatment for several weeks with an antibacterial which penetrates prostatic tissue such as some of the quinolones (ciprofloxacin p. 527 or ofloxacin p. 530), or alternatively, trimethoprim.

Suggested duration of treatment is 28 days. Where infection is localised and associated with an indwelling catheter, a bladder instillation is often effective.

Pregnancy
Urinary-tract infection in pregnancy may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cefalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulfonamides and quinolones should be
avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

**Renal impairment**

In renal failure antibacterial agents normally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminoglycosides which should be used with great caution; tetracyclines, methenamine hippurate, and nitrofurantoin should be avoided altogether.

**Urinary-tract infections in children**

Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring. Uncomplicated 'lower' urinary-tract infections in children over 3 months of age can be treated with trimethoprim, nitrofurantoin, a first generation cephalosporin (e.g. cefalexin), or amoxicillin for recurrent episodes of infection, significant urinary-tract anomalies, or significant kidney damage.

**ANTIBACTERIALS**

### Methenamine hippurate

*(Hexamine hippurate)*

- **INDICATIONS AND DOSE**
  - **Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections**
    - **BY MOUTH**
      - Adult: 1 g every 12 hours
    - **Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections in patients with catheters**
      - **BY MOUTH**
      - Adult: 1 g every 8–12 hours

- **CONTRA-INDICATIONS**
  - Acute porphyrias
  - Severe chronic recurrent urinary-tract infections

- **INTERACTIONS**
  - Appendix 1: methenamine

- **SIDE-EFFECTS**
  - Bladder irritation
  - Gastro-intestinal disturbances
  - Rash

- **PREGNANCY**
  - Use with caution.

- **BREAST FEEDING**
  - Amount too small to be harmful.

- **HEPATIC IMPAIRMENT**
  - Avoid.

- **RENAL IMPAIRMENT**
  - Avoid if eGFR less than 10 mL/minute/1.73 m²—risk of hippurate crystalluria.

- **LESS SUITABLE FOR PRESCRIBING**
  - Methenamine (hexamine) hippurate should not generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections. It is considered less suitable for prescribing.

### Nitrofurantoin

- **INDICATIONS AND DOSE**
  - **Acute uncomplicated urinary-tract infections**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 3 months–11 years: 750 micrograms/kg 4 times a day for 3–7 days
      - Child 12–17 years: 50 mg 4 times a day for 3–7 days
      - Adult: 50 mg 4 times a day for 3–7 days, dose to be taken with food
    - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
      - Child 12–17 years: 100 mg twice daily, dose to be taken with food
      - Adult: 100 mg twice daily, dose to be taken with food

  - **Severe chronic recurrent urinary-tract infections**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 3 months–11 years: 100 mg 4 times a day for 3–7 days
      - Child 12–17 years: 100 mg 4 times a day for 7 days, dose to be taken with food, reduce dose or discontinue treatment if severe nausea occurs

  - **Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 3 months–11 years: 1 mg/kg once daily, dose to be taken at night
      - Child 12–17 years: 50–100 mg once daily, dose to be taken at night
    - **Adult: 50–100 mg once daily, dose to be taken at night**

  - **Genito-urinary surgical prophylaxis**
    - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
      - Adult: 100 mg twice daily on day of procedure and for 3 days after

- **CONTRA-INDICATIONS**
  - Acute porphyrias p. 969 • G6PD deficiency • infants less than 3 months old

- **CAUTIONS**
  - Anaemia • diabetes mellitus • electrolyte imbalance • folate deficiency • pulmonary disease • susceptibility to peripheral neuropathy • urine may be coloured yellow or brown • vitamin B deficiency

- **INTERACTIONS**
  - Appendix 1: nitrofurantoin

- **SIDE-EFFECTS**
  - Rare: Agranulocytosis • aplastic anaemia • arthralgia • benign intracranial hypertension • blood disorders • cholestatic jaundice • erythema multiforme • exfoliative dermatitis • hepatitis • pancreatitis • thrombocytopenia • transient alopecia

  - Frequency not known: Acute pulmonary reactions • anaphylaxis • angioedema • anorexia • chronic pulmonary reactions (pulmonary fibrosis reported; possible association with lupus erythematosus-like syndrome) • diarrhoea • hypersensitivity reactions • nausea • peripheral neuropathy • pruritus • rash • sialadenitis • urticaria • vomiting

- **PREGNANCY**
  - Avoid at term—may produce neonatal haemolysis.

- **BREAST FEEDING**
  - Avoid; only small amounts in milk but enough to produce haemolysis in G6PD-deficient infants.
Hepatic Impairment

Use with caution; cholestatic jaundice and chronic active hepatitis reported.

Renal Impairment

Risk of peripheral neuropathy; antibacterial efficacy depends on renal secretion of the drug into urinary tract.

In adults

Avoid if eGFR less than 45 mL/minute/1.73 m²; may be used with caution if eGFR 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.

In children

Avoid if estimated glomerular filtration rate less than 45 mL/minute/1.73 m²; may be used with caution if estimated glomerular filtration rate 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.

Monitoring Requirements

On long-term therapy, monitor liver function and monitor for pulmonary symptoms, especially in the elderly (discontinue if deterioration in lung function).

Effect on Laboratory Tests

False positive urinary glucose (if tested for reducing substances).

Patient and Carer Advice

Medicines for Children leaflet: Nitrofurantoin for urinary tract infections www.medicinesforchildren.org.uk/nitrofurantoin-for-urinary-tract-infections

Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 9, 14, 21

- Nitrofurantoin (Non-proprietary)
  - Nitrofurantoin 50 mg Nitrofurantoin 50mg tablets | 28 tablet £35.00 DT price = £11.66 | 100 tablet £111.89
  - Nitrofurantoin 100 mg Nitrofurantoin 100mg tablets | 28 tablet £16.80 DT price = £7.03 | 100 tablet £60.00
- Genfura (Genesis Pharmaceuticals Ltd)
  - Nitrofurantoin 50 mg Genfura 50mg tablets | 28 tablet £23.57 DT price = £11.66
  - Nitrofurantoin 100 mg Genfura 100mg tablets | 28 tablet £18.76 DT price = £7.03 | 100 tablet £67.02

Oral Suspension

CAUTIONARY AND ADVISORY LABELS 9, 14, 21

- Nitrofurantoin (Non-proprietary)
  - Nitrofurantoin 5 mg per 1 ml Nitrofurantoin 25mg/5ml oral suspension sugar free sugar-free | 300 ml £446.95 DT price = £446.95

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 9, 14, 21, 25

- Macrobid (AMCo)
  - Nitrofurantoin 100 mg Macrobid 100mg modified-release capsules | 14 capsule £9.50 DT price = £9.50

Capsule

CAUTIONARY AND ADVISORY LABELS 9, 14, 21

- Nitrofurantoin (Non-proprietary)
  - Nitrofurantoin 50 mg Nitrofurantoin 50mg capsules | 30 capsule £15.42 DT price = £15.42
  - Nitrofurantoin 100 mg Nitrofurantoin 100mg capsules | 30 capsule £10.42 DT price = £10.42

Fungal infection

Antifungals, systemic use

Common fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. Local treatment is suitable for a number of fungal infections (genital, bladder, eye, ear, oropharynx, and skin).

Aspergillosis

Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole p. 566 is the treatment of choice for aspergillosis; liposomal amphotericin p. 561 is an alternative first-line treatment when voriconazole cannot be used. Caspofungin p. 560, itraconazole p. 564, or posaconazole p. 565 can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication].

Candidiasis

Many superficial candidal infections including infections of the skin are treated locally; widespread or intractable infection requires systemic antifungal treatment. Vaginal candidiasis may be treated with locally acting antifungals or with fluconazole p. 562 given by mouth; for resistant organisms in adults, itraconazole can be given by mouth.

Oropharyngeal candidiasis generally responds to topical therapy; fluconazole is given by mouth for unresponsive infections; it is effective and is reliably absorbed. Itraconazole may be used for infections that do not respond to fluconazole. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

For invasive or disseminated candidiasis, an echinocandin can be used. Fluconazole is an alternative for Candida albicans infection in clinically stable patients who have not received an azole antifungal recently. Amphotericin is an alternative when an echinocandin or fluconazole cannot be used, however, amphotericin should be considered for the initial treatment of CNS candidiasis. Voriconazole can be used for infections caused by fluconazole-resistant Candida spp. when oral therapy is required, or in patients intolerant of amphotericin or an echinocandin. In refractory cases, flucytosine p. 567 can be used with intravenous amphotericin.

Cryptococcosis

Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin by intravenous infusion and flucytosine by intravenous infusion for 2 weeks, followed by fluconazole by mouth for 8 weeks or until cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

Histoplasmosis

Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. Itraconazole can be used for the treatment of immunocompetent patients with indolent non-meningeal...
infection, including chronic pulmonary histoplasmosis. Amphotericin by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

**Skin and nail infections**

Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy. Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis). Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine p. 1132 are used more frequently than griseofulvin p. 568 because they have a broader spectrum of activity and require a shorter duration of treatment.

*Tinea capitis* is treated systemically; additional topical application of an antifungal may reduce transmission. Griseofulvin is used for tinea capitis in adults and children; it is effective against infections caused by *Trichophyton tonsurans* and *Microsporum* spp. Terbinafine is used for tinea capitis caused by *T. tonsurans* [unlicensed indication]. The role of terbinafine in the management of *Microsporum* infections is uncertain. *Pityriasis versicolor* may be treated with itraconazole by mouth if topical therapy is ineffective; fluconazole by mouth is an alternative. Oral terbinafine is not effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. Terbinafine and itraconazole have largely replaced griseofulvin for the systemic treatment of *onychomycosis*, particularly of the toenail; terbinafine is considered to be the drug of choice. Itraconazole can be administered as intermittent ‘pulse’ therapy. Topical antifungals also have a role in the treatment of onychomycosis.

**Immunocompromised patients**

Immunocompromised patients are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. Fluconazole is more reliably absorbed than itraconazole, but fluconazole is not effective against *Aspergillus* spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. Posaconazole can be used for prophylaxis in patients who are undergoing haematopoietic stem cell transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome, if they are intolerant of fluconazole or itraconazole. Micafungin p. 560 can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole, itraconazole or posaconazole cannot be used.

Amphotericin by intravenous infusion or caspofungin is used for the empirical treatment of serious fungal infections; caspofungin is not effective against fungal infections of the CNS.

**Triazole antifungals**

Triazole antifungal drugs have a role in the prevention and systemic treatment of fungal infections.

Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria.

Itraconazole is active against a wide range of dermatophytes. Itraconazole capsules require an acid environment in the stomach for optimal absorption. Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Posaconazole is licensed for the treatment of invasive fungal infections unresponsive to conventional treatment. Voriconazole is a broad-spectrum antifungal drug which is licensed for use in life-threatening infections.

**Imidazole antifungals**

The imidazole antifungals include clotrimazole p. 781, econazole nitrte p. 781, ketoconazole p. 641, and itraconazole p. 1131. They are used for the local treatment of vaginal candidiasis and for dermatophyte infections. Miconazole p. 782 can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

**Polyene antifungals**

The polyene antifungals include amphotericin p. 561 and nystatin p. 1116; neither drug is absorbed when given by mouth. Nystatin is used for oral, oropharyngeal, and perioral infections by local application in the mouth. Nystatin is also used for *Candida albicans* infection of the skin.

Amphotericin by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (Abelcet® and AmBisome®) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

**Echinocandin antifungals**

The echinocandin antifungals include anidulafungin p. 560, caspofungin p. 560 and micafungin p. 560. They are only active against *Aspergillus* spp. and *Candida* spp.; however, anidulafungin and micafungin are not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS.

**Other antifungals**

Flucytosine p. 567 is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy.

Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. Flucytosine has a role in the treatment of systemic candidiasis and cryptococcal meningitis.

Griseofulvin p. 568 is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for trichophytion infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months.

Terbinafine p. 1132 is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate.
**Antifungals**

**Anidulafungin**

- **INDICATIONS AND DOSE**
  - **Invasive candidiasis**
    - BY INTRAVENOUS INFUSION
    - Adult: Initially 200 mg once daily for 1 day, then 100 mg once daily.

- **SIDE-EFFECTS**
  - Common or very common: Coagulopathy, convulsion, diarrhoea, flushing, headache, hypokalaemia, nausea, pruritus, raised serum creatinine, rash, vomiting
  - Uncommon: Abdominal pain, cholestasis, hyperglycaemia, hypertension, injection-site pain, urticaria
  - Frequency not known: Bronchospasm, dyspnoea, hepatitis, hypotension

- **PREGNANCY**
  - Manufacturer advises avoid—no information available.

- **BREAST FEEDING**
  - Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion (Ecalta®), give intermittently in glucose 5% or sodium chloride 0.9%. Reconstitute each 100 mg with 30 mL water for injections and allow up to 5 minutes for reconstitution; dilute dose in infusion fluid to a concentration of 770 micrograms/mL; give at a rate not exceeding 1.1 mg/minute. Follow product information if using stock supplied with ethanol solvent.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- Ecalta (Pfizer Ltd)
  - Anidulafungin 100 mg: Ecalta 100mg powder for concentrate for solution for infusion vials | 1 vial (PO) £299.99 (Hospital only)

**Caspofungin**

- **INDICATIONS AND DOSE**
  - **Invasive aspergillosis | Invasive candidiasis | Empirical treatment of systemic fungal infections in patients with neutropenia**
    - BY INTRAVENOUS INFUSION
    - Adult (body-weight up to 81 kg): 70 mg once daily for 1 day, then 50 mg once daily
    - Adult (body-weight 81 kg and above): 70 mg once daily

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  - Manufacturer advises increase dose to 70 mg daily with concurrent use of some enzyme inducers (such as carbamazepine, dexamethasone, phenytoin, and rifampicin); no dose adjustment required for patients already on 70 mg daily.

- **INTERACTIONS** → Appendix 1: caspofungin

- **SIDE-EFFECTS**
  - Common or very common: Arthralgia, diarrhoea, dyspnoea, headache, hypokalaemia, injection-site reactions, nausea, pruritus, rash, sweating, vomiting
  - Uncommon: Abdominal pain, anaemia, anorexia, anxiety, arrhythmia, ascites, blurred vision, bronchospasm, chest pain, cholestasis, constipation, cough, disorientation, dizziness, dry mouth, dyspepsia, dysphagia, erythema multiforme, fatigue, flatulence, flushing, heart failure, hepatic dysfunction, hyperglycaemia, hypertension, hypoaesthesia, hypocalcaemia, hypomagnesaemia, hypotension, leucopenia, metabolic acidosis, muscular weakness, myalgia, palpitation, paraesthesia, renal failure, sleep disturbances, taste disturbances, thrombocytopenia, thrombophlebitis, tremor
  - Frequency not known: Adult respiratory distress syndrome—anaphylaxis

- **PREGNANCY**
  - Adult respiratory distress syndrome—anaphylaxis

- **BREAST FEEDING**
  - Present in milk in animal studies—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT**
  - 70 mg on first day then 35 mg once daily in moderate impairment. No information available for severe impairment.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion (Cancidas®), give intermittently in sodium chloride 0.9%. Allow vial to reach room temperature; initially reconstitute each vial with 10.5 mL water for injections, mixing gently to dissolve then dilute requisite dose in 250 mL infusion fluid (35- or 50-mg doses may be diluted in 100 mL infusion fluid if necessary); give over 60 minutes; incompatible with glucose solutions.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- Cancidas (Merck Sharp & Dohme Ltd)
  - Caspofungin (as Caspofungin acetate) 50 mg: Cancidas 50mg powder for solution for infusion vials | 1 vial (PO) £372.67
  - Caspofungin (as Caspofungin acetate) 70 mg: Cancidas 70mg powder for solution for infusion vials | 1 vial (PO) £416.78

**Micafungin**

- **INDICATIONS AND DOSE**
  - **Invasive candidiasis**
    - BY INTRAVENOUS INFUSION
    - Adult (body-weight up to 40 kg): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate
    - Adult (body-weight 40 kg and above): 100 mg once daily for at least 14 days; increased if necessary to 200 mg once daily, increase dose if response inadequate

- **Oesophageal candidiasis**
  - BY INTRAVENOUS INFUSION
  - Adult (body-weight up to 40 kg): 3 mg/kg once daily
  - Adult (body-weight 40 kg and above): 150 mg once daily

- **Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days**
  - BY INTRAVENOUS INFUSION
  - Adult (body-weight up to 40 kg): 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range
  - Adult (body-weight 40 kg and above): 50 mg once daily continue for at least 7 days after neutrophil count is in desirable range

- **INTERACTIONS** → Appendix 1: micafungin

- **SIDE-EFFECTS**
  - Common or very common: Abdominal pain, anaemia, diarrhoea, fever, headache, hypocalcaemia, hypokalaemia, hypomagnesaemia, leucopenia, nausea, phlebitis, rash, vomiting
  - Uncommon: Anorexia, anxiety, blood pressure changes, bradycardia, cholestasis, confusion, constipation, dizziness, dyspepsia, dysphagia, hyperglycaemia, hyperhidrosis, hyperkalaemia, hyponatraemia, hypophosphataemia, palpitation, pancytopenia, pruritus, sleep disturbances, tachycardia, taste disturbances, thrombocytopenia, tremor
  - Rare: Haemolytic anaemia
ANTIFUNGALS

Amphotericin (Amphotericin B)

INDICATIONS AND DOSE

ABELCET®, AMBISOME®, FUNGIZONE®

Severe invasive candidiasis
Severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients

BY INTRAVENOUS INFUSION

Adult: Test dose 1 mg, to be given over 15 minutes, then 5 mg/kg once daily for at least 14 days

AMBISOME®

Severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin | Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials

BY INTRAVENOUS INFUSION

Adult: Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

Aspergillosis

BY INTRAVENOUS INFUSION

Adult: Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

Visceral leishmaniasis (unresponsive to the antimonial alone)

BY INTRAVENOUS INFUSION

Adult: 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg, alternatively 3 mg/kg for 5 consecutive days, followed by 3 mg/kg after 6 days for 1 dose

FUNGIZONE®

Systemic fungal infections

BY INTRAVENOUS INFUSION

Adult: Test dose 1 mg, to be given over 20–30 minutes, then 250 micrograms/kg daily, gradually increased over 2–4 days, increased if tolerated to 1 mg/kg daily, max. (severe infection) 1.5 mg/kg daily or on alternate days. Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

UNLICENSED USE

AMBISOME® Use at the maximum dose of 5 mg/kg once daily is an unlicensed dose.

CAUTIONS

Avoid rapid infusion (risk of arrhythmias) - when given parenterally, toxicity common (close supervision necessary and close observation required for at least 30 minutes after test dose)

CAUTIONS, FURTHER INFORMATION

Anaphylaxis: Anaphylaxis can occur with any intravenous amphotericin product and a test dose is advisable before the first infusion; the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential).

INTERACTIONS

Appendix 1: amphotericin

SIDE-EFFECTS

Common or very common: Abdominal pain - abnormal liver function (discontinue treatment) - anaemia - arrhythmias - blood disorders - blood pressure changes - cardiovascular effects - chest pain - diarrhoea - disturbances in renal function - dyspnoea - electrolyte disturbances - febrile reactions - headache - hypokalaemia - hypomagnesaemia - nausea - rash - renal tubular acidosis - thrombocytopenia - vomiting

PREGNANCY

Not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk.

BREAST FEEDING

No information available.

RENAL IMPAIRMENT

Use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation.

MONITORING REQUIREMENTS

Hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required.

DIRECTIONS FOR ADMINISTRATION

ABELCET® Amphotericin (lipid complex)

For intravenous infusion, give intermittently in Glucose 5%. Allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17-19 gauge needle) into one or more 20-mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute to a concentration of 1 mg/mL (2 mg/mL can be used in fluid restriction and in children); preferably give via an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose of 1 mg over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium chloride or other electrolyte solutions, flush existing intravenous line with glucose 5% or use separate line.
AMBSOME® Amphotericin (liposomal)
For intravenous infusion (AmBisome®), give intermittently in Glucose 5% or 10%. Reconstitute each vial with 12 mL water for injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into infusion fluid through the 5 micron filter provided to produce a final concentration of 0.2–2 mg/mL; Infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur Infuse over 2 hours (initial test dose of 1 mg over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or 10%, or use separate line.

FUNGIZONE® Amphotericin (as sodium deoxycollate complex)
For intravenous infusion (Fungizone®), give intermittently in Glucose 5%. Reconstitute each vial with 10 mL water of injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in infusion fluid to a concentration of 100 micrograms/mL; pH of the glucose must not be below 4.2 (check each container—consult product literature for details of the buffer); infuse over 2–4 hours, or longer if not tolerated (initial test dose of 1 mg over 20–30 minutes); begin infusion immediately after dilution; protect from light; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used.

**PRESCRIBING AND DISPENSING INFORMATION** Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should not be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Suspension for infusion

**ELECTROLYTES:** May contain Sodium
- Abelcet (Teva UK Ltd)
  - Amphotericin B (as Amphotericin B phospholipid complex) 5 mg per 1 ml Abelcet 100mg/20ml concentrate for suspension for infusion vials 1 x 10 vial (Rx) £775.04 (Hospital only)
- Powder for solution for infusion
  - EXCIPIENTS: May contain Sucrose ELECTROLYTES: May contain Sodium
  - AmBisome (Gilead Sciences International Ltd)
    - Amphotericin B liposomal 50 mg AmBisome 50mg powder for solution for infusion vials 1 x 10 vial (Rx) £821.87
  - Fungizone (Bristol-Myers Squibb Pharmaceuticals Ltd)
    - Amphotericin B 50 mg Fungizone Intravenous 50mg powder for solution for infusion vials 1 x 1 vial (POM) £3.88

**ANTIFUNGALS > TRIAZOLE ANTIFUNGALS**

Fluconazole

**INDICATIONS AND DOSE**

**Candidal balanitis**
- **BY MOUTH**
  - Child 16–17 years: 150 mg for 1 dose
  - Adult: 150 mg for 1 dose

**Vaginal candidiasis**
- **BY MOUTH**
  - Child 16–17 years: 150 mg for 1 dose
  - Adult: 150 mg for 1 dose

**Vulvovaginal candidiasis (recurrent)**
- **BY MOUTH**
  - Adult: Initially 150 mg every 72 hours for 3 doses, then 150 mg once weekly for 6 months

**Mucosal candidiasis (except genital)**
- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Child 1 month–11 years: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg daily (max. per dose 100 mg) for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections)
  - Child 12–17 years: 50 mg daily for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections
  - **BY MOUTH**
    - Adult: 50 mg daily given for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14 days in atrophic oral candidiasis associated with dentures; for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections

Tinea pedis, corporis, cruris, pityriasis versicolor | Dermal candidiasis
- **BY MOUTH**
  - Adult: 50 mg daily for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks

Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis)
- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Child: 6–12 mg/kg daily (max. per dose 800 mg), treatment continued according to response (at least 8 weeks for cryptococcal meningitis)
  - Adult: 400 mg, dose to be given on first day, then 200–400 mg daily (max. per dose 800 mg once daily), treatment continued according to response (at least 8 weeks for cryptococcal meningitis), maximum dose for use in severe infections

Prevention of fungal infections in immunocompromised patients
- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Child: 3–12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose given according to extent and duration of neutropenia
  - Adult: 50–400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose adjusted according to risk

Prevention of fungal infections in immunocompromised patients (for patients with high risk of systemic infections e.g. following bone-marrow transplantation)
- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Adult: 400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range

Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy
- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Adult: 200 mg daily

**CONTRA-INDICATIONS** Acute porphyrias p. 969
**CAUTIONS** Susceptibility to QT interval prolongation
**INTERACTIONS** → Appendix 1: antifungals, azoles
**SIDE-EFFECTS**

- **Common or very common** Abdominal discomfort - diarrhoea - flatulence - headache - nausea - rash
- **Uncommon** Alopecia - anaphylaxis - angioedema (in children) - dizziness - dyspepsia - hepatic disorders - hyperlipidaemia - hypersensitivity reactions (in adults) - pruritus - seizures - Stevens-Johnson syndrome - taste disturbance - toxic epidermal necrolysis - vomiting
- **Frequency not known** Hypokalaemia - leucopenia - thrombocytopenia

**SIDE-EFFECTS, FURTHER INFORMATION**

If rash occurs, discontinue treatment (or monitor closely if infection invasive or systemic); severe cutaneous reactions are more likely in patients with AIDS.

**PREGNANCY**

Manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses.

**BREAST FEEDING**

Present in milk but amount probably too small to be harmful.

**HEPATIC IMPAIRMENT** Toxicity with related drugs.

**RENAL IMPAIRMENT**

- In adults Usual initial dose then halve subsequent doses if eGFR less than 50 ml/minute/1.73 m².
- In children Usual initial dose then halve subsequent doses if estimated glomerular filtration rate less than 50 ml/minute/1.73 m².

**MONITORING REQUIREMENTS** Monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic disease (risk of hepatic necrosis).

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children For intravenous infusion, give over 10–30 minutes; do not exceed an infusion rate of 5–10 ml/minute.

**PRESCRIBING AND DISPENSING INFORMATION**

- Flavours of oral liquid formulations may include orange.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary

Fluconazole Capsules 50 mg may be prescribed. Fluconazole Oral Suspension 50 mg/5 ml may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY**

Fluconazole capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

**ELECTROLYTES:** May contain Sodium

- **Fluconazole (Non-proprietary)**
  - Fluconazole 2 mg per 1 ml Fluconazole 100 mg/50 ml solution for infusion bottles | 5 bottle | £12.60
  - Fluconazole 200 mg/100 ml solution for infusion vials | 1 vial | £29.28
  - Fluconazole 50 mg/25 ml solution for infusion vials | 1 vial | £7.31–£7.32
  - Fluconazole 200 mg/100 ml solution for infusion bottles | 5 bottle | £247.50
  - **Diffucan** (Pfizer Ltd)
  - Fluconazole 2 mg per 1 ml Diffucan 200 mg/100 ml solution for infusion vials | 1 vial | £29.28

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS**

- **Fluconazole (Non-proprietary)**
  - Fluconazole 10 mg per 1 ml Fluconazole 50 mg/5 ml oral suspension | 35 ml | £20.51 DT price = £20.51
  - **Diffucan** (Pfizer Ltd)
  - Fluconazole 10 mg per 1 ml Diffucan 50 mg/5 ml oral suspension | 35 ml | £16.61 DT price = £16.61
  - Fluconazole 40 mg per 1 ml Diffucan 200 mg/5 ml oral suspension | 35 ml | £66.42 DT price = £66.42

**Capsule**

**CAUTIONARY AND ADVISORY LABELS**

- **Fluconazole (Non-proprietary)**
  - Fluconazole 50 mg Fluconazole 50 mg capsules | 7 capsule | £5.00 DT price = £5.91
  - Fluconazole 150 mg Fluconazole 150 mg capsules | 1 capsule | £8.50 DT price = £8.41
  - Fluconazole 200 mg Fluconazole 200 mg capsules | 7 capsule | £6.92 DT price = £6.62

**Isavuconazole**

**DRUG ACTION** Isavuconazole is a triazole antifungal that blocks the synthesis of ergosterol, a key component of the fungal cell membrane.

**INDICATIONS AND DOSE**

Invasive aspergillosis | Mucormycosis in patients for whom amphotericin B is inappropriate

- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Adult: Loading dose 200 mg every 8 hours for 48 hours (6 administrations in total), then maintenance 200 mg once daily, maintenance dose to be started at least 12 hours after the last loading dose; long-term treatment should be reviewed after 6–months

**CONTRA-INDICATIONS** Short QT syndrome

**CAUTIONS** Elderly—limited information

**INTERACTIONS** Appendix 1: antifungals, azoles

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - chest pain - decreased appetite - delirium - diarrhoea - dysphoria - electrolyte disturbances - headache - nausea - pruritus - rash - renal failure - somnolence - thrombophlebitis - vomiting

**Frequency not known**

- Infusion-related reactions - Stevens-Johnson syndrome

**SIDE-EFFECTS, FURTHER INFORMATION**

- Infusion-related reactions Infusion-related reactions have been reported, including hypotension, dyspnoea, dizziness, paraesthesia, nausea, and headache—manufacturer advises discontinue treatment if these reactions occur.

**PREGNANCY**

Manufacturer advises avoid unless severe or life-threatening infection—toxicity in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises use with caution and monitor for toxicity in severe impairment—no information available.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, reconstitute each 200 mg with 5 ml Water for Injection; dilute dose to concentration of 0.8 mg/ml with
Glucose 5% or Sodium Chloride 0.9% and give via a
0.2–1.2 micron filter over at least 1 hour.

● HANDLING AND STORAGE
- With intravenous use Manufacturer advises store in a
refrigerator (2–8°C)—consult product literature for storage
after reconstitution or dilution.

● PATIENT AND CARER ADVICE
Driving and skilled tasks
Manufacturer advises patients and carers should be
cautioned on the effects on driving and performance of
skilled tasks—increased risk of confusion, syncope and
dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS
All Wales Medicines Strategy Group (AWMSG) Decisions
The All Wales Medicines Strategy Group has advised
(January 2017) that isavuconazole (Cresemba) is
recommended as an option for use in adults within NHS
Wales for the treatment of invasive aspergillosis, and the
treatment of mucormycosis in patients for whom
amphotericin B is inappropriate, only if the approved
Wales Patient Access Scheme (WPAS) is used or where the
list/contract price is equivalent or lower.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines
containing the same drug.

Powder for solution for infusion
CAUTIONARY AND ADVISORY LABELS 3
- Cresemba (Basilea Pharmaceutica International Ltd) ☑
Isavuconazole (as isavuconazolum sulfate) 200 mg Cresemba
200mg powder for concentrate for solution for infusion vials | 1 vial [PO] £297.84 (Hospital only)

Capsule
CAUTIONARY AND ADVISORY LABELS 25, 3
- Cresemba (Basilea Pharmaceutica International Ltd) ☑
Isavuconazole (as isavuconazolum sulfate) 100 mg Cresemba
100mg capsules | 14 capsule [PO] £599.28 (Hospital only)

Itraconazole

● INDICATIONS AND DOSE

Vulvovaginal candidiasis
- BY MOUTH
- Adult: 200 mg twice daily for 1 day

Vulvovaginal candidiasis (recurrent)
- BY MOUTH
- Adult: 50–100 mg daily for 6 months

Oral or oesophageal candidiasis that has not responded to
fluconazole
- BY MOUTH USING ORAL SOLUTION
- Adult: 100–200 mg twice daily for 2 weeks (continue
for another 2 weeks if no response; the higher dose
should not be used for longer than 2 weeks if no signs
of improvement)

Oral or oesophageal candidiasis in HIV-positive or other
immunocompromised patients
- BY MOUTH USING ORAL SOLUTION
- Adult: 200 mg daily in 1–2 divided doses for 1 week
(continue for another week if no response)

Systemic candidiasis where other antifungal drugs
inappropriate or ineffective
- BY MOUTH
- Adult: 100–200 mg once daily
- BY INTRAVENOUS INFUSION
- Adult: 200 mg every 12 hours for 2 days, then 200 mg
once daily for max. 12 days

Systemic candidiasis (invasive or disseminated) where
other antifungal drugs inappropriate or ineffective
- BY MOUTH
- Adult: 200 mg twice daily

Pityriasis versicolor
- BY MOUTH
- Adult: 200 mg once daily for 7 days

Tinea pedis | Tinea manuum
- BY MOUTH
- Adult: 100 mg once daily for 30 days, alternatively
200 mg twice daily for 7 days

Tinea corporis | Tinea cruris
- BY MOUTH
- Adult: 100 mg once daily for 15 days, alternatively
200 mg once daily for 7 days

Onychomycosis
- BY MOUTH
- Adult: 200 mg twice daily

Systemic aspergillosis where other antifungal drugs
inappropriate or ineffective
- BY INTRAVENOUS INFUSION
- Adult: 200 mg every 12 hours for 2 days, then 200 mg
once daily for max. 12 days

Histoplasmosis
- BY MOUTH
- Adult: 200 mg 3 times a day for 3 days, then 200 mg
1–2 times a day
- BY INTRAVENOUS INFUSION
- Adult: 200 mg every 12 hours for 2 days, then 200 mg
once daily for max. 12 days

Systemic cryptococcosis including cryptococcal meningitis
where other antifungal drugs inappropriate or ineffective
- BY MOUTH
- Adult: 200 mg once daily, dose increased in invasive or
disseminated disease and in cryptococcal meningitis,
increased to 200 mg twice daily
- BY INTRAVENOUS INFUSION
- Adult: 200 mg every 12 hours for 2 days, then 200 mg
once daily for max. 12 days

Maintenance in HIV-infected patients to prevent relapse
of underlying fungal infection and prophylaxis in
neutropenia when standard therapy inappropriate
- BY MOUTH
- Adult: 200 mg once daily, then increased to 200 mg
twice daily, dose increased only if low plasma-
itraconazole concentration

Prophylaxis of deep fungal infections (when standard
therapy inappropriate) in patients with haematological
malignancy or undergoing bone-marrow transplantation
who are expected to become neutropenic
- BY MOUTH USING ORAL SOLUTION
- Adult: 5 mg/kg daily in 2 divided doses, to be started
before transplantation or before chemotherapy (taking
care to avoid interaction with cytotoxic drugs) and
continued until neutrophil count recovers, safety and
efficacy not established in elderly patients

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Manufacturer advises max. dose 200 mg daily with
concurrent use of cobicistat.
Itraconazole doses in BNF may differ from those in product literature.

**UNLICENSED USE**

**IMPORTANT SAFETY INFORMATION**

**HEART FAILURE**
Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:
- patients receiving high doses and longer treatment courses;
- older adults and those with cardiac disease;
- patients with chronic lung disease (including chronic obstructive pulmonary disease) associated with pulmonary hypertension;
- patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.

Itraconazole should be avoided in patients with ventricular dysfunction or a history of heart failure unless the infection is serious.

**CONTRA-INDICATIONS**
Acute porphyrias p. 969

**CAUTIONS**
Active liver disease - history of hepatotoxicity with other drugs - susceptibility to congestive heart failure

**INTERACTIONS**
- Appendix 1: antifungals, azoles

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Common or very common Abdominal pain - diarrhoea - dyspepsia - headache - hepatitis - hypokalaemia - nausea - rash - taste disturbances - vomiting
- Uncommon Constipation - dizziness - dyspepsia - flatulence - menstrual disorder - myalgia - oedema - peripheral neuropathy (discontinue treatment)
- Rare Alopecia - deafness - electrolyte dysfunction - heart failure - hypertriglyceridaemia - leucopenia - pancreatitis - photosensitivity - Stevens-Johnson syndrome - tinnitus - toxic epidermal necrolysis - urinalysis - visual disturbances
- Frequency not known Arthralgia - blood pressure changes - confusion - drowsiness - hepatotoxicity - renal impairment - thrombocytopenia - tremor

**SPECIFIC SIDE-EFFECTS**
- With intravenous use Hyperglycaemia

**SIDE-EFFECTS, FURTHER INFORMATION**
- Hepatotoxicity Potentially life-threatening hepatotoxicity reported very rarely — discontinue if signs of hepatitis develop.

**CONCEPTION AND CONTRACEPTION**
Ensure effective contraception during treatment and until the next menstrual period following end of treatment.

**PREGNANCY**
Manufacturer advises use only in life-threatening situations (toxicity at high doses in animal studies).

**BREAST FEEDING**
Small amounts present in milk — may accumulate; manufacturer advises avoid.

**HEPATIC IMPAIRMENT**
Dose reduction may be necessary. Use only if potential benefit outweighs risk of hepatotoxicity.

**RENAL IMPAIRMENT**
Risk of congestive heart failure.
- With oral use Bioavailability of oral formulations possibly reduced.
- With intravenous use Use intravenous infusion with caution if eGFR 30–80 mL/minute/1.73 m²; avoid intravenous infusion if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**
- Absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary).
- Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For intravenous infusion (Sporanox®), give intermittently in Sodium Chloride 0.9%; dilute 250 mg in 50 mL infusion fluid and infuse only 60 mL through an in-line filter (0.2 micron) over 60 minutes.
- With oral use For oral liquid, do not take with food; swish around mouth and swallow, do not rinse afterwards.

**PRESCRIBING AND DISPENSING INFORMATION**
Flavours of oral liquid formulations may include cherry.

**PATIENT AND CARER ADVICE**
Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop.

Patients or carers should be given advice on how to administer itraconazole oral liquid.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Solution for infusion**
EXCIPIENTS: May contain Propylene glycol
- **Sporanox** (Janssen-Cilag Ltd)
  - Itraconazole 10 mg per 1 mL Sporanox i.v. 250 mg/25 mL solution for infusion amphotericin and diluent | 1 ampoule (POM) £79.71

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS**
9, 23

**Itraconazole (Non-proprietary)**
- Itraconazole 10 mg per 1 mL Itraconazole 50 mg/mL oral solution sugar free sugar-free | 150 mL (POM) £58.34 DT price + £58.34
- **Sporanox** (Janssen-Cilag Ltd)
  - Itraconazole 10 mg per 1 mL Itraconazole 50 mg/mL oral solution sugar free sugar-free | 150 mL (POM) £58.34 DT price + £58.34

**Capsule**

**CAUTIONARY AND ADVISORY LABELS**
5, 9, 21, 25

**Itraconazole (Non-proprietary)**
- Itraconazole 100 mg Itraconazole 100 mg capsules | 15 capsule (POM) £13.77 DT price + £3.19 | 60 capsule (POM) £56.21
- **Sporanox** (Janssen-Cilag Ltd)
  - Itraconazole 100 mg Sporanox-Pulse 100 mg capsules | 28 capsule (POM) £25.72
  - Sporanox 100 mg capsules | 4 capsule (POM) £3.67 | 15 capsule (POM) £13.77 DT price + £3.19 | 60 capsule (POM) £55.10

**Posaconazole**

**INDICATIONS AND DOSE**
Invasive aspergillosis in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin | Fusariosis either unresponsive to, or in patients intolerant of, amphotericin | Chromoblastomycosis and mycetoma either unresponsive to, or in patients intolerant of, itraconazole | Coccidioidomycosis either unresponsive to, or in patients intolerant of, amphotericin, itraconazole, or fluconazole
- **BY MOUTH USING ORAL SUSPENSION**
  - Adult: 400 mg twice daily, to be taken with food, alternatively 200 mg 4 times a day, dose if food not tolerated
- **BY MOUTH USING TABLETS**
  - Adult: 300 mg twice daily on first day, then 300 mg once daily

**Oropharyngeal candidiasis (severe infection or in immunocompromised patients only)**
- **BY MOUTH USING ORAL SUSPENSION**
  - Adult: 200 mg on first day, then 100 mg once daily for 13 days, dose to be taken with food

**Posaconazole**

**Indications and Dose**
- Invasive aspergillosis in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin
- Fusariosis either unresponsive to, or in patients intolerant of, amphotericin
- Chromoblastomycosis and mycetoma either unresponsive to, or in patients intolerant of, itraconazole
- Coccidioidomycosis either unresponsive to, or in patients intolerant of, amphotericin, itraconazole, or fluconazole

**Dosage Forms**
- Oral Suspension
  - Posaconazole 250 mg/5 mL Oral Suspension sugar free sugar-free [250 mg/5 mL]; 280 mg/5 mL Oral Suspension sugar free sugar-free [280 mg/5 mL]; 420 mg/5 mL Oral Suspension sugar free sugar-free [420 mg/5 mL]

**Administration**
- Adult: 200 mg twice daily
- Pediatric: 200 mg twice daily in three divided doses

**Contraindications**
- Hypersensitivity to posaconazole or any component of the formulation
- Severe liver impairment

**Warnings**
- False positive reactions with sugars, alcohol, and glucose oxidase-based immunoassays for blood and urine glucose tests
- Pregnancy: Category B. Use only if potential benefit outweighs any potential risk to the fetus
- Breastfeeding: Use only if potential benefit outweighs any potential risk to the neonate

**Interactions**
- Posaconazole may inhibit the metabolism of other drugs that rely on the CYP3A4 isoenzyme
- Drug interactions may alter the pharmacodynamics and/or pharmacokinetics of co-administered drugs

**Pharmacology**
- Posaconazole is a triazole antifungal agent
- Inhibits fungal RNA polymerase
- Has broad-spectrum activity against a variety of fungi

**Pharmacokinetics**
- Posaconazole is well absorbed after oral administration
- Bioavailability is increased with food
- Distribution is extensive, with high concentrations in lung, liver, and spleen
- Metabolism is primarily via the cytochrome P450 3A4 system
- Elimination is mainly via the bile and粪便

**Adverse Effects**
- Common: Headache, nausea, diarrhea, abdominal pain, vomiting, anorexia, and rash
- Serious: Hepatotoxicity, bone marrow suppression, and skin reactions

**Dosage and Administration**
- Oral Suspension: Administer on a full stomach
- Tablets: Take with food

**Monitoring**
- Liver function tests
- Complete blood count

**Special Considerations**
- Use with caution in patients with liver or bone marrow toxicity
- Discontinue if signs of hepatotoxicity or rash develop

**Precautions**
- Use with caution in patients with renal impairment
- Use with caution in patients with hypersensitivity to other triazole antifungals

**Manufacturers**
- Pfizer

**References**
- FDA approval
- Summary of Product Characteristics

**Downloaded from www.medicalbr.com**
Prophylaxis of invasive fungal infections in patients undergoing bone-marrow transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome who are expected to become neutropenic, and who are intolerant of fluconazole or itraconazole

▶ BY MOUTH USING ORAL SUSPENSION
  Adult: 200 mg 3 times a day start before transplantation or before chemotherapy and continued until neutrophil count recovers, dose to be taken with food

▶ BY MOUTH USING TABLETS
  Adult: 300 mg twice daily on first day, then 300 mg once daily start before transplantation or before chemotherapy and continued until neutrophil count recovers

DOSE EQUIVALENCE AND CONVERSION
Posaconazole oral suspension is not interchangeable with tablets on a milligram-for-milligram basis.

PHARMACOKINETICS
Posaconazole oral suspension should be taken with food (preferably a high fat meal) or nutritional supplement to ensure adequate exposure for systemic effects. Where possible, tablets should be used in preference to suspension because tablets have a higher bioavailability.

UNLICENSED USE Tablets not licensed for oophoronygael candidiasis.

CONTRA-INDICATIONS Acute porphyrias p. 969

CAUTIONS Body-weight over 120 kg—risk of treatment failure possibly increased.
Body-weight under 60 kg—risk of side effects increased.
Bradycardia, cardiomyopathy, history of QT interval prolongation, symptomatic arrhythmias

INTERACTIONS ▶ Appendix 1: antifungals, azoles

SIDE-EFFECTS
▶ Common or very common Abdominal pain, anaemia, anorexia, blood disorders, constipation, diarrhoea, dizziness, drowsiness, dry mouth, dyspepsia, electrolyte disturbances, fatigue, fever, flatulence, gastro-intestinal disturbances, headache, nausea, neutropenia, paraesthesia, pruritus, rash, thrombocytopenia, vomiting
▶ Uncommon Alopecia, aphasia, arthralgias, bradyarrhythmia, changes in blood pressure, convulsions, cough, gastro-oesophageal reflux, hepatic disorders, hiccups, hyperglycaemia, insomnia, menstrual disorders, mouth ulcers, musculoskeletal pain, neuropathy, oedema, palpitation, pancreatitis, renal failure, tachycardia, tremor, vasculitis, visual disturbances
▶ Rare Adrenal insufficiency, breast pain, cardiac failure, depression, encephalopathy, hearing impairment, ileus, myocardial infarction, pneumonitis, psychosis, Stevens-Johnson syndrome, stroke, syncope, thrombosis

CONCEPTION AND CONTRAINDICATIONS Manufacturer recommends effective contraception during treatment.

PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk; toxicity in animal studies.

BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT Manufacturer advises caution. Monitor liver function in hepatic impairment.

MONITORING REQUIREMENTS
Monitor electrolytes (including potassium, magnesium, and calcium) before and during therapy.
Monitor liver function before and during therapy.

PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include cherry.

MEDICATION FORMS
There can be variation in the licensing of different medicines containing the same drug.

Oral suspension
CAUTIONARY AND ADVISORY LABELS 3, 9, 21
▶ Noxafil (Merck Sharp & Dohme Ltd)
  Posaconazole 40 mg per 1 ml Noxafil 40mg/ml oral suspension ▶ 105 ml £491.20 (Hospital only)

Gastro-resistant tablet
CAUTIONARY AND ADVISORY LABELS 3, 9, 25
▶ Noxafil (Merck Sharp & Dohme Ltd)
  Posaconazole 100 mg Noxafil 100mg gastro-resistant tablets ▶ 24 tablet £596.96 ▶ 96 tablet £2,387.85

Voriconazole

INDICATIONS AND DOSE
Invasive aspergillosis ▶ Serious infections caused by Scedosporium spp., Fusarium spp., or invasive fluconazole-resistant Candida spp. (including C. krusei)
▶ BY MOUTH
  Adult (body-weight up to 40 kg): Initially 200 mg every 12 hours for 2 doses, then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours
  Adult (body-weight 40 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours

▶ BY INTRAVENOUS INFUSION
  Adult: Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours; reduced if not tolerated to 3 mg/kg every 12 hours; for max. 6 months

DOSE ADJUSTMENTS DUE TO INTERACTIONS
With intravenous use Manufacturer advises increase maintenance dose to 5 mg/kg every 12 hours with concurrent use of fosphenytoin, phenytoin or rifabutin.

With oral use Manufacturer advises increase maintenance dose with concurrent use of fosphenytoin or phenytoin; 400 mg every 12 hours for patients of body-weight 40 kg and above; 200 mg every 12 hours for patients of body-weight less than 40 kg. Manufacturer advises if concurrent use of rifabutin is unavoidable, increase maintenance dose to 350 mg every 12 hours for patients of body-weight 40 kg and above; 200 mg every 12 hours for patients of body-weight less than 40 kg.

CONTRA-INDICATIONS Acute porphyrias p. 969

CAUTIONS Avoid exposure to sunlight, bradycardia, cardiomyopathy, electrolyte disturbances, history of QT interval prolongation, patients at risk of pancreatitis, symptomatic arrhythmias

INTERACTIONS ▶ Appendix 1: antifungals, azoles

SIDE-EFFECTS
GENERAL SIDE-EFFECTS

Abdominal pain, acute renal failure, agitation, alopecia, altered perception, anaemia, anxiety, asthenia, blood disorders, blurred vision, cheilitis, chest pain, confusion, depression, diarrhoea, dizziness, haematuria, hallucinations, headache, hypoglycaemia, hypokalaemia, hypotension, influenza-like symptoms, jaundice, leucopenia, nausea, oedema, pancreatopathy, paraesthesia, photophobia, photosensitivity, pruritus, rash, respiratory distress syndrome, sinuses, thrombocytopenia, tremor, visual disturbances, vomiting

Uncommon Adrenocortical insufficiency, arrhythmias, arthritis, ataxia, blepharitis, cholecytitis, constipation, duodenitis, dyspepsia, flushing, fulminant hepatic failure, gingivitis, glossitis, hepatitis, hypersensitivity reactions, hypoaesthesia, hyponatraemia, nystagmus

Uncommon Gotaitan and seizures, headache, hypothermia, intercurrent infection, joint pain, myalgia, myoperoneal weakness, myopathy, parasthesia, pancytopenia, pericarditis, petechiae, peritonitis, photosensitivity, postural hypotension, pruritus, rash, respiratory distress syndrome, sepsis, shivering, sinusitis, thrombocytopenia, tremor, visual disturbances, vomiting

Uncommon Drowsiness, fatigue, fever, flu-like symptoms, headache, myalgia, nervousness, pancytopenia, paraesthesia, photophobia, photosensitivity, pruritus, rash, respiratory distress syndrome, sinusitis, thrombocytopenia, tremor, visual disturbances, vomiting

Uncommon Adrenocortical insufficiency, arrhythmias, arthritis, ataxia, blepharitis, cholecytitis, constipation, duodenitis, dyspepsia, flushing, fulminant hepatic failure, gingivitis, glossitis, hepatitis, hypersensitivity reactions, hypoaesthesia, hyponatraemia, nystagmus
optic neuritis · pancreatitis · psoasitis · QT interval prolongation · raised serum cholesterol · scleritis · Stevens-Johnson syndrome · syncope

- Rare · Convulsions · discoid lupus erythematosus · extrapyramidal effects · hearing disturbances · hypertension · hypotension · hypothyroidism · insomnia · optic atrophy · pseudomembranous colitis · pseudoporphyria · retinal haemorrhage · taste disturbances (more common with oral suspension) · tinnitus · toxic epidermal necrolysis

- Frequency not known · On long term treatment, squamous cell carcinoma of skin (particularly in presence of phototoxicity) · peristitis (particularly in transplant patients)

SPECIFIC SIDE-EFFECTS

- Common or very common

- With intravenous use · Injection-site reactions

SIDE-EFFECTS, FURTHER INFORMATION

- Hepatotoxicity · Hepatitis, cholestasis, and fulminant hepatic failure usually occur in the first 10 days; risk of hepatotoxicity increased in patients with haematological malignancy. Consider treatment discontinuation if severe abnormalities in liver function tests.

- Phototoxicity · Phototoxicity occurs commonly. If phototoxicity occurs, consider treatment discontinuation; if treatment is continued, monitor for pre-malignant skin lesions and squamous cell carcinoma, and discontinue treatment if they occur.

- CONCEPTION AND CONTRACEPTION · Effective contraception required during treatment.

- PREGNANCY · Toxicity in animal studies—manufacturer advises avoid unless potential benefit outweighs risk.

- BREAST FEEDING · Manufacturer advises avoid—no information available.

- HEPATIC IMPAIRMENT · In mild to moderate hepatic cirrhosis use usual initial dose then halve maintenance dose. No information available for severe hepatic cirrhosis—manufacturer advises use only if potential benefit outweighs risk.

- RENAL IMPAIRMENT · Intravenous vehicle may accumulate if eGFR less than 50 mL/minute/1.73 m²—use intravenous infusion only if potential benefit outweighs risks, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required).

- MONITORING REQUIREMENTS

- Monitor renal function.

- Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment.

- DIRECTIONS FOR ADMINISTRATION · For intravenous infusion, reconstitute each 200 mg with 19 mL. Water for Injections or Sodium Chloride 0.9% to produce a 10 mg/mL solution; dilute dose to concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give intermittently at a rate not exceeding 3 mg/kg/hour.

- PRESCRIBING AND DISPENSING INFORMATION · Flavours of oral liquid formulations may include orange.

- PATIENT AND CARER ADVICE · Patients and their carers should be advised to keep the alert card with them at all times.

- Patients and their carers should be told how to recognise symptoms of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomitining, malaise or jaundice develop.

- Patients and their carers should be advised that patients should avoid intense or prolonged exposure to direct sunlight, and to avoid the use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunscreen with a high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun.

MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9, 11, 23

- Voriconazole (Non-proprietary)

Voriconazole 50 mg · Voriconazole 50 mg tablets · 28 tablet $54.43–$273.68 DT price = $118.99

Voriconazole 200 mg · Voriconazole 200 mg tablets · 28 tablet $157.49–$1,102.74 DT price = $460.32

- VFEND (Pfizer Ltd)

Voriconazole 50 mg · VFEND 50 mg tablets · 28 tablet $275.68 DT price = $118.99

Voriconazole 200 mg · VFEND 200 mg tablets · 28 tablet $1,102.74 DT price = $460.32

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9, 11, 23

- VFEND (Pfizer Ltd)

Voriconazole 40 mg per 1 ml · VFEND 40 mg/ml oral suspension · 75 ml $551.37

Powder for solution for infusion

EXCIPIENTS: · May contain Sulfobutylether beta cyclodextrin sodium

ELECTROLYTES: · May contain Sodium

- Voriconazole (Non-proprietary)

Voriconazole 200 mg · Voriconazole 200 mg powder for solution for infusion vials · 1 vial $51.43–$77.14 (Hospital only)

- VFEND (Pfizer Ltd)

Voriconazole 200 mg · VFEND 200 mg powder for solution for infusion vials · 1 vial $77.14 (Hospital only)

Powder and solvent for solution for infusion

EXCIPIENTS: · May contain Sulfobutylether beta cyclodextrin sodium

ELECTROLYTES: · May contain Sodium

- VFEND (Pfizer Ltd)

Voriconazole 200 mg · VFEND 200 mg powder and solvent for solution for infusion vials · 1 vial $77.14 (Hospital only)

OTHER

Flucytosine

INDICATIONS AND DOSE

- Systemic yeast and fungal infections · Adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections

B Y INTRAVENOUS INFUSION

- Adult: Usual dose 200 mg/kg daily in 4 divided doses usually for not more than 7 days, alternatively 100–150 mg/kg daily in 4 divided doses, lower dose may be sufficient for extremely sensitive organisms

Cytococcal meningitis (adjunct to amphotericin)

B Y INTRAVENOUS INFUSION

- Adult: 100 mg/kg daily in 4 divided doses for 2 weeks

UNLICENSED USE

Use in cryptococcal meningitis for 2 weeks is an unlicensed duration.

CAUTIONS · Blood disorders · elderly

INTERACTIONS · Appendix 1: flucytosine

SIDE-EFFECTS

Common or very common · Diarrhoea · nausea · rashes · vomitining

Uncommon · Alterations in liver function tests · cardiotoxicity · confusion · convulsions · hallucinations · headache · sedation · toxic epidermal necrolysis · vertigo

Frequency not known · Aplastic anaemia · blood disorders · hepatic necrosis · hepatitis · leucopenia · thrombocytopenia

PREGNANCY · Teratogenic in animal studies; manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING · Manufacturer advises avoid.

RENAL IMPAIRMENT · Use 50 mg/kg every 12 hours if creatinine clearance 20–40 mL/minute; use 50 mg/kg every
24 hours if creatinine clearance 10–20 mL/minute; use initial dose of 50 mg/kg if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration. In renal impairment liver- and kidney-function tests and blood counts required weekly.

**MONITORING REQUIREMENTS**
- For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre).
- Liver- and kidney-function tests and blood counts required (weekly in Wilson diseases).

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, give over 20–40 minutes.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**
- **ELECTROLYTES:** May contain Sodium
  - Ancotil (Meda Pharmaceuticals Ltd)
  - Flucytosine 10 mg per 1 ml Ancotil 2.5g/250ml solution for infusion bottles | 5 bottle [PoM] £151.67 (Hospital only)

**Griseofulvin**

- **INDICATIONS AND DOSE**
  - **Dermatophyte infections of the skin, scalp, hair and nails where topical therapy has failed or is inappropriate**
    - **BY MOUTH**
    - Adult: 500 mg daily, increased if necessary to 1 g daily, for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses
  - **Tinea capitis caused by Trichophyton tonsurans**
    - **BY MOUTH**
    - Adult: 1 g once daily, alternatively 1 g daily in divided doses

- **UNLICENSED USE** Griseofulvin doses in BNF may differ from those in product literature.

- **CONTRA-INDICATIONS** Acute porphyrias p. 969; systemic lupus erythematosus (risk of exacerbation)

- **INTERACTIONS** → Appendix 1: griseofulvin

- **SIDE-EFFECTS**
  - **Rare** Erythema multiforme; toxic epidermal necrolysis
  - **Very rare** Headache
  - **Frequency not known** Abdominal pain; agitation; confusion; depression; diarrhoea; dizziness; dyspepsia; fatigue; glossitis; hepatotoxicity; impaired coordination; impaired hearing; leucopenia; menstrual disturbances; nauscea; peripheral neuropathy; photosensitivity; rash; renal failure; sleep disturbances; systemic lupus erythematosus; taste disturbances; vomiting

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 1 month after administration to women (important: effectiveness of oral contraceptives may be reduced, additional contraceptive precautions e.g. barrier method, required). Men should avoid fathering a child during and for at least 6 months after administration

- **PREGNANCY** Avoid (fetotoxicity and teratogenicity in animals).

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
    - May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
  - **Tablet**
    - **CAUTIONARY AND ADVISORY LABELS** 9, 21
    - **Griseofulvin (Non-proprietary)**
      - **Griseofulvin 125 mg** Griseofulvin 125mg tablets | 100 tablet [PoM] £96.67 DT price = £96.67
      - **Griseofulvin 500 mg** Griseofulvin 500mg tablets | 90 tablet [PoM] £99.00 | 100 tablet [PoM] £100.17

### 3.1 Pneumocystis pneumonia

**Pneumocystis pneumonia**

**Overview**
Pneumonia caused by *Pneumocystis jirovecii* (*Pneumocystis carinii*) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

**Treatment**

**Mild to moderate disease**
Co-trimoxazole p. 531 in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone p. 569 is licensed for the treatment of mild to moderate pneumocystis infection in patients who cannot tolerate co-trimoxazole. A combination of dapsone p. 545 with trimethoprim p. 542 is given by mouth for the treatment of mild to moderate disease [unlicensed indication].

A combination of clindamycin p. 506 and primaquine p. 585 by mouth is used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

**Severe disease**
Co-trimoxazole in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate p. 569 given by intravenous infusion is an alternative for patients who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia.

**Adjunctive therapy**
In moderate to severe infections associated with HIV infection, prednisolone p. 639 is given by mouth for 5 days (alternatively, hydrocortisone p. 637 may be given parenterally); the dose is then reduced to complete 21 days of treatment. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

**Prophylaxis**
Prophylaxis against pneumocystis pneumonia should be given to all patients with a history of the infection. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised patients. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the patient has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.
Co-trimoxazole by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. It is given daily or on alternate days (3 times a week); the dose may be reduced to improve tolerance.

Inhaled pentamidine isetionate is better tolerated than parenteral pentamidine isetionate. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in patients unable to tolerate co-trimoxazole. It is effective but patients may be prone to extrapulmonary infection. Alternatively, dapsone can be used. Atovaquone has also been used for prophylaxis [unlicensed indication].

**INTERACTIONS**

Co-trimoxazole by mouth is the drug of choice for antiprotozoals [unlicensed indication].

Atovaquone has also been used for prophylaxis against pneumocystis pneumonia. It is effective but patients may be prone to pneumocystis pneumonia in patients unable to tolerate pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in patients unable to tolerate co-trimoxazole. It is effective but patients may be prone to extrapulmonary infection. Alternatively, dapsone can be used. Atovaquone has also been used for prophylaxis [unlicensed indication].

</table>

**Prophylaxis of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia (specialist use only)**

- **BY INHALATION OF NEBULISED SOLUTION**
  - Adult: 300 mg every 4 weeks, alternatively 150 mg every 2 weeks, using suitable equipment—consult product literature

**Visceral leishmaniasis (specialist use only)**

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 3–4 mg/kg once daily on alternate days, maximum total of 10 injections, course may be repeated if necessary

**Cutaneous leishmaniasis (specialist use only)**

- **BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 4 mg/kg once daily or on alternate days for a total of 7–10 injections

**UNLICENSED USE**

- Not licensed for primary prevention of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia by inhalation of nebulised solution.

**CAUTIONS**

- Anemia—bradycardia—coronary heart disease—history of ventricular arrhythmias—hyperglycaemia—hypertension—hypoglycaemia—hypokalaemia—hypomagnesaemia—hypotension—leucopenia—risk of severe hypotension following administration—thrombocytopenia

**INTERACTIONS**

- ▶ Appendix 1: antimalarials

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Abnormal liver function tests—acute renal failure—anaemia—arrhythmias (can be severe and sometimes fatal)—azotaemia—dizziness—flushing—hyperglycaemia—hyperkalaemia—hypocalcaemia—hypoglycaemia (can be severe and sometimes fatal)—hypotension (can be severe and sometimes fatal)—leucopenia—nausea—pancreatitis (can be severe and sometimes fatal)—rash—Stevens-Johnson syndrome—syncope—taste disturbances—thrombocytopenia—vomiting

**SPECIFIC SIDE-EFFECTS**

- When used by inhalation—Bronchoconstriction (may be prevented by prior use of bronchodilators)—cough—shortness of breath

- With intramuscular use or intravenous use. Injection site reactions (muscle necrosis, discomfort, pain, induration, abscess formation)

**PREGNANCY**

- Manufacturer advises avoid unless essential.

**BREAST FEEDING**

- Manufacturer advises avoid unless essential—no information available.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution.

**RENAL IMPAIRMENT**

- Manufacturer advises caution. Monitor more closely in renal impairment.

**PRESCRIBING AND DISPENSING INFORMATION**

- Flavours of oral liquid formulations may include tutti-frutti.
Infection
Niclosamide [unlicensed] (available from Taenicide well tolerated.
side-effects are limited to occasional gastrointestinal upset, light-headedness, and pruritus; it is not effective against
Powder for injection (dissolved in water for injection) may be used for nebulisation.

**HANDLING AND STORAGE** Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- Pentamidine isetionate 300 mg
  - Pentamidine isetionate 300 mg powder for solution for injection vials | 5 vial (Poz) £158.86

**Drugs for threadworms**
Anthelmintics are effective in threadworm (pinworms, *Enterobius vermicularis*) infections, but their use needs to be combined with hygiene measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole is effective against *Ascaris lumbricoides* and is generally considered to be the drug of choice.

Levamisole p. 571 [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is an alternative when mebendazole cannot be used. It is very well tolerated.

**Drugs for tapeworm infections**

**Taenicides**

Niclosamide [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, light-headedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in *Taenia solium* infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel p. 572 [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is as effective as niclosamide.

**Hydatid disease**

Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. Albendazole p. 571 [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to *E. multilocularis* is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

**Drugs for hookworms**

Hookworms (anctlostomiasis, necatoriasis) live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole has a useful broad-spectrum activity, and is effective against hookworms. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is an alternative. Levamisole is also is effective in children.

**Schistosomicides (bilharziasis)**

Adult *Schistosoma haematobium* worms live in the genito-urinary veins and adult *S. mansoni* in those of the colon and mesentery. *S. japonicum* is more widely distributed in veins of the alimentary tract and portal system.

Praziquantel [unlicensed] is available from Merck Serono (Cysticide *) and is effective against all human schistosomes. No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

**Filaricides**

Diethylcarbamazine [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions, treatment in adults and children over 1 month, is commenced with a dose of diethylcarbamazine citrate on the first day and increased gradually over 3 days. Length of treatment varies according to infection type, and usually gives a radical cure for these infections. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin p. 571 [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is very effective in onchocerciasis and it is now the drug of choice; reactions are usually slight. Diethylcarbamazine or suramin should no longer be used for onchocerciasis because of their toxicity.
Drugs for cutaneous larva migrans (creeping eruption)

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical tiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or tiabendazole (tiabendazole) by mouth [all unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies).

Drugs for strongyloidiasis

Adult Strongyloides stercoralis live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is the treatment of choice for chronic Strongyloides infection in adults and children over 5 years. Albendazole [unlicensed] (available from ‘special order’ manufacturers or specialist importing companies) is an alternative given to adults and children over 2 years.

ANTHELMINTICS

Albendazole

- **INDICATIONS AND DOSE**
  - Chronic Strongyloides infection
    - **BY MOUTH**
      - Adult: 400 mg twice daily for 3 days, dose may be repeated after 3 weeks if necessary
  - Hydatid disease, in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases
    - **BY MOUTH**
      - Adult: (consult product literature)
  - Hookworm infections
    - **BY MOUTH**
      - Adult: 400 mg for 1 dose
- **UNLICENSED USE** Albendazole is an unlicensed drug.
- **INTERACTIONS** → Appendix 1: albendazole

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet, oral suspension
  - **Tablet**
    - CAUTIONARY AND ADVISORY LABELS 9
      - Albendazole (Non-proprietary)
        - Albendazole 400 mg Eskazole 400mg tablets | 60 tablet | no price available
  - **Chewable tablet**
    - CAUTIONARY AND ADVISORY LABELS 9
      - Albendazole (Non-proprietary)
        - Albendazole 200 mg Zentel 200mg chewable tablets | 6 tablet | no price available
        - Albendazole 400 mg Zentel 400mg chewable tablets | 1 tablet | no price available | 3 tablet | no price available

Diethylcarbamazine

- **INDICATIONS AND DOSE**
  - Wuchereria bancrofti infections | Brugia malayi infections
    - **BY MOUTH**
      - Adult: Initially 1 mg/kg daily on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days
- **UNLICENSED USE** Diethylcarbamazine is an unlicensed drug.
- **INTERACTIONS** → Appendix 1: diethylcarbamazine

Ivermectin

**INDICATIONS AND DOSE**

- Chronic Strongyloides infection
  - **BY MOUTH**
    - Adult: 200 micrograms/kg for 2 days
- Onchocerciasis
  - **BY MOUTH**
    - Adult: 150 micrograms/kg for 1 dose, retreatment at intervals of 6 to 12 months, depending on symptoms, must be given until the adult worms die out
- Scabies, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or ‘Norwegian’) scabies that does not respond to topical treatment alone
  - **BY MOUTH**
    - Adult: 200 micrograms/kg for 1 dose, further doses of 200 micrograms/kg may be required

- **UNLICENSED USE** Ivermectin is unlicensed.
- **SIDE-EFFECTS** Aggravation of itching - aggravation of rash
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2015) that ivermectin (Soolantra®) is accepted for restricted use within NHS Scotland for the treatment of moderate-to-severe inflammatory lesions of rosacea (papulopustular) where a topical treatment is considered appropriate.

All Wales Medicines Strategy Group (AWMSG) Decisions

The All Wales Medicines Strategy Group has advised (April 2016) that ivermectin (Soolantra®) is recommended as an option for use within NHS Wales for the topical treatment of inflammatory lesions of rosacea (papulopustular) in adult patients.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet
  - **Tablet**
    - Ivermectin (Non-proprietary)
      - Ivermectin 3 mg Stromectol 3mg tablets | 4 tablet | no price available | 20 tablet | no price available

Levamisole

- **INDICATIONS AND DOSE**
  - Roundworm infections
    - **BY MOUTH**
      - Adult: 120–150 mg for 1 dose
- **UNLICENSED USE** Not licensed.
- **CONTRA-INDICATIONS** Blood disorders
- **CAUTIONS** Epilepsy · Sjögren’s syndrome
572 Protozoal infection

Mebendazole

**INDICATIONS AND DOSE**

**Threadworm infections**

- **BY MOUTH**
  - Child 6 months–17 years: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks
  - Adult: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks

** Whipworm infections** | **Hookworm infections**

- **BY MOUTH**
  - Child 1–17 years: 100 mg twice daily for 3 days
  - Adult: 100 mg twice daily for 3 days

**Roundworm infections**

- **BY MOUTH**
  - Child 1 year: 100 mg twice daily for 3 days
  - Child 2–17 years: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose
  - Adult: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose

**UNLICENSED USE** Not licensed for use as a single dose of 500 mg in roundworm infections. Not licensed for use in children under 2 years.

**INTERACTIONS** → Appendix 1: mebendazole

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain
- **Uncommon** Diarrhoea • flatulence
- **Rare** Alopecia • convulsions • dizziness • hepatitis • neutropenia • rash • Stevens-Johnson syndrome • toxic epidermal necrolysis • urticaria

**PREGNANCY** Manufacturer advises avoid—tendency in animal studies.

**BREAST FEEDING** Amount present in milk too small to be harmful but manufacturer advises avoid.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Mebendazole for worm infections www.medicinesforchildren.org.uk/mebendazole-for-worm-infections

**EXCEPTIONS TO LEGAL CATEGORY** Mebendazole tablets can be sold to the public if supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- **Ovex (McNeil Products Ltd)**
  - Mebendazole 20 mg per 1 ml Ovex 100mg/5ml oral suspension | 30 ml £6.03 DT price = £1.55
  - Vermox (Janssen-Cilag Ltd)
  - Mebendazole 20 mg per 1 ml Vermox 100mg/5ml oral suspension | 30 ml £1.55 DT price = £1.55

**Chewable tablet**

- **Ovex (McNeil Products Ltd)**
  - Mebendazole 100 mg Ovex 100mg chewable tablets sugar-free | 1 tablet £2.03 sugar-free | 4 tablet £4.74
  - Vermox (Janssen-Cilag Ltd)
  - Mebendazole 100 mg Vermox 100mg chewable tablets sugar-free | 6 tablet £1.34 DT price = £1.34

Praziquantel

**INDICATIONS AND DOSE**

**Tapeworm infections (Taenia solium)**

- **BY MOUTH**
  - Adult: 5–10 mg/kg for 1 dose, to be taken after a light breakfast

**Tapeworm infections (Hymenolepis nana)**

- **BY MOUTH**
  - Adult: 25 mg/kg for 1 dose, to be taken after a light breakfast

**Schistosoma haematobium worm infections | Schistosoma mansoni worm infections**

- **BY MOUTH**
  - Adult: 20 mg/kg, followed by 20 mg/kg after 4–6 hours

**Schistosoma japonicum worm infections**

- **BY MOUTH**
  - Adult: 20 mg/kg 3 times a day for 1 day

**UNLICENSED USE** Praziquantel is an unlicensed drug.

**INTERACTIONS** → Appendix 1: praziquantel

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Tablet**

- **Cysticide (Imported (Germany))**
  - Praziquantel 500 mg tablets | 90 tablet no price available

### 5 Protozoal infection

#### Antiprotozoal drugs

**Amebicicides**

Metronidazole p. 512 is the drug of choice for acute invasive amoebic dysentery since it is very effective against vegetative forms of Entamoeba histolytica in ulcers. Tindazole p. 514 is also effective. Metronidazole and tindazole are also active against amoebae which may have migrated to the liver.

Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate p. 479.

Diloxanide furoate is the drug of choice for asymptomatic patients with E. histolytica cysts in the faeces; metronidazole and tindazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of...
10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For amoebic abscesses of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with more than 100 mL of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

**Trichomonacides**

Metronidazole is the treatment of choice for *Trichomonas vaginalis* infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole may be tried.

**Antigiardial drugs**

Metronidazole is the treatment of choice for *Giardia lamblia* infections. Alternative treatments are tinidazole or mepacrine hydrochloride p. 479.

**Leishmaniaces**

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate below, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dosage varies with different geographical regions and expert advice should be obtained. Some early non-inflamed lesions of cutaneous leishmaniasis can be treated with intralesional injections of sodium stibogluconate under specialist supervision.

Amphotericin p. 561 is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (*AmBisome*®). *Abelcet®*, a lipid formulation of amphotericin is also likely to be effective but less information is available.

Pentamidine isetionate p. 569 has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies).

**Trypanocides**

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

**Drugs for toxoplasmosis**

Most infections caused by *Toxoplasma gondii* are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma chorioretinitis), and those who are immunosuppressed. Toxoplasminic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine p. 586 and sulfadiazine p. 532, given for several weeks (expert advice essential). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folinic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin p. 506 or clarithromycin p. 508 or azithromycin p. 507. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) may reduce the risk of transmission of maternal infection to the fetus.

### 5.1 Leishmaniasis

Other drugs used for Leishmaniasis

*Amphotericin, p. 561 - Pentamidine isetionate, p. 569*

**ANTIPROTOZOALS**

### Sodium stibogluconate

<table>
<thead>
<tr>
<th>INDICATIONS AND DOSE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Visceral leishmaniasis (specialist use only)</td>
</tr>
<tr>
<td>By intravenous injection, or by intramuscular injection</td>
</tr>
<tr>
<td>Adult: 20 mg/kg daily for 28 days</td>
</tr>
</tbody>
</table>

| Cutaneous leishmaniasis (specialist use only) |
| By intravenous injection, or by intramuscular injection |
| Adult: 20 mg/kg daily for 20 days |

| CAUTIONS |
| Heart disease (withdraw if conduction disturbances occur) • mucocutaneous disease • predisposition to QT interval prolongation • treat intercurrent infection (e.g. pneumonia) |

| CAUTIONS, FURTHER INFORMATION |
| Mucocutaneous disease Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening if pharyngeal or tracheal involvement) — may require corticosteroid. |

| INTERACTIONS |
| Appendix 1: sodium stibogluconate |

| SIDE-EFFECTS |
| Rare |
| Bleeding from gums • bleeding from nose • fever • flushing • jaundice • rash • substernal pain • sweating • vertigo |

| Frequency not known |
| Abdominal pain • anaphylaxis • anorexia • arthralgia • coughing • diarrhea • ECG changes • headache • lethargy • myalgia • nausea • pain on intramuscular injection • pain on intravenous administration • pancreatitis • thrombosis on intravenous administration • vomiting |

| PREGNANCY |
| Manufacturer advises use only if potential benefit outweighs risk. |

| BREAST FEEDING |
| Amount probably too small to be harmful. |

| HEPATIC IMPAIRMENT |
| Use with caution. |

| RENAL IMPAIRMENT |
| Avoid in significant impairment. |

| MONITORING REQUIREMENTS |
| Monitor ECG before and during treatment. |

| DIRECTIONS FOR ADMINISTRATION |
| Intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain occur. Injection should be filtered immediately before administration using a filter of 5 microns or less. |
### 5.2 Malaria

#### Antimalarials

**Artemether with lumefantrine**
Artemether with lumefantrine p. 581 is licensed for the treatment of acute non-complicated falciparum malaria.

**Chloroquine**
Chloroquine p. 582 is used for the prophylaxis of malaria in areas of the world where the risk of chloroquine-resistant falciparum malaria is still low. It is also used with proguanil hydrochloride p. 585 when chloroquine-resistant falciparum malaria is present but this regimen may not give optimal protection (see recommended regimens for prophylaxis against malaria in Malaria, prophylaxis p. 574). Chloroquine is no longer recommended for the treatment of falciparum malaria owing to widespread resistance, nor is it recommended if the infective species is not known or if the infection is mixed; in these cases treatment should be with quinine p. 586, Malarone®, or Riamet®. It is still recommended for the treatment of non-falciparum malaria.

**Mefloquine**
Mefloquine p. 584 is used for the prophylaxis of malaria in areas of the world where there is a high risk of chloroquine-resistant falciparum malaria (for details, see recommended regimens for prophylaxis against malaria in Malaria, prophylaxis below). Mefloquine is now rarely used for the treatment of falciparum malaria because of increased resistance. It is rarely used for the treatment of non-falciparum malaria because better tolerated alternatives are available. Mefloquine should not be used for treatment if it has been used for prophylaxis.

**Piperaquine with artenimol**
Artenimol with piperaquine phosphate p. 581 is not recommended for the first-line treatment of acute uncomplicated falciparum malaria because there is limited experience of its use in travellers who usually reside in areas where malaria is not endemic. Piperaquine has a long half-life.

**Primaquine**
Primaquine p. 585 is used to eliminate the liver stages of P. vivax or P. ovale following chloroquine treatment.

**Proguanil**
Proguanil hydrochloride is used (usually with chloroquine, but occasionally alone) for the prophylaxis of malaria, (for details, see Recommended regimens for prophylaxis against malaria p. 575). Proguanil hydrochloride used alone is not suitable for the treatment of malaria; however, Malarone® (a combination of atovaquone with proguanil hydrochloride p. 582) is licensed for the treatment of acute uncomplicated falciparum malaria. Malarone® is also used for the prophylaxis of falciparum malaria in areas of widespread mefloquine or chloroquine resistance. Malarone® is also used as an alternative to mefloquine or doxycycline p. 534. Malarone® is particularly suitable for short trips to highly chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

**Pyrimethamine**
Pyrimethamine p. 586 should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine p. 586 is not recommended for the prophylaxis of malaria, but can be used in the treatment of falciparum malaria with (or following) quinine.

**Quinine**
Quinine is not suitable for the prophylaxis of malaria. Quinine is used for the treatment of falciparum malaria or if the infective species is not known or if the infection is mixed (for details see Malaria, treatment p. 580).

**Tetracyclines**
Doxycycline is used in adults and children over 12 years for the prophylaxis of malaria in areas of widespread mefloquine or chloroquine resistance. Doxycycline is also used as an alternative to mefloquine or Malarone® (for details, see Recommended regimens for prophylaxis against malaria p. 575).

#### Malaria, prophylaxis

**Prophylaxis**
The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists; the advice is aimed at residents of the UK who travel to endemic areas. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria
- extent of drug resistance
- efficacy of the recommended drugs
- side-effects of the drugs
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen)

**Protection against bites**
Prophylaxis is not absolute, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important. Mosquito nets impregnated with permethrin p. 1135 provide the most effective barrier protection against insects; mats and vaporised insecticides are also useful. Diethyltoluamide (DEET) 20–50% in lotions, sprays, or roll-on formulations is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. When sunscreen is also required, DEET should be applied after the sunscreen. DEET reduces the SPF of sunscreen, so a sunscreen of SPF 30–50 should be applied. Long sleeves and trousers worn after dusk also provide protection against bites.

**Length of prophylaxis**
In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (2–3 weeks in the case of mefloquine p. 584) before travel into an endemic area; Malarone® or doxycycline p. 534 prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for 4 weeks after leaving (except for Malarone® prophylaxis which should be stopped 1 week after leaving). For extensive journeys across different regions, the traveller must be protected in all areas of risk.

In those requiring long-term prophylaxis, chloroquine p. 582 and proguanil hydrochloride p. 585 may be used for periods of over 5 years. Mefloquine is licensed for up to...

Return from malarial region

It is important to be aware that any illness that occurs within 1 year and especially within 3 months of return might be malaria even if all recommended precautions against malaria were taken. Travellers should be warned of this and told that if they develop any illness particularly within 3 months of their return they should go immediately to a doctor and specifically mention their exposure to malaria.

Epilepsy

Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In areas without chloroquine resistance proguanil alone is recommended; in areas with chloroquine resistance, doxycycline or Malarone® may be considered.

Asplenia

Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

Renal impairment

Avoidance (or dosage reduction) of proguanil hydrochloride is recommended since it is excreted by the kidneys. Malarone® should not be used for prophylaxis in patients with estimated glomerular filtration rate less than 30 mL/minute/1.73m². Chloroquine is only partially excreted by the kidneys and reduction of the dose for prophylaxis is not required except in severe impairment. Mefloquine is considered to be appropriate to use in renal impairment and does not require dosage reduction. Doxycycline is also considered to be appropriate.

Pregnancy

Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil hydrochloride can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in Sub-Saharan Africa; in the case of proguanil hydrochloride, folic acid (dosed as a pregnancy at ‘high-risk’ of neural tube defects) should be given for at least the first trimester. The centres listed (see Malaria, treatment p. 580) should be consulted for advice on prophylaxis in chloroquine-resistant areas. Although the manufacturer advises that mefloquine should not be used during pregnancy, particularly in the first trimester, unless the potential benefit outweighs the risk, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline is contra-indicated during pregnancy; however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks’ gestation [unlicensed]. Malarone® should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative.

Breast-feeding

Prophylaxis is required in breast-fed infants; although antimalarials are present in milk, the amounts are too variable to give reliable protection.
Anticoagulants
Travellers taking warfarin sodium p. 135 should begin chemoprophylaxis 2–3 weeks before departure. The INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

Standby treatment
Travellers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be avoided if medical help is accessible.

In order to avoid excessive self-medication, the traveller should be provided with written instructions that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course available for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

Specific recommendations
Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice. See Recommended regimens for prophylaxis against malaria.

Important
Settled immigrants (or long-term visitors) to the UK may be unaware that any immunity they may have acquired while living in malarious areas is lost rapidly after migration to the UK, or that any non-malarious areas where they lived previously may now be malarious.

Treatment of malaria
Recommendations on the treatment of malaria reflect guidelines agreed by UK malaria specialists.

If the infective species is not known, or if the infection is mixed, initial treatment should be as for falciparum malaria with quinine p. 586, Malarone® (atovaquone with proguaulin hydrochloride p. 582), or Riamet® (artemether with lumefantrine p. 581). Falciparum malaria can progress rapidly in unprotected individuals and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

Falciparum malaria (treatment)
Falciparum malaria (malignant malaria) is caused by Plasmodium falciparum. In most parts of the world P. falciparum is now resistant to chloroquine p. 582 which should not therefore be given for treatment.

Quinine, Malarone® (atovaquone with proguaulin hydrochloride), or Riamet® (artemether with lumefantrine) can be given by mouth if the patient can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given by intravenous infusion if the patient is seriously ill or unable to take tablets. Mefloquine p. 584 is now rarely used for treatment because of concerns about resistance.

Oral quinine is given by mouth for 5–7 days, together with or followed by either doxycycline p. 534 for 7 days or clindamycin p. 506 for 7 days [unlicensed].

If the parasite is likely to be sensitive, pyrimethamine with sulfadoxine p. 586 as a single dose [unlicensed] may be given (instead of either clindamycin or doxycycline) together with, or after, a course of quinine.

Alternatively, Malarone®, or Riamet® may be given instead of quinine. It is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after Malarone® or Riamet® treatment.

If the patient is seriously ill or unable to take tablets, or if more than 2% of red blood cell are parasitized, quinine should be given by intravenous infusion [unlicensed] (until patient can swallow tablets to complete the 7-day course together with or followed by either doxycycline or clindamycin).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for ’named-patient’ use.

Pregnancy
Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The adult treatment doses or oral and intravenous quinine (including the loading dose) can safely be given to pregnant women. Chloramycin should be given after quinine [unlicensed indication]. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development); pyrimethamine with sulfadoxine, Malarone®, and Riamet® are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for ’named patient’ use.

Non-falciparum malaria (treatment)
Non-falciparum malaria is usually caused by Plasmodium vivax and less commonly by P. ovale and P. malariae. P. knowlesi is also present in the Asia-Pacific region.

Chloroquine is the drug of choice for the treatment of non-falciparum malaria (but chloroquine-resistant P. vivax has been reported in the Indonesian archipelago, the Malay Peninsula, including Myanmar, and eastward to Southern Vietnam).

For the treatment of chloroquine-resistant non-falciparum malaria, Malarone®[unlicensed indication], quinine, or Riamet®[unlicensed indication] can be used; as with
chloroquine, primaquine p. 585 should be given for radical cure.

Chloroquine alone is adequate for *P. malarias* and *P. knowlesi* infections but in the case of *P. vivax* and *P. ovale*, a radical cure (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine [unlicensed] given after chloroquine, with the dose dependent on the infecting organism. For a radical cure, primaquine [unlicensed] is then given for 14 days, with the dose also dependent on the infecting organism.

**Parenteral**

Parenteral If the patient is unable to take oral therapy, quinine can be given by intravenous infusion [unlicensed], changed to oral chloroquine as soon as the patient’s condition permits.

**Pregnancy**
The adult treatment doses of chloroquine can be given for non-falciparum malaria. In the case of *P. vivax* or *P. ovale*, however, the radical cure with primaquine should be postponed until the pregnancy is over; instead chloroquine should be continued, given weekly during the pregnancy.

Infection

**HEPATIC IMPAIRMENT** No information available in moderate to severe impairment. Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe hepatic impairment.

**RENAL IMPAIRMENT** No information available in moderate to severe impairment. Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe renal impairment.

**MONITORING REQUIREMENTS**
- Consider obtaining ECG in all patients before third dose and 4–6 hours after third dose. If QTc interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours.
- In adults Obtain ECG as soon as possible after starting treatment then continue monitoring in those taking medicines that increase plasma-piperazine concentration, in females, or in the elderly.
- In children Obtain ECG as soon as possible after starting treatment then continue monitoring in those taking medicines that increase plasma-piperazine concentration, in children who are vomiting or in females.

**DIRECTIONS FOR ADMINISTRATION** Tablets to be taken at least 3 hours before and at least 3 hours after food. Tablets may be crushed and mixed with water immediately before administration.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tablets containing piperaquine phosphate with arteminol.

**MEDICINAL FORMS**

**Tablet**
- Eurartesim (Logixx Pharma Solutions Ltd)
  - Artenimol 40 mg, Piperaquine phosphate 320 mg
  - Eurartesim 320mg/40mg tablets | 12 tablet [PPh] £40.00

**Atovaquone with proguanil hydrochloride**

**INDICATIONS AND DOSE**

**MALARONE**

Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected
- **BY MOUTH**
  - Adult (body-weight 41 kg and above): 1 tablet daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving

Treatment of acute uncomplicated falciparum malaria
- **BY MOUTH**
  - Adult: 4 tablets once daily for 3 days

**UNLICENSED USE** Not licensed for treatment of non-falciparum malaria.

**CAUTIONS** Diarrhoea or vomiting (reduced absorption of atovaquone) - efficacy not evaluated in cerebral or complicated malaria (including hyperparasitaemia, pulmonary oedema or renal failure)

**INTERACTIONS** → Appendix 1: antimalarials

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain - abnormal dreams - anorexia - cough - depression - diarrhoea - dizziness - fever - headache - insomnia - nausea - pruritus - rash - vomiting
- **Uncommon** Anxiety - blood disorders - hair loss - hyponatraemia - palpitation - stomatitis

**Chloroquine**

**INDICATIONS AND DOSE**

Active rheumatoid arthritis (administered on expert advice) | Systemic and discoid lupus erythematosus (administered on expert advice)
- **BY MOUTH**
  - Adult: 150 mg daily; maximum 2.5 mg/kg per day

Prophylaxis of malaria
- **INITIALLY BY MOUTH USING SYRUP**
  - Child 4-5 weeks (body-weight up to 4.5 kg): 25 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 6 weeks–5 months (body-weight 4.5–7 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 6–11 months (body-weight 8–10 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 1–2 years (body-weight 11–14 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 3–4 years (body-weight 15–16.4 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 5–7 years (body-weight 16.5–24 kg): 150 mg once weekly, alternatively (by mouth using syrup) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 8–13 years (body-weight 25–44 kg): 225 mg once weekly, alternatively (by mouth using syrup) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 14–17 years (body-weight 45 kg and above): 310 mg once weekly, alternatively (by mouth using syrup) 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

- **INITIALLY BY MOUTH USING TABLETS**
  - Child 4–5 weeks (body-weight up to 4.5 kg): 25 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 6 weeks–5 months (body-weight 4.5–7 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 6–11 months (body-weight 8–10 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 1–2 years (body-weight 11–14 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 3–4 years (body-weight 15–16.4 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 5–7 years (body-weight 16.5–24 kg): 150 mg once weekly, alternatively (by mouth using syrup) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 8–13 years (body-weight 25–44 kg): 225 mg once weekly, alternatively (by mouth using syrup) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 14–17 years (body-weight 45 kg and above): 310 mg once weekly, alternatively (by mouth using syrup) 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

**FREQUENCY NOT KNOWN** Cholestasis - hallucinations - hepatitis - mouth ulcers - photosensitivity - seizures - Stevens-Johnson syndrome - tachycardia - vasculitis

**PREGNANCY** Manufacturer advises avoid unless essential.

**RENAL IMPAIRMENT** Avoid for malaria prophylaxis (and if possible for malaria treatment) if eGFR less than 30 mL/minute/1.73m².

**PATIENT AND CARER ADVICE** Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

**NATIONAL FUNDING/ACCESS DECISIONS**

NHS restrictions Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **CAUTIONARY AND ADVISORY LABELS** 21
  - Malarone (GlaxoSmithKline UK Ltd)
    - Proguanil hydrochloride 25 mg, Atovaquone 62.5 mg
    - Malarone Paediatric tablets | 12 tablet [PPh] £6.26
    - Proguanil hydrochloride 100 mg, Atovaquone 250 mg
    - Malarone tablets | 12 tablet [PPh] £25.21 DT price = £25.21

**Chloroquine**

**INDICATIONS AND DOSE**

Active rheumatoid arthritis (administered on expert advice) | Systemic and discoid lupus erythematosus (administered on expert advice)
- **BY MOUTH**
  - Adult: 150 mg daily; maximum 2.5 mg/kg per day

Prophylaxis of malaria
- **INITIALLY BY MOUTH USING SYRUP**
  - Child 4-5 weeks (body-weight up to 4.5 kg): 25 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 6 weeks–5 months (body-weight 4.5–7 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 6–11 months (body-weight 8–10 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 1-2 years (body-weight 11–14 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 3–4 years (body-weight 15–16.4 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 5-7 years (body-weight 16.5–24 kg): 150 mg once weekly, alternatively (by mouth using syrup) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 8–13 years (body-weight 25–44 kg): 225 mg once weekly, alternatively (by mouth using syrup) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 14–17 years (body-weight 45 kg and above): 310 mg once weekly, alternatively (by mouth using syrup) 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

- **INITIALLY BY MOUTH USING TABLETS**
  - Child 4–5 weeks (body-weight up to 4.5 kg): 25 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 6 weeks–5 months (body-weight 4.5–7 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 6–11 months (body-weight 8–10 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 1–2 years (body-weight 11–14 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 3–4 years (body-weight 15–16.4 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 5–7 years (body-weight 16.5–24 kg): 150 mg once weekly, alternatively (by mouth using tablets) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 8–13 years (body-weight 25–44 kg): 225 mg once weekly, alternatively (by mouth using tablets) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 14–17 years (body-weight 45 kg and above): 310 mg once weekly, alternatively (by mouth using syrup) 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
Treatment of non-falciparum malaria

**BY MOUTH**
- **Child:** Initially 10 mg/kg (max. per dose 620 mg), then 5 mg/kg after 6–8 hours (max. per dose 310 mg), then 5 mg/kg daily (max. per dose 310 mg) for 2 days
- **Adult:** Initially 620 mg, then 310 mg after 6–8 hours, then 310 mg daily for 2 days, approximate total cumulative dose of 25 mg/kg of base

**P. vivax or P. ovale infection during pregnancy while radical cure is postponed**

**BY MOUTH**
- **Adult:** 310 mg once weekly

**DOSE EQUIVALENCE AND CONVERSION**
- Doses expressed as chloroquine base. Chloroquine base 150 mg = chloroquine sulfate 200 mg = chloroquine phosphate 250 mg (approx.).

**DOSES AT EXTREMES OF BODY-WEIGHT**
- With oral use in adults In active rheumatoid arthritis and systemic and discoid lupus erythematosus, to avoid excessive dosage in obese patients, the daily maximum dose should be calculated on the basis of ideal body weight.

**INTERACTIONS**
- Appendix 1: antimalarials

**SIDE-EFFECTS**
- **Common or very common** Gastro-intestinal disturbances - headache - pruritus - rashes - skin reactions
- **Uncommon** Convulsions - discoloration of mucous membranes - discolouration of nails - discoloration of skin - ECG changes - hair depigmentation - hair loss - keratopathy - otoxicity - retinal damage - visual changes
- **Rare** Acute generalised exanthematous pustulosis - agranulocytosis - angioedema - aplastic anaemia - blood disorders - bone marrow suppression - cardiomyopathy - emotional disturbances - exfoliative dermatitis - hepatic damage - hypersensitivity reactions - mental changes - myopathy - neutropenia - photosensitivity - psychosis - Stevens-Johnson syndrome - thrombocytopenia - urticaria

**WARNING**
- Frequency not known Bronchospasm (in children) - diffuse parenchymal lung disease - drug rash with eosinophilia and systemic symptoms - extrapyramidal symptoms (associated with use in malaria) - hypotension - visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**
- **Malaria prophylaxis and treatment** Serious skin reactions, ECG changes, visual effects, ototoxicity, blood disorders, mental changes, myopathies and hepatic damage are not usually associated with malaria prophylaxis or treatment.

**Overdose**
- Chloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).
- **PREGNANCY** Benefit of use in prophylaxis and treatment in malaria outweighs risk. For rheumatoid disease, it is not necessary to withdraw an antimalarial drug during pregnancy if the disease is well controlled.
- **BREAST FEEDING** Present in breast milk and breast-feeding should be avoided when used to treat rheumatic disease. Amount in milk probably too small to be harmful when used for malaria.
- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment.
- **RENAI IMPAIRMENT** Only partially excreted by the kidneys and reduction of the dose is not required for prophylaxis of malaria except in severe impairment. For rheumatoid arthritis and lupus erythematosus, reduce dose. Manufacturers advise caution.

**MONITORING REQUIREMENTS**
- In adults Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory.
- In children Ophthalmic examination with long-term therapy.

**PATIENT AND CARER ADVICE**
- Warnings travellers going to malarious areas about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

**NATIONAL FUNDING/ACCESS DECISIONS**
- **NHS restrictions** Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed.

**EXCEPTIONS TO LEGAL CATEGORY**
- Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Oral solution**
- **CAUTIONARY AND ADVISORY LABELS 5**
- **Malarivon** (Wallace Manufacturing Chemists Ltd)
- Chloroquine phosphate 16 mg per 1 ml
- Malarivon 80mg/5ml syrup
- 75 ml [POM] £30.00

**Tablet**
- **CAUTIONARY AND ADVISORY LABELS 5**
- **Avloclor** (Alliance Pharmaceuticals Ltd)
- Chloroquine phosphate 250 mg
- Avloclor 250mg tablets 20 tablet [POM] £7.95 DT price = £7.95
Chloroquine with proguanil

The properties listed below are those particular to the combination only. For the properties of the components please consider, chloroquine p. 582, proguanil hydrochloride p. 585.

- **INDICATIONS AND DOSE**
  - **Prophylaxis of malaria**
    - By mouth
    - Adult: (consult product literature)

- INTERACTIONS → Appendix 1: antimalarials
- EXCEPTIONS TO LEGAL CATEGORY Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - Paludrine/Avloclor (Alliance Pharmaceuticals Ltd)
      - Paludrine/Avloclor tablets anti-malarial travel pack | 112 tablet | £13.50

Mefloquine

- **INDICATIONS AND DOSE**
  - **Treatment of malaria**
    - By mouth
    - Adult: (consult product literature)
  - **Prophylaxis of malaria**
    - By mouth
      - Child (body-weight 5–15 kg): 62.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
      - Child (body-weight 16–24 kg): 125 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
      - Child (body-weight 25–44 kg): 187.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
      - Child (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
      - Adult (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
  - **LICENSED USE** Mefloquine doses in BNF Publications may differ from those in product literature.
  - In children Not licensed for use in children under 5 kg body-weight and under 3 months.
  - **CONTRA-INDICATIONS** Avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions
  - Avoid for standby treatment if history of convulsions
  - History of blackwater fever
  - **CAUTIONS** Cardiac conduction disorders, epilepsy (avoid for prophylaxis), not recommended in infants under 3 months (5 kg), traumatic brain injury
  - **CAUTIONS, FURTHER INFORMATION**
    - Neuropsychiatric reactions Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for a more serious event. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. For a prescribing checklist, and further information on side-effects, particularly neuropsychiatric side-effects, which may be associated with the use of mefloquine for malaria prophylaxis, see the Guide for Healthcare Professionals provided by the manufacturer.
  - **INTERACTIONS** → Appendix 1: antimalarials
  - **SIDE-EFFECTS**
    - Common or very common Abdominal pain, diarrhoea, dizziness, headache, nausea, neuropsychiatric reactions, pruritis, visual disturbances, vomiting
    - Very rare Optic neuropathy
  - **Frequency not known** Alopecia, anemia, anorexia, arrhythmias, arthralgia, ataxia, blood disorders, bradycardia, cataract, chest pain, confusion, drowsiness, dyspepsia, dyspnoea, encephalopathy, fever, flushing, hepatic failure, hyperhidrosis, hypertension, hypotension, leucocytosis, leucopenia, malaise, motor neuropathies, muscle weakness, myalgia, oedema, palpitation, panic attacks, pneumonitis, rash, seizures, senory neuropathies, speech disturbances, Stevens-Johnson syndrome, syncope, tachycardia, thrombocytopenia, tremor, vestibular disorders
  - **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to quinine.
  - **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in animal studies).
  - **PREGNANCY** Manufacturer advises avoid (particularly in the first trimester) unless the potential benefit outweighs the risk; however, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas.
  - **BREAST FEEDING** Present in milk but risk to infant minimal.
  - **HEPATIC IMPAIRMENT** Elimination may be prolonged; avoid in severe impairment.
  - **RENAL IMPAIRMENT** Manufacturer advises caution.
  - **DIRECTIONS FOR ADMINISTRATION** Tablet may be crushed and mixed with food such as jam or honey just before administration.
  - **PATIENT AND CARER ADVICE** A patient alert card should be provided. Manufacturer advises that patients receiving mefloquine for malaria prophylaxis should be informed to discontinue its use if neuropsychiatric symptoms occur and seek immediate medical advice so that mefloquine can be replaced with an alternative antimalarial. Travellers should also be warned about importance of avoiding mosquito bites. importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.
  - **Driving and skilled tasks** Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine.
  - **NATIONAL FUNDING/ACCESS DECISIONS** NHS restrictions Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed.
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Tablet**
      - CAUTIONARY AND ADVISORY LABELS 10, 21, 27
        - Lariam (Rochef Products Ltd)
          - Mefloquine (as Mefloquine hydrochloride) 250 mg | Lariam 250mg tablets | 8 tablet | £14.53
Primaquine

- **INDICATIONS AND DOSE**
  - Adjunct in the treatment of non-falciparum malaria caused by *P. vivax* infection
    - **BY MOUTH**
    - Adult: 30 mg daily for 14 days
  - Adjunct in the treatment of non-falciparum malaria caused by *P. ovale* infection
    - **BY MOUTH**
    - Adult: 15 mg daily for 14 days
  - Adjunct in the treatment of non-falciparum malaria caused by *P. vivax* infection in patients with mild G6PD deficiency (administered on expert advice)
    - **BY MOUTH**
    - Adult: 600 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Treatment of mild to moderate pneumocystis infection (in combination with clindamycin)
    - **BY MOUTH**
    - Adult: 30 mg daily, this combination is associated with considerable toxicity

- **UNLICENSED USE**
  Not licensed.

- **CAUTIONS**
  G6PD deficiency · systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)

- **INTERACTIONS** → Appendix 1: antimalarials

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain · anorexia · nausea · vomiting
  - Uncommon Haemolytic anaemia especially in G6PD deficiency · leucopenia · methaemoglobinemia

- **PREGNANCY**
  Risk of neonatal haemolysis and methaemoglobinemia in third trimester.

- **BREAST FEEDING**
  No information available; theoretical risk of haemolysis in G6PD-deficient infants.

- **PRE-TREATMENT SCREENING**
  Before starting primaquine, blood should be tested for glucose-6-phosphate dehydrogenase (G6PD) activity since the drug can cause haemolysis in G6PD-deficient patients. Specialist advice should be obtained in G6PD deficiency.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  **Tablet**
  - Primaquine (Non-proprietary)
    - Primaquine (as Primaquine phosphate) 15 mg

  **Primaquine tablets** | 100 tablet [Pack] no price available

---

Proguanil hydrochloride

- **INDICATIONS AND DOSE**
  - Prophylaxis of malaria
    - **BY MOUTH**
    - Child 4–7 years (body-weight 16–24 kg): 100 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
    - Child 8–12 years (body-weight 25–44 kg): 150 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
    - Child 13–17 years (body-weight 45 kg and above): 200 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
    - Adult: 200 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

- **UNLICENSED USE**
  Proguanil doses in BNF Publications may differ from those in product literature.

- **INTERACTIONS** → Appendix 1: antimalarials

- **SIDE-EFFECTS**
  - Very rare Cholestasis · hair loss · skin reactions · vasculitis
  - Frequency not known Mouth ulcers · stomatitis
  - Pregnancy Benefit of prophylaxis in malaria outweighs risk. Adequate folate supplements should be given to mother.

- **BREAST FEEDING**
  Amount in milk probably too small to be harmful when used for malaria prophylaxis.

- **RENAL IMPAIRMENT**
  - In children Use half normal dose if estimated glomerular filtration rate 20–60 mL/minute/1.73m². Use one-quarter normal dose on alternate days if estimated glomerular filtration rate 10–20 mL/minute/1.73m². Use one-quarter normal dose once weekly if estimated glomerular filtration rate less than 10 mL/minute/1.73m²; increased risk of haematological toxicity in severe impairment.
  - In adults 100 mg once daily if eGFR 20–60 mL/minute/1.73m². 50 mg on alternate days if eGFR 10–20 mL/minute/1.73m². 50 mg once weekly if eGFR less than 10 mL/minute/1.73m²; increased risk of haematological toxicity in severe impairment.

- **DIRECTIONS FOR ADMINISTRATION**
  Tablet may be crushed and mixed with food such as milk, jam, or honey just before administration.

- **PATIENT AND CARER ADVICE**
  Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  **NHS restrictions** Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY**
  Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 21
    - Paludrine (Alliance Pharmaceuticals Ltd)
      - Proguanil hydrochloride 100 mg
      - Paludrine 100mg tablets | 98 tablet [Pack] £11.95 DT price = £11.95
**Pyrimethamine**

- **INDICATIONS AND DOSE**
  - Toxoplasmosis in pregnancy (in combination with sulfadiazine and folic acid)
    - **BY MOUTH**
    - Adult: 50 mg once daily until delivery
  - Malaria
    - **BY MOUTH**
    - Adult: No dose stated because not recommended alone

- **CAUTIONS** History of seizures—avoid large loading doses
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS**
  - Common or very common Anaemia (with high doses)
  - Blood disorders (with high doses)
  - Diarrhoea
  - Dizziness
  - Headache
  - Leucopenia
  - Nausea
  - Rash
  - Thrombocytopenia
  - Vomiting
  - Uncommon Abnormal skin pigmentation
  - Very rare Buccal ulceration
  - Other: Convulsions

- **PREGNANCY** Theoretical teratogenic risk in first trimester (folate antagonist). Adequate folate supplements should be given to the mother.

- **BREAST FEEDING** Significant amount in milk—avoid administration of other folate antagonists to infant. Avoid breast-feeding during toxoplasmosis treatment.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **RENAL IMPAIRMENT** Manufacturer advises caution.

- **MONITORING REQUIREMENTS** Blood counts required with prolonged treatment.

- **LESS SUITABLE FOR PRESCRIBING** Pyrimethamine should not be used alone for malaria, but is used with sulfadoxine.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  - **Tablet**
    - Daraprim (GlaxoSmithKline UK Ltd)
      - Pyrimethamine 25 mg Daraprim 25mg tablets | 30 tablet Pack £13.00

**Pyrimethamine with sulfadoxine**

- **INDICATIONS AND DOSE**
  - Adjunct to quinine in treatment of Plasmodium falciparum malaria
    - **BY MOUTH**
    - Child 1 month–4 years (body-weight 5 kg and above): 12.5/250 mg for 1 dose
    - Child 5–6 years: 25/500 mg for 1 dose
    - Child 7–9 years: 37.5/750 mg for 1 dose
    - Child 10–13 years: 50/1000 mg for 1 dose
    - Child 14–17 years: 75/1500 mg for 1 dose
    - Adult: 75/1500 mg for 1 dose
  - Malaria prophylaxis
    - **BY MOUTH**
    - Adult: Not recommended by UK malaria experts

- **DOSE EQUIVALENCE AND CONVERSION**
  - Dose quantities are expressed in the form x/y where x and y are the strengths in milligrams of pyrimethamine and sulfadoxine respectively.

- **UNLICENSED USE** Not licensed for use in children of body-weight under 5 kg.

- **CONTRA-INDICATIONS** Acute porphyrias p. 969

- **CAUTIONS** Asthma—avoid in blood disorders (unless under specialist supervision)
  - Avoid in infants under 6 weeks
  - Elderly
  - G6PD deficiency
  - History of seizures—avoid large loading doses
  - Not recommended for prophylaxis (severe side-effects on long-term use)
  - Predisposition to folate deficiency
  - Predisposition to hyperkalaemia (in adults)

- **INTERACTIONS** → Appendix 1: antimalarials

- **SIDE-EFFECTS**
  - Common or very common Diarrhoea, headache, hyperkalaemia, nausea, rash
  - Uncommon Vomiting
  - Very rare Anorexia, antibiotic-associated colitis, arthralgia, aseptic meningitis, ataxia, blood disorders, convulsions, cough, depression, eosinophilia, glossitis, hallucinations, hepatic necrosis, hypoglycaemia, hyponatraemia, interstitial nephritis, jaundice, leucopenia, liver damage, megaloblastic anaemia, myalgia, myocarditis, pancreatitis, peripheral neuropathy, photosensitivity, renal disorders, rhabdomyolysis reported in HIV-infected patients, shortness of breath, Stevens-Johnson syndrome, stomatitis, systemic lupus erythematosus, thrombocytopenia, tinnitus, toxic epidermal necrolysis, uveitis, vasculitis, vertigo

- **FREQUENCY NOT KNOWN** Allergic alveolitis, eosinophilic alveolitis, pulmonary infiltrates

**SIDE-EFFECTS, FURTHER INFORMATION**
- Discontinue immediately if blood disorders or rash occur. Discontinue if cough or shortness of breath occur.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with sulfonamide allergy.

- **PREGNANCY** Possible teratogenic risk in first trimester (pyrimethamine a folate antagonist); in third trimester—risk of neonatal haemolysis and methaemoglobinæmia. Fear of increased risk of kernicterus in neonates appears to be unfounded.

- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants; risk of haemolysis in G6PD-deficient infants (due to sulfadoxine).

- **MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.

- **PATIENT AND CARER ADVICE** Patients should be advised to maintain adequate fluid intake.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

**Quinine**

- **INDICATIONS AND DOSE**
  - Nocturnal leg cramps
    - **BY MOUTH**
    - Adult: 200–300 mg once daily, to be taken at bedtime
  - Non-falciparum malaria
    - **BY INTRAVENOUS INFUSION**
    - Adult: 10 mg/kg every 8 hours (max. per dose 700 mg), infused over 4 hours, given if patient is unable to take oral therapy. Changed to oral chloroquine as soon as the patient’s condition permits
  - Falciparum malaria
    - **BY MOUTH**
    - Child: 10 mg/kg every 8 hours (max. per dose 600 mg) for 7 days, together with or followed by either doxycycline (in children over 12 years), or clindamycin
    - Adult: 600 mg every 8 hours for 5–7 days, the quinine should be given together with or followed by either doxycycline or clindamycin
## Hepatitis

### 6 Viral infection

#### 6.1 Hepatitis

**Hepatitis**

**Overview**

Treatment for viral hepatitis should be initiated by a specialist. The management of uncomplicated acute viral hepatitis is largely symptomatic. Early treatment of acute hepatitis C with interferon alfa p. 882 [unlicensed indication] may reduce the risk of chronic infection. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. Active or passive immunisation against hepatitis A and B infections can be given.

**Chronic hepatitis B**

Peginterferon alfa p. 590 is an option for the initial treatment of chronic hepatitis B and may be preferable to interferon alfa. The use of peginterferon alfa and interferon alfa is limited by a response rate of 30–40% and relapse is frequent. Treatment should be discontinued if no improvement occurs after 4 months. The manufacturers of peginterferon alfa-2a and interferon alfa contraindicate use in decompensated liver disease, but low doses can be used with great caution in these patients. Although interferon alfa is contra-indicated in patients receiving immunosuppressant treatment (or who have received it recently), cautious use of peginterferon alfa-2a may be justified in some cases.

Entecavir p. 588 or tenofovir disoproxil p. 616 are options for the initial treatment of chronic hepatitis B. If the response is inadequate after 6–9 months of treatment, a change in treatment should be considered. Other drugs that are licensed for the treatment of chronic hepatitis B include adefovir dipivoxil p. 589, lamivudine p. 615, or telbivudine p. 589.

Entecavir alone, tenofovir disoproxil alone, or a combination of lamivudine with either adefovir dipivoxil or tenofovir disoproxil can be used in patients with decompensated liver disease.

If drug-resistant hepatitis B virus emerges during treatment, another antiviral drug to which the virus is not resistant may be added.
sensitive should be added. Hepatitis B viruses with reduced susceptibility to lamivudine have emerged following extended therapy. Adefovir dipivoxil or tenofovir disoproxil can be given with lamivudine in lamivudine-resistant chronic hepatitis B; telbivudine or entecavir should not be used because cross-resistance can occur.

If there is no toxicity or loss in efficacy, treatment with adefovir dipivoxil, entecavir, lamivudine, telbivudine, or tenofovir disoproxil is usually continued until adequate seroconversion has occurred. Treatment is usually continued long-term in patients with decompensated liver disease.

Tenofovir disoproxil, or a combination of tenofovir disoproxil with either emtricitabine p. 613 or lamivudine may be used with other antiretrovirals, as part of “highly active antiretroviral therapy” in patients who require treatment for both HIV and chronic hepatitis B. If patients infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV, such as peginterferon alfa or adefovir dipivoxil. Treatment may be continued long-term, even if adequate seroconversion occurs. Management of these patients should be coordinated between HIV and hepatology specialists.

### Chronic hepatitis C

Before starting treatment, the genotype of the infecting hepatitis C virus should be determined and the viral load measured as this may affect the choice and duration of treatment. A combination of ribavirin p. 593 and peginterferon alfa is used for the treatment of chronic hepatitis C. The combination of ribavirin and interferon alfa is less effective than the combination of peginterferon alfa and ribavirin. Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Ribavirin monotherapy is ineffective.

Daclatasvir p. 591 is licensed for use in combination with sofosbuvir p. 595 for the treatment of chronic hepatitis C infection of genotypes 1 or 4, with or without compensated cirrhosis; the addition of ribavirin should be considered for patients with advanced liver disease or with other negative prognostic factors, such as prior treatment experience. It is also licensed in combination with sofosbuvir and ribavirin for the treatment of chronic hepatitis C infection of genotype 3 in patients who are treatment experienced, with or without compensated cirrhosis, and in combination with peginterferon alfa and ribavirin for the treatment of chronic hepatitis C infection of genotype 4. Daclatasvir must not be given as monotherapy.

Ombitasvir with paritaprevir and ritonavir p. 592 (Viekirax®,) is licensed for use in combination with dasabuvir p. 598, with or without ribavirin, for the treatment of chronic hepatitis C infection of genotype 1 in patients with or without compensated cirrhosis; it is also licensed for use in combination with ribavirin for the treatment of chronic hepatitis C infection of genotype 4 with or without compensated cirrhosis.

Ribavirin inhibits a wide range of DNA and RNA viruses. It is given by mouth for the treatment of chronic hepatitis C infection, in double therapy with peginterferon alfa, interferon alfa, or sofosbuvir, or in triple therapy with peginterferon alfa and one protease inhibitor (i.e. sipimprev p. 597) or sofosbuvir. Ribavirin is also effective in Lassa fever [unlicensed indication].

Sofosbuvir is a pro-drug of a nucleoside inhibitor that is effective against hepatitis C virus polymerase NS5B. It is licensed for use in combination with ribavirin, with or without peginterferon alfa, for the treatment of chronic hepatitis C infection of genotypes 1, 2, 3, 4, 5, or 6 in patients with compensated liver disease. Sofosbuvir monotherapy is not recommended because it is less effective than combination therapy.

Ledipasvir is licensed for use in combination with sofosbuvir (sofosbuvir with ledipasvir p. 596), with or without ribavirin, for the treatment of chronic hepatitis C infections of genotypes 1, 3, 4, 5, or 6.

Simeprevir is licensed for use in combination with ribavirin and peginterferon alfa for the treatment of chronic hepatitis C infection of genotype 1 or 4; regimens containing peginterferon alfa-2a are less effective than those containing peginterferon alfa-2b. Simeprevir may also be used in combination with sofosbuvir, with or without ribavirin, for the urgent treatment of chronic hepatitis C infection of genotypes 1 or 4 only when peginterferon alfa cannot be used because of intolerance or contra-indications. Simeprevir monotherapy is not recommended.

### 6.2 Hepatitis infections

#### 6.2a Chronic hepatitis B

#### ANTIVIRALS > NUCLEOSIDE ANALOGUES

### Entecavir

- **INDICATIONS AND DOSE**

  **Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) not previously treated with nucleoside analogues**

  - **BY MOUTH**
  - Adult: 500 micrograms once daily

  **Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) and lamivudine-resistance**

  - **BY MOUTH**
  - Adult: 1 mg once daily, consider other treatment if inadequate response after 6 months

  **Chronic hepatitis B in patients with decompensated liver disease**

  - **BY MOUTH**
  - Adult: 1 mg once daily

- **CAUTIONS**

  - HIV infection—risk of HIV resistance in patients not receiving “highly active antiretroviral therapy” lamivudine-resistant chronic hepatitis B—risk of entecavir resistance

- **CAUTIONS, FURTHER INFORMATION**

  Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

- **SIDE-EFFECTS**

  - **Common or very common** Diarrhoea · dizziness · dyspepsia · fatigue · headache · nausea · raised serum amylase · raised serum lipase · sleep disturbances · vomiting
  - **Uncommon** Alopecia · rash · thrombocytopenia

- **CONCEPTION AND CONTRACEPTION**

  Effective contraception required during treatment.

- **PREGNANCY**

  - Toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING**

  Manufacturer advises avoid—present in milk in animal studies.

- **RENAL IMPAIRMENT**

  - Reduce dose if eGFR less than 50 mL/minute/1.73 m². Consult product literature.
● **MONITORING REQUIREMENTS** Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

- **DIRECTIONS FOR ADMINISTRATION** To be taken at least 2 hours before or 2 hours after food.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.

- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on the administration of entecavir tablets and oral solution.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE technology appraisals (TAs)**
    - Entecavir for chronic hepatitis B (August 2008) NICE TA153
    - Entecavir is an option for the treatment of chronic hepatitis B.
    - www.nice.org.uk/TA153

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  - **Oral solution**
    - **Baraclude** (Bristol-Myers Squibb Pharmaceuticals Ltd)
      - Entecavir (as Entecavir monohydrate) 50 microgram per 1 ml
      - Entecavir (as Entecavir monohydrate) 500 microgram per 1 ml
    - **Tablet**
      - **Baraclude** (Bristol-Myers Squibb Pharmaceuticals Ltd)
        - Entecavir (as Entecavir monohydrate) 1 mg
        - Entecavir (as Entecavir monohydrate) 500 microgram
        - Entecavir (as Entecavir monohydrate) 50 microgram
        - Entecavir (as Entecavir monohydrate) 100 microgram
      - **Baraclude** (Bristol-Myers Squibb Pharmaceuticals Ltd)
        - Tablet containing the same drug.

**Telbivudine**

- **INDICATIONS AND DOSE**
  Chronic hepatitis B infection with compensated liver disease, evidence of viral replication, and histologically documented active liver inflammation or fibrosis, when other treatment is not appropriate.

  - **BY MOUTH**
    - Adult: 600 mg once daily

- **CAUTIONS**
  - Lamivudine-resistant chronic hepatitis B—risk of telbivudine resistance.
  - CAUTIONS, FURTHER INFORMATION
    - Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

- **INTERACTIONS**
  - Appendix 1: telbivudine

- **SIDE-EFFECTS**
  - Common or very common: Abdominal pain, cough, diarrhoea, dizziness, fatigue, headache, nausea, raised serum amylase, raised serum lipase, rash.
  - Uncommon: Arthralgia, myalgia, myopathy (discontinue treatment), peripheral neuroopathy, taste disturbance.
  - Rare: Lactic acidosis, rhabdomyolysis.

- **PREGNANCY**
  - Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING**
  - Manufacturer advises avoid—present in milk in animal studies.

- **RENAL IMPAIRMENT**
  - 600 mg every 48 hours if eGFR 30–49 mL/minute/1.73 m²; 600 mg every 72 hours if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Monitor liver function tests every 3 months and viral markers of hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

- **PATIENT AND CARER ADVICE**
  - Muscle effects and peripheral neuropathy: Patients should be advised to promptly report unexplained muscle pain, tenderness, or weakness, or numbness, tingling or burning sensations.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE technology appraisals (TAs)**
    - Telbivudine for chronic hepatitis B (August 2008) NICE TA154
    - Telbivudine is not recommended for the treatment of chronic hepatitis B. Patients currently receiving telbivudine can continue treatment until they and their clinician consider it appropriate to stop.
    - www.nice.org.uk/TA154

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  - **Tablet**
    - Sebivo (Novartis Pharmaceuticals UK Ltd)
      - Telbivudine 600 mg Sebivo 600mg tablets | 28 tablet pack
      - £290.33

**ANTIVIRALS > NUCLEOTIDE ANALOGUES**

Adefovir dipivoxil

- **INDICATIONS AND DOSE**
  Chronic hepatitis B infection with either compensated liver disease with evidence of viral replication, and histologically documented active liver inflammation and fibrosis, when other treatment not appropriate or decompensated liver disease in combination with another antiviral for chronic hepatitis B that has no cross-resistance to adefovir.

  - **BY MOUTH**
    - Adult: 10 mg once daily

- **CAUTIONS**
  - Elderly
  - CAUTIONS, FURTHER INFORMATION
    - Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

- **INTERACTIONS**
  - Appendix 1: adefovir

- **SIDE-EFFECTS**
  - Abdominal pain, asthenia, diarrhoea, dyspepsia, flatulence, headache, hypophosphataemia, nausea, pancreatitis, pruritus, rash, renal failure, vomiting.

- **PREGNANCY**
  - Toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT**
  - 10 mg every 48 hours if eGFR 30–50 mL/minute/1.73 m²; 10 mg every 72 hours if eGFR 10–30 mL/minute/1.73 m². No information available if eGFR less than 10 mL/minute/1.73 m². Monitor renal function more frequently in patients with renal impairment.

- **MONITORING REQUIREMENTS**
  - Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

  - Monitor renal function before treatment then every 3 months, more frequently in patients receiving nephrotoxic drugs.
Peginterferon alfa

**DRUG ACTION** Polyethylene glycol-conjugated (‘pegylated’) derivatives of interferon alfa (peginterferon alfa-2a and peginterferon alfa-2b) are available; pegylation increases the persistence of the interferon in the blood.

**INDICATIONS AND DOSE**

PEGASYS®

Combined with ribavirin for chronic hepatitis C | Monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated | Monotherapy for chronic hepatitis B

- BY SUBCUTANEOUS INJECTION
- Adult: consult product literature

VIRAFERONPEG®

Combined with ribavirin for chronic hepatitis C | Combined with ribavirin and boceprevir for chronic hepatitis C infection of genotype 1 in patients with compensated liver disease | Monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated

- BY SUBCUTANEOUS INJECTION
- Adult: consult product literature

**CONTRA-INDICATIONS** For contra-indications consult product literature.

**CAUTIONS** For cautions consult product literature.

**INTERACTIONS** Appendix 1: interferons

**SIDE-EFFECTS**

- Common or very common: Anorexia • diarrhoea • influenza-like symptoms • lethargy • nausea
- Frequency not known: Alopecia • arrhythmias • cardiovascular problems • coma (usually with high doses in the elderly) • confusion • depression • hepatotoxicity • hyperglycaemia • hypersensitivity reactions • hypertension • hypertriglyceridaemia (sometimes severe) • hypotension • myelosuppression (particularly affecting granulocyte counts) • nephrotoxicity • ocular side-effects • palpitation • psoriasisform rash • seizures (usually with high doses in the elderly) • suicidal behaviour • thyroid abnormalities

SIDE-EFFECTS, FURTHER INFORMATION

For information on side effects consult product literature.

**CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.

**PREGNANCY** Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in animal studies).

**BREAST FEEDING** Manufacturers advise avoid—no information available.

**HEPATIC IMPAIRMENT** Avoid in severe impairment. Close monitoring required in mild to moderate hepatic impairment.

**RENAL IMPAIRMENT** Reduce dose in moderate to severe impairment. For information on peginterferon alfa use in renal impairment consult product literature. Close monitoring required in renal impairment.

**MONITORING REQUIREMENTS** Monitoring of lipid concentration is recommended.
6.2b Chronic hepatitis C

Other drugs used for Chronic hepatitis C interferon alfa, p. 882 • Peginterferon alfa, p. 590

ANTIVIRALS ▶ HCV INHIBITORS

Elbasvir with grazoprevir 24-Apr-2017

▶ DRUG ACTION Elbasvir is an HCV NS5A inhibitor and grazoprevir is an HCV NS3/4A protease inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

▶ INDICATIONS AND DOSE Chronic hepatitis C infection of genotypes 1 or 4 (with or without ribavirin) (initiated by a specialist)
  ▶ BY MOUTH
  ▶ Adult: 50/100 mg once daily for 12 weeks (may extend to 16 weeks in some circumstances—consult product literature)

DOSE EQUIVALENCE AND CONVERSION
▶ Dose expressed as x/y mg elbasvir/grazoprevir.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

▶ CAUTIONS Hepatitis B co-infection - re-treatment following treatment failure—efficacy not established
▶ INTERACTIONS ▶ Appendix 1: elbasvir, grazoprevir
▶ SIDE-EFFECTS
  ▶ Common or very common Abdominal pain · alopecia · anxiety · arthralgia · constipation · decreased appetite · depression · diarrhea · dizziness · dry mouth · headache · insomnia · irritability · malaise · myalgia · nausea · pruritus · vomiting
  ▶ Frequency not known Elevated liver enzymes
▶ PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
▶ BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.
▶ HEPATIC IMPAIRMENT Manufacturer advises avoid in moderate-to-severe impairment.
▶ MONITORING REQUIREMENTS Manufacturer advises monitor liver function before treatment, at week 8 in all patients, at week 12 in patients receiving 16 weeks of treatment, and then as clinically indicated—consider discontinuing treatment if alanine aminotransferase (ALT) is greater than 10 times the upper limit of normal; discontinue treatment if ALT elevation is accompanied by signs or symptoms of hepatic impairment or inflammation.

PATIENT AND CARER ADVICE
Hepatic effects Manufacturer advises that patients and their carers should consult a healthcare professional if signs and symptoms of hepatic dysfunction occur (including fatigue, weakness, lack of appetite, nausea and vomiting, jaundice or discoloured faeces).

Vomiting Manufacturer advises if vomiting occurs within 4 hours of a dose, an additional dose should be taken.

Missed doses Manufacturer advises if a dose is more than 16 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
▶ Elbasvir–grazoprevir for treating chronic hepatitis C (October 2016) NICE TA413

Elbasvir with grazoprevir is recommended, within its marketing authorisation, as an option for treating genotype 1 or 4 chronic hepatitis C infection:
  ▶ of genotype 1a—12 weeks’ treatment (consider use in combination with ribavirin for 16 weeks in patients with a baseline hepatitis C virus RNA level of more than 800 000 IU/mL or specific NSSA polymorphisms causing at least a 5-fold reduction in activity of elbasvir);
  ▶ of genotype 1b—12 weeks’ treatment;
  ▶ of genotype 4—12 weeks’ treatment (consider use in combination with ribavirin for 16 weeks in patients with a baseline hepatitis C virus RNA level of more than 800 000 IU/mL).

This is contingent on the manufacturer providing the drug at the same price or lower than that agreed with the Commercial Medicines Unit.

www.nice.org.uk/guidance/ta413

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium advises (December 2016) that Zepatier® (elbasvir with grazoprevir) is accepted for use within NHS Scotland for the treatment of chronic hepatitis C in adults with genotype 1a, 1b or 4; this advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS

Electrolytes: May contain Sodium
▶ Zepatier (Merck Sharp & Dohme Ltd)
  ▶ Elbasvir 50 mg, Grazoprevir 100 mg
  ▶ 28 tablet (Po) £12,166.67

ANTIVIRALS ▶ NON-STRUCTURAL PROTEIN 5A INHIBITORS

Daclatasvir 11-May-2017

▶ DRUG ACTION Daclatasvir is an inhibitor of the multifunctional protein NSSA, which is an essential component of the hepatitis C virus replication process.

▶ INDICATIONS AND DOSE
In combination with sofosbuvir for the treatment of chronic hepatitis C infection of genotypes 1 or 4, with or without compensated cirrhosis; in combination with sofosbuvir and ribavirin for the treatment of chronic hepatitis C infection of genotype 3 in patients who are treatment experienced, with or without compensated cirrhosis; in combination with peginterferon alfa and ribavirin for the treatment of chronic hepatitis C infection of genotype 4
▶ BY MOUTH
  ▶ Adult: Usual dose 60 mg once daily (for duration of treatment consult product literature)
DOSE ADJUSTMENTS DUE TO INTERACTIONS
Manufacturer advises reduce dose to 30 mg once daily with concurrent use of some of the potent CYP3A4 inhibitors—consult product literature. Manufacturer advises increase dose to 90 mg once daily with bosentan.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

- CAUTIONS
  - Decompensated liver disease • hepatitis B virus co-infection • human immunodeficiency virus co-infection • organ transplant patients • retreatment • efficacy not established in patients with prior exposure to a NS5A inhibitor
- INTERACTIONS → Appendix 1: daclatasvir
- SIDE-EFFECTS
  - Common or very common Abdominal pain • alopecia • anaemia • anxiety • arthralgia • blurred vision • constipation • cough • decreased appetite • depression • diarrhoea • disturbance in attention • dizziness • dry mouth • dry skin • dyspnoea • flatulence • gastro-oesophageal reflux • headache • hot flush • insomnia • irritability • lymphopenia • malaise • migraine • myalgia • nasal congestion • nausea • neutropenia • pruritus • pyrexia • rash • reduced visual acuity • vomiting
  - Frequency not known Hyperbilirubinaemia
- SIDE-EFFECTS, FURTHER INFORMATION
  Side-effects listed are reported when daclatasvir is used in combination with sofosbuvir with or without ribavirin or with ribavirin and peginterferon alfa.
- CONCEPTION AND CONTRACEPTION
  Highly effective contraception required during and for 5 weeks after treatment.
- PREGNANCY
  Manufacturer advises avoid (toxicity in animal studies).
- BREAST FEEDING
  Manufacturer advises avoid—present in milk in animal studies.
- PATIENT AND CARER ADVICE
  Missed doses
  If a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- Driving and skilled tasks
  May affect performance of skilled tasks (e.g. driving)
- NATIONAL FUNDING/ACCESS DECISIONS
- NICE technology appraisals (TAs)
  - Daclatasvir for treating chronic hepatitis C (November 2015)
    NICE TA364
    Daclatasvir in combination with sofosbuvir or peginterferon alfa, and with/without ribavirin, is recommended as an option for the treatment of chronic hepatitis C infection of genotypes 1, 3 or 4 in adults, depending on the level of fibrosis and only if the manufacturer provides daclatasvir at the same price or lower than agreed with the Commercial Medicines Unit. www.nice.org.uk/TA364

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (November 2014) that daclatasvir (Daklinza®) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C virus infection in patients with significant fibrosis (Metavir score F3–F4) or compensated cirrhosis.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

- **Chronic hepatitis C (in combination with interferon alfa 2b, or peginterferon alfa 2b with or without boceprevir)**
  - **BY MOUTH**
  - **Adult** (body-weight up to 65 kg): 400 mg twice daily
  - **Adult** (body-weight 65–80 kg): 400 mg, dose to be taken in the morning and 600 mg, dose to be taken in the evening
  - **Adult** (body-weight 81–104 kg): 600 mg twice daily
  - **Adult** (body-weight 105 kg and above): 600 mg, dose to be taken in the morning and 800 mg, dose to be taken in the evening

**REBETOL ▶ ORAL SOLUTION**

- **Chronic hepatitis C (in combination with interferon alfa 2b, or peginterferon alfa 2b with or without boceprevir)**
  - **BY MOUTH**
  - **Adult** (body-weight up to 65 kg): 400 mg twice daily
  - **Adult** (body-weight 65–80 kg): 400 mg daily, dose to be taken in the morning and 600 mg daily, dose to be taken in the evening
  - **Adult** (body-weight 81–104 kg): 600 mg twice daily
  - **Adult** (body-weight 105 kg and above): 600 mg daily, dose to be taken in the morning and 800 mg daily, dose to be taken in the evening

- **UNLICENSED USE** Inhalation licensed for use in children (age range not specified by manufacturer). Intravenous preparation not licensed.

- **CONTRA-INDICATIONS**
  - With systemic use Active severe psychiatric condition (in children) - autoimmune disease (in children) - autoimmune hepatitis (in children) - consult product literature for specific contra-indications when ribavirin above used in combination with other medicinal products - haemoglobinopathies - history of severe psychiatric condition (in children) - severe cardiac disease (in adults) - severe debilitating medical conditions - severe, uncontrolled cardiac disease in children with chronic hepatitis C - unstable or uncontrolled cardiac disease in previous 6 months (in adults)

- **CAUTIONS**
  - When used by inhalation Maintain standard supportive respiratory and fluid management therapy
  - With systemic use Anaemia (haemoglobin concentration should be monitored during the treatment and corrective action taken) (in adults) - cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration) - consult product literature for specific cautions when ribavirin above used in combination with other medicinal products - gout (in adults) - haemolysis (haemoglobin concentration should be monitored during the treatment and corrective action taken) (in adults) - patients with a transplant—risk of rejection - risk of growth retardation in children, the reversibility of which is uncertain—if possible, consider starting treatment after pubertal growth spurt - severe
dental disorders (in adults) • severe ocular disorders (in adults) • severe periodontal disorders (in adults) • severe psychiatric effects (in adults)

- **INTERACTIONS** → Appendix 1: ribavirin
- **SIDE-EFFECTS**
  - When used by inhalation Bacterial pneumonia • haemolysis • non-specific anaemia • pneumothorax • worsening respiration
  - With oral use Abdominal pain • abnormal dreams • acne • alopecia • angina • anorexia • anxiety • aplastic anaemia • arrhythmias • arthralgia • ataxia • bipolar disorders • breast pain • cardiomyopathy • cerebral haemorrhage • cerebral ischaemia • changes in blood pressure • cholecystitis • chest pain • colitis • constipation • cough • dehydration • depression • diabetes • diarrhoea • dizziness • dry eyes • dry mouth • dry skin • dyspepsia • dysphagia • dyspnoea • earache • endocarditis • eye pain • flatulence • flushing • gastrointestinal bleeding • gingival bleeding • gingivitis • glossitis • haemolytic anaemia (anaemia may be improved by epoetin) • headache • hearing impairment • hearing loss • hyperaesthesia • hyperglycaemia • hypertonia • hypertensive glomerulonephritis • impotence • injury • inflammation • influenza-like symptoms • interstitial pneumonitis • leucopenia • lymphadenopathy • malaise • mania • menstrual disturbance • micturition disorders • mouth ulcers • musculoskeletal pain • myalgia • myocardial infarction • myositis • nasal congestion • nausea • neutropenia • optic neureopathy • oral candidiasis • palpitation • pancreatitis • paraesthesia • peptic ulcer • pericarditis • peripheral neuropathy • peripheral oedema • photosensitivity • prostatitis • pruritus • psoriasis • psychotic disorders • pulmonary embolism • rash • renal failure • respiratory infections • retinal detachment • retinal haemorrhage • rhabdomyolysis • rheumatoid arthritis • sarcoidosis • seizures • sexual dysfunction • sinus congestion • skin discoloration • sleep disturbances • sore throat • Stevens–Johnson syndrome • stomatitis • suicidal ideation • syncope • systemic lupus erythematosus • tachycardia • taste disturbance • thrombocytopenia • thrombocytopenia purpura • thyroid disorders • tinnitus • tongue pigmentation • toxic epidermal necrolysis • tremor • urinary tract infections • vacuolitis • vision loss • visual disturbances • vomiting • weight loss • wheezing

**SIDE-EFFECTS, FURTHER INFORMATION**
Side effects listed are reported when oral ribavirin is used in combination with peginterferon alfa or interferon alfa, consult product literature for details.

- **CONCEPTION AND CONTRACEPTION**
  - With systemic use Exclude pregnancy before treatment in females of childbearing age. Effective contraception essential during treatment and for 4 months after treatment in females and for 7 months after treatment in males of childbearing age. Routine monthly pregnancy tests recommended. Condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen).
  - When used by inhalation Women planning pregnancy should avoid exposure to aerosol.
- **PREGNANCY** Avoid; teratogenicity in animal studies.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** No dosage adjustment required. Avoid oral ribavirin in severe hepatic dysfunction or decompensated cirrhosis.
- **RENAL IMPAIRMENT** Plasma-ribavirin concentration increased.
  - In adults Manufacturer advises avoid oral ribavirin unless essential if eGFR less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely.
  - In children Manufacturer advises avoid oral ribavirin if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—monitor haemoglobin concentration closely. Manufacturer advises use intravenous preparation with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
  - When used by inhalation Monitor electrolytes closely. Monitor equipment for precipitation.
  - With systemic use Determine full blood count, platelets, electrolytes, glucose, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature).
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include bubble-gum.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010) NICE TA200
      The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage (‘watchful waiting’). www.nice.org.uk/TA200
    - Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010) NICE TA200
      The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:
      - not previously treated with interferon alfa or peginterferon alfa;
      - treated previously with interferon alfa alone or in combination with ribavirin;
      - whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed;
      - co-infected with HIV.
      Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa. www.nice.org.uk/TA200
  - **LESS SUITABLE FOR PRESCRIBING** Ribavirin inhalation is less suitable for prescribing.

In combination with ribavirin (Copegus®, with or without peginterferon alfa, for chronic hepatitis C infection of genotypes 1, 3, 4, 5, or 6 in patients with compensated liver disease | In combination with ribavirin (Copegus®) for chronic hepatitis C infection of genotype 2 in patients with compensated liver disease | In combination with daclatasvir for chronic hepatitis C infection of genotype 1, 3, or 4

▶ BY MOUTH

▶ Adult: 400 mg once daily, for duration of treatment consult product literature

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

**CAUTIONS**

CAUTIONS, FURTHER INFORMATION

In chronic hepatitis C of genotype 1, 4, 5, or 6, only use sofosbuvir with ribavirin in those with intolerance or contra-indications to peginterferon alfa who require urgent treatment.

**INTERACTIONS** ▶ Appendix 1: sofosbuvir

**SIDE-EFFECTS**

▶ Common or very common Hyperbilirubinaemia

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects listed are reported when sofosbuvir is used in combination with ribavirin or with ribavirin and peginterferon alfa.

▶ PREGNANCY Manufacturer advises avoid.

▶ BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

**RENAL IMPAIRMENT** Safety and efficacy not established if eGFR less than 30 mL/minute/1.73 m²—accumulation may occur.

**PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

**PATIENT AND CARER ADVICE**

Missed doses

If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

▶ Sofosbuvir for treating chronic hepatitis C (February 2015) NICE TA330

Sofosbuvir in combination with peginterferon alfa and ribavirin is an option for treating adults with chronic hepatitis C infection:

- of genotype 1
- of genotype 3 with cirrhosis (treatment naive patients)
- of genotype 3 that has not adequately responded to interferon-based treatment
- of genotype 4, 5, or 6 with cirrhosis

Sofosbuvir in combination with ribavirin is an option for treating adults with chronic hepatitis C infection:

- of genotype 2 who are intolerant to or ineligible for interferon (treatment naive patients)
- of genotype 2 that has not adequately responded to interferon-based treatment
- of genotype 3 with cirrhosis who are intolerant to or ineligible for interferon (treatment naive patients)
- of genotype 3 with cirrhosis that has not adequately responded to interferon-based treatment

www.nice.org.uk/TA330

▶ Sofosbuvir for treating chronic hepatitis C (February 2015) NICE TA330

Sofosbuvir in combination with ribavirin is not recommended for the treatment of adults with chronic hepatitis C infection of genotypes 1, 4, 5, or 6.

www.nice.org.uk/TA330

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2014) that sofosbuvir (Sovaldi®) is accepted for use within NHS Scotland for the treatment of chronic hepatitis C infection of genotypes 1 to 6; its use in combination with ribavirin as dual therapy for chronic hepatitis C infection of either genotype 2 (in treatment naive patients) or genotype 3 is restricted to those who cannot use peginterferon alfa because of intolerance or contra-indications.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS  21, 25

▶ Sovaldi (Gilead Sciences International Ltd) ▼

Sofosbuvir 400 mg | Sovaldi 400mg tablets | 28 tablet (POM) £11,660.98
Sofosbuvir with ledipasvir 12-Apr-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, sofosbuvir p. 595.

- **DRUG ACTION** Sofosbuvir is a nucleotide analogue inhibitor and ledipasvir is an HCV inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

- **INDICATIONS AND DOSE**
  - Chronic hepatitis C of genotypes 1, 4, 5 or 6 in patients with or without compensated cirrhosis (with or without ribavirin) | Chronic hepatitis C of genotypes 1, 4, 5 or 6 in patients with or without compensated cirrhosis (with or without ribavirin) | Chronic hepatitis C of genotypes 1, 4, 5 or 6 in patients with or without compensated cirrhosis, irrespective of transplant status (with or without ribavirin) | Chronic hepatitis C of genotype 3 in patients with compensated cirrhosis or prior treatment failure

- **SIDE-EFFECTS**
  - Common or very common: Headache, malaise

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  - Manufacturer advises reduce dose of concurrent proton pump inhibitor if above a dose comparable to omeprazole 20 mg; take at the same time as sofosbuvir with ledipasvir.

| CAUTIONS | Retreatment following treatment failure—efficacy not established |
| INTERACTIONS | Appendix 1: ledipasvir, sofosbuvir |
| PRESCRIBING AND DISPENSING INFORMATION | Dispense in original container (contains desiccant). |
| PATIENT AND CARER ADVICE | Vomiting | Mismeasured doses |
  - If vomiting occurs within 5 hours of administration, an additional dose should be taken. |
  - If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. |

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Ledipasvir with sofosbuvir for the treatment of chronic hepatitis C (November 2015) NICE TA363
      - Ledipasvir with sofosbuvir is recommended as an option for treating adults with chronic hepatitis C infection: |
      - of genotype 1 without cirrhosis (treatment naive patients)—8 weeks’ treatment |
      - of genotype 1 or 4 with cirrhosis (treatment naive patients)—12 weeks’ treatment |
      - of genotype 1 or 4 without cirrhosis (or with cirrhosis but only if the person has a low risk of the disease getting worse) that has not responded adequately to previous treatment—12 weeks’ treatment |
    - In addition, ledipasvir with sofosbuvir is only recommended in patients with cirrhosis for the durations mentioned above if the following criteria are met:
      - Child-Pugh class A |
      - platelet count of 75 000/mm³ or more |
      - no features of portal hypertension |
      - no history of an HCV-associated decompensation episode |
      - not previously treated with an NS5A inhibitor

Patients whose treatment with ledipasvir with sofosbuvir is not recommended in this NICE guidance, but was started within the NHS before this guidance was published, should be able to continue treatment until they and their clinician consider it appropriate to stop.

- **Scottish Medicines Consortium (SMC) Decisions**
  - The Scottish Medicines Consortium has advised (March and September 2015) that Harvoni® (ledipasvir with sofosbuvir) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C infection of genotypes 1, 3 and 4 only, in patients who are ineligible for, or unable to tolerate, interferon.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

Sofosbuvir with velpatasvir 24-Apr-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, sofosbuvir p. 595.

- **DRUG ACTION** Sofosbuvir is a nucleotide analogue inhibitor and velpatasvir is an HCV inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

- **INDICATIONS AND DOSE**
  - Chronic hepatitis C infection, with or without ribavirin (initiated by a specialist)
    - BY MOUTH |
    - Adult: 400/100 mg once daily for 12 weeks (may extend to 24 weeks in some circumstances—consult product literature) |

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  - Manufacturer advises reduce dose of concurrent H₂-receptor antagonist if above a dose comparable to famotidine 40 mg twice daily. |
  - Manufacturer advises reduce dose of concurrent proton pump inhibitor if above a dose comparable to omeprazole 20 mg; take at the same time as sofosbuvir with ledipasvir.

- **DOSE EQUIVALENCE AND CONVERSION**
  - Dose expressed as x/y mg sofosbuvir/velpatasvir.

- **CAUTIONS**
  - Hepatitis B co-infection |

- **INTERACTIONS**
  - Appendix 1: sofosbuvir, velpatasvir |

- **PATIENT AND CARER ADVICE**
  - Vomiting | Manufacturer advises if vomiting occurs within 5 hours of administration, an additional dose should be taken. |
  - Missed doses | If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. |

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Sofosbuvir–velpatasvir for treating chronic hepatitis C (January 2017) NICE TA430
      - Sofosbuvir with velpatasvir is recommended as an option for treating chronic hepatitis C infection, if the following criteria are met:
        - of genotype 1, 3, 4, 5 or 6 with or without cirrhosis (previously treated or treatment naive patients); |
        - of genotype 2 with cirrhosis (previously treated or treatment naive patients); |
        - of genotype 2 without cirrhosis (treatment naive patients), only if interferon not suitable or not tolerated, or without cirrhosis (previously treated patients); |

- **Scottish Medicines Consortium (SMC) Decisions**
  - The Scottish Medicines Consortium has advised (March and September 2015) that Harvoni® (ledipasvir with sofosbuvir) is accepted for restricted use within NHS Scotland for the treatment of chronic hepatitis C infection of genotypes 1, 3 and 4 only, in patients who are ineligible for, or unable to tolerate, interferon.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**ANTIVIRALS › PROTEASE INHIBITORS**

**Simeprevir**

**INDICATIONS AND DOSE**

In combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 or 4

In combination with sofosbuvir (with or without ribavirin) for urgent treatment of chronic hepatitis C infection of genotype 1 or 4 when peginterferon alfa cannot be used because of intolerance or contra-indications

- **BY MOUTH**
- **Adult**: 150 mg once daily (for duration of treatment consult product literature)

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: DIRECT-ACTING ANTI-VIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)**

An EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

**MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRAL INTERFERON-FREE REGIMENS TO TREAT CHRONIC HEPATITIS C: RISK OF HEPATITIS B REACTIVATION (JANUARY 2017)**

An EU-wide review has concluded that direct-acting antiviral interferon-free regimens for chronic hepatitis C can cause hepatitis B reactivation in patients co-infected with hepatitis B and C viruses; the MHRA recommends to screen patients for hepatitis B before starting treatment—patients infected with both hepatitis B and C viruses must be monitored and managed according to current clinical guidelines.

**CAUTIONS**

Consider alternative treatment in presence of NS3 Q80K polymorphism—efficacy of simeprevir is reduced—patients of East Asian origin

**INTERACTIONS** → Appendix 1: simeprevir

**SIDE-EFFECTS**

Constipation • dyspepsia • fatigue (in combination with sofosbuvir) • headache (in combination with sofosbuvir) • hepatic decompensation • hepatic failure • insomnia (in combination with sofosbuvir) • nausea • photosensitivity • pruritus • raised bilirubin concentration • rash

**SIDE-EFFECTS, FURTHER INFORMATION**

- Rash  Monitor for deterioration if mild or moderate; discontinue if severe.
- **CONCEPTION AND CONTRACEPTION**  Effective contraception essential during treatment.
- **PREGNANCY**  Manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies.
- **BREAST FEEDING**  Manufacturer advises avoid—present in plasma of breast-fed animals.
- **HEPATIC IMPAIRMENT**  Manufacturer advises caution in moderate to severe impairment—elimination reduced in severe impairment. Manufacturer advises caution in decompensated cirrhosis—elimination reduced in severe impairment.
- **RENAL IMPAIRMENT**  Manufacturer advises caution if eGFR less than 30 ml/minute/1.73 m²—elimination may be reduced.
- **PRE-TREATMENT SCREENING**  Test for NS3 Q80K polymorphism before combination treatment with ribavirin and peginterferon alfa in patients with chronic hepatitis C infection of genotype 1a. Consider testing for NS3 Q80K polymorphism before combination treatment with sofosbuvir (with or without ribavirin) in patients with chronic hepatitis C infection of genotype 1a.

6.3 Herpesvirus infections

**Herpesvirus infections**

**Herpes simplex and varicella–zoster infection**

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella–zoster virus.

**Herpes simplex infections**

Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV–1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV–1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection.

In individuals with good immune function, mild infection of the eye (ocular herpes) and of the lips (herpes labialis or cold sores) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics. Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance.

Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

**Varicella-zoster infections**

Regardless of immune function and the use of any immunoglobulins, neonates with chickenpox should be treated with a parenteral antiviral to reduce the risk of severe disease. Oral therapy in children is not recommended as absorption is variable. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents and adults than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adults and adolescents.

Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

Pregnant women who develop severe chickenpox may be at risk of complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Those who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella–zoster immunoglobulin (see under Disease Specific Immunoglobulins).

In herpes zoster (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce
complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days. Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management.

**Choice**

Aciclovir below is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella–zoster and the systemic and topical treatment of herpes simplex infections of the skin and mucous membranes. It is used by mouth for severe herpetic stomatitis. Aciclovir eye ointment is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famciclovir p. 601, a prodrug of penciclovir, is similar to aciclovir and is licensed for use in herpes zoster and genital herpes.

Valaciclovir p. 602 is an ester of aciclovir, licensed for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed for preventing cytomegalovirus disease following solid organ transplantation. Famciclovir or valaciclovir are suitable alternatives to aciclovir for oral lesions associated with herpes zoster. Valaciclovir once daily may reduce the risk of transmitting genital herpes to heterosexual partners—specialist advice should be sought.

Foscarnet sodium p. 604 is used for mucocutaneous herpes simplex virus infection unresponsive to aciclovir in immunocompromised patients; it is toxic and can cause renal impairment.

Inosine pranobex below has been used by mouth for herpes simplex infections; its effectiveness remains unproven.

**Cytomegalovirus infection**

Ganciclovir p. 603 is related to aciclovir but it is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the initial treatment of CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine p. 617; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration.

Valaciclovir is licensed for prevention of cytomegalovirus disease following renal transplantation.

Valganciclovir p. 603 is an ester of ganciclovir which is licensed for the initial treatment and maintenance treatment of CMV retinitis in AIDS patients. Valganciclovir is also licensed for preventing CMV disease following solid organ transplantation from a cytomegalovirus-positive donor.

Foscarnet sodium is also active against cytomegalovirus; it is toxic and can cause renal impairment.

See local treatment of CMV retinitis.

**ANTIVIRALS > INOSINE COMPLEXES**

**Inosine pranobex**

(Inosine acedoben dimepranol)

**INDICATIONS AND DOSE**

**Muco-cutaneous herpes simplex**

► **BY MOUTH**

► Adult: 1 g 4 times a day for 7–14 days

**Adjunctive treatment of genital warts**

► **BY MOUTH**

► Adult: 1 g 3 times a day for 14–28 days

**Subacute sclerosing panencephalitis**

► **BY MOUTH**

► Adult: 50–100 mg/kg daily in 6 divided doses

**CAUTIONS** History of gout; history of hyperuricaemia

**SIDE-EFFECTS**

► Common or very common Reversible increase in serum uric acid; reversible increase in urinary uric acid

► Uncommon Arthralgia; epigastric discomfort; fatigue; headache; itching; nausea; rashes; vertigo; vomiting

► Rare Anxiety; constipation; diarrhoea; polyuria; sleep disturbances

**PREGNANCY** Manufacturer advises avoid.

**RENAL IMPAIRMENT** Manufacturer advises caution; metabolised to uric acid.

**LESS SUITABLE FOR PRESCRIBING** Inosine pranobex is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 9

► Imunovir (KoRa Healthcare)

Inosine acedoben dimepranol 500 mg Imunovir 500mg tablets | 100 tablet £39.50

**ANTIVIRALS > NUCLEOSIDE ANALOGUES**

**Aciclovir**

(Acyclovir)

**INDICATIONS AND DOSE**

**Herpes simplex, suppression**

► **BY MOUTH**

► Child 12–17 years: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

► Adult: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

**Herpes simplex, prophylaxis in the immunocompromised**

► **BY MOUTH**

► Child 1–23 months: 100–200 mg 4 times a day

► Child 2–17 years: 200–400 mg 4 times a day

► Adult: 200–400 mg 4 times a day

► **BY INTRAVENOUS INFUSION**

► Adult: 5 mg/kg every 8 hours

**Herpes simplex, treatment (non-genital)**

► **BY MOUTH**

► Adult: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

continued →
Infection

▶ BY MOUTH
- Adult: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Herpes simplex, treatment of recurrent infection in immunocompromised or if absorption impaired
▶ BY MOUTH
- Adult: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- Child 1-2 years: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Herpes simplex, treatment, in immunocompromised or if absorption impaired
▶ BY MOUTH
- Adult: 200 mg 5 times a day, alternatively 400 mg 3 times a day both courses usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Severe genital herpes simplex, treatment, initial infection
▶ INTRAVENOUS INFUSION
- Adult: Initially 5 mg/kg every 8 hours usually for 5 days, alternatively 10 mg/kg every 8 hours for at least 14 days in encephalitis (at least 21 days if also immunocompromised)—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment, higher dose to be used only if resistant organisms suspected or in simplex encephalitis

Genital herpes simplex, treatment of recurrent infection in immunocompromised or HIV-positive patients
▶ BY MOUTH
- Adult: 800 mg 3 times a day for 2 days, alternatively 200 mg 5 times a day for 5 days, alternatively 400 mg 3 times a day for 3–5 days

Varicella zoster (chickenpox), treatment | Herpes zoster (shingles), treatment
▶ BY MOUTH
- Child 1-2 years: 200 mg 4 times a day for 5 days
- Child 2-5 years: 400 mg 4 times a day for 5 days
- Child 6-11 years: 800 mg 4 times a day for 5 days
- Child 12-17 years: 800 mg 5 times a day for 7 days
▶ INTRAVENOUS INFUSION
- Adult: 5 mg/kg every 8 hours usually for 5 days

Varicella zoster (chickenpox), treatment in immunocompromised | Herpes zoster (shingles), treatment in immunocompromised
▶ INTRAVENOUS INFUSION
- Adult: 10 mg/kg every 8 hours usually for 5 days

Herpes zoster (shingles), treatment in immunocompromised
▶ BY MOUTH
- Child 1-2 years: 200 mg 4 times a day continued for 2 days after crusting of lesions
- Child 2-5 years: 400 mg 4 times a day continued for 2 days after crusting of lesions
- Child 6-11 years: 800 mg 4 times a day continued for 2 days after crusting of lesions
- Child 12-17 years: 800 mg 5 times a day continued for 2 days after crusting of lesions
- Adult: 800 mg 5 times a day continued for 2 days after crusting of lesions

Herpes zoster, treatment in encephalitis | Varicella zoster, treatment in encephalitis
▶ INTRAVENOUS INFUSION
- Adult: 10 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised or if severe infection

Varicella zoster (chickenpox), attenuation of infection if varicella-zoster immunoglobulin not indicated
▶ BY MOUTH
- Child: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure
- Adult: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure

DOSES AT EXTREMES OF BODY-WEIGHT
To avoid excessive dosage in obese patients parenteral dose should be calculated on the basis of ideal weight for height.

- UNLICENSED USE Tablets and suspension not licensed for suppression of herpes simplex or for treatment of herpes zoster in children. Aciclovir doses in BNF may differ from those in product literature. Attenuation of chickenpox is an unlicensed indication.

- CAUTIONS Elderly (risk of neurological reactions) · maintain adequate hydration (especially with infusion or high doses)

- INTERACTIONS → Appendix 1: aciclovir

- SIDE-EFFECTS
  - Common or very common Abdominal pain · diarrhoea · fatigue · headache · nausea · photosensitivity · pruritus · rash · urticaria · vomiting
  - Very rare Acute renal failure · anaemia · ataxia · confusion · convulsions · dizziness · drowsiness · dysarthria · dyspnoea · hallucinations · hepatitis · jaundice · leucopenia · neurological reactions · thrombocytopenia
  - With intravenous use Agitation · fever · psychosis · severe local inflammation (sometimes leading to ulceration) · tremors

- PREGNANCY Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.

- BREAST FEEDING Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.

- RENAL IMPAIRMENT Risk of neurological reactions increased. Maintain adequate hydration (especially during renal impairment).

- With intravenous use Use normal intravenous dose every 12 hours if eGFR 25–50 mL/minute/1.73 m² (every 24 hours if eGFR 10–25 mL/minute/1.73 m²). Consult product literature for intravenous dose if eGFR less than 10 mL/minute/1.73 m².

- With oral use in adults For herpes zoster, use normal oral dose every 8 hours if eGFR 10–25 mL/minute/1.73 m² (every 12 hours if eGFR less than 10 mL/minute/1.73 m²). For herpes simplex, use normal oral dose every 12 hours if eGFR less than 10 mL/minute/1.73 m².
With oral use in children For herpes zoster, use normal oral dose every 8 hours if estimated glomerular filtration rate 10 – 25 ml/minute/1.73 m² (every 12 hours if estimated glomerular filtration rate less than 10 ml/minute/1.73 m²). For herpes simplex, use normal dose every 12 hours if estimated glomerular filtration rate less than 10 ml/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion Zovirax IV®, Aciclovir IV (Genus), give intermittently in Sodium chloride 0.9% or Sodium chloride and glucose; initially reconstitute to 25 mg/ml in water for injection or Sodium chloride 0.9% then dilute to not more than 5 mg/ml with the infusion fluid; to be given over 1 hour; alternatively, may be administered in a concentration of 25 mg/ml using a suitable infusion pump and given over 1 hour; for Aciclovir IV (Hospira) dilute to not more than 5 mg/ml with infusion fluid; give over 1 hour.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid preparations may include banana, or orange.

**PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Aciclovir (oral) for viral infections www.medicinesforchildren.org.uk/aciclovir-for-viral-infections

**PROFESSION SPECIFIC INFORMATION**
Dental practitioners’ formulary
Aciclovir Tablets 200 mg or 800 mg may be prescribed. Aciclovir Oral Suspension 200 mg/5ml may be prescribed.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Valaciclovir

**INDICATIONS AND DOSE**

**Herpes zoster infection, treatment**

- **BY MOUTH**
- Adult: 1 g 3 times a day for 7 days

**Herpes zoster infection, treatment in immunocompromised patients**

- **BY MOUTH**
- Adult: 1 g 3 times a day for at least 7 days and continued for 2 days after crusting of lesions

**Herpes simplex, treatment of first infective episode**

- **BY MOUTH**
- Adult: 500 mg twice daily for 5 days (longer if new lesions appear during treatment or healing is incomplete)

**Herpes simplex infections treatment of first episode in immunocompromised or HIV-positive patients**

- **BY MOUTH**
- Adult: 1 g twice daily for 10 days

**Herpes simplex, treatment of recurrent infections**

- **BY MOUTH**
- Adult: 500 mg twice daily for 3–5 days

**Treatment of recurrent herpes simplex infections in immunocompromised or HIV-positive patients**

- **BY MOUTH**
- Adult: 1 g twice daily for 5–10 days

**Herpes labialis treatment**

- **BY MOUTH**
- Child 12–17 years: Initially 2 g, then 2 g after 12 hours
- Adult: Initially 2 g, then 2 g after 12 hours

**Herpes simplex, suppression of infections**

- **BY MOUTH**
- Adult: 500 mg daily in 1–2 divided doses, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

---

**Herpes simplex, suppression of infections in immunocompromised or HIV-positive patients**

- **BY MOUTH**
  - Adult: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

**Genital herpes, reduction of transmission (administered on expert advice)**

- **BY MOUTH**
  - Adult: 500 mg once daily, to be taken by the infected partner

**Prevention of cytomegalovirus disease following solid organ transplantation when valganciclovir or ganciclovir cannot be used**

- **BY MOUTH**
  - Adult: 2 g 4 times a day usually for 90 days, preferably starting within 72 hours of transplantation

---

**CAUTIONS**

- Elderly (risk of neurological reactions) • maintain adequate hydration (especially with high doses)

**INTERACTIONS**

- Appendix 1: valaciclovir

**SIDE-EFFECTS**

- Very rare: Acute renal failure • anaemia • ataxia • confusion • convulsions • dizziness • drowsiness • dysarthria • dysphoria • hallucinations • hepatitis • jaundice • leucopenia • neurological reactions • thrombocytopenia

- Frequency not known: Abdominal pain • diarrhoea • fatigue • headache • nausea • photosensitivity • pruritus • rash • urticaria • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Neurological reactions: Neurological reactions (including dizziness, confusion, hallucinations, convulsions, ataxia, dysarthria, and drowsiness) more frequent with higher doses

**PREGNANCY**

- Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk

**BREAST FEEDING**

- Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution with high doses used for herpes labialis and prevention of cytomegalovirus disease—no information available

**RENAL IMPAIRMENT**

- Maintain adequate hydration.
  - In adults: For herpes zoster: 1 g every 12 hours if eGFR 30–50mL/minute/1.73 m² (1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m²; 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m²). For treatment of herpes simplex, 500 mg (1 g in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m². For treatment of herpes labialis, if eGFR 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if eGFR 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if eGFR less than 10 mL/minute/1.73 m², 500 mg as a single dose). For suppression of herpes simplex, 250 mg (500 mg in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m². For reduction of genital herpes transmission, 250 mg every 24 hours if eGFR less than 15 mL/minute/1.73 m². Reduce dose according to eGFR for cytomegalovirus prophylaxis following solid organ transplantation (consult product literature).
  - In children: For treatment of herpes labialis, if estimated glomerular filtration rate 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if estimated glomerular filtration rate 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if estimated glomerular filtration rate
f he filtration rate is less than $10 \text{mL/minute}/1.73 \text{m}^2$, 500 mg as a single dose).

**PRESCRIBING AND DISPENSING INFORMATION** Valaciclovir is a pro-drug of aciclovir.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- Valaciclovir (Non-proprietary)
  - Valaciclovir (as Valaciclovir hydrochloride) 500 mg  Valaciclovir 500mg tablets | 10 tablet  £20.59 07 price | £2.80 | 42 tablet  £86.30
- Valtrex (GlaxoSmithKline UK Ltd)
  - Valaciclovir (as Valaciclovir hydrochloride) 250 mg  Valtrex 250mg tablets | 60 tablet  £123.28 07 price = £123.28
  - Valaciclovir (as Valaciclovir hydrochloride) 500 mg  Valtrex 500mg tablets | 10 tablet  £20.59 07 price = £2.80 | 42 tablet  £86.30

---

6.3a Cytomegalovirus infections

**ANTIVIRALS**

### Ganciclovir

**INDICATIONS AND DOSE**

**Prevention of cytomegalovirus disease during immunosuppressive therapy following organ transplantation**

- **BY INTRAVENOUS INFUSION**
  - Adult: 5 mg/kg every 12 hours for 7–14 days

**Treatment of life-threatening or sight-threatening cytomegalovirus infections in immunocompromised patients only**

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 5 mg/kg every 12 hours for 14–21 days, followed by maintenance 6 mg/kg daily on 5 days of the week, alternatively 5 mg/kg daily until adequate recovery of immunity, maintenance only for patients at risk of relapse of retinitis, if retinitis progresses initial induction treatment may be repeated

**CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) • abnormally low neutrophil count (consult product literature) • abnormally low platelet count (consult product literature)

**CAUTIONS** Children (possible risk of long-term carcinogenic or reproductive toxicity) • ensure adequate hydration • history of cytopenia • potential carcinogen • potential teratogen • radiotherapy • vesicant

**INTERACTIONS** → Appendix 1: ganciclovir

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain • abnormal thinking • anaemia • anorexia • anxiety • arthralgia • chest pain • confusion • constipation • convulsions • cough • depression • dermatitis • diarrhoea • dizziness • dyspepsia • dysphagia • dyspnoea • ear pain • eye pain • fatigue • flattulence • headache • hepatic dysfunction • infection • injection-site reactions • insomnia • leucopenia • macular oedema • myalgia • nausea • night sweats • pancytopenia • peripheral neuropathy • pruritus • pyrexia • renal impairment • retinal detachment • taste disturbance • thrombocytopenia • vitreous floaters • vomiting • weight loss

- **Uncommon** Alopecia • anaphylactic reactions • arrhythmias • disturbances in hearing and vision • haematuria • hypotension • male infertility • mouth ulcers • pancreatitis • psychosis • tremor

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to ganciclovir, aciclovir, or valaciclovir.

**CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment.

**PREGNANCY** Avoid—teratogenic risk.

**BREAST FEEDING** Avoid—no information available.

**RENAL IMPAIRMENT** Reduce dose if eGFR less than 70 mL/minute/1.73 m²; consult product literature.

**MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

**DIRECTIONS FOR ADMINISTRATION** Infuse into vein with adequate flow preferably using plastic cannula. For intravenous infusion (Cymevene®) give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially in water for injections (500 mg/10 mL) then dilute to not more than 10 mg/mL with infusion fluid (usually 100 mL); give over 1 hour.

**HANDLING AND STORAGE**

Caution in handling Ganciclovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with soap and water.

---

### Valganciclovir

**INDICATIONS AND DOSE**

**Cytomegalovirus retinitis, induction and maintenance treatment in patients with AIDS**

- **BY MOUTH**
  - Adult: Initially 900 mg twice daily for 21 days, then 900 mg daily, induction regimen may be repeated if retinitis progresses

**Prevention of cytomegalovirus disease following solid organ transplantation from a cytomegalovirus positive donor**

- **BY MOUTH**
  - Adult: 900 mg daily for 100 days (for 100–200 days following kidney transplantation), to be started within 10 days of transplantation

**DOSE EQUIVALENCE AND CONVERSION**

- Oral valganciclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily.

**CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) • abnormally low neutrophil count (consult product literature) • abnormally low platelet count (consult product literature)

**CAUTIONS** Children (possible risk of long-term carcinogenic or reproductive toxicity) • history of cytopenia • potential carcinogen • potential teratogen • radiotherapy

**INTERACTIONS** → Appendix 1: valganciclovir

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain • abnormal thinking • anaemia • anorexia • anxiety • arthralgia • chest pain • confusion • constipation • convulsions • cough • depression • dermatitis • diarrhoea • dizziness • dyspepsia • dysphagia • dyspnoea • ear pain • eye pain • fatigue •...
Foscarnet sodium

**Indications and dose**

**Cytomegalovirus disease**
- **By intravenous infusion**
  - Adult: Initially 60 mg/kg every 8 hours for 2–3 weeks, alternatively initially 90 mg/kg every 12 hours for 2–3 weeks, then maintenance 60 mg/kg daily, then increased if tolerated to 90–120 mg/kg daily, if disease progresses on maintenance dose, repeat induction regimen

**Mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients**
- **By intravenous infusion**
  - Adult: 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

**Antivirals**

**Unlicensed use**
Licensed for CMV retinitis in AIDS patients only. Foscarnet doses in BNF may differ from those in product literature.

**Cautions**
Ensure adequate hydration

**Interactions**
Appendix 1: foscarnet

**Side-effects**
- **Common or very common** Abdominal pain · acute renal failure · aggression · agitation · anaemia · anorexia · anxiety · changes in blood pressure · changes in ECG · confusion · constipation · convulsions · depression · diarrhoea · dizziness · dyspepsia · dysuria · electrolyte disturbances · genital irritation and ulceration (due to high concentrations excreted in urine) · granulocytopenia · headache · hepatic dysfunction · hypocalcaemia · hypokalaemia · hypomagnesaemia · leucopenia · malaise · myalgia · nausea · renal impairment · retinal detachment · taste disturbance · thrombocytopenia · vitreous floaters · vomiting · weight loss
- **Uncommon** Alopecia · anaphylactic reactions · arrhythmias · disturbances in hearing · disturbances in vision · haematuria · hypotension · male infertility · mouth ulcers · pancreatitis · psychosis · tremor

**Allergy and cross-sensitivity**
Contra-indicated in patients hypersensitive to ganciclovir, aciclovir, or valaciclovir.

**Conception and contraception**
Ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment.

**Pregnancy**
Avoid—teratogenic risk.

**Breast feeding**
Avoid—no information available.

**Renal impairment**
Reduce dose, consult product literature.

**Monitoring requirements**
Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

**Prescribing and dispensing information**
Valganciclovir is a pro-drug of ganciclovir.
  - Flavours of oral liquid formulations may include tutti-frutti.

**Handling and storage**
Caution in handling Valganciclovir is a potential teratogen and carcinogen and caution is advised when handling the powder, reconstituted solution, or broken tablets; if these come into contact with skin or mucosa, wash off immediately with water; avoid inhalation of powder.

**Medicinal forms**

**Oral solution**

**6.4 HIV infection**

**Overview**

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) may be associated with serious side-effects. Although antiretrovirals increase life expectancy considerably and decrease the risk of complications associated with premature ageing, mortality and morbidity remain slightly higher than in uninfected individuals. Treatment should be undertaken only by those experienced in their use.
Principles of treatment
Treatment aims to prevent the mortality and morbidity associated with chronic HIV infection whilst minimising drug toxicity. Although it should be started before the immune system is irreversibly damaged, the need for early drug treatment should be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and patient tolerance. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

Treatment also reduces the risk of HIV transmission to sexual partners, but the risk is not eliminated completely; this risk and strategies to reduce HIV transmission should be discussed with patients and their sexual partners.

Initiation of treatment
The optimum time for initiating antiretroviral treatment depends primarily on the CD4 cell count. The timing and choice of treatment should also take account of clinical symptoms, comorbidities, and the possible effect of antiretroviral drugs on factors such as the risk of cardiovascular events. Treatment includes a combination of drugs known as 'highly active antiretroviral therapy'. Treatment of HIV-1 infection is initiated with 2 nucleoside reverse transcriptase inhibitors and either a non-nucleoside reverse transcriptase inhibitor, or a boosted protease inhibitor, or an integrase inhibitor; the regimen of choice contain tenofovir disoproxil p. 616 and emtricitabine p. 613 with either efavirenz p. 608 or ritonavir p. 621-boosted atazanavir p. 618, or ritonavir-boosted darunavir p. 619, or raltegravir p. 607. Alternative regimens contain abacavir p. 610 and lamivudine p. 615 with either lopinavir with ritonavir p. 620, or ritonavir-boosted fosamprenavir p. 620, or nevirapine p. 609, or rilpivirine p. 610. Patients who require treatment for both HIV and chronic hepatitis B should be treated with antivirals active against both diseases.

Switching therapy
Deterioration of the condition (including clinical and virological changes) may require a change in therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance and the possibility of cross-resistance.

Pregnancy
Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although information on the teratogenic potential of most antiretroviral drugs is limited), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. All treatment options require careful assessment by a specialist. Combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. However, it may be associated with a greater risk of preterm delivery. Pregnancies in HIV-positive women and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at www.ucl.ac.uk/nshpc/ and to the Antiretroviral Pregnancy Registry at www.apregistry.com.

Breast-feeding
Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

Pre-exposure prophylaxis
The risk of acquiring HIV is increased in:
- men or transgendered individuals who have unprotected intercourse with men;
- partners of people who are HIV-positive and have a detectable viral load; and
- heterosexual men and women who have unprotected intercourse with a partner who is HIV positive.

Emtricitabine with tenofovir disoproxil p. 615 may be appropriate for pre-exposure prophylaxis to reduce the risk of sexually acquired HIV-1 infection in combination with safer sex practices in adults at high risk; recommendations developed by the British Association for Sexual Health and HIV are available at: www.bashh.org. Note: there is currently no publicly funded HIV pre-exposure prophylaxis programme in the UK.

Post-exposure prophylaxis
Prophylaxis with antiretroviral drugs [unlicensed indication] may be appropriate following exposure to HIV-contaminated material. Immediate expert advice should be sought in such cases; national guidelines on post-exposure prophylaxis for healthcare workers have been developed (by the Chief Medical Officer’s Expert Advisory Group on AIDS), www.gov.uk/dh and local ones may also be available. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Prompt prophylaxis with antiretroviral drugs [unlicensed indication] is also appropriate following potential sexual exposure to HIV; recommendations have been developed by the British Association for Sexual Health and HIV, www.bashh.org.

Drugs for HIV infection
Zidovudine p. 617, a nucleoside reverse transcriptase inhibitor (or ‘nucleoside analogue’), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include abacavir, didanosine p. 612, emtricitabine, lamivudine, stavudine p. 616, and tenofovir disoproxil.

The protease inhibitors include atazanavir, darunavir, fosamprenavir (a pro-drug of amprenavir), indinavir p. 620, lopinavir (available as lopinavir with ritonavir), ritonavir, saquinavir p. 621, and tipranavir p. 622. Indinavir is rarely used in the treatment of HIV-infection because it is associated with nephrolithiasis. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, indinavir, lopinavir (available as lopinavir with ritonavir), saquinavir, and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects.

The non-nucleoside reverse transcriptase inhibitors efavirenz, etravirine p. 608, nevirapine, and rilpivirine are used in the treatment of HIV-1 infection, but not against the subtype HIV-2, a subtype that is rare in the UK. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and occasionally fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz; CNS disturbances are often self-limiting and can be reduced by taking the dose at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz has also been associated with an increased plasma-cholesterol concentration. Etravirine is used in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.
Enfuvirtide below, which inhibits the fusion of HIV to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs; enfuvirtide should be combined with other potentially active antiretroviral drugs.

Maraviroc p. 622 is an antagonist of the CCR5 chemokine receptor. It is licensed for patients exclusively infected with CCR5-tropic HIV.

Dolutegravir below, elvitegravir p. 607 and raltegravir p. 607 are inhibitors of HIV integrase. They are licensed for the treatment of HIV infection in combination with other antiretroviral drugs.

Cobicistat p. 622 is a pharmacokinetic enhancer that boosts the concentrations of other antiretrovirals, but it has no antiretroviral activity itself.

**Immune reconstitution syndrome**

Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms; these reactions may occur within the first few weeks or months of initiating treatment. Autoimmune disorders (such as Graves’ disease) have also been reported many months after initiation of treatment.

**Osteonecrosis**

Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

**HIV infection in children**

HIV disease in children has a different natural progression to HIV disease in adults. Children infected with HIV should be managed within a formal paediatric HIV clinical network by specialists with expertise in HIV infection in children. Differences in the natural progression of HIV disease or following long-term exposure to combination antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms; these reactions may occur within the first few weeks or months of initiating treatment. Autoimmune disorders (such as Graves’ disease) have also been reported many months after initiation of treatment.

**SIDE-EFFECTS, FURTHER INFORMATION**

Hypersensitivity reactions Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge.

Osteonecrosis For further information see HIV infection p. 604.
HIV infection

Elvitegravir

**DRUG ACTION** Elvitegravir is an inhibitor of HIV integrase, which is an enzyme required for viral replication.

**INDICATIONS AND DOSE**

**HIV infection without resistance to other inhibitors of HIV integrase, in combination with low-dose ritonavir and atazanavir or lopinavir**

**BY MOUTH**

- Adult: 85 mg once daily, take at the same time as a once daily ritonavir-boosted regimen or with the first dose of a twice daily ritonavir-boosted regimen

**HIV infection without resistance to other inhibitors of HIV integrase, in combination with low-dose ritonavir and darunavir or fosamprenavir**

**BY MOUTH**

- Adult: 150 mg once daily, take with the first dose of a twice daily ritonavir-boosted regimen

**CAUTIONS**

- Elderly—limited information available

**INTERACTIONS**

- Appendix 1: elvitegravir

**SIDE-EFFECTS**

- Common or very common Diarrhoea, fatigue, headache, nausea, rash, vomiting

- Uncommon Abdominal distension, depression, dizziness, dysgeusia, dyspepsia, flatulence, insomnia, paraesthesia, somnolence, suicidal ideation (in patients with history of depression or psychiatric illness)

- Frequency not known Hyperglycaemia, increased blood lipids, osteonecrosis, weight gain

**SIDE-EFFECTS, FURTHER INFORMATION**

- Osteonecrosis For further information see HIV infection p. 604.

**CONCEPTION AND CONTRACEPTION**

- Manufacturer advises women of child-bearing potential should use effective contraception during treatment (if using a hormonal contraceptive, it must contain norgestimate as the progestogen and at least 30 micrograms ethinylestradiol)

**PREGNANCY**

- Manufacturer advises avoid unless essential—limited data available

**HEPATIC IMPAIRMENT**

- Manufacturer advises use with caution in severe impairment—no information available. Use with caution in patients with chronic hepatitis B or C (greater risk of hepatic side-effects).

**PATIENT AND CARER ADVICE**

- Missed doses

  Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. If vomiting occurs within 1 hour of taking a dose, a replacement dose should be taken.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Elvitegravir 150 mg**
  - Tivicay 150mg tablets | 30 tablet (PO) £523.79

**Combinations available:** Elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide, p. 613 - Elvitegravir with cobicistat, emtricitabine and tenofovir disoproxil, p. 613

**RALTEGRAVIR**

**DRUG ACTION** Raltegravir is an inhibitor of HIV integrase.

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**

- **BY MOUTH USING TABLETS**
  - Adult: 400 mg twice daily

**DOSE EQUIVALENCE AND CONVERSION**

- The bioavailability of Isentress® chewable tablets is higher than that of the ‘standard’ 400 mg tablets; the chewable tablets are not interchangeable with the ‘standard’ tablets on a milligram-for-milligram basis.

**CAUTIONS**

- Psychiatric illness (may exacerbate underlying illness including depression) - risk factors for myopathy - risk factors for rhabdomyolysis

**INTERACTIONS**

- Appendix 1: raltegravir

**SIDE-EFFECTS**

- Common or very common Abdominal pain, abnormal dreams, asthenia, depression, diarrhoea, dizziness, dyspepsia, flatulence, headache, hyperactivity, hypertriglyceridaemia, insomnia, nausea, rash, vomiting

- Uncommon Acne, alopecia, anaemia, anxiety, appetite changes, arthralgia, bradycardia, carpal tunnel syndrome, chest pain, chills, confusion, constipation, drowsiness, dry mouth, dry skin, dysphonia, epistaxis, erectile dysfunction, flushing, gastritis, gingivitis, glossitis, gynaecomastia, hepatitis, hyperhidrosis, hypertension, impaired memory and attention, lipodystrophy, Lipodystrophy Syndrome, menopausal symptoms, myalgia, nasal congestion, neutropenia, nocturia, oedema, osteopenia, pain on swallowing, palpitation, pancreatitis, peptic ulcer, peripheral neuropathy, polydipsia, pruritus, pyrexia, rash with eosinophilia and systemic symptoms, rectal bleeding, renal failure, rhabdomyolysis, skin papilloma, Stevens-Johnson syndrome, suicidal ideation, taste disturbances, thrombocytopenia, tinnitus, tremor, ventricular extrasystoles, visual disturbances

- Frequency not known Osteonecrosis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Rash Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia.

- Osteonecrosis For further information see HIV infection p. 604.

**PHARMACOKINETICS**

- Absorption Rapid, complete absorption following oral dosing

- Metabolism Mainly liver; no active metabolites

- Excretion Renal, mainly via faeces

- **Half-life**
  - Raltegravir: 5.3 hours
  - Raltegravir-phosphate: 6.7 hours

**DRUG INTERACTIONS**

- Rifampicin: Raltegravir concentration reduced, rifampicin concentration increased

**CONTRAINDICATIONS**

- Hypersensitivity to any component of the formulation

**CAUTIONS**

- Pregnancy
  - Category B
  - Use only if benefit to the mother clearly outweighs potential risk to the fetus

- Lactation
  - Use with caution, advise against breastfeeding

- Elderly
  - Use with caution

**SIDE-EFFECTS, FURTHER INFORMATION**

- Rash Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia.

- Osteonecrosis For further information see HIV infection p. 604.

**PATIENT AND CARER ADVICE**

- Missed doses

  Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. If vomiting occurs within 1 hour of taking a dose, a replacement dose should be taken.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- CAUTIONARY AND ADVISORY LABELS 21
  - **Vitekta** (Gilead Sciences International Ltd)
    - Elvitegravir 85 mg Vitekta 85mg tablets | 30 tablet (PO) £249.38
    - Elvitegravir 150 mg Vitekta 150mg tablets | 30 tablet (PO) £253.79

**Combinations available:** Elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide, p. 613 - Elvitegravir with cobicistat, emtricitabine and tenofovir disoproxil, p. 613

**CONTRAINDICATIONS**

- Hypersensitivity to any component of the formulation

**CAUTIONS**

- Pregnancy
  - Category B
  - Use only if benefit to the mother clearly outweighs potential risk to the fetus

- Lactation
  - Use with caution, advise against breastfeeding

- Elderly
  - Use with caution

**SIDE-EFFECTS, FURTHER INFORMATION**

- Rash Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia.

- Osteonecrosis For further information see HIV infection p. 604.

**PREGNANCY**

- Manufacturer advises avoid unless essential—limited data available

**HEPATIC IMPAIRMENT**

- Manufacturer advises use with caution in severe impairment—no information available. Use with caution in patients with chronic hepatitis B or C (greater risk of hepatic side-effects).

**PHEMIPAR IMPAIRMENT**

- Manufacturer advises caution in severe impairment—no information available.
PREGNANCY  Manufacturer advises avoid—toxicity in animal studies.

HEPATIC IMPAIRMENT  Manufacturer advises caution in severe impairment—no information available. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side-effects).

PRESCRIBING AND DISPENSING INFORMATION  Dispense raltegravir chewable tablets in original container (contains desiccant).

NATIONAL FUNDING/ACCESS DECISIONS  Scottish Medicines Consortium (SMC) Decisions The Scottish Medicines Consortium has advised (April 2010) that raltegravir (Isentress®) is accepted for restricted use within NHS Scotland for the treatment of HIV infection when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Tablet  CAUTIONARY AND ADVISORY LABELS  25
   • Isentress (Merck Sharp & Dohme Ltd)
   • Raltegravir 400 mg Isentress 400mg tablets | 60 tablet  £471.41

ANTIVIRALS  >  NON-NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS  Efavirenz

INDICATIONS AND DOSE  HIV infection in combination with other antiretroviral drugs
   •一件事情 USING CAPSULES
   • Adult: 600 mg once daily
   •事情 USING TABLETS
   •成人: 600 mg once daily
   •事情 USING ORAL SOLUTION
   •成人: 720 mg once daily

DOSE EQUIVALENCE AND CONVERSION  The bioavailability of Sustiva® oral solution is lower than that of the capsules and tablets; the oral solution is not interchangeable with either capsules or tablets on a milligram-for-milligram basis.

UNLICENSED USE  Opening capsules and adding contents to food is an unlicensed method of administration.

CAUTIONS  Acute porphyrias p. 969  • elderly  • history of psychiatric disorders  • history of seizures

INTERACTIONS  >  Appendix 1: efavirenz

SIDE-EFFECTS  Common or very common Abdominal pain  • abnormal dreams  • anxiety  • depression  • diarrhoea  • dizziness  • fatigue  • headache  • impairead concentration  • nausea  • pruritus  • rash  • sleep disturbances  • Stevens-Johnson syndrome  • vomiting
   • Uncommon Amnesia  • ataxia  • blurred vision  • convulsions  • flushing  • gynaecomastia  • hepatitis  • hypersensitivity  • mania  • pancreatitis  • psychosis  • suicidal ideation  • tinnitus  • tremor  • vertigo
   • Rare Hepatic failure  • photosensitivity  • suicide
   • Frequency not known Lipodystrophy syndrome  • osteonecrosis  • raised serum cholesterol SIDE-EFFECTS, FURTHER INFORMATION

 Rash  Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month.

CNS effects  Administration at bedtime especially in first 2-4 weeks reduces CNS effects.

Osteonecrosis  For further information see HIV infection p. 604.

Immune Reconstitution Syndrome  For further information see HIV infection p. 604.

PREGNANCY  Reports of neural tube defects when used in first trimester.

HEPATIC IMPAIRMENT  Greater risk of hepatic side-effects in chronic hepatitis B or C. Avoid in moderate to severe impairment. In mild liver disease, monitor for dose related side-effects (e.g. CNS effects) and monitor liver function.

RENAL IMPAIRMENT  Manufacturer advises caution in severe renal failure—no information available.

MONITORING REQUIREMENTS  Monitor liver function if receiving other hepatotoxic drugs.

DIRECTIONS FOR ADMINISTRATION  Capsules may be opened and contents added to food (contents have a peppery taste).

PRESCRIBING AND DISPENSING INFORMATION  Flavours of oral liquid formulations may include strawberry and mint.

PATIENT AND CARER ADVICE  Psychiatric disorders  Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Combinations available: Efavirenz with emtricitabine and tenofovir disoproxil, p. 612

Etravirine

INDICATIONS AND DOSE  HIV infection resistant to other non-nucleoside reverse transcriptase inhibitor and protease inhibitors in combination with other antiretroviral drugs (including a boosted protease inhibitor)

   • BY MOUTH
   • Adult: 200 mg twice daily, to be taken after food

CONTRA-INDICATIONS  Acute porphyrias p. 969

INTERACTIONS  >  Appendix 1: etravirine

SIDE-EFFECTS  Common or very common Abdominal pain  • anaemia  • diabetes  • flatulence  • gastritis  • gastro-oesophageal reflux  • hyperlipidaemia  • hypertension  • Lipodystrophy Syndrome  • myocardial infarction  • nausea  • peripheral neuropathy  • rash  • renal failure
   • Uncommon Angina  • blurred vision  • bronchospasm  • drowsiness  • dry mouth  • gynaecomastia  • haematemesis  • hepatitis  • malaise  • pancreatitis  • sweating
HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 200 mg twice daily
  - BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - Adult: 400 mg once daily

**CONTRA-INDICATIONS**
Acute porphyrias p. 969 · post-exposure prophylaxis

**CAUTIONS**
Females (at greater risk of hepatic side effects) · high CD4 cell count (at greater risk of hepatic side effects)

**CAUTIONS, FURTHER INFORMATION**
- Hepatic effects
  - Patients with chronic hepatitis B or C, high CD4 cell count, and women are at increased risk of hepatic side effects— if plasma HIV-1 RNA detectable, manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm³ or in men with CD4 cell count greater than 400 cells/mm³ unless potential benefit outweighs risk.

**INTERACTIONS** 
Appendix 1: nevirapine

**SIDE-EFFECTS**
- Common or very common
  - Abdominal pain · diarrhoea · fatigue · fever · granulocytopenia · headache · hepatitis · hypersensitivity reactions (may involve hepatic reactions and rash) · nausea · rash · Stevens-Johnson syndrome · toxic epidermal necrolysis · vomiting

- Uncommon
  - Anaemia · arthralgia · myalgia

- Frequency not known
  - Osteonecrosis

**SIDE-EFFECTS, FURTHER INFORMATION**
- Hepatic effects
  - Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction.

- Rash
  - Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually (after 14 days); Discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves.

- Osteonecrosis
  - For more information see HIV infection p. 604.

**Hepatic impairment**
Manufacturer advises avoid modified-release preparation—no information available; use ‘immediate-release’ preparation with caution in moderate impairment and avoid in severe impairment. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side effects).

**Renal impairment**
Manufacturer advises avoid modified-release preparation—no information available.

**Monitoring requirements**
- Hepatic disease
  - Close monitoring of liver function required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly.
  - Rash
  - Monitor closely for skin reactions during first 18 weeks.

**Patient and carer advice**
Hypersensitivity reactions
Patients or carers should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention.

---

**Rare**
- Stevens-Johnson syndrome

**Very rare**
- Toxic epidermal necrolysis

**Frequency not known**
- Haemorrhagic stroke · hypersensitivity reactions · osteonecrosis

**Side-effects, further information**
- Hypersensitivity reactions
  - Rash, usually in the second week, is the most common side-effect and appears more frequently in females. Life-threatening hypersensitivity reactions reported usually during week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks.

- Osteonecrosis
  - For further information see HIV infection p. 604.

**Hepatic impairment**
- Manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available; greater risk of hepatic side-effects in chronic hepatitis B or C.

**Directions for administration**
- Patients with swallowing difficulties may disperse tablets in a glass of water just before administration.

**Prescribing and dispensing information**
- Dispense in original container (contains desiccant).

**Patient and carer advice**
- Hypersensitivity reactions
  - Patients or carers should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop.

- Missed doses
  - If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- CAUTIONARY AND ADVISORY LABELS
  - **IntenCe** (Janssen-Cilag Ltd)
    - **Etravirine 25 mg** IntenCe 25mg tablets | 120 tablet £75.32
    - **Etravirine 100 mg** IntenCe 100mg tablets | 120 tablet £301.27
    - **Etravirine 200 mg** IntenCe 200mg tablets | 60 tablet £301.27

---

**Nevirapine**

**Indications and dose**

**HIV infection in combination with other antiretroviral drugs (initial dose)**

- **By mouth using immediate-release medicines**
  - Adult: Initially 200 mg once daily for first 14 days, initial dose titration using ‘immediate-release’ preparation should not exceed 28 days; if rash occurs and is not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose of the ‘immediate-release’ preparation for the first 14 days as for new treatment
attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop.

Missed doses
If a dose is more than 8 hours late with the ‘immediate-release’ preparation (or more than 12 hours late with the modified-release preparation), the missed dose should not be taken and the next dose should be taken at the usual time.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Oral suspension
- Viramune (Boehringer Ingelheim Ltd)
- Nevirapine (as Nevirapine hemihydrate) 10 mg per 1 ml Viramune 50mg/5ml oral suspension | 240 ml $50.40

Modified-release tablet
CAUTIONARY AND ADVISORY LABELS 25
- Nevirapine (Non-proprietary)
  - Nevirapine 400 mg Nevirapine 400mg modified-release tablets | 30 tablet POM £52.13–£161.50
  - Nevirapine 100 mg Nevirapine 100mg modified-release tablets | 90 tablet POM £17.50 (Hospital only)
  - Nevirapine 400 mg Nevirapine 400mg modified-release tablets | 30 tablet POM £170.00 (Hospital only)

Tablet
- Nevirapine (Non-proprietary)
  - Nevirapine 200 mg Nevirapine 200mg tablets | 14 tablet POM £33.69 | 60 tablet POM £21.45–£170.00
  - Viramune (Boehringer Ingelheim Ltd)
  - Nevirapine 200 mg Viramune 200mg tablets | 14 tablet POM £39.67 | 60 tablet POM £170.00

Rilpivirine 28-Sep-2016

INDICATIONS AND DOSE
HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy and if plasma HIV-1 RNA concentration less than or equal to 100 000 copies/mL
- BY MOUTH
- Adult: 25 mg once daily

INTERACTIONS  Appendix 1: rilpivirine
SIDE-EFFECTS
Abdominal pain  anorexia  arthralgia  blood disorders  cough  diarrhea  dizziness  dyspnoea  fatigue  fever  flatulence  gastrointestinal disturbances  headache  insomnia  liver damage  metabolic effects  myalgia  nausea  neutropenia  osteonecrosis  pancreatitis  rash  thrombocytopenia  urticaria  vomiting
SIDE-EFFECTS, FURTHER INFORMATION
- Osteonecrosis  For further information see HIV infection p. 604.
- PREGNANCY  Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.
- HEPATIC IMPAIRMENT  Use with caution in patients with chronic hepatitis B or C (greater risk of hepatic side-effects).

Abacavir

INDICATIONS AND DOSE
HIV infection in combination with other antiretroviral drugs
- BY MOUTH
- Adult: 600 mg daily in 1–2 divided doses

CAUTIONS
HIV load greater than 100 000 copies/mL  patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%)

INTERACTIONS  Appendix 1: abacavir
SIDE-EFFECTS
- Very rare  Stevens-Johnson syndrome  toxic epidermal necrolysis
- Frequency not known  Hypersensitivity reactions

SIDE-EFFECTS, FURTHER INFORMATION
- Hypersensitivity reactions  Life-threatening hypersensitivity reactions reported—characterised by fever or rash and possibly nausea, vomiting, diarrhea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and myalgia; less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure; rarely myolysis; laboratory abnormalities may include raised liver function tests and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time.
Discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction); discontinue if hypersensitivity cannot be ruled out, even when other diagnoses possible—if rechallenge necessary it must be carried out in hospital setting; if abacavir is stopped for any reason other than hypersensitivity, exclude hypersensitivity reaction as the cause and rechallenge only if medical assistance is readily available; care needed with concomitant use of drugs which cause skin toxicity.

- Rash More common in children.

**ALLERGY AND CROSS-SENSITIVITY** Caution—increased risk of hypersensitivity reaction in presence of HLA-B*5701 allele.

**HEPATIC IMPAIRMENT** Monitor closely in mild impairment (combination preparations not recommended as reduced abacavir dose may be required). Avoid in moderate impairment unless essential—close monitoring recommended. Avoid in severe impairment.

**RENAL IMPAIRMENT** Manufacturer advises avoid in end-stage renal disease.

**PRE-TREATMENT SCREENING** Test for HLA-B*5701 allele before treatment or if restarting treatment and HLA-B*5701 status not known.

**MONITORING REQUIREMENTS** Monitor for symptoms of hypersensitivity reaction every 2 weeks for 2 months.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana, or strawberry.

**PATIENT AND CARER ADVICE** Patients should be provided with an alert card and advised to keep it with them at all times.

Patients and their carers should be told the importance of regular dosing (intermittent therapy may increase the risk of sensitisation), how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment.

**INDICATIONS AND DOSE**

**HIV infection**

**BY MOUTH**

Adult (body-weight 40 kg and above): 1 tablet once daily

**PATIENT AND CARER ADVICE**

Missed doses

If a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- *Triumeq* (ViiV Healthcare UK Ltd)
  - Dolutegravir (as Dolutegravir sodium) 50 mg, Lamivudine 300 mg, Abacavir (as Abacavir sulfate) 600 mg
  - Triumeq 50mg/600mg/300mg tablets | 30 tablet pack £79.816

**Abacavir with lamivudine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 610, lamivudine p. 615.

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretrovirals**

**BY MOUTH**

Adult (body-weight 40 kg and above): 1 tablet once daily

**INTERACTIONS**

- Appendix 1: abacavir, lamivudine

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- *Abacavir with lamivudine (Non-proprietary)*
  - Lamivudine 300 mg, Abacavir 600 mg
  - Lamivudine 300mg tablets | 30 tablet pack £150.83-£299.41 | 30 tablet pack £224.56 (Hospital only)
  - *Kivexa* (ViiV Healthcare UK Ltd)
  - Lamivudine 300 mg, Abacavir 600 mg
  - Kivexa 600mg/300mg tablets | 30 tablet pack £299.41

**Abacavir with lamivudine and zidovudine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 610, lamivudine p. 615, zidovudine p. 617.

**INDICATIONS AND DOSE**

**HIV infection (use only if patient is stabilised for 6–8 weeks on the individual components in the same proportions)**

**BY MOUTH**

- Adult: 1 tablet twice daily

**INTERACTIONS**

- Appendix 1: abacavir, lamivudine, zidovudine

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- *Trizivir* (ViiV Healthcare UK Ltd)
  - Lamivudine 150 mg, Abacavir (as Abacavir sulfate) 300 mg, Zidovudine 300 mg
  - Trizivir tablets | 60 tablet pack £432.70

**Abacavir with dolutegravir and lamivudine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 610, lamivudine p. 615, dolutegravir p. 606.

**INDICATIONS AND DOSE**

**HIV infection**

**BY MOUTH**

- Adult (body-weight 40 kg and above): 1 tablet once daily

**INTERACTIONS**

- Appendix 1: abacavir, dolutegravir, lamivudine

**RENAI IMPAIRMENT**

- Avoid *Triumeq* if eGFR less than 50 mL/minute/1.73 m² (consult product literature).
Didanosine (ddI; DDI)

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs

- **BY MOUTH**
  - Adult (body-weight up to 60 kg): 250 mg daily in 1–2 divided doses
  - Adult (body-weight 60 kg and above): 400 mg daily in 1–2 divided doses

**CAUTIONS**  History of pancreatitis (preferably avoid, otherwise extreme caution) · hyperuricaemia · lactic acidosis · peripheral neuropathy

**CAUTIONS, FURTHER INFORMATION**

- Lactic acidosis  Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with didanosine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

**INTERACTIONS**  → Appendix 1: didanosine

**SIDE-EFFECTS**

- Acute renal failure · alopecia · anaphylactic reactions · diabetes mellitus · dry eyes · dry mouth · hyperuricaemia (suspend if raised significantly) · hypoglycaemia · lactic acidosis · lipodystrophy · liver failure · non-cirrhotic portal hypertension · optic nerve changes · pancreatitis (less common in children) · parotid gland enlargement · peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) · retinal changes · rhabdomyolysis · sialadenitis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Pancreatitis  Suspend treatment if serum lipase raised (even if asymptomatic) or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible avoid concomitant treatment with other drugs known to cause pancreatic toxicity (e.g. intravenous pentamidine isetionate); monitor closely if concomitant therapy unavoidable. Since significant elevations of triglycerides cause pancreatitis monitor closely if elevated.

- Lipodystrophy syndrome  Metabolic effects may occur with antiretroviral regimens containing didanosine; these include fat redistribution, insulin resistance, and dyslipidaemia—collectively termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting treatment, after 3–6 months of treatment, and then annually.

- PREGNANCY  Manufacturer advises use only if potential benefit outweighs risk.

- HEPATIC IMPAIRMENT  Insufficient information. In hepatic impairment, monitor for toxicity.

- RENAL IMPAIRMENT  Reduce dose if eGFR less than 60 mL/minute/1.73 m²; consult product literature.

- MONITORING REQUIREMENTS  Ophthalmological examination (including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur.

- DIRECTIONS FOR ADMINISTRATION  Capsules should be swallowed whole and taken at least 2 hours before or 2 hours after food.

  With chewable tablets, to ensure sufficient antacid, each dose to be taken as at least 2 tablets chewed thoroughly, crushed or dispersed in water; clear apple juice may be added for flavouring; tablets to be taken 2 hours after lopinavir with ritonavir capsules and oral solution or atazanavir with ritonavir.

**PATIENT AND CARER ADVICE**  Patients or carers should be given advice on how to administer didanosine capsules and chewable tablets.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant capsule**

**CAUTIONARY AND ADVISORY LABELS** 25

- Videx EC  (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Didanosine 125 mg Videx EC 125mg capsules | 30 capsule £48.18 (Hospital only)
  - Didanosine 200 mg Videx EC 200mg capsules | 30 capsule £77.09 (Hospital only)
  - Didanosine 250 mg Videx EC 250mg capsules | 30 capsule £96.37 (Hospital only)
  - Didanosine 400 mg Videx EC 400mg capsules | 30 capsule £154.19 (Hospital only)

**Chewable tablet**

**CAUTIONARY AND ADVISORY LABELS** 23

**EXCIPIENTS:** May contain Aspartame

- Videx  (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Didanosine 25 mg Videx 25mg chewable dispersible tablets sugar-free | 60 tablet £25.06 (Hospital only)

Efavirenz with emtricitabine and tenofovir disoproxil

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 616, efavirenz p. 608, emtricitabine p. 613.

**INDICATIONS AND DOSE**

HIV infection stabilised on antiretroviral therapy for more than 3 months

- **BY MOUTH**
  - Adult: 1 tablet once daily

**INTERACTIONS**  → Appendix 1: efavirenz, tenofovir

**HEPATIC IMPAIRMENT**  Manufacturer of Atripla® advises caution in mild impairment; avoid Atripla® in moderate to severe impairment.

**RENAI IMPAIRMENT**  Avoid Atripla® if eGFR less than 50 mL/minute/1.73 m².

**PATIENT AND CARER ADVICE**

Missed doses

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 23, 25

- Atripla  (Gilead Sciences International Ltd)
  - Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg, Efavirenz 600 mg Atripla 600mg/200mg/245mg tablets | 30 tablet £53.87
Elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 616, emtricitabine below, cobicistat p. 622.

- **INDICATIONS AND DOSE**
  - **HIV infection (specialist use only)**
    - By mouth
    - Adult: 1 tablet once daily

- **INTERACTIONS**
  - Appendix 1: cobicistat, elvitegravir, tenofovir

- **SIDE-EFFECTS**
  - Uncommon Angioedema

- **CONCEPTION AND CONTRACEPTION**
  - Manufacturer advises effective contraception in women of childbearing potential; if using a hormonal contraceptive, it must contain norgestimate as the progestogen and at least 30 micrograms ethinylestradiol—no information available on progestogens other than norgestimate.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises use with caution in mild-to-moderate impairment (greater risk of hepatic side-effects); avoid in severe impairment—no information available.

- **RENAL IMPAIRMENT**
  - Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—limited information available.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Dispense in original container—contains desiccant.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
    - Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) Decisions**
    - The Scottish Medicines Consortium has advised (June 2016) that elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide (Genvoya) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 (HIV-1), without known mutations associated with resistance to the integrase inhibitor class, emtricitabine or tenofovir. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

  - **All Wales Medicines Strategy Group (AWMSG) Decisions**
    - The All Wales Medicines Strategy Group has advised (July 2016) that elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide (Genvoya) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1 (HIV-1), without known mutations associated with resistance to the integrase inhibitor class, emtricitabine or tenofovir. The recommendation applies only if the approved Wales Patient Access Scheme (WPAS) is used or where the list price is equivalent or lower.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Tablet**
    - CAUTIONARY AND ADVISORY LABELS 21
      - Genvoya (Gilead Sciences International Ltd)
        - Tenofovir alafenamide 10 mg, Cobicistat 150 mg, Elvitegravir 150 mg, Emtricitabine 200 mg
        - Genovaya 150mg/150mg/200mg/10mg tablets | 30 tablet

Elvitegravir with cobicistat, emtricitabine and tenofovir disoproxil

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 616, emtricitabine below, cobicistat p. 622.

- **INDICATIONS AND DOSE**
  - **HIV infection**
    - By mouth
    - Adult: 1 tablet once daily

- **INTERACTIONS**
  - Appendix 1: cobicistat, elvitegravir, tenofovir

- **SIDE-EFFECTS**
  - Uncommon Depression and suicidal ideation (in patients with a history of psychiatric illness)

- **CONCEPTION AND CONTRACEPTION**
  - Women of childbearing potential should use effective contraception during treatment (if using a hormonal contraceptive, it must contain norgestimate as the progestogen and at least 30 micrograms ethinylestradiol).

- **PREGNANCY**
  - Manufacturer advises use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT**
  - Avoid Stribild in severe impairment.

- **RENAL IMPAIRMENT**
  - If eGFR less than 90 mL/minute/1.73 m², only initiate Stribild if other treatments cannot be used (avoid initiating Stribild if eGFR less than 70 mL/minute/1.73 m²); if eGFR less than 70 mL/minute/1.73 m², only continue Stribild if potential benefit outweighs risk (discontinue Stribild if eGFR less than 50 mL/minute/1.73 m²).

- **MONITORING REQUIREMENTS**
  - Test urine glucose before treatment, then every 4 weeks for 1 year and then every 3 months.

- **DIRECTIONS FOR ADMINISTRATION**
  - Avoid antacids 4 hours before or 4 hours after taking Stribild.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Dispense in original container (contains desiccant).

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be given advice on how to administer Stribild.

- **Missed doses**
  - If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Tablet**
    - CAUTIONARY AND ADVISORY LABELS 21
      - Stribild (Gilead Sciences International Ltd)
        - Cobicistat 150 mg, Elvitegravir 150 mg, Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg
        - Stribild 150mg/150mg/200mg/245mg tablets | 30 tablet
        - £879.51

Emtricitabine (FTC)

- **INDICATIONS AND DOSE**
  - **HIV infection in combination with other antiretroviral drugs**
    - By mouth using capsules
    - Adult: 200 mg once daily
    - By mouth using oral solution
    - Adult: 240 mg once daily
Emtricitabine with rilpivirine and tenofovir alafenamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 613, rilpivirine p. 610.

**INDICATIONS AND DOSE**

HIV infection in patients with plasma HIV-1 RNA concentration of 100 000 copies/mL or less (specialist use only)

- **BY MOUTH**
  - Adult: 1 tablet once daily

**INTERACTIONS** → Appendix 1: rilpivirine, tenofovir

**SIDE-EFFECTS**

- **Common or very common** Raised bilirubin
- **Uncommon** Angioedema, dyspepsia, severe skin reactions (with systemic symptoms)

**SIDE-EFFECTS, FURTHER INFORMATION**

- Severe skin reactions Systemic symptoms reported with severe skin reactions include fever, blisters, conjunctivitis, angioedema, elevated liver function tests, and eosinophilia.

**HEPATIC IMPAIRMENT**

Manufacturer advises use with caution in moderate impairment (greater risk of hepatic side-effects); avoid in severe impairment—no information available.

**RENAL IMPAIRMENT**

Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—no information available.

**PATIENT AND CARER ADVICE**

Vomiting Manufacturer advises if vomiting occurs within 4 hours of taking a dose, a replacement dose should be taken.

Driving and skilled tasks

Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

**INDICATIONS AND DOSE**

HIV infection in patients with plasma HIV-1 RNA concentration less than 100 000 copies/mL

- **BY MOUTH**
  - Adult: 1 tablet once daily

**INTERACTIONS** → Appendix 1: rilpivirine, tenofovir

**HEPATIC IMPAIRMENT**

Manufacturer of Eviplera® advises caution in moderate impairment; avoid Eviplera® in severe impairment.

**RENAL IMPAIRMENT**

Avoid Eviplera® if eGFR less than 50 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**

Avoid antacids 2 hours before or 4 hours after taking Eviplera®.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer Eviplera®.

**Missed doses**

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**DOSE EQUIVALENCE AND CONVERSION**

- 240 mg oral solution = 200 mg capsule; where appropriate the capsule may be used instead of the oral solution.

**SIDE-EFFECTS**

Abnormal dreams, hyperpigmentation, pruritus

**HEPATIC IMPAIRMENT**

On discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis).

**RENAL IMPAIRMENT**

Reduce dose if eGFR less than 50 mL/minute/1.73 m²; consult product literature.

**PRESCRIBING AND DISPENSING INFORMATION**

Flavours of oral liquid formulations may include candy.

**PATIENT AND CARER ADVICE**

- **Missed doses**
  - If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

**ELECTROLYTES:** May contain Sodium

- **Emtriva** (Gilead Sciences International Ltd)
  - Emtricitabine 10 mg per 1 ml Emtriva 10mg/ml oral solution sugar-free 170 ml [POM] £39.53

**Capsule**

- **Emtriva** (Gilead Sciences International Ltd)
  - Emtricitabine 200 mg Emtriva 200mg capsules 30 capsule [POM] £138.98

**Emtricitabine with rilpivirine and tenofovir alafenamide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 610.

**INDICATIONS AND DOSE**

HIV infection in patients with plasma HIV-1 RNA concentration of 100 000 copies/mL or less (specialist use only)

- **BY MOUTH**
  - Adult: 1 tablet once daily

**INTERACTIONS** → Appendix 1: rilpivirine, tenofovir

**SIDE-EFFECTS**

- **Common or very common** Raised bilirubin
- **Uncommon** Angioedema, dyspepsia, severe skin reactions (with systemic symptoms)

**SIDE-EFFECTS, FURTHER INFORMATION**

- Severe skin reactions Systemic symptoms reported with severe skin reactions include fever, blisters, conjunctivitis, angioedema, elevated liver function tests, and eosinophilia.

**HEPATIC IMPAIRMENT**

Manufacturer advises use with caution in moderate impairment (greater risk of hepatic side-effects); avoid in severe impairment—no information available.

**RENAL IMPAIRMENT**

Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—no information available.

**PATIENT AND CARER ADVICE**

Vomiting Manufacturer advises if vomiting occurs within 4 hours of taking a dose, a replacement dose should be taken.

Driving and skilled tasks

Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (October 2016) that emtricitabine with rilpivirine and tenofovir alafenamide (Odefsey®) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 (HIV-1), without known mutations associated with resistance to the non-nucleoside reverse transcriptase inhibitor (NNRTI) class, tenofovir or emtricitabine, and with viral load HIV-1 RNA of 100 000 copies/mL or less.

**All Wales Medicines Strategy Group (AWMSG) Decisions**

The All Wales Medicines Strategy Group has advised (November 2016) that emtricitabine with rilpivirine and tenofovir alafenamide (Odefsey®) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1, without known mutations associated with resistance to the non-nucleoside reverse transcriptase inhibitor (NNRTI) class, tenofovir or emtricitabine, and with viral load HIV-1 RNA of 100 000 copies/mL or less.

**MEDICINAL FORMS**

  - 25 mg, Emtricitabine 200 mg
  - Tenofovir disoproxil (as Tenofovir disoproxil fumarate)
  - 245 mg
  - Eviplera 200mg/25mg/245mg tablets | 30 tablet [Pom] £525.95

---

**Emtricitabine with tenofovir disoproxil**

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 616, emtricitabine p. 613.

### INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs**

- **BY MOUTH**
- **Adult:** 1 tablet once daily

### INTERACTIONS

Appendix 1: tenofovir

### SIDE-EFFECTS

- **Uncommon**
  - Angioedema, dyspepsia

### HEPATIC IMPAIRMENT

Manufacturer advises use with caution (greater risk of hepatic side-effects).

### RENAL IMPAIRMENT

Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—limited information available.

### PATIENT AND CARER ADVICE

Vomiting

Manufacturer advises if vomiting occurs within 1 hour of taking a dose, a replacement dose should be taken.

Missed doses

Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks

Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

### NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The **Scottish Medicines Consortium** has advised (April 2017) that emtricitabine with tenofovir disoproxil (Truvada®) is accepted for use within NHS Scotland in combination with safer sex practices for pre-exposure prophylaxis of sexually acquired HIV-1 infection in adults at high risk.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Truvada (Gilead Sciences International Ltd)
  - Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg
  - Truvada tablets | 30 tablet [Pom] £355.73

---

**Lamivudine**

(3TC)

### INDICATIONS AND DOSE

**EPIVIR® ORAL SOLUTION**

**HIV infection in combination with other antiretroviral drugs**

- **BY MOUTH**
- **Adult:** 150 mg every 12 hours, alternatively 300 mg once daily

### EPIVIR® TABLETS

**HIV infection in combination with other antiretroviral drugs**

- **BY MOUTH**
- **Adult:** 150 mg every 12 hours, alternatively 300 mg once daily
**ZEFFIX ®**

Chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) when first-line treatments cannot be used, or (in combination with another antiviral drug without cross-resistance to lamivudine) with decompensated liver disease

- **BY MOUTH**
  - Adult: 100 mg once daily, patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

**CAUTIONS** Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine

**INTERACTIONS** → Appendix 1: lamivudine

**SIDE-EFFECTS** Alopecia · muscle disorders · nasolabial symptoms · peripheral neuropathy · rhabdomyolysis

**BREAST FEEDING** Can be used with caution in women infected with chronic hepatitis B alone, providing that adequate measures are taken to prevent hepatitis B infection in infants.

**RENAL IMPAIRMENT** Reduce dose if eGFR less than 50 mL/minute/1.73 m²; consult product literature.

**MONITORING REQUIREMENTS** When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral markers of hepatitis B every 3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue for at least 1 year after discontinuation— recurrent hepatitis may occur on discontinuation).

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana and strawberry.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

EXCIPIENTS: May contain Sucrose

- **Epivir** (ViiV Healthcare UK Ltd)
  - Lamivudine 10 mg per 1 ml Epivir 50mg/5ml oral solution | 240 ml [POM] £33.16

**Tablet**

- **Epivir** (ViiV Healthcare UK Ltd)
  - Lamivudine 150 mg Epivir 150mg tablets | 60 tablet [POM] £121.82
  - Lamivudine 300 mg Epivir 300mg tablets | 30 tablet [POM] £133.89

- **Zeffix** (GliaSmithKline UK Ltd)
  - Lamivudine 100 mg Zeffix 100mg tablets | 28 tablet [POM] £78.09
  - Lamivudine 200 mg Zeffix 200mg tablets | 14 tablet [POM] £120.10

**Stavudine**

(d4T)

**INTERACTIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs when no suitable alternative available and when prescribed for shortest period possible

- **BY MOUTH**
  - Adult (body-weight up to 60 kg): 30 mg every 12 hours, to be taken preferably at least 1 hour before food
  - Adult (body-weight 60 kg and above): 40 mg every 12 hours, to be taken preferably at least 1 hour before food

**CAUTIONS** Excessive alcohol intake · history of pancreatitis · history of peripheral neuropathy · lactic acidosis (especially when used in combination with didanosine)—use only if alternative regimens are not suitable

**SIDE-EFFECTS**

- Lactic acidosis Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with stavudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

**INTERACTIONS** → Appendix 1: stavudine

**SIDE-EFFECTS**

- Common or very common Abnormal dreams · cognitive dysfunction · depression · drowsiness · peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) · pruritus

**INTERACTIONS**

- ** Frequencies of stavudine interactions:**
  - **Very common** Lipodystrophy syndrome · Metabolic effects may occur with antiretroviral regimens containing stavudine; these include fat redistribution, insulin resistance, and dyslipidaemia—collectively termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting treatment, after 3–6 months of treatment, and then annually.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**CAUTIONS, FURTHER INFORMATION**

- **RENAL IMPAIRMENT** Use half normal dose every 12 hours if eGFR 25–50 mL/minute/1.73 m². Use half normal dose every 24 hours if eGFR less than 25 mL/minute/1.73 m².

**PRESCRIBING AND DISPENSING INFORMATION**

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Oral solution**
    - **EXCIPIENTS:** May contain Sucrose
    - **Epivir** (ViiV Healthcare UK Ltd)
      - Lamivudine 10 mg per 1 ml Epivir 50mg/5ml oral solution | 240 ml [POM] £33.16

      - Lamivudine 200 mg Zeffix 200mg tablets | 14 tablet [POM] £120.10

**Stavudine**

**d4T**

01-Sep-2016

**Tenofovir disoproxil**

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs | Chronic hepatitis B infection with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) | Chronic hepatitis B infection with decompensated liver disease

- **BY MOUTH**
  - Adult: 245 mg once daily

**DOSE EQUIVALENCE AND CONVERSION**

- 7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate).
Zidovudine
(Azidothymidine; AZT)

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**
- **BY MOUTH**
- Adult: 250–300 mg twice daily

**Prevention of maternal-fetal HIV transmission**
- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
- Adult: Seek specialist advice (combination therapy preferred) (consult local protocol)

**HIV infection in combination with other antiretroviral drugs in patients temporarily unable to take zidovudine by mouth**
- **BY INTRAVENOUS INFUSION**
- Adult: 0.8–1 mg/kg every 4 hours usually for not more than 2 weeks, dose approximating to 1.2–1.5 mg/kg every 4 hours by mouth

**CONTRA-INDICATIONS**
Abnormally low haemoglobin concentration (consult product literature) • Abnormally low neutrophil counts (consult product literature) • acute porphyrias p. 969

**CAUTIONS**
Elderly • lactic acidosis • risk of haematological toxicity particularly with high dose and advanced disease • vitamin B12 deficiency (increased risk of neutropenia)

**CAUTIONS, FURTHER INFORMATION**
Lactic acidosis • Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with zidovudine.

Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

**INTERACTIONS**
-> Appendix 1: zidovudine

**SIDE-EFFECTS**
Anaemia (may require transfusion) • anxiety • chest pain • convulsions • depression • dizziness • drowsiness • gynaecomastia • influenza-like symptoms • lactic acidosis • lipodystrophy • loss of mental acuity • myopathy • neuropathy • paraesthesia • pigmentation of nails • pigmentation of oral mucosa • pigmentation of skin • pruritus • sweating • taste disturbance • urinary frequency

**SIDE-EFFECTS, FURTHER INFORMATION**
Anaemia and myelosuppression If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment.

Lipodystrophy syndrome Metabolic effects may occur with antiretroviral regimens containing zidovudine; these include fat redistribution, insulin resistance, and dyslipidaemia—collectively termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting treatment, after 3–6 months of treatment, and then annually.

**HEPATIC IMPAIRMENT**
Accumulation may occur.

**RENAL IMPAIRMENT**
Reduce oral dose to 300–400 mg daily in divided doses or intravenous dose to 1 mg/kg 3–4 times daily if eGFR is less than 10 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**
Monitor full blood count after 4 weeks of treatment, then every 3 months.

**DIRECTIONS FOR ADMINISTRATION**
For intermittent intravenous infusion, dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give over 1 hour.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Granules**

**CAUTIONARY AND ADVISORY LABELS. 21**
- **Viread** (Gilead Sciences International Ltd)
  - Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 33 mg per 1 gram Viread 33mg/g granules | 60 gram (Pom) £54.50

**Tablet**

**CAUTIONARY AND ADVISORY LABELS. 21**
- **Viread** (Gilead Sciences International Ltd)
  - Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 123 mg Viread 123mg tablets | 30 tablet (Pom) £102.60
  - Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 163 mg Viread 163mg tablets | 30 tablet (Pom) £135.98
  - Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 204 mg Viread 204mg tablets | 30 tablet (Pom) £170.19
  - Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg Viread 245mg tablets | 30 tablet (Pom) £204.39
SYNOPSIS

**Zidovudine with lamivudine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, zidovudine p. 617, lamivudine p. 615.

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**—with low-dose ritonavir

- **BY MOUTH**
  - Adult: 300 mg once daily

**HIV infection in combination with other antiretroviral drugs**—with cobicistat

- **BY MOUTH**
  - Adult: 300 mg daily

**CAUTIONS** Cardiac conduction disorders—electrolyte disturbances—predisposition to QT interval prolongation

**INTERACTIONS** → Appendix 1: HIV—protease inhibitors

**SIDE-EFFECTS, FURTHER INFORMATION**

- Uncommon Abnormal dreams—alopecia—amnesia—anxiety—arthralgia—chest pain—cholelithiasis—depression—disorientation—dry mouth—dysphagia—gynaecomastia—haematuria—hypertension—increased appetite—mouth ulcers—nephrolithiasis—peripheral neuropathy—proteinuria—syncope—tenderness—urinary frequency—weight changes

- Rare Abnormal gait—cholecystitis—hepatosplenomegaly—oedema—palpitation

**ANTIVIRALS** > **PROTEASE INHIBITORS**

**Protease inhibitors**

- **CONTRA-INDICATIONS** Acute porphyrias p. 969

- **CAUTIONS** Haemophilia (increased risk of bleeding)

**SIDE-EFFECTS, FURTHER INFORMATION**

- Osteonecrosis For further information see HIV infection p. 604.

**HEPATIC IMPAIRMENT** Use with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

**Atazanavir**

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**—with low-dose ritonavir

- **BY MOUTH**
  - Adult: 300 mg once daily

**HIV infection in combination with other antiretroviral drugs**—with cobicistat

- **BY MOUTH**
  - Adult: 300 mg daily

**CAUTIONS** Cardiac conduction disorders—electrolyte disturbances—predisposition to QT interval prolongation

**INTERACTIONS** → Appendix 1: HIV—protease inhibitors

**SIDE-EFFECTS, FURTHER INFORMATION**

- Uncommon Abnormal dreams—alopecia—amnesia—anxiety—arthralgia—chest pain—cholelithiasis—depression—disorientation—dry mouth—dysphagia—gynaecomastia—haematuria—hypertension—increased appetite—mouth ulcers—nephrolithiasis—peripheral neuropathy—proteinuria—syncope—tenderness—urinary frequency—weight changes

- Rare Abnormal gait—cholecystitis—hepatosplenomegaly—oedema—palpitation

**ANTIVIRALS** > **PROTEASE INHIBITORS**

**Protease inhibitors**

- **CONTRA-INDICATIONS** Acute porphyrias p. 969

- **CAUTIONS** Haemophilia (increased risk of bleeding)

**SIDE-EFFECTS, FURTHER INFORMATION**

- Osteonecrosis For further information see HIV infection p. 604.

**HEPATIC IMPAIRMENT** Use with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

**Atazanavir with cobicistat**

**INDICATIONS AND DOSE**

**HIV infection, in combination with other antiretroviral drugs** (initiated by a specialist)

- **BY MOUTH**
  - Adult: 300/150 mg once daily

**DOSE EQUIVALENCE AND CONVERSION**

- Dose expressed as x/y mg of atazanavir/cobicistat.
**CONTRA-INDICATIONS**  
Haemodialysis

**INTERACTIONS**  
Appendix 1: cobicistat, HIV-protease inhibitors

**SIDE-EFFECTS**

- **Common or very common**  
  Abdominal distension · dysgeusia · dyspepsia · hyperbilirubinemia · insomnia · jaundice · ocular icterus · somnolence
- **Uncommon**  
  Angioedema · asthma · cholestasis · erythema multiforme · gastritis · hepatitis · interstitial nephritis · malaise · muscle atrophy · pollakiuria · pyrexia · stomatitis · urticaria
- **Rare**  
  Eczema · myopathy · QTc prolongation · vasodilatation

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Darunavir

#### INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—with low-dose ritonavir**

- **BY MOUTH**
  - Adult: 600 mg twice daily, alternatively 800 mg once daily, once daily dose only to be used if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells × 10⁶/litre

**HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—with cobicistat**

- **BY MOUTH**
  - Adult: 800 mg once daily, dose appropriate if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells × 10⁶/litre

**HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with low-dose ritonavir**

- **BY MOUTH**
  - Adult: 800 mg once daily

**HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with cobicistat**

- **BY MOUTH**
  - Adult: 800 mg once daily

**INTERACTIONS**  
Appendix 1: HIV-protease inhibitors

**SIDE-EFFECTS**

- **Common or very common**  
  Peripheral neuropathy · rash
- **Uncommon**  
  Abnormal dreams · acne · alopecia · angina · anxiety · arthralgia · conjunctival hyperaemia · cough · depression · dry eyes · dry mouth · dyspnoea · dysuria · eczema · erectile dysfunction · flushing · gynaecomastia · hypertension · hypothyroidism · increased appetite · increased sweating · memory impairment · myocardial infarction · nail discoloration · nephrolithiasis · osteoporosis · peripheral oedema · polyuria · pyrexia · QT interval prolongation · reduced libido · renal failure · severe skin rash · Stevens-Johnson syndrome · stomatitis · tachycardia · throat irritation · toxic epidermal necrolysis · weight changes

**Rare**  
Bradycardia · confusion · convulsions · haematemesis · palpitation · rhinorrhea · seborrhoeic dermatitis · syncope · visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Rash**  
  Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if severe rash develops.

**ALLERGY AND CROSS-SENSITIVITY**  
Use with caution in patients with sulfonamide sensitivity.

**PREGNANCY**  
Manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen.

**HEPATIC IMPAIRMENT**  
Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment—no information available.

**MONITORING REQUIREMENTS**  
Monitor liver function before and during treatment.

**PRESCRIBING AND DISPENSING INFORMATION**  
Flavours of oral liquid formulations may include strawberry.

**PATIENT AND CARER ADVICE**

**Missed doses**

If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

### Darunavir with cobicistat

19-Apr-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, cobicistat p. 622, darunavir above.

#### INDICATIONS AND DOSE

**HIV infection, in combination with other antiretroviral drugs (initiated by a specialist)**

- **BY MOUTH**
  - Adult: 800/150 mg once daily, dosage should not be altered or therapy discontinued without instruction from the healthcare provider

#### DOSE EQUIVALENCE AND CONVERSION

- Dose expressed as x/y mg of darunavir/cobicistat.

#### CONTRA-INDICATIONS

Treatment-experienced patients with 1 or more darunavir resistance-associated mutations,
plasma HIV-RNA concentration of 100,000 copies/mL or greater, or CD4 count less than 100 cells × 10⁹/litre

- **CAUTIONS** Elderly
- **INTERACTIONS** → Appendix 1: cobicistat, HIV-protease inhibitors

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal distension · angioedema · diabetes mellitus · dyspepsia · hypercholesterolaemia · hyperlipidaemia · hypertriglyceridaemia · pruritus · urticaria
  - **Uncommon** Asthenia · hepatitis

- **PREGNANCY**
  - **Manufacturer advises use only if potential benefit outweighs risk.**

### MEDICINAL FORMS

**Tablet**

<table>

</tr>
</thead>
</table>
| Cobicistat 150 mg, Darunavir (as Darunavir ethanolate) 800 mg Rezolsta 800mg/150mg tablets | 30 tablet [Base] £317.24

**Drug Action**

Fosamprenavir is a pro-drug of amprenavir.

#### INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir**

- **BY MOUTH**
  - **Adult:** 700 mg twice daily

**DOSE EQUIVALENT AND CONVERSION**

700 mg fosamprenavir is equivalent to approximately 600 mg amprenavir.

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors
- **SIDE-EFFECTS**
  - **Rare** Stevens-Johnson syndrome
  - **Frequency not known** Rash

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Rash** Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves within 2 weeks and may respond to antihistamines.

- **PREGNANCY**
  - **Toxicity in animal studies; manufacturer advises use only if potential benefit outweighs risk; theoretical risk of hyperbilirubinaemia and renal stones in neonate if used at term.**
  - **Hepatic Impairment** Reduce dose in mild to moderate impairment. Not studied in severe impairment. Increased risk of nephrolithiasis.
  - **Renal Impairment** Use with caution. In patients with renal impairment, monitor for nephrolithiasis.

- **DIRECTIONS FOR ADMINISTRATION**
  - **Administer 1 hour before or 2 hours after a meal; may be administered with a low-fat light meal; in combination with didanosine tablets, allow 1 hour between each drug (antacids in didanosine tablets reduce absorption of indinavir); in combination with low-dose ritonavir, give with food.**

- **Prescribing and Dispensing Information**
  - Dispense in original container (contains desiccant).
  - **Patient and Carer Advice** Patients or carers should be given advice on how to administer fosamprenavir oral suspension.

- **Medicinal Forms**
  - **Tablet**
    - **Telzir (ViiV Healthcare UK Ltd)**
      - Fosamprenavir (as Fosamprenavir calcium) 50 mg per 1 ml Telzir 50mg/ml oral suspension | 225 ml [Plast] £58.70

---

### Indinavir

#### INDICATIONS AND DOSE

**HIV infection in combination with nucleoside reverse transcriptase inhibitors**

- **BY MOUTH**
  - **Adult:** Seek specialist advice

- **CAUTIONS** Ensure adequate hydration (risk of nephrolithiasis) · patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%) · patients at risk of nephrolithiasis (monitor for nephrolithiasis)

- **INTERACTIONS** → Appendix 1: HIV-protease inhibitors

- **SIDE-EFFECTS**
  - **Alopecia · crystalluria · dry mouth · dry skin · dysuria · haematuria · haemolytic anaemia · hyperpigmentation · hypoaesthesia · interstitial nephritis (with medullary calcification and cortical atrophy in asymptomatic severe leucocyturia) · nephrolithiasis (may require interruption or discontinuation) · paronychia · proteinuria · pyelonephritis**

- **PREGNANCY**
  - **Toxicity in animal studies; manufacturer advises use only if potential benefit outweighs risk; theoretical risk of hyperbilirubinaemia and renal stones in neonate if used at term.**

- **Hepatic Impairment** Reduce dose in mild to moderate impairment. Not studied in severe impairment. Increased risk of nephrolithiasis.

- **Renal Impairment** Use with caution. In patients with renal impairment, monitor for nephrolithiasis.

- **DIRECTIONS FOR ADMINISTRATION**
  - **Administer 1 hour before or 2 hours after a meal; may be administered with a low-fat light meal; in combination with didanosine tablets, allow 1 hour between each drug (antacids in didanosine tablets reduce absorption of indinavir); in combination with low-dose ritonavir, give with food.**

- **Prescribing and Dispensing Information**
  - Dispense in original container (contains desiccant).

- **Patient and Carer Advice**
  - Patients or carers should be given advice on how to administer indinavir capsules.

- **Less Suitable for Prescribing**
  - Indinavir is rarely used in the treatment of HIV-infection because it is associated with nephrolithiasis; it is considered to be less suitable for prescribing.

- **Medicinal Forms**
  - **Capsule**

---

### Lopinavir with ritonavir

#### INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs**

- **BY MOUTH USING TABLETS**
  - **Adult:** 400/100 mg twice daily, alternatively 800/200 mg once daily, once daily dose to be used only in adults with a HIV strain that has less than 3 mutations to protease inhibitors.
MEDICINAL FORMS

BY MOUTH USING ORAL SOLUTION
Adult: 5 mL twice daily, to be taken with food, oral solution contains 400 mg lopinavir, 100 mg ritonavir/5 mL.

CAUTIONS Cardiac conduction disorders · pancreatitis · patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%) · structural heart disease

INTERACTIONS → Appendix 1: HIV-protease inhibitors

SIDE-EFFECTS

Common or very common Amenorrhoea · anxiety · arthralgia · colitis · hypertension · menorrhagia · neuropathy · night sweats · sexual dysfunction · weight change

Uncommon Abnormal dreams · alopecia · AV block · cerebrovascular accident · convulsions · deep vein thrombosis · dry mouth · gastrointestinal ulcer · haematuria · myocardial infarction · nephritis · rectal bleeding · stomatitis · tinnitus · tremor · visual disturbances

CAUTIONARY AND ADVISORY LABELS

Pregnancy Avoid oral solution due to high propylene glycol content; use tablets only if potential benefit outweighs risk (toxicity in animal studies).

Hepatic Impairment Avoid oral solution due to propylene glycol content; manufacturer advises avoid tablets in severe impairment.

Renal Impairment Avoid oral solution due to high propylene glycol content. Use tablets with caution in severe impairment.

Monitoring Requirements Monitor liver function before and during treatment.

Patient and Carer Advice Oral solution tastes bitter.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

INDICATIONS AND DOSE

HIV infection in combination with other antiretrovirals in patients previously treated with antiretroviral therapy— with low-dose ritonavir

BY MOUTH
Adult: 1 g every 12 hours

HIV infection in combination with other antiretrovirals in patients not previously treated with antiretroviral therapy— with low-dose ritonavir

BY MOUTH
Adult: 500 mg every 12 hours for 7 days, then increased to 1 g every 12 hours

CONTRA-INDICATIONS Bradycardia · congenital QT prolongation · electrolyte disturbances · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias · predisposition to cardiac arrhythmias

INTERACTIONS → Appendix 1: HIV-protease inhibitors

SIDE-EFFECTS

Common or very common Alopecia · changes in libido · dry mouth · dysphonia · increased appetite · peripheral neuropathy

Uncommon Convulsions · mucosal ulceration · renal impairment · visual impairment

Hepatic Impairment Manufacturer advises caution in moderate impairment; avoid in decompensated liver disease.

Renal Impairment Use with caution if eGFR less than 30 mL/minute/1.73 m².

Monitoring Requirements Monitor ECG before starting treatment (do not initiate treatment if QT interval over 450 milliseconds); if baseline QT interval less than 450 milliseconds, monitor ECG during treatment.
HEPATIC IMPAIRMENT

▶ Hepatotoxicity
▶ Rare

PREGNANCY

PATIENT AND CARER ADVICE

Arrhythmias Patients should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

▶ Invirase (Roche Products Ltd)

Saquinavir (as Saquinavir mesilate) 500 mg Invirase 500mg tablets | 120 tablet [PSt] £251.26

INDICATIONS AND DOSE

HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals—with low-dose ritonavir

▶ BY MOUTH USING CAPSULES
▶ Adult: 500 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

▶ The bioavailability of tipranavir oral solution is higher than that of the capsules; the oral solution is not interchangeable with the capsules on a milligram-for-milligram basis.

SAFETY AND PHARMACOTHERAPEUTIC CONSIDERATIONS

SAFETY AND PHARMACOTHERAPEUTIC CONSIDERATIONS

SIDE-EFFECTS

▶ Rare
▶ Frequency not known

Anorexia · dyspnoea · influenza-like symptoms · peripheral neuropathy · photosensitivity · renal impairment

SIDE-EFFECTS, FURTHER INFORMATION

Hepatotoxicity Potentially life-threatening hepatotoxicity reported. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature).

PREGNANCY

Manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies.

HEPATIC IMPAIRMENT

Manufacturer advises caution in mild impairment; avoid in moderate or severe impairment—no information available.

MONITORING REQUIREMENTS

Monitor liver function before treatment then every 2 weeks for 1 month, then every 3 months.

PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral liquid formulations may include toffee and mint.

PATIENT AND CARER ADVICE

Patients or carers should be told to observe the oral solution for crystallisation; the bottle should be replaced if more than a thin layer of crystals form (doses should continue to be taken at the normal time until the bottle is replaced).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 5, 21

EXCIPIENTS: May contain Vitamin e

▶ Aptivus (Boehringer Ingelheim Ltd)

Tipranavir 100 mg per 1 ml Aptivus 100mg/ml oral solution sugar-free | 95 ml [PSt] £129.65

ANTIVIRALS > OTHER

Maraviroc

DRUG ACTION

Maraviroc is an antagonist of the CCR5 chemokine receptor.

INDICATIONS AND DOSE

CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

▶ BY MOUTH
▶ Adult: 300 mg twice daily

CAUTIONS

Cardiovascular disease

INTERACTIONS ➔ Appendix 1: maraviroc

SIDE-EFFECTS

▶ Common or very common

Abdominal pain · anaemia · anorexia · depression · diarrhoea · flatulence · headache · insomnia · malaise · nausea · rash

▶ Uncommon

Myositis · proteinuria · renal failure · seizures

▶ Rare

Angina · granulocytopenia · hepatitis · pancytopenia · Stevens-Johnson syndrome · toxic epidermal necrolysis

Frequency not known

Eosinophilia · fever · hepatic reactions · hypersensitivity reactions · osteonecrosis · rash

SIDE-EFFECTS, FURTHER INFORMATION

Osteonecrosis For further information see HIV infection p. 604.

PREGNANCY

Manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies.

HEPATIC IMPAIRMENT

Manufacturer advises caution in hepatic impairment, including patients with chronic hepatitis B or C.

RENAL IMPAIRMENT

If eGFR less than 80 mL/minute/1.73 m², consult product literature.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (March 2008) that maraviroc (Celsentri®) is not recommended for use within NHS Scotland.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Celsentri (ViiV Healthcare UK Ltd)

Maraviroc 150 mg Celsentri 150mg tablets | 60 tablet [PSt] £441.27

Maraviroc 300 mg Celsentri 300mg tablets | 60 tablet [PSt] £441.27

PHARMACOKINETIC ENHANCERS

Cobicistat

INDICATIONS AND DOSE

Pharmacokinetic enhancer used to increase the effect of atazanavir or darunavir

▶ BY MOUTH
▶ Adult: 150 mg once daily

INTERACTIONS ➔ Appendix 1: cobicistat

PREGNANCY

Manufacturer advises avoid unless essential.

downloaded from www.medicalbr.com
**6.5 Influenza**

**Influenza**

**Management**

Oseltamivir below and zanamivir p. 625 are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; they are licensed for use within 48 hours of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days. Oseltamivir or zanamivir can reduce the risk of complications from influenza in the elderly and in patients with chronic disease.

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. However, in patients with severe influenza or in those who are immunocompromised, antivirals may still be effective after this time if viral shedding continues [unlicensed use]. Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

There is evidence that some strains of influenza A virus have reduced susceptibility to oseltamivir, but may retain susceptibility to zanamivir. Resistance to oseltamivir may be greater in severely immunocompromised patients.

Zanamivir should be reserved for patients who are severely immunocompromised, or when oseltamivir cannot be used, or when resistance to oseltamivir is suspected. For those unable to use the dry powder for inhalation, zanamivir is available as a solution that can be administered by nebuliser or intravenously [unlicensed].

Information on pandemic influenza, avian influenza, and swine influenza may be found at www.gov.uk/phe.

Immunisation against influenza is recommended for persons at high risk, and to reduce transmission of infection.

**Oseltamivir in children under 1 year of age**

Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore, oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. However, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be overseen by healthcare professionals experienced in assessing children.

**ANTIVIRALS > NEURAMINIDASE INHIBITORS**

**Oseltamivir**

**Drug action** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

**Indications and dose**

**Prevention of influenza**

- **By mouth**
  - Child 1–11 months: 3 mg/kg once daily for 10 days for post-exposure prophylaxis
  - Child 1–12 years (body-weight 10–15 kg): 30 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
  - Child 1–12 years (body-weight 15–23 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
  - Child 1–12 years (body-weight 23–40 kg): 90 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
  - Child 1–12 years (body-weight 40 kg and above): 120 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
  - Child 13–17 years: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
  - Adult: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

**Treatment of influenza**

- **By mouth**
  - Child 1–11 months: 3 mg/kg twice daily for 5 days
  - Child 1–12 years (body-weight 10–15 kg): 30 mg twice daily for 5 days
  - Child 1–12 years (body-weight 15–23 kg): 45 mg twice daily for 5 days
  - Child 1–12 years (body-weight 23–40 kg): 60 mg twice daily for 5 days
  - Child 1–12 years (body-weight 40 kg and above): 75 mg twice daily for 5 days
  - Child 13–17 years: 75 mg twice daily for 5 days
  - Adult: 75 mg twice daily for 5 days

**Unlicensed use** Not licensed for use in premature infants.

**Side-effects**

- **Common or very common** Abdominal pain · dyspepsia · headache · nausea · vomiting
- **Uncommon** Altered consciousness (in children) · altered consciousness (usually in children and adolescents) (in adults) · arrhythmias · convulsions · eczema · rash
- **Rare** Gastro-intestinal bleeding · hepatitis · neuropsychiatric disorders (in children) · neuropsychiatric disorders (usually in children and adolescents) (in adults) · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis · visual disturbances
- **Pregnancy** Although safety data are limited, oseltamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a...
pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

**BREAST FEEDING** Although safety data are limited, oseltamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding. Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

**RENAL IMPAIRMENT**
- In adults For treatment, use 30 mg twice daily if eGFR 30–60 mL/minute/1.73 m² (30 mg once daily if eGFR 10–30 mL/minute/1.73 m²). For prevention, use 30 mg once daily if eGFR 30–60 mL/minute/1.73 m² (30 mg every 48 hours if eGFR 10–30 mL/minute/1.73 m²). Avoid for treatment and prevention if eGFR less than 10 mL/minute/1.73 m².
- In children For treatment, use 40% of normal dose twice daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose once daily if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²). For prevention, use 40% of normal dose once daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose every 48 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²). Avoid for treatment and prevention if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION** If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.

**PATIENT AND CARER ADVICE**
- Medicines for Children leaflet: Oseltamivir for influenza (flu)
  www.medicinesforchildren.org.uk/oseltamivir-for-influenza

**NATIONAL FUNDING/ACCESS DECISIONS**

### NICE technology appraisals (TAs)
- Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158
  Oseltamivir is not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
- Oseltamivir is not recommended for seasonal prophylaxis against influenza.
- When influenza is circulating in the community, oseltamivirs an option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who can start treatment within 48 hours of the onset of symptoms. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for treatment in at-risk patients living in long-term residential or nursing homes.
- At risk patients include those aged over 65 years or those who have one or more of the following conditions:
  - chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
  - chronic heart disease;
  - chronic renal disease;
  - chronic liver disease;
  - chronic neurological disease;
  - immunosuppression;
  - diabetes mellitus.
  The Department of Health in England has advised (November 2010 and April 2011) that ‘at risk patients’ also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.
  This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.
  www.nice.org.uk/TA158
- Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2009) NICE TA168
  Oseltamivir is not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
- When influenza is circulating in the community, oseltamivirs an option recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours of the onset of symptoms. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)

Zanamivir

**DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

**INDICATIONS AND DOSE**

**Post-exposure prophylaxis of influenza**
- **BY INHALATION OF POWDER**
  - Child 5-17 years: 10 mg once daily for 10 days
  - Adult: 10 mg once daily for 10 days

**Prevention of influenza during an epidemic**
- **BY INHALATION OF POWDER**
  - Child 5-17 years: 10 mg once daily for up to 28 days
  - Adult: 10 mg once daily for up to 28 days

**Treatment of influenza**
- **BY INHALATION OF POWDER**
  - Child 5-17 years: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)
  - Adult: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)

**UNLICENSED USE** Use of zanamivir for up to 10 days if resistance to oseltamivir suspected is an unlicensed duration.

**CAUTIONS** Asthma · chronic pulmonary disease · uncontrolled chronic illness

**CAUTIONS, FURTHER INFORMATION**
- Asthma and chronic pulmonary disease  Risk of bronchospasm—short-acting bronchodilator should be available.
- Avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm.

**SIDE-EFFECTS**
- **Common or very common** Rash
- **Uncommon** Angioedema · bronchospasm · dyspnoea · urticaria
- **Rare** Neuropsychiatric disorders (in children) · neuropsychiatric disorders (especially in children and adolescents) (in adults) · Stevens-Johnson syndrome · toxic epidermal necrolysis

**PREGNANCY** Although safety data are limited, zanamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

**BREAST FEEDING** Although safety data are limited, zanamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

**DIRECTIONS FOR ADMINISTRATION** Other inhaled drugs should be administered before zanamivir.

**PRESCRIBING AND DISPENSING INFORMATION** Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription ‘SLS’.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158
  - Zanamivir is not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
  - Zanamivir is not recommended for seasonal prophylaxis against influenza.
  - When influenza is circulating in the community, zanamivir is an option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Zanamivir should be given within 36 hours of exposure to influenza.
    - (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community).
  - During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, zanamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.
  - At risk patients include those aged over 65 years or those who have one or more of the following conditions:
    - chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
    - chronic heart disease;
    - chronic renal disease;
    - chronic liver disease;
    - chronic neurological disease;
    - immunosuppression;
    - diabetes mellitus.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder
• Relenza (GlaxoSmithKline UK Ltd)
  Zanamivir 5 mg Relenza 5mg inhalation powder blisters with Diskhaler | 20 blister £16.36

6.6 Respiratory syncytial virus

Respiratory syncytial virus

Management in children
Ribavirin p. 593 is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis.

Palivizumab is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation.

Palivizumab is recommended for:
• children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm;
• children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm.

Palivizumab should be considered for:
• children under 2 years of age with severe combined immunodeficiency syndrome;
• children under 1 year of age who require long-term ventilation;
• children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

For details of the preterm age groups included in the recommendations, see Immunisation against Infectious Disease (2006), available at www.gov.uk/dh.
Chapter 6
Endocrine system

1 Antidiuretic hormone disorders

Posterior pituitary hormones and antagonists

Posterior pituitary hormones

Diabetes insipidus

Vasopressin p. 630 (antiuretic hormone, ADH) is used in the treatment of pituitary ('cranial') diabetes insipidus as is its analogue desmopressin p. 628. Dosage is tailored to produce a slight diuresis every 24 hours to avoid water intoxication. Treatment may be required for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus. Following a dose intramuscularly or intranasally, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of cranial diabetes insipidus. Failure to respond occurs in nephrogenic diabetes insipidus. In nephrogenic and partial pituitary diabetes insipidus benefit may be gained from the paradoxical antidiuretic effect of thiazides.

Carbamazepine p. 297 is sometimes useful in partial pituitary diabetes insipidus [unlicensed]; it may act by sensitising the renal tubules to the action of remaining endogenous vasopressin.

Other uses

Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand's disease; it is also used to test fibrinolytic response. Desmopressin may also have a role in nocturnal enuresis.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, prior to more definitive treatment and with variable results. Terlipressin acetate, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, is used similarly.

Oxytocin p. 775, another posterior pituitary hormone, is indicated in obstetrics.

Antidiuretic hormone antagonists

Demeclocycline hydrochloride p. 533 can be used in the treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable. Demeclocycline hydrochloride is thought to act by directly blocking the renal tubular effect of antidiuretic hormone.

Tolvaptan p. 630 is a vasopressin V1-receptor antagonist licensed for the treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion; treatment duration with tolvaptan is determined by the underlying disease and its treatment.

Rapid correction of hyponatraemia during tolvaptan therapy can cause osmotic demyelination, leading to serious neurological events; close monitoring of serum sodium concentration and fluid balance is essential.

Desmopressin

09-Jun-2017

Desmopressin is an analogue of vasopressin.

**INDICATIONS AND DOSE**

**Diabetes insipidus, treatment**

- **BY MOUTH**
  - Child 1–23 months: Initially 10 micrograms 2–3 times a day, adjusted according to response; usual dose 30–150 micrograms daily
  - Child 2–11 years: Initially 50 micrograms 2–3 times a day, adjusted according to response; usual dose 100–800 micrograms daily
  - Child 12–17 years: Initially 100 micrograms 2–3 times a day, adjusted according to response; usual dose 0.2–1.2 mg daily
  - Adult: Initially 100 micrograms 3 times a day; maintenance 100–200 micrograms 3 times a day; usual dose 0.2–1.2 mg daily

- **BY SUBLINGUAL ADMINISTRATION**
  - Child 2–17 years: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
  - Adult: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day

- **BY INTRANASAL ADMINISTRATION**
  - Child 1–23 months: Initially 2.5–5 micrograms 1–2 times a day, adjusted according to response
  - Child 2–11 years: Initially 5–20 micrograms 1–2 times a day, adjusted according to response
  - Child 12–17 years: Initially 10–20 micrograms 1–2 times a day, adjusted according to response
  - Adult: 10–40 micrograms daily in 1–2 divided doses

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAVENTEVEN INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: 1–4 micrograms daily

**Primary nocturnal enuresis**

- **BY MOUTH**
  - Child 5–17 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
  - Adult 18–65 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration

- **BY SUBLINGUAL ADMINISTRATION**
  - Child 5–17 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week
  - Adult 18–65 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week

**Postoperative polyuria or polydipsia**

- **BY MOUTH**
  - Adult: Dose to be adjusted according to urine osmolality

**Polyuria or polydipsia after hypophysectomy**

- **BY SUBLINGUAL ADMINISTRATION**
  - Adult: Dose to be adjusted according to urine osmolality

**Idiopathic nocturnal polyuria in females**

- **BY SUBLINGUAL ADMINISTRATION**
  - Adult: 50 micrograms daily, to be taken 1 hour before bedtime

**Idiopathic nocturnal polyuria in males**

- **BY SUBLINGUAL ADMINISTRATION**
  - Adult: 50 micrograms daily, to be taken 1 hour before bedtime

**Diabetes insipidus, diagnosis (water deprivation test)**

- **BY INTRANASAL ADMINISTRATION**
  - Adult: 20 micrograms, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration
  - **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Adult: 2 micrograms for 1 dose, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration

**Nocturia associated with multiple sclerosis (when other treatments have failed)**

- **BY INTRANASAL ADMINISTRATION**
  - Adult 18–65 years: 10–20 micrograms once daily, to be taken at bedtime, dose not to be repeated within 24 hours, limit fluid intake from 1 hour before to 8 hours after administration

**Renal function testing**

- **BY INTRANASAL ADMINISTRATION**
  - Adult: 40 micrograms, empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload
  - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: 2 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

**Mild to moderate haemophilia and von Willebrand’s disease**

- **BY INTRANASAL ADMINISTRATION**
  - Adult: 300 micrograms every 12 hours if required, one 150 microgram spray into each nostril, 30 minutes before surgery or when bleeding, dose may alternatively be repeated at intervals of at least 3 days, if self-administered
  - **BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION**
  - Adult: 300 nanograms/kg for 1 dose, to be administered immediately before surgery or after trauma; may be repeated at intervals of 12 hours

**Fibrinolytic response testing**

- **BY INTRANASAL ADMINISTRATION**
  - Adult: 300 micrograms, blood to be sampled after 1 hour for fibrinolytic activity, one 150 microgram spray to be administered into each nostril

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION**
  - Adult: 300 nanograms/kg for 1 dose, blood to be sampled after 20 minutes for fibrinolytic activity

**Lumbar-puncture-associated headache**

- **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Adult: (consult product literature)
**UNLICENSED USE** Consult product literature for individual preparations. Oral use of DDAVP intravenous injection is not licensed.

**CONTRA-INDICATIONS** Cardiac insufficiency· conditions treated with diuretics· history of hyponatraemia· polydipsia in alcohol dependence· psychogenic polydipsia· syndrome of inappropriate ADH secretion (in adults)

**CAUTIONS**

**GENERAL CAUTIONS**
Asthma· avoid fluid overload· cardiovascular disease (not indicated for nocturnal enuresis or nocturia)· conditions which might be aggravated by water retention· cystic fibrosis· elderly (avoid for primary nocturnal enuresis and nocturia associated with multiple sclerosis in those over 65 years)· epilepsy· heart failure· hypertension (not indicated for nocturnal enuresis or nocturia)· migraine· nocturia—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards· nocturnal enuresis—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards

**SPECIFIC CAUTIONS**
With intranasal use Should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects

**SIDE-EFFECTS, FURTHER INFORMATION**
Elderly patients are at increased risk of hyponatraemia and renal impairment—manufacturer advises measure baseline serum sodium concentration, then monitor regularly during treatment; discontinue treatment if levels fall below the normal range. Review treatment if no therapeutic benefit after 3 months.

**INTERACTIONS** → Appendix 1: desmopressin

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

**Common or very common** Hyponatraemia (in more serious cases with convulsions) on administration without restricting fluid intake· nausea

**Frequency not known** Allergic reactions· emotional disturbance in children· epistaxis· fluid retention· headache· nasal congestion· stomach pain· vomiting

**SPECIFIC SIDE-EFFECTS**

**With intranasal use** Rhinitis

**SIDE-EFFECTS, FURTHER INFORMATION**
Hyponatraemic convulsions The risk of hyponatraemic convulsions can be minimised by keeping to the recommended starting doses and by avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants).

**PREGNANCY** Small oxytocic effect in third trimester; increased risk of pre-eclampsia.

**BREAST FEEDING** Amount too small to be harmful.

**RENAL IMPAIRMENT** Use with caution; antidiuretic effect may be reduced.

**MONITORING REQUIREMENTS** In nocturia, periodic blood pressure and weight checks are needed to monitor for fluid overload.

**DIRECTIONS FOR ADMINISTRATION** DDAVP® and Desmotabs® tablets may be crushed. DDAVP® intranasal solution may be diluted with Sodium Chloride 0.9% to a concentration of 10 micrograms/mL. DDAVP® injection may be administered orally. Desmopressin oral lozenges are for sublingual administration.

For intravenous infusion (DDAVP®, Octim®), give intermittently in Sodium chloride 0.9%; dilute with 50 mL and give over 20 minutes.

**PRESCRIBING AND DISPENSING INFORMATION** Oral, intranasal, intravenous, subcutaneous and intramuscular doses are expressed as desmopressin acetate; sublingual doses are expressed as desmopressin base.

Children requiring an intranasal dose of less than 10 micrograms should be given DDAVP® intranasal solution.

**PATIENT AND CARER ADVICE**

Hyponatraemic convulsions Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal).

Medicines for Children leaflet: Desmopressin for bedwetting www.medicinesforchildren.org.uk/desmopressin-bedwetting-0

**NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions

In adults The Scottish Medicines Consortium has advised (February 2017) that desmopressin (Noqdirna®) is not recommended for use within NHS Scotland for the symptomatic treatment of nocturia due to idiopathic nocturnal polyuria in adults as the economic case was not demonstrated.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, spray, nasal drops

**Tablet**

- Desmopressin (Non-proprietary)
  - Desmopressin acetate 100 microgram Desmopressin 100microgram tablets | 90 tablet (POM) £76.62 DT price = £63.08
  - Desmopressin acetate 200 microgram Desmopressin 200microgram tablets | 30 tablet (POM) £35.23 DT price = £7.25 | 90 tablet (POM) no price available

- DDAVP (Ferring Pharmaceuticals Ltd)
  - Desmopressin acetate 100 microgram DDAVP 0.1mg tablets | 90 tablet (POM) £44.12 DT price = £63.08
  - Desmopressin acetate 200 microgram DDAVP 0.2mg tablets | 90 tablet (POM) £88.23

- Desmotabs (Ferring Pharmaceuticals Ltd)
  - Desmopressin acetate 200 microgram Desmotabs 0.2mg tablets | 30 tablet (POM) £29.43 DT price = £7.25

**Solution for injection**

- DDAVP (Ferring Pharmaceuticals Ltd)
  - Desmopressin acetate 4 microgram per 1 ml DDAVP 4micrograms/1ml solution for injection ampoules | 10 ampoule (POM) £13.16

- Octim (Ferring Pharmaceuticals Ltd)
  - Desmopressin acetate 15 microgram per 1 ml Octim 15micrograms/1ml solution for injection ampoules | 10 ampoule (POM) £192.20

**Spray**

- Desmopressin (Non-proprietary)
  - Desmopressin acetate 2.5 microgram per 1 dose Desmopressin 2.5 microgram/spray | 10 dose (POM) £31.50 DT price = £23.25

- Desmospray (Ferring Pharmaceuticals Ltd)
  - Desmopressin acetate 2.5 microgram per 1 dose Desmospray 2.5micrograms/spray | 50 dose no price available

- Desmopressin acetate 10 microgram per 1 dose Desmospray 10micrograms/spray | 60 dose (POM) £25.02 DT price = £23.25

- Octim (Ferring Pharmaceuticals Ltd)
  - Desmopressin acetate 150 microgram per 1 dose Octim 150micrograms/spray | 25 dose (POM) £576.60

**Oral solution**

- Desmopressin (Non-proprietary)
  - Desmopressin (as Desmopressin acetate) 360 microgram per 1 ml Desmopressin 360micrograms/ml oral solution | 15 ml (POM) £30.00 DT price = £30.00
**Oral lyophilisate**

**CAUTIONARY AND ADVISORY LABELS 26**

- **Desmopressin (Non-proprietary)**
  - **Desmopressin (as Desmopressin acetate)**
    - 120 microgram Desmopressin 120 microgram oral lyophilisates sugar-free sugar-free | 30 tablet (Pot) no price available DT price = £30.34
  - **Desmopressin (as Desmopressin acetate)**
    - 240 microgram Desmopressin 240 microgram oral lyophilisates sugar-free sugar-free | 30 tablet (Pot) no price available DT price = £60.68
  - **DDAVP (Ferring Pharmaceuticals Ltd)**
    - **Desmopressin (as Desmopressin acetate) 60 microgram**
      - DDAVP Melt 60 microgram oral lyophilisates sugar-free | 100 tablet (Pot) £50.53 DT price = £50.53
    - **Desmopressin (as Desmopressin acetate) 120 microgram**
      - DDAVP Melt 120 microgram oral lyophilisates sugar-free | 100 tablet (Pot) £101.07 DT price = £101.07
    - **Desmopressin (as Desmopressin acetate) 240 microgram**
      - DDAVP Melt 240 microgram oral lyophilisates sugar-free | 100 tablet (Pot) £202.14
  - **Desmopressin acetate (non-proprietary)**
    - 25 microgram Desmopressin acetate 25 microgram oral lyophilisates sugar-free | 30 tablet (Pot) £15.16 DT price = £15.16
  - **Desmopressin acetate (as Desmopressin acetate) 50 microgram**
    - Noqdirna 50microgram oral lyophilisates sugar-free | 30 tablet (Pot) £15.16 DT price = £15.16

- **Nasal drops**
  - **DDAVP (Ferring Pharmaceuticals Ltd)**
    - Desmopressin acetate 100 microgram per 1 ml DDAVP 100 micrograms/ml intranasal solution | 2.5 ml (Pot) £9.72 DT price = £9.72

**Vasopressin**

- **INDICATIONS AND DOSE**
  - **Pituitary diabetes insipidus**
    - **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
    - Adult: 5–20 units every 4 hours
  - **Initial control of oesophageal variceal bleeding**
    - **BY INTRAVENOUS INFUSION**
    - Adult: 20 units, dose to be administered over 15 minutes

- **CONTRA-INDICATIONS**
  - Chronic nephritis (until reasonable blood nitrogen concentrations attained) - vascular disease (especially disease of coronary arteries) unless extreme caution
  - **CAUTIONS**
    - Asthma - avoid fluid overload - conditions which might be aggravated by water retention - epilepsy - heart failure - hypertension - migraine
  - **SIDE-EFFECTS**
    - Rare
    - Frequent not known
      - Abdominal cramps - anaphylaxis - anginal attacks - belching - constriction of coronary arteries - desire to defaecate - fluid retention - headache - hypersensitivity reactions - myocardial ischaemia - nausea - pallor - peripheral ischaemia - sweating - tremor - vertigo - vomiting
  - **PREGNANCY**
    - Oxytocic effect in third trimester.
  - **BREAST FEEDING**
    - Not known to be harmful.
  - **DIRECTIONS FOR ADMINISTRATION**
    - For intravenous infusion (argipressin), give intermittently in Glucose 5%; suggested concentration 20 units/100 ml given over 15 minutes.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Vasopressin (Non-proprietary)**
  - **Argipressin 20 unit per 1 ml**
    - Argipressin 20 units/ml solution for injection ampoules | 10 ampoule (Pot) £800.00 (Hospital only)

**1.2 Syndrome of inappropriate antidiuretic hormone secretion**

**INDICATIONS AND DOSE**

- **JINARC ®**
  - **Autosomal dominant polycystic kidney disease in adults with CKD stage 1 to 3 at initiation of treatment with evidence of rapidly progressing disease (initiated by a specialist)**
    - **BY MOUTH**
    - Adult: Initially 60 mg daily in 2 divided doses for at least a week, 45 mg in the morning before breakfast, and then 15 mg taken 8 hours later; increased to 90 mg daily in 2 divided doses for at least a week, 60 mg in the morning before breakfast, and then 30 mg taken 8 hours later, then increased if tolerated to 120 mg daily in 2 divided doses, 90 mg in the morning before breakfast, and then 30 mg taken 8 hours later, dose titration should be performed cautiously; patients may down-titrate to lower doses based on tolerability

**SAMSCA ®**

- **Treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion**
  - **BY MOUTH**
  - Adult: 15 mg once daily, increased if necessary up to 60 mg daily; treatment duration is determined by the underlying disease and its treatment

- **CONTRA-INDICATIONS**
  - Anuria - hyporeninaemic hypoaldosteronism - impaired perception of thirst - volume depletion

- **CAUTIONS**
  - Alcoholism (increased risk of demyelination syndrome if rapid correction of hyponatraemia) - diabetes mellitus - ensure adequate fluid intake - hypovolaemia (increased risk of demyelination syndrome if rapid correction of hyponatraemia) - malnutrition (increased risk of demyelination syndrome if rapid correction of hyponatraemia) - pseudohyponatraemia associated with diabetes mellitus (exclude before treatment)

- **INTERACTIONS**
  - Appendix 1: tolvaptan

- **SIDE-EFFECTS**
  - Common or very common
    - Constipation - decreased appetite - dehydration - dry mouth - ecchymosis - fever - hyperglycaemia - hyperkalaemia - increased blood creatinine - malaise - nausea - neurological disturbance (following rapid correction of hyponatraemia) - postural hypotension - pruritus - thirst - urinary frequency

Corticosteroid responsive conditions

2 Corticosteroid responsive conditions

Corticosteroids, general use

Overview

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in psoriasis.

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn’s disease. They are also included in locally applied creams for haemorrhoids.

Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 637 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone p. 637 and fludrocortisone acetate is of benefit in adrenocortical insufficiency resulting from septic shock.

Dexamethasone p. 635 and betamethasone p. 635 have little if any mineralocorticoid action and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and by measurement of adrenal androgens and 17-hydroxypregosterone.

In common with all glucocorticoids their suppressive action on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most individuals a single dose of dexamethasone at night, is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the ‘overnight dexamethasone suppression test’ for diagnosing Cushing’s syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see Prescribing in palliative care p. 23); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should not be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions, such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline/epinephrine p. 216. In such cases hydrocortisone (as sodium succinate) by intravenous injection may be required.

Corticosteroids are preferably used by inhalation in the management of asthma but systemic therapy in association

MEDICINAL FORMS

There are several corticosteroids available in different strengths and in different dosage forms. They may be obtained over the counter from pharmacies or by prescription from a doctor.

Available for oral administration are tablets, liquid, intramuscular (IM) and intravenous (IV) injections.

A tablet of fludrocortisone is available in the same form.

SIDE-EFFECTS

Corticosteroids may cause side-effects such as weakness, joint pain, muscle weakness, dizziness, abnormal blood pressure, infection, acne, heartburn or a feeling of fullness.

Monitor for dehydration in patients who are fluid-restricted.

Prescribe tablets of corticosteroids to be taken 30 minutes before food to avoid irritation to the stomach.

The corticosteroids are easily absorbed from the gastrointestinal tract and are used to treat a wide range of medical conditions, including inflammatory conditions such as rheumatoid arthritis and Crohn’s disease.

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn’s disease. They are also included in locally applied creams for haemorrhoids.

Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 637 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone p. 637 and fludrocortisone acetate is of benefit in adrenocortical insufficiency resulting from septic shock.

Dexamethasone p. 635 and betamethasone p. 635 have little if any mineralocorticoid action and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and by measurement of adrenal androgens and 17-hydroxypregosterone. In common with all glucocorticoids their suppressive action on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most individuals a single dose of dexamethasone at night, is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the ‘overnight dexamethasone suppression test’ for diagnosing Cushing’s syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see Prescribing in palliative care p. 23); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should not be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions, such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline/epinephrine p. 216. In such cases hydrocortisone (as sodium succinate) by intravenous injection may be required.

Corticosteroids are preferably used by inhalation in the management of asthma but systemic therapy in association
with bronchodilators is required for the emergency treatment of severe acute asthma.

Corticosteroids may also be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia, and some cases of the nephrotic syndrome (particularly in children) and thrombocytopenic purpura.

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus, temporal arteritis, and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose, and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see: Prescribing in Palliative Care, immunosuppression, rheumatic diseases, eye, otis externa allergic rhinitis, and aphthous ulcers.

**Side-effects**

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

**Mineralocorticoid side effects**

- hypertension
- sodium retention
- water retention
- potassium loss
- calcium loss

Mineralocorticoid side effects are most marked with fludrocortisone, but are significant with hydrocortisone, corticosterone, and tetracosactide. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone, prednisolone, and triamcinolone.

**Glucocorticoid side effects**

- diabetes
- osteoporosis, which is a danger, particularly in the elderly, as it can result in osteoporotic fractures for example of the hip or vertebrae;
- in addition high doses are associated with avascular necrosis of the femoral head.
- Muscle wasting (proximal myopathy) can also occur.
- Corticosteroid therapy is also weakly linked with peptic ulceration and perforation.
- Psychiatric reactions may also occur.

**Managing side-effects**

Side-effects can be minimised by using lowest effective dose for minimum period possible. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma. Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug.

Whenever possible local treatment with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to systemic treatment.

Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids, but adverse effects including adrenal suppression have been reported. Use of other corticosteroid therapy (including topical) or concurrent use of drugs which inhibit corticosteroid metabolism should be taken into account when assessing systemic risk. In children, growth restriction associated with systemic corticosteroid therapy does not seem to occur with recommended doses of inhaled therapy; although initial growth velocity may be reduced, there appears to be no effect on achieving normal adult height. Large-volume spacer devices should be used for administering inhaled corticosteroids in children under 15 years; they are also useful in older children and adults, particularly if high doses are required. Spacer devices increase airway deposition and reduce oropharyngeal deposition.

**Corticosteroids, replacement therapy**

**Overview**

The adrenal cortex normally secretes hydrocortisone p. 637 (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone and the mineralocorticoid fludrocortisone acetate p. 637; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In Addison’s disease or following adrenalectomy, hydrocortisone by mouth is usually required. This is given in 2 doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone acetate.

In acute adrenocortical insufficiency, hydrocortisone is given intravenously (preferably as sodium succinate) every 6 to 8 hours in sodium chloride intravenous infusion 0.9% p. 955.

In hypopituitarism, glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levethyroxine sodium p. 729 and sex hormones should be given as indicated by the pattern of hormone deficiency.

**Glucocorticoid therapy**

**Glucocorticoid and mineralocorticoid activity**

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids). The mineralocorticoid activity of fludrocortisone acetate p. 637 is so high that its anti-inflammatory activity is of no clinical relevance.

Corticosteroids (systemic)

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates - avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished) - systemic infection (unless specific therapy given)

**CONTRA-INDICATIONS, FURTHER INFORMATION**

For further information on contra-indications associated with intra-articular, intradermal and intraleisional preparations, consult product literature.

- **CAUTIONS** Congestive heart failure - diabetes mellitus (including a family history of) - diverticulitis - epilepsy - glaucoma (including a family history of or susceptibility to) - history of steroid myopathy - history of tuberculosis or X-ray changes (frequent monitoring required) - hypertension - hypothyroidism - infection (particularly untreated) - myasthenia gravis - ocular herpes simplex (risk of corneal perforation) - osteoporosis (in children) - osteoporosis (post-menopausal women and the elderly at special risk) - peptic ulcer - psychiatric reactions - recent intestinal anastomoses - recent myocardial infarction (rupture reported) - severe affective disorders (particularly if history of steroid-induced psychosis) - should not be used long-term - thromboembolic disorders - ulcerative colitis

**CAUTIONS, FURTHER INFORMATION**

For further information on cautions associated with intra-articular, intradermal and intraleisional preparations, consult product literature.

- **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

**SPECIFIC SIDE-EFFECTS**

- With intra-articular use Flushing - may affect the hyaline cartilage

**SIDE-EFFECTS, FURTHER INFORMATION**

For further information on side-effects associated with intra-articular, intradermal and intraleisional preparations, consult product literature.

Side-effects can be managed by choice of route and duration of course. For further detail see Corticosteroids, general use p. 631

- Adrenal suppression During prolonged therapy with corticosteroids, particularly with systemic use, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension, or death.

  To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment. To avoid a precipitous fall in blood pressure during anaesthesia or in the immediate postoperative period, anaesthetists must know whether a patient is taking or has been taking a corticosteroid. A suitable regimen for corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of surgery, is:

  - Minor surgery under general anaesthesia—usual oral corticosteroid dose on the morning of surgery or hydrocortisone (usually the sodium succinate) intravenously at induction; the usual oral corticosteroid dose is recommenced after surgery.

  - Moderate or major surgery—usual oral corticosteroid dose on the morning of surgery and hydrocortisone intravenously at induction, followed by hydrocortisone 3 times a day by intravenous injection for 24 hours after moderate surgery or for 48–72 hours after major surgery; the usual pre-operative oral corticosteroid dose is recommenced on stopping hydrocortisone injections. Patients on long-term corticosteroid treatment should carry a steroid treatment card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

- Infections Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. septicaemia and tuberculosis may reach an advanced stage before being recognised, and amoebiasis or strongyloidiasis may be activated or
exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral ocular infections may also be exacerbated.

- **Chickenpox** Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at risk of severe chickenpox (see Steroid Treatment Card). Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature.

  Passive immunisation with varicella–zoster immunoglobulin is needed for exposed non–immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment. Corticosteroids should not be stopped and dosage may need to be increased.

  Topical, inhaled or rectal corticosteroids are less likely to be associated with an increased risk of severe chickenpox.

- **Measles** Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin may be needed.

- **Psychiatric reactions** Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, nightmares, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. A serious paranoid state or depression with risk of suicide can be induced, particularly in patients with a history of mental disorder. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment.

  Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid–induced psychosis, or who have a personal or family history of psychiatric disorders.

- **PREGNANCY** The benefit of treatment with corticosteroids during pregnancy outweighs the risk. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast–feeding the CSM (May 1998) concluded that corticosteroids vary in their ability to cross the placenta but there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip. When administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra–uterine growth restriction; there is no evidence of intra–uterine growth restriction following short–term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome). Any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important.

  Pregnant women with fluid retention should be monitored closely when given systemic corticosteroids.

- **BREAST FEEDING** The benefit of treatment with corticosteroids during breast–feeding outweighs the risk.

- **HEPATIC IMPAIRMENT** The plasma–drug concentration may be increased (particularly on systemic use). Oral and parenteral use should be undertaken with caution.

- **RENAL IMPAIRMENT** Use by oral and injectable routes should be undertaken with caution.

- **MONITORING REQUIREMENTS**
  - In children The height and weight of children receiving prolonged treatment with corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.
  - **EFFECT ON LABORATORY TESTS** Suppression of skin test reactions.
  - **TREATMENT CESSATION** In adults Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension or death. Withdrawal can also be associated with fever, myalgia, arthralgia, rhinitis, conjunctivitis, painful itchy skin nodules and weight loss. The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case–by–case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. **Gradual withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:**
    - received more than 40 mg prednisolone (or equivalent) daily for more than 1 week;
    - been given repeat doses in the evening;
    - received more than 3 weeks’ treatment;
    - recently received repeated courses (particularly if taken for longer than 3 weeks);
    - taken a short course within 1 year of stopping long–term therapy;
    - other possible causes of adrenal suppression.
  
  Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse and who have received treatment for 3 weeks or less and who are not included in the patient groups described above.

  During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 7.5 mg daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

  - In children The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case–by–case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. **Gradual withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:**
    - received more than 40 mg prednisolone (or equivalent) daily for more than 1 week or 2 mg/kg daily for 1 week or 1 mg/kg daily for 1 month;
    - been given repeat doses in the evening;
    - received more than 3 weeks’ treatment;
    - recently received repeated courses (particularly if taken for longer than 3 weeks);
    - taken a short course within 1 year of stopping long–term therapy;
    - other possible causes of adrenal suppression.

  Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse and who have received treatment for 3 weeks or less and who are not included in the patient groups described above.

  During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 2–2.5 mg/m² daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

- **PATIENT AND CARER ADVICE**
  - **Advice for patients** Patients on long–term corticosteroid treatment should carry a Steroid Treatment Card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.
A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Patients should especially be advised of the following:

- **Immunosuppression** Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognized. Unless already immune, patients are at risk of severe chickenpox and should avoid close contact with people who have chickenpox or shingles. Similarly, precautions should also be taken against contracting measles;

- **Adrenal suppression** If the corticosteroid is given for longer than 3 weeks, treatment must not be stopped abruptly. Adrenal suppression can last for a year or more after stopping treatment and the patient must mention the course of corticosteroid when receiving treatment for any illness or injury;

- **Mood and behaviour changes** Corticosteroid treatment, especially with high doses, can alter mood and behaviour early in treatment—the patient can become confused, irritable and suffer from delusion and suicidal thoughts. These effects can also occur when corticosteroid treatment is being withdrawn. Medical advice should be sought if worrying psychological changes occur;

- **Other serious effects** Serious gastro-intestinal, musculoskeletal, and ophthalmic effects which require medical help can also occur.

Steroid treatment cards Steroid treatment cards should be issued where appropriate. Consider giving a ‘steroid card’ to support communication of the risks associated with treatment, and specific written advice to consider corticosteroid replacement during an episode of stress, such as severe intercurrent illness or an operation, to patients using greater than maximum licensed doses of inhaled corticosteroids. Steroid treatment cards are available for purchase from the NHS Print online ordering portal www.nhsforms.co.uk

GP practices can obtain supplies through Primary Care Support England. NHS Trusts can order supplies via the online ordering portal www.stockorders.dppas@apsgroup.co.uk or by fax on 0131 629 9967.

### Betamethasone

#### INDICATIONS AND DOSE

**Suppression of inflammatory and allergic disorders**

- **Congenital adrenal hyperplasia**
  - **BY MOUTH**
  - Adult: Usual dose 0.5–5 mg daily
  - **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 4–20 mg, repeated up to 4 times in 24 hours

#### INTERACTIONS

- **Appendix 1: corticosteroids**
- **PREGNANCY** Readily crosses the placenta. Transient effect on fetal movements and heart rate.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (as sodium phosphate) (Betnesol®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%
- **PATIENT AND CARER ADVICE** Patient counselling is advised for betamethasone soluble tablets (steroid card).

### Deflazacort

#### INDICATIONS AND DOSE

**Suppression of inflammatory and allergic disorders**

- **BY MOUTH**
- Adult: Maintenance 3–18 mg daily

**Suppression of inflammatory and allergic disorders (acute disorders)**

- **BY MOUTH**
- Adult: Initially up to 120 mg daily

**Inflammatory and allergic disorders**

- **BY MOUTH**
  - Child 1 month-11 years: 0.25–1.5 mg/kg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations
  - Child 12-17 years: 3–18 mg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations

#### INTERACTIONS

- **Appendix 1: deflazacort**

#### PATIENT AND CARER ADVICE

Patient counselling is advised for deflazacort tablets (steroid card).

### Dexamethasone

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Soluble tablet**

- **CAUTIONARY AND ADVISORY LABELS** 10, 13, 21 (not for use as mouthwash for oral ulceration)
  - Betamethasone (Non-proprietary)
  - Betamethasone (as Betamethasone sodium phosphate) 500 microgram Betamethasone 500 microgram soluble tablets sugar free sugar-free
  - 100 tablet [POM] £42.60 DT price = £42.60

**Solution for injection**

- **CAUTIONARY AND ADVISORY LABELS** 10
  - Betamethasone (Non-proprietary)
  - Betamethasone (as Betamethasone sodium phosphate) 4 mg per
  - 1 ml Betamethasone 4 mg/mL solution for injection ampoules | 5 ampoules [POM] £13.06–15.68

#### INDICATIONS AND DOSE

**Suppression of inflammatory and allergic disorders**

- **BY MOUTH**
- Adult: 0.5–10 mg daily

**Mild croup**

- **BY MOUTH**
- Child: 150 micrograms/kg for 1 dose

**Severe croup (or mild croup that might cause complications)**

- **INITIALLY BY MOUTH**
- Child: Initially 150 micrograms/kg for 1 dose, to be given before transfer to hospital, then (by mouth or by intravenous injection) 150 micrograms/kg, then (by mouth or by intravenous injection) 150 micrograms/kg after 12 hours if required continued →
Congenital adrenal hyperplasia (under expert supervision)

- **BY MOUTH**
  - Adult: Consult specialist for advice on dosing
- **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: Consult specialist for advice on dosing

**Overnight dexamethasone suppression test**

- **BY MOUTH**
  - Adult: 1 mg for 1 dose, to be given at night

**Adjuvant treatment of bacterial meningitis (starting before or with first dose of antibacterial)**

- **BY INTRAVENOUS INJECTION**
  - Adult: 8.3 mg every 6 hours for 4 days

**Symptom control of anorexia (in palliative care)**

- Adult: 2–4 mg daily

**Obstruction due to tumour (dysphagia in palliative care)**

- Adult: 8 mg daily

**Bronchospasm or partial obstruction (dyspnoea in palliative care)**

- Adult: 4–8 mg daily

**Nausea and vomiting (adjunct in palliative care)**

- **BY MOUTH**
  - Adult: 8–16 mg daily

**Headaches due to raised intracranial pressure (in palliative care)**

- Adult: 16 mg daily for 4–5 days, then reduced to 4–6 mg daily, reduce dose if possible. To be given before 6pm to reduce the risk of insomnia

**Pain due to nerve compression (in palliative care)**

- Adult: 8 mg daily

**Cerebral oedema associated with malignancy**

- **BY MOUTH**
  - Adult: 0.5–10 mg daily

**Cerebral oedema**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 8–16 mg for 1 dose, then (by intramuscular injection or by intravenous injection)

5 mg every 6 hours until adequate response achieved then taper-off gradually, use the 3.8 mg/mL injection preparation for this dose

**Cerebral oedema associated with malignancy**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 8.3 mg for 1 dose, then (by intramuscular injection) 3.3 mg every 6 hours as required for 2–4 days, subsequently, reduce dose gradually and stop over 5–7 days, use the 3.3 mg/mL injection preparation for this dose

---

**UNLICENSED USE** Consult product literature; not licensed for use in bacterial meningitis.

**INTERACTIONS** → Appendix 1: corticosteroids

**SIDE-EFFECTS**

With intravenous use Perineal irritation may follow intravenous administration of the phosphate ester

**PREGNANCY** Dexamethasone readily crosses the placenta.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use in children For administration by mouth tablets may be dispersed in water or injection solution given by mouth.
- With intravenous use in adults For intravenous infusion (Dexamethasone, Hospira) give continuously or intermittently or via drip tubing in Glucose 5% or Sodium Chloride 0.9%.

**PRESCRIBING AND DISPENSING INFORMATION**

Dexamethasone 3.8 mg/mL Injection has replaced Dexamethasone 4 mg/mL Injection. All dosage recommendations for intravenous, intramuscular, intrarticular use or local infiltration; are given in units of dexamethasone base.

**PATIENT AND CARER ADVICE** Patient counselling is advised for dexamethasone tablet, oral solution and injection (steroid card).

Medicines for Children leaflet: Dexamethasone for croup www.medicinesforchildren.org.uk/dexamethasone-croup-0

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Soluble tablet**

- **Dexamethasone (Non-proprietary)**
  - Dexamethasone (as Dexamethasone sodium phosphate)
    - 2 mg Dexamethasone 2mg soluble tablets sugar free sugar-free | 50 tablet £30.00–£31.03 DT price = £31.03
    - Dexamethasone (as Dexamethasone sodium phosphate)
    - 4 mg Dexamethasone 4mg soluble tablets sugar free sugar-free | 50 tablet £60.00–£62.06 DT price = £62.06
    - Dexamethasone (as Dexamethasone sodium phosphate)
    - 8 mg Dexamethasone 8mg soluble tablets sugar free sugar-free | 50 tablet £120.00–£123.70 DT price = £123.70

**Tablet**

**CAUTIONARY AND ADVISORY LABELS. 10, 21**

- **Dexamethasone (Non-proprietary)**
  - Dexamethasone 500 microgram Dexamethasone 500microgram tablets | 28 tablet £54.25 DT price = £54.25 | 30 tablet £64.82
  - Dexamethasone 2 mg Dexamethasone 2mg tablets | 50 tablet £49.00 DT price = £42.85 | 100 tablet £98.00 | 500 tablet £490.00
  - Dexamethasone 4 mg Dexamethasone 4mg tablets | 50 tablet £85.00–£96.00

**Solution for injection**

**CAUTIONARY AND ADVISORY LABELS. 10, 21**

- **Dexamethasone (Non-proprietary)**
  - Dexamethasone (as Dexamethasone sodium phosphate) 3.3 mg per 1 ml Dexamethasone 6.6mg/2ml solution for injection vials | 5 vial £24.00 DT price = £24.00
  - Dexamethasone (as Dexamethasone sodium phosphate) 6.6mg/2ml solution for injection ampoules | 5 ampoule £11.00 DT price = £11.00 | 10 ampoule £22.00
  - Dexamethasone 3.3mg/1ml solution for injection ampoules | 5 ampoule £12.00 | 10 ampoule £12.00 DT price = £12.00
  - Dexamethasone (as Dexamethasone sodium phosphate) 3.8 mg per 1 ml Dexamethasone 3.8mg/1ml solution for injection vials | 10 vial £19.99 DT price = £19.99

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS. 10, 21**

- **Dexamethasone (Non-proprietary)**
  - Dexamethasone (as Dexamethasone sodium phosphate)
    - 400 microgram per 1 ml Dexamethasone 2mg/5ml oral solution sugar free sugar-free | 75 ml £42.30 DT price = £42.30
    - Dexamethasone (as Dexamethasone sodium phosphate) 2 mg per 1 ml Dexamethasone 10mg/5ml oral solution sugar free sugar-free | 50 ml £24.50–£24.95 sugar-free | 150 ml £101.40 DT price = £94.44
  - Dexsol (Rosemont Pharmaceuticals Ltd)
    - Dexamethasone (as Dexamethasone sodium phosphate) 4 mg per 1 ml Dexamethasone 20mg/5ml oral solution sugar free sugar-free | 50 ml £49.50 DT price = £49.50
  - Martapan (Martindale Pharmaceuticals Ltd)
    - Dexamethasone (as Dexamethasone sodium phosphate) 400 microgram per 1 ml Martapan 2mg/5ml oral solution sugar-free | 75 ml £21.15 sugar-free | 150 ml £42.30 DT price = £42.30
    - Dexamethasone (as Dexamethasone sodium phosphate) 400 microgram per 1 ml Martapan 2mg/5ml oral solution sugar-free | 150 ml £42.30 DT price = £42.30

636 Corticosteroid responsive conditions

BNF 74

6

Endocrine system

downloaded from www.medicalbr.com
**Fludrocortisone acetate**

**INDICATIONS AND DOSE**

- **Neuropathic postural hypotension**
  - Adult: 100–400 micrograms daily

- **Mineralocorticoid replacement in adrenocortical insufficiency**
  - Adult: 50–300 micrograms once daily

- **Adrenocortical insufficiency resulting from septic shock**
  - Adult: 50 micrograms daily

**UNLICENSED USE** Not licensed for use in neuropathic postural hypotension.

**INTERACTIONS** → Appendix 1: corticosteroids

**HEPATIC IMPAIRMENT** Monitor patient closely in hepatic impairment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension.

**Tablet**

- **Fludrocortisone acetate (Non-proprietary)**
  - Fludrocortisone acetate 100 microgram Fludrocortisone 100 microgram tablets: 30 tablet £30.00 DT price = £26.77
  - 100 tablet £55.00

**Hydrocortisone**

**INDICATIONS AND DOSE**

- **Thyrotoxic crisis (thyroid storm)**
  - Adult: 100 mg every 6 hours, to be administered as sodium succinate

- **Adrenocortical insufficiency resulting from septic shock**
  - Adult: 50 mg every 6 hours, given in combination with fludrocortisone

- **Acute hypersensitivity reactions such as angioedema of the upper respiratory tract and anaphylaxis (adjunct to adrenaline)**
  - Adult: 100–300 mg, to be administered as sodium succinate

- **Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of minor surgery under general anaesthesia**
  - Adult: Initially 25–50 mg, to be administered at induction of surgery, the patient’s usual oral corticosteroid dose is recommenced after surgery

- **Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of moderate or major surgery**
  - Adult: Initially 25–50 mg, to be administered at induction of surgery (following usual oral corticosteroid dose on the morning of surgery), followed by 25–50 mg 3 times a day for 24 hours after moderate surgery and for 48–72 hours after major surgery

**DOSE EQUIVALENCE AND CONVERSION**

When switching from immediate-release hydrocortisone tablets to modified release Plenadren® use same total daily dose. Bioavailability of Plenadren® lower than immediate release tablets—monitor clinical response.

**CONTRA-INDICATIONS**

- With rectal use Bowel perforation • extensive fistulas • intestinal obstruction • recent intestinal anastomoses

**Adrenocortical insufficiency in Addison’s disease or following adrenalectomy**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 20–30 mg daily in 2 divided doses, the larger dose to be given in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion, the optimum daily dose is determined on the basis of clinical response

**Adrenocortical insufficiency**

- **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 100–500 mg 3–4 times a day or when required

**Severe inflammatory bowel disease**

- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 100–500 mg 3–4 times a day or when required

**Replacement in adrenocortical insufficiency**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 20–30 mg once daily, adjusted according to response, dose to be taken in the morning

**Ulcerative colitis | Proctitis | Proctosigmoiditis**

- **BY RECTUM USING RECTAL FOAM**
  - Adult: Initially 1 metered application 1–2 times a day for 2–3 weeks, then reduced to 1 metered application once daily on alternate days, to be inserted into the rectum

**Acute hypersensitivity reactions | Angioedema**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 20–30 mg once daily, adjusted according to response

- **Child 1–5 months: Initially 25 mg 3 times a day, adjusted according to response**

- **Child 6–11 months: Initially 100 mg 3 times a day, adjusted according to response**

- **Child 12–17 years: Initially 200 mg 3 times a day, adjusted according to response**

**Severe acute asthma | Life-threatening acute asthma**

- **BY INTRAVENOUS INJECTION**
  - Child 1 month–1 year: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 25 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

  - Child 2–4 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 50 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

  - Child 5–11 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

  - Child 12–17 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

  - Adult: 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

**DOSE EQUIVALENCE AND CONVERSION**

- When switching from immediate-release hydrocortisone tablets to modified release Plenadren® use same total daily dose. Bioavailability of Plenadren® lower than immediate release tablets—monitor clinical response.
Methylprednisolone

**INDICATIONS AND DOSE**

**Suppression of inflammatory and allergic disorders**
- Cerebral oedema associated with malignancy
  - By mouth
  - Adult: Initially 2–40 mg daily
  - By intramuscular injection, or by slow intravenous injection, or by intravenous infusion
  - Adult: Initially 10–500 mg

**Treatment of graft rejection reactions**
- By intravenous infusion
- Adult: Up to 1 g daily for up to 3 days

**Treatment of relapse in multiple sclerosis**
- By mouth
- Adult: 500 mg once daily for 5 days

**Treatment of relapse in multiple sclerosis (when oral steroids have failed or have not been tolerated, or in those who require hospital admission)**
- By intravenous infusion
- Adult: 1 g once daily for 3–5 days

**DEPO-MEDRONE**

**Suppression of inflammatory and allergic disorders**
- By deep intramuscular injection
- Adult: 40–120 mg, then 40–120 mg after 2–3 weeks if required, to be injected into the gluteal muscle

**LICENSED USE**
- Methylprednisolone doses in the BNF may differ from those in product literature.

**CAUTIONS**
- With intravenous use Rapid intravenous administration of large doses associated with cardiovascular collapse
- INTERACTIONS → Appendix 1: corticosteroids

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion
- Propylene glycol or Sodium Chloride
- Rapid intravenous administration
- For small doses, give over at least 30 minutes.
- For large doses associated with cardiovascular collapse, give over at least 30 minutes.

**SIDE-EFFECTS**

- Systemic absorption may occur
- Phosphate ester associated with pain and paraesthesia (particularly in the perineal region)
- Local irritation

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children For intravenous administration, dilute with Glucose 5% or Sodium Chloride 0.9%. For intermittent infusion give over 20–30 minutes.
- With intravenous use in adults For intravenous infusion (SoluCortef® or Efocortesol®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium Chloride 0.9%

**INTERACTIONS**

- Systemic use Patient counselling is advised for hydrocortisone tablets and injections (steroid card).
- Systemic use Where administration is for saving life in emergency.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Modified-release tablet**

**Powder for solution for injection**

- Plenadren [Plifer Ltd]
- Hydrocortisone (as Hydrocortisone sodium succinate)
- 100 mg | Solu-Cortef powder for solution for injection vials | 10 vial | £9.17 |

**Suspension for injection**

- Hydrocortisone acetate 25 mg per 1 ml | Hydrocortisone sodium succinate 500mg solution for injection ampoules | 5 ampoule | £36.45 |

**Foam**

- EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, hydroxybenzoates (parabens), propylene glycol
- Colifoam (Medd Pharmaceuticals Ltd)
- Hydrocortisone acetate 100 mg per 1 gram | Colifoam 10% aerosol | 14 dose | £3.39 |

**Medicinal System**

**CAUTIONS**

- With rectal use Systemic absorption may occur
- With intravenous use Phosphate ester associated with pain and paraesthesia (particularly in the perineal region)
- With rectal use Local irritation

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children For intravenous administration, dilute with Glucose 5% or Sodium Chloride 0.9%. For intermittent infusion give over 20–30 minutes.
- With intravenous use in adults For intravenous infusion (SoluCortef® or Efocortesol®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium Chloride 0.9%.
**Prednisolone**

**INDICATIONS AND DOSE**

**Acute exacerbation of chronic obstructive pulmonary disease (if increased breathlessness interferes with daily activities)**

- **BY MOUTH**
  - Adult: 30 mg daily for 7–14 days

**Severe croup (before transfer to hospital) / Mild croup that might cause complications (before transfer to hospital)**

- **BY MOUTH**
  - Child: 1–2 mg/kg

**Mild to moderate acute asthma (when oral corticosteroid taken for more than a few days) / Severe or life-threatening acute asthma (when oral corticosteroid taken for more than a few days)**

- **BY MOUTH**
  - Child 1 month-11 years: 2 mg/kg once daily (max. per dose 60 mg) for up to 3 days, longer if necessary
  - Child 12-17 years: 40–50 mg daily for at least 5 days
  - Adult: 40–50 mg daily for at least 5 days

**Mild to moderate acute asthma / Severe or life-threatening acute asthma**

- **BY MOUTH**
  - Child 1 month-11 years: 2 mg/kg once daily (max. per dose 40 mg) for up to 3 days, longer if necessary
  - Child 12-17 years: 40–50 mg daily for at least 5 days
  - Adult: Initially 10–20 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months

**Suppression of inflammatory and allergic disorders**

- **BY MOUTH**
  - Adult: Initially 10–20 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months
may be necessary to continue long term low-dose corticosteroid treatment

Polyarteritis nodosa | Polymyositis | Systemic lupus erythematosus
▶ By mouth
- Adult: Initially 60 mg daily, to be reduced gradually; maintenance 10–15 mg daily

Anorexia (symptom control in palliative care)
▶ By mouth
- Adult: 15–30 mg daily

Pneumocystis pneumonia in moderate to severe infections associated with HIV infection
▶ By mouth
- Adult: 50–80 mg daily for 5 days, the dose is then reduced to complete 21 days of treatment; corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete

Short-term prophylaxis of episodic cluster headache as monotherapy or in combination with verapamil during verapamil titration
▶ By mouth
- Adult: 60–100 mg once daily for 2–5 days, then reduced in steps of 10 mg every 2–3 days until prednisolone is discontinued

Proctitis
▶ By rectum using rectal foam
- Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone
▶ By rectum using suppositories
- Adult: 5 mg twice daily, to be inserted into the rectum morning and night, after a bowel movement

Distal ulcerative colitis
▶ By rectum using rectal foam
- Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

Rectal complications of Crohn's disease
▶ By rectum using suppositories
- Adult: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

Rectal and rectosigmoidal ulcerative colitis | Rectal and rectosigmoidal Crohn’s disease
▶ By rectum using enema
- Adult: 20 mg daily for 2–4 weeks, continued if response good, to be used at bedtime

With systemic use Infant should be monitored for adrenal suppression if mother is taking a dose higher than 40 mg.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for prednisolone tablets (steroid card). Medicines for Children leaflet: Prednisolone for asthma www.medicinesforchildren.org.uk/prednisolone-for-asthma

### Cushing’s syndrome and disease

**Management**

Most types of Cushing’s syndrome are treated surgically, that which occasionally accompanies carcinoma of the bronchus is not usually amenable to surgery. Metyrapone p. 642 has been found helpful in controlling the symptoms of the disease; it is also used in other forms of Cushing’s syndrome to prepare the patient for surgery.

The dosages of metyrapone used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

Ketoconazole below may have a direct effect on corticotropin tumour cells in patients with Cushing’s disease. It is used under specialist supervision for treatment of endogenous Cushing’s syndrome.

### Enzyme inhibitors

#### Ketoconazole

**Drug action**
An imidazole derivative which acts as a potent inhibitor of cortisol and aldosterone synthesis by inhibiting the activity of 17α-hydroxylase, 11-hydroxylase steps and at higher doses the cholesterol side-chain cleavage enzyme. It also inhibits the activity of adrenal C17–20 lyase enzymes resulting in androgen synthesis inhibition, and may have a direct effect on corticotropin tumour cells in patients with Cushing’s disease.

### Other drugs used for Cushing’s syndrome and disease
Pasireotide, p. 878

---

**Prednisone**

### INDICATIONS AND DOSE

**Moderate to severe rheumatoid arthritis**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- **Adult:** 10–20 mg daily, adjusted according to response, dose to be take at bedtime

### INTERACTIONS
- Appendix 1: corticosteroids

### HEPATIC IMPAIRMENT
- Monitor patient closely in hepatic impairment.

### PATIENT AND CARER ADVICE
- Patient counselling is advised for prednisone tablets (steroid card).

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Modified-release tablet

**CAUTIONARY AND ADVISORY LABELS 10, 21, 25**

- **Lodotra** (Napp Pharmaceuticals Ltd)
  - Prednisone 1 mg Lodotra 1mg modified-release tablets: 30 tablet {pom} £26.70
  - Prednisone 2 mg Lodotra 2mg modified-release tablets: 30 tablet {pom} £26.70 | 100 tablet {pom} £89.00
  - Prednisone 5 mg Lodotra 5mg modified-release tablets: 30 tablet {pom} £26.70 | 100 tablet {pom} £89.00

---

**Triamcinolone acetonide**

### INDICATIONS AND DOSE

**Suppression of inflammatory and allergic disorders**

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 40 mg (max. per dose 100 mg), repeated if necessary, dose given for depot effect, to be administered into gluteal muscle; repeated at intervals according to patient’s response

### CAUTIONS
- High dosage (may cause proximal myopathy), avoid in chronic treatment

### INTERACTIONS
- Appendix 1: corticosteroids

### PATIENT AND CARER ADVICE
- Patient counselling is advised for triamcinolone acetonide injection (steroid card).

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Suspension for injection

**CAUTIONARY AND ADVISORY LABELS 10**

- **EXCipients:** May contain Benzyl alcohol
  - **Kenalog** (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Triamcinolone acetonide 40 mg per 1 ml Kenalog Intra-articular / Intramuscular 40mg/1ml suspension for injection vials: 5 vial {pom} £7.45 DT price = £7.45
increased appetite · insomnia · menstrual disorder · myalgia · nervousness · paraesthesia · peripheral oedema · photophobia · photosensitivity · raised intracranial pressure · reduced testosterone concentrations · tongue discoloration · xeroderma

SIDE-EFFECTS, FURTHER INFORMATION

- Hepatotoxicity Potentially life-threatening hepatotoxicity reported rarely.
- CONCEPTION AND CONTRACEPTION Effective contraception must be used in women of child-bearing potential.
- PREGNANCY Manufacturer advises avoid—teratogenic in animal studies.
- BREAST FEEDING Manufacturer advises avoid—present in breast milk.
- HEPATIC IMPAIRMENT Avoid in acute or chronic impairment. Do not initiate treatment if liver enzymes greater than 2 times the normal upper limit.
- MONITORING REQUIREMENTS
  - Monitor ECG before and one week after initiation, and then as clinically indicated thereafter.
  - Adrenal insufficiency Monitor adrenal function within one week of initiation, then regularly thereafter. When cortisol levels are normalised or close to target and effective dose established, monitor every 3–6 months as there is a risk of autoimmune disease development or exacerbation after normalisation of cortisol levels. If symptoms suggestive of adrenal insufficiency such as fatigue, anorexia, nausea, vomiting, hypotension, hyponatraemia, hyperkalaemia, and/or hypoglycaemia occur, measure cortisol levels and discontinue treatment temporarily (can be resumed thereafter at lower dose) or reduce dose and if necessary, initiate corticosteroid substitution.
- Hepatotoxicity Monitor liver function before initiation of treatment, then weekly for 1 month after initiation, then monthly for 6 months—more frequently if dose adjusted or abnormal liver function detected. Reduce dose if liver enzymes increase less than 3 times the normal upper limit—consult product literature; if liver enzymes are raised to 3 times or greater the normal upper limit, discontinue treatment permanently.
- PATIENT AND CARER ADVICE Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, jaundice, abdominal pain, or dark urine develop.
  - Patients or their carers should also be told how to recognise signs of adrenal insufficiency.

Driving and skilled tasks

Dizziness and somnolence may affect the performance of skilled tasks (e.g. driving).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 5, 21

- Ketoconazole (non-proprietary) ▼
  - Ketoconazole 200 mg Ketoconazole 200mg tablets | 60 tablet [Pom] £460.00

Metyrapone

- DRUG ACTION Metyrapone is a competitive inhibitor of 11β-hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of anterior pituitary function.

INDICATIONS AND DOSE

Differential diagnosis of ACTH-dependent Cushing’s syndrome (specialist supervision in hospital)

- BY MOUTH
  - Adult: 750 mg every 4 hours for 6 doses

Management of Cushing’s syndrome (specialist supervision in hospital)

- BY MOUTH
  - Adult: Usual dose 0.25–6 g daily, dose to be tailored to cortisol production, dose is either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed

Resistant oedema due to increased aldosterone secretion in cirrhosis, nephrotic syndrome, and congestive heart failure (with glucocorticoid replacement therapy) (specialist supervision in hospital)

- BY MOUTH
  - Adult: 3 g daily in divided doses

CONTRA-INDICATIONS Adrenocortical insufficiency

- CAUTIONS Avoid in acute porphyrias p. 969 · gross hypopituitarism (risk of precipitating acute adrenal failure) · hypertension on long-term administration · hypothyroidism (delayed response)

INTERACTIONS → Appendix 1: metyrapone

- SIDE-EFFECTS
  - Rare Abdominal pain · allergic skin reactions · hirsutism · hypoadrenalism
  - Frequency not known Dizziness · headache · hypotension · nausab · sedation · vomiting

- PREGNANCY Avoid (may impair biosynthesis of fetal-placental steroids).

- BREAST FEEDING Avoid—no information available.

- HEPATIC IMPAIRMENT Use with caution in hepatic impairment (delayed response).

PATIENT AND CARER ADVICE

Driving and skilled tasks

Drowsiness may affect the performance of skilled tasks (e.g. driving).

MEDITICL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 21

Diabetes mellitus and hypoglycaemia

3.1 Diabetes mellitus

Diabetes

05-Jun-2017

Description of condition

Diabetes mellitus is a group of metabolic disorders in which persistent hyperglycaemia is caused by deficient insulin secretion or by resistance to the action of insulin. This leads to the abnormalities of carbohydrate, fat and protein metabolism that are characteristic of diabetes mellitus.

Type 1 diabetes mellitus p. 644 and Type 2 diabetes mellitus p. 646 are the two most common classifications of diabetes. Other common types of diabetes are gestational diabetes (develops during pregnancy and resolves after delivery) and secondary diabetes (may be caused by pancreatic damage, hepatic cirrhosis, or endocrine disease). Treatment with endocrine, antiviral, or antipsychotic drugs may also cause secondary diabetes.

Driving

Drivers with diabetes may be required to notify the Driver and Vehicle Licensing Agency (DVLA) of their condition depending on their treatment, the type of licence they hold, and whether they have diabetic complications (including episodes of hypoglycaemia). All drivers who are treated with insulin must inform the DVLA, with some exceptions for temporary treatment. Detailed guidance on notification requirements, eligibility to drive, and precautions required, is available from the DVLA at www.gov.uk/guidance/diabetes-mellitus-assessing-fitness-to-drive

Advice from the DVLA

The DVLA recommends (2016) that drivers with diabetes need to be particularly careful to avoid hypoglycaemia and should be informed of the warning signs and actions to take. Drivers treated with insulin should always carry a glucose meter and blood glucose strips when driving, and check their blood-glucose concentration no more than 2 hours before driving and every 2 hours while driving. More frequent self-monitoring may be required if, for any reason, there is a greater risk of hypoglycaemia, such as after physical activity or altered meal routine.

Blood glucose should always be above 5 mmol/litre while driving. If blood glucose falls to 5 mmol/litre or below, a snack should be taken. Drivers treated with insulin should ensure that a supply of fast-acting carbohydrate is always available in the vehicle. If blood glucose is less than 4 mmol/Litre, or warning signs of hypoglycaemia develop, the driver should not drive. If already driving, the driver should:

- stop the vehicle in a safe place;
- switch off the engine, remove keys from the ignition, and move from the driver’s seat;
- eat or drink a suitable source of sugar;
- wait until 45 minutes after blood glucose has returned to normal, before continuing journey.

Drivers must not drive if hypoglycaemia awareness has been lost and the DVLA must be notified; driving may resume if a medical report confirms that awareness has been regained.

Depending on the type of licence, notification and monitoring may also be necessary for drivers taking oral antidiabetic drugs, particularly those which carry a risk of hypoglycaemia (e.g. sulfonylureas, nateglinide p. 660, repaglinide p. 660).

Note: additional criteria apply for drivers of large goods or passenger carrying vehicles—consult DVLA guidance.

Alcohol

Alcohol can make the signs of hypoglycaemia less clear, and can cause delayed hypoglycaemia; specialist sources recommend that patients with diabetes should drink alcohol only in moderation, and when accompanied by food.

Oral glucose tolerance tests

The oral glucose tolerance test is used mainly for diagnosis of impaired glucose tolerance; it is not recommended or necessary for routine diagnostic use when severe symptoms of hyperglycaemia are present. In patients who have less severe symptoms and a blood-glucose concentration that does not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose tolerance test may be required. It is also used to establish the presence of gestational diabetes.

An oral glucose tolerance test involves measuring the blood-glucose concentration after fasting, and then 2 hours after drinking a standard anhydrous glucose drink. Anhydrous glucose may alternatively be given as the appropriate amount of Polycal® or as Rapilose® OGTT oral solution.

HbA1c measurement

Glycated haemoglobin (HbA1c) forms when red blood cells are exposed to glucose in the plasma. The HbA1c test reflects average plasma glucose over the previous 2 to 3 months and provides a good indicator of glycaemic control. Unlike the oral glucose tolerance test, an HbA1c test can be performed at any time of the day and does not require any special preparation such as fasting.

HbA1c values are expressed in mmol of glycated haemoglobin per mol of haemoglobin (mmol/mol), a standardised unit specific for HbA1c created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA1c values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

Diagnosis

The HbA1c test is used for monitoring glycaemic control in both Type 1 diabetes p. 644 and Type 2 diabetes p. 646 and is now also used for diagnosis of type 2 diabetes. HbA1c should not be used for diagnosis in those with suspected type 1 diabetes, in children, during pregnancy, or in women who are up to two months postpartum. It should also not be used for patients who have:

- had symptoms of diabetes for less than 2 months;
- a high diabetes risk and are acutely ill;
- treatment with medication that may cause hyperglycaemia;
- Acute pancreatic damage;
- end-stage chronic kidney disease;
- HIV infection.

HbA1c used for diagnosis of diabetes should be interpreted with caution in patients with abnormal haemoglobin, anaemia, altered red cell lifespan, or who have had a recent blood transfusion.
Endocrine system

Diabetes mellitus and hypoglycaemia

Monitoring
HbA1c is also a reliable predictor of microvascular and macrovascular complications and mortality. Lower HbA1c is associated with a lower risk of long-term vascular complications and patients should be supported to aim for an individualised HbA1c target (see Type 1 diabetes p. 644 and Type 2 diabetes p. 646).

HbA1c should usually be measured in patients with type 1 diabetes every 3 to 6 months, and more frequently if blood glucose control is thought to be changing rapidly. Patients with type 2 diabetes should be monitored every 3 to 6 months until HbA1c and medication are stable when monitoring can be reduced to every 6 months.

HbA1c monitoring is invalid for patients with disturbed erythrocyte turnover or for patients with a lack of, or abnormal haemoglobin. In these cases, quality-controlled plasma glucose profiles, total glycated haemoglobin estimation (if there is abnormal haemoglobin), or fructosamine estimation can be used.

Laboratory measurement of fructosamine concentration measures the glycated fraction of all plasma proteins over the previous 14 to 21 days but is a less accurate measure of glycaemic control than HbA1c.

Type 1 diabetes

Description of condition
Type 1 diabetes describes an absolute insulin deficiency in which there is little or no endogenous insulin secretory capacity due to destruction of insulin-producing beta-cells in the pancreatic islets of Langerhans. This form of the disease has an auto-immune basis in most cases, and it can occur at any age, but most commonly before adulthood.

Loss of insulin secretion results in hyperglycaemia and other metabolic abnormalities. If poorly managed, the resulting tissue damage has both short-term and long-term adverse effects on health; this can result in retinopathy, nephropathy, neuropathy, premature cardiovascular disease, and peripheral arterial disease.

Typical features in adult patients presenting with type 1 diabetes are hyperglycaemia (random plasma-glucose concentration above 11 mmol/litre), ketosis, rapid weight loss, a body mass index below 25 kg/m², age younger than 50 years, and a personal/family history of autoimmune disease (though not all features may be present).

Aims of treatment
Treatment is aimed at using insulin regimens to achieve as optimal a level of blood-glucose control as is feasible, while avoiding or reducing the frequency of hypoglycaemic episodes, in order to minimise the risk of long-term microvascular and macrovascular complications.

Disability from complications can often be prevented by early detection and active management of the disease (see Diabetic complications p. 648). The target for glycaemic control should be individualised for each patient, considering factors such as daily activities, aspirations, likelihood of complications, adherence to treatment, comorbidities, occupation and history of hypoglycaemia.

A target HbA1c concentration of 48 mmol/mol (6.5 %) or lower is recommended in patients with type 1 diabetes.

Blood-glucose concentration should be monitored at least four times a day, including before each meal and before bed. Patients should aim for:

- a fasting blood-glucose concentration of 5–7 mmol/litre on waking;
- a blood-glucose concentration of 4–7 mmol/litre before meals at other times of the day;
- a blood-glucose concentration of 5–9 mmol/litre at least 90 minutes after eating;
- a blood-glucose concentration of at least 5 mmol/litre when driving.

Overview
Type 1 diabetes requires insulin replacement, supported by active management of other cardiovascular risk factors, such as hypertension and high circulating lipids (see Diabetic complications p. 648). Insulin replacement therapy aims to recreate normal fluctuations in circulating insulin concentrations while supporting a flexible lifestyle with minimal restrictions. Flexible insulin therapy usually involves self-injecting multiple daily doses of insulin, with doses adjusted according to planned exercise, intended food intake and other factors, including current blood-glucose, which the patient needs to test on a regular basis.

Patients who have a BMI of 25 kg/m² or above (23 kg/m² or above for patients of South Asian or related ethnicity) who wish to improve their blood-glucose control while minimising their effective insulin dose, may benefit from metformin hydrochloride p. 652 [unlicensed indication] as an addition to insulin therapy.

Dietary control is important in both type 1 and type 2 diabetes and patients should receive advice from a dietitian. Dietary advice should include information on weight control, cardiovascular risk, hyperglycaemic effects of different foods and appropriate changes in insulin doses according to food intake. Healthy eating can reduce cardiovascular risk and dietary modifications may be recommended to account for various associated features of diabetes such as excess weight and obesity, low body-weight, eating disorders, hypertension and renal failure. Patients with type 1 diabetes should be offered carbohydrate-counting training as part of a structured education programme.

Management of type 1 diabetes with insulin
All patients with type 1 diabetes require insulin therapy (see also Insulin p. 645). Treatment should be initiated and managed by clinicians with relevant expertise; there are several different types of regimens.

Multiple daily injection basal-bolus insulin regimens
One or more separate daily injections of intermediate-acting insulin or long-acting insulin analogue as the basal insulin; alongside multiple bolus injections of short-acting insulin before meals. This regimen offers flexibility to tailor insulin therapy with the carbohydrate load of each meal.

Mixed (biphasic) regimen
One, two, or three insulin injections per day of short-acting insulin mixed with intermediate-acting insulin. The insulin preparations may be mixed by the patient at the time of injection, or a premixed product can be used.

Continuous subcutaneous insulin infusion (insulin pump)
A regular or continuous amount of insulin (usually in the form of a rapid-acting insulin analogue or soluble insulin), delivered by a programmable pump and insulin storage reservoir via a subcutaneous needle or cannula.

Recommended insulin regimens
Patients with type 1 diabetes should be offered multiple daily injection basal-bolus insulin regimens as the first-line choice. Twice-daily insulin detemir p. 671 should be offered as the long-acting basal insulin therapy. Once-daily insulin glargine p. 672 may be prescribed if insulin detemir is not tolerated, or if a twice-daily regimen is not acceptable to the patient. Insulin detemir may also be offered as an alternative once-daily regimen.

Patients who are using alternative basal regimens may continue if agreed targets are being achieved; other basal insulin regimens should be considered only if the recommended regimens do not deliver agreed targets. Non-basal-bolus insulin regimens (e.g. twice-daily mixed [biphasic], basal-only, or bolus-only regimens) are not
recommended for adults with newly diagnosed type 1 diabetes.

A rapid-acting insulin analogue is recommended as the bolus or mealtime insulin replacement, rather than soluble human insulin or animal insulin (rarely used). The rapid-acting insulin analogue should be injected before meals—routine use after meals should be discouraged. Patients who have a strong preference for an alternative mealtime insulin should be offered their preferred insulin.

Alternatively, if a multiple daily injection basal–bolus regimen is not possible, a twice-daily mixed insulin regimen should be considered if it is preferred.

In patients who are using a twice-daily human insulin mixed regimen and have hypoglycaemia that affects their quality of life, a trial of a twice-daily analogue mixed insulin regimen should be considered.

Continuous subcutaneous insulin infusion (insulin pump) therapy, should only be offered to adults who suffer disabling hypoglycaemia, or, who have high HbA1c concentrations (69 mmol/mol [8.5%] or above) with multiple daily injection therapy (including, if appropriate, the use of long-acting insulin analogues) despite a high level of care. Insulin pump therapy should be initiated by a specialist team.

Insulin requirements

The dosage of insulin must be determined individually for each patient and should be adjusted as necessary according to the results of regular monitoring of blood-glucose concentrations.

Persistent poor glucose control, leading to erratic insulin requirements or episodes of hypoglycaemia, may be due to many factors, including adherence, injection technique, injection site problems, blood-glucose monitoring skills, lifestyle issues (including diet, exercise and alcohol intake), psychological issues, and organic causes such as renal disease, thyroid disorders, coeliac disease, Addison’s disease or gastroparesis.

Infection, stress, accidental or surgical trauma can all increase the required insulin dose. Insulin requirements may be decreased (and therefore susceptibility to hypoglycaemia increased) by physical activity, intercurrent illness, reduced food intake, impaired renal function, and in certain endocrine disorders.

Risks of hypoglycaemia with insulin

Hypoglycaemia is an inevitable adverse effect of insulin treatment, and patients should be advised of the warning signs and actions to take (for guidance on management, see Hypoglycaemia p. 680).

Impaired awareness of hypoglycaemia can occur when the ability to recognise usual symptoms is lost, or when the symptoms are blunted or no longer present. Patients’ awareness of hypoglycaemia should be assessed annually using the Gold score or the Clarke score.

An increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the patient. Impaired awareness of symptoms below 3 mmol/litre is associated with a significantly increased risk of severe hypoglycaemia. Beta-blockers can also blunt hypoglycaemic awareness, by reducing warning signs such as tremor.

Loss of warning of hypoglycaemia among insulin-treated patients can be a serious hazard, especially for drivers and those in dangerous occupations. Advice should be given in line with the Driver and Vehicle Licensing Agency (DVLA) guidance (see Driving under Diabetes p. 643).

To restore the warning signs, episodes of hypoglycaemia must be minimised. Insulin regimens, doses and blood-glucose targets should be reviewed and continuous subcutaneous insulin infusion therapy and real-time continuous blood-glucose monitoring should be considered. Patients should receive structured education to ensure they are following the principles of a flexible insulin regimen correctly, with additional education regarding avoiding and treating hypoglycaemia for those who continue to have impaired awareness. Relaxation of individualised blood-glucose targets should be avoided as a strategy to improve impaired awareness of symptoms. If recurrent severe episodes of hypoglycaemia continue despite appropriate interventions, the patient should be referred to a specialist centre.

There is conflicting evidence regarding reports that some patients may experience loss of awareness of hypoglycaemia after transfer from animal to human insulin; clinical studies do not confirm that human insulin decreases hypoglycaemia awareness.

Manufacturers advise any switch between brands or formulation of insulin (including switching from animal to human insulin) should be done under strict supervision; a change in dose may be required.

Hypodermic equipment

Patients should be advised on the safe disposal of lancets, single-use syringes, and needles, and should be provided with suitable disposal containers. Arrangements should be made for the suitable disposal of these containers.

Lancets, needles, syringes, and accessories are listed under Hypodermic Equipment in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 of the Scottish Drug Tariff). The drug Tariffs can be access online at:

- Health and Personal Social Services for Northern Ireland Drug Tariff: www.hsbcusiness.hscni.net/services/2034.htm
- Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff

Useful Resources

Type 1 diabetes in adults: diagnosis and management.

Insulin

Overview

For recommended insulin regimens see Type 1 diabetes p. 644 and Type 2 diabetes p. 646.

Insulin is a polypeptide hormone secreted by pancreatic beta-cells. Insulin increases glucose uptake by adipose tissue and muscles, and suppresses hepatic glucose release. The role of insulin is to lower blood-glucose concentrations in order to prevent hyperglycaemia and its associated microvascular, macrovascular and metabolic complications.

The natural profile of insulin secretion in the body consists of basal insulin (a low and steady secretion of background insulin that controls the glucose continuously released from the liver) and meal-time bolus insulin (secreted in response to glucose absorbed from food and drink).

Sources of insulin

Three types of insulin are available in the UK: human insulin, human insulin analogues, and animal insulin. Animal insulins are extracted and purified from animal sources (bovine or porcine insulin). Although widely used in the past, animal insulins are no longer initiated in people with diabetes but may still be used by some adult patients who cannot, or do not wish to, change to human insulins.

Human insulins are produced by recombinant DNA technology and have the same amino acid sequence as...
endogenous human insulin. Human insulin analogues are produced in the same way as human insulins, but the insulin is modified to produce a desired kinetic characteristic, such as an extended duration of action or faster absorption and onset of action.

Immunological resistance to insulin is uncommon and true insulin allergy is rare. Human insulin and insulin analogues are less immunogenic than animal insulins.

Administration of insulin

Insulin is inactivated by gastro-intestinal enzymes and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin should be injected into a body area with plenty of subcutaneous fat—usually the abdomen (fastest absorption rate) or outer thighs/buttocks (slower absorption compared with the abdomen or inner thighs).

Absorption from a limb site can vary considerably (by as much as 20–40%) day-to-day, particularly in children. Local tissue reactions, changes in insulin sensitivity, injection site, blood flow, depth of injection, and the amount of insulin injected can all affect the rate of absorption. Increased blood flow around the injection site due to exercise can also increase insulin absorption. Lipohypertrophy can occur due to repeatedly injecting into the same small area, and can cause erratic absorption of insulin, and contribute to poor glycaemic control. Patients should be advised not to use affected areas for further injection until the skin has recovered. Lipohypertrophy can be minimised by using different injection sites in rotation. Injection sites should be checked for signs of infection, swelling, bruising, and lipohypertrophy before administration.

Insulin preparations

Insulin preparations can be broadly categorised into three groups based on their time-action profiles: short-acting insulins (including soluble insulin and rapid-acting insulins), intermediate-acting insulins and long-acting insulins. The duration of action of each particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Short-acting insulins

Short-acting insulins have a short duration and a relatively rapid onset of action, to replicate the insulin normally produced by the body in response to glucose absorbed from a meal. These are available as soluble insulin (human and, bovine or porcine—both rarely used), and the rapid-acting insulin analogues (insulin aspart p. 673, insulin glulisine p. 674 and insulin lispro p. 675).

Soluble insulin

Soluble insulin is usually given subcutaneously but some preparations can be given intravenously and intramuscularly. For maintenance regimes, it is usual to inject the insulin 15 to 30 minutes before meals, depending on the insulin preparation used.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 1 and 4 hours, and a duration of action of up to 9 hours.

When injected intravenously, soluble insulin has a short half-life of only a few minutes and its onset of action is instantaneous.

Soluble insulin administered intravenously is the most appropriate form of insulin for use in diabetic emergencies e.g. Diabetic ketoacidosis p. 651 and peri-operatively.

Rapid-acting insulin

Insulin aspart, insulin glulisine, and insulin lispro have a faster onset of action (within 15 minutes) and shorter duration of action (approximately 2–5 hours) than soluble insulin, and are usually given by subcutaneous injection. For maintenance regimes, these insulins should ideally be injected immediately before meals. Rapid-acting insulin, administered before meals, has an advantage over short-acting soluble insulin in terms of improved glucose control, reduction of HbA1c, and reduction in the incidence of severe hypoglycaemia, including nocturnal hypoglycaemia.

The routine use of post-meal injections of rapid-acting insulin should be avoided—when given during or after meals, they are associated with poorer glucose control, an increased risk of high postprandial-glucose concentration, and subsequent hypoglycaemia.

Intermediate-acting insulin

Intermediate-acting insulins (isophane insulin p. 670) have an intermediate duration of action, designed to mimic the effect of endogenous basal insulin. When given by subcutaneous injection, they have an onset of action of approximately 1–2 hours, a maximal effect at 3–12 hours, and a duration of action of 11–24 hours.

Insuline glargine and insulin glargine are given once daily and insulin detemir is given once or twice daily according to individual requirements. The older long-acting insulins, insulin glargine and insulin detemir are now rarely prescribed.

Type 2 diabetes

Description of condition

Type 2 diabetes is a chronic metabolic condition characterised by insulin resistance. Insufficient pancreatic insulin production also occurs progressively over time, resulting in hyperglycaemia.

It is commonly associated with obesity, physical inactivity, raised blood pressure, dyslipidaemia and a tendency to develop thrombosis; therefore it increases cardiovascular risk. It is associated with long-term microvascular and macrovascular complications, together with reduced quality of life and life expectancy.

Type 2 diabetes typically develops later in life but is increasingly diagnosed in children, despite previously being considered a disease of adulthood.

Aims of treatment

Treatment is aimed at minimising the risk of long-term microvascular and macrovascular complications by effective treatment.
Overview

Weight loss, smoking cessation and regular exercise can help to reduce hyperglycaemia and reduce cardiovascular risk, and should be encouraged (with input from a dietitian where appropriate). Antidiabetic drugs should be prescribed to augment lifestyle interventions, when these changes are not adequate to control blood-glucose alone.

Antidiabetic drugs

There are several classes of non-insulin antidiabetic drugs available for the treatment of type 2 diabetes. The choice of drug should be based on effectiveness, safety, tolerability and should also take into consideration the patient’s comorbidities and concomitant medication. For recommended treatment regimens and the place in therapy of each drug, see Drug treatment, antidiabetic drugs (below).

Metformin hydrochloride p. 652 has an anti-hyperglycaemic effect, lowering both basal and postprandial blood-glucose concentrations. It does not stimulate insulin secretion and therefore, when given alone, does not cause hypoglycaemia. The dose of standard-release metformin hydrochloride should be increased gradually to minimise the risk of gastro-intestinal side effects. Modified-release metformin hydrochloride should be offered if standard treatment is not tolerated.

The sulfonylureas (glibenclamide p. 665, gliclazide p. 666, glimepiride p. 666, glipizide p. 667, tolbutamide p. 667) may cause hypoglycaemia; it is more likely with long-acting sulfonylureas such as glibenclamide, which have been associated with severe, prolonged and sometimes fatal cases of hypoglycaemia. Sulfonylureas are also associated with modest weight gain, probably due to increased plasma-insulin concentrations.

Acarbose p. 651 has a poorer anti-hyperglycaemic effect than many other antidiabetic drugs, including the sulfonylureas, metformin hydrochloride, and pioglitazone p. 667.

The meglitinides, nateglinide p. 660 and repaglinide p. 660, have a rapid onset of action and short duration of activity. These drugs can be used flexibly around mealtimes and adjusted to fit around individual eating habits which may be beneficial for some patients, but generally are a less preferred option than the sulfonylureas.

The thiazolidinedione, pioglitazone, is associated with several long-term risks and its ongoing benefit to the patient should be reviewed regularly and treatment stopped if response is insufficient (see Important safety information under pioglitazone).

The dipeptidylpeptidase-4 inhibitors (glitins), alogliptin p. 653, linagliptin p. 654, sitagliptin p. 655, saxagliptin p. 654, and vildagliptin p. 656, do not appear to be associated with weight gain and have less incidence of hypoglycaemia than the sulfonylureas.

The sodium glucose co-transporter 2 inhibitors, canagliflozin p. 661, dapagliflozin p. 662, and empagliflozin p. 664, may be suitable for some patients when first-line options are not appropriate; they are associated with a risk of diabetic ketoacidosis.

The glucagon-like peptide-1 receptor agonists, albiglutide p. 657, dulaglutide p. 657, exenatide p. 658, liraglutide p. 659 and lixisenatide p. 659, should be reserved for combination therapy when other treatment options have failed.

Polycystic ovary syndrome

Metformin hydrochloride (initiated by a specialist) is prescribed as an insulin sensitising drug in women with polycystic ovary syndrome who are not planning pregnancy [unlicensed indication]. Long-term benefit or superiority over other treatment options has not been confirmed by good quality evidence. Metformin hydrochloride may improve short-term insulin sensitivity and reduce androgen concentrations, but there is insufficient supporting evidence that metformin improves weight gain, hirsutism, acne or regulation of the menstrual cycle. Treatment should only be initiated by a specialist. Metformin hydrochloride does not exert a hypoglycaemic action in non-diabetic patients except in overdose.

Drug treatment, antidiabetic drugs

Type 2 diabetes should initially be treated with a single oral antidiabetic drug. A target HbA1c concentration of 48 mmol/mol (6.5 %) is generally recommended when type 2 diabetes is managed by diet and lifestyle alone or when combined with a single antidiabetic drug not associated with hypoglycaemia (such as metformin hydrochloride). Adults prescribed a single drug associated with hypoglycaemia (such as a sulphonylurea), or two or more antidiabetic drugs in combination, should usually aim for an HbA1c concentration of 53 mmol/mol (7.0 %). Targets may differ and should be individualised and agreed with each patient.

Note: Consider relaxing the target HbA1c level on a case-by-case basis, with particular consideration for people who are older, frail, or where tight blood-glucose control is not appropriate or poses a high risk of the consequences of hypoglycaemia.

If HbA1c concentrations are poorly controlled despite treatment with a single drug (usually considered to be a rise of HbA1c to 58 mmol/mol (7.5 %) or higher), the drug treatment should be intensified, alongside reinforcement of advice regarding diet, lifestyle, and adherence to drug treatment.

When two or more antidiabetic drugs are prescribed, an HbA1c concentration target of 53 mmol/mol (7.0 %) is recommended for patients in which it is appropriate, but a relaxation of the target may be more appropriate in some individual cases (for example, those at high risk of the consequences of hypoglycaemia, poor life expectancy, or significant comorbidities).

Initial treatment

Metformin hydrochloride is recommended as the first choice for initial treatment for all patients, due to its positive effect on weight loss, reduced risk of hypoglycaemic events and the additional long-term cardiovascular benefits associated with its use.

If metformin is contra-indicated or not tolerated, see Alternative non-metformin regimens below.

First intensification of treatment

If metformin hydrochloride (alongside modification to diet) does not control HbA1c to below the agreed threshold, treatment should be intensified, and metformin hydrochloride combined with one of the following:

- a sulfonylurea (glibenclamide, gliclazide, glimepiride, glipizide, tolbutamide);
- pioglitazone;
- a dipeptidylpeptidase-4 inhibitor (linagliptin, saxagliptin, sitagliptin, or vildagliptin);
- a sodium glucose co-transporter 2 inhibitor (canagliflozin, dapagliflozin or empagliflozin) only when sulfonylureas are contra-indicated or not tolerated, or if the patient is at significant risk of hypoglycaemia or its consequences.

Elderly patients or those with renal impairment are at particular risk of hypoglycaemia; if a sulfonylurea is indicated, a shorter-acting sulfonylurea, such as gliclazide or tolbutamide should be prescribed.

The place in therapy of alogliptin (a dipeptidylpeptidase-4 inhibitor) is not yet known.
Second intensification of treatment

If dual therapy is unsuccessful, treatment should be intensified again, and one of the following triple therapy regimens prescribed:

- metformin hydrochloride p. 652 and a dipeptidylpeptidase-4 inhibitor and a sulfonylurea;
- metformin hydrochloride and pioglitazone p. 667 and a sulfonylurea;
- metformin hydrochloride and a sulfonylurea and one of the sodium glucose co-transporter 2 inhibitors;
- metformin hydrochloride and pioglitazone and a sodium glucose co-transporter 2 inhibitor (canagliflozin p. 661 or empagliflozin p. 664; note that dapagliflozin is not recommended in a triple therapy regimen with pioglitazone).

Alternatively, it may be appropriate to start insulin-based treatment at this stage—see Drug treatment, insulin.

Glucagon-like peptide-1 receptor agonists

If triple therapy with metformin hydrochloride and two other oral drugs is tried and is not effective, not tolerated or contra-indicated, a glucagon-like peptide-1 receptor agonist (exenatide p. 658, liraglutide p. 659 or lixisenatide p. 659) may be prescribed as part of a triple combination regimen with metformin hydrochloride and a sulfonylurea. These should only be prescribed for patients who have a BMI of 35 kg/m² or above (adjusted for ethnicity) and who also have specific psychological or medical problems associated with obesity; or for those who have a BMI lower than 35 kg/m² but for whom insulin therapy would have significant occupational implications or if the weight loss associated with glucagon-like peptide-1 receptor agonists would benefit other significant obesity-related comorbidities.

After 6 months, the drug should be reviewed and only continued if there has been a beneficial metabolic response (a reduction of at least 11 mmol/mol [1.0%] in HbA1c and a weight loss of at least 3% of initial body-weight).

The place in therapy of the newer glucagon-like peptide-1 receptor agonists, albiglutide p. 657 and dulaglutide p. 657, is not yet known.

Insulin should only be prescribed in combination with a glucagon-like peptide-1 receptor agonist under specialist care advice and with ongoing support from a consultant-led multidisciplinary team.

Alternative non-metformin regimens

If metformin is contra-indicated or not tolerated, initial treatment should be single therapy with:

- a dipeptidylpeptidase-4 inhibitor (linagliptin p. 654, saxagliptin p. 654, sitagliptin p. 655, or vildagliptin p. 656), or
- pioglitazone, or

The sodium glucose co-transporter 2 inhibitors canagliflozin, dapagliflozin p. 662, or empagliflozin are also options for monotherapy when metformin is contra-indicated or not tolerated, only if a dipeptidylpeptidase-4 inhibitor would otherwise be prescribed and neither a sulfonylurea nor pioglitazone is appropriate.

Repaglinide p. 660 is also an effective alternative option for single therapy, but it has a limited role in treatment because, should an intensification of treatment be required, it is not licensed to be used in any combination other than with metformin hydrochloride; it would therefore require a complete change of treatment in those patients who have started it due to intolerance or contra-indication to metformin.

Intensification

If the initial single drug does not control HbA1c to below the agreed threshold, treatment should be intensified and one of the following dual combinations prescribed:

- a dipeptidylpeptidase-4 inhibitor and pioglitazone;
- a dipeptidylpeptidase-4 inhibitor and a sulfonylurea; or
- pioglitazone and a sulfonylurea.

If dual therapy does not provide adequate glucose control, insulin-based treatment should be considered—see Drug treatment, insulin.

Drug treatment, insulin

When indicated for intensification, insulin (see also, Insulin p. 645) should be started with a structured support programme covering insulin dose titration, injection technique, self-monitoring, and knowledge of dietary effects and glucose control. Metformin hydrochloride should be continued unless it is contra-indicated or not tolerated. Other antidiabetic drugs should be reviewed and stopped if necessary.

Recommended insulin regimens include:

- human isophane insulin p. 670 injected once or twice daily, according to requirements;
- a human isophane insulin in combination with a short-acting insulin, administered either separately or as a pre-mixed (biphasic) human insulin preparation (this may be particularly appropriate if HbA1c is 75 mmol/mol (9.0%) or higher);
- Insulin detemir p. 671 or insulin glargine p. 672 as an alternative to human isophane insulin. This can be preferable if a once daily injection would be beneficial (for example if assistance is required to inject insulin), or if recurrent symptomatic hypoglycaemic episodes are problematic, or if the patient would otherwise need twice-daily human isophane insulin injections in combination with oral glucose-lowering drugs. Also consider switching to insulin detemir or insulin glargine from human isophane insulin if significant hypoglycaemia is problematic, or in patients who cannot use the device needed to inject human isophane insulin;
- biphasic preparations (pre-mixed) that include a short-acting human analogue insulin (rather than short-acting human soluble insulin) can be preferable for patients who prefer injecting insulin immediately before a meal, or if hypoglycaemia is a problem, or if blood-glucose concentrations rise markedly after meals.

Patients who are prescribed a basal insulin regimen (human isophane insulin, insulin detemir or insulin glargine) should be monitored for the need for short-acting insulin before meals (or a biphasic insulin preparation).

Patients who are prescribed a biphasic insulin should be monitored for the need for a further injection of short-acting insulin before meals or for a change to a basal-bolus regimen with human isophane insulin or insulin detemir or insulin glargine if blood-glucose control remains inadequate.

Useful Resources

Diabetic complications

Cardiovascular disease

Diabetes is a strong risk factor for cardiovascular disease. Other risk factors for cardiovascular disease such as smoking, hypertension, obesity, and hyperlipidaemia should be addressed. Cardiovascular risk in patients with diabetes
can be further reduced by the use of an ACE inhibitor, low-dose aspirin p. 117 and a lipid-regulating drug.

**Diabetic nephropathy**

Regular review of diabetic patients should include an annual test for urinary protein (using Albustix®) and serum creatinine measurement. If the urinary protein test is negative, the urine should be tested for microalbuminuria (the earliest sign of nephropathy). If reagent strip tests (Micral-Test II® or Microbumintest®) are used and prove positive, the result should be confirmed by laboratory analysis of a urine sample. Provided there are no contraindications, all diabetic patients with nephropathy causing proteinuria or with established microalbuminuria (at least 3 positive tests) should be treated with an ACE inhibitor or an angiotensin-II receptor antagonist even if the blood pressure is normal; in any case, to minimise the risk of renal deterioration, blood pressure should be carefully controlled. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor together with an angiotensin-II receptor antagonist. ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in patients with renal impairment.

See also treatment of hypertension in diabetes.

**Diabetic neuropathy**

Optimal diabetic control is beneficial for the management of painful neuropathy in patients with type 1 diabetes. Paracetamol p. 422 or a non-steroidal anti-inflammatory drug such as ibuprofen p. 1041 may relieve mild to moderate pain.

Duloxetine p. 350 is effective for the treatment of painful diabetic neuropathy; amitriptyline hydrochloride p. 355 [unlicensed use] can be used if duloxetine is ineffective or unsuitable. Nortriptyline p. 361 [unlicensed use] may be better tolerated than amitriptyline hydrochloride. If treatment with amitriptyline hydrochloride or duloxetine is inadequate, treatment with pregabalin p. 310 should be tried. Combination therapy of duloxetine or amitriptyline hydrochloride with pregabalin can be used if monotherapy at the maximum tolerated dose does not control symptoms.

Neuropathic pain may respond to opioid analgesics. There is evidence of efficacy for tramadol hydrochloride p. 447, morphine p. 439, and oxycodone hydrochloride p. 442; however treatment with morphine or oxycodone hydrochloride should be initiated only under specialist supervision. Tramadol hydrochloride can be prescribed while the patient is waiting for assessment by a specialist if other treatments have been unsuccessful.

Gabapentin p. 301 and carbamazepine p. 297 are sometimes used for the treatment of neuropathic pain. Capsaicin cream 0.075% p. 458 is licensed for painful diabetic neuropathy and may have some effect, but it produces an intense burning sensation during the initial treatment period.

In autonomic neuropathy diabetic diarrhoea can often be managed by tetracycline [unlicensed use], otherwise codeine phosphate p. 431 is the best drug, but other antidiarrhoeal preparations can be tried. Erythromycin p. 510 (especially when given intravenously) may be beneficial for gastroparesis [unlicensed use] but this needs confirmation.

In neuropathic postural hypotension increased salt intake and the use of the mineralcorticoid fludrocortisone acetate p. 637 [unlicensed use] may help by increasing plasma volume, but uncomfortable oedema is a common side-effect. Fludrocortisone can also be combined with flurbiprofen p. 1040 and ephedrine hydrochloride p. 261 [both unlicensed]. Midodrine [unlicensed], an alpha agonist, may also be useful in postural hypotension.

Gustatory sweating can be treated with an antimuscarinic such as propantheline bromide p. 84; side-effects are common. See also, the management of hyperhidrosis (Hyperhidrosis p. 1159).

In some patients with neuropathic oedema, ephedrine hydrochloride [unlicensed use] offers effective relief.

See also the management of Erectile dysfunction p. 765.

**Diabetes, pregnancy and breast-feeding**

**Pregnancy and breast-feeding**

During pregnancy, women with pre-existing diabetes can be treated with metformin hydrochloride p. 652 [unlicensed use], either alone or in combination with insulin. Metformin hydrochloride can be continued, or glibenclamide p. 665 resumed, during breast-feeding for those with pre-existing diabetes. Women with gestational diabetes may be treated, with or without concomitant insulin, with glibenclamide from 11 weeks gestation (after organogenesis) [unlicensed use] or with metformin [unlicensed use]. Women with gestational diabetes should discontinue hypoglycaemic treatment after giving birth.

**Diabetes, surgery and medical illness**

Peri-operative management of blood-glucose concentrations depends on factors including the required duration of fasting, timing of surgery (morning or afternoon), usual treatment regimen (insulin, antidiabetic drugs or diet), prior glycaemic control, other co-morbidities, and the likelihood that the patient will be capable of self-managing their diabetes in the immediate post-operative period. All patients should have emergency treatment for hypoglycaemia written on their drug chart on admission.

**Use of insulin during surgery**

**Elective surgery—minor procedures in patients with good glycaemic control**

Patients usually treated with insulin who have good glycaemic control (HbA1c less than 69 mmol/mol or 8.5 %) and are undergoing minor procedures, can be managed during the operative period by adjustment of their usual insulin regimen, which should be adjusted depending on the type of insulin usually prescribed, following detailed local protocols (which should also include intravenous fluid management, monitoring and control of electrolytes and avoidance of hyperchloreaemic metabolic acidosis). On the day before the surgery, the patient’s usual insulin should be given as normal, other than once daily long-acting insulin analogues, which should be given at a dose reduced by 20%.

**Elective surgery—major procedures or poor glycaemic control**

Patients usually treated with insulin, who are either undergoing major procedures (surgery requiring a long fasting period of more than one missed meal) or whose diabetes is poorly controlled, will usually require a variable insulin infusion, with or without concomitant insulin, with glibenclamide from 11 weeks gestation (after organogenesis) [unlicensed use] or with metformin [unlicensed use]. Women with gestational diabetes should discontinue hypoglycaemic treatment after giving birth.
insulin at a variable rate. Detailed local protocols should be consulted. In general, the following steps should be followed:

- on the day before surgery, once daily long-acting insulin analogues should be given at 80 % of the usual dose; otherwise the patient’s usual insulin should be given as normal;
- on the day of surgery and throughout the intra-operative period, once daily long-acting insulin analogues should be continued at 80 % of the usual dose; all other insulin should be stopped until the patient is eating and drinking again after surgery;
- on the day of surgery, start an intravenous substrate infusion of potassium chloride with glucose and sodium chloride p. 952 (based on serum electrolytes which must be measured frequently), and infuse at a rate appropriate to the patient’s fluid requirements. To prevent hypoglycaemia, this infusion must not be stopped while the insulin infusion is running;
- a variable rate intravenous insulin infusion of soluble human insulin p. 673 in sodium chloride 0.9 % p. 953 (made either according to locally agreed protocols or using prefilled syringes) should be given via a syringe pump at an initial infusion rate determined by bedside capillary blood glucose measurement. Hourly blood glucose measurement should be taken to ensure that the intravenous insulin infusion rate is correct for at least the first 12 hours; the insulin infusion rate should be adjusted according to local protocol to maintain blood glucose concentrations within the usual target range (6–10 mmol/litre; up to 12 mmol/litre is acceptable);
- intravenous glucose 20 % p. 955 should be given if blood glucose drops below 6 mmol/litre, and blood glucose checked every hour, to prevent a drop below 4 mmol/litre. If blood glucose drops below 4 mmol/litre, intravenous glucose 20 % should be adjusted and blood glucose checked every 15 minutes, until blood glucose is above 6 mmol/litre (testing can then revert to hourly). If blood glucose rises above 12 mmol/litre, check ketones and consider other signs of diabetic ketoacidosis (see Diabetic ketoacidosis p. 651).

Conversion back to a subcutaneous insulin should not begin until the patient can eat and drink without nausea or vomiting. Once the patient’s previous insulin regimen is re-started, the usual insulin dose may require adjustment, as insulin requirements can change due to post-operative stress, infection or altered food intake.

Previous subcutaneous basal-bolus regimens, should be restarted when the first postoperative meal-time insulin dose is due (e.g. with breakfast or lunch); doses may need adjustment due to postoperative stress, infection or altered food intake. The variable rate intravenous insulin infusion and intravenous fluids should be continued until 30–60 minutes after the first meal-time short-acting insulin dose. If the patient was previously on a long-acting insulin analogue, this should have been continued throughout the operative period at 80 % of the normal dose, and should now just continue at that same dose until the patient leaves hospital—only the short-acting insulin needs to be restarted as above.

Previous subcutaneous twice-daily mixed insulin regimens, should be restarted before breakfast or an evening meal (not at any other time). The variable rate intravenous insulin infusion should be maintained for 30–60 minutes after the first subcutaneous insulin dose has been given.

Patients who were previously managed with a continuous subcutaneous insulin infusion should be referred to a specialist team. The subcutaneous infusion should be restarted at the normal basal rate, not at bedtime, and the insulin infusion continued until the next meal bolus has been given.

Patients not previously prescribed insulin, who are to start a subcutaneous insulin regimen post-surgery, should have an insulin dose calculated with advice from a specialist diabetes team, considering the patient’s sensitivity to insulin, degree of glycaemic control, weight, age, and the average hourly insulin dose used in the peri-operative period.

Emergency surgery

Patients with diabetes (type 1 and 2) requiring emergency surgery, should always have their blood glucose, blood or urinary ketone concentration, serum electrolytes and serum bicarbonate checked before surgery. If ketones are high or bicarbonate is low, blood gases should also be checked. If ketoacidosis is present, recommendations for Diabetic ketoacidosis p. 651 should be followed immediately, and surgery delayed if possible. If there is no acidosis, intravenous fluids and an insulin infusion should be started and managed as for major elective surgery (above).

Use of antidiabetic drugs during surgery

Manipulation of antidiabetic drug may not be appropriate for all surgery or for all patients; particularly when fasting time is more than one missed meal, in patients with poor glycaemic control, and when there is risk of renal injury. In these cases, a variable rate intravenous insulin p. 673 infusion should be used as for major elective surgery (above), and usual antidiabetic medication adjusted in the peri-operative period. Insulin is almost always required in medical and surgical emergencies.

When insulin is required and given during surgery, acarbose p. 651, miglitolines, sulfonylureas, pioglitazone p. 667, dipeptidyl peptidase-4 inhibitors (gliptins) and sodium glucose co-transporter 2 inhibitors should be stopped once the insulin infusion is commenced and not restarted until the patient is eating and drinking normally. Glucagon-like peptide-1 receptor agonists can be continued as normal during the insulin infusion.

If elective minor surgical procedures only require a short-fasting period (just one missed meal), it may be possible to adjust antidiabetic drugs to avoid a switch to a variable rate intravenous insulin infusion; normal drug treatment can continue.

In suitable cases, acarbose, nateglinide p. 660 and repaglinide p. 660 can be continued with just the dose omitted on the morning of surgery if fasting (the morning dose may be given if the patient is not fasting and surgery is in the afternoon).

Pioglitazone, dipeptidylpeptidase-4 inhibitors (gliptins) and glucagon-like peptide-1 receptor agonists can be taken as normal during the whole peri-operative period.

Sodium glucose co-transporter 2 inhibitors should be omitted on the day of surgery and not restarted until the patient is stable; their use during periods of dehydration and acute illness is associated with an increased risk of developing diabetic ketoacidosis.

Sulfonylureas are associated with hypoglycaemia in the fasted state and therefore should always be omitted on the day of surgery until the patient is eating and drinking again. Capillary blood glucose should be checked hourly. If hyperglycaemia occurs, an appropriate dose of subcutaneous rapid-acting insulin may be given. A second dose may be given 2 hours later, and a variable rate intravenous insulin infusion considered if hyperglycaemia persists.

Metformin hydrochloride p. 652 is renally excreted; renal impairment may lead to accumulation and lactic acidosis during surgery. If only one meal will be missed during surgery, and the patient has an eGFR greater than 60 mL/minute/1.73m² and a low risk of acute kidney injury (and the procedure does not involve administration of contrast media), it may be possible to continue metformin...
hydrochloride throughout the peri-operative period—just the lunchtime dose should be omitted if the usual dose is prescribed three times a day.

If the patient will miss more than one meal or there is significant risk of the patient developing acute kidney injury, metformin hydrochloride should be stopped when the pre-operative fast begins. A variable rate intravenous insulin infusion should be started if the metformin hydrochloride dose is more than once daily. Otherwise insulin should only be started if blood glucose concentration is greater than 12 mmol/litre on two consecutive occasions. Metformin should not be recommenced until the patient is eating and drinking again, and normal renal function has been assured.

There is no need to stop metformin hydrochloride after contrast medium in patients missing only one meal or who have an eGFR greater than 60 mL/minute/1.73m². If contrast medium is to be used, and eGFR is less than 60 mL/minute/1.73m², metformin should be omitted on the day of the procedure and for the following 48 hours.

Use of antidiabetic drugs during medical illness
Manufacturers of some antidiabetic drugs recommend that they may need to be replaced temporarily with insulin during undercurrent illness when the drug is unlikely to control hyperglycaemia (such as myocardial infarction, coma, severe infection, trauma and other medical emergencies). Consult individual product literature.

Sodium glucose co-transporter 2 inhibitors are associated with increased risk of developing diabetic ketoacidosis during periods of dehydration, stress, surgery, trauma, acute medical illness or any other catabolic state, and should be used with caution during these times. The MHRA has advised (2016) that these drugs should be temporarily stopped in patients who are hospitalised for acute serious illness until the patient is medically stable.

Diabetic ketoacidosis
Management

- To restore circulating volume if systolic blood pressure is below 90 mmHg (adjusted for age, sex, and medication as appropriate), give 500 mL sodium chloride 0.9% by intravenous infusion over 10–15 minutes; repeat if blood pressure remains below 90 mmHg and seek senior medical advice.
- When blood pressure is over 90 mmHg, sodium chloride 0.9% should be given by intravenous infusion at a rate that replaces deficit and provides maintenance; see guideline or suggested regimen.
- Include potassium chloride in the fluids unless anauria is suspected; adjust according to plasma-potassium concentration (measure at 60 minutes, 2 hours, and 2 hourly thereafter; measure hourly if outside the normal range).
- Start an intravenous insulin infusion: soluble insulin should be diluted (and mixed thoroughly) with sodium chloride 0.9% intravenous infusion to a concentration of 1 unit/mL; infuse at a fixed rate of 0.1 units/kg/hour.
- Established subcutaneous therapy with long-acting insulin analogues (insulin detemir p. 671 or insulin glargine p. 672) should be continued during treatment of diabetic ketoacidosis.
- Monitor blood-ketone and blood-glucose concentrations hourly and adjust the insulin infusion rate accordingly. Blood-ketone concentration should fall by at least 0.5 mmol/litre/hour and blood-glucose concentration should fall by at least 3 mmol/litre/hour.
- Once blood-glucose concentration falls below 14 mmol/litre, glucose 10% should be given by intravenous infusion (into a large vein through a large-gauge needle) at a rate of 125 mL/hour, in addition to the sodium chloride 0.9% infusion.
- Continue insulin infusion until blood-ketone concentration is below 0.3 mmol/litre, blood pH is above 7.3 and the patient is able to eat and drink; ideally give subcutaneous fast-acting insulin and a meal, and stop the insulin infusion 1 hour later.

The management of hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion are usually necessary and slower rehydration may be required.

BLOOD GLUCOSE LOWERING DRUGS > ALPHA GLUCOSIDASE INHIBITORS

Acarbose
- **DRUG ACTION** Acarbose, an inhibitor of intestinal alpha glucosidases, delays the digestion and absorption of starch and sucrose; it has a small but significant effect in lowering blood glucose.

- **INDICATIONS AND DOSE**
  - **Diabetes mellitus inadequately controlled by diet or by diet with oral antidiabetic drugs**
    - **BY MOUTH**
    - **Adult:** Initially 50 mg daily, then increased to 50 mg 3 times a day for 6–8 weeks, then increased if necessary to 100 mg 3 times a day (max. per dose 200 mg 3 times a day).
  - **SIDE-EFFECTS**
    - Common or very common: Abdominal distention and pain, diarrhoea (may need to reduce dose or withdraw), flatulence, soiled stools.
    - Rare: Abnormal liver function tests, nausea, skin reactions.
    - Very rare: Hepatitis, ileus, jaundice, oedema.

- **CONTRA-INDICATIONS**
  - Hernia, inflammatory bowel disease.
  - Hypersensitivity to acarbose.
  - Predisposition to partial intestinal obstruction.
  - Previous abdominal surgery.
  - **CAUTIONS** May enhance hypoglycaemic effects of insulin and sulfonylureas (hypoglycaemic episodes may be treated with oral glucose but not with sucrose).
  - **INTERACTIONS**
    - **Appendix 1:** acarbose.

- **PREGNANCY**
  - **Avoid.**

- **BREAST FEEDING**
  - **Avoid.**

- **HEPATIC IMPAIRMENT**
  - **Avoid.**

- **RENAL IMPAIRMENT**
  - **Avoid.** eGFR less than 25 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Monitor liver function.

- **DIRECTIONS FOR ADMINISTRATION**
  - Tablets should be chewed with first mouthful of food or swallowed whole with a little liquid immediately before food.

- **PATIENT AND CARER ADVICE**
  - Antacids unlikely to be beneficial for treating side effects. To counteract possible hypoglycaemia, patients receiving insulin or a sulfonylurea as well as acarbose need to carry glucose (not...
sucrose—acarbose interferes with sucrose absorption). Patients should be given advice on how to administer acarbose tablets.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Acarbose (Non-proprietary)**
  - Acarbose 50 mg Acarbose 50mg tablets | 90 tablet [Pax] £11.51 DT price = £11.51
  - Acarbose 100 mg Acarbose 100mg tablets | 90 tablet [Pax] £19.03 DT price = £13.03
  - **Glucobay (Bayer Plc)**
    - Acarbose 50 mg Glucobay 50mg tablets | 90 tablet [Pax] £7.35 DT price = £11.51
    - Acarbose 100 mg Glucobay 100mg tablets | 90 tablet [Pax] £13.50 DT price = £13.03

**BLOOD GLUCOSE LOWERING DRUGS**

**BIGUANIDES**

**Metformin hydrochloride**

**DRUG ACTION** Metformin exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

**INDICATIONS AND DOSE**

- **Diabetes mellitus**
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
    - Child 10–17 years (special use only): Initially 500 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day
  - **Adult:** Initially 500 mg once daily for at least 1 week, dose to be taken with breakfast, then 500 mg twice daily for at least 1 week, dose to be taken with breakfast and evening meal, then 500 mg 3 times a day, dose to be taken with breakfast, lunch and evening meal; maximum 2 g per day
  - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
    - **Adult:** Initially 500 mg once daily, then increased if necessary up to 2 g once daily, dose increased gradually, every 10–15 days, dose to be taken with evening meal, alternatively increased to 1 g twice daily, dose to be taken with meals, alternative dose only to be used if control not achieved with once daily dose regimen. If control still not achieved then change to standard release tablets
  - **Polycystic ovary syndrome**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - **Adult:** Initially 500 mg once daily for 1 week, dose to be taken with breakfast, then 500 mg twice daily for 1 week, dose to be taken with breakfast and evening meal, then 1.5–1.7 g daily in 2–3 divided doses

**UNLICENSED USE**

- In adults Doses in the BNF may differ from those in the product literature. Not licensed for polycystic ovary syndrome.
- In children Not licensed for use in children under 10 years.

**CONTRA-INDICATIONS** Acute metabolic acidosis (including lactic acidosis and diabetic ketoacidosis)

**CAUTIONS** Risk factors for lactic acidosis

**CAUTIONS, FURTHER INFORMATION**

- Risk factors for lactic acidosis Manufacturer advises caution in chronic stable heart failure (monitor cardiac function), and concomitant use of drugs that can acutely impair renal function; interrupt treatment if dehydration occurs, and avoid in conditions that can acutely worsen renal function, or cause tissue hypoxia.

**INTERACTIONS** → Appendix 1: metformin

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, anorexia, diarrhoea (usually transient), nausea, taste disturbance, vomiting
- **Rare** Decreased vitamin-B₁₂, absorption, erythema, lactic acidosis (withdraw treatment), pruritus, urticaria
- **Frequency not known** Hepatitis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Gastro-intestinal effects Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses are given. A slow increase in dose may improve tolerability.

**PREGNANCY** Can be used in pregnancy for both pre-existing and gestational diabetes. Women with gestational diabetes should discontinue treatment after giving birth.

**BREAST FEEDING** May be used during breast-feeding in women with pre-existing diabetes.

**HEPATIC IMPAIRMENT** Withdraw if tissue hypoxia likely.

**RENAL IMPAIRMENT**

- In children Manufacturer advises consider dose reduction in moderate impairment. Manufacturer advises avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².
- In adults Manufacturer advises reduce dose in moderate impairment—consult product literature. Manufacturer advises avoid if eGFR is less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected).

**PRESCRIBING AND DISPENSING INFORMATION**

- In adults Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of metformin modified release; not suitable if dose of standard-release tablets more than 2 g daily.
- **PATIENT AND CARER ADVICE** Manufacturer advises that patients and their carers should be informed of the risk of lactic acidosis and told to seek immediate medical attention if symptoms such as dyspnoea, muscle cramps, abdominal pain, hypothermia, or asthenia occur. Medicines for Children leaflet: Metformin for diabetes www.medicinesforchildren.org.uk/metformin-diabetes

**NATIONAL FUNDING/ACCESS DECISIONS**

**GLUCOPHAGE® SR**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (September 2009) that Glucophage® SR is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in adult patients who are intolerant of standard-release metformin, and in whom the prolonged-release tablet allows the use of a dose of metformin not previously tolerated, or in patients for whom a once daily preparation offers a clinically significant benefit.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS** 21, 25

Combinations available:  
- Alogliptin with metformin, p. 654 - Canagliflozin with metformin, p. 662 - Dapagliflozin with metformin, p. 663 - Empagliflozin with metformin, p. 665 - Linagliptin with metformin, p. 656 - Pioglitazone with metformin, p. 668 - Saxagliptin with metformin, p. 655 - Sitagliptin with metformin, p. 656 - Vildagliptin with metformin, p. 656

**BLOOD GLUCOSE LOWERING DRUGS**  
**DIPEPTIDYLPEPTIDASE-4 INHIBITORS (GLIPTINS)**

**Alogliptin**  
**DRUG ACTION**  
Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

**INDICATIONS AND DOSE**  
Type 2 diabetes mellitus as dual therapy in combination with either metformin, pioglitazone, a sulfonylurea, or insulin (when treatment with these drugs alone fails to achieve adequate glycaemic control), or as triple therapy in combination with metformin and either pioglitazone or insulin

- **BY MOUTH**  
  - Adult: 25 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**  
Dose of concomitant sulfonylurea or insulin may need to be reduced. Caution with use in combination with both metformin and pioglitazone—risk of hypoglycaemia (dose of metformin or pioglitazone may need to be reduced).

**CONTRA-INDICATIONS**  
Ketoacidosis

**CAUTIONS**  
History of pancreatitis not recommended in moderate to severe heart failure (limited experience)

**INTERACTIONS**  
Appendix 1: alogliptin

**SIDE-EFFECTS**  
- Common or very common  
  - Abdominal pain, gastrointestinal reflux, headache, nasopharyngitis, pruritus, rash, upper respiratory-tract infection

**Frequency not known**  
Angioma, hepatic impairment, pancreatitis, Stevens-Johnson syndrome, urticaria

**SIDE-EFFECTS, FURTHER INFORMATION**  
Pancreatitis Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).

**ALLERGY AND CROSS-SENSITIVITY**  
Contra—indicated if history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors.

**PREGNANCY**  
Manufacturer advises avoid—no information available.

**BREAST FEEDING**  
Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**  
Manufacturer advises avoid in severe impairment—no information available.

**RENAL IMPAIRMENT**  
Reduce dose to 12.5 mg once daily if eGFR 30–50 mL/minute/1.73 m². Reduce dose to 6.25 mg once daily if eGFR less than 30 mL/minute/1.73 m². Use with caution if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**  
Determine renal function before treatment and periodically thereafter.

**MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**  
- Alogliptin (non-proprietary)  
  - Alogliptin (as Alogliptin benzoate) 6.25 mg Alogliptin 6.25mg tablets | 28 tablet (PO) no price available DT price = £26.60

  - Alogliptin (as Alogliptin benzoate) 25 mg Alogliptin 25mg tablets | 28 tablet (PO) no price available DT price = £26.60  
  - Vipidia (Takeda UK Ltd)  
    - Alogliptin (as Alogliptin benzoate) 6.25 mg Vipidia 6.25mg tablets | 28 tablet (PO) £26.60 DT price = £26.60  
    - Alogliptin (as Alogliptin benzoate) 12.5 mg Vipidia 12.5mg tablets | 28 tablet (PO) £26.60 DT price = £26.60  
    - Alogliptin (as Alogliptin benzoate) 25 mg Vipidia 25mg tablets | 28 tablet (PO) £26.60 DT price = £26.60
Alogliptin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, alogliptin p. 653, metformin hydrochloride p. 652.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either pioglitazone or insulin

- **BY MOUTH**
- **Adult:** 1 tablet twice daily, based on patient’s current metformin dose

**INTERACTIONS** → Appendix 1: alogliptin, metformin

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21

- Alogliptin with metformin (non-proprietary)

  - Alogliptin (as Alogliptin benzoate) 12.5 mg, Metformin hydrochloride 1 gram  Alogliptin 12.5mg / Metformin 1g tablets | 56 tablet [POf] no price available DT price = £26.60
  - Vipdomet (Takeda UK Ltd)

    - Alogliptin (as Alogliptin benzoate) 12.5 mg, Metformin hydrochloride 1 gram  Vipdomet 12.5mg/1000mg tablets | 56 tablet [POf] £26.60 DT price = £26.60

Linagliptin

**DRUG ACTION**

Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with metformin (when treatment with metformin alone fails to achieve adequate glycaemic control), or both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control) | Type 2 diabetes mellitus in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control

- **BY MOUTH**
- **Adult:** 5 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose of concomitant sulfonylurea or insulin may need to be reduced.

**INTERACTIONS** → Appendix 1: linagliptin

**SIDE-EFFECTS**

- Uncommon  Cough - nasopharyngitis
- Frequency not known  Pancreatitis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Pancreatitis  Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).
- PREGNANCY  Avoid—no information available.
- BREAST FEEDING  Avoid—present in milk in animal studies.
- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised that linagliptin (Trajenta®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as monotherapy when both metformin and sulfonylurea are inappropriate (January 2013), and in combination with metformin when addition of a sulfonylurea is inappropriate (December 2011).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Trajenta (Boehringer Ingelheim Ltd) Linagliptin 5 mg  Trajenta 5mg tablets | 28 tablet [POf] £33.26 DT price = £33.26

Linagliptin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, linagliptin above, metformin hydrochloride p. 652.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin

- **BY MOUTH**
- **Adult:** 1 tablet twice daily, based on patient’s current metformin dose

**INTERACTIONS** → Appendix 1: linagliptin, metformin

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (May 2015) that linagliptin plus metformin combination tablets (Jentadueto®) are accepted for restricted use within NHS Scotland for the treatment of adult patients with type 2 diabetes mellitus in combination with insulin, as an adjunct to diet and exercise to improve glycaemic control when a combination of insulin and metformin alone is inadequate. It is restricted to use in the treatment of patients for whom a combination of linagliptin and metformin is an appropriate choice of therapy and the fixed doses are considered appropriate.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21

- Jentadueto (Boehringer Ingelheim Ltd)

  - Linagliptin 2.5 mg, Metformin hydrochloride 850 mg  Jentadueto 2.5mg/850mg tablets | 56 tablet [POf] £33.26
  - Linagliptin 2.5 mg, Metformin hydrochloride 1000 mg  Jentadueto 2.5mg/1000mg tablets | 56 tablet [POf] £33.26

Saxagliptin

**DRUG ACTION**

Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with metformin or a sulfonylurea (if metformin inappropriate), or pioglitazone (when treatment with either metformin or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control), and also in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control) | Type 2 diabetes mellitus in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control

- **BY MOUTH**
- **Adult:** 5 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose of concomitant sulfonylurea or insulin may need to be reduced.

**CAUTIONS**

Elderly
● **INTERACTIONS** → Appendix 1: saxagliptin

**SIDE-EFFECTS**

- **Common or very common** Dizziness, dyspepsia, fatigue, gastritis, gastroenteritis, headache, hypoglycaemia, myalgia, nasopharyngitis, peripheral oedema, sinusitis, upper respiratory tract infection, urinary tract infection, vomiting
- **Uncommon** Anaphylaxis, arthralgia, dyslipidaemia, erectile dysfunction, hypersensitivity reactions, hypertriglyceridaemia, pancreatitis
- **Frequency not known** Rash

**SIDE-EFFECTS, FURTHER INFORMATION**

- Pancreatitis: Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has a history of severe hypersensitivity to dipeptidylpeptidase-4 inhibitors.
- **PREGNANCY** Avoid unless essential—toxicity in animal studies.
- **LACTATION** Not recommended.
- **BREAST FEEDING** Avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Use with caution in moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce dose to 2.5 mg once daily in moderate to severe impairment. Use with caution in severe impairment.
- **MONITORING REQUIREMENTS** Determine renal function before treatment and periodically thereafter.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised that saxagliptin (Onglyza®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as triple therapy in combination with metformin and a sulfonylurea, as an alternative to existing dipeptidyl peptidase-4 inhibitors, when treatment with metformin and a sulfonylurea is inadequate (November 2013).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Onglyza (AstraZeneca UK Ltd)
  - Saxagliptin (as Saxagliptin hydrochloride) 2.5 mg: Onglyza 2.5 mg tablets | 28 tablet | £31.60 DT price = £31.60
  - Saxagliptin (as Saxagliptin hydrochloride) 5 mg: Onglyza 5 mg tablets | 28 tablet | £31.60 DT price = £31.60

**MEDICINAL USES**

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with metformin or a sulfonylurea (if metformin inappropriate), or pioglitazone when treatment with either metformin or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control, and also in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control)

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin

- **BY MOUTH**
  - Adult: 1 tablet twice daily, based on patient’s current metformin dose

**INTERACTIONS** → Appendix 1: metformin, saxagliptin

**SIDE-EFFECTS**

- **Common or very common** Gastro-intestinal disturbances, nasopharyngitis, pain, peripheral oedema, upper respiratory tract infection
- **Uncommon** Anorexia, dizziness, drowsiness, dry mouth, headache, hypoglycaemia, osteoarthritis
- **Frequency not known** Cutaneous vasculitis, pancreatitis, rash, Stevens-Johnson syndrome

**SIDE-EFFECTS, FURTHER INFORMATION**

- Pancreatitis: Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).
- **PREGNANCY** Avoid—toxicity in animal studies.
- **LACTATION** Not recommended.
- **BREAST FEEDING** Avoid—present in milk in animal studies.
- **RENAL IMPAIRMENT** Reduce dose to 2.5 mg once daily if eGFR 30–50 mL/min/1.73 m². Reduce dose to 25 mg once daily if eGFR less than 30 mL/min/1.73 m².

**NATIONAL FUNDING/ACCESS DECISIONS**

The Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2010) that Januvia® is accepted for restricted use within NHS Scotland as monotherapy, to improve glycaemic control in patients with type 2 diabetes mellitus, for whom both metformin and sulfonylureas are not appropriate.

**CONTRA-INDICATIONS**

Ketoacidosis

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin

- **BY MOUTH**
  - Adult: 1 tablet twice daily, based on patient’s current metformin dose

**INTERACTIONS** → Appendix 1: metformin, saxagliptin

**SIDE-EFFECTS**

- **Common or very common** Gastro-intestinal disturbances, nasopharyngitis, pain, peripheral oedema, upper respiratory tract infection
- **Uncommon** Anorexia, dizziness, drowsiness, dry mouth, headache, hypoglycaemia, osteoarthritis
- **Frequency not known** Cutaneous vasculitis, pancreatitis, rash, Stevens-Johnson syndrome

**SIDE-EFFECTS, FURTHER INFORMATION**

- Pancreatitis: Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).
- **PREGNANCY** Avoid—toxicity in animal studies.
- **LACTATION** Not recommended.
- **BREAST FEEDING** Avoid—present in milk in animal studies.
- **RENAL IMPAIRMENT** Reduce dose to 2.5 mg once daily if eGFR 30–50 mL/min/1.73 m². Reduce dose to 25 mg once daily if eGFR less than 30 mL/min/1.73 m².

**NATIONAL FUNDING/ACCESS DECISIONS**

The Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (May 2013) that Komboglyze® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients unable to achieve adequate glycaemic control with metformin alone and when the addition of a sulfonylurea is inappropriate.
Sitagliptin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, sitagliptin p. 655, metformin hydrochloride p. 652.

- **INDICATIONS AND DOSE**
  Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or pioglitazone or insulin
  - **BY MOUTH**
  - Adult: 1 tablet twice daily

- **INTERACTIONS** → Appendix 1: metformin, sitagliptin

- **NATIONAL FUNDING/ACCESS DECISIONS**
  **Scottish Medicines Consortium (SMC) Decisions**
  The Scottish Medicines Consortium has advised (July 2008) that Janumet® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus when the addition of a sulfonylurea to metformin is not appropriate; it is also accepted for use in NHS Scotland in combination with a sulfonylurea in patients inadequately controlled on maximum tolerated doses of metformin and a sulfonylurea.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  **Tablet**
  CAUTIONARY AND ADVISORY LABELS 21
  - Janumet (Merck Sharp & Dohme Ltd)
  - Sitagliptin (as Sitagliptin phosphate) 50 mg, Metformin hydrochloride 1 gram | 56 tablet | **£33.26 DT price = £33.26**

Vildagliptin

- **DRUG ACTION**
  Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

- **INDICATIONS AND DOSE**
  Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) | Type 2 diabetes mellitus in combination with metformin or pioglitazone (when treatment with either metformin or pioglitazone fails to achieve adequate glycaemic control) | Type 2 diabetes mellitus in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control) | Type 2 diabetes mellitus in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control
  - **BY MOUTH**
  - Adult: 50 mg twice daily

  **Type 2 diabetes mellitus in combination with sulfonylurea (if metformin inappropriate)**
  - **BY MOUTH**
  - Adult: 50 mg daily, dose to be taken in the morning

  **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  Dose of concomitant sulfonylurea or insulin may need to be reduced.

- **CONTRA-INDICATIONS**
  Ketoacidosis

- **CAUTIONS**
  Manufacturer advises avoid in severe heart failure—no information available

- **INTERACTIONS** → Appendix 1: vildagliptin

- **SIDE-EFFECTS**
  - Common or very common Asthenia · dizziness · headache · nausea · peripheral oedema · tremor
  - Uncommon Arthralgia · constipation · hypoglycaemia
  - Rare Hepatic dysfunction
  - Very rare Nasopharyngitis · upper respiratory tract infection

- **FREQUENCY NOT KNOWN**
  Bullous skin reactions · exfoliative skin reactions · pancreatitis

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Pancreatitis Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain)
  - Liver toxicity Rare reports of liver dysfunction; discontinue if jaundice or other signs of liver dysfunction occur.
  - **PREGNANCY**
    Avoid— toxicity in animal studies.
  - **BREAST FEEDING**
    Avoid— present in milk in animal studies.
  - **HEPATIC IMPAIRMENT**
    Avoid.
  - **RENAL IMPAIRMENT**
    Reduce dose to 50 mg once daily if eGFR less than 50 mL/minute/1.73 m².
  - **MONITORING REQUIREMENTS**
    Monitor liver function before treatment and every 3 months for first year and periodically thereafter.
  - **PATIENT AND CARER ADVISE**
    Liver toxicity Patients should be advised to seek prompt medical attention if symptoms such as nausea, abdominal pain, fatigue, and dark urine develop.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  **Scottish Medicines Consortium (SMC) Decisions**
  The Scottish Medicines Consortium has advised that vildagliptin (Galvus®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as monotherapy when treatment with metformin or a sulfonylurea is inappropriate (December 2012), and in combination with metformin when addition of a sulfonylurea is inappropriate (March 2008), and in combination with a sulfonylurea if metformin is inappropriate (September 2009), and also as triple therapy in combination with metformin and a sulfonylurea, as an alternative to existing dipeptidyl peptidase-4 inhibitors, when treatment with metformin and a sulfonylurea is inadequate (November 2013).

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  **Tablet**
  - Galvus (Novartis Pharmaceuticals UK Ltd)
  - Vildagliptin 50 mg | 56 tablet | **£33.35 DT price = £33.35**

Vildagliptin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, vildagliptin above, metformin hydrochloride p. 652.

- **INDICATIONS AND DOSE**
  Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin
  - **BY MOUTH**
  - Adult: 1 tablet twice daily, based on patient’s current metformin dose

- **INTERACTIONS** → Appendix 1: metformin, vildagliptin

- **NATIONAL FUNDING/ACCESS DECISIONS**
  **Scottish Medicines Consortium (SMC) Decisions**
  The Scottish Medicines Consortium has advised (June 2008) that Euceran® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in
patients unable to achieve adequate glycaemic control with metformin alone or those already treated with vildagliptin and metformin as separate tablets.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

- **Euceran** (Novartis Pharmaceuticals UK Ltd)
  - Vildagliptin 50 mg, Metformin hydrochloride 850 mg Euceran 50mg/850mg tablets | 60 tablet [PDT] £35.68 DT price = £35.68
  - Vildagliptin 50 mg, Metformin hydrochloride 1 gram Euceran 50mg/1000mg tablets | 60 tablet [PDT] £35.68 DT price = £35.68

**CONTRA-INDICATIONS**

- **BLOOD GLUCOSE LOWERING DRUGS**
  - **GLUCAGON-LIKE PEPTIDE-1 RECEPTOR AGONISTS**

---

### Albiglutide 01-Jun-2016

**DRUG ACTION**

Albiglutide is a GLP-1 (glucagon-like peptide-1) receptor agonist that augments glucose-dependent insulin secretion, and slows gastric emptying.

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus as monotherapy when treatment with metformin is considered inappropriate** | **Type 2 diabetes mellitus in combination with basal insulin and other oral glucose lowering agents**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 30 mg once weekly, increased if necessary up to 50 mg once weekly, to be administered on the same day each week

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**CONTRA-INDICATIONS**

- Severe gastrointestinal disease—no information available

**CAUTIONS**

- History of pancreatitis - moderate to severe heart failure—no information available

**INTERACTIONS**

- Appendix 1: albiglutide

**SIDE-EFFECTS**

- **Common or very common** Atrial fibrillation - constipation - diarrhoea - dyspepsia - gastro-oesophageal reflux disease - hypoglycaemia - injection site reactions - nausea - vomiting

- **Uncommon** Intestinal obstruction - pancreatitis (discontinue treatment)

**CONCEPTION AND CONTRACEPTION**

Manufacturer recommends effective contraception in women of childbearing potential. Discontinue treatment at least one month before a planned pregnancy.

**PREGNANCY**

Manufacturer advises avoid—xicity in animal studies.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**RENAL IMPAIRMENT**

Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m².

**HANDLING AND STORAGE**

Store at 2–8°C. May be stored at temperatures up to 30°C for up to 4 weeks.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer albiglutide injection. Acute pancreatitis Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.

**Missed doses**

If a dose is missed it should be administered as soon as possible within 3 days; if more than 3 days have passed, the missed dose should not be taken and the next dose should be taken at the normal time.

---

### Dulaglutide 14-Jun-2016

**DRUG ACTION**

Dulaglutide is a long-acting glucagon-like peptide 1 (GLP-1) receptor agonist that augments glucose-dependent insulin secretion, and slows gastric emptying.

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus as monotherapy if metformin inappropriate**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 0.75 mg once weekly

**Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 1.5 mg once weekly

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**CONTRA-INDICATIONS**

- Severe gastro-intestinal disease—no information available

**CAUTIONS**

- Congestive heart failure—no information available

**INTERACTIONS**

- Appendix 1: dulaglutide

**SIDE-EFFECTS**

- **Common or very common** Abdominal distention, - abdominal pain - atrioventricular block - constipation - decreased appetite - diarrhoea - dyspepsia - fatigue - flatulence - gastro-oesophageal reflux disease - nausea - sinus tachycardia - vomiting

- **Rare** Acute pancreatitis (discontinue treatment)

**PREGNANCY**

Manufacturer advises avoid—xicity in animal studies.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**RENAL IMPAIRMENT**

Manufacturer advises avoid in severe impairment and end stage renal disease—no information available.

**HANDLING AND STORAGE**

Refrigerated storage is usually necessary (2°C – 8°C). Once in use, may be stored unrefrigerated for up to 14 days at a temperature not above 30°C.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer dulaglutide injection. Acute pancreatitis Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.
Missed doses
If a dose is missed, it should be administered as soon as possible only if there are at least 3 days until the next scheduled dose; if less than 3 days remain before the next scheduled dose, the missed dose should not be taken and the next dose should be taken at the normal time.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (January 2016) that dulaglutide (Trulicity®) is accepted for restricted use for treating adults with type 2 diabetes to improve glycaemic control as add-on therapy in combination with other glucose-lowering medicines, when these, together with diet and exercise, do not provide adequate glycaemic control. It is restricted to use as part of a triple therapy in people with inadequate glycaemic control on control. It is restricted to use as part of a triple therapy in combination with basal insulin in patients where treatment with metformin or sulfonylurea (or both) at maximally tolerated doses has been inadequate, and treatment with insulin would be the next option.

**INTERACTIONS**

- people with inadequate glycaemic control on control. It is restricted to use as part of a triple therapy in combination with basal insulin in patients where treatment with metformin or sulfonylurea (or both) at maximally tolerated doses has been inadequate, and treatment with insulin would be the next option.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Trulicity** (Eli Lilly and Company Ltd)
  - Dulaglutide 1.5 mg per 1 ml Trulicity 0.75mg/0.5ml solution for injection prefilled pen 4 prefilled disposable injection £73.25
  - Dulaglutide 3 mg per 1 ml Trulicity 1.5mg/0.5ml solution for injection prefilled pen 4 prefilled disposable injection £73.25

**Exenatide**

**DRUG ACTION**

Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, or with pioglitazone, or with both metformin and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination

- **By subcutaneous injection using immediate-release medicines**
  - Adult: Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)

**By subcutaneous injection using modified-release medicines**

- Adult: 2 mg once weekly

Type 2 diabetes mellitus in combination with basal insulin alone or with metformin or pioglitazone (or both)

- **By subcutaneous injection using immediate-release medicines**
  - Adult: Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose of concomitant sulfonylurea may need to be reduced.

**Pharmacokinetics**

Effect of modified-release exenatide injection (Bydureon®) may persist for 10 weeks after discontinuation.

**CONTRA-INDICATIONS**

- Ketoacidosis · severe gastrointestinal disease

**CAUTIONS**

- Elderly · may cause weight loss greater than 1.5 kg weekly · pancreatitis

**INTERACTIONS**

- Appendix 1: exenatide

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain and distension · agitation · antibody formation · asthenia · decreased appetite · diarrhoea · dizziness · dyspepsia · gastrointestinal disturbances · gastro-oesophageal reflux disease · headache · hypoglycaemia · increased sweating · injection-site reactions · nausea · vomiting · weight loss

- **Uncommon** Pancreatitis

- **Rare** Alopecia

- **Very rare** Anaphylactic reactions

- **Frequency not known** Angioedema · constipation · dehydration · drowsiness · eructation · flatulence · pruritus · rash · renal impairment · taste disturbance · urticaria

**SIDE-EFFECTS, FURTHER INFORMATION**

- Pancreatitis · Severe pancreatitis (sometimes fatal), including haemorrhagic or necrotising pancreatitis, has been reported rarely; discontinue permanently if pancreatitis is diagnosed.

**CONCEPTION AND CONTRACEPTION**

Women of child-bearing age should use effective contraception during treatment with modified-release exenatide and for 12 weeks after discontinuation.

**PREGNANCY**

Avoid—toxicity in animal studies.

**BREAST FEEDING**

Avoid—no information available.

**RENAL IMPAIRMENT**

- **Standard-release injection**, use with caution if eGFR less than 30 mL/minute/1.73 m². For standard-release injection, avoid if eGFR less than 30 mL/minute/1.73 m². For modified-release injection, avoid if eGFR less than 50 mL/minute/1.73 m².

**PATIENT AND CARER ADVICE**

Patients changing from standard-release to modified-release exenatide formulation may experience initial transient increase in blood glucose.

Some oral medications should be taken at least 1 hour before or 4 hours after exenatide injection—consult product literature for details.

Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek prompt medical attention if symptoms such as abdominal pain, nausea, and vomiting develop.

**Missed doses**

If a dose of the immediate-release medicine is missed, continue with the next scheduled dose—do not administer after a meal.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (June 2007) that standard-release exenatide (Byetta®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin or sulfonylurea (or both), as an alternative to treatment with insulin in patients where treatment with metformin or sulfonylurea (or both) at maximally tolerated doses has been inadequate, and treatment with insulin would be the next option.

The Scottish Medicines Consortium has also advised (February 2011) that standard-release exenatide (Byetta®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin and pioglitazone as a third-line pre-insulin treatment option.

The Scottish Medicines Consortium has advised (December 2011) that modified-release exenatide (Bydureon®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes as a third-line treatment option.
Liraglutide

01-Jun-2016

DRUG ACTION Liraglutide binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

INDICATIONS AND DOSE Type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination | Type 2 diabetes mellitus in combination with basal insulin or both metformin and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control

BY SUBCUTANEOUS INJECTION

Adult: Initially 0.6 mg once daily for at least 1 week, then increased to 1.2 mg once daily for at least 1 week, then increased if necessary up to 1.8 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS Dose of concomitant insulin or sulfonylurea may need to be reduced.

CONTRA-INDICATIONS Diabetic gastroparesis; inflammatory bowel disease; ketoacidosis; moderate to severe congestive heart failure—no information available

CAUTIONS History of pancreatitis; mild congestive heart failure—limited experience; thyroid disease

INTERACTIONS → Appendix 1: liraglutide

SIDE-EFFECTS

Common or very common Abdominal pain and distension; bronchitis; constipation; decreased appetite; diarrhoea; dizziness; dyspepsia; flatulence; gastritis; gastrointestinal disturbances; gastro-oesophageal reflux disease; headache; hypoglycaemia; injection site reactions; malaise; nasopharyngitis; nausea; tachycardia; vomiting

Uncommon Acute renal failure; dehydration; renal impairment

Very rare Acute pancreatitis

Frequent or not known Goitre; increased blood calcitonin; thyroid neoplasm

SIDE-EFFECTS, FURTHER INFORMATION

Pancreatitis Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).

PREGNANCY Manufacturer advises avoid—toxicity in animal studies (recommendation also supported by primary literature).

BREAST FEEDING Avoid—no information available.

HEPATIC IMPAIRMENT Manufacturer advises avoid—limited experience.

RENAL IMPAIRMENT Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m²—limited experience.

HANDLING AND STORAGE Store in a refrigerator (2°C–8°C); after first use can be stored below 30°C, discard 1 month after first use.

PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer liraglutide injection. Acute pancreatitis Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek immediate medical attention if symptoms such as persistent, severe abdominal pain develop.

Lixisenatide

DRUG ACTION Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

INDICATIONS AND DOSE Type 2 diabetes mellitus in combination with oral antidiabetic drugs (e.g. metformin, pioglitazone, or a sulfonylurea) or basal insulin, or both, when adequate glycaemic control has not been achieved with these drugs

BY SUBCUTANEOUS INJECTION

Adult: Initially 10 micrograms once daily for 14 days, then increased to 20 micrograms once daily, dose to be taken within 1 hour before the first meal of the day or the evening meal

DOSE ADJUSTMENTS DUE TO INTERACTIONS Dose of concomitant sulfonylurea or insulin may need to be reduced.

CONTRA-INDICATIONS Ketoacidosis; severe gastrointestinal disease

INTERACTIONS → Appendix 1: lixisenatide

SIDE-EFFECTS

Common or very common Diarrhoea; dizziness; drowsiness; dyspepsia; headache; hypoglycaemia; injection site reactions; nausea; palpititation; vomiting

Uncommon Tachycardia; urticaria

SIDE-EFFECTS, FURTHER INFORMATION

Pancreatitis Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).

CONCEPTION AND CONTRACEPTION Women of child-bearing age should use effective contraception.

PREGNANCY Avoid—toxicity in animal studies.

BREAST FEEDING Avoid—no information available.

RENAL IMPAIRMENT Use with caution if eGFR 30–50 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m²—no information available.
PATIENT AND CARER ADVICE
Some oral medications should be taken at least 1 hour before or 4 hours after lixisenatide injection—consult product literature for details.

MISSED DOSES
If a dose is missed, inject within 1 hour before the next meal—do not administer after a meal.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (August 2013) that lixisenatide (Lyxumia®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with oral antidiabetic drugs or basal insulin (or both), when adequate glycaemic control has not been achieved with these drugs; use is restricted to patients in whom a GLP-1 agonist is appropriate, as an alternative to an existing GLP-1 agonist (exenatide or liraglutide).

MEDICAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
CAUTIONARY AND ADVISORY LABELS
Nateglinide

DRUG ACTION
Nateglinide stimulates insulin secretion.

INDICATIONS AND DOSE
Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate)

BY MOUTH
Initial 50 micrograms (max. per dose 150 micrograms)

Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate), if transferring from another oral antidiabetic drug

BY MOUTH
Initial 1 mg (max. per dose 3 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day

Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate), if transferring from another oral antidiabetic drug

BY MOUTH
Initial 1 mg (max. per dose 3 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day

CONTRA-INDICATIONS
Ketoacidosis

CAUTIONS
Debilitated patients · malnourished patients

CAUTIONS, FURTHER INFORMATION
Substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit nateglinide on morning of surgery and recommence when eating and drinking normally).

INTERACTIONS
Appendix 1: nateglinide

SIDE-EFFECTS
Hypersensitivity reactions · hypoglycaemia · pruritus · rash · urticaria · vasculitis · visual disturbances

PREGNANCY
Avoid.

BREAST FEEDING
Avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
Avoid in severe liver disease.

PATIENT AND CARER ADVICE
Driving and skilled tasks
Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet

Starlix (Novartis Pharmaceuticals UK Ltd)
Nateglinide 60 mg Starlix 60 mg tablets | 84 tablet pack £26.12 DT price = £26.12
Nateglinide 120 mg Starlix 120 mg tablets | 84 tablet pack £29.76 DT price = £29.76
Nateglinide 180 mg Starlix 180 mg tablets | 84 tablet pack £29.76 DT price = £29.76

Repaglinide

DRUG ACTION
Repaglinide stimulates insulin secretion.

INDICATIONS AND DOSE
Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate)

BY MOUTH
Adult 18–74 years: Initially 50 micrograms (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day

Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate), if transferring from another oral antidiabetic drug

BY MOUTH
Adult 18–74 years: Initially 1 mg (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day

CONTRA-INDICATIONS
Ketoacidosis

CAUTIONS
Debilitated patients · malnourished patients

CAUTIONS, FURTHER INFORMATION
Substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery.

INTERACTIONS
Appendix 1: repaglinide

SIDE-EFFECTS
Common or very common Abdominal pain · constipation · diarrhoea · nausea · vomiting

Rare Hypersensitivity reactions · hypoglycaemia · pruritus · rash · urticaria · vasculitis · visual disturbances

PREGNANCY
Avoid.

BREAST FEEDING
Avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
Avoid in severe liver disease.

PATIENT AND CARER ADVICE
Driving and skilled tasks
Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet

Repaglinide (Non-proprietary)
Repaglinide 500 microgram Repaglinide 500 microgram tablets | 30 tablet pack £3.92 | 90 tablet pack £11.76 DT price = £10.48
Repaglinide 1 mg Repaglinide 1 mg tablets | 30 tablet pack £3.92 | 90 tablet pack £11.76 DT price = £10.48
Repaglinide 2 mg Repaglinide 2 mg tablets | 90 tablet pack £28.00 DT price = £5.88
GLUCOSE CO-TRANSPORTER 2 INHIBITORS

BLOOD GLUCOSE LOWERING DRUGS

Canagliflozin

**DRUG ACTION**
Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

**INDICATIONS AND DOSE**
Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) | Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)
- **BY MOUTH**
  - **Adult:** 100 mg once daily; increased if tolerated to 300 mg once daily if required, dose to be taken preferably before breakfast

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
Manufacturer advises increase dose if tolerated to 300 mg once daily with concurrent use of rifampicin.

**IMPORTANCE SAFETY INFORMATION**

**CONTRA-INDICATIONS**
Ketoacidosis

**CAUTIONS**
Cardiovascular disease (risk of hypotension) | elderly (risk of hypotension) | elevated haematocrit | history of hypotension

**CAUTIONS, FURTHER INFORMATION**
Volume depletion | Correct hypovolaemia before starting treatment.

**INTERACTIONS**
Appendix 1: canagliflozin

**SIDE-EFFECTS**
Common or very common
- Constipation | dyslipidaemia | genital infection | hypoglycaemia (in combination with insulin or sulfonylurea) | nausea | polyuria | raised haematocrit | thirst | urinary frequency | urinary-tract infection

Uncommon
- Dehydration | dizziness | hypovolaemia | lower-limb amputation | postural hypotension | raised serum creatinine | raised serum urea | rash | syncope

**SIDE-EFFECTS, FURTHER INFORMATION**
Volume depletion | Consider interrupting treatment if volume depletion occurs.

**PREGNANCY**
Avoid—toxicity in animal studies.

**BREAST FEEDING**
Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**
Manufacturer advises avoid in severe impairment—no information available.

**RENAL IMPAIRMENT**
Reduce dose to 100 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m² and existing canagliflozin treatment tolerated. Avoid initiation if eGFR less than 60 mL/minute/1.73 m². Avoid if eGFR less than 45 mL/minute/1.73 m². Monitor renal function at least twice a year in moderate impairment.

**MONITORING REQUIREMENTS**
Determine renal function before treatment and at least annually thereafter, and before initiation of concomitant drugs that reduce renal function and periodically thereafter.

**PATIENT AND CARER ADVICE**
Patients should be advised to report symptoms of volume depletion including postural hypotension and dizziness. Patients should be informed of having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:
- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use canagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 treatment in patients who are hospitalised for major surgery or acute serious illnesses; treatment may be restarted once the patient’s condition has stabilised

Canagliflozin (Consilent Health Ltd)

Repaglinide 500 microgram | Prandin 0.5mg tablets | 30 tablet | £3.92
- Repaglinide 1 mg | Enyglid 2mg tablets | 90 tablet | £11.76 DT price = £5.88

**BNF 74**

Diabetes mellitus 661

Endocrine system
the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Canagliflozin, dapagliflozin and empagliflozin as monotherapies for treating type 2 diabetes (May 2016) NICE TA390

Canagliflozin as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated, only if a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise be prescribed and a sulfonylurea or pioglitazone is not appropriate.

Patients currently receiving canagliflozin whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA390

- Canagliflozin in combination therapy for treating type 2 diabetes (June 2014) NICE TA315

Canagliflozin in a dual therapy regimen in combination with metformin is recommended for the treatment of type 2 diabetes, only if a sulfonylurea is contra-indicated or not tolerated or the patient has a significant risk of hypoglycaemia.

Canagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with metformin and a sulfonylurea or metformin and a thiazolidinedione.

Canagliflozin in combination with insulin (alone or with other antidiabetic drugs) is an option for the treatment of type 2 diabetes.

Patients currently receiving canagliflozin in a dual or triple therapy regimen that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA315

  Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM–GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these

- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal

- use dapagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased
insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 treatment in patients who are hospitalised for major surgery or acute serious illnesses; treatment may be restarted once the patient’s condition has stabilised

- **CONTRA-INDICATIONS** Ketoadiabetes
- **CAUTIONS** Cardiovascular disease (risk of hypotension) • elderly (risk of hypotension) • electrolyte disturbances • hypotension • raised haematocrit

**CAUTIONS, FURTHER INFORMATION**
- Volume depletion Correct hypovolaemia before starting treatment.

**INTERACTIONS** → Appendix 1: dapagliflozin

**SIDE-EFFECTS**
- Common or very common Back pain • constipation • dyslipidaemia • dysuria • genital infection • hypoglycaemia (in combination with insulin or sulfonylurea) • polyuria • sweating • thirst • urinary-tract infection
- Uncommon Dehydration • dizziness • hypotension • hypovolaemia • nausea • nocturia • raised serum creatinine • raised serum urea • rash

**SIDE-EFFECTS, FURTHER INFORMATION**
- Volume depletion Consider interrupting treatment if volume depletion occurs.

**PREGNANCY** Avoid—toxicity in animal studies.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Initial dose 5 mg daily in severe impairment, increased according to response.

**RENAL IMPAIRMENT** Avoid if eGFR less than 60 mL/minute/1.73 m² (ineffective).

**MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually thereafter.

**PATIENT AND CARER ADVICE** Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- **Dapagliflozin in combination therapy for treating type 2 diabetes (updated November 2016)** NICE TA288 Dapagliflozin in a dual therapy regimen in combination with metformin is recommended for the treatment of type 2 diabetes, only if the patient is at significant risk of hypoglycaemia or its consequences, or if a sulfonylurea is contra-indicated or not tolerated. Dapagliflozin in combination with insulin (alone or with other antidiabetic drugs) is an option for the treatment of type 2 diabetes. Patients currently receiving dapagliflozin in a dual therapy regimen that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA288
- **Canagliflozin, dapagliflozin and empagliflozin as monotherapies for treating type 2 diabetes (May 2016)** NICE TA390 Dapagliflozin as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated, only if a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise be prescribed and a sulfonylurea or pioglitazone is not appropriate.

Patients currently receiving dapagliflozin whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA390

**Dapagliflozin in triple therapy for treating type 2 diabetes (November 2016) NICE TA418** Dapagliflozin in a triple therapy regimen is recommended as an option for treating type 2 diabetes in adults, only in combination with metformin and a sulfonylurea. Patients currently receiving dapagliflozin in other triple therapy regimens, whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA418

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium (SMC) has advised that dapagliflozin (Forxiga®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin, when treatment with metformin alone is inadequate and a sulfonylurea is inappropriate (December 2012), or in combination with insulin when treatment with insulin alone is inadequate (February 2014).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Forxiga (AstraZeneca UK Ltd)**
  - Dapagliflozin 5 mg Forxiga 5mg tablets | 28 tablet | £36.59 DT price = £36.59
  - Dapagliflozin 10 mg Forxiga 10mg tablets | 28 tablet | £36.59 DT price = £36.59

**Dapagliflozin with metformin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, dapagliflozin p. 662, metformin hydrochloride p. 652.

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with insulin or other antidiabetic drugs**
- **BY MOUTH**
  - Adult 18–74 years: 1 tablet twice daily, based on patient’s current metformin dose
  - Adult 75 years and over: Initiation not recommended

**INTERACTIONS** → Appendix 1: dapagliflozin, metformin

**HEPATIC IMPAIRMENT** Avoid.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (July 2014) that dapagliflozin plus metformin (Xigduo®) is accepted for restricted use within NHS Scotland in patients for whom a combination of dapagliflozin and metformin is an appropriate choice of therapy i.e when metformin alone does not provide adequate glycaemic control and a sulfonylurea is inappropriate, or in combination with insulin, when insulin and metformin does not provide adequate control, or in combination with a sulfonylurea, when a sulfonylurea and metformin does not provide adequate control.
Empagliflozin

18-May-2017

DRUG ACTION
Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

INDICATIONS AND DOSE
Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) | Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)

BY MOUTH
Adult 18-84 years: 10 mg once daily, increased to 25 mg once daily if necessary and if tolerated
Adult 85 years and over: Initiation not recommended

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

CONTRA-INDICATIONS
Diabetic ketoacidosis

CAUTIONS
Cardiovascular disease (increased risk of volume depletion) - complicated urinary tract infections - consider temporarily interrupting treatment - concomitant antihypertensive therapy (increased risk of volume depletion) - elderly patients aged over 75 years (increased risk of volume depletion) - heart failure - history of hypotension (increased risk of volume depletion) - patients at increased risk of volume depletion - predisposition to fluid disturbances e.g. gastro-intestinal illness, concomitant use of diuretics (increased risk of volume depletion)

CAUTIONS, FURTHER INFORMATION
Volume depletion Correct hypovolaemia before starting treatment. Consider interrupting treatment if volume depletion occurs.

INTERACTIONS
Appendix 1: empagliflozin

SIDE-EFFECTS
Common or very common
Genital infection, hypoglycaemia (in combination with insulin or sulfonylurea), polyuria, pruritus, urinary tract infection
Uncommon
Dysuria, volume depletion

PREGNANCY
Manufacturer advises avoid — toxicity in animal studies.

BREAST FEEDING
Manufacturer advises avoid — present in milk in animal studies.

HEPATIC IMPAIRMENT
Manufacturer advises avoid in severe impairment—no information available.

RENAL IMPAIRMENT
Reduce dose to 10 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m². Avoid initiation if eGFR below 60 mL/minute/1.73 m². Avoid if eGFR is persistently below 45 mL/minute/1.73 m².

MONITORING REQUIREMENTS
Determine renal function before treatment and before initiation of concomitant drugs that may reduce renal function, then at least annually thereafter.

PATIENT AND CARER ADVICE
Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)

Canagliflozin, dapagliflozin and empagliflozin as monotherapies for treating type 2 diabetes (May 2016) NICE TA390
Empagliflozin as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated, only if a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise be prescribed and a sulfonylurea or pioglitazone is not appropriate.

Canagliflozin, dapagliflozin and empagliflozin in combination therapy for treating type 2 diabetes (March 2015) NICE TA336
Empagliflozin in a dual therapy regimen in combination with metformin is an option for the treatment of type 2 diabetes, only if:
- a sulfonylurea is contra-indicated or not tolerated, or
- the patient is at significant risk of hypoglycaemia or its consequences.

Empagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with:
- metformin and a sulfonylurea or
- metformin and a thiazolidinedione.

IMPORTANT SAFETY INFORMATION
MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)
A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with an SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use empagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 treatment in patients who are hospitalised for major surgery or acute serious illnesses; treatment may be restarted once the patient’s condition has stabilised
Empagliflozin in combination with insulin with or without other antidiabetic drugs is an option for the treatment of type 2 diabetes.

Patients currently receiving empagliflozin whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA336

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Jardiance** (Boehringer Ingelheim Ltd) ▼
  - Empagliflozin 10 mg Jardiance 10mg tablets | 28 tablet [POM] £36.59 DT price = £36.59
  - Empagliflozin 25 mg Jardiance 25mg tablets | 28 tablet [POM] £36.59 DT price = £36.59

**Empagliflozin with metformin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, empagliflozin p. 664, metformin hydrochloride p. 652.

**Indications and Dose**

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with other antidiabetic drugs or insulin

- **By Mouth**
  - Adult 18–84 years: 5/850–5/1000 mg twice daily, based on patient’s current metformin dose, increased if necessary to 12.5/850–12.5/1000 mg twice daily
  - **By Mouth**
  - Adult 85 years and over: Initiation not recommended

**Dose Adjustments Due to Interactions**

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**Dose Equivalence and Conversion**

The proportions are expressed in the form “x”/“y” where “x” and “y” are the strengths in milligrams of empagliflozin and metformin respectively.

**Interactions** → Appendix 1: empagliflozin, metformin

**National Funding/Access Decisions**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (October 2015) that Synjardy® (empagliflozin with metformin) is accepted for restricted use within NHS Scotland in patients for whom a fixed dose combination of empagliflozin and metformin is an appropriate choice of therapy or when use of a sulfonylurea is considered inappropriate.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21

- **Synjardy** (Boehringer Ingelheim Ltd) ▼
  - Empagliflozin 12.5 mg, Metformin hydrochloride 850 mg Synjardy 12.5mg/850mg tablets | 56 tablet [POM] £36.59 DT price = £36.59
  - Empagliflozin 12.5 mg, Metformin hydrochloride 1500 mg Synjardy 12.5mg/1500mg tablets | 56 tablet [POM] £36.59 DT price = £36.59
  - Empagliflozin 25 mg, Metformin hydrochloride 1500 mg Synjardy 25mg/1500mg tablets | 56 tablet [POM] £36.59 DT price = £36.59

**Sulfonylureas**

**Drug Action**

The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.

**Contra-Indications**

Presence of ketoacidosis

**Cautions**

Can encourage weight gain (should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting) · elderly · G6PD deficiency

**Side-Effects**

- **Uncommon**
  - Hypoglycaemia
  - **Rare**
  - Agranulocytosis · aplastic anaemia · blood disorders · cholestatic jaundice · haemolytic anaemia · hepatic failure · hepatitis · leucopenia · pancytopenia · thrombocytopenia

**Frequency Not Known**

Allergic skin reactions (usually in the first 6–8 weeks of therapy) · constipation · diarrhoea · disturbance in liver function · erythema multiforme (usually in the first 6–8 weeks of therapy) · exfoliative dermatitis (usually in the first 6–8 weeks of therapy) · fever (usually in the first 6–8 weeks of therapy) · gastrointestinal disturbances · hypersensitivity reactions (usually in the first 6–8 weeks of therapy) · jaundice (usually in the first 6–8 weeks of therapy) · nausea · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Hypoglycaemia: This is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.

**Hepatic Impairment**

Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.

**Renal Impairment**

Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia. Care is required to use the lowest dose that adequately controls blood glucose. Avoid where possible in severe renal impairment.

**Patient and Carer Advice**

The risk of hypoglycaemia associated with sulfonylureas should be discussed with the patient, especially when concomitant glucose-lowering drugs are prescribed.

**Driving and skilled tasks**

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

**Glibenclamide**

**Indications and Dose**

Type 2 diabetes mellitus

- **By Mouth**
  - Adult: Initially 5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

**Unlicensed Use**

**Contra-Indications**

Avoid where possible in acute porphyrias p. 969

**Interactions** → Appendix 1: sulfonylureas

**Pregnancy**

The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used
during the second and third trimesters of pregnancy in women with gestational diabetes.

- **BREAST FEEDING** Glibenclamide can be used during breast-feeding in women with pre-existing diabetes.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

### Tablet
- **Glibenclamide (Non-proprietary)**
  - Glibenclamide 2.5 mg Glibenclamide 2.5 mg tablets | 28 tablet (Prop) £11.46 DT price = £8.91
  - Glibenclamide 5 mg Glibenclamide 5 mg tablets | 28 tablet (Prop) £14.72 DT price = £11.39

### Gliclazide

- **INDICATIONS AND DOSE**
  - **Type 2 diabetes mellitus**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Adult: Initially 40–80 mg daily, adjusted according to response, increased if necessary up to 160 mg once daily, dose to be taken with breakfast, doses higher than 160 mg to be given in divided doses; maximum 320 mg per day
    - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
      - Adult: Initially 30 mg daily, dose to be taken with breakfast, adjust dose according to response every 4 weeks (after 2 weeks if no decrease in blood glucose); maximum 120 mg per day
  - **DOSE EQUIVALENT AND CONVERSION**
    - Gliclazide modified release 30 mg may be considered to be approximately equivalent in therapeutic effect to standard formulation gliclazide 80 mg.

- **CONTRA-INDICATIONS** Avoid where possible in acute porphyrias p. 969
- **INTERACTIONS** Appendix 1: sulfonylureas
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** Avoid—there is theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, gliclazide which is mainly metabolised in the liver, can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Modified-release tablet
**CAUTIONARY AND ADVISORY LABELS 25**

- **Gliclazide (Non-proprietary)**
  - Gliclazide 30 mg Gliclazide 30 mg modified-release tablets | 28 tablet (Prop) £2.81 DT price = £2.81 | 56 tablet (Prop) £5.62

    - Gliclazide 30 mg Edeil MR 30 mg tablets | 28 tablet (Prop) £2.62 DT price = £2.81 | 56 tablet (Prop) £5.24

#### Glimepiride

- **INDICATIONS AND DOSE**
  - **Type 2 diabetes mellitus**
    - **BY MOUTH**
      - Adult: Initially 1 mg daily, adjusted according to response, then increased in steps of 1 mg every 1–2 weeks, increased to 4 mg daily, dose to be taken shortly before or with first main meal, the daily dose may be increased further, in exceptional circumstances; maximum 6 mg per day

- **CAUTIONS, FURTHER INFORMATION**
  - **Porphyria** Sulfonylureas should be avoided where possible in acute porphyrias p. 969 but glimepiride is thought to be safe.
  - **INTERACTIONS** Appendix 1: sulfonylureas
  - **SIDE-EFFECTS** Hyponatraemia
  - **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
  - **BREAST FEEDING** Avoid—there is theoretical possibility of hypoglycaemia in the infant.

- **MONITORING REQUIREMENTS** Manufacturer recommends regular hepatic and haematological monitoring but limited evidence of clinical value.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**BLOOD GLUCOSE LOWERING DRUGS**

Pioglitazone

- **DRUG ACTION** The thiazolidinedione, pioglitazone, reduces peripheral insulin resistance, leading to a reduction of blood-glucose concentration.

- **INDICATIONS AND DOSE**
  - **Type 2 diabetes mellitus** (alone or combined with metformin or a sulfonylurea, or with both, or with insulin)
    - **BY MOUTH**
    - **Adult**: Initially 15–30 mg once daily, adjusted according to response to 45 mg once daily, in elderly patients, initiate with lowest possible dose and increase gradually; review treatment after 3–6 months and regularly thereafter

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  - Dose of concomitant sulfonylurea or insulin may need to be reduced.

**Tolbutamide**

- **INDICATIONS AND DOSE**
  - **Type 2 diabetes mellitus**
    - **BY MOUTH**
    - **Adult**: 0.5–1.5 g daily in divided doses, dose to be taken with or immediately after meals, alternatively 0.5–1.5 g once daily, dose to be taken with or immediately after breakfast; maximum 2 g per day

- **CONTRA-INDICATIONS** Avoid where possible in acute porphyrias p. 969
- **INTERACTIONS** → Appendix 1: sulfonylureas
- **SIDE-EFFECTS** Headache · tinnitus
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** The use of sulfonylureas in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, the short-acting drug tolbutamide can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

**IMPORTANT SAFETY INFORMATION**

**PIOGLITAZONE: RISK OF BLADDER CANCER (JULY 2011)**

The European Medicines Agency has advised that there is a small increased risk of bladder cancer associated with pioglitazone use. However, in patients who respond adequately to treatment, the benefits of pioglitazone continue to outweigh the risks.

Pioglitazone should not be used in patients with active bladder cancer or a past history of bladder cancer, or in those who have uninvestigated macroscopic haematuria. Pioglitazone should be used with caution in elderly patients as the risk of bladder cancer increases with age.

Before initiating treatment with pioglitazone, patients should be assessed for risk factors of bladder cancer (including age, smoking status, exposure to certain occupational or chemotherapy agents, or previous radiation therapy to the pelvic region) and any macroscopic haematuria should be investigated. The safety and efficacy of pioglitazone should be reviewed after 3–6 months and pioglitazone should be stopped in patients who do not respond adequately to treatment.

Patients already receiving treatment with pioglitazone should be assessed for risk factors of bladder cancer and treatment should be reviewed after 3–6 months, as above.

Patients should be advised to report promptly any haematuria, dysuria, or urinary urgency during treatment.
**Rare national pregnancy contraindications**

**CAUTIONS, FURTHER INFORMATION**

Substitute insulin during peri-operative period.

**INTERACTIONS → Appendix 1: pioglitazone**

**SIDE-EFFECTS**

- **Common or very common** Anaemia; arthralgia; dizziness; gastro-intestinal disturbances; haematuria; headache; hypoaesthesia; impotence; oedema; vertigo; visual disturbances; weight gain

- **Uncommon** Altered blood lipids; bladder cancer; fatigue; hypoglycaemia; insomnia; proteinuria; sweating

- **Rare** Liver dysfunction

**SIDE-EFFECTS, FURTHER INFORMATION**

- Liver toxicity. Rare reports of liver dysfunction; discontinue if jaundice occurs.

**PREGNANCY** Avoid—toxicity in animal studies.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Avoid.

**MONITORING REQUIREMENTS** Monitor liver function before treatment and periodically thereafter.

**PATIENT AND CARER ADVICE**

Lever toxicity. Patients should be advised to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue and dark urine develop.

**NATIONAL FUNDING/ACCESS DECISIONS**

The Scottish Medicines Consortium accepts use of pioglitazone (February 2007) with metformin and a sulfonylurea, for patients (especially if overweight) whose glycaemic control is inadequate despite the use of 2 oral hypoglycaemic drugs and who are unable or unwilling to take insulin; treatment should be initiated and monitored by an experienced diabetes physician.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- **Pioglitazone (Non-proprietary)**
  - Pioglitazone (as Pioglitazone hydrochloride) 15 mg, Metformin 1000 mg tablets | 28 tablet pack £55.00 DT price = £2.22
  - Pioglitazone (as Pioglitazone hydrochloride) 15 mg, Metformin 500 mg tablets | 28 tablet pack £40.00 DT price = £1.63

- **Actos** (Takeda UK Ltd)
  - Pioglitazone (as Pioglitazone hydrochloride) 15 mg, Metformin 1000 mg tablets | 28 tablet pack £50.89 DT price = £1.79

- **Diabimol** (Tillomed Laboratories Ltd)
  - Pioglitazone (as Pioglitazone hydrochloride) 15 mg, Metformin 500 mg tablets | 28 tablet pack £45.89 DT price = £1.71

- **Gildipion** (Actavis UK Ltd)
  - Pioglitazone (as Pioglitazone hydrochloride) 15 mg, Metformin 1000 mg tablets | 28 tablet pack £52.89 DT price = £1.90

**INSULINS**

**Insulins**

**IMPORTANT SAFETY INFORMATION**

**NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF SEVERE HARM AND DEATH DUE TO WITHDRAWING INSULIN FROM PEN DEVICES (NOVEMBER 2016)**

Insulin should not be extracted from insulin pen devices. The strength of insulin in pen devices can vary by multiples of 100 units/mL. Insulin syringes have graduations only suitable for calculating doses of standard 100 units/mL. If insulin extracted from a pen or cartridge is of a higher strength, and that is not considered in determining the volume required, it can lead to a significant and potentially fatal overdose.

**SIDE-EFFECTS**

- **Common or very common** Fat hypertrophy at injection site - local reactions at injection site - transient oedema

- **Rare** Hypersensitivity reactions - rash - urticaria

**ACTIONS**

- **Overdose**
  - Overdose causes hypoglycaemia.

- **PREGNANCY** During pregnancy, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.

- **BREAST FEEDING**
  - During breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.

- **HEPATIC IMPAIRMENT**
  - Insulin requirements may be decreased in patients with hepatic impairment.

- **RENAL IMPAIRMENT**
  - Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary. The compensatory response to hypoglycaemia is impaired in renal impairment.

**MONITORING REQUIREMENTS**

- Many patients now monitor their own blood-glucose concentrations; all carers and children need to be trained to do this.
Since blood-glucose concentration varies substantially throughout the day, ‘normoglycaemia’ cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia.

In adults It is therefore best to recommend that patients should maintain a blood-glucose concentration of between 4 and 9 mmol/litre for most of the time (4–7 mmol/litre before meals and less than 9 mmol/litre after meals).

In children It is therefore best to recommend that children should maintain a blood-glucose concentration of between 4 and 10 mmol/litre for most of the time (4–8 mmol/litre before meals and less than 10 mmol/litre after meals).

While accepting that on occasions, for brief periods, the blood-glucose concentration will be above these values; strenuous efforts should be made to prevent it from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.

**DIRECTIONS FOR ADMINISTRATION** Insulin is generally given by subcutaneous injection; the injection site should be rotated to prevent lipodystrophy. Injection devices (‘pens’), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form, but are less popular with children and carers. For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

**PRESCRIBING AND DISPENSING INFORMATION** Show container to patient or carer and confirm the expected version is dispensed.

Units The word ‘unit’ should not be abbreviated.

**PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems. Insulin Passport Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient’s current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:

3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham
OL9 9QH
Tel: 0845 610 1112
GP practices can obtain supplies through their Local Area Team stores.

NHS Trusts can order supplies from www.nhsforms.co.uk/ or by emailing nhsforms@mnim.com. Further information is available at www.npsa.nhs.uk.

Hypoglycaemia Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

      - Insulman Basal 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Po) £17.50 DT price = £19.08
    - **Insuman Basal SoloStar** (Sanofi)
      - Insulin human (as insulin isophane human) 100 unit per 1 ml Insuman Basal SoloStar 100units/ml suspension for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection (Po) £19.80 DT price = £21.70

Biphasic insulin aspart

(Intermediate-acting insulin)

- **INDICATIONS AND DOSE**
  - **Diabetes mellitus**
    - **By subcutaneous injection**
    - **Child:** Administer up to 10 minutes before or soon after a meal, according to requirements
    - **Adult:** Administer up to 10 minutes before or soon after a meal, according to requirements
  - **INTERACTIONS** → Appendix 1: insulins
  - **SIDE-EFFECTS** Protamine may cause allergic reactions.
  - **PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Suspension for injection**
    - **NovoMix 30 FlexPen** (Novo Nordisk Ltd)
      - Insulin aspart 30 unit per 1 ml, Insulin aspart (as insulin aspart protamine) 70 unit per 1 ml NovoMix 30 FlexPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (Po) £29.89 DT price = £29.89
    - **NovoMix 30 Penfill** (Novo Nordisk Ltd)
      - Insulin aspart 30 unit per 1 ml, Insulin aspart (as insulin aspart protamine) 70 unit per 1 ml NovoMix 30 Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Po) £28.79 DT price = £28.79

Biphasic insulin lispro

(Intermediate-acting insulin)

- **INDICATIONS AND DOSE**
  - **Diabetes mellitus**
    - **By subcutaneous injection**
    - **Child:** Administer up to 15 minutes before or soon after a meal, according to requirements
    - **Adult:** Administer up to 15 minutes before or soon after a meal, according to requirements
  - **CAUTIONS** Children under 12 years (use only if benefit likely compared to soluble insulin)
  - **INTERACTIONS** → Appendix 1: insulins
  - **SIDE-EFFECTS** Protamine may cause allergic reactions.
  - **PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Suspension for injection**
    - **Humalog Mix25** (Eli Lilly and Company Ltd)
      - Insulin lispro 25 unit per 1 ml, Insulin lispro (as insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 100units/ml suspension for injection 10ml vials | 1 vial (Po) £16.61
      - Humalog Mix25 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Po) £22.46 DT price = £22.46
    - **Humalog Mix25 KwikPen** (Eli Lilly and Company Ltd)
      - Insulin lispro 25 unit per 1 ml, Insulin lispro (as insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 KwikPen 100units/ml
Insulin degludec with liraglutide

02-Jun-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, insulin degludec above, liraglutide p. 659.

**INDICATIONS AND DOSE**

As add-on to oral antidiabetics in type 2 diabetes mellitus not controlled by oral antidiabetics alone

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 10 dose-steps once daily, adjusted according to response; maximum 50 dose-steps per day

When transferring from basal insulin in type 2 diabetes mellitus not controlled by oral antidiabetics in combination with basal insulin

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 16 dose-steps once daily, adjusted according to response; maximum 50 dose-steps per day

**INTERACTIONS**  ➔ Appendix 1: insulins, liraglutide

**PATIENT AND CARER ADVICE**

Counselling advised on administration. Show container to patient and confirm that patient is expecting the version dispensed.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (October 2015) that insulin degludec with liraglutide (Xultophy®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus to improve glycaemic control in combination with oral glucose-lowering medicinal products when these alone or combined with a GLP-1 receptor agonist or with basal insulin do not provide adequate glycaemic control.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Xultophy (Novo Nordisk Ltd)**
  - Liraglutide 3.6 mg per 1 ml, Insulin human (as Insulin degludec) 100 unit per 1 ml / Xultophy 100units/ml / 3.6mg/ml solution for injection 3ml pre-filled pen | 3 pre-filled disposable injection £95.53

**Insulin detemir**

(Recombinant human insulin analogue—long acting)

**INDICATIONS AND DOSE**

Diabetes mellitus

- **BY SUBCUTANEOUS INJECTION**
  - Child 2-17 years: According to requirements
  - Adult: According to requirements

**INTERACTIONS**  ➔ Appendix 1: insulins

**PREGNANCY**

Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 670 is recommended where longer-acting insulins are needed; insulin detemir may also be considered where longer-acting insulins are needed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Levemir FlexPen (Novo Nordisk Ltd)**
  - Insulin human (as Insulin detemir) 100 unit per 1 ml / Levemir FlexPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection £42.00 DT price = £42.00
Insulin glargine
(Recombinant human insulin analogue—long acting)

- **INDICATIONS AND DOSE**
  - **Diabetes mellitus**
    - By subcutaneous injection
    - Child: 2–17 years: According to requirements
    - Adult: According to requirements
  - **TOUJEO®**
    - **Diabetes mellitus**
      - By subcutaneous injection
      - Adult: According to requirements

- **INTERACTIONS** → Appendix 1: insulins
- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.
- **PRESCRIBING AND DISPENSING INFORMATION** Insulin glargine is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1. Dose adjustments and close metabolic monitoring is recommended if switching between insulin glargine preparations.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) Decisions
    - The Scottish Medicines Consortium has advised that Lantus® preparations (April 2013) and Toujeo® (August 2015) are accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:
      - in those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulin
      - as a once daily insulin therapy for patients who require a carer to administer their insulin
    - It is **not** recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent episodes of hypoglycaemia or require assistance with their insulin injections.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - **Abasaglar (Eli Lilly and Company Ltd)**
      - Insulin human (as Insulin glargine) 100 unit per 1 ml Abasaglar 100 units/ml solution for injection 3ml cartridges | 5 cartridge POM £42.00 DT price = £42.00
    - **Abasaglar KwikPen (Eli Lilly and Company Ltd)**
      - Insulin human (as Insulin glargine) 100 unit per 1 ml Abasaglar KwikPen 100 units/ml solution for injection 3ml cartridges | 5 cartridge POM £42.00 DT price = £42.00
    - **Lantus (Sanofi)**
      - Insulin human (as Insulin glargine) 100 unit per 1 ml Lantus 100 units/ml solution for injection 3ml cartridges | 5 cartridge POM £41.50 DT price = £41.50
      - Lantus 100 units/ml solution for injection 10ml vials | 1 vial POM £30.68
  - **Toujeo® (Sanofi)**
      - Insulin human (as Insulin glargine) 100 unit per 1 ml Toujeo 100 units/ml solution for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection (POM) £44.85 DT price = £44.85
      - Insulin human (as Insulin glargine) 300 unit per 1 ml Toujeo 300 units/ml solution for injection 1.5ml pre-filled SoloStar pen | 3 pre-filled disposable injection (POM) £33.13

Insulin zinc suspension
(Insulin zinc suspension (mixed)—long acting)

- **INDICATIONS AND DOSE**
  - **Diabetes mellitus**
    - By subcutaneous injection
    - Child: According to requirements
    - Adult: According to requirements
  - **INTERACTIONS** → Appendix 1: insulins
  - **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 670 is recommended where longer-acting insulins are needed; insulin detemir p. 671 may also be considered.
  - **PRESCRIBING AND DISPENSING INFORMATION**
    - A sterile neutral suspension of bovine and/or porcine insulin or of human insulin in the form of a complex obtained by the addition of a suitable zinc salt; consists of rhombohedral crystals (10–40 microns) and of particles of no uniform shape (not exceeding 2 microns).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Suspension for injection**
    - **Hypurin Bovine Lente** (Wockhardt UK Ltd)
      - Insulin bovine (as Insulin zinc suspension mixed bovine) 100 unit per 1 ml
      - Hypurin Bovine Lente 100 units/ml suspension for injection 10ml vials | 1 vial POM £27.72

Protamine zinc insulin
(Protamine zinc insulin injection—long acting)

- **INDICATIONS AND DOSE**
  - **Diabetes mellitus**
    - By subcutaneous injection
    - Child: According to requirements
    - Adult: According to requirements
  - **INTERACTIONS** → Appendix 1: insulins
  - **SIDE-EFFECTS** Protamine may cause allergic reactions
  - **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 670 is recommended where longer-acting insulins are needed; insulin detemir p. 671 may also be considered.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - A sterile suspension of insulin in the form of a complex obtained by the addition of a suitable protamine and zinc chloride; this preparation was included in BP 1980 but is not included in BP 1988.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Suspension for injection**
    - **Hypurin Bovine Protamine Zinc** (Wockhardt UK Ltd)
      - Insulin bovine (as Insulin protamine zinc bovine) 100 unit per 1 ml
      - Hypurin Bovine Protamine Zinc 100 units/ml suspension for injection 10ml vials | 1 vial POM £27.72
**INSULINS › RAPID-ACTING**

**Insulin**
*(Insulin Injection; Neutral Insulin; Soluble Insulin—short acting)*

**INDICATIONS AND DOSE**

**Diabetes mellitus**
- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
  - Adult: According to requirements

**Diabetic ketoacidosis › Diabetes during surgery**
- BY INTRAVENOUS INJECTION
  - Adult: (consult local protocol)

**INTERACTIONS › Appendix 1: insulins**

**DIRECTIONS FOR ADMINISTRATION**

Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team. Some insulin preparations are not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle—consult product literature.

With intravenous use For intravenous infusion give continuously in Sodium chloride 0.9%. Adsorbed to some extent by plastic infusion set; ensure insulin is not injected into ‘dead space’ of injection port of the infusion bag.

**PRESCRIBING AND DISPENSING INFORMATION**

A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151
  - Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:
    - who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or
    - whose glycaemic control remains inadequate (HbA1c over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).
  - Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.
  - www.nice.org.uk/TA151

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

**Solution for injection**
- Actrapid (Novo Nordisk Ltd)

- Insumin Insufast 100units/ml solution for injection 10ml vials | 3 vial (Cost) £250.00
- Insumin Rapid (Sanofi)
  - Insulin human (as Insulin soluble human) 100 unit per 1 ml Insumin Rapid 100units/ml solution for injection 3ml cartridges | 5 cartridge (Cost) £17.50

**Insulin aspart**
*(Recombinant human insulin analogue—short acting)*

**INDICATIONS AND DOSE**

**Diabetes mellitus**
- BY SUBCUTANEOUS INJECTION
  - Child 2–17 years: Administer immediately before meals or when necessary shortly after meals, according to requirements
  - Adult: Administer immediately before meals or when necessary shortly after meals, according to requirements
- BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
  - Child 2–17 years: According to requirements
  - Adult: According to requirements

**FIASP ®**

**Diabetes mellitus**
- BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY CONTINUOUS SUBCUTANEOUS INFUSION
  - Adult: According to requirements

**UNLICENSED USE**

Not licensed for use in children under 2 years.

**INTERACTIONS › Appendix 1: insulins**

**PREGNANCY**

Not known to be harmful—may be used during pregnancy.

**BREAST FEEDING**

Not known to be harmful—may be used during lactation.

**DIRECTIONS FOR ADMINISTRATION**

Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for
patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.

- With intravenous use in adults. For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%; dilute to 0.05–1 unit/mL with infusion fluid; adsorbed to some extent by plastics of infusion set.
- With intravenous use in children. For intravenous infusion, dilute to a concentration of 0.05–1 unit/mL with Glucose 5% or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151

Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:

- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or

- whose glycaemic control remains inadequate (HbA1c over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

www.nice.org.uk/TA151

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (April 2017) that insulin aspart (Fiasp®) is accepted for use within NHS Scotland for the treatment of diabetes mellitus in adults.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Fiasp** (Novo Nordisk Ltd) ▼
  - Insulin aspart 100 unit per 1 ml Flasp 100units/ml solution for injection 10ml vials | 1 vial £0.80 DT price = £14.08

**Diabetes mellitus, diagnostic and monitoring devices**

**Urinalysis**

Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely required unless they become unwell—see Blood Monitoring.

Microalbuminuria can be detected with Micral-Test II® but this should be followed by confirmation in the laboratory, since false positive results are common.

**Blood monitoring**

Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Patients should be properly trained in the use of blood glucose monitoring systems and to take appropriate action on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. Self-monitoring of blood-glucose concentration is appropriate for patients with type 2 diabetes:

- who are treated with insulin;
- who are treated with oral hypoglycaemic drugs e.g. sulfonylureas, to provide information on hypoglycaemia;
- to monitor changes in blood-glucose concentration resulting from changes in lifestyle or medication, and during intercurrent illness;
- to ensure safe blood-glucose concentration during activities, including driving.
In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units. If the patient is unwell and diabetic ketoacidosis is suspected, blood ketones should be measured according to local guidelines. Patients and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

- **Autoopen Classic hypodermic insulin injection pen reusable for 3ml cartridge 2 unit dial up / range 2-42 units** (Owen Mumford Ltd)
  - 1device - NHS indicative price = £16.72 - Drug Tariff (Part IXa)
3.2 Hypoglycaemia

Hypoglycaemia

Treatment of hypoglycaemia

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. If necessary this may be repeated after 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal (if it is due) can prevent blood-glucose concentration from falling again.

Proprietary products of quick-acting carbohydrate (e.g. GlucoGel®, DextroGel®, GSF-Syrup®, Rapilose® gel) are available on prescription for patients to keep on hand in case of hypoglycaemia.

Alternatively, approximately 10 g of glucose is available from 2 teaspoons of sugar, or from 3 sugar lumps, and also from non-diet versions of the following soft drinks: 110 mL of Lucozade® Energy Original® (also, see note below), 100 mL of Coca-Cola®, 19 mL of Ribena® Blackcurrant (to be diluted). Note: the carbohydrate content of some commercially available glucose-containing drinks is currently subject to change—individual product labels should be checked. Patients should be aware that for a time, both old and new bottles and cans may be available—individual product labels should be checked.

Hypoglycaemia which causes unconsciousness is an emergency. Glucagon p. 681, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases plasma-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon may be issued to close relatives of insulin-treated patients for emergency use in hypoglycaemic attacks. It is often advisable to prescribe on an “if necessary” basis to hospitalised insulin-treated patients, so that it may be given rapidly by the nurses during an hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, glucose intravenous infusion 20% may be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritating especially if extravasation occurs. Glucose intravenous infusion 10% may also be used but larger volumes are needed. Glucose intravenous infusion 50% is not recommended because of the higher risk of extravasation injury and because administration is difficult. Close monitoring is necessary in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Patients whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs may persist for many hours.

See also, emergency management of hypoglycaemia in dental practice for further advice.

Chronic hypoglycaemia

Diazoxxe p. 681, administered by mouth, is useful in the management of patients with chronic hypoglycaemia from
excess endogenous insulin secretion, either from an islet cell tumour or islet cell hyperplasia. It has no place in the management of acute hypoglycaemia.

**GLYCOGENOLYTIC HORMONES**

**Glucagon**

- **INDICATIONS AND DOSE**
  - **Insulin-induced hypoglycaemia**
    - By subcutaneous injection, or by intramuscular injection
  - **Child 1 month–1 year**: 500 micrograms
  - **Child 2–7 years (body weight up to 25 kg)**: 500 micrograms, if no response within 10 minutes intravenous glucose must be given
  - **Child 2–7 years (body weight 25 kg and above)**: 1 mg, if no response within 10 minutes intravenous glucose must be given
  - **Adult**: 1 mg, if no response within 10 minutes intravenous glucose must be given

- **Beta-blocker poisoning (cardiogenic shock unresponsive to atropine)**
  - Initially by intravenous injection
  - **Child**: 50–150 micrograms/kg (max. per dose 10 mg), to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour
  - **Adult**: 2–10 mg, to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour

- **Diagnostic aid**
  - By intravenous injection, or by intramuscular injection
  - **Adult**: (consult product literature)

- **DOSE EQUIVALENCE AND CONVERSION**
  - 1 unit of glucagon = 1 mg of glucagon.

- **UNLICENSED USE** Dose and indication for cardiogenic shock unresponsive to atropine in beta-blocker overdose not licensed.

- **CONTRA-INDICATIONS** Phaeochromocytoma

- **CAUTIONS** Glucagonoma - ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency - insulinoma

- **INTERACTIONS** → Appendix 1: glucagon

- **SIDE-EFFECTS**
  - Rare
  - Hypersensitivity reactions
  - Frequency not known
  - Abdominal pain (in adults) - diarrhoea (in children) - hypokalaemia - hypotension (in adults) - nausea - vomiting

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use in children. When administered by continuous intravenous infusion, do not add to infusion fluids containing calcium—precipitation may occur.

- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Glucagon for hypoglycaemia
  - www.medicinesforchildren.org.uk/glucagon-for-hypoglycaemia

- **EXCEPTIONS TO LEGAL CATEGORY** Prescription-only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**THIAZIDE DERIVATIVES**

**Diazoxide**

- **INDICATIONS AND DOSE**
  - **Chronic intractable hypoglycaemia**
    - By mouth
  - **Adult**: Initially 5 mg/kg daily in 2–3 divided doses, adjusted according to response; maintenance 3–8 mg/kg daily in 2–3 divided doses

- **CAUTIONS** Aortic coarctation - aortic stenosis - arteriovenous shunt - heart failure - hyperuricaemia - impaired cardiac circulation - impaired cerebral circulation

- **INTERACTIONS** → Appendix 1: diazoxide

- **PREGNANCY** Use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity during labour.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAI IMPAIRMENT** Dose reduction may be required.

- **MONITORING REQUIREMENTS**
  - Monitor blood pressure.
  - Monitor white cell and platelet count during prolonged use.

**Disorders of bone metabolism**

**Bone metabolism**

**Osteoporosis**

Osteoporosis occurs most commonly in postmenopausal women and in those taking long-term oral corticosteroids (glucocorticosteroids). Other risk factors for osteoporosis include low body weight, cigarette smoking, excess alcohol intake, lack of physical activity, family history of osteoporosis, and early menopause.
Those at risk of osteoporosis should maintain an adequate intake of **calcium and vitamin D** and any deficiency should be corrected by increasing dietary intake or taking supplements.

Elderly patients, especially those who are housebound or live in residential or nursing homes, are at increased risk of calcium and vitamin D deficiency and may benefit from supplements. Reversible secondary causes of osteoporosis such as hyperthyroidism, hyperparathyroidism, osteomalacia or hypogonadism should be excluded, in both men and women, before treatment for osteoporosis is initiated.

Also see: calcium, phosphorus, vitamin D and oestrogens in postmenopausal osteoporosis.

**Postmenopausal osteoporosis**
The **bisphosphonates** (alendronic acid and risedronate) are effective for preventing postmenopausal osteoporosis.

**Hormone replacement therapy (HRT)** is an option where other therapies are contra-indicated, cannot be tolerated, or if there is a lack of response. The CSM has advised that HRT should not be considered first-line therapy for long-term prevention of osteoporosis in women over 50 years of age. HRT is of most benefit for the prophylaxis of postmenopausal osteoporosis if started early in menopause and continued for up to 5 years, but bone loss resumes (possibly at an accelerated rate) on stopping HRT. Women of Afro-Caribbean origin appear to be less susceptible to osteoporosis than those who are white or of Asian origin.

Postmenopausal osteoporosis may be treated with a **bisphosphonate**. The bisphosphonates (such as alendronate and risedronate) decrease the risk of vertebral fracture; alendronate and risedronate have also been shown to reduce non-vertebral fractures. If bisphosphonates are unsuitable calcitriol p. 992 or **strontium ranelate** may be considered.

Calcitonin (salmon) p. 689 is no longer recommended for the treatment of postmenopausal osteoporosis as the benefits are outweighed by the risk of malignancy associated with long-term use. Calcitonin (salmon) [unlicensed indication] has been used for pain relief for up to 3 months after a vertebral fracture when other analgesics were ineffective, but the benefits of treatment should be balanced against the risks. **Teriparatide** has been introduced for the treatment of postmenopausal osteoporosis.

**Corticosteroid-induced osteoporosis**
To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible. The risk of osteoporosis may be related to cumulative dose of corticosteroids; even intermittent courses can therefore increase the risk. The greatest rate of bone loss occurs during the first 6–12 months of corticosteroid use and so early steps to prevent the development of osteoporosis are important.

Long-term use of high-dose inhaled corticosteroids may also contribute to corticosteroid-induced osteoporosis.

Patients taking (or who are likely to take) an oral corticosteroid for 3 months or longer should be assessed and where necessary given prophylactic treatment; those aged over 55 years are at greater risk. Patients taking oral corticosteroids who have sustained a low trauma fracture should receive treatment for osteoporosis. The therapeutic options for **prophylaxis and treatment** of corticosteroid-induced osteoporosis are the same:

- a bisphosphonate;
- calcitriol [unlicensed indication];
- hormone replacement (HRT in women, testosterone in men [unlicensed indication]).

**Calcitonin and parathyroid hormone**
Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homeostasis. Calcitonin (salmon) (synthetic or recombinant salmon calcitonin) is used to lower the plasma-calcium concentration in patients with hypercalcaemia associated with malignancy.

Calcitonin (salmon) is also licensed for treatment of Paget’s disease of bone when other treatments are ineffective or inappropriate; it is also licensed for the prevention of acute bone loss due to sudden immobility.

Calcitonin (salmon) is no longer recommended for the prevention or treatment of postmenopausal osteoporosis because the benefits are outweighed by the risk of malignancy associated with long-term use.

Teriparatide p. 690 (a recombinant fragment of parathyroid hormone) is used for the treatment of postmenopausal osteoporosis, osteoporosis in men at increased risk of fracture, and corticosteroid-induced osteoporosis.

Cinacalcet p. 957 is licensed for the treatment of hypercalcaemia in parathyroid carcinoma.

**Bisphosphonates**
Bisphosphonates have an important role in the prophylaxis and treatment of osteoporosis and corticosteroid-induced osteoporosis; alendronic acid p. 683 or risedronate sodium p. 686 are considered the drugs of choice for these conditions. There is no consistent evidence of any further benefit from continuing treatment with a bisphosphonate beyond 3 years in patients with osteoporosis.

**Strontium ranelate**
Strontium ranelate treatment has been associated with an increased risk of serious cardiovascular disease, including myocardial infarction, and the risk should be assessed before treatment and regularly during treatment.

**ANABOLIC STEROID**

---

**Nandrolone**

- **INDICATIONS AND DOSE**
  - **Osteoporosis in postmenopausal women (but not recommended)**
    - **BY DEEP INTRAMUSCULAR INJECTION**
      - Adult (female): 50 mg every 3 weeks.
  - **CONTRA-INDICATIONS**
    - Acute porphyrias p. 969 - male breast cancer - prostate cancer
  - **CAUTIONS**
    - Cardiac impairment - diabetes mellitus - epilepsy - hypertension - migraine - skeletal metastases (risk of hypercalcaemia)
  - **INTERACTIONS**
    - **SIDE-EFFECTS** Abnormal liver-function tests (with high doses) - acne - amenorrhoea - inhibition of spermatogenesis - liver tumours (with prolonged treatment with anabolic steroids) - premature epiphyseal closure - sodium retention with oedema - virilisation (with high doses including voice changes—sometimes irreversible)
Bisphosphonates

**DRUG ACTION** Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: BISPHOSPHONATES: ATYPICAL FEMORAL FRACTURES (JUNE 2011)**

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis.

The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget’s disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of osteoporosis.

All patients should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients should also maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms such as dental mobility, pain, or swelling, non-healing sores or discharge to a doctor and dentist during treatment.

Before prescribing an intravenous bisphosphonate, patients should be given a patient reminder card and informed of the risk of osteonecrosis of the jaw. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, and if the patient wears dentures, they should make sure their dentures fit properly. Patients should tell their doctor and dentist that they are receiving an intravenous bisphosphonate if they need dental treatment or dental surgery.

**MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE EXTERNAL AUDITORY CANAL (DECEMBER 2015)**

Benign idiopathic osteonecrosis of the external auditory canal has been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term therapy (2 years or longer).

The possibility of osteonecrosis of the external auditory canal should be considered in patients receiving bisphosphonates who present with ear symptoms, including chronic ear infections, or suspected cholesteatoma.

Risk factors for developing osteonecrosis of the external auditory canal include: steroid use, chemotherapy, infection, an ear operation, or cotton-bud use.

Patients should be advised to report any ear pain, discharge from the ear, or an ear infection during treatment with a bisphosphonate.

**Alendronic acid** (Alendronate)

### INDICATIONS AND DOSE

**Treatment of postmenopausal osteoporosis**

- **BY MOUTH**
  - Adult (female): 10 mg daily, alternatively 70 mg once weekly.

**Treatment of osteoporosis in men**

- **BY MOUTH**
  - Adult (male): 10 mg daily.

**Prevention and treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving hormone replacement therapy**

- **BY MOUTH**
  - Adult (female): 10 mg daily.

### CONTRA-INDICATIONS

Abnormalities of oesophagus - hypocalcaemia - other factors which delay emptying (e.g. stricture or achalasia)

### CAUTIONS

Active gastro-intestinal bleeding - atypical femoral fractures - duodenitis - dysphagia - exclude other causes of osteoporosis - gastritis - history (within 1 year) of ulcers - surgery of the upper gastro-intestinal tract - symptomatic oesophageal disease - ulcers - upper gastro-intestinal disorders

### INTERACTIONS

Appendix 1: bisphosphonates

### SIDE-EFFECTS

- Common or very common - Abdominal distension - abdominal pain - constipation - diarrhoea - dyspepsia -
684 Disorders of bone metabolism

Endocrine system

flatulence · headache · oesophageal reactions · regurgitation

- **Uncommon** Episcleritis · erythema · gastritis · nausea · rash · scleritis · uveitis · vomiting
- **Rare** Atypical femoral fractures with long-term use · hypocalcaemia · osteonecrosis of the jaw · photosensitivity · severe skin reactions · Stevens-Johnson syndrome · toxic epidermal necrolysis · upper gastro-intestinal ulcers
- **Very rare** Osteonecrosis of the external auditory canal
- **Frequency not known** Musculoskeletal pain

**SIDE-EFFECTS, FURTHER INFORMATION**

- Oesophageal reactions  Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

- **PREGNANCY** Avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 35 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting treatment. Monitor serum-calcium concentration during treatment.

**DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole and oral solution should be swallowed as a single 100 mL dose. Doses should be taken with plenty of water while sitting or standing, on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after administration.

- **PATIENT AND CARER ADVICE** Patients or their carers should be given advice on how to administer alendronic acid tablets and oral solution. Oesophageal reactions Patients (or their carers) should be advised to stop taking alendronic acid and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA160

**Alendronate** is recommended as a treatment option for the primary prevention of osteoporotic fractures in the following susceptible postmenopausal women:

- Women over 70 years who have an independent risk factor for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis) or an indicator of low bone mineral density (body mass index under 22 kg/m², ankylosing spondylitis, Crohn’s disease, prolonged immobility, untreated premature menopause, or rheumatoid arthritis) and confirmed osteoporosis.
- Women aged 65–69 years who have an independent risk factor for fracture and confirmed osteoporosis.
- Women under 65 years who have an independent risk factor for fracture and at least one additional indicator of low bone mineral density and confirmed osteoporosis.

www.nice.org.uk/TA160

- Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

**Alendronate** is recommended as a treatment option for the secondary prevention of osteoporotic fractures in susceptible postmenopausal women.

www.nice.org.uk/TA161

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (April 2016) that alendronic acid (*Binosto®*) is accepted for restricted use within NHS Scotland for the treatment of postmenopausal osteoporosis where alendronic acid is the appropriate treatment choice, but the patient is unable to swallow tablets.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Oral solution**

- **Alendronic acid (Non-proprietary)**
  - Alendronic acid 700 microgram per 1 mL  Alendronic acid 70mg/100ml oral solution unit dose sugar free sugar-free | 4 unit dose (PoP) £27.36 DT price + £27.36

**Effervescent tablet**

- **Binosto** (Internis Pharmaceuticals Ltd)
  - Alendronic acid (as Alendronate sodium) 70 mg Binosto 70mg effervescent tablets sugar-free | 4 tablet (PoP) £22.80 DT price + £22.80

**Tablet**

- **Alendronic acid (Non-proprietary)**
  - Alendronic acid (as Alendronate sodium) 10 mg Alendronic acid 10mg tablets | 28 tablet (PoP) £3.25 DT price + £1.83
  - Alendronic acid (as Alendronate sodium) 70 mg Alendronic acid 70mg tablets | 4 tablet (PoP) £22.80 DT price + £0.74

- **Fosamax** (Merck Sharp & Dohme Ltd)
  - Alendronic acid (as Alendronate sodium) 10 mg Fosamax 10mg tablets | 28 tablet (PoP) £23.12 DT price + £1.83
  - Alendronic acid (as Alendronate sodium) 70 mg Fosamax Once Weekly 70mg tablets | 4 tablet (PoP) £22.80 DT price + £0.74

**Alendronic acid with colecalciferol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, alendronic acid p. 683, colecalciferol p. 992.

**INDICATIONS AND DOSE**

**Treatment of postmenopausal osteoporosis in women at risk of vitamin D deficiency**

- **BY MOUTH**
  - Adult (female): 1 tablet once weekly.

**INTERACTIONS**

- **Appendix 1:** bisphosphonates, vitamin D substances

**DIRECTIONS FOR ADMINISTRATION**

Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer alendronic acid with colecalciferol tablets.
Ibodranic acid

### INDICATIONS AND DOSE

**Reduction of bone damage in bone metastases in breast cancer**
- **INITIALLY BY MOUTH**
- Adult: 50 mg daily, alternatively (by intravenous infusion) 6 mg every 3–4 weeks

**Hypercalcaemia of malignancy**
- **BY INTRAVENOUS INFUSION**
- Adult: 2–4 mg as a single infusion, dose to be adjusted according to serum calcium concentration

**Treatment of postmenopausal osteoporosis**
- **INITIALLY BY MOUTH**
- Adult (female): 150 mg once a month, alternatively (by intravenous injection) 3 mg every 3 months, to be administered over 15–30 seconds.

### CONTRA-INDICATIONS

**GENERAL CONTRA-INDICATIONS**

Hypocalcaemia

**SPECIFIC CONTRA-INDICATIONS**

- With oral use Abnormalities of the oesophagus - other factors which delay emptying (e.g. stricture or achalasia)
- **CAUTIONS** Atypical femoral fractures - cardiac disease (avoid fluid overload)

**INTERACTIONS**

- Appendix 1: bisphosphonates

**SIDE-EFFECTS**

- **RARE** Anaemia - angioedema - atypical femoral fractures - bronchospasm - hypersensitivity reactions - injection-site reactions - pruritus - urticaria
- **VERY RARE** Osteonecrosis of the external auditory canal - osteonecrosis of the jaw

**SPECIFIC SIDE-EFFECTS**

- With oral use Severe oesophageal reactions (discontinue)
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid—present in milk in animal studies.
- **RENAL IMPAIRMENT**
  - With intravenous use When used for bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce dose to 4 mg and infuse over 1 hour; if eGFR less than 30 mL/minute/1.73 m² reduce dose to 2 mg and infuse over 1 hour.
  - With oral use When used for bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce dose to 50 mg on alternate days; if eGFR less than 30 mL/minute/1.73 m² reduce dose to 50 mg once weekly. When used for postmenopausal osteoporosis, avoid if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor renal function and serum calcium, phosphate and magnesium.

**DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes (for most ibandronic acid tablets, 50 mg) or 1 hour (for Boniva™ tablets, 150 mg) before first food or drink (other than water) of the day, or another oral medicine; patient should stand or sit upright for at least 1 hour after taking tablet.

For **intravenous infusion (Bondronat®)**, give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute requisite dose in 500 mL infusion fluid and give over 1–2 hours.

### PATIENT AND CARER ADVICE

A patient reminder card should be provided to patients receiving intravenous ibandronic acid (risk of osteonecrosis of the jaw).

Patients or carers should be given advice on how to administer ibandronic acid tablets.

**Oesophageal reactions** Patients and carers should be advised to stop tablets and seek medical attention for symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Ibandronic acid (Non-proprietary)**
  - Ibandronic acid (as ibandronic sodium monohydrate) 1 mg per 1 mL Ibandronic acid 3mg/3ml solution for injection pre-filled syringes
    | 1 pre-filled disposable injection
  - Bondronat (Roche Products Ltd)
  - Ibandronic acid (as ibandronic sodium monohydrate) 1 mg per 1 mL Bonviva 3mg/3ml solution for injection pre-filled syringes
    | 1 pre-filled disposable injection

**Solution for infusion**
- **Ibandronic acid (Non-proprietary)**
  - Ibandronic acid (as ibandronic sodium monohydrate) 1 mg per 1 mL Ibandronic acid 2mg/2ml solution for infusion vials
    | 1 vial
  - Bondronat (Roche Products Ltd)
  - Ibandronic acid (as ibandronic sodium monohydrate) 1 mg per 1 mL Bondronat 2mg/2ml concentrate for solution for infusion vials
    | 1 vial

**Tablet**
- **Ibandronic acid (Non-proprietary)**
  - Ibandronic acid (as ibandronic sodium monohydrate) 50 mg
    | 28 tablet

  | Price
  | £17.51

  | 150 mg
  | 28 tablet

  | Price
  | £14.80

  | 50 mg
  | 28 tablet

  | Price
  | £18.40

  | 150 mg
  | 28 tablet

  | Price
  | £18.00

**Bondronat (Roche Products Ltd)**
- Ibandronic acid (as ibandronic sodium monohydrate) 150 mg
    | 1 tablet

  | Price
  | £17.48

  | 150 mg
  | 1 tablet

  | Price
  | £18.40

**Iasibon (Aspire Pharma Ltd)**
- Ibandronic acid (as ibandronic sodium monohydrate) 50 mg
    | 28 tablet

  | Price
  | £17.50

**Quodixor (Aspire Pharma Ltd)**
- Ibandronic acid (as ibandronic sodium monohydrate) 150 mg
    | 1 tablet

  | Price
  | £18.40
Pamidronate disodium
(Formerly called aminohydroxypropylidenediphosphonate disodium (APD))

- **INDICATIONS AND DOSE**
  - **Hypercalcaemia of malignancy**
    - **BY INTRAVENOUS INFUSION**
      - Adult: 15–60 mg, to be given (via cannula in a relatively large vein) as a single infusion or in divided doses over 2–4 days, dose adjusted according to serum calcium concentration; maximum 90 mg per course
  - **OSTEOLYTIC LESIONS AND BONE PAIN IN BONE METASTASES ASSOCIATED WITH BREAST CANCER OR MULTIPLE MYELOMA**
    - **BY INTRAVENOUS INFUSION**
      - Adult: 90 mg every 4 weeks, to be administered via cannula in a relatively large vein, dose may alternatively be administered every 3 weeks, to coincide with chemotherapy in breast cancer
  - **Paget’s disease of bone**
    - **BY INTRAVENOUS INFUSION**
      - Adult: 30 mg every week for a 6 week course (total dose 180 mg), alternatively initially 30 mg once weekly for 1 week, then increased to 60 mg every 2 weeks (max. per dose 60 mg) for a 6 week course (total dose 210 mg), to be administered via cannula in a relatively large vein, course may be repeated every 6 months; maximum 360 mg per course

- **CAUTIONS**
  - Atypical femoral fractures - cardiac disease (especially in elderly) - ensure adequate hydration - previous thyroid surgery (risk of hypocalcaemia)
  - **INTERACTIONS**
    - Appendix 1: bisphosphonates

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain - anaemia - anorexia - arthralgia - bone pain - constipation - diarrhoea - drowsiness - fever - headache - hypertension - hypomagnesaemia - hypophosphataemia - influenza - like symptoms (sometimes accompanied by malaise, rigor, fatigue and flushest) - insomnia - lymphocytopenia - myalgia - nausea - paraesthesia - rash - symptomatic hypocalcaemia - tetany - thrombocytopenia - vomiting
  - Rare Acute renal failure - agitation - atypical femoral fractures - confusion - conjunctivitis - deterioration of renal disease - dizziness - dyspepsia - haematuria - hallucinations - hyperkalaemia - hypernatraemia - hypokalaemia - hypotension - isolated cases of seizures - lethargy - leucopenia - muscle cramps - osteonecrosis of the jaw - other ocular symptoms - pruritus
  - Very rare Osteonecrosis of the external auditory canal
  - Frequency not known Atrial fibrillation - injection-site reactions - reactivation of herpes simplex - reactivation of herpes zoster

**SIDE-EFFECTS, FURTHER INFORMATION**

- Calcium and vitamin D supplements Oral supplements are advised to minimise potential risk of hypocalcaemia for those with mainly lytic bone metastases or multiple myeloma at risk of calcium or vitamin D deficiency (e.g. through malabsorption or lack of exposure to sunlight) and in those with Paget’s disease.
- **PREGNANCY** Avoid — toxicity in animal studies.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Caution in severe hepatic impairment — no information available.
- **RENA L IMPAIRMENT** Max. infusion rate 20 mg/hour. Avoid if eGFR less than 30 mL/minute/1.73 m², except in life-threatening hypercalcaemia if benefit outweighs risk. If renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value.

- **MONITORING REQUIREMENTS**
  - Monitor serum electrolytes, calcium and phosphate — possibility of convulsions due to electrolyte changes.
  - Assess renal function before each dose.

- **DIRECTIONS FOR ADMINISTRATION** For slow intravenous infusion (Aredia®, Pamidronate disodium, Hospira, Medac, Wockhardt), give intermittently in Glucose 5% or Sodium chloride 0.9%; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium. For Aredia®, reconstitute initially with water for injections (15 mg in 5 mL, 30 mg or 90 mg in 10 mL), then dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL. For Pamidronate disodium (Medac, Hospira, Wockhardt) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL.

- **PATIENT AND CARER ADVICE** A patient reminder card should be provided (risk of osteonecrosis of the jaw).

- **DRIVING AND SKILLED TASKS**
  - Patients should be warned against performing skilled tasks (e.g. cycling, driving or operating machinery) immediately after treatment (somnolence or dizziness can occur).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Pamidronate disodium (Non-proprietary)**
  - Pamidronate disodium 3 mg per 1 mL Pamidronate disodium 15mg/5mL solution for infusion vials | 1 vial (£0.75 (Hospital only) | 5 vial (£14.95)
  - Pamidronate disodium 30mg/10mL solution for infusion vials | 1 vial (£1.65 (Hospital only) | 1 vial (£0.55)
  - Pamidronate disodium 60mg/20mL solution for infusion vials | 1 vial (£1.00 (Hospital only) | 1 vial (£11.00)
  - Pamidronate disodium 90mg/30mL solution for infusion vials | 1 vial (£1.00 (Hospital only) | 1 vial (£1.10)
  - Pamidronate disodium 9 mg per 1 mL Pamidronate disodium 90mg/10mL solution for infusion vials | 1 vial (£0.75 (Hospital only) | 1 vial (£17.05)
  - Pamidronate disodium 15 mg per 1 mL Pamidronate disodium 60mg/4ml solution for infusion ampoules | 1 ampoule (£0.32 (Hospital only) | 1 ampoule (£11.99)
  - Pamidronate disodium 15mg/1ml solution for infusion ampoules | 4 ampoules (£0.06 (Hospital only) | 0.06 (Hospital only)
  - Pamidronate disodium 90mg/6ml solution for infusion ampoules | 1 ampoule (£17.00 (Hospital only) | 1 ampoule (£0.66)
  - Pamidronate disodium 30mg/2ml solution for infusion ampoules | 2 ampoules (£11.32)

Risedronate sodium

- **INDICATIONS AND DOSE**
  - **Paget’s disease of bone**
    - **BY MOUTH**
    - Adult: 30 mg daily for 2 months, course may be repeated if necessary after at least 2 months

- **TREATMENT OF POSTMENOPAUSAL OSTEOPOROSIS TO REDUCE RISK OF VERTEBRAL OR HIP FRACTURES**
  - **BY MOUTH**
    - Adult (female): 5 mg daily, alternatively 35 mg once weekly.

- **PREVENTION OF OSTEOPOROSIS (INCLUDING CORTICOSTEROID-INDUCED OSTEOPOROSIS) IN POSTMENOPAUSAL WOMEN**
  - **BY MOUTH**
    - Adult (female): 5 mg daily.

- **TREATMENT OF OSTEOPOROSIS IN MEN AT HIGH RISK OF FRACTURES**
  - **BY MOUTH**
    - Adult (male): 35 mg once weekly.

- **CONTRA-INDICATIONS**
  - Hypocalcaemia

- **CAUTIONS**
  - Atypical femoral fractures - oesophageal abnormalities - other factors which delay transit or emptying (e.g. stricture or achalasia)
Risedronate with calcium carbonate and colecalciferol

The properties listed below are those particular to the combination only. For the properties of the components please consider, risedronate sodium p. 686, calcium carbonate p. 958, colecalciferol p. 992.

INDICATIONS AND DOSE

Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures

BY MOUTH

Adult: 1 tablet once weekly on day 1 of the weekly cycle, followed by 1 sachet daily on days 2–6 of the weekly cycle

INTERACTIONS → Appendix 1: bisphosphonates, calcium salts, vitamin D substances

DIRECTIONS FOR ADMINISTRATION

Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet. Granules should be stirred into a glass of water and after dissolution complete taken immediately.

PRESCRIBING AND DISPENSING INFORMATION

Actonel Combi® effervescent granules contain calcium carbonate 2.5 g (calcium 1 g or Ca²⁺ 25 mmol) and colecalciferol 22 micrograms (880 units)/sachet.

PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer calcium carbonate with colecalciferol and risedronate tablets and granules.

INTERACTIONS → Appendix 1: bisphosphonates, calcium salts, vitamin D substances

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

Risedronate sodium (Non-proprietary)

Risedronate sodium 5 mg Risedronate sodium 5mg tablets | 28 tablet | £24.78 DT price = £18.85

Sodium clodronate

**INDICATIONS AND DOSE**

**Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma**

- **BY MOUTH**
  - **Adult:** 1.6 g daily in 1–2 divided doses, then increased if necessary up to 3.2 g daily in 2 divided doses

**SIDE-EFFECTS**

**PRECAUTIONS**

**CAUTIONS**
- Atypical femoral fractures - maintain adequate fluid intake during treatment
- **INTERACTIONS** → Appendix 1: bisphosphonates
- **SIDE-EFFECTS**
  - **Common or very common** Bronchospasm - diarrhoea - nausea - skin reactions - vomiting
  - **Rare** Atypical femoral fractures
  - **Very rare** Osteonecrosis of the external auditory canal - osteonecrosis of the jaw
  - **Frequency not known** Renal impairment - uveitis
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Max. initial dose 1200 mg daily if eGFR 30–50 mL/minute/1.73 m². Use half normal dose if eGFR 10–30 mL/minute/1.73 m². Avoid if eGFR less than 10 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor renal function, serum calcium and serum phosphate before and during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Avoid food for 2 hours before and 1 hour after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer sodium clodronate capsules and tablets.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS**
  - **Sodium clodronate 800 mg** Sodium clodronate 800mg tablets | 60 tablet [PoT]: £116.72 DT price = £146.43
  - **Bonefos** (Bayer Plc) Sodium clodronate 800 mg Bonefos 800mg tablets | 60 tablet [PoT]: £146.43 DT price = £146.43
  - **Clasteon** (Beacon Pharmaceuticals Ltd) Sodium clodronate 800 mg Clasteon 800mg tablets | 60 tablet [PoT]: £146.43 DT price = £146.43
  - **Loron** (Intrapharm Laboratories Ltd) Sodium clodronate 520 mg Loron 520mg tablets | 60 tablet [PoT]: £152.50 DT price = £152.50
  - **Sodium clodronate (Non-proprietary)** Sodium clodronate 400 mg Sodium clodronate 400mg capsules | 30 capsule [PoT]: £40.49 | 120 capsule [PoT]: £161.97 DT price = £139.83

**Capsule**

- **Sodium clodronate (Non-proprietary)**
  - **Sodium clodronate 400 mg** Sodium clodronate 400mg capsules | 30 capsule [PoT]: £40.49 | 120 capsule [PoT]: £161.97 DT price = £139.83

Zoledronic acid

**INDICATIONS AND DOSE**

**ACLASTA®**

Treatment of Paget's disease of bone

- **BY INTRAVENOUS INFUSION**
  - **Adult:** 5 mg as a single dose, to be administered over at least 15 minutes, at least 500 mg elemental calcium twice daily (with vitamin D) for at least 10 days is recommended following infusion

Treatment of postmenopausal osteoporosis and osteoporosis in men (including corticosteroid-induced osteoporosis)

- **BY INTRAVENOUS INFUSION**
  - **Adult:** 5 mg once yearly as a single dose, to be administered over at least 15 minutes, in patients with a recent low-trauma hip fracture, the dose should be given 2 or more weeks following hip fracture repair; before first infusion give 50000–125000 units of vitamin D

**ZOMETA®**

Reduction of bone damage in advanced malignancies involving bone

- **BY INTRAVENOUS INFUSION**
  - **Adult:** 4 mg every 3–4 weeks, to be administered over at least 15 minutes, calcium 500 mg daily and vitamin D 400 units daily should also be taken

**Hypercalcaemia of malignancy**

- **BY INTRAVENOUS INFUSION**
  - **Adult:** 4 mg for 1 dose, to be administered over at least 15 minutes

**CAUTIONS**
- Atypical femoral fractures - cardiac disease (avoid fluid overload) - concomitant medicines that affect renal function
- **INTERACTIONS** → Appendix 1: bisphosphonates
- **SIDE-EFFECTS**
  - **Common or very common** Anaemia - arthralgia - atrial fibrillation - bone pain - conjunctivitis - dizziness - fever - gastro-intestinal disturbances - headache - hypophosphataemia - influenza - like symptoms - myalgia - renal impairment - rigors
  - **Rare** Acute renal failure - atypical femoral fractures - bradycardia - confusion - hyperkalaemia - hypernatraemia - osteonecrosis of the jaw - pancyclopenia
  - **Very rare** Episcleritis - osteonecrosis of the external auditory canal - uveitis

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Renal function** Renal impairment and renal failure have been reported; ensure patient is hydrated before each dose and assess renal function.
- **CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.
- **PREGNANCY** Avoid—toxicity in animal studies.
CALCIUM REGULATING DRUGS > BONE RESORPTION INHIBITORS

Calcitonin (salmon)
(Salcatonin)

- INDICATIONS AND DOSE

Hypercalcaemia of malignancy
- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 100 units every 6–8 hours (max. per dose 400 units every 6–8 hours), adjusted according to response
- BY INTRAVENOUS INFUSION
- Adult: Up to 10 units/kg, in severe or emergency cases, to be administered by slow intravenous infusion over at least 6 hours

Paget’s disease of bone
- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 100 units daily, adjusted according to response for maximum 3 months (6 months in exceptional circumstances), a minimum dosage regimen of 50 units three times a week has been shown to achieve clinical and biochemical improvement

Prevention of acute bone loss due to sudden immobility
- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: Initially 100 units daily in 1–2 divided doses, then reduced to 50 units daily at the start of mobilisation, usual duration of treatment is 2 weeks; maximum 4 weeks

- CONTRA-INDICATIONS
Hypocalcaemia

- CAUTIONS
Heart failure • history of allergy (skin test advised) • risk of malignancy—avoid prolonged use (use lowest effective dose for shortest possible time)

- INTERACTIONS
Appendix 1: calcitonin (salmon)

- SIDE-EFFECTS
Common or very common
Abdominal pain • diarrhoea • dizziness • fatigue • flushing • headache • malignancy (with long-term use) • musculoskeletal pain • nausea • taste disturbances • vomiting

Uncommon
Cough • hypersensitivity reactions • hypotension • injection-site reactions • oedema • polyuria • pruritus • rash • visual disturbances

Frequency not known
Tremor

- PREGNANCY
Avoid unless potential benefit outweighs risk (toxicity in animal studies).

- BREAST FEEDING
Avoid; inhibits lactation in animals.

- RENAL IMPAIRMENT
Use with caution.

- DIRECTIONS FOR ADMINISTRATION
For intravenous infusion (Micalef®), give intermittently in Sodium chloride 0.9%; dilute requisite dose according to product literature; infuse over at least 15 minutes; administer as a single intravenous solution in a separate infusion line.

- MEDICAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
- Zometa (Novartis Pharmaceuticals UK Ltd)
  - 800 microgram per 1 ml Zometa 4mg/5ml solution for infusion vials | 1 vial (POM) £174.14

Infusion
- Aclasta (Novartis Pharmaceuticals UK Ltd)
  - Zoledronic acid (as Zoledronic acid monohydrate) 50 microgram per 1 ml Aclasta 5mg/100ml infusion bottles | 1 bottle (POM) £253.38

- Zometa (Novartis Pharmaceuticals UK Ltd)
  - Zoledronic acid (as Zoledronic acid monohydrate) 40 microgram per 1 ml Zometa 4mg/100ml infusion bottles | 1 bottle (POM) £174.14

- CALCITONIN (salmon) (Non-proprietary)
  - Calcitonin (salmon) 50 unit per 1 ml Calcitonin (salmon) 50units/1ml solution for injection ampoules | 5 ampoule (POM) £167.50
  - Calcitonin (salmon) 100 unit per 1 ml Calcitonin (salmon) 100units/1ml solution for injection ampoules | 5 ampoule (POM) £220.00
  - Calcitonin (salmon) 200 unit per 1 ml Calcitonin (salmon) 400units/2mlm solution for injection vials | 1 vial (POM) £352.00

- MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Zoledronic acid (Novartis Pharmaceuticals UK Ltd)
  - Zoledronic (40 microgram per 1 ml Zoledronic 40microgram/1ml solution for infusion vials | 1 bottle (POM) £174.14

- MONITORING REQUIREMENTS

  - Correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypocalcaemia) before starting. Monitor serum electrolytes, calcium, phosphate and magnesium.
  - Monitor renal function in patients at risk, such as those with pre-existing renal impairment, those of advanced age, those taking concomitant nephrotoxic drugs or diuretics, or those who are dehydrated.

- DIRECTIONS FOR ADMINISTRATION
For intravenous infusion (Zometa®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute requisite dose according to product literature; infuse over at least 15 minutes; administer as a single intravenous solution in a separate infusion line.

- PATIENT AND CARER ADVICE
A patient reminder card should be provided (risk of osteonecrosis of the jaw).

- NATIONAL FUNDING/ACCESS DECISIONS
ZOMETA® INFUSION

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (May 2003) that for the prevention of skeletal related events Zometa® is accepted for restricted use within NHS Scotland for the treatment of patients with breast cancer and multiple myeloma if prescribed by an oncologist.

ACLAStA®

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (February 2008) that in postmenopausal women Aclasta® is accepted for restricted use within the NHS Scotland for the treatment of osteoporosis in those for whom oral treatment options for osteoporosis are inappropriate and when initiated by a specialist.

- BREAST FEEDING
Avoid—no information available.

- HEPATIC IMPAIRMENT
Caution in severe hepatic impairment—limited information available.

- RENAL IMPAIRMENT
In advanced malignancies involving bone, if eGFR 50–60 mL/minute/1.73 m² reduce dose to 3.5 mg every 3–4 weeks; if eGFR 40–50 mL/minute/1.73 m² reduce dose to 3.3 mg every 3–4 weeks; if eGFR 30–40 mL/minute/1.73 m² reduce dose to 3 mg every 3–4 weeks; if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value. Avoid in tumour-induced hypercalcaemia if serum creatinine above 400 micromol/litre. Avoid in advanced malignancies involving bone if eGFR less than 30 mL/minute/1.73 m² (or if serum creatinine greater than 265 micromol/litre).

Avoid in Paget’s disease, treatment of postmenopausal osteoporosis and osteoporosis in men if eGFR less than 35 mL/minute/1.73 m².

- MONITORING REQUIREMENTS

  - There can be variation in the licensing of different medicines returns to within 130% of baseline value. Avoid in tumour-induced hypercalcaemia if serum creatinine above 400 micromol/litre. Avoid in advanced malignancies involving bone if eGFR less than 30 mL/minute/1.73 m² (or if serum creatinine greater than 265 micromol/litre).

  - Scottish Medicines Consortium (SMC) Decisions

  - Calcitonin (salmon)

  - Zolendronic acid (as Zoledronic acid monohydrate) 40 microgram per 1 ml Zometa 4mg/100ml infusion bottles | 1 bottle (POM) £174.14
Strontium ranelate

**DRUG ACTION** Stimulates bone formation and reduces bone resorption.

**INDICATIONS AND DOSE**

Treatment of severe osteoporosis in postmenopausal women or men at high risk of fracture for whom other treatments are contra-indicated or not tolerated (initiated under specialist supervision)

- **BY MOUTH**
  - Adult: 2 g once daily, dose to be taken in water, preferably at bedtime

**CONTRA-INDICATIONS**
Cerebrovascular disease · current or previous venous thromboembolic event · ischaemic heart disease · peripheral arterial disease · temporary or prolonged immobilisation · uncontrolled hypertension

**CAUTIONS**
Predisposition to cardiovascular disease—assess risk before and every 6–12 months during treatment

**INTERACTIONS** → Appendix 1: strontium ranelate

**SIDE-EFFECTS**

- **Common or very common** Dermatitis · diarrhoea · eczema · headache · myocardial infarction · nausea · venous thromboembolism
- **Very rare** Angioedema · hypersensitivity reactions · pruritus · rash · urticaria

**SIDE-EFFECTS, FURTHER INFORMATION**
Severe allergic reactions
Severe allergic reactions, including drug rash with eosinophilia and systemic symptoms (DRESS), have been reported in patients taking strontium ranelate. DRESS starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal. Treatment with strontium ranelate should not be restarted.

**RENA L IMPAIRMENT**
Avoid if eGFR less than 30 mL/minute/1.73 m².

**EFFECT ON LABORATORY TESTS**
Interferes with colorimetric measurements of calcium in blood and urine.

**DIRECTIONS FOR ADMINISTRATION**
Avoid food for 2 hours before and after taking granules, particularly calcium-containing products e.g. milk; also preferably avoid concomitant antacids containing aluminium and magnesium hydroxides for 2 hours after taking granules.

**PATIENT AND CARER ADVICE**
Patients or carers should be given advice on how to administer strontium ranelate granules.
Severe allergic reactions
Patients should be advised to stop taking strontium ranelate and consult their doctor immediately if skin rash develops.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Alendronate, etidronate, risedronate, raloxifene and strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

- Strontium ranelate is recommended as an alternative for women:
  - in whom alendronate and risedronate are contra-indicated or not tolerated and
  - who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.

www.nice.org.uk/TA160

**CALCIUM REGULATING DRUGS**

**TERIPARATIDE**

**INDICATIONS AND DOSE**

Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures | Treatment of corticosteroid-induced osteoporosis

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 20 micrograms daily for maximum duration of treatment 24 months (course not to be repeated)

**CONTRA-INDICATIONS**
Bone metastases · hyperparathyroidism · metabolic bone diseases · Paget’s disease · pre-existing hypercalcaemia · previous radiation therapy to the skeleton · skeletal malignancies · unexplained raised alkaline phosphatase

**SIDE-EFFECTS**

- **Common or very common** Anaemia · arthralgia · asthenia · depression · dizziness · dyspepsia · fatigue · gastrointestinal disorders · haemorrhoids · headache · increased sweating · muscle cramps · myalgia · nausea · palpitation · reflux · sciatica · vertigo
- **Uncommon** Hypercalcaemia · injection-site reactions · urinary disorders
- **Rare** Hypersensitivity reactions

**PREGNANCY**
Avoid.

**BREAST FEEDING**
Avoid.

**RENA L IMPAIRMENT**
Caution in moderate impairment; avoid if severe.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.
Teriparatide is recommended as an alternative for women:
- in whom alendronate or risedronate, or strontium ranelate are contra-indicated or not tolerated, or where treatment with alendronate or risedronate has been unsatisfactory (indicated by another fragility fracture and a decline in bone mineral density despite treatment for 1 year) and
- who comply with particular combinations of bone mineral density measurement, age, and number of fractures, as indicated in the full NICE guidance.

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (December 2003) that the use of teriparatide (Forsteo®) in postmenopausal women should be restricted to the treatment of established (severe) osteoporosis and should be initiated by specialists experienced in the treatment of osteoporosis.

Medicinal Forms
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Forsteo (Eli Lilly and Company Ltd)
  - Teriparatide 250 microgram per 1 ml Forsteo
  - 20micrograms/80microlitres solution for injection 2.4ml pre-filled disposable devices | 1 pre-filled disposable injection (BNF 74) £271.88

Drugs Affecting Bone Structure and Mineralisation > Monoclonal Antibodies

Denosumab
- Drug Action Denosumab is a human monoclonal antibody that inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption.

Indications and Dose

Prolia®
Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures | Treatment of bone loss associated with hormone ablation in men with prostate cancer at increased risk of fractures
- By Subcutaneous Injection
- Adult: 60 mg every 6 months, supplement with calcium and vitamin D

Xgeva®
Prevention of skeletal related events in patients with bone metastases from solid tumours
- By Subcutaneous Injection
- Adult: 120 mg every 4 weeks, supplementation of at least Calcium 500 mg and vitamin D 400 units daily should also be taken unless hypercalcaemia is present

Treatment of giant cell tumour of bone that is unresectable or where surgical resection is likely to result in severe morbidity in adults and skeletally mature adolescents
- By Subcutaneous Injection
- Adult: 120 mg every 4 weeks, give additional dose on days 8 and 15 of the first month of treatment only, supplementation of at least Calcium 500 mg and vitamin D 400 units daily should also be taken unless hypercalcaemia is present

Important Safety Information
MHRA/CHM Advice: Denosumab: Atypical Femoral Fractures (February 2013)
Atypical femoral fractures have been reported rarely in patients receiving denosumab for the long-term treatment (2.5 or more years) of postmenopausal osteoporosis.

Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.
Discontinuation of denosumab in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

MHRA/CHM Advice: Denosumab: Minimising the Risk of Osteonecrosis of the Jaw; Monitoring for Hypocalcaemia—Updated Recommendations (September 2014) and Denosumab: Osteonecrosis of the Jaw—Further Measures to Minimise Risk (July 2015)
Denosumab is associated with a risk of osteonecrosis of the jaw (ONJ) and with a risk of hypocalcaemia.

Osteonecrosis of the Jaw
Osteonecrosis of the jaw is a well-known and common side-effect in patients receiving denosumab 120 mg for cancer. Risk factors include smoking, old age, poor oral hygiene, invasive dental procedures (including tooth extractions, dental implants, oral surgery), comorbidity (including dental disease, anaemia, coagulopathy, infection), advanced cancer, previous treatment with bisphosphonates, and concomitant treatments (including chemotherapy, anti-angiogenic biologics, corticosteroids, and radiotherapy to head and neck). The following precautions are now recommended to reduce the risk of ONJ:
- Denosumab 120 mg (cancer indication)
  - A dental examination and appropriate preventative dentistry before starting treatment are now recommended for all patients
  - Do not start denosumab in patients with a dental or jaw condition requiring surgery, or in patients who have unhealed lesions from dental or oral surgery
- Denosumab 60 mg (osteoporosis indication)
  - Check for ONJ risk factors before starting treatment. A dental examination and appropriate preventative dentistry are now recommended for patients with risk factors

All patients should be given a patient reminder card and informed of the risk of ONJ. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, if they wear dentures they should make sure their dentures fit properly before starting treatment, to maintain good oral hygiene, receive routine dental check-ups during treatment, and immediately report any oral symptoms such as dental mobility, pain, swelling, non-healing sores or discharge to a doctor and dentist. Patients should tell their doctor and dentist that they are receiving denosumab if they need dental treatment or dental surgery.

Hypocalcaemia
Denosumab is associated with a risk of hypocalcaemia. This risk increases with the degree of renal impairment. Hypocalcaemia usually occurs in the first weeks of denosumab treatment, but it can also occur later in treatment.

Plasma-calcium concentration monitoring is recommended for denosumab 120 mg (cancer indication):
- before the first dose
- within two weeks after the initial dose
- if suspected symptoms of hypocalcaemia occur
- consider monitoring more frequently in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)

Plasma-calcium concentration monitoring is recommended for denosumab 60 mg (osteoporosis indication):
- before each dose
- within two weeks after the initial dose in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)
impaired, creatinine clearance less than 30 mL/minute)
- if suspected symptoms of hypocalcaemia occur
  All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

- **CONTRA-INDICATIONS** Hypocalcaemia
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal discomfort, constipation, diarrhoea, dyspepsia, eczema, hypocalcaemia, fatigue cases reported, hypophosphataemia, musculoskeletal pain, pain in extremity, rash, scatica, sweating, upper respiratory tract infection, urinary tract infection
  - **Uncommon** Cellulitis, diverticulitis, ear infection, skin infections (seek prompt medical attention)
  - **Rare** Atypical femoral fractures, osteonecrosis of the jaw
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception in women of child-bearing potential, during treatment and for at least 5 months after stopping treatment.
- **PREGNANCY** Avoid—in toxicity in animal studies; risk of toxicity increases with each trimester—advise women who become pregnant during treatment to enrol in the manufacturer’s Pregnancy Surveillance Programme (consult product literature).
- **BREAST FEEDING** Avoid (if women do decide to breast-feed during treatment, they should enrol in the manufacturer’s Lactation Surveillance Programme—consult product literature.
- **RENAI IMPAIRMENT** Increased risk of hypocalcaemia if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Correct hypocalcaemia and vitamin D deficiency before starting. Monitor plasma-calcium concentration during therapy.
- **PATIENT AND CARER ADVICE** A patient reminder card should be provided (risk of osteonecrosis of the jaw). Atypical femoral fractures Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab. Osteonecrosis of the jaw All patients should be informed to maintain good oral hygiene, receive routine dental check-ups, and immediately report any oral symptoms such as dental mobility, pain, or swelling to a doctor and dentist. Hypocalcaemia. All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Denosumab for the prevention of osteoporotic fractures in postmenopausal women (October 2010) NICE TA204
    - Denosumab is recommended as a treatment option for the primary prevention of osteoporotic fragility fractures in postmenopausal women at increased risk of fractures:
      - who are unable to comply with the special instructions for administering alendronate and risedronate, or have an intolerance of, or a contra-indication to, those treatments and
      - who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.

Denosumab is recommended as a treatment option for the secondary prevention of osteoporotic fragility fractures only in postmenopausal women at increased risk of fractures who are unable to comply with the special instructions for administering alendronate and risedronate, or have an intolerance of, or a contra-indication to, those treatments.

- **SIDE-EFFECTS**
  - Denosumab for the prevention of skeletal-related events in adults with bone metastases from solid tumours (October 2012) NICE TA265
    - Denosumab is recommended for the prevention of skeletal-related events in adults with bone metastases from breast cancer and from solid tumours other than prostate if:
      - bisphosphonates would otherwise be prescribed, and
      - the manufacturer provides denosumab with the discount agreed in the patient access scheme.
    - Patients with bone metastases from solid tumours currently receiving denosumab whose disease does not meet the above criteria can continue treatment until they and their clinician consider it appropriate to stop.
    - www.nice.org.uk/TA265
- **PROLIA**
  - **Scottish Medicines Consortium (SMC) Decisions**
  - *The Scottish Medicines Consortium has advised (November 2010) that denosumab (Prolia®) is accepted for restricted use within NHS Scotland for the treatment of osteoporosis in postmenopausal women at increased risk of fractures who have a bone mineral density T-score < −2.5 and ≥−4.0 and for whom bisphosphonates are unsuitable.*

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**
  - **Prolia** (Amgen Ltd)
    - Denosumab 60 mg per 1 ml Prolia 60mg/1ml solution for injection pre-filled syringes 1 pre-filled disposable injection (PHV) £183.00 DT price = £183.00
    - Xgeva (Amgen Ltd)
  - **Xgeva** 70 mg per 1 ml Xgeva 120mg/1.7ml solution for injection vials 1 vial (PHV) £309.86

## 5 Dopamine responsive conditions

### DOPAMINERGIC DRUGS > DOPAMINE RECEPTOR AGONISTS

**Dopamine-receptor agonists**

**Overview**

Bromocriptine p. 399 is used for the treatment of galactorrhoea, and for the treatment of prolactinomas (when it reduces both plasma prolactin concentration and tumour size). Bromocriptine also inhibits the release of growth hormone and is sometimes used in the treatment of acromegaly, but somatostatin analogues (such as octreotide p. 877) are more effective.

Cabergoline p. 400 has similar side-effects to bromocriptine, however patients intolerant of bromocriptine may be able to tolerate cabergoline (and vice versa).
Quinagolide below has actions and uses similar to those of ergot-derived dopamine agonists, but its side-effects differ slightly.

### Suppression of lactation

Although bromocriptine and cabergoline are licensed to suppress lactation, they are not recommended for routine suppression (or for the relief of symptoms of postpartum pain and engorgement) that can be adequately treated with simple analgesics and breast support. If a dopamine-receptor agonist is required, cabergoline is preferred. Quinagolide is not licensed for the suppression of lactation.

### Quinagolide

**Drug action** Quinagolide is a non-ergot dopamine D₂ agonist.

#### Indications and dose

**Hyperprolactinaemia**

- **By mouth**
  - Adult: Initially 25 micrograms once daily for 3 days, dose to be taken at bedtime, increased in steps of 25 micrograms every 3 days; usual dose 75–150 micrograms daily, for doses higher than 300 micrograms daily increase in steps of 75–150 micrograms at intervals of not less than 4 weeks

**Unlicensed use** Not licensed for the suppression of lactation.

**Caution**

- Acute porphyrias p. 969
- History of psychotic illness
- History of serious mental disorders

**Caution, Further information**

Hyperprolactinaemic patients In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).

**Interactions**

- Common or very common
  - Abdominal pain
  - Anorexia
  - Constipation or diarrhoea
  - Dizziness
  - Fatigue
  - Flushing
  - Headache
  - Hypotension
  - Insomnia
  - Nasal congestion
  - Nausea
  - Oedema
  - Syncope
  - Vomiting

- Very rare
  - Psychosis

**Side-effects**

- Gastro-intestinal bleeding
  - Treatment should be withdrawn if gastro-intestinal bleeding occurs.

**Allergy and cross-sensitivity**

Quinagolide should not be used in patients with hypersensitivity to quinagolide (does not apply to hypersensitivity to ergot alkaloids).

**Conception and contraception**

Advise non-hormonal contraception if pregnant not desired.

**Pregnancy**

Discontinue when pregnancy confirmed unless medical reason for continuing (specialist advice needed).

**Breast feeding**

Suppresses lactation.

**Hepatic impairment**

Avoid—no information available.

**Renal impairment**

Avoid—no information available.

**Monitoring requirements**

Monitor blood pressure for a few days after starting treatment and following dosage increase.

**Patient and carer advice**

- **Sudden onset of sleep**
  - Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

  Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

  Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions**

Hypotensive reactions can be disturbing in some patients during the first few days of treatment with dopamine-receptor agonists, particular care should be exercised when driving or operating machinery.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

### 6 Gonadotrophin responsive conditions

#### Gonadotrophins

**Drugs affecting gonadotrophins**

Danazol p. 699 is licensed for the treatment of endometriosis and for the relief of severe pain and tenderness in benign fibrocystic breast disease where other measures have proved unsatisfactory. It may also be effective in the long-term management of hereditary angioedema [unlicensed indication].

Cetrorelix p. 694 and ganirelix p. 694 are luteinising hormone releasing hormone antagonists, which inhibit the release of gonadotrophins (luteinising hormone and follicle stimulating hormone). They are used in the treatment of infertility by assisted reproductive techniques.

**Gonadorelin analogues**

Gonadorelin analogues are used in the treatment of endometriosis, precocious puberty, infertility, male hypersexuality with severe sexual deviation, anaemia due to uterine fibroids (together with iron supplementation), breast cancer, prostate cancer and before in-uterine surgery. Use of leuprolrelin acetate and triptorelin for 3 to 4 months before surgery reduces the uterine volume, fibroid size and associated bleeding. For women undergoing hysterecomy or myomectomy, a vaginal procedure is made more feasible following the use of a gonadorelin analogue.

**Breast pain (mastalgia)**

Once any serious underlying cause for breast pain has been ruled out, most women will respond to reassurance and reduction in dietary fat; withdrawal of an oral contraceptive
Endocrine system

694 Gonadotropin responsive conditions

BNF 74

or of hormone replacement therapy may help to resolve the pain.
Mild, non-cyclical breast pain is treated with simple analgesics; moderate to severe pain, cyclical pain or symptoms that persist for longer than 6 months may require specific drug treatment.
Danazol is licensed for the relief of severe pain and tenderness in benign fibrocystic breast disease which has not responded to other treatment.
Tamoxifen p. 879 may be a useful adjunct in the treatment of mastalgia [unlicensed indication] especially when symptoms can definitely be related to cyclic oestrogen production; it may be given on the days of the cycle when symptoms are predicted.
Treatment for breast pain should be reviewed after 6 months and continued if necessary. Symptoms recur in about 50% of women within 2 years of withdrawal of therapy but may be less severe.

PITUITARY AND HYPOTHALAMIC HORMONES

AND ANALOGUES  >  ANTI-GONADOTROPHIN-RELEASING HORMONES

Cetrorelix

● INDICATIONS AND DOSE

Adjunct in the treatment of female infertility (initiated under specialist supervision)

> BY SUBCUTANEOUS INJECTION

> Adult (female): 250 micrograms once daily, dose to be administered in the morning, starting on day 5 or 6 of ovarian stimulation with gonadotrophins (or each evening starting on day 5 of ovarian stimulation), continue throughout administration of gonadotrophin including day of ovulation induction (or evening before ovulation induction), dose to be injected into the lower abdominal wall.

> BY INTRanasal ADMINISTRATION

> Adult: 150 microgram spray into each nostril 1–2 times a day maximum duration of treatment 6 months then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on day 21) and continued until down-regulation achieved (usually 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of choriionic gonadotrophin at appropriate stage of follicular development)

> BY INTRanasAL ADMINISTRATION

> Adult: 200–500 micrograms once daily, increased if necessary up to 500 micrograms twice daily, starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of choriionic gonadotrophin at appropriate stage of follicular development)

● SIDE-EFFECTS

> Very rare  Facial oedema  hypersensitivity reactions  rash

> Frequency not known  Dyspnoea  headache  injection-site reactions  malaise  nausea

> PREGNANCY  Avoid in confirmed pregnancy—toxicity in animal studies.

> BREAST FEEDING  Avoid—no information available.

> HEPATIC IMPAIRMENT  Avoid in moderate or severe hepatic impairment.

> RENAL IMPAIRMENT  Avoid in moderate to severe renal impairment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

> Cetrotide  (Merck Serono Ltd)

Cetrorelix (as Cetrorelix acetate) 250 microgram  Cetrotide  250 microgram powder and solvent for solution for injection vials  1 vial (PODS) £22.61

Ganirelix

● INDICATIONS AND DOSE

Adjunct in the treatment of female infertility (initiated under specialist supervision)

> BY SUBCUTANEOUS INJECTION

> Adult: 250 micrograms once daily, dose to be administered in the morning (or each afternoon) starting on day 5 or day 6 of ovarian stimulation with gonadotrophins, continue throughout administration of gonadotrophins including day of ovulation induction (if administering in afternoon, give last dose in afternoon before ovulation induction), dose to be injected preferably into the upper leg (rotate injection sites to prevent lipoatrophy)

> BY INTRANASAL ADMINISTRATION

> Adult: 300 micrograms 3 times a day maximum duration of treatment 6 months then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of choriionic gonadotrophin at appropriate stage of follicular development)

● INDICATIONS AND DOSE

Endometriosis

> BY INTRanasAL ADMINISTRATION

> Adult: 300 micrograms 3 times a day maximum duration of treatment 6 months then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of choriionic gonadotrophin at appropriate stage of follicular development)

> BY SUBCUTANEOUS INJECTION

> Adult: 200–500 micrograms once daily, increased if necessary up to 500 micrograms twice daily, starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of choriionic gonadotrophin at appropriate stage of follicular development)

> BY INTRanasAL ADMINISTRATION

> Adult: 200–500 micrograms once daily, increased if necessary up to 500 micrograms twice daily, starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of
chorionic gonadotrophin at appropriate stage of follicular development

Advanced prostate cancer

- **INITIALLY BY SUBCUTANEOUS INJECTION**
  - Adult: 500 micrograms every 8 hours for 7 days, then (by intranasal administration) 200 micrograms 6 times a day, (a single 100 microgram spray to be administered into each nostril)

**SIDE-EFFECTS**

- **GENERAL SIDE-EFFECTS**
  - Abdominal pain, acne, altered blood lipids, anaphylaxis, anxiety, arthralgia, asthma, bleeding associated with fibroid degeneration (when treating uterine fibroids), breakthrough bleeding, breast tenderness, changes in appetite, changes in breast size, changes in scalp and body hair, concentration disturbances, constipation, decrease in trabecular bone density, depression, diarrhoea, dizziness, drowsiness, dry eyes, dry skin, dyspareunia, fatigue, gynaecomastia, hair loss, headache, hearing disturbances, hot flushes, hypersensitivity reactions, hypertension, increased sweating, increased thirst, initially withdrawal bleeding, lactation, leucopenia, leucorrhoea, local reactions at injection site, loss of libido, memory disturbances, menopausal-like symptoms, migraine, mood changes, musculoskeletal pain, musculoskeletal weakness, myalgia, nausea, nervousness, oedema of the face and extremities, ovarian cysts (may require withdrawal), palpitation, paraesthesia, pruritus, rash, reduced glucose tolerance, sexual dysfunction, sleep disturbances, splitting nails, thrombocytopenia, urticaria, vaginal dryness, visual disturbances, vomiting, weight changes

**SPECIFIC SIDE-EFFECTS**

- With intranasal use: Altered sense of taste and smell, nasal irritation, nose bleeds

**SIDE-EFFECTS, FURTHER INFORMATION**

- Tumour flare (when used for advanced prostate cancer) During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain.

**CONCEPTION AND CONTRACEPTION**

- Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

**PREGNANCY**

- Avoid.

**BREAST FEEDING**

- Avoid.

**DIRECTIONS FOR ADMINISTRATION**

- With intranasal use: Avoid use of nasal decongestants before treatment and for at least 30 minutes after treatment.
- With subcutaneous use: Rotate injection site to prevent atrophy and nodule formation.

**PATIENT AND CARER ADVICE**

- Patients or carers should be given advice on how to administer buserelin nasal spray.

**CAUTIONS**

- Depression, diabetes, hypertension, patients with metabolic bone disease (decrease in bone mineral density can occur), polycystic ovarian disease

**PATIENT AND CARER ADVICE**

- When used for endometriosis: Hormone dependent tumours, undiagnosed vaginal bleeding, use longer than 6 months (do not repeat)
- When used for pituitary desensitisation: Hormone dependent tumours, undiagnosed vaginal bleeding

**INDICATIONS AND DOSE**

**Goseralin**

- **DRUG ACTION**
  - Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Suprecur** (Sanofi)
  - Buserelin (as Buserelin acetate) 1 mg per 1 ml Suprecur
    - 5.5mg/5.5ml solution for injection vials | 2 vial [Pom] £33.02

  - Buserelin (as Buserelin acetate) 1 mg per 1 ml Suprecur
    - 5.5mg/5.5ml solution for injection vials | 2 vial [Pom] £34.37

**Spray**

- **Suprecur** (Sanofi)
  - Buserelin (as Buserelin acetate) 150 microgram per 1 dose Suprecur
    - 150micrograms/dose nasal spray | 168 dose [Pom] £105.16
  - **Suprecur** (Sanofi)
  - Buserelin (as Buserelin acetate) 100 microgram per 1 dose Suprecur
    - 100micrograms/dose nasal spray | 336 dose [Pom] £122.24

**ZOLADEX LA®**

- Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer
  - **BY SUBCUTANEOUS INJECTION**
  - Adult: 10.8 mg every 12 weeks, to be administered into the anterior abdominal wall

**ZOLADEX®**

- Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer | Advanced breast cancer | Oestrogen-receptor-positive early breast cancer
  - **BY SUBCUTANEOUS INJECTION**
  - Adult: 3.6 mg every 28 days, to be administered into the anterior abdominal wall

**Endometriosis**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 3.6 mg every 28 days maximum duration of treatment 6 months (do not repeat), to be administered into the anterior abdominal wall

**Endometrial thinning before intra-uterine surgery**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 3.6 mg, dose may be repeated after 28 days if uterus is large or to allow flexible surgical timing, to be administered into the anterior abdominal wall

**Before surgery in women who have anaemia due to uterine fibroids**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 3.6 mg every 28 days maximum duration of treatment 3 months, to be given with
supplementary iron, to be administered into the anterior abdominal wall

Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (after exclusion of pregnancy) (under expert supervision)

- By subcutaneous injection
  - Adult: 3.6 mg, dose given to achieve pituitary down-regulation (usually 1–3 weeks) then gonadotrophin is administered (stopping gonadotrophin on administration of chorionic gonadotrophin at appropriate stage of follicular development), to be administered into the anterior abdominal wall

- Contra-indications
  - Undiagnosed vaginal bleeding: use longer than 6 months in endometriosis (do not repeat)
  - Rare: Hypercalcaemia (in women)
  - Frequency not known
    - Anaphylaxis - arthralgia - asthma - breast tenderness - changes in blood pressure - changes in breast size - changes in scalp and body hair - decrease in trabecular bone density - depression - dizziness - dyspareunia (when used for gynaecological conditions) - gastro-intestinal disturbances - gynaecomastia - headache - heart failure (when used for prostate or breast cancer) - hot flushes - hypersensitivity reactions - increased sweating - local reactions at injection site - loss of libido - menopausal-like symptoms - migraine - mood changes - musculoskeletal pain - musculoskeletal weak (when used for gynaecological conditions) - myalgia - myocardial infarction (when used for prostate or breast cancer) - oedema of the face and extremities (when used for gynaecological conditions) - ovarian cysts (may require withdrawal) - palpitation (when used for gynaecological conditions) - paraesthesia - parasthesia - pruritus - rash - sexual dysfunction - sleep disorders - urticaria - vaginal bleeding - vaginal dryness - visual disturbances - weight change - withdrawal bleeding

- Side-effects, further information
  - Tumour flare (when used for advanced prostate cancer) During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureretic obstruction or increased bone pain.

- Contra-indications
  - Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- Pregnancy
  - Avoid.

- Breast feeding
  - Avoid.

- Monitoring requirements
  - Men at risk of tumour ‘flare’ should be monitored closely during the first month of therapy for prostate cancer.

- Directions for administration
  - Rotate injection site to prevent atrophy and nodule formation.

Leuprolrelin acetate

- Drug action
  - Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins ( follicle stimulating hormone and lutening hormone) which in turn leads to inhibition of androgen and oestrogen production.

- Indications and dose

  **Prostap 3 Dcs**
  - Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer
  - By subcutaneous injection
  - Adult: 11.25 mg every 3 months

  **Endometriosis**
  - By intramuscular injection
  - Adult: Initially 11.25 mg for single dose to be given as a single dose in first 5 days of menstrual cycle, then 11.25 mg every 3 months for maximum 6 months (course not to be repeated)

  **Prostap Sr Dcs**
  - Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer
  - By subcutaneous injection, or by intramuscular injection
  - Adult: 3.75 mg every month

  **Endometriosis**
  - By subcutaneous injection, or by intramuscular injection
  - Adult: Initially 3.75 mg for single dose, dose to be given as a single dose in first 5 days of menstrual cycle, then 3.75 mg every month for maximum 6 months (course not to be repeated)

  **Endometrial thinning before intra-uterine surgery**
  - By subcutaneous injection, or by intramuscular injection
  - Adult: Initially 3.75 mg for single dose, dose to be given as a single dose between day 3 and 5 of menstrual cycle, 5–6 weeks before surgery

  **Reduction of size of uterine fibroids and of associated bleeding before surgery**
  - By subcutaneous injection, or by intramuscular injection
  - Adult: Initially 3.75 mg every month usually for 3–4 months (maximum 6 months)

- Contra-indications
  - General contra-indications
  - Undiagnosed vaginal bleeding
SPECIFIC CONTRA-INDICATIONS

- When used for endometriosis Use longer than 6 months (do not repeat)

- **CAUTIONS**
  - Diabetes · family history of osteoporosis · patients with metabolic bone disease (decrease in bone mineral density can occur) · risk of spinal cord compression in men with prostate cancer · risk of ureteric obstruction in men with prostate cancer

- **INTERACTIONS**
  - Appendix 1: leuprolin

- **SIDE-EFFECTS**
  - Alteration of glucose tolerance · altered blood lipids · anaphylaxis · anorexia · asthma · breast tenderness (males and females) · changes in blood pressure · changes in breast size · changes in scalp and body hair · chills · decrease in trabecular bone density · depression · diarrhoea · diziness · dyspareunia · fatigue · fever · gastrointestinal disturbances · headache · hot flushes · hypersensitivity reactions · increased sweating · jaundice · leucopenia · local reactions at injection site · loss of libido · menopausal-like symptoms · migraine · mood changes · musculoskeletal pain · musculoskeletal weakness · nausea · palpitation · paraesthesia · paraesthesia · pruritus · pulmonary embolism · rash · sexual dysfunction · sleep disturbances · spinal fracture · thrombocytopenia · urticaria · vaginal bleeding · vaginal dryness · visual disturbances · vomiting · weight changes

SIDE-EFFECTS, FURTHER INFORMATION

- Tumour flare (when used for advanced prostate cancer) During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain.

- **CONCEPTION AND CONTRACEPTION**
  - Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY**
  - Avoid—teratogenic in animal studies.

- **BREAST FEEDING**
  - Avoid.

- **MONITORING REQUIREMENTS**
  - Monitor liver function.
  - Men at risk of tumour ‘flare’ should be monitored closely during the first month of therapy.

- **DIRECTIONS FOR ADMINISTRATION**
  - Rotate injection site to prevent atrophy and nodule formation.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

 **Powder and solvent for suspension for injection**

- **Prostap 3 DCS (Takeda UK Ltd)**
  - Leuprorelin acetate 11.25 mg Prostap 3 DCS 11.25mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection [Pack] £225.72 DT price = £225.72

- **Prostap SR DCS (Takeda UK Ltd)**
  - Leuprorelin acetate 3.75 mg Prostap SR DCS 3.75mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection [Pack] £75.24 DT price = £75.24

- **DRUG ACTION**
  - Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

- **INDICATIONS AND DOSE**

  **Endometriosis**
  - **BY INTRANASAL ADMINISTRATION**
    - Adult (female): 200 micrograms twice daily for maximum 6 months (do not repeat), one spray in one nostril in the morning, and one spray in the other nostril in the evening (starting on days 2–4 of menstruation)

  **Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)**
  - **BY INTRANASAL ADMINISTRATION**
    - Adult: 400 micrograms twice daily, one spray in each nostril, to be started in early follicular phase (day 2) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down regulation achieved (usually within 4 weeks) then maintained (usually for 8–12 days) during gonadotrophin administration (stopping gonadotrophin and nafarelin on administration of chorionic gonadotrophin at follicular maturity), discontinue if down-regulation not achieved within 12 weeks

- **CONTRA-INDICATIONS**
  - Undiagnosed vaginal bleeding · use longer than 6 months in the treatment of endometriosis (do not repeat)

- **CAUTIONS**
  - Patients with metabolic bone disease (decrease in bone mineral density can occur)

- **SIDE-EFFECTS**
  - Acne · anaphylaxis · asthma · changes in breast size · changes in scalp and body hair · decrease in trabecular bone density · depression · dyspareunia · headache · hot flushes · hypersensitivity reactions · hypertension · increased sweating · irritation of the nasal mucosa · loss of libido · menopausal-like symptoms · migraine · mood changes · musculoskeletal pain · musculoskeletal weakness · oedema of the face and extremities · ovarian cysts (may require withdrawal) · palpitation · paraesthesia · pruritus · rash · urticaria · vaginal dryness · visual disturbances · weight changes

SIDE-EFFECTS, FURTHER INFORMATION

- Menopausal-like symptoms These effects can be reduced by hormone replacement (e.g. with an oestrogen and a progestogen or with tibolone).

- **CONCEPTION AND CONTRACEPTION**
  - Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first dose should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY**
  - Avoid.

- **BREAST FEEDING**
  - Avoid.

- **DIRECTIONS FOR ADMINISTRATION**
  - Avoid use of nasal decongestants before and for at least 30 minutes after treatment; repeat dose if sneezing occurs during or immediately after administration.

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be given advice on how to administer nafarelin nasal spray.
MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Spray
CAUTORY AND ADVISORY LABELS 10
- Synarel (Pfizer Ltd) Nafarelin (as Nafarelin acetate) 200 microgram per
  1 dose Synarel 200micrograms/dose nasal spray | 60 dose POM
  £52.43

DRUG ACTION
Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

INDICATIONS AND DOSE
DECAPEPTYL® SR 11.25MG
Locally advanced non-metastatic prostate cancer as an alternative to surgical castration | Metastatic prostate cancer | Adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression
- BY INTRAMUSCULAR INJECTION
  Adult: 11.25 mg every 3 months
Endometriosis
- BY INTRAMUSCULAR INJECTION
  Adult: 11.25 mg every 3 months for maximum
  6 months (not to be repeated), to be started during first
  5 days of menstrual cycle
DECAPEPTYL® SR 22.5MG
Locally advanced non-metastatic prostate cancer as an alternative to surgical castration | Metastatic prostate cancer | Adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression
- BY INTRAMUSCULAR INJECTION
  Adult: 22.5 mg every 6 months
DECAPEPTYL® SR 3MG
Locally advanced non-metastatic prostate cancer as an alternative to surgical castration | Metastatic prostate cancer | Adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression
- BY INTRAMUSCULAR INJECTION
  Adult: 3 mg every 4 weeks
Endometriosis
- BY INTRAMUSCULAR INJECTION
  Adult: 3 mg every 4 weeks maximum duration of
  6 months (not to be repeated), to be started during first
  5 days of menstrual cycle

Reduction in size of uterine fibroids
- BY INTRAMUSCULAR INJECTION
  Adult: 3 mg every 4 weeks for at least 3 months, maximum duration of treatment 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

GONAPEPTYL DEPOT®
Advanced prostate cancer
- BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
  Adult: 3.75 mg every 4 weeks
Endometriosis | Reduction in size of uterine fibroids
- BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
  Adult: 3.75 mg every 4 weeks maximum duration of
  6 months (not to be repeated), to be started during first
  5 days of menstrual cycle
SALVACYL®
Male hypersexuality with severe sexual deviation
- BY INTRAMUSCULAR INJECTION
  Adult: 11.25 mg every 12 weeks

CONTRA-INDICATIONS
In endometriosis do not use for longer than 6 months (do not repeat) - undiagnosed vaginal bleeding
SALVACYL® Severe osteoporosis

CAUTIONS
GENERAL CAUTIONS
Patients with metabolic bone disease (decrease in bone mineral density can occur)

SPECIFIC CAUTIONS
- When used for prostate cancer Risk factors for osteoporosis - risk of spinal cord compression in men - risk of ureteric obstruction in men
SALVACYL® Increased risk of sensitivity to restored testosterone if treatment interrupted—consider administration of an antiandrogen before stopping treatment - transient increase in serum testosterone occurs on initiation—consider administration of an anti-androgen

SIDE-EFFECTS
GENERAL SIDE-EFFECTS
Anaphylaxis | arthralgia | asthenia | asthma | breast tenderness (males and females) - changes in blood pressure | changes in breast size - changes in scalp and body hair - depression - gastro-intestinal disturbances - headache - hot flushes - hypersensitivity reactions - increased sweating - local reactions at injection site - mood changes - ovarian cysts (may require withdrawal) - paraesthesia - pruritus - rash - urticaria - visual disturbances - weight changes

SPECIFIC SIDE-EFFECTS
- When used for endometriosis Decrease in trabecular bone density - dyspareunia - loss of libido - menopausal-like symptoms - migraine - musculoskeletal pain - musculoskeletal weakness - oedema of the face and extremities - palpitation - vaginal dryness - withdrawal bleeding (may occur in the first month of treatment)
- When used for male hypersexuality with severe sexual deviation Decrease in trabecular bone density - dyspareunia - loss of libido - migraine - musculoskeletal pain - musculoskeletal weakness - oedema of the face and extremities - palpitation
- When used for prostate cancer Dizziness - dry mouth - hair loss - increased dysuria - myalgia - peripheral oedema - sexual dysfunction - sleep disorders
- When used for reduction in size of uterine fibroids Bleeding associated with fibroid degeneration - decrease in trabecular bone density - dyspareunia - loss of libido - menopausal-like symptoms - migraine - musculoskeletal density.
pain • musculoskeletal weakness • oedema of the face and extremities • palpitation • vaginal dryness • withdrawal bleeding (may occur in the first month of treatment)

SIDE-EFFECTS, FURTHER INFORMATION

- Tumour flare (when used for advanced prostate cancer) During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain.

- CONCEPTION AND CONTRACEPTION Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- PREGNANCY Avoid.

- BREAST FEEDING Avoid.

- MONITORING REQUIREMENTS

- When used for Prostate cancer Men at risk of tumour ‘flare’ should be monitored closely during the first month of therapy.

- DIRECTIONS FOR ADMINISTRATION Rotate injection site to prevent atrophy and nodule formation.

- PRESCRIBING AND DISPENSING INFORMATION

  DECAPEPTYL® SR 11.25MG Each vial includes an overage to allow accurate administration of an 11.25 mg dose.

  DECAPEPTYL® SR 22.5MG Each vial includes an overage to allow accurate administration of a 22.5 mg dose.

  DECAPEPTYL® SR 3MG Each vial includes an overage to allow accurate administration of 3 mg dose.

- NATIONAL FUNDING/ACCESS DECISIONS

All Wales Medicines Strategy Group (AWMSG) Decisions The All Wales Medicines Strategy Group (AWMSG) has advised (March 2017) that triptorelin (Decapeptyl® SR) is recommended as an option for use within NHS Wales as an adjuvant treatment to radiotherapy and as a neoadjuvant treatment prior to radiotherapy, in patients with high-risk localised or locally advanced prostate cancer.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

- Decapeptyl® SR (Ipsen Ltd) Triptorelin (as Triptorelin acetate) 3 mg Decapeptyl® SR 3mg powder and solvent for suspension for injection vials | 1 vial | £65.00

- Decapeptyl® SR (Ipsen Ltd) Triptorelin (as Triptorelin acetate) 11.25 mg Decapeptyl® SR 11.25mg powder and solvent for suspension for injection vials | 1 vial | £200.00

- Decapeptyl® SR (Ipsen Ltd) Triptorelin (as Triptorelin embonate) 22.5 mg Decapeptyl® SR 22.5mg powder and solvent for suspension for injection vials | 1 vial | £414.00

- Gonapexyl Depot® (Ferring Pharmaceuticals Ltd) Triptorelin (as Triptorelin acetate) 3.75 mg Gonapexyl Depot 3.75mg powder and solvent for suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection | £81.69

- Salvacyl® (Ipsen Ltd) Triptorelin (as Triptorelin embonate) 11.25 mg Salvacyl 11.25mg powder and solvent for suspension for injection vials | 1 vial | £248.00

6.1 Hereditary angioedema

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > ANTI-GONADOTROPHIN-RELEASING HORMONES

Danazol

- DRUG ACTION Danazol inhibits pituitary gonadotrophins; it combines androgenic activity with antioestrogenic and antiprogestogenic activity.

- INDICATIONS AND DOSE

  Endometriosis

  - BY MOUTH

  Adult: 200–800 mg daily in up to 4 divided doses usually for 3–6 months, dose to be adjusted to achieve amenorrhoea, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

  Severe pain and tenderness in benign fibrocystic breast disease not responding to other treatment

  - BY MOUTH

  Adult: 300 mg daily in divided doses usually for 3–6 months, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

- HEREDITARY ANGIOEDEMA

  - BY MOUTH

  Adult: Initially 100–200 mg daily, dose to be reduced according to response, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

- UNLICENSED USE Not licensed for use in hereditary angioedema.

- CONTRA-INDICATIONS Acute porphyrias p. 969 • androgen-dependent tumours • thromboembolic disease • undiagnosed genital bleeding

- CAUTIONS Cardiac impairment (avoid if severe) • diabetes mellitus • elderly • epilepsy • history of thrombosis or thromboembolic disease • hypertension • lipoprotein disorder • migraine • polycythaemia

- INTERACTIONS Appendix 1: danazol

- SIDE-EFFECTS

  Rare • Benign hepatic adenomata • cholestatic jaundice • clitoral hypertrophy • pancreatitis • peliosis hepatitis

  Frequency not known Acne • androgenic effects • anxiety • backache • changes in libido • dizziness • eosinophilia • epigastric pain • exfoliative dermatitis • fatigue • fever • flushing and reduction in breast size • hair loss • headache • headache (may indicate benign intracranial hypertension) • hirsutism • insulin resistance • joint pain • joint swelling • leucopenia • menstrual disturbances • mood changes • musculo-skeletal spasm • nausea • nervousness • oedema • oily skin • pleuritic pain • rashes • reversible erythrocytosis • reversible polycythaemia • skin reactions • temporary alteration in lipoproteins and other metabolic changes • thrombocytopoenia • thrombotic events • vaginal dryness • vaginal irritation • vertigo • visual disturbances (may indicate benign intracranial hypertension) • voice changes • weight gain

SIDE-EFFECTS, FURTHER INFORMATION

- Virilisation Withdraw if virilisation effects occur—may be irreversible on continued use.

- CONCEPTION AND CONTRACEPTION Ensure patients with amenorrhoea are not pregnant. Non-hormonal contraceptive methods should be used, if appropriate.
700 Hypothalamic and anterior pituitary hormone related disorders

7 Hypothalamic and anterior pituitary hormone related disorders

Hypothalamic and anterior pituitary hormones

Anterior pituitary hormones

Corticotrophins

Tetracosactide (tetracosactrin), an analogue of corticotropin (ACTH), is used to test adrenocortical function; failure of the plasma cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency.

Both corticotropin and tetracosactide were formerly used as alternatives to corticosteroids in conditions such as Crohn's disease or rheumatoid arthritis; their value was limited by the variable and unpredictable therapeutic response and by the waning of their effect with time.

Gonadotrophins

Follicle-stimulating hormone (FSH) and luteinising hormone (LH) together, follicle-stimulating hormone alone (as in follitropin), or chionic gonadotrophin p. 702, are used in the treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene citrate p. 723, or in superovulation treatment for assisted conception (such as in vitro fertilisation).

The gonadotrophins are also occasionally used in the treatment of hypergonadotrophic hypogonadism and associated oligosperma. There is no justification for their use in primary gonadal failure.

Chorionic gonadotrophin has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone.

Growth hormone

Growth hormone is used to treat deficiency of the hormone in children and in adults. In children it is used in Prader-Willi syndrome, Turner syndrome, chronic renal insufficiency, short children considered small for gestational age at birth, and short stature homeobox-containing gene (SHOX) deficiency.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatropin p. 705, produced using recombinant DNA technology.

Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency.

Hypothalamic hormones

Gonadorelin p. 701 when injected intravenously in normal subjects leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. Gonadorelin analogues are indicated in endometriosis and infertility and in breast and prostate cancer.

7.1 Adrenocortical function testing

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > CORTICOTROPHINS

Tetracosactide

(Tetracosactrin)

CONTRA-INDICATIONS

Acute psychosis - adenogenital syndrome - allergic disorders - asthma - avoid injections containing benzyl alcohol in neonates - Cushing's syndrome - infectious diseases - peptic ulcer - primary adrenocortical insufficiency - refractory heart failure

CAUTIONS

Active infectious diseases (should not be used unless adequate disease-specific therapy is being given) - active systemic diseases (should not be used unless adequate disease-specific therapy is being given) - diabetes mellitus - diverticulitis - history of asthma - history of atopic allergy - history of eczema - history of hayfever - history of hypersensitivity - hypertension - latent amoebiasis (may become activated) - latent tuberculosis (may become activated) - myasthenia gravis - ocular herpes simplex - osteoporosis - predisposition to thromboembolic - psychological disturbances may be triggered - recent intestinal anastomosis - reduced immune response (should not be used unless adequate disease-specific therapy is being given) - ulcerative colitis
7.2 Assessment of pituitary function

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES \( \supset \) GONADOTROPIN-RELEASING HORMONES

**Gonadorelin**

**(Gonadotrophin-releasing hormone; GnRH; LH-RH)**

- **INDICATIONS AND DOSE**
  - **Assessment of pituitary function**
    - **By subcutaneous injection, or by intravenous injection**
    - Adult: 100 micrograms for 1 dose
  - **CAUTIONS**
    - Pituitary adenoma
  - **SIDE-EFFECTS**
    - Abdominal pain
    - Headache
    - Hypersensitivity reaction on repeated administration of large doses
    - Increased menstrual bleeding
    - Irritation at injection site
    - Nausea
  - **PREGNANCY**
    - Avoid
  - **BREAST FEEDING**
    - Avoid

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder and solvent for solution for injection**
    - **Gonadorelin (Non-proprietary)**
      - 100 microgram Gonadorelin 100 microgram powder and solvent for solution for injection vials | 1 vial (POD) £75.00 (Hospital only)

7.3 Gonadotrophin replacement therapy

**GONADOTROPHINS**

**Choriogonadotropin alfa**

**(Human chorionic gonadotropin)**

- **INDICATIONS AND DOSE**
  - Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene.
  - Superovulation treatment for assisted conception (such as in vitro fertilisation)
  - **By subcutaneous injection**
    - Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS**
  - Active thromboembolic disorders
  - Ectopic pregnancy in previous 3 months
  - Hypothalamic malignancy
  - Mammary malignancy
  - Ovarian enlargement or cyst (unless caused by polycystic ovarian disease)
  - Ovarian malignancy
  - Pituitary malignancy
  - Uterine malignancy

- **CAUTIONS**
  - Acute porphyrias p. 969

- **SIDE-EFFECTS**
  - Abdominal pain
  - Depression
  - Diarrhoea
  - Ecopic pregnancy
  - Headache
  - Injection-site
reactions · irritability · nausea · ovarian hyperstimulation syndrome · ovarian torsion · tiredness · vomiting

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Ovitrelle (Merck Serono Ltd)
  - Chorionic gonadotrophin alfa 500 microgram per 1 ml
  - Ovitrelle 250micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [Pom] £31.38 (C04-2)
  - Ovitrelle 250micrograms/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection [Pom] £31.38 (C04-2)

**Chorionic gonadotrophin**
(Human chorionic gonadotrophin; HCG)

**DRUG ACTION** A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone.

**INDICATIONS AND DOSE**
Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)
- BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- Adult (female): Adjusted according to response.

**CONTRA-INDICATIONS** Androgen-dependent tumours
**CAUTIONS** Asthma · cardiac impairment · epilepsy · migraine · prepubertal boys (risk of premature epiphysseal closure or precocious puberty)
**SIDE-EFFECTS** Gynaecomastia · headache · local reactions · may aggravate ovarian hyperstimulation · mood changes · multiple pregnancy · oedema (particularly in males—reduce dose) · tiredness
**RENAL IMPAIRMENT** Use with caution.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- Choragon (Ferring Pharmaceuticals Ltd)
  - Chorionic gonadotrophin human 5000 unit | Choragon 5,000unit powder and solvent for solution for injection ampoules | 3 ampoules [Pom] £9.77 (C04-Z)
- Pregnyl (Merck Sharp & Dohme Ltd)
  - Chorionic gonadotrophin human 1500 unit | Pregnyl 1,500unit powder and solvent for solution for injection ampoules | 1 ampoule [Pom] £2.12 (C04-Z)
  - Chorionic gonadotrophin human 5000 unit | Pregnyl 5,000unit powder and solvent for solution for injection ampoules | 1 ampoule [Pom] £3.15 (C04-Z)

**Corifollitropin alfa**

**INDICATIONS AND DOSE**
Controlled ovarian stimulation in combination with a gonadotrophin-releasing hormone antagonist
- BY SUBCUTANEOUS INJECTION
  - Adult (body-weight up to 60 kg): 100 micrograms
  - Adult (body-weight 60 kg and above): 150 micrograms

**CONTRA-INDICATIONS** History of ovarian hyperstimulation syndrome · ovarian enlargement or cyst · polycystic ovarian syndrome · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of uterus · vaginal bleeding of unknown cause

**CAUTIONS** Acute porphyrias p. 969 · risk factors for thromboembolism · risk of ovarian hyperstimulation syndrome

**SIDE-EFFECTS**
- Common or very common Breast pain · fatigue · headache · nausea · ovarian hyperstimulation · pelvic pain
- Uncommon Abdominal distension and pain · constipation · diarrhoea · dizziness · ovarian torsion · vomiting
- Frequency not known Ectopic pregnancy · miscarriage · multiple pregnancies
**BREAST FEEDING** Avoid.
**RENAL IMPAIRMENT** Avoid.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Elonva (Merck Sharp & Dohme Ltd)
  - Corifollitropin alfa 200 microgram per 1 ml
  - Elonva 100micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [Pom] £838.00
  - Corifollitropin alfa 300 microgram per 1 ml
  - Elonva 150micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [Pom] £638.00

**Follitropin alfa**
(Recombinant human follicle stimulating hormone)

**INDICATIONS AND DOSE**
Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)
- BY SUBCUTANEOUS INJECTION
- Adult (female): Adjusted according to response.

**Hypogonadotrophic hypogonadism**
- BY SUBCUTANEOUS INJECTION
- Adult (male): (consult product literature).

**CONTRA-INDICATIONS** Ovarian cysts (not caused by polycystic ovarian syndrome) · ovarian enlargement (not caused by polycystic ovarian syndrome) · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of prostate · tumours of testes · tumours of uterus · vaginal bleeding of unknown cause

**CAUTIONS** Acute porphyrias p. 969 · history of tubal disease

**SIDE-EFFECTS**
- Common or very common Fever · gastro-intestinal disturbances · headache · hypersensitivity reactions · injection site reactions · joint pain · ovarian hyperstimulation · varicocele
- Very rare Exacerbation or aggravation of asthma · thromboembolism
- Frequency not known Acne · gynaecomastia · increased risk of miscarriage · increased risk of multiple pregnancy · weight gain

**PREGNANCY** Avoid.
**BREAST FEEDING** Avoid.

**PRESCRIBING AND DISPENSING INFORMATION** Follitropin alfa is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

**PATIENT AND CARER ADVICE**
Patient advice required around conception and contraception
Patients planning to conceive should be warned that there is a risk of multiple pregnancy.
Follitropin beta
(Recombinant human follicle stimulating hormone)

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

INDICATIONS AND DOSE
Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superoovulation treatment for assisted conception (such as in vitro fertilisation)
▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
▶ Adult (female): Adjusted according to response.

CONTRA-INDICATIONS
Ovarian cysts (not caused by polycystic ovarian syndrome) | ovarian enlargement (not caused by polycystic ovarian syndrome) | tumours of breast | tumours of hypothalamus | tumours of ovaries | tumours of pituitary | tumours of prostate | tumours of testes | tumours of uterus | vaginal bleeding of unknown cause

CAUTIONS
Acute porphyrias p. 969 | history of tubal disease

SIDE-EFFECTS
▶ Common or very common
- Fever | gastro-intestinal disturbances | headache | hypersensitivity reactions | injection site reactions | joint pain | ovarian hyperstimulation
- Very rare
- Thromboembolism
- Frequency not known
- Acne | gynaecomastia | increased risk of miscarriage | increased risk of multiple pregnancy | weight gain

PREGNANCY
Avoid.

BREAST FEEDING
Avoid.

DIRECTIONS FOR ADMINISTRATION
Cartridges and vials are used for subcutaneous administration; vials are used for intramuscular injection.

PATIENT AND CARER ADVICE
Patient advice required around conception and contraception
Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

MEDICAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

SOLUTION FOR INJECTION
EXCIPIENTS: May contain Neomycin, streptomycin
- Puregon (Merck Sharp & Dohme Ltd)
  Follitropin beta 100 unit per 1 ml Puregon 50units/0.5ml solution for injection vials | 1 vial (POM) £18.03
  Follitropin beta 200 unit per 1 ml Puregon 100units/0.5ml solution for injection vials | 1 vial (POM) £36.06
  Follitropin beta 833 unit per 1 ml Puregon 900units/1.08ml solution for injection vials | 1 vial (POM) £292.23
- Puregon 600units/0.72ml solution for injection cartridges | 1 cartridge (POM) £194.82
- Puregon 300units/0.36ml solution for injection cartridges | 1 cartridge (POM) £57.41
Lutropin alfa
(Recombinant human luteinising hormone)

- **INDICATIONS AND DOSE**
  Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene (in conjunction with follicle-stimulating hormone)
  - Superovulation treatment for assisted conception (such as in vitro fertilisation) (in conjunction with follicle-stimulating hormone)
  - **BY SUBCUTANEOUS INJECTION**
  - Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS** Mammary carcinoma - ovarian carcinoma - ovarian enlargement or cyst (unless caused by polycystic ovarian disease) - tumours of hypothalamus - tumours of pituitary - undiagnosed vaginal bleeding - uterine carcinoma

- **CAUTIONS** Acute porphyrias p. 969

- **SIDE-EFFECTS** Abdominal pain - adnexal torsion - breast pain - ectopic pregnancy - haemoperitoneum - headache - injection-site reactions - nausea - ovarian cyst - ovarian hyperstimulation syndrome - pelvic pain - somnolence - thromboembolism - vomiting

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Powder and solvent for solution for injection**
  - **Lutropin alfa 75 unit** Luveris 75 unit powder and solvent for solution for injection vials | 1 vial £16.38 | 10 vial £163.80
  - **Menotrophin 75 unit** Menopur 75 unit powder and solvent for solution for injection vials | 1 vial £16.38 | 10 vial £163.80
  - **Menotrophin 150 unit** Menopur 150 unit powder and solvent for solution for injection vials | 5 vial £163.80 | 10 vial £227.60
  - **Menotrophin 600 unit** Menopur 600 unit powder and solvent for solution for injection vials | 1 vial £131.04
  - **Menotrophin 1200 unit** Menopur 1200 unit powder and solvent for solution for injection vials | 1 vial £262.08
  - **Merional** (IBSA Farmaceutici Italia Srl)
    - **Menotrophin 75 unit** Merional 75 unit powder and solvent for solution for injection vials | 10 vial £279.00
    - **Menotrophin 150 unit** Merional 150 unit powder and solvent for solution for injection vials | 10 vial £558.00

Menotrophin

- **INDICATIONS AND DOSE**
  Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)
  - **BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION**
  - Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS** Ovarian cysts (not caused by polycystic ovarian syndrome) - tumours of breast - tumours of hypothalamus - tumours of ovaries - tumours of pituitary - tumours of prostate - tumours of testes - tumours of uterus - vaginal bleeding of unknown cause

- **CAUTIONS** Acute porphyrias p. 969

- **SIDE-EFFECTS**
  - Very rare Thromboembolism
  - Frequency not known Fever - gastro-intestinal disturbances - headache - hypersensitivity reactions - increased risk of miscarriage - increased risk of multiple pregnancy - injection site reactions - joint pain - ovarian hyperstimulation

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **PRESCRIBING AND DISPENSING INFORMATION**
  Menotrophin is purified extract of human post-menopausal urine containing follicle-stimulating hormone (FSH) and luteinising hormone (LH) in a ratio of 1:1

- **PATIENT AND CARER ADVICE**
  Patient advice required around conception and contraception
  Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

Urofollitropin

- **INDICATIONS AND DOSE**
  Infertility in women with proven hypopituitarism or who have not responded to clomifene
  - Superovulation treatment for assisted conception (such as in vitro fertilisation)

  - **BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION**
  - Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS** Ovarian cysts - tumours of breast - tumours of hypothalamus - tumours of ovaries - tumours of pituitary - tumours of prostate - tumours of testes - tumours of uterus - vaginal bleeding of unknown cause

- **CAUTIONS** Acute porphyrias p. 969

- **SIDE-EFFECTS**
  - Very rare Thromboembolism
  - Frequency not known Fever - gastro-intestinal disturbances - headache - hypersensitivity reactions - increased risk of miscarriage - increased risk of multiple pregnancy - injection site reactions - joint pain - ovarian hyperstimulation

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **PRESCRIBING AND DISPENSING INFORMATION**
  Urofollitropin is purified extract of human post-menopausal urine containing follicle-stimulating hormone (FSH).

- **PATIENT AND CARER ADVICE**
  Patient advice required around conception and contraception
  Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Powder and solvent for solution for injection**
  - **Bravelle** (Ferring Pharmaceuticals Ltd)
    - **Follicle stimulating hormone human (as Urofollitropin)**
      - **75 unit** Bravelle 75 unit powder and solvent for solution for injection vials | 10 vial £270.00
      - **Fostimon** (IBSA Farmaceutici Italia Srl)
        - **Follicle stimulating hormone human (as Urofollitropin)**
          - **75 unit** Fostimon 75 unit powder and solvent for solution for injection vials | 10 vial £279.00
7.4 Growth hormone disorders

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES

RECEPTOR ANTAGONISTS

Somatropin

(Recombinant Human Growth Hormone)

- INDICATIONS AND DOSE
  Gonadal dysgenesis (Turner syndrome)
  → BY SUBCUTANEOUS INJECTION
    - Adult: 1.4 mg/m² daily, alternatively 45–50 micrograms/kg daily
  Deficiency of growth hormone
  → BY SUBCUTANEOUS INJECTION
    - Adult: Initially 150–300 micrograms daily, then increased if necessary up to 1 mg daily, dose to be increased gradually, use minimum effective dose (requirements may decrease with age)

- DOSE EQUIVALENCE AND CONVERSION
  - Dose formerly expressed in units; somatropin 1 mg = 3 units.

- CONTRA-INDICATIONS
  - Evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting) - not to be used after renal transplantation - severe obesity in Prader-Willi syndrome - severe respiratory impairment in Prader-Willi syndrome

- CAUTIONS
  - Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) - liver disease

- SIDE-EFFECTS
  - Uncommon
    - Bleeding tendency
    - Leucocytosis
    - Leucopenia
    - Thrombocytopenia
  - Frequency not known
    - Abdominal distension
    - Arthritis
    - Asthenia
    - Constipation
    - Diarrhoea
    - Dizziness
    - Drowsiness
    - Dyspepsia
    - Elevated enzyme levels
    - Fatigue
    - Flatulence
    - Headache
    - Hypercholesterolaemia
    - Hyperglycaemia
    - Hypertension
    - Hypoglycaemia
    - Influenza-like syndrome
    - Injection-site reactions
    - Myalgia
    - Nausea
    - Pruritus
    - Rash
    - Sleep disturbances
    - Sweating
    - Tremor
    - Vomiting
    - Weight gain

SIDE-EFFECTS, FURTHER INFORMATION
- Injection-site reactions
  - Rotate injection sites to avoid lipoatrophy.

- CONCEPTION AND CONTRACEPTION
  - Possible increase in female fertility.

- PREGNANCY
  - Avoid.

- BREAST FEEDING
  - Avoid.

- MONITORING REQUIREMENTS
  - Monitor liver enzymes every 4–6 weeks for 6 months or if symptoms of hepatitis develop.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection
- Somavert (Pfizer Ltd)
  - Pegvisomant 10 mg Somavert 10 mg powder and solvent for solution for injection vials | 30 vial £1,500.00 (Hospital only)
  - Pegvisomant 15 mg Somavert 15 mg powder and solvent for solution for injection vials | 30 vial £2,250.00 (Hospital only)
  - Pegvisomant 20 mg Somavert 20 mg powder and solvent for solution for injection vials | 1 vial £100.00 (Hospital only) | 30 vial £3,000.00 (Hospital only)
  - Pegvisomant 25 mg Somavert 25 mg powder and solvent for solution for injection vials | 30 vial £3,750.00 (Hospital only)
  - Pegvisomant 30 mg Somavert 30 mg powder and solvent for solution for injection vials | 30 vial £4,500.00 (Hospital only)

Papilloedema
- Funduscop}'y for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

- PREGNANCY
  - Discontinue if pregnancy occurs—no information available.

- BREAST FEEDING
  - No information available. Absorption from milk unlikely.

- DIRECTIONS FOR ADMINISTRATION
  - Rotate subcutaneous injection sites to prevent lipoatrophy.

SAIZEN® SOLUTION FOR INJECTION
- For use by subcutaneous injection.

NUTROPINAQ®
- For use by subcutaneous injection.

OMNITROPE®
- For use by subcutaneous injection.

NORDITROPIN® PREPARATIONS
- For use by subcutaneous injection.

ZOMACTON®
- For use by subcutaneous injection.

GENOTROPIN® PREPARATIONS
- For use by subcutaneous injection.
SAIZEN® POWDER AND SOLVENT FOR SOLUTION FOR INJECTION For use by subcutaneous injection.
HUMATROPE® Cartridges for use by subcutaneous injection. Powder for reconstitution for use by subcutaneous or intramuscular injection.

● PRESCRIBING AND DISPENSING INFORMATION Somatropin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.
SAIZEN® SOLUTION FOR INJECTION For use with cool.click® needle-free autoinjector device or easypod® autoinjector device (non-NHS but available free of charge from clinics).
NUTROPIN® For use with NutropinAq® Pen device (non-NHS but available free of charge from clinics).
OMNITROPE® For use with Omnitrope Pen® and Omnitrope Pen 10® devices (non-NHS but available free of charge from clinics).
NORDITROPIN® PREPARATIONS Cartridges are for use with appropriate NordiPen® device (non-NHS but available free of charge from clinics). Multidose disposable prefilled pens for use with NovoFine® or NovoTwist® needles.
ZOMACRON® 4 mg vial for use with Zomact 2® Vision needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.
10 mg vial for use with Zomact 2® Vision needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.
GENOTROPIN® PREPARATIONS Cartridges are for use with Genotropin® Pen device (non-NHS but available free of charge from clinics).
SAIZEN® POWDER AND SOLVENT FOR SOLUTION FOR INJECTION For use with one. click® autoinjector device or cool.click® needle-free autoinjector device or easypod® autoinjector device (non-NHS but available free of charge from clinics).

● NATIONAL FUNDING/ACCESS DECISIONS NICE technology appraisals (TAs)
Somatropin for the treatment of growth failure in children (May 2010) NICE TA188 Somatropin is recommended for children with growth failure who:
- have growth-hormone deficiency
- have Turner syndrome
- have Prader-Willi syndrome
- have chronic renal insufficiency
- are born small for gestational age with subsequent growth failure at 4 years of age or later
- have short stature homeobox-containing gene (SHOX) deficiency.
Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.

www.nice.org.uk/TA188 Somatropin for adults with growth hormone deficiency (August 2003) NICE TA64 Somatropin is recommended in adults only if the following 3 criteria are fulfilled:
- Severe growth hormone deficiency, established by an appropriate method,
- Impaired quality of life, measured by means of a specific questionnaire,
- Already receiving treatment for another pituitary hormone deficiency.
Somatropin treatment should be discontinued if the quality of life has not improved sufficiently by 9 months.
Severe growth hormone deficiency developing after linear growth is complete but before the age of 25 years should be treated with growth hormone; treatment should continue until adult peak bone mass has been achieved. Treatment for adult–onset growth hormone deficiency should be stopped only when the patient and the patient’s physician consider it appropriate.
Treatment with somatropin should be initiated and managed by a physician with expertise in growth hormone disorders; maintenance treatment can be prescribed in the community under a shared-care protocol.

www.nice.org.uk/TA64

● MEDICINAL FORMS There can be variation in the prescribing of different medicines containing the same drug.

Solution for injection EXCIPIENTS: May contain Benzyl alcohol

Norditropin NordiFlex (Novo Nordisk Ltd)
- Somatropin (epr) 3.3 mg per 1 ml Norditropin NordiFlex 5 mg/1.5 ml solution for injection pre-filled pen | 1 pre-filled disposable injection (Pom) £115.90 (CD4-2)
- Somatropin (epr) 6.7 mg per 1 ml Norditropin NordiFlex 10 mg/1.5 ml solution for injection pre-filled pen | 1 pre-filled disposable injection (Pom) £231.80 (CD4-2)
- Somatropin (epr) 10 mg per 1 ml Norditropin NordiFlex 15 mg/1.5 ml solution for injection pre-filled pen | 1 pre-filled disposable injection (Pom) £347.70 (CD4-2)

Sex hormone responsive conditions 707

Hormone replacement therapy

Hormone replacement therapy (HRT) with small doses of an oestrogen (together with a progestogen in women with a uterus) is appropriate for alleviating menopausal symptoms such as vaginal atrophy or vasomotor instability. Oestrogen given systemically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal osteoporosis but other drugs are preferred. Menopausal atrophic vaginitis may respond to a short course of a topical vaginal oestrogen preparation used for a few weeks and repeated if necessary.

Systemic therapy with an oestrogen or drugs with oestrogenic properties alleviates the symptoms of oestrogen deficiency such as vasomotor symptoms. Tibolone combines oestrogenic and progestogenic activity with weak androgenic activity; it is given continuously, without cyclical progestogen.

HRT may be used in women with early natural or surgical menopause (before age 45 years), since they are at high risk of osteoporosis. For early menopause, HRT can be given until the approximate age of natural menopause (i.e. until age 50 years). Alternatives to HRT should be considered if osteoporosis is the main concern. Clonidine hydrochloride p. 139 may be used to reduce vasomotor symptoms in women who cannot take an oestrogen, but clonidine hydrochloride may cause unacceptable side-effects.

HRT increases the risk of venous thromboembolism, stroke, endometrial cancer (reduced by a progestogen), breast cancer, and ovarian cancer; there is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. For details of these risks see HRT Risk table.

The minimum effective dose of HRT should be used for the shortest duration. Treatment should be reviewed at least annually and for osteoporosis alternative treatments considered. HRT does not prevent coronary heart disease or protect against a decline in cognitive function and it should not be prescribed for these purposes. Experience of treating women over 65 years with HRT is limited.

For the treatment of menopausal symptoms the benefits of short-term HRT outweigh the risks in the majority of women, especially in those aged under 60 years.

Risk of breast cancer

It is estimated that using all types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use; tibolone has only a limited effect on mammographic density.

Risk of endometrial cancer

The increased risk of endometrial cancer depends on the dose and duration of oestrogen–only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

Risk of ovarian cancer

Long-term use of combined HRT or oestrogen–only HRT is associated with a small increased risk of ovarian cancer; this excess risk disappears within a few years of stopping.

Risk of venous thromboembolism

Women using combined or oestrogen–only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. In women who

</table>

Where background incidence or additional cases have not been included in the table, this indicates a lack of available data. NS indicates a non-significant difference. Taken from MHRA/CHM (Drug Safety 2007; 1 (2): 2-6) available at [www.gov.uk/drug-safety-update](http://www.gov.uk/drug-safety-update)

1. Tibolone increases the risk of breast cancer but to a lesser extent than with combined HRT.
2. Evidence suggests an increased risk of endometrial cancer with tibolone. After 2.7 years of use (in women of average age 68 years), 1 extra case of endometrial hyperplasia and 4 extra cases of endometrial cancer were diagnosed compared with placebo users.
3. The risk of endometrial cancer cannot be reliably estimated in those using combined HRT because the addition of progestogen for at least 10 days per 28-day cycle greatly reduces the additional risk, and addition of a daily progestogen eliminates the additional risk. The risk of endometrial cancer in women who have not used HRT increases with body mass index (BMI); the increased risk of endometrial cancer in users of oestrogen-only HRT or tibolone is more apparent in women who are not overweight.
4. Limited data does not suggest an increased risk of thromboembolism with tibolone compared with combined HRT or women not taking HRT.
5. Although the level of risk of thromboembolism associated with non-oral routes of administration of HRT has not been established, it may be lower for the transdermal route.
6. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment; risk of stroke is age-dependent and therefore the absolute risk of stroke with tibolone increases with age.
7. Increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause.
8. There is insufficient data to draw a conclusion on the risk of coronary heart disease with tibolone.

- Tibolone increases the risk of breast cancer but to a lesser extent than with combined HRT.
- Evidence suggests an increased risk of endometrial cancer with tibolone.
- The risk of endometrial cancer cannot be reliably estimated in those using combined HRT.
- Limited data does not suggest an increased risk of thromboembolism with tibolone.
- Tibolone increases the risk of stroke about 2.2 times from the first year of treatment.
- Increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause.

In younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

**Risk of stroke**

Risk of stroke increases with age; therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment.

**Risk of coronary heart disease**

HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

**Choice**

The choice of HRT for an individual depends on an overall balance of indication, risk, and convenience. A woman with a uterus normally requires oestrogen with cyclical progestogen for the last 12 to 14 days of the cycle or a preparation which involves continuous administration of an oestrogen and a progestogen (or one which provides both oestrogenic and progestogenic activity in a single preparation). Continuous combined preparations or tibolone are not suitable for use in the perimenopause or within 12 months of the last menstrual period; women who use such preparations may bleed irregularly in the early stages of treatment—if bleeding continues endometrial abnormality should be ruled out and consideration given to changing to cyclical HRT.

An oestrogen alone is suitable for continuous use in women without a uterus. However, in endometriosis, endometrial foci may remain despite hysterectomy and the addition of a progestogen should be considered in these circumstances.

An oestrogen may be given by mouth or by transdermal administration, which avoids first-pass metabolism.

**Surgery**

Major surgery under general anaesthesia, including orthopaedic and vascular leg surgery, is a predisposing factor for venous thromboembolism and it may be prudent to stop HRT 4–6 weeks before surgery; it should be restarted only after full mobilisation. If HRT is continued or if discontinuation is not possible (e.g. in non-elective surgery), prophylaxis with unfractionated or low molecular weight heparin and graduated compression hosiery is advised.

**Reasons to stop HRT**

Hormone replacement therapy should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
Female sex hormone responsive conditions 709

- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg;
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment.

**Ethinylestradiol**

Ethinylestradiol p. 715 (ethinylestradiol) is licensed for short-term treatment of symptoms of oestrogen deficiency, for osteoporosis prophylaxis if other drugs cannot be used and for the treatment of female hypogonadism and menstrual disorders.

Ethinylestradiol is occasionally used under specialist supervision for the management of hereditary haemorrhagic telangiectasia (but evidence of benefit is limited). It is also used licensed for the palliative treatment of prostate cancer.

**Raloxifene**

Raloxifene hydrochloride is licensed for the treatment and prevention of postmenopausal osteoporosis; unlike hormone replacement therapy, raloxifene hydrochloride does not reduce menopausal vasomotor symptoms.

**Progestogens and progesterone receptor modulators**

There are two main groups of progestogen, progesterone and its analogues (dydrogesterone and medroxyprogesterone acetate p. 763) and testosterone analogues (norethisterone p. 720 and norgestrel). The newer progestogens (desogestrel p. 758, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel p. 759 is the active isomer of norgestrel and has twice its potency. Progesterone p. 721 and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

Where endometriosis requires drug treatment, it may respond to a progestogen, e.g. norethisterone, administered on a continuous basis. Danazol p. 699 and gonadorelin analogues are also available.

Although oral progestogens have been used widely for menorrhagia they are relatively ineffective compared with tranexamic acid p. 107 or, particularly where dysmenorrhoea is also a factor, mefenamic acid p. 1046; the levonorgestrel-releasing intra-uterine system may be particularly useful for women also requiring contraception. Oral progestogens have also been used for severe dysmenorrhoea, but where contraception is also required in younger women the best choice is a combined oral contraceptive.

Progestogens have also been advocated for the alleviation of premenstrual symptoms, but no convincing physiological basis for such treatment has been shown.

Progestogens have been used for the prevention of miscarriage in women with a history of recurrent miscarriage but there is no evidence of benefit and they are not recommended for this purpose. In pregnant women with antiphospholipid antibody syndrome who have suffered recurrent miscarriage, administration of low-dose aspirin p. 117 and a prophylactic dose of a low molecular weight heparin may decrease the risk of fetal loss (use under specialist supervision only).

**Hormone replacement therapy**

In women with a uterus a progestogen needs to be added to long-term oestrogen therapy for hormone replacement, to prevent cystic hyperplasia of the endometrium and possible transformation to cancer; it can be added on a cyclical or a continuous basis. Combined packs incorporating suitable progestogen tablets are available.

**Oral contraception**

Desogestrel, gestodene, levonorgestrel, norethisterone, and norgestimate are used in combined oral contraceptives and in progestogen-only contraceptives.

**Cancer**

Progestogens also have a role in neoplastic disease.

**Progestosterone receptor modulators**

Ulipristal acetate p. 757 is a progestosterone receptor modulator with a partial progesterone antagonist effect. Ulipristal acetate is used in the pre-operative treatment of moderate to severe symptoms of uterine fibroids; it is also used as an hormonal emergency contraceptive.

**Heavy menstrual bleeding**

Ulipristal acetate (up to four courses) is recommended in patients with heavy menstrual bleeding associated with uterine fibroids of a diameter of 3 cm or more, and a haemoglobin level of 102 g/litre or below; ulipristal acetate may also be considered if the haemoglobin level is greater than 102 g/litre.

### 8.1 Female sex hormone responsive conditions

**Calcium regulating drugs**

**Bone resorption inhibitors**

**Raloxifene hydrochloride**

- **indications and dose**
  - Treatment and prevention of postmenopausal osteoporosis
  - By mouth
  - Adult: 60 mg once daily

- **Adverse effects**

  - **Contra-indications**
    - Cholestasis - endometrial cancer - history of venous thromboembolism - undiagnosed uterine bleeding
  - **Caution**
    - Avoid in acute porphyrias
    - Hypertriglyceridaemia (monitor serum triglycerides)
    - Risk factors for stroke - risk factors for venous thromboembolism (discontinue if prolonged immobilisation)
  - **Interactions**
    - ![Appendix 1: raloxifene](downloaded from www.medicalbr.com)
  - **Side-effects**
    - **Common or very common**
      - Hot flushes - influenza-like symptoms - leg cramps - peripheral oedema
    - **Uncommon**
      - Thrombophlebitis - venous thromboembolism
    - **Rare**
      - Arterial thromboembolism - breast discomfort - gastro-intestinal disturbances - headache - hypertension - migraine - rashes - thrombocytopenia
  - **Hepatic Impairment**
    - Avoid.
  - **Renal Impairment**
    - Caution in mild to moderate impairment. Avoid in severe impairment.
  - **National funding/access decisions**

**Nice technology appraisals (TAs)**

- Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic
Endocrine system

OESTROGENS

Conjugated oestrogens (equine)

**INDICATIONS AND DOSE**

**PREMARIN® TABLETS**

**Menopausal symptoms**

- **BY MOUTH**
  - Adult: 0.3–1.25 mg daily continuously; with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**Osteoporosis prophylaxis**

- **BY MOUTH**
  - Adult: 0.625–1.25 mg daily continuously; with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**CONTRA-INDICATIONS**

- Active arterial thromboembolic disease (e.g. angina or myocardial infarction) - active thrombophlebitis - Dubin–Johnson syndromes (or monitor closely) - history of breast cancer - history of recurrent venous thromboembolism (unless already on anticoagulant treatment) - liver disease (where liver function tests have failed to return to normal) - oestrogen-dependent cancer - recent arterial thromboembolic disease (e.g. angina or myocardial infarction) - Rotor syndromes (or monitor closely) - thrombophilic disorder - undiagnosed vaginal bleeding - untreated endometrial hyperplasia - venous thromboembolism

**CAUTIONS**

- Acute porphyrias p. 969 - diabetes (increased risk of heart disease) - factors predisposing to thromboembolism - history of breast nodules (closely monitor breast status — risk of breast cancer) - history of endometrial hyperplasia - history of fibrocystic disease (closely monitor breast status — risk of breast cancer) - hypophyseal tumours - increased risk of gall-bladder disease reported - migraine - migraine-like headaches - presence of antiphospholipid antibodies (increased risk of thrombotic events) - risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) - risk of breast cancer

**CAUTIONS, FURTHER INFORMATION**

- Risk of breast cancer It is estimated that using all types of HRT, including tibolone, increases the risk of breast cancer in women who start combined HRT more than 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.

- Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.

- Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

- Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

- In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

**Travel** involving prolonged immobility further increases the risk of deep vein thrombosis.

- Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

- Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

- Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

**INTERACTIONS** → Appendix 1: hormone replacement therapy
CONCEPTION AND CONTRACEPTION  HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

PREGNANCY  Not known to be harmful.

BREAST FEEDING  Avoid until weaning or for 6 months after birth (adverse effects on lactation).

HEPATIC IMPAIRMENT  Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until safe), cholestasis.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Tablet
- Premarin (Pfizer Ltd)  Conjugated oestrogens 300 microgram  Premarin 0.3mg tablets | 84 tablet  £6.07 DT price + £6.07
- Conjugated oestrogens 625 microgram  Premarin 0.625mg tablets | 84 tablet  £4.02 DT price + £4.02
- Conjugated oestrogens 1.25 mg  Premarin 1.25mg tablets | 84 tablet  £3.58 DT price + £3.58

Combinations available: Conjugated oestrogens with medroxyprogesterone, p. 717

Conjugated oestrogens with bazedoxifene acetate  28-Mar-2017
The properties listed below are those particular to the combination only. For the properties of the components please consider, conjugated oestrogens (equine) p. 710.

INDICATIONS AND DOSE  Menopausal symptoms (in women with at least 12 months since last menses for whom treatment with progestogen-containing therapy is not appropriate)
- By mouth
  - Adult: 0.45/20 mg daily continuously

DOSE EQUIVALENCE AND CONVERSION  Dose expressed as x/y mg conjugated oestrogens/bazedoxifene.

INTERACTIONS  → Appendix 1: hormone replacement therapy

SIDE-EFFECTS  Common or very common
- Common or very common  Dry mouth • muscle spasms • somnolence
- Uncommon  Cholecytitis
- Frequency not known  Visual disturbances

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet
CAUTIONARY AND ADVISORY LABELS  3, 25
- Duavive (Merck Sharp & Dohme Ltd)  Conjugated oestrogens 450 microgram, Bazedoxifene (as Bazedoxifene acetate) 20 mg  Duavive 0.45mg/20mg modified-release tablets | 28 tablet  £15.00

Estradiol  28-Mar-2017

INDICATIONS AND DOSE  BEDOL ®
Menopausal symptoms | Osteoporosis prophylaxis
- By mouth
  - Adult: 2 mg daily, started on day 1–5 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

CLIMAVAL ®
Menopausal symptoms (if patient has had a hysterectomy)
- By mouth
  - Adult: 1–2 mg daily

ELLESTE SOLO ® MX
Menopausal symptoms
- By transdermal application
  - Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with MX 40, subsequently adjust according to response

Osteoporosis prophylaxis
- By transdermal application
  - Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with MX 80, subsequently adjust according to response
**ELLESTESOLO® 1-MG**

**Menopausal symptoms**
- **By mouth**
  - Adult: 1 mg daily, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**ELLESTESOLO® 2-MG**

**Menopausal symptoms not controlled with lower strength**
- **Osteoporosis prophylaxis**
  - **By mouth**
  - Adult: 2 mg daily, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be given with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**ESTRADERM MX®**

**Menopausal symptoms**
- **By transdermal application**
  - Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus, initiate therapy with MX25 for first 3 months; subsequently adjust according to response

**Osteoporosis prophylaxis**
- **By transdermal application**
  - Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus, initiate therapy with MX50; subsequently adjust according to response

**ESTRADO®**

**Menopausal symptoms**
- **By transdermal application**
  - Adult: Apply 1 patch twice weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with 25 patch for 3 months; subsequently adjust according to response

**Osteoporosis prophylaxis**
- **By transdermal application**
  - Adult: Apply 1 patch twice weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with 50 patch; subsequently adjust according to response

**EVOREL®**

**Menopausal symptoms | Osteoporosis prophylaxis**
- **By transdermal application**
  - Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, therapy should be initiated with Evarel 50 patch; subsequently adjust according to response; dose may be reduced to Evarel 25 patch after first month if necessary for menopausal symptoms only

**FEMSEVEN®**

**Menopausal symptoms | Osteoporosis prophylaxis**
- **By transdermal application**
  - Adult: Apply 1 patch once weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with FemSeven 50 patches for the first few months, subsequently adjust according to response

**OESTROGEL®**

**Menopausal symptoms**
- **To the skin**
  - Adult: Apply 1.5 mg once daily continuously, increased if necessary up to 3 mg after 1 month continuously, to be applied over an area twice that of the template provided, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus

**Osteoporosis prophylaxis**
- **To the skin**
  - Adult: Apply 1.5 mg once daily continuously, to be applied over an area twice that of the template provided, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus

**Dose equivalence and conversion**
- For Oestrogel®: 2 measures is equivalent to estradiol 1.5 mg.

**PROGYNOVA®**

**Menopausal symptoms**
- **By mouth**
  - Adult: 1–2 mg daily continuously, to be started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**Osteoporosis prophylaxis**
- **By mouth**
  - Adult: 2 mg daily continuously, to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**PROGYNOVA® TS**

**Menopausal symptoms | Osteoporosis prophylaxis**
- **By transdermal application**
  - Adult: Apply 1 patch once weekly continuously, alternatively apply 1 patch once weekly for 3 weeks, followed by a 7-day patch-free interval (cyclical), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with Progynova TS 50, subsequently adjust according to response, women receiving Progynova TS 100 patches for menopausal symptoms may continue with this strength for osteoporosis prophylaxis

**SANDRENA®**

**Menopausal symptoms**
- **To the skin**
  - Adult: Apply 1 mg once daily, to be applied over area 1–2 times size of hand; with cyclical progestogen for 12–14 days of each cycle in women with a uterus, dose may be adjusted after 2–3 cycles to lowest effective dose; usual dose 0.5–1.5 mg daily

**ZUMENON®**

**Menopausal symptoms**
- **By mouth**
  - Adult: Initially 1 mg daily, to be started within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), increased if necessary to 2 mg daily, to be taken with a cyclical progestogen for 12–14 days of each cycle in women with a uterus

**Osteoporosis prophylaxis**
- **By mouth**
  - Adult: 2 mg daily, to be taken with a cyclical progestogen for 12–14 days of each cycle in women with a uterus
CONTRA-INDICATIONS Active arterial thromboembolic disease (e.g. angina or myocardial infarction) • active thrombophlebitis • Dubin–Johnson syndrome (or monitor closely) • history of breast cancer • history of recurrent venous thromboembolism (unless already on anticoagulant treatment) • oestrogen-dependent cancer • recent arterial thromboembolic disease (e.g. angina or myocardial infarction) • Rotor syndrome (or monitor closely) • thrombopathic disorder • undiagnosed vaginal bleeding • untreated endometrial hyperplasia • venous thromboembolism

CAUTIONS Acute porphyrias p. 969 • diabetes (increased risk of heart disease) • history of breast nodules—closely monitor breast status (risk of breast cancer) • history of endometrial hyperplasia; factors predisposing to thromboembolism • history of fibrocystic disease—closely monitor breast status (risk of breast cancer) • hypophyseal tumours • increased risk of gall-bladder disease • migraine (or migraine-like headaches) • presence of antiphospholipid antibodies (increased risk of thrombotic events) • prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer • risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) • symptoms of endometriosis may be exacerbated • uterine fibroids may increase in size

CAUTIONS, FURTHER INFORMATION
- Risk of breast cancer It is estimated that using all types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.

Radioiodine detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

- Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

- Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

- Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

- Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, meloma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

INTERACTIONS Appendix 1: hormone replacement therapy

SIDE-EFFECTS
GENERAL SIDE-EFFECTS Abdominal bloating • abdominal cramps • altered blood lipids (may lead to pancreatitis, rashes and chloasma) • breast enlargement • breast tenderness • changes in libido • cholestatic jaundice • contact lenses may irritate • depression • dizziness • fluid retention • glucose intolerance • headache • headache (on vigorous exercise) • leg cramps (rule out venous thrombosis) • migraine • mood changes • nausea • premenstrual-like syndrome • sodium retention • vaginal candidiasis • vomiting • weight changes

SPECIFIC SIDE-EFFECTS
- With transdermal use Cause contact sensitisation (possible severe hypersensitivity reaction on continued exposure)

SIDE-EFFECTS, FURTHER INFORMATION
- Withdrawal bleeding Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

CONCEPTION AND CONTRACEPTION HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

PREGNANCY Not known to be harmful.

BREAST FEEDING Avoid; adverse effects on lactation.

HEPATIC IMPAIRMENT Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin–Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

MONITORING REQUIREMENTS
- Close diagnosis of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer).

The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

**INDICATIONS AND DOSE**

**Short-term treatment of symptoms of oestrogen deficiency**

- **Osteoporosis prophylaxis if other drugs cannot be used**
  - **BY MOUTH**
    - Adult (male): 10–50 micrograms daily for 21 days, repeated after 7-day tablet-free period, to be given with progestogen for 12–14 days per cycle in women with intact uterus.

**Female hypogonadism**

- **BY MOUTH**
  - Adult (female): 10–50 micrograms daily usually on cyclical basis, initial oestrogen therapy should be followed by combined oestrogen and progestogen therapy.

**Menstrual disorders**

- **BY MOUTH**
  - Adult (female): 20–50 micrograms daily from day 5 to day 25 of each cycle, to be given with progestogen, added either throughout the cycle or from day 15 to 25.

**Palliative treatment of prostate cancer**

- **BY MOUTH**
  - Adult (male): 0.15–1.5 mg daily.

**CONTRA-INDICATIONS** Active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) • active thrombophlebitis • acute porphyrias p. 969 • Dubin–Johnson and Rotor syndromes (or monitor closely) • gallstones • heart disease associated with pulmonary hypertension • heart disease associated with risk of embolus • history during pregnancy of cholestatic jaundice • history during pregnancy of chorea • history during pregnancy of pemphigoid gestationis • history during pregnancy of pruritus • history of breast cancer • history of haemolytic uraemic syndrome • liver disease (where liver function tests have failed to return to normal) • migraine with aura • oestrogen-dependent cancer • sclerosing treatment for varicose veins • severe or multiple risk factors for arterial disease • severe or multiple risk factors for venous thromboembolism • systemic lupus erythematosus with (or unknown) antiphospholipid antibodies • thrombophilic disorder • transient cerebral ischaemic attacks without headaches • undiagnosed vaginal bleeding • untreated endometrial hyperplasia • venous thromboembolism, or history of recurrent venous thromboembolism (unless already on antiocoagulant treatment)

**CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice • cardiovascular disease (sodium retention with oedema, thromboembolism) • Crohn’s disease • diabetes (increased risk of heart disease) • gene mutations associated with breast cancer (e.g. BRCA 1) • history of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer) • history of endometrial hyperplasia • history of severe depression (especially if induced by hormonal contraceptive) • hyperprolactinaemia (seek specialist advice) • hypophysial tumours • increased risk of gall-bladder disease • inflammatory bowel disease • migraine (migraine-like headaches) • personal or family history of hypertrophiccardiama (increased risk of pancreatitis) • presence of antiphospholipid antibodies (increased risk of thrombotic events) • prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer • risk factors for arterial disease • risk factors for migraine • risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) • risk factors for venous thromboembolism • sickle-cell disease • undiagnosed breast mass

**CAUTIONS, FURTHER INFORMATION**

- **Other conditions** The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present, see above). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **Risk of venous thromboembolism** Use with caution if any of the following factors present but avoid if two or more factors present:
  - family history of venous thromboembolism in first-degree relative aged under 45 years (avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
  - obesity—body mass index ≥30 kg/m² (avoid body mass index ≥35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
  - long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
  - history of superficial thrombophlebitis;
  - age over 35 years (avoid if over 50 years);
  - smoking.

- **Risk factors for arterial disease** Use with caution if any one of the following factors present but avoid if two or more factors present:
  - family history of arterial disease in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
  - diabetes mellitus (avoid if diabetes complications present);
  - hypertension—blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg); (In adolescents, avoid if blood pressure very high);
  - smoking (avoid if smoking 40 or more cigarettes daily);
  - age over 35 years (avoid if over 50 years);
  - obesity (avoid if body mass index ≥35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
  - migraine without aura (avoid if migraine with aura (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

- **Migraine** Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

**INTERACTIONS** → Appendix 1: hormone replacement therapy

**SIDE-EFFECTS**

- **Rare** Gallstones • systemic lupus erythematosus

- **Frequency not known** Abdominal bloating • abdominal cramps • absence of withdrawal bleeding • altered blood lipids (may lead to pancreatitis) • amenorrhoea after discontinuation • breast enlargement • breast secretion • breast tenderness • cervical erosion • changes in libido • changes in lipid metabolism • changes in vaginal discharge • chloasma • cholestatic jaundice • chorea • contact lenses may irritate • depression • dizziness • feminising effects • fluid retention • glucose intolerance • headache • hepatic tumours • hypertension • irritability • leg cramps (rule out venous thrombosis) • liver impairment • migraine • mood changes • nausea • nervousness • photosensitivity

---

*downloaded from www.medicalbr.com*
premenstrual-like syndrome • rash • reduced menstrual loss • skin reactions • sodium retention • symptoms of endometriosis may be exacerbated • thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) • uterine fibroids may increase in size • vaginal candidiasis • visual disturbances • vomiting • weight changes • ‘spotting’ in early cycles

**SIDE-EFFECTS, FURTHER INFORMATION**

- Withdrawal bleeding  
  Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

**PREGNANCY**  
Not known to be harmful.

**BREAST FEEDING**  
Avoid until weaning or for 6 months after birth (adverse effects on lactation).

**HEPATIC IMPAIRMENT**  
Avoid.

**Tibolone**

**INDICATIONS AND DOSE**

Short-term treatment of symptoms of oestrogen deficiency (including women being treated with gonadotrophin releasing hormone analogues)  
Osteoporosis prophylaxis in women at high risk of fractures when other prophylaxis contra-indicated or not tolerated

- **BY MOUTH**
- Adult: 2.5 mg daily

**CONTRA-INDICATIONS**

- Active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) • active thrombophlebitis • acute porphyrias p. 969 • Dubin–Johnson and Rotor syndrome (or monitor closely) • history of breast cancer • history of cardiovascular disease • history of cerebrovascular disease • history of recurrent venous thromboembolism (unless already on anticoagulant treatment) • history of thrombolysis • history of thrombophlebitis • hormone-dependent tumours • liver disease (where liver function tests have failed to return to normal) • oestrogen-dependent cancer • thrombophilic disorder • uninvestigated or undiagnosed vaginal bleeding • untreated endometrial hyperplasia • venous thromboembolism

**CAUTIONS**

- Acute porphyrias p. 969 • diabetes (increased risk of heart disease) • epilepsy • factors predisposing to thromboembolism • history of breast nodules—closely monitor breast status (risk of breast cancer) • history of endometrial hyperplasia • history of fibrocystic disease—closely monitor breast status (risk of breast cancer) • history of liver disease • hypertriglyceridaemia • hypophysial tumours • migraine (or migraine-like headaches) • presence of antiphospholipid antibodies (increased risk of thrombotic events) • prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer • risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) • risk of stroke

**INTERACTIONS**

- Other conditions  
  The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

**SIDE-EFFECTS**

- Common or very common  
  Abdominal pain • facial hair • leucorrhoea • vaginal bleeding • weight changes

- Rare  
  Amnesia

- Frequency not known  
  Arthralgia • breast cancer • depression • dizziness • gastro-intestinal disturbances • headache • increased risk of gall-bladder disease • migraine • myalgia • oedema • pruritus • rash • seborrhoeic dermatitis • symptoms of endometriosis may be exacerbated • uterine fibroids may increase in size • visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

- Vaginal bleeding  
  Investigate for endometrial cancer if bleeding continues beyond 6 months or after stopping treatment.

- Reasons to withdraw treatment  
  Withdraw treatment if signs of thromboembolic disease, abnormal liver function tests, or signs of cholestatic jaundice.

- **PREGNANCY**  
  Avoid; toxicity in animal studies.

- **BREAST FEEDING**  
  Avoid.

- **HEPATIC IMPAIRMENT**  
  Avoid in acute liver disease or if history of liver disease and liver function tests not returned to normal.

- **RENAI IMPAIRMENT**  
  Patients with renal impairment should be closely monitored (risk of fluid retention).

**PRESCRIBING AND DISPENSING INFORMATION**

- Unsuitable for use in the premenopause (unless being treated with gonadotrophin-releasing hormone analogue) and as (or with) an oral contraceptive.

- Also unsuitable for use within 12 months of last menstrual period (may cause irregular bleeding).

- If transferring from cyclical HRT, start at end of regimen; if transferring from continuous–combined HRT, start at any time.

**MEDICINAL FORMS**

OESTROGENS COMBINED WITH PROGESTOGENS

Conjugated oestrogens with medroxyprogesterone

The properties listed below are those particular to the combination only. For the properties of the components please consider, conjugated oestrogens (equine) p. 710, medroxyprogesterone acetate p. 763.

- **INDICATIONS AND DOSE**
  - **PREMIQUE® LOW DOSE TABLETS**
    - Menopausal symptoms in women with a uterus
      - BY MOUTH
        - Adult: 1 tablet daily continuously

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Modified-release tablet**
    - **Premique** (Pfizer Ltd)
      - Conjugated oestrogens 300 microgram, Medroxyprogesterone acetate 1.5 mg
  - **Premique Low Dose**

Estradiol with drospirenone

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 711.

- **INDICATIONS AND DOSE**
  - **Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously**
    - BY MOUTH
      - Adult: 1 tablet daily continuously, if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase

- **CAUTIONS** Use with care if an increased concentration of potassium might be hazardous
- **INTERACTIONS** → Appendix 1: hormone replacement therapy
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - **Angeliq** (Bayer Plc)
      - Estradiol (as Estradiol hemihydrate) 1 mg, Drospirenone 2 mg

Estradiol with dydrogesterone

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 711.

- **INDICATIONS AND DOSE**
  - **FEMOSTON® 1 MG/10 MG**
    - Menopausal symptoms in women with a uterus
      - BY MOUTH
        - Adult: 1 tablet daily for 14 days, white tablet to be taken and started within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), then 1 tablet daily for 14 days, grey tablet to be taken, subsequent courses repeated without interval, **Femoston® 1 mg/10 mg** substituted if symptoms not controlled

  - **Osteoporosis prophylaxis in women with a uterus**
    - BY MOUTH
      - Adult: 1 tablet daily for 14 days, white tablet to be taken and started within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), then 1 tablet daily for 14 days, grey tablet to be taken, subsequent courses repeated without interval

  - **FEMOSTON® 2 MG/10 MG**
    - Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously
      - BY MOUTH
        - Adult: 1 tablet daily for 14 days, red tablet to be taken and started within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), then 1 tablet daily for 14 days, yellow tablet to be taken, subsequent courses repeated without interval

  - **Osteoporosis prophylaxis in women with a uterus**
    - BY MOUTH
      - Adult: 1 tablet daily for 14 days, red tablet to be taken and started within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), then 1 tablet daily for 14 days, yellow tablet to be taken, subsequent courses repeated without interval

  - **FEMOSTON®-CONTI 0.5 MG/2.5MG**
    - Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously
      - BY MOUTH
        - Adult: 1 tablet daily continuously, if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase

  - **Osteoporosis prophylaxis in women with a uterus**
    - BY MOUTH
      - Adult: 1 tablet daily continuously, if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase

- **CONTRA-INDICATIONS**
  - Acute porphyrias p. 969 • genital or breast cancer • history during pregnancy of idiopathic jaundice, severe pruritus, or pempigoid gestationis • history of liver tumours • severe arterial disease • undiagnosed vaginal bleeding

- **CAUTIONS** Conditions that may worsen with fluid retention e.g. epilepsy, hypertension, migraine, asthma, or cardiac dysfunction • diabetes (progestogens can decrease glucose tolerance) • history of depression • in those
susceptible to thromboembolism (particular caution with high dose)

- INTERACTIONS → Appendix 1: hormone replacement therapy
- SIDE-EFFECTS Acne · alopecia · anaphylactoid reactions · bloating · breast tenderness · change in libido · depression · dizziness · drowsiness · fluid retention · headache · hirsutism · insomnia · jaundice · menstrual disturbances · nausea · premenstrual-like syndrome · pruritus · rash · skin reactions · urticaria · weight change
- HEPATIC IMPAIRMENT Avoid.
- RENAL IMPAIRMENT Use with caution.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  **Tablet**
  - Femoston 1/10 (Mylan Ltd)
    Femoston 1/10mg tablets | 84 tablet (POM) £16.16

**Estradiol with levonorgestrel**

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 711, levonorgestrel p. 759.

- INDICATIONS AND DOSE

  **FEMSEVEN SEQUI®**
  *Menopausal symptoms in women with a uterus*  
  → BY TRANSDERMAL APPLICATION  
  *Adult:* Apply 1 patch once weekly continuously

  **FEMSEVEN CONTI®**
  *Menopausal symptoms in women with a uterus*  
  → BY TRANSDERMAL APPLICATION  
  *Adult:* Apply 1 patch once weekly for 2 weeks, phase 1 patches to be applied, then apply 1 patch once weekly for 2 weeks, phase 2 patches to be applied, subsequent courses are repeated without interval

- INTERACTIONS → Appendix 1: hormone replacement therapy
- PATIENT AND CARER ADVICE Patient counselling is advised for estradiol with levonorgestrel patches (application).

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  **Transdermal patch**
  - FemSeven Conti (Teva UK Ltd)
    Levonorgestrel 7 microgram per 24 hour, Estradiol 50 microgram per 24 hour FemSeven Conti patches | 4 patch (POM) £15.48 | 12 patch (POM) £44.12
  - FemSeven Sequi (Teva UK Ltd)
    FemSeven Sequi patches | 4 patch (POM) £13.18 | 12 patch (POM) £37.54

**Estradiol with medroxyprogesterone**

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 711, medroxyprogesterone acetate p. 763.

- INDICATIONS AND DOSE

  **INDIVINA® TABLETS**
  *Menopausal symptoms in women with a uterus whose last menstrual period occurred over 3 years previously*  
  → BY MOUTH  
  *Adult:* Initially 1/2.5 mg daily taken continuously, adjust according to response, to be started at end of scheduled bleed if changing from cyclical HRT

  **TRIDESTRA®**
  *Menopausal symptoms in women with a uterus*  
  → BY MOUTH  
  *Adult:* 1 tablet daily for 70 days, white tablet to be taken, then 1 tablet daily for 14 days, blue tablet to be taken, then 1 tablet daily for 7 days, yellow tablet to be taken, subsequent courses are repeated without interval

- INTERACTIONS → Appendix 1: hormone replacement therapy

**Estradiol with norethisterone**

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 711, norethisterone p. 720.

- INDICATIONS AND DOSE

  **CLIMAGET® 1-MG**
  *Menopausal symptoms*  
  → BY MOUTH  
  *Adult:* 1 tablet daily for 16 days, grey tablet to be taken and started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, white tablet to be taken, subsequent courses are repeated without interval

  **CLIMAGET® 2-MG**
  *Menopausal symptoms (if symptoms not controlled with lower strength)*  
  → BY MOUTH  
  *Adult:* 1 tablet daily for 16 days, blue tablet to be taken and started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, white tablet to be taken, subsequent courses are repeated without interval
Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

- **BY MOUTH**
  - Adult: 1 tablet daily continuously

**KLIOFEM**

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

- **BY MOUTH**
  - Adult: 1 tablet daily continuously, to be started at end of scheduled bleed if changing from cyclical HRT

**EVOREL**

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

- **BY TRANSDERMAL APPLICATION**
  - Adult: 1 tablet daily for 16 days, white tablets to be taken, started on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, pink tablets to be taken, subsequent courses repeated without interval

**ELLESTE-DUET**

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

- **BY MOUTH**
  - Adult: 1 tablet daily for 16 days, white tablets to be taken, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, green tablets to be taken, subsequent courses repeated without interval

**EVOREL CONTI**

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

- **BY TRANSDERMAL APPLICATION**
  - Adult: 1 patch twice weekly for 1 week, Evorel® patch to be applied, subsequent courses repeated without interval

**KLIOVANCE**

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

- **BY MOUTH**
  - Adult: 1 tablet daily continuously, to be started at end of scheduled bleed if changing from cyclical HRT

**NOVFEM**

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

- **BY MOUTH**
  - Adult: 1 tablet daily for 16 days, red tablets to be taken, then 1 tablet daily for 12 days, white tablets to be taken, subsequent courses repeated without interval; start treatment with red tablet at any time or if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase

**NUVELLE CONTINUOUS**

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

- **BY MOUTH**
  - Adult: 1 tablet daily continuously, if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase

**TRISEQUENS**

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

- **BY MOUTH**
  - Adult: 1 tablet daily for 12 days, blue tablets to be taken, followed by 1 tablet daily for 10 days, white tablets to be taken, then 1 tablet daily for 6 days, red tablet to be taken, subsequent courses repeated without interval

**INTERACTIONS** Appendix 1: hormone replacement therapy

**PATIENT AND CARER ADVICE**

Evorel® Sequi Patients and carers should be advised on the application of Evorel® Sequi patches.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

  - Trisequens tablets | 84 tablet [POM] £11.10
Estradiol with norgestrel

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 711.

**INDICATIONS AND DOSE**

**CYCLO-PROGYNOVA® 2MG TABLETS**

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

- **BY MOUTH**
  - Adult: 1 tablet daily for 11 days, white tablet to be taken; start on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 10 days, brown tablet to be taken, followed by a 7-day tablet free interval

**INTERACTIONS**

Appendix 1: hormone replacement therapy

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablets

- Cyclo-Progynova (Meda Pharmaceuticals Ltd)
  - Cyclo-Progynova 2mg tablets | 21 tablet (PO) £3.11

PROGESTOGENS

Norethisterone

**INDICATIONS AND DOSE**

**Endometriosis**

- **BY MOUTH**
  - Adult: 10–15 mg daily for 4–6 months or longer, to be started on day 5 of cycle; increased to 20–25 mg daily if required, dose only increased if spotting occurs and reduced once bleeding has stopped

**Dysfunctional uterine bleeding (to arrest bleeding) | Menorrhagia (to arrest bleeding)**

- **BY MOUTH**
  - Adult: 5 mg 3 times a day for 10 days

**Dysfunctional uterine bleeding (to prevent bleeding) | Menorrhagia (to prevent bleeding)**

- **BY MOUTH**
  - Adult: 5 mg twice daily, to be taken from day 19 to day 26 of cycle

**Dysmenorrhoea**

- **BY MOUTH**
  - Adult: 5 mg 3 times a day for 3–4 cycles, to be taken from day 5–24 of cycle

**Premenstrual syndrome (but not recommended)**

- **BY MOUTH**
  - Adult: 5 mg 2–3 times a day for several cycles, to be taken from day 19–26 of cycle

**Postponement of menstruation**

- **BY MOUTH**
  - Females of childbearing potential: 5 mg 3 times a day, to be started 3 days before expected onset (menstruation occurs 2–3 days after stopping)

**CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS**

Avoid in patients with a history of liver tumours, breast cancer (unless progestogens are being used in the management of this condition), genital cancer (unless progestogens are being used in the management of this condition), history during pregnancy of idiopathic jaundice, history during pregnancy of pemphigoid gestationis (non-contraceptive indications), history during pregnancy of severe pruritus (non-contraceptive indications) when used as a contraceptive, history of breast cancer (can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable)

**SPECIFIC CONTRA-INDICATIONS**

- With oral use: Acute porphyrias, severe arterial disease, undiagnosed vaginal bleeding

**CAUTIONS**

**GENERAL CAUTIONS**

Asthma, cardiac dysfunction, conditions that may worsen with fluid retention, diabetes (progestogens can decrease glucose tolerance—monitor patient closely), epilepsy, history of depression, hypertensive migraine, susceptibility to thromboembolism (particular caution with high dose)

**SPECIFIC CAUTIONS**

- When used for contraception: Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice. arterial disease, functional ovarian cysts, history of jaundice in pregnancy, malabsorption syndromes, past ectopic pregnancy, sex-stereoid dependent cancer, systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies
- With intramuscular use: Disturbances of lipid metabolism, history during pregnancy of deterioration of otosclerosis, history during pregnancy of pruritus, possible risk of breast cancer

**CAUTIONS, FURTHER INFORMATION**

- Use as a contraceptive in co-morbidities. The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.
- Breast cancer risk with contraceptive use. There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess...
risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

- **INTERACTIONS** → Appendix 1: norethisterone

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

Acne · alopecia · anaphylactoid reactions · breast tenderness · change in libido · depression · disturbance of appetite · dizziness · fluid retention · headache · hirsutism · insomnia (non-contraceptive indications) · jaundice · menstrual disturbances · nausea · premenstrual-like syndrome · pruritus · rash · skin reactions · urticaria · vomiting · weight change

**SPECIFIC SIDE-EFFECTS**

- With intramuscular use Injection-site reactions
- Cervical cancer Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives (use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years). The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

- **PREGNANCY**

  - With oral use Masculinisation of female fetuses and other defects reported with non-contraceptive use.

- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation. Higher doses (used in malignant conditions) may suppress lactation and alter milk composition—use lowest effective dose.

  - With intramuscular use Withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment.

- **HEPATIC IMPAIRMENT** When used as a contraceptive; caution in severe liver disease and recurrent cholestatic jaundice, avoid in liver tumour. Avoid in non-contraceptive indications.

- **RENAL IMPAIRMENT** Use with caution in non-contraceptive indications.

- **PATIENT AND CARER ADVICE**

  **Missed oral contraceptive pill** The following advice is recommended: ‘If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.’

  The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

  Diarrhoea and vomiting with oral contraceptives Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

  Starting routine for oral contraceptives One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if norethisterone is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

  Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

  After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days. Contraceptives by injection Full counselling backed by patient information leaflet required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  **Solution for injection**

  - Noristerat (Bayer Plc)
    - Norethisterone enantate 200 mg per 1 ml Noristerat 200mg/1ml solution for injection ampoules | 1 ampoule (POD) £4.05
  - Noristerate (Non-proprietary)
    - Norethisterone 5 mg Norethisterone 5mg tablets | 30 tablet (POD) £2.48 DT price = £2.18
    - Noriday (Pfizer Ltd)
      - Norethisterone 350 microgram Noriday 350mcg tablets | 84 tablet (POD) £2.10 DT price = £1.80
      - Primolut N (Bayer Plc)
        - Norethisterone 5 mg Primolut N 5mg tablets | 30 tablet (POD) £2.26 DT price = £2.18
        - Utovlan (Pfizer Ltd)
          - Norethisterone 5 mg Utovlan 5mg tablets | 30 tablet (POD) £1.40 DT price = £2.18 | 90 tablet (POD) £4.21

  Combinations available: Estradiol with norethisterone, p. 718

**Progesterone 06-Jun-2017**

**INDICATIONS AND DOSE**

**CRINONE® VAGINAL GEL**

Infertility due to inadequate luteal phase

- **BY VAGINA**
  - Adult: 1 applicatorful daily, to be started either after documented ovulation or on day 18–21 of cycle, in vitro fertilisation, daily application continued for 30 days after laboratory evidence of pregnancy

**CYCLOGEST® PESSARIES**

Premenstrual syndrome | Post-natal depression

- **BY VAGINA, OR BY RECTUM**
  - Adult: 200–800 mg daily, doses above 200 mg to be given in 2 divided doses, for premenstrual syndrome start on day 12–14 and continue until onset of menstruation (but not recommended); rectally if barrier methods of contraception are used, in patients who have recently given birth or in those who suffer from vaginal infection or recurrent cystitis

**GESTONE® SOLUTION FOR INJECTION**

Dysfunctional uterine bleeding

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 5–10 mg daily for 5–10 days until 2 days before expected onset of menstruation, to be administered into buttocks continued →
722  Sex hormone responsive conditions

**Recurrent miscarriage due to inadequate luteal phase** (but not recommended) or following in vitro fertilisation or gamete intra-fallopian transfer

- **BY DEEP INTRAMUSCULAR INJECTION**
- Adult: 25–100 mg 2–7 times a week from day 15, or day of embryo or gamete transfer, until 8–16 weeks of pregnancy, to be administered into buttocks; maximum 200 mg per day

**LUBION**

Supplementation of luteal phase during assisted reproductive technology (ART) treatment in women for whom vaginal preparations are inappropriate

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
- Adult: 25 mg once daily from day of oocyte retrieval up to week 12 of pregnancy

**LUTIGEST**

Luteal support as part of an Assisted Reproductive Technology (ART) treatment programme

- **BY VAGINA**
- Adult: 100 mg 3 times a day, to be started the day after oocyte retrieval, and continued for 30 days once pregnancy is confirmed

**UTROGESTAN**

Progestogenic opposition of oestrogen HRT

- **BY MOUTH**
- Adult: 200 mg once daily on days 15–26 of each 28-day oestrogen HRT cycle, alternatively 100 mg once daily on days 1–25 of each 28-day oestrogen HRT cycle

**UTROGESTAN**

Supplementation of luteal phase during assisted reproductive technology (ART) cycles

- **BY VAGINA**
- Adult: 1 capsule 3 times a day from day of embryo transfer until at least week 7 of pregnancy up to week 12 of pregnancy

**CONTRA-INDICATIONS** Acute porphyrias p. 969 - avoid in patients with a history of liver tumours - breast cancer (unless progestogens are being used in the management of this condition) - genital cancer (unless progestogens are being used in the management of this condition) - history during pregnancy of idiopathic jaundice - history during pregnancy of pempigoid gestationis - history during pregnancy of severe pruritus - history of thromboembolism - incomplete miscarriage - missed miscarriage - severe arterial disease - thrombophlebitis - undiagnosed vaginal bleeding

**CAUTIONS** Asthma - cardiac dysfunction - conditions that may worsen with fluid retention - diabetes (progestogens can decrease glucose tolerance—monitor patient closely) - epilepsy - history of depression - hypertension - migraine - susceptibility to thromboembolism (particular caution with high dose)

**INTERACTIONS** → Appendix 1: progesterone

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

**SPECIFIC SIDE-EFFECTS**

- With intramuscular use or subcutaneous use Injection-site reactions
- With rectal use Diarrhoea - flatulence - pain
- With vaginal use Local irritation

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Avoid—present in milk.

**HEPATIC IMPAIRMENT** Avoid in hepatic impairment. Avoid in active liver disease including disorders of hepatic excretion (e.g. Dublin-Johnson or Rotor Syndromes), infective hepatitis (until liver function returns to normal) and liver tumours.

**RENAL IMPAIRMENT** Use with caution.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use Capsules should be taken at bedtime on an empty stomach.

**PATIENT AND CARER ADVICE**

- With oral use Patient counselling is advised for progesterone capsules (administration).

**NATIONAL FUNDING/ACCESS DECISIONS**

**LUTIGEST**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (October 2016) that progesterone (Lutigest®) is accepted for use within NHS Scotland for luteal support as part of an assisted reproductive technology (ART) treatment program for infertile women. This advice is contingent upon the continuing availability of the Patient Access Scheme (PAS) in NHS Scotland or a list price that is equivalent or lower.

**UTROGESTAN**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (May 2017) that micronised progesterone (Utrogestan Vaginal)® is accepted for use within NHS Scotland for supplementation of the luteal phase during Assisted Reproductive Technology cycles in women. This advice is contingent upon the continuing availability of the Patient Access Scheme in Scotland or a list price that is equivalent or lower.

**LESS SUITABLE FOR PRESCRIBING** Progesterone pessaries are less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Pessary**

- **Cyclogest** (Actavis UK Ltd)
  - Progesterone 200 mg Cyclogest 200mg pessaries | 15 pessary £6.95 DT price = £8.95
  - Progesterone 400 mg Cyclogest 400mg pessaries | 15 pessary £12.96 DT price = £12.96
- **Lutigest** (Ferring Pharmaceuticals Ltd)
  - Progesterone 100 mg Lutigest 100mg vaginal tablets | 21 pessary £19.50 DT price = £19.50

**Solution for injection**

- **Gestone** (Nordic Pharma Ltd)
  - Progesterone 50 mg per 1 ml Gestone 50mg/1ml solution for injection ampoules | 10 ampoule £45.00
  - Gestone 100mg/2ml solution for injection ampoules | 10 ampoule £45.00
- **Lubion** (Pharmasure Ltd)
  - Progesterone 22.35 mg per 1 ml Lubion 25mg/1.119ml solution for injection vials | 7 vial £56.00

**Vaginal gel**

- **Crinone** (Merck Serono Ltd)
  - Progesterone 80 mg per 1 gram Crinone 8% progesterone vaginal gel | 15 unit dose £30.83

**Capsule**

**EXCIPIENTS:** May contain Arachis (peanut) oil

- **Utrogestan** (Besins Healthcare (UK) Ltd)
  - Progesterone 100 mg Utrogestan 100mg capsules | 30 capsule £5.13
  - Progesterone 200 mg Utrogestan 200mg vaginal capsules with applicators | 21 capsule £21.00

**BNF 74**
8.1a Anti-oestrogens

**OVULATION STIMULANTS**

### Clomifene citrate

*Clomiphene citrate*

#### Drug Action
Anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used as an adjunct.

#### Indications and Dose
Treatment of female infertility due to oligomenorrhoea or secondary amenorrhoea (e.g. associated with polycystic ovarian disease)

- **By Mouth**
  - Adult (female): 50 mg daily for 5 days, to be started within about 5 days of onset of menstruation (preferably on 2nd day) or at any time (normally preceded by a progestogen induced withdrawal bleed) if cycles have ceased, followed by 100 mg daily if required for a further 5 days, this second course may be given in absence of ovulation; most patients who are going to respond will do so to first course, 3 courses should constitute adequate therapeutic trial; long-term cyclical therapy not recommended.

<table>
<thead>
<tr>
<th>Important Safety Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>The CSM has recommended that clomifene should not normally be used for longer than 6 cycles (possibly increased risk of ovarian cancer).</td>
</tr>
</tbody>
</table>

#### Contra-Indications
Abnormal uterine bleeding of undetermined cause - hormone-dependent tumours - ovarian cysts

#### Cautions
Ectopic pregnancy - incidence of multiple births increased (consider ultrasound monitoring) - ovarian hyperstimulation syndrome - polycystic ovary syndrome (cysts may enlarge during treatment, also risk of exaggerated response to usual doses) - uterine fibroids

#### Interactions
- **Appendix 1: clomifene**
- **Side-effects** Abdominal discomfort - breast tenderness - convulsions - depression - dizziness - endometriosis - hair loss - headache - hot flushes - insomnia - intermenstrual spotting - menorrhagia - nausea - ovarian hyperstimulation (withdraw) - rash - visual disturbances (withdraw and initiate ophthalmological examination) - vomiting - weight gain

#### Conception and Contraception
Exclude pregnancy before treatment.

#### Pregnancy
Possible effects on fetal development.

#### Breast Feeding
May inhibit lactation.

#### Hepatic Impairment
Avoid in severe liver disease.

#### Patient and Carer Advice
Patient advice required around conception and contraception. Patients planning to conceive should be warned that there is a risk of multiple pregnancy (rarely) more than twins.

### Medicinal Forms
There can be variation in the licensing of different medicines containing the same drug.

#### Tablet
- **Clomifene citrate (Non-proprietary)**
  - Clomifene citrate 50 mg Clomifene 50mg tablets | 30 tablet £9.15 DT price = £10.15

---

## 8.2 Male sex hormone responsive conditions

### Androgens, anti-androgens and anabolic steroids

#### Androgens
Androgens cause masculinisation; they may be used as replacement therapy in castrated adults and in those who are hypogonadal due to either pituitary or testicular disease. In the normal male they inhibit pituitary gonadotrophin secretion and depress spermatogenesis. Androgens also have an anabolic action which led to the development of anabolic steroids.

Androgens are useless as a treatment of impotence and impaired spermatogenisis unless there is associated hypogonadism; they should not be given until the hypogonadism has been properly investigated. Treatment should be under expert supervision.

When given to patients with hypopituitarism they can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone which will stimulate spermatogenesis as well as androgen production.

Intramuscular depot preparations of testosterone esters are preferred for replacement therapy. Testosterone enantate, propionate or undecanoate, or alternatively Sustanon®, which consists of a mixture of testosterone esters and has a longer duration of action, may be used.

#### Anti-androgens

**Cyproterone acetate**

Cyproterone acetate p. 725 is an anti-androgen used in the treatment of severe hypersexuality and sexual deviation in the male. It inhibits spermatogenesis and produces reversible infertility (but is not a male contraceptive); abnormal sperm forms are produced. Fully informed consent is recommended and an initial spermogram. As hepatic tumours have been produced in animal studies, careful consideration should be given to the risk/benefit ratio before treatment. Cyproterone acetate is also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy and has been used as an adjunct in prostatic cancer and in the treatment of acne and hirsutism in women.

**Dutasteride and finasteride**

Dutasteride p. 741 and finasteride p. 742 are alternatives to alpha-blockers particularly in men with a significantly enlarged prostate. Finasteride is also licensed for use with doxazosin p. 738 in the management of benign prostatic hyperplasia.

A low strength of finasteride is licensed for treating male-pattern baldness in men.

#### Anabolic steroids

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in women. They are used in the treatment of some aplastic anaemias. Anabolic steroids have been given for osteoporosis in women but they are no longer advocated for this purpose.

The protein-building properties of anabolic steroids have not proved beneficial in the clinical setting. Their use as
ENDOCRINE SYSTEM

and they abuse

ANDROGENS

Androgens

- CONTRA-INDICATIONS Breast cancer in males • history of liver tumours • hypercalcaemia • prostate cancer
- CAUTIONS Cardiac impairment • diabetes mellitus • elderly • epilepsy • hypertension • ischaemic heart disease • migraine • pre-pubertal boys (fetus of epiphyses is hardened and may result in short stature) – statural growth and sexual development should be monitored • skeletal metastases – risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored) • sleep apnoea • stop treatment or reduce dose if severe polycythaemia occurs • tumours – risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)
- SIDE-EFFECTS
  - Common or very common Acne • androgenic effects (to be assessed regularly in women) • anxiety • arthralgia • asthenia • changes in libido • cholestatic jaundice • depression • electrolyte disturbances • excessive duration of penile erection • excessive frequency of penile erection • gastro-intestinal bleeding • gynaecomastia • headache • hirsutism • hypercalcaemia • hypertension • increased bone growth • irritability • male-pattern baldness • muscle cramps • nausea • nervousness • oedema • paraesthesia • polycythaemia • precocious sexual development in pre-pubertal males • premature closure of epiphyses in pre-pubertal males • prostate abnormalities • prostate cancer • pruritus • seborrhoea • sodium retention • suppression of virilism in women • vomiting • weight gain
  - Rare Liver tumours
  - Frequency not known Sleep apnoea

SIDE-EFFECTS, FURTHER INFORMATION

- Polycythaemia Stop treatment or reduce dose if severe polycythaemia occurs.
- PREGNANCY Avoid – causes masculinisation of female fetus.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Avoid if possible – fluid retention and dose-related toxicity.
- RENAL IMPAIRMENT Caution – potential for fluid retention.
- MONITORING REQUIREMENTS
  - Monitor haematocrit and haemoglobin before treatment, every three months for the first year, and yearly thereafter.
  - Monitor prostate and PSA in men over 45 years.
- PATIENT AND CARER ADVICE
  - Androgenic effects in women • Women should be advised to report any signs of virilisation e.g. deepening of the voice or hirsutism.

Mesterolone

- INDICATIONS AND DOSE
  - Androgen deficiency • Male infertility associated with hypogonadism
  - BY MOUTH
  - Adult: 25 mg 3–4 times a day for several months, then maintenance 50–75 mg daily in divided doses

TESTIM®

Hypogonadism due to testosterone deficiency in men

- BY TRANSDERMAL APPLICATION
  - Adult: Apply 50 mg once daily, subsequent application adjusted according to response; maximum 100 mg per day

DOSE EQUIVALENCE AND CONVERSION

- One tube of 5 g contains 50 mg testosterone.

TESTOGEL®

Hypogonadism due to androgen deficiency in men

- BY TRANSDERMAL APPLICATION
  - Adult: Apply 50 mg once daily; increased in steps of 25 mg, adjusted according to response; maximum 100 mg per day

DOSE EQUIVALENCE AND CONVERSION

- One sachet of 5 g contains 50 mg of testosterone.

TOSTRAN®

Hypogonadism due to testosterone deficiency in men

- BY TRANSDERMAL APPLICATION
  - Adult: Apply 60 mg once daily, subsequent application adjusted according to response; maximum 80 mg per day

DOSE EQUIVALENCE AND CONVERSION

- 1 g of gel contains 20 mg testosterone.

- SIDE-EFFECTS
  - Allergic reactions • local irritation • suppression of spermatogenesis
- DIRECTIONS FOR ADMINISTRATION
  - Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children – consult product literature.

TESTOGEL®

Apply thin layer of gel on clean, dry, healthy skin such as shoulders, arms or abdomen, immediately after sachet is opened. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, avoid shower or bath for at least 6 hours.

TESTIM®

Squeeze entire content of tube on to one palm and apply as a thin layer on clean, dry, healthy skin of shoulder or upper arm, preferably in the morning after washing or bathing (if 2 tubes required use 1 per shoulder or upper arm); rub in and allow to dry before putting on clothing to cover site; wash hands with soap after application; avoid washing application site for at least 2 hours.

TOSTRAN®

Apply gel on clean, dry, intact skin of abdomen or both inner thighs, preferably in the morning. Gently rub in with a finger until dry before dressing. Wash hands with soap and water after applying gel; avoid washing application site for at least 2 hours. Not to be applied on genital area.

- PATIENT AND CARER ADVICE
  - Patient or carer should be given advice on how to administer testosterone gel.
Testosterone decanoate, isocaproate, phenylpropionate and propionate

The properties listed below are those particular to the combination only. For the properties of the components please consider, testosterone propionate below.

**INDICATIONS AND DOSE**
- **Androgen deficiency**
  - Adult: 1 mL every 3 weeks

**MEDICAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Sustanon** (Aspen Pharma Trading Ltd)
  - Testosterone propionate 30 mg per 1 mL, Testosterone isocaproate 60 mg per 1 mL, Testosterone phenylpropionate 60 mg per 1 mL, Testosterone decanoate 100 mg per 1 mL
  - Solution for injection ampoules | 1 ampoule (£2.45 C04-2)

Testosterone enantate

**INDICATIONS AND DOSE**
- **Hypogonadism**
  - Adult: Initially 250 mg every 2–3 weeks; maintenance 250 mg every 3–6 weeks
- **Breast cancer**
  - Adult: 250 mg every 2–3 weeks

**UNLICENSED USE**
- Not licensed for use in breast cancer.

**SIDE-EFFECTS**
- Suppression of spermatogenesis

**MEDICAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Testosterone enantate (Non-proprietary)**
  - Testosterone enantate 250 mg per 1 mL
  - Solution for injection ampoules | 3 ampoules (£79.75 C04-2)

Testosterone propionate

**INDICATIONS AND DOSE**
- **Androgen deficiency**
  - Adult: 50 mg 2–3 times a week
Thyroid disorders

9 Thyroid disorders

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES

Thyrotropin alfa
(Recombinant human thyroid stimulating hormone; rhTSH)

- **DRUG ACTION** Thyrotropin alfa is a recombinant form of thyrotrophin (thyroid stimulating hormone).

- **INDICATIONS AND DOSE**
  Detection of thyroid remnants and thyroid cancer in post-thyroidectomy patients, together with serum thyroglobulin testing (with or without radiodine imaging)
  To increase radio-iodine uptake for the ablation of thyroid remnant tissue in suitable post-thyroidectomy patients

  - **BY INTRAMUSCULAR INJECTION**
  - Adult: 900 micrograms every 24 hours for 2 doses, dose to be administered into the gluteal muscle, consult product literature for further information on indications and dose

- **CAUTIONS**
  Presence of thyroglobulin autoantibodies may give false negative results

- **SIDE-EFFECTS**
  - **Common or very common** Dizziness, fatigue, headache, nausea, vomiting
  - **Uncommon** Asthenia, back pain, influenza-like symptoms, paraesthesia, rash, urticaria
  - **Rare** Diarrhoea, very rare Arthralgia, dyspnoea, flushing, hyperhidrosis, injection-site pain, injection-site pruritus, injection-site rash, injection-site reactions, myalgia, pain at site of metastases, palpitation, tremor

- **ALLERGY AND CROSS-SENSITIVITY**
  Contra-indicated if previous hypersensitivity to bovine or human thyrotropin.

- **PREGNANCY**
  Avoid.

- **BREAST FEEDING**
  Avoid.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- Thyrogen (Genzyme Therapeutics Ltd)
  Thyrotropin alfa 900 microgram Thyrogen 900 microgram powder for solution for injection vials

9.1 Hyperthyroidism

Antithyroid drugs

**Overview**

Antithyroid drugs are used for hyperthyroidism either to prepare patients for thyroidectomy or for long-term management. In the UK carbimazole p. 727 is the most commonly used drug. Propylthiouracil p. 728 should be reserved for patients who are intolerant of carbimazole or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones.
Over-treatment with antithyroid drugs can result in the rapid development of hypothyroidism and should be avoided particularly during pregnancy because it can cause fetal goitre.

A combination of carbimazole with levotyroxine sodium p. 729 daily, may be used in a blocking-replacement regimen; therapy is usually given for 18 months. The blocking-replacement regimen is not suitable during pregnancy.

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (\(^{131}\)I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

Propranolol hydrochloride p. 145 is useful for rapid relief of thyrotoxic symptoms and may be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol hydrochloride has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol hydrochloride but nadolol p. 144 is also used.

Thyrotoxic crisis (‘thyroid storm’) requires emergency treatment with intravenous administration of fluids, propranolol hydrochloride and hydrocortisone p. 637 (as sodium succinate), as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

Pregnancy
Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen is not suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate, therefore propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hyperthyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

Other drugs used for Hyperthyroidism Metoprolol tartrate, p. 149

ANTITHYROID DRUGS SULFUR-CONTAINING IMIDAZOLES

Carbimazole

INDICATIONS AND DOSE

Hyperthyroidism

› By mouth

› Adult: 15–40 mg daily continue until the patient becomes euthyroid, usually after 4 to 8 weeks, higher doses should be prescribed under specialist supervision only, then reduced to 5–15 mg daily, reduce dose gradually, therapy usually given for 12 to 18 months

DOSE EQUIVALENCE AND CONVERSION

› When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

Hyperthyroidism (blocking-replacement regimen) in combination with levothyroxine

› By mouth

› Adult: 40–60 mg daily, therapy usually given for 18 months

IMPORTANT SAFETY INFORMATION

NEUTROPENIA AND AGRANULOCYTOSIS

Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

› Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.

› A white blood cell count should be performed if there is any clinical evidence of infection.

› Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

› CONTRA-INDICATIONS Severe blood disorders

› INTERACTIONS Appendix 1: carbimazole

› SIDE-EFFECTS

› Common or very common Arthralgia · fever · headache · jaundice · malaise · mild gastro-intestinal disturbances · nausea · pruritus · rash · taste disturbance

› Rare Agranulocytosis · alopecia · bone marrow suppression · jaundice · myopathy · pancytopenia

SIDE-EFFECTS, FURTHER INFORMATION

Rashes and pruritus are common with carbimazole but they can be treated with antihistamines without discontinuing therapy; alternatively propylthiouracil can be substituted.

› PREGNANCY Carbimazole can be given but the blocking-replacement regimen is not suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate. Carbimazole cross the placenta and in high doses may cause fetal goitre and hyperthyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

› BREAST FEEDING Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.

› HEPATIC IMPAIRMENT Use with caution in mild to moderate impairment. Avoid in severe impairment.

› PATIENT AND CARER ADVICE Warn patient or carers to tell doctor immediately if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops.

› MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

› Carbimazole (Non-proprietary)

ANTITHYROID DRUGS  THIOUARCILS

Propylthiouracil

**INDICATIONS AND DOSE**

Hyperthyroidism

- By mouth
- Adult: Initially 200–400 mg daily in divided doses until the patient becomes euthyroid, then reduced to 50–150 mg daily in divided doses, initial dose should be gradually reduced to the maintenance dose.

**DOSE EQUIVALENCE AND CONVERSION**

- When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

**INTERACTIONS**  Appendix 1: propylthiouracil

**SIDE-EFFECTS**

- Common or very common  Arthralgia, fever, headache, jaundice, leucopenia, malaise, mild gastrointestinal disturbances, nausea, pruritus, rash, taste disturbance
- Rare  Agranulocytosis, alopecia, aplastic anaemia, bone marrow suppression, cutaneous vasculitis, encephalopathy, hepatic disorders, hepatic failure, hepatic necrosis, hepatitis, hypoprophosphorobinaemia, jaundice, lupus erythematosus-like syndromes, myopathy, nephritis, pancreatopathy, thrombocytopenia

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hepatotoxicity  Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop.

**PREGNANCY**

- Propylthiouracil can be given but the blocking-replacement regimen is not suitable.
- Propylthiouracil crosses the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

**BREAST FEEDING**

- Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function.
- Monitor infant’s thyroid status.

**HEPATIC IMPAIRMENT**

- Reduce dose.

**RENAL IMPAIRMENT**

- Use three-quarters normal dose if eGFR 10–50 mL/minute/1.73 m². Use half normal dose if eGFR less than 10 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Monitor for hepatotoxicity.

**PATIENT AND CARER ADVICE**

- Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Tablet**

- Propylthiouracil (Non-proprietary)
  - Propylthiouracil 50 mg  Propylthiouracil 50 mg tablets  56 tablet  £71.14 DT price  £59.47  100 tablet  £127.57

VITAMINS AND TRACE ELEMENTS

Iodide with iodine elements

**INDICATIONS AND DOSE**

Thyrotoxicosis (pre-operative)

- By mouth using oral solution
- Adult: 0.1–0.3 mL 3 times a day

**CAUTIONS**

- Children: not for long-term treatment

**SIDE-EFFECTS**

- Bronchitis, conjunctivitis, coryza-like symptoms, depression (on prolonged treatment), goitre in infants of mothers taking iodides, headache, hypersensitivity reactions, impotence (on prolonged treatment), insomnia (on prolonged treatment), lachrymation, laryngitis, pain in salivary glands, rashes

**PREGNANCY**

- Neonatal goitre and hypothyroidism.

**BREAST FEEDING**

- Stop breast-feeding. Danger of neonatal hypothyroidism or goitre. Appears to be concentrated in milk.

**DIRECTIONS FOR ADMINISTRATION**

- For oral solution, dilute well with milk or water.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

- CAUTIONARY AND ADVISORY LABELS  27
- Iodide with iodine (Non-proprietary)
  - Iodine 50 mg per 1 mL, Potassium iodide 100 mg per 1 mL  Iodine aqueous oral solution  500 mL  £9.58

9.2 Hypothyroidism

Thyroid hormones

**Overview**

Thyroid hormones are used in hypothyroidism (myxoedema), and also in diffuse non-toxic goitre, Hashimoto’s thyroiditis (lymphadenoid goitre), and thyroid carcinoma. Neonatal hypothyroidism requires prompt treatment for normal development. Levothyroxine sodium p. 729 (thyroxine sodium) is the treatment of choice for maintenance therapy.

- In infants and children with congenital hypothyroidism and juvenile myxoedema, the dose of levothyroxine sodium should be titrated according to clinical response, growth assessment, and measurements of plasma thyroxine and thyroid-stimulating hormone.
- Lithotryonine sodium p. 729 has a similar action to levothyroxine sodium but is more rapidly metabolised and has a more rapid effect. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in severe hypothyroid states when a rapid response is desired.
- Lithotryonine sodium by intravenous injection is the treatment of choice in hypothyroid coma. Adjunctive therapy includes intravenous fluids, hydrocortisone p. 637, and treatment of infection; assisted ventilation is often required.

728 Thyroid disorders
thyroid hormones

Levothyroxine sodium
(Thyroxine sodium)

indications and dose

Hypothyroidism

▶ BY MOUTH
- Adult 18-49 years: Initially 50–100 micrograms once daily; adjusted in steps of 25–50 micrograms every 3–4 weeks, adjusted according to response; maintenance 100–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication
- Adult 50 years and over: Initially 25 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication

Hypothyroidism in patients with cardiac disease | Severe hypothyroidism

▶ BY MOUTH
- Adult: Initially 25 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication

Hyperthyroidism (blocking-replacement regimen) in combination with carbimazole

▶ BY MOUTH
- Adult: 50–150 micrograms daily therapy usually given for 18 months

contraindications

Thyrotoxicosis

cautions

Cardiovascular disorders - diabetes insipidus - diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) - elderly - hypertension - long-standing hypothyroidism - myocardial infarction - myoccardial insufficiency - panhypopituitarism (initiate corticosteroid therapy before starting levothyroxine) - predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine)

cautions, further information

Cardiovascular disorders Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia.

interactions

▶ Appendix 1: levothyroxine

side-effects

Anginal pain (usually at excessive dosage) - arrhythmias (usually at excessive dosage) - diarrhoea (usually at excessive dosage) - excitability (usually at excessive dosage) - fever - flushing - headache - heat intolerance - hypersensitivity reactions - insomnia (usually at excessive dosage) - muscle cramp - muscular weakness - oedema - palpitation (usually at excessive dosage) - pruritus - rash - restlessness (usually at excessive dosage) - sweating - tachycardia (usually at excessive dosage) - transient hair loss in children - tremor (usually at excessive dosage) - vomiting (usually at excessive dosage) - weight-loss

side-effects, further information

Initial dosage in patients with cardiovascular disorders If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.

Pregnancy

Levothyroxine requirement may increase during pregnancy. Levothyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.

Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).

Breast Feeding

Amount too small to affect tests for neonatal hypothyroidism.

medicinal forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

- Levothyroxine sodium (Non-proprietary)
  - Levothyroxine sodium anhydrous 12.5 microgram Levothyroxine sodium 12.5microgram tablets | 28 tablet (PO) £12.75–£15.00 DT price = £14.10

  - Levothyroxine sodium anhydrous 50 microgram Levothyroxine sodium 50microgram tablets lactose free | 100 tablet (PO) no price available
  - Levothyroxine sodium 50microgram tablets lactose free | 100 tablet (PO) no price available
  - Levothyroxine sodium 50microgram tablets | 100 tablet (PO) £4.98 DT price = £1.66 | 1000 tablet (PO) £68.21
  - Levothyroxine sodium anhydrous 75 microgram Levothyroxine sodium 75microgram tablets | 28 tablet (PO) £2.82–£4.00 DT price = £3.34
  - Levothyroxine sodium anhydrous 100 microgram Levothyroxine sodium 100microgram tablets lactose free | 100 tablet (PO) no price available
  - Levothyroxine sodium 100microgram tablets lactose free | 100 tablet (PO) no price available
  - Levothyroxine sodium 100microgram tablets | 100 tablet (PO) £4.75 DT price = £1.66 | 1000 tablet (PO) £68.57
  - Eltroxin (AMCo)
    - Levothyroxine sodium anhydrous 25 microgram Eltroxin 25microgram tablets | 28 tablet (PO) £2.33 DT price = £2.91
    - Levothyroxine sodium anhydrous 50 microgram Eltroxin 50microgram tablets | 28 tablet (PO) £1.33 DT price = £1.66
    - Levothyroxine sodium anhydrous 100 microgram Eltroxin 100microgram tablets | 28 tablet (PO) £1.33 DT price = £1.66

oral solution

- Levothyroxine sodium (Non-proprietary)
  - Levothyroxine sodium anhydrous 5 microgram per
    - 1 ml Levothyroxine sodium 5microgram/5ml oral solution sugar free sugar-free | 100 ml (PO) £95.00 DT price = £94.59
  - Levothyroxine sodium anhydrous 10 microgram per
    - 1 ml Levothyroxine sodium 10microgram/5ml oral solution sugar free sugar-free | 100 ml (PO) £94.44 DT price = £93.02
  - Levothyroxine sodium anhydrous 20 microgram per
    - 1 ml Levothyroxine sodium 100micrograms/5ml oral solution sugar free sugar-free | 100 ml (PO) £165.00 DT price = £164.14

liothyronine sodium
(L-Tri-iodothyronine sodium)

indications and dose

Hypothyroidism

▶ BY MOUTH
- Adult: Initially 10–20 micrograms daily; increased to 60 micrograms daily in 2–3 divided doses, dose should be increased gradually, smaller initial doses given for the elderly

Hypothyroid coma

▶ BY SLOW INTRAVENOUS INJECTION
- Adult: 5–20 micrograms every 12 hours, increased to 5–20 micrograms every 4 hours if required, continued
alternatively initially 50 micrograms for 1 dose, then 25 micrograms every 8 hours, reduced to 25 micrograms twice daily

**DOSE EQUIVALENCE AND CONVERSION**
- 20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levothyroxine sodium.
- Brands without a UK licence may not be bioequivalent and dose adjustment may be necessary.

**CONTRA-INDICATIONS** Thyrotoxicosis

**CAUTIONS** Cardiovascular disorders - diabetes insipidus - diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) - elderly - hypertension - long-standing hypothyroidism - myocardial infarction - myocardial insufficiency - panhypopituitarism (initiate corticosteroid therapy before starting liothyronine) - predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting liothyronine)

**INTERACTIONS** → Appendix 1: liothyronine

**SIDE-EFFECTS**
- Anginal pain (usually at excessive dosage)
- arrhythmias (usually at excessive dosage)
- diarrhoea (usually at excessive dosage)
- excitation (usually at excessive dosage)
- fever
- flushing
- headache
- heat intolerance
- hypersensitivity reactions
- insomnia (usually at excessive dosage)
- muscle cramp
- muscular weakness
- oedema
- palpitation (usually at excessive dosage)
- pruritus
- rash
- restlessness (usually at excessive dosage)
- sweating
- tachycardia (usually at excessive dosage)
- tremor
- vomiting (usually at excessive dosage)
- weight-loss

**SIDE-EFFECTS, FURTHER INFORMATION**
- Initial dosage in patients with cardiovascular disorders. If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.

**PREGNANCY** Liothyronine requirement may increase during pregnancy. Does not cross the placenta in significant amounts. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.

Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine).

**BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.

**PRESCRIBING AND DISPENSING INFORMATION**

Switching to a different brand. Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent. Pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection

**Tablet**
- Liothyronine sodium (Non-proprietary)
  - Liothyronine sodium 20 microgram tablets | 28 tablet £258.20 DT price = £258.20

**Powder for solution for injection**
- Liothyronine sodium (Non-proprietary)
  - Liothyronine sodium 20 microgram powder for solution for injection vials | 5 vial £1,425.00

1 Bladder and urinary disorders

1.1 Urinary frequency, enuresis, and incontinence

Urinary frequency, enuresis and incontinence

Urinary frequency and incontinence

Incontinence in adults which arises from detrusor instability is managed by combining drug therapy with conservative methods for managing urge incontinence such as pelvic floor exercises and bladder training; stress incontinence is generally managed by non-drug methods. Duloxetine p. 350 can be added and is licensed for the treatment of moderate to severe stress incontinence in women; it may be more effective when used as an adjunct to pelvic floor exercises.

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity. Oxybutynin hydrochloride p. 733 also has a direct relaxant effect on urinary smooth muscle. Side-effects limit the use of oxybutynin hydrochloride, but they may be reduced by starting at a lower dose. A modified-release preparation of oxybutynin hydrochloride is effective and has fewer side-effects; a transdermal patch is also available. The efficacy and side-effects of tolterodine tartrate p. 735 are comparable to those of modified-release oxybutynin hydrochloride. Flavoxate hydrochloride p. 733 has less marked side-effects but it is also less effective. Darifenacin p. 732, fesoterodine fumarate p. 732, propiverine hydrochloride p. 735, solifenacin succinate p. 734, and trospium chloride p. 734 are newer antimuscarinic drugs licensed for urinary frequency, urgency, and incontinence. The need for continuing antimuscarinic drug therapy should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

Propantheline bromide p. 84 and tricyclic antidepressants were used for urge incontinence but they are little used now because of their side-effects. The use of imipramine hydrochloride p. 359 is limited by its potential to cause cardiac side-effects.

Mirabegron p. 736, a selective beta_3 agonist, is licensed for the treatment of urinary frequency, urgency, and urge incontinence associated with overactive bladder syndrome. Purified bovine collagen implant (Contigen®, Bard) is indicated for urinary incontinence caused by intrinsic sphincter deficiency (poor or non-functioning bladder outlet mechanism). The implant should be inserted only by surgeons or physicians trained in the technique for injection of the implant.

See also Nocturnal enuresis in children, below.

Nocturnal enuresis in children

23-May-2017

Description of condition

Nocturnal enuresis is the involuntary discharge of urine during sleep, which is common in young children. Children are generally expected to be dry by a developmental age of 5 years, and historically it has been common practice to consider children for treatment only when they reach 7 years; however, symptoms may still persist in a small proportion by the age of 10 years.

Treatment

Children under 5 years

For children under 5 years, treatment is usually unnecessary as the condition is likely to resolve spontaneously. Reassurance and advice can be useful for some families.

Non Drug Treatment

Initially, advice should be given on fluid intake, diet, toileting behaviour, and use of reward systems. For children who do not respond to this advice (more than 1–2 wet beds per week), an enuresis alarm should be the recommended treatment for motivated, well-supported children. Alarms in
children under 7 years should be considered depending on the child’s maturity, motivation and understanding of the alarm. Alarms have a lower relapse rate than drug treatment when discontinued.

Treatment using an alarm should be reviewed after 4 weeks and continued until a minimum of 2 weeks’ uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months but the condition is still improving and the child remains motivated to use the alarm, it is recommended to continue the treatment.

Combined treatment with desmopressin p. 628, or the use of desmopressin alone, is recommended if the initial alarm treatment is unsuccessful or it is no longer appropriate or desirable. ▲

Drug Treatment

Treatment with oral or sublingual desmopressin is recommended for children over 5 years of age when alarm use is inappropriate or undesirable, or when rapid or short-term results are the priority (for example, to cover periods away from home). Desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm alone. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Repeated courses of desmopressin can be used in responsive children who experience repeated recurrences of bedwetting, but should be withdrawn gradually at regular intervals (for 1 week every 3 months) for full reassessment.

Under specialist supervision, nocturnal enuresis associated with daytime symptoms (overflowing bladder) can be managed with desmopressin alone or in combination with an antimuscarinic drug (such as oxybutynin hydrochloride p. 733 or tolterodine tartrate p. 735 [unlicensed indication]). Treatment should be continued for 3 months; the course can be repeated if necessary.

The tricyclic antidepressant imipramine hydrochloride p. 359 can be considered for children who have not responded to all other treatments and have undergone specialist assessment, however relapse is common after withdrawal and children and their carers should be aware of the dangers of overdose. Initial treatment should continue for 3 months; further courses can be considered following a medical review every 3 months. Tricyclic antidepressants should be withdrawn gradually. ▲

Useful Resources

ANTIMUSCARINICS

Antimuscarinics (systemic)

● CONTRA-INDICATIONS Gastro-intestinal obstruction • intestinal atony • myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) • paralytic ileus • prostatic enlargement (in adults) • pyloric stenosis • severe ulcerative colitis • significant bladder outflow obstruction • toxic megacolon • urinary retention

● CAUTIONS Acute myocardial infarction (in adults) • arrhythmias (may be worsened) • autonomic neuropathy • cardiac insufficiency (due to association with tachycardia) • cardiac surgery (due to association with tachycardia) • children (increased risk of side-effects) • conditions characterised by tachycardia • congestive heart failure (may be worsened) • coronary artery disease (may be worsened) • diarrhoea • elderly (especially if frail) • gastro-oesophageal reflux disease • hiatus hernia with reflux oesophagitis • hypertension • hyperthyroidism (due to association with tachycardia) • individuals susceptible to angle-closure glaucoma • prostatic hyperplasia (in adults) • pyrexia • ulcerative colitis

● SIDE-EFFECTS

▶ Common or very common Constipation • dilation of pupils with loss of accommodation • dry mouth • photophobia • reduced bronchial secretions • skin dryness • skin flushing • transient bradycardia (followed by tachycardia, palpitation and arrhythmias) • urinary retention • urinary urgency

▶ Uncommon Confusion (in children) • confusion (particularly in the elderly) • giddiness • nausea • vomiting

▶ Very rare Angle-closure glaucoma

● FREQUENCY NOT KNOWN Angioedema • blurred vision • blurred vision • central nervous system stimulation • convulsion • diarrhoea • difficulty in micturition • disorientation • dizziness • drowsiness • dry eyes • euphoria • fatigue • flatulence • hallucinations • headache • impaired memory • palpitation • photosensitivity • rash • reduced sweating (may lead to heat sensations and fainting in hot environments or patients with fever) • restlessness • taste disturbances

● PATIENT AND CARER ADVICE

Driving and skilled tasks Antimuscarinics can affect the performance of skilled tasks (e.g. driving).

ANTIMUSCARINICS > URINARY

Darifenacin

● INDICATIONS AND DOSE

Urinary frequency | Urinary urgency | Incontinence

▶ BY MOUTH

Adult: Initially 7.5 mg once daily, increased if necessary to 15 mg after 2 weeks

● INTERACTIONS ➔ Appendix 1: darifenacin

● SIDE-EFFECTS

▶ Uncommon Cough • dyspnoea • hypertension • impotence • insomnia • oedema • rhinitis • ulcerative stomatitis • vaginitis • weakness

● PREGNANCY Manufacturer advises avoid—toxicity in animal studies.

● BREAST FEEDING Present in milk in animal studies—manufacturer advises caution.

● HEPATIC IMPAIRMENT Max. 7.5 mg daily in moderate impairment. Avoid in severe impairment.

● PRESCRIBING AND DISPENSING INFORMATION The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 3, 25

▶ Emselex (Merus Labs Luxco S.A R.L.)

Darifenacin (as Darifenacin hydrobromide) 7.5 mg Emselex 7.5mg modified-release tablets ▲ 28 tablet £25.48 DT price = £25.48

Darifenacin (as Darifenacin hydrobromide) 15 mg Emselex 15mg modified-release tablets ▲ 28 tablet £25.48 DT price = £25.48

Fesoterodine fumarate

● INDICATIONS AND DOSE

Urinary frequency | Urinary urgency | Urge incontinence

▶ BY MOUTH

Adult: 4 mg once daily, increased if necessary up to 8 mg once daily

08-May-2017
DOSE ADJUSTMENTS DUE TO INTERACTIONS
Manufacturer advises max. 4 mg daily with concurrent use of potent inhibitors of CYP3A4; avoid concurrent use in patients who also have hepatic or renal impairment. For dose adjustments with concurrent use of moderate inhibitors of CYP3A4 in patients with hepatic or renal impairment, consult product literature.

INTERACTIONS → Appendix 1: fesoterodine

SIDE-EFFECTS
- Common or very common: Insomnia
- Uncommon: Cough, nasal dryness, pharyngolaryngeal pain, vertigo

PREGNANCY Manufacturer advises avoid—toxicity in animal studies.

BREAST FEEDING Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT Manufacturer advises increase dose cautiously in mild impairment; max. 4 mg daily in moderate impairment. Manufacturer advises avoid in severe impairment.

RENAL IMPAIRMENT Increase dose cautiously if eGFR 30–80 mL/minute/1.73 m²; max. 4 mg daily if eGFR less than 30 mL/minute/1.73 m².

PRESCRIBING AND DISPENSING INFORMATION The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (June 2008) that fesoterodine (Toviaz®) is accepted for restricted use within NHS Scotland as a second-line treatment for overactive bladder syndrome.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 3

Oxybutynin hydrochloride

INDICATIONS AND DOSE
Urinary frequency | Urinary urgency | Urinary incontinence | Neurogenic bladder instability
- By mouth using immediate-release medicines
- Child 5–11 years: Initially 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day
- Child 12–17 years: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day
- Adult: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day
- Elderly: Initially 2.5–3 mg twice daily, increased if tolerated to 5 mg twice daily, adjusted according to response

By mouth using modified-release tablets
- Child 5–11 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day
- Adult: Initially 5 mg once daily, increased in steps of 5 mg every week, adjusted according to response; maximum 20 mg per day

Urinary frequency | Urinary urgency | Urinary incontinence
- By transdermal application using patches
- Adult: Apply 1 patch twice weekly, patch is to be applied to clean, dry unbroken skin on abdomen, hip or buttock. Patch should be removed every 3–4 days and site replacement patch on a different area. The same area should be avoided for 7 days

Nocturnal enuresis associated with overactive bladder
- By mouth using immediate-release medicines
- Child 5–11 years: 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day, last dose to be taken before bedtime

By mouth using modified-release tablets
- Child 5–11 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

DOSE EQUIVALENCE AND CONVERSION
- Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of Lyrinel® XL

INTERACTIONS → Appendix 1: oxybutynin

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
- Common: Anorexia, facial flushing
- Rare: Night terrors
- Frequency not known: Cognitive impairment (in adults)

SPECIFIC SIDE-EFFECTS
- Rare
- With transdermal use: Application site reactions with patches

PREGNANCY
- Manufacturers advise avoid—present in milk in animal studies.

BREAST FEEDING
- Manufacturers advise avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
- Manufacturer advises caution.

RENAL IMPAIRMENT
- Manufacturer advises caution.

Urinary frequency | Urinary urgency | Urinary incontinence | Neurogenic bladder instability
- By mouth using immediate-release medicines
- Child 5–11 years: Initially 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day
- Child 12–17 years: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day
- Adult: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day
- Elderly: Initially 2.5–3 mg twice daily, increased if tolerated to 5 mg twice daily, adjusted according to response

By mouth using modified-release tablets
- Child 5–11 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day
- Adult: Initially 5 mg once daily, increased in steps of 5 mg every week, adjusted according to response; maximum 20 mg per day

Urinary frequency | Urinary urgency | Urinary incontinence
- By transdermal application using patches
- Adult: Apply 1 patch twice weekly, patch is to be applied to clean, dry unbroken skin on abdomen, hip or buttock. Patch should be removed every 3–4 days and site replacement patch on a different area. The same area should be avoided for 7 days

Nocturnal enuresis associated with overactive bladder
- By mouth using immediate-release medicines
- Child 5–11 years: 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day, last dose to be taken before bedtime

By mouth using modified-release tablets
- Child 5–11 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

DOSE EQUIVALENCE AND CONVERSION
- Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of Lyrinel® XL

INTERACTIONS → Appendix 1: oxybutynin

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
- Common: Anorexia, facial flushing
- Rare: Night terrors
- Frequency not known: Cognitive impairment (in adults)

SPECIFIC SIDE-EFFECTS
- Rare
- With transdermal use: Application site reactions with patches

PREGNANCY
- Manufacturers advise avoid—present in milk in animal studies.

BREAST FEEDING
- Manufacturers advise avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
- Manufacturer advises caution.

RENAL IMPAIRMENT
- Manufacturer advises caution.
Oxybutynin hydrochloride

**INDICATIONS AND DOSE**

Urinary frequency | Urinary urgency | Urinary incontinence

▶ BY MOUTH

Adult: 5 mg once daily, increased if necessary to 10 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises max. dose 5 mg daily with concurrent use of potent inhibitors of CYP3A4; avoid concurrent use in patients who also have moderate hepatic impairment or severe renal impairment.

**CONTRA-INDICATIONS**

Narrow-angle glaucoma

**CAUTIONS**

Neurogenic bladder disorder - susceptibility to QT-interval prolongation

**INTERACTIONS** → Appendix 1: solifenacin

**SIDE-EFFECTS**

- Uncommon Gastro-oesophageal reflux - oedema
- Frequency not known Dysphonia - hepatic impairment - hyperkalaemia - muscle weakness - reduced appetite - torsade de pointes
- **PREGNANCY**
  - Manufacturer advises caution—no information available.
- **BREAST FEEDING**
  - Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT**
  - Max. 5 mg daily in moderate impairment.
  - Avoid in severe impairment.
- **RENAL IMPAIRMENT**
  - Max. 5 mg daily if eGFR less than 30 mL/minute/1.73 m².

**PREScribing AND DISPENSING INFORMATION**

The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Modified-release tablet**

Mirabegron

- **INDICATIONS AND DOSE**
  - Urinary frequency, urgency, and urge incontinence
    - **BY MOUTH**
    - Adult: 50 mg once daily

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  - Manufacturer advises reduce dose to 25 mg once daily in patients with mild hepatic impairment with concurrent use of potent inhibitors of CYP3A4; avoid in moderate impairment.
  - Manufacturer advises reduce dose to 25 mg once daily if eGFR 30–89 mL/minute/1.73 m\(^2\) with concurrent use of potent inhibitors of CYP3A4; avoid if eGFR less than 30 mL/minute/1.73 m\(^2\).

- **CONTRA-INDICATIONS**
  - Severe uncontrolled hypertension (systolic blood pressure ≥180 mmHg or diastolic blood pressure ≥110 mmHg)

- **CAUTIONS**
  - History of QT-interval prolongation - stage 2 hypertension

- **INTERACTIONS**
  - Appendix 1: mirabegron

- **SIDE-EFFECTS**
  - Common or very common
    - Tachycardia - urinary-tract infection
  - Uncommon
    - Atrial fibrillation - dyspepsia - gastritis - hypertension - joint swelling - palpitation - pruritus - rash - vulvovaginal infection - vulvovaginal pruritus

- **CONCEPTION AND CONTRACEPTION**
  - Contraception advised in women of child-bearing potential.

- **PREGNANCY**
  - Avoid — toxicity in animal studies.

- **BREAST FEEDING**
  - Avoid — present in milk in animal studies.

- **HEPATIC IMPAIRMENT**
  - Reduce dose to 25 mg once daily in moderate impairment. Avoid in severe impairment — no information available.

- **RENAL IMPAIRMENT**
  - Reduce dose to 25 mg once daily if eGFR 15–29 mL/minute/1.73 m\(^2\). Avoid if eGFR less than 15 mL/minute/1.73 m\(^2\) — no information available.

- **MONITORING REQUIREMENTS**
  - Blood pressure should be monitored before starting treatment and regularly during treatment, especially in patients with pre-existing hypertension.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - NICE technology appraisals (TAs)
  - Mirabegron for treating symptoms of overactive bladder (June 2013) NICE TA290
  - Mirabegron is recommended as an option only for patients in whom antimuscarinic drugs are ineffective, contra-indicated, or not tolerated; patients currently receiving mirabegron who do not meet these criteria should have the option to continue until they and their clinician consider it appropriate to stop.

1.2 Urinary retention

**Urinary retention**

31-May-2017

**Description of condition**

Urinary retention is the inability to voluntarily urinate. It may be secondary to urethral blockage, drug treatment (such as use of antimuscarinic drugs, sympathomimetics, tricyclic antidepressants), conditions that reduce detrusor contractions or interfere with relaxation of the urethra, neurogenic causes, or it may occur postpartum or postoperatively.

Acute urinary retention is a medical emergency characterised by the abrupt development of the inability to pass urine (over a period of hours).

Chronic urinary retention is the gradual (over months or years) development of the inability to empty the bladder completely, characterised by a residual volume greater than one litre or associated with the presence of a distended or palpable bladder.

**Urinary retention due to benign prostatic hyperplasia**

The most common cause of urinary retention in men is benign prostatic hyperplasia. Men with an enlarged prostate can have lower urinary tract symptoms associated with obstruction, such as urinary retention (acute or chronic), frequency, urgency or nocturia.

**Treatment**

Treatment of urinary retention depends on the underlying condition. Catheterisation is used to relieve acute painful urinary retention or when no cause can be found. Surgical procedures or dilatation are often used to correct mechanical outflow obstructions.

**Acute urinary retention**

Acute retention is painful and requires immediate treatment by catheterisation. Before the catheter is removed an alpha-adrenoceptor blocker (such as alfuzosin hydrochloride p. 737, doxazosin p. 738, tamsulosin hydrochloride p. 739, prazosin p. 739, indoramin p. 738 or terazosin p. 741) should be given for at least two days to manage acute urinary retention.

**Chronic urinary retention**

In patients with chronic urinary retention, intermittent bladder catheterisation should be offered before an indwelling catheter. Catheters may be used as a long-term solution where persistent urinary retention is causing...
incontinence, infection, or renal dysfunction and a surgical solution is not feasible. A Their use is associated with an increased risk of adverse events including recurrent urinary infections, trauma to the urethra, pain, and stone formation. ESGR In men who have symptoms that are bothersome, drug treatment should only be offered when other conservative management options have failed. Men with moderate-to-severe symptoms should be offered an alpha-adrenoceptor blocker (alfuzosin hydrochloride, doxazosin, tamsulosin hydrochloride or terazosin). Treatment should initially be reviewed after 4–6 weeks and then every 6–12 months. A

The parasympathetic bethanechol chloride p. 741 increases detrusor muscle contraction. It is licensed for acute postoperative, postpartum and neurogenic urinary retention but its use has largely been superseded by catheterisation.

**Urinary retention due to benign prostatic hyperplasia**

In patients with benign prostatic hyperplasia, treatment is influenced by the severity of symptoms and their effect on the patient’s quality of life. ESGR Watchful waiting is suitable for men with symptoms that are not troublesome and in those who have not yet developed complications of benign prostatic hyperplasia such as renal impairment, urinary retention or recurrent infection.

The recommended treatment of benign prostatic hyperplasia is usually an alpha-adrenoceptor blocker. The alpha₁-selective adrenoceptor blockers relax smooth muscle in benign prostatic hyperplasia producing an increase in urinary flow-rate and an improvement in obstructive symptoms.

In patients with an enlarged prostate, a raised prostate specific antigen concentration, and who are considered to be at high risk of progression (such as the elderly), a 5α-reductase inhibitor (such as finasteride p. 742 or dutasteride p. 741) should be used. A combination of an alpha-adrenoceptor blocker and a 5α-reductase inhibitor can be offered if symptoms remain a problem.

Surgery is recommended for men with more severe symptoms that do not respond to drug therapy, or who have complications such as acute urinary retention, haematuria, renal failure, bladder calculi or recurrent urinary-tract infection. A

Other drugs used for Urinary retention Tadalafil, p. 767

### ALPHA-ADRENOCEPTOR BLOCKERS

**Alfuzosin hydrochloride**

**INDICATIONS AND DOSE**

**Benign prostatic hyperplasia**

- **Adult:** 2.5 mg 3 times a day; maximum 10 mg per day
- **Elderly:** Initially 2.5 mg twice daily, adjusted according to response; maximum 10 mg per day
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- **Adult:** 10 mg once daily

**Acute urinary retention associated with benign prostatic hyperplasia**

- **BY MOUTH USING MODIFIED-RELEASE TABLETS**
- **Elderly:** 10 mg once daily for 2–3 days during catheterisation and for one day after removal; max. 4 days

- **CONTRA-INDICATIONS** Avoid if history of micturition syncope - avoid if history of postural hypotension

- **CAUTIONS** Acute heart failure - concomitant antihypertensives (reduced dosage and specialist supervision may be required) - discontinue if angina worsens - elderly - history of QT-interval prolongation - patients undergoing cataract surgery (risk of intra-operative floppy iris syndrome)

- **INTERACTIONS** → Appendix 1: alpha blockers

- **SIDE-EFFECTS**
  - **Uncommon** Chest pain - flushes
  - **Frequency not known** Angioedema - asthenia - blurred vision - cholestasis - depression - dizziness - drowsiness - dry mouth - erectile disorders (including priapism) - gastrointestinal disturbances - headache - hypersensitivity - hypotension (notably postural hypotension) - intra-operative floppy iris syndrome - liver damage - oedema - palpitations - pruritus - rash - rhinitis - syncope - tachycardia

**SIDE-EFFECTS, FURTHER INFORMATION**

- **First dose effect** First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.

- **HEPATIC IMPAIRMENT** Initial dose 2.5 mg once daily, adjusted according to response to 2.5 mg twice daily in mild to moderate impairment—avoid if severe. Avoid modified-release preparations.

- **RENAL IMPAIRMENT** Initial dose 2.5 mg twice daily and adjust according to response. Manufacturers advise avoid use of modified-release preparations if eGFR less than 30 ml/minute/1.73 m² as limited experience.

- **PATIENT AND CARER ADVICE** Patient should be counselled on the first dose effect.

**Driving and skilled tasks**

May affect performance of skilled tasks e.g. driving.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS** 21, 25

- **Alfuzosin hydrochloride (Non-proprietary)**
  - Alfuzosin hydrochloride 10 mg
  - Alfuzosin 10 mg modified-release tablets | 30 tablet pack no price available DT price = £12.51
  - Besavar XL (Zentiva)
  - Alfuzosin hydrochloride 10 mg

  - Xatral XL (Sanofi)
  - Alfuzosin hydrochloride 10 mg
  - Xatral XL 10 mg tablets | 10 tablet pack | £4.17 | 30 tablet pack | £12.51 DT price = £12.51

**Tablet**

- **Alfuzosin hydrochloride (Non-proprietary)**
  - Alfuzosin hydrochloride 2.5 mg
  - Alfuzosin 2.5 mg tablets | 60 tablet pack | £21.20 DT price = £2.10
  - Xatral (Sanofi)
  - Alfuzosin hydrochloride 2.5 mg
  - Xatral 2.5 mg tablets | 60 tablet pack | £20.37 DT price = £2.10
Doxazosin

**INDICATIONS AND DOSE**

**Hypertension**

- **By mouth using immediate-release medicines**
  - Adult: Initially 1 mg once daily for 1–2 weeks, then increased to 2 mg once daily, then increased if necessary to 4 mg once daily; maximum 16 mg per day

- **By mouth using modified-release medicines**
  - Adult: Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily

**Benign prostatic hyperplasia**

- **By mouth using immediate-release medicines**
  - Adult: Initially 1 mg daily, dose may be doubled at intervals of 1–2 weeks according to response; usual maintenance 2–4 mg daily; maximum 8 mg per day

- **By mouth using modified-release medicines**
  - Adult: Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily

**DOSE EQUIVALENCE AND CONVERSION**

- Patients stabilised on immediate-release doxazosin can be transferred to the equivalent dose of modified-release doxazosin.

**CONTRA-INDICATIONS**

History of micturition syncope (in patients with benign prostatic hypertrophy) - history of postural hypotension - monotherapy in patients with overflow bladder or anuria

**CAUTIONS**

Care with initial dose (postural hypotension) - cataract surgery (risk of intra-operative floppy iris syndrome) - elderly - heart failure - pulmonary oedema due to aortic or mitral stenosis

**INTERACTIONS** → Appendix 1: alpha blockers

**SIDE-EFFECTS**

- Common or very common
  - Anxiety - back pain - coughing - dyspnoea - fatigue - influenza-like symptoms - myalgia - paraesthesia - sleep disturbance - vertigo

- Uncommon
  - Agitation - angina - arthralgia - epistaxis - gout - hypoesthesia - micturition disturbance - myocardial infarction - tinnitus - tremor - weight changes

- Very rare
  - Abnormal ejaculation - alopecia - arrhythmias - bradycardia - bronchospasm - cholostasis - gynaecomastia - hepatitis - hot flushes - jaundice - leucopenia - thrombocytopenia

- Frequency not known

**PREGNANCY**

No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk

**BREAST FEEDING**

Accumulates in milk in animal studies—manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

Use with caution. Manufacturer advises avoid in severe impairment—no information available.

**PATIENT AND CARER ADVICE**

Patient counselling is advised for doxazosin tablets (initial dose).

**Driving and skilled tasks**

May affect performance of skilled tasks e.g. driving.

**MEDICINAL FORMS**

There may be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS 25**

**Indoramin**

**INDICATIONS AND DOSE**

**Hypertension**

- **By mouth**
  - Adult: Initially 25 mg twice daily, increased in steps of 25–50 mg every 2 weeks, maximum daily dose should be given in divided doses; maximum 200 mg per day

**Benign prostatic hyperplasia**

- **By mouth**
  - Adult: 20 mg twice daily, increased in steps of 20 mg every 2 weeks if required, increased if necessary up to 100 mg daily in divided doses
  - Elderly: 20 mg daily may be adequate, dose to be taken at night

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required.

**CONTRA-INDICATIONS**

Established heart failure - history micturition syncope (when used for benign prostatic hyperplasia) - history of postural hypotension (when used for benign prostatic hyperplasia)

**CAUTIONS**

Cataract surgery (risk of intra-operative floppy iris syndrome) - control incipient heart failure before initiating indoramin - elderly - epilepsy (convulsions in animal studies) - history of depression - Parkinson’s disease (extrapyramidal disorders reported)

**INTERACTIONS** → Appendix 1: alpha blockers
Side-effects

- Common or very common: Sedation
- Uncommon: Failure of ejaculation, fatigue, weight gain
- Frequency not known: Angioedema, asthenia, blurred vision, depression, dizziness, drowsiness, dry mouth, erectile disorders, extrapyramidal disorders, gastrointestinal disturbances, headache, hypersensitivity reactions, hypotension, incontinence, intra-operative floppy iris syndrome, oedema, palpitations, postural hypotension, priapism, pruritus, rash, rhinitis, syncope, tachycardia, urinary frequency

Pregnancy

- No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

Breast Feeding

- No information available.

Hepatic Impairment

- Manufacturer advises caution.

Renal Impairment

- Manufacturer advises caution.

Patient and Carer Advice

- Driving and skilled tasks: Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Cautionary and Advisory Labels: 2

  - Indoramin (Non-proprietary)
    - Indoramin hydrochloride 20 mg: Indoramin 20mg tablets | 60 tablet (PF) £61.00 DT price = £8.21
    - Indoramin (as Indoramin hydrochloride) 25 mg: Indoramin 25mg tablets | 84 tablet (PF) £60.26 DT price = £60.26
  - Doralese Tiltab (Chemidex Pharma Ltd)
    - Indoramin hydrochloride 20 mg: Doralese Tiltab 20mg tablets | 60 tablet (PF) £11.44 DT price = £8.21

Prazosin

- Indications and Dose

  - Hypertension
    - By Mouth
      - Adult: Initially 500 micrograms 2–3 times a day for 3–7 days, the initial dose should be taken on retiring to bed at night to avoid collapse, increased to 1 mg 2–3 times a day for a further 3–7 days, then increased if necessary up to 20 mg daily in divided doses
  - Congestive heart failure (rarely used)
    - By Mouth
      - Adult: 500 micrograms 2–4 times a day, initial dose to be taken at bedtime, then increased to 4 mg daily in divided doses; maintenance 4–20 mg daily in divided doses
  - Raynaud’s syndrome (but efficacy not established)
    - By Mouth
      - Adult: Initially 500 micrograms twice daily, initial dose to be taken at bedtime, dose may be increased after 3–7 days, then increased if necessary to 1–2 mg twice daily
  - Benign prostatic hyperplasia
    - By Mouth
      - Adult: Initially 500 micrograms twice daily for 3–7 days, subsequent doses should be adjusted according to response, maintenance 2 mg twice daily, initiate with lowest possible dose in elderly patients

Dose Adjustments due to Interactions

Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required.

Contra-Indications

- History of micturition syncope, history of postural hypotension, not recommended for congestive heart failure due to mechanical obstruction (e.g. aortic stenosis)

Caution

- Cataract surgery (risk of intra-operative floppy iris syndrome) - elderly, first dose hypotension

Interactions

- Appendix 1: alpha blockers

Side-Effects

- Angioedema, asthenia, blurred vision, depression, dizziness, drowsiness, dry mouth, erectile disorders, extrapyramidal disorders, gastrointestinal disturbances, headache, hypersensitivity reactions, hypotension, incontinence, intra-operative floppy iris syndrome, oedema, palpitations, postural hypotension, priapism, pruritus, rash, rhinitis, syncope, tachycardia, urinary frequency

Renal Impairment

- No information available.

Hepatic Impairment

- Manufacturer advises caution.

Patient and Carer Advice

- Driving and skilled tasks: Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Tamsulosin Hydrochloride

- Indications and Dose

  - Benign prostatic hyperplasia
    - By Mouth Using Modified-Release Medicines
      - Adult: 400 micrograms once daily

Contra-Indications

- History of micturition syncope, history of postural hypotension

Caution

- Cataract surgery (risk of intra-operative floppy iris syndrome) - concomitant antihypertensives (reduced dosage and specialist supervision may be required) - elderly

Interactions

- Appendix 1: alpha blockers

Side-Effects

- Angioedema, asthenia, blurred vision, depression, dizziness, drowsiness, dry mouth, erectile disorders, extrapyramidal disorders, gastrointestinal disturbances, headache, hypersensitivity reactions, hypotension, incontinence, intra-operative floppy iris syndrome, oedema, palpitations, postural hypotension, priapism, pruritus, rash, rhinitis, syncope, tachycardia, urinary frequency

Terazosin

● INDICATIONS AND DOSE

Mild to moderate hypertension

BY MOUTH

Adult: 1 mg daily for 7 days, then increased if necessary to 2 mg daily, dose should be taken at bedtime; maintenance 2–10 mg once daily, doses above 20 mg rarely improve efficacy

Benign prostatic hyperplasia

BY MOUTH

Adult: Initially 1 mg daily, dose should be taken at bedtime, if necessary dose may be doubled at intervals of 1–2 weeks according to response; maintenance 5–10 mg daily; maximum 10 mg per day

● CONTRA-INDICATIONS

History of micturition syncope (in benign prostatic hyperplasia) - history of postural hypotension (in benign prostatic hyperplasia)

● CAUTIONS

Cataract surgery (risk of intra-operative floppy iris syndrome) - elderly - first dose

CAUTIONS, FURTHER INFORMATION

First dose may cause collapse due to hypotension within 30–90 minutes, therefore should be taken on retiring to bed; may also occur with rapid dose increase.

● INTERACTIONS → Appendix 1: alpha blockers

● SIDE-EFFECTS

● PREGNANCY

No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

● BREAST FEEDING

No information available.

● PATIENT AND CARER ADVICE

Patient counselling is advised for terazosin tablets (initial dose).

First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.

Driving and skilled tasks

May affect performance of skilled tasks e.g. driving.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Terazosin (Non-proprietary)

Terazosin (as Terazosin hydrochloride) 2 mg Terazosin 2mg tablets | 28 tablet (PO) £2.70 DT price = £1.92

Terazosin (as Terazosin hydrochloride) 5 mg Terazosin 5mg tablets | 28 tablet (PO) £3.34 DT price = £2.10

Terazosin (as Terazosin hydrochloride) 10 mg Terazosin 10mg tablets | 28 tablet (PO) £8.11 DT price = £7.87

Benph (Mylan Ltd)

Terazosin (as Terazosin hydrochloride) 2 mg Benph 2mg tablets | 28 tablet (PO) £1.87 DT price = £1.92

Hytrin BPH tablets starter pack | 28 tablet (PO) £10.97

Hytrin tablets starter pack | 28 tablet (PO) £13.00

CHOLINE ESTERS

Bethanechol chloride

● INDICATIONS AND DOSE

Urinary retention

BY MOUTH

Adult: 10–25 mg 3–4 times a day, to be taken within 30 minutes before food

● CONTRA-INDICATIONS

Bradycardia - cardiovascular disorders - conditions where increased motility of the gastro-intestinal tract could be harmful - conditions where increased motility of the urinary tract could be harmful - epilepsy - heart block - hypothyroidism - hypotension - intestinal obstruction - obstructive airways disease - parkinsonism - peptic ulcer - recent myocardial infarction - urinary obstruction

● CAUTIONS

Autonomic neuropathy (use lower initial dose)

● SIDE-EFFECTS

Abdominal pain - bradycardia - bronchoconstriction - diarrhoea - eructation - flushing - headache - hypotension - increased lacrimation - increased salivation - increased sweating - nausea - rhinorrhoea - vomiting

● PREGNANCY

Manufacturer advises avoid — no information available.

● BREAST FEEDING

Manufacturer advises avoid; gastrointestinal disturbances in infant reported.

● LESS SUITABLE FOR PRESCRIBING

Less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS

Myotonine (Glenwood GmbH)

Bethanechol chloride 10 mg Myotonine 10mg tablets | 100 tablet (PO) £18.51

Bethanechol chloride 25 mg Myotonine 25mg tablets | 100 tablet (PO) £27.26

5α-REDUCTASE INHIBITORS

Dutasteride

● DRUG ACTION

A specific inhibitor of the enzyme 5α-reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

● INDICATIONS AND DOSE

Benign prostatic hyperplasia

BY MOUTH

Adult: 500 micrograms daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained)

● INTERACTIONS → Appendix 1: dutasteride

● SIDE-EFFECTS

Breast enlargement - breast tenderness - decreased libido - ejaculation disorders - impotence

● CONCEPTION AND CONTRACEPTION

Dutasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.

● HEPATIC IMPAIRMENT

Avoid in severe impairment — no information available.
**Finasteride**

**DRUG ACTION** A specific inhibitor of the enzyme 5α-reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

**INDICATIONS AND DOSE**

**Benign prostatic hyperplasia**
- **BY MOUTH**
  - Adult: 5 mg daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained)

**Androgenetic alopecia in men**
- **BY MOUTH**
  - Adult: 1 mg daily

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: RARE REPORTS OF DEPRESSION AND SUICIDAL THOUGHTS (MAY 2017)

The MHRA has received reports of depression and, in rare cases, suicidal thoughts in men taking finasteride (*Proppecia*®) for male pattern hair loss; depression is also associated with *Proscar*® for benign prostatic hyperplasia. Patients should be advised to stop finasteride immediately and inform a healthcare professional if they develop depression.

**CAUTIONS**
- Obstructive uropathy

**SIDE-EFFECTS**
- Rare: Depression - suicidal ideation
- Frequency not known: Breast enlargement - breast tenderness - decreased libido - ejaculation disorders - face swelling - hypersensitivity reactions - impotence - lip swelling - male breast cancer - pruritus - rash - testicular pain

**CONCEPTION AND CONTRACEPTION** Finasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.

**EFFECT ON LABORATORY TESTS** Decreases serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment.

**HANDLING AND STORAGE** Women of childbearing potential should avoid handling crushed or broken tablets of finasteride.

**PATIENT AND CARER ADVICE** Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.

**NATIONAL FUNDING/ACCESS DECISIONS**

NHS restrictions Finasteride is not prescribable under the NHS for the treatment of androgenetic alopecia in men.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Capsule**

**CAUTIONARY AND ADVISORY LABELS**

**SIDE-EFFECTS**

- **Finasteride (Non-proprietary)**
  - Finasteride 1 mg: Finasteride 1mg tablets | 28 tablet [PoM] no price available
  - Finasteride 5 mg: Finasteride 5mg tablets | 28 tablet [PoM] £11.85 DT price = £1.12
  - Aindeem (Actavis UK Ltd)
    - Finasteride 1 mg: Aindeem 1mg tablet | 28 tablet [PoM] £33.68 | 84 tablet [PoM] £88.40
  - Propecia (Merck Sharp & Dohme Ltd)
    - Finasteride 1 mg: Propecia 1mg tablets | 28 tablet [PoM] £33.68 | 84 tablet [PoM] £88.40
  - Proscar (Merck Sharp & Dohme Ltd)
    - Finasteride 5 mg: Proscar 5mg tablets | 28 tablet [PoM] £13.94 DT price = £1.12

**1.3 Urological pain**

**Urological pain**

**Treatment**

The acute pain of *ureteric colic* may be relieved with pethidine hydrochloride p. 445. *Diclofenac* by injection or as suppositories is also effective and compares favourably with pethidine hydrochloride; other non-steroidal anti-inflammatory drugs are occasionally given by injection.

Lidocaine hydrochloride gel is a useful topical application in *urethral pain* or to relieve the discomfort of catheterisation.

**Alkalisation of urine**

*Alkalisation* of urine can be undertaken with potassium citrate. The alkalising action may relieve the discomfort of *cystitis* caused by lower urinary tract infections. Sodium bicarbonate p. 950 is used as a urinary alkalising agent in some metabolic and renal disorders.

**ALKALISING DRUGS**

**Citric acid with potassium citrate**

**INDICATIONS AND DOSE**

**Relief of discomfort in mild urinary-tract infections**

**Alkalisation of urine**

- **BY MOUTH USING ORAL SOLUTION**
  - Adult: 10 mL 3 times a day, diluted well with water

**CAUTIONS**
- Cardiac disease - elderly

**INTERACTIONS** → Appendix 1: potassium citrate

**SIDE-EFFECTS**
- Hyperkalaemia on prolonged high dosage - mild diuresis

**RENAL IMPAIRMENT** Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.

**PRESCRIBING AND DISPENSING INFORMATION**

When prepared extemporaneously, the BP states Potassium Citrate Mixture BP consists of potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillia tincture 0.1 mL, lemon spirit 0.05 mL, double-
Sodium citrate

**INDICATIONS AND DOSE**

**Bladder washouts**
- Adult: (consult product literature)

**Relief of discomfort in mild urinary-tract infections**
- **BY MOUTH**
- **Adult:** (consult product literature)

**MICOLETTE®**

**Constipation**
- **BY RECTUM**
  - Child 3-17 years: 5–10 mL for 1 dose
  - Adult: 5–10 mL for 1 dose

**MICRALAX®**

**Constipation**
- **BY RECTUM**
  - Child 3-17 years: 5 mL for 1 dose
  - Adult: 5 mL for 1 dose

**RELAXIT®**

**Constipation**
- **BY RECTUM**
  - Child 1 month-2 years: 5 mL for 1 dose, insert only half the nozzle length
  - Child 3-17 years: 5 mL for 1 dose
  - Adult: 5 mL for 1 dose

**CONTRA-INDICATIONS**
- With rectal use Acute gastro-intestinal conditions

**CAUTIONS**
- With oral use Cardiac disease · elderly · hypertension · patients on a sodium-restricted diet
- With rectal use Debilitated patients (in adults) · sodium and water retention in susceptible individuals

**INTERACTIONS**
- Appendix 1: sodium citrate

**SIDE-EFFECTS**
- With oral use Mild diuresis

**PREGNANCY**
- With oral use Use with caution.

**RENAL IMPAIRMENT**
- With oral use In patients with fluid retention, avoid antacids containing large amounts of sodium.

**PRESCRIBING AND DISPENSING INFORMATION**
- Sodium citrate 300 mmol/litre (88.2 mg/mL) oral solution is licensed for use before general anaesthesia for caesarean section (available from Viridian).

**EXCEPTIONS TO LEGAL CATEGORY**
- Proprietary brands of sodium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

**MEDICINAL FORMS**

2 Bladder instillations and urological surgery

Bladder instillations and urological surgery

Bladder infection

Various solutions are available as irrigations or washouts. Aqueous chlorhexidine p. 1108 can be used in the management of common infections of the bladder but it is ineffective against most *Pseudomonas spp.* Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they...
may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride solution 0.9% (physiological saline) is usually adequate and is preferred as a mechanical irrigant.

Continuous bladder irrigation with amphotericin p. 561 50 micrograms/mL may be of value in mycotic infections in adults.

**Dissolution of blood clots**

Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution for bladder irrigation 3% p. 743 may also be helpful.

**Bladder cancer**

Bladder instillations of doxorubicin hydrochloride p. 835 and mitomycin p. 850 are used for recurrent superficial bladder tumours. Such instillations reduce systemic side-effects; adverse effects on the bladder (e.g. micturition disorders and reduction in bladder capacity) may occur.

Instillation of epirubicin hydrochloride p. 836 is used for treatment and prophylaxis of certain forms of superficial bladder cancer; instillation of doxorubicin hydrochloride is also used for some papillary tumours.

Instillation of BCG (Bacillus Calmette-Guérin p. 884), a live attenuated strain derived from Mycobacterium bovis is licensed for the treatment of primary or recurrent bladder carcinoma in-situ and for the prevention of recurrence following transurethral resection.

**Urological surgery**

Glycine below irrigation solution 1.5% is the irrigant of choice for transurethral resection of the prostate gland and bladder tumours; sterile sodium chloride solution 0.9% (physiological saline) is used for percutaneous renal surgery.

**Maintenance of indwelling urinary catheters**

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

**ANTISEPTICS AND DISINFECTANTS**

### Chlorhexidine with lidocaine

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 1108, lidocaine hydrochloride p. 1242.

#### INDICATIONS AND DOSE

**Urethral sounding and catheterisation**

- **Adult:** 6–11 mL

**Cystoscopy**

- **Adult:** 11 mL, then 6–11 mL if required

#### INTERACTIONS

→ Appendix 1: antiarrhythmics

#### MEDICINAL FORMS

- **Excipients:** May contain hydroxybenzoates (parabens)
- **Instillagel (Clinimed Ltd)**

Chlorhexidine gluconate 500 microgram per 1 ml, Lidocaine hydrochloride 20 mg per 1 ml Instillagel gel 60 mL £14.05 DT price = £11.00 110 mL

### IRRIGATING SOLUTIONS

#### Glycine

- **INDICATIONS AND DOSE**

Bladder irrigation during urological surgery | Irrigation for transurethral resection of the prostate gland and bladder tumours

- **Adult:** (consult product literature)

- **CAUTIONS**

FURTHER INFORMATION

- **Urological surgery** There is a high risk of fluid absorption from the irrigant used in endoscopic surgery within the urinary tract.

- **SIDE-EFFECTS** Haemolysis • Hypervolaemia • Renal failure

#### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

### IRRIGATING SOLUTIONS

#### Glycine

- **INDICATIONS AND DOSE**

Bladder irrigation during urological surgery | Irrigation for transurethral resection of the prostate gland and bladder tumours

- **Adult:** (consult product literature)

#### CAUTIONS

- **Urological surgery** There is a high risk of fluid absorption from the irrigant used in endoscopic surgery within the urinary tract.

#### SIDE-EFFECTS

- Haemolysis • Hypervolaemia • Renal failure

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

#### INTRAVESICAL INSTALLATION

- **Glycine (Non-proprietary)**

Glycine 1.5% irrigation solution 3 litre Easyflow bags | 1 bottle no price available

Glycine 1.5% irrigation solution 1 litre Flowfusor bottles | 1 bottle no price available

Glycine 1.5% irrigation solution 1 litre Easyflow bags | 1 bottle no price available

Glycine 1.5% irrigation solution 2 litre Flowfusor bottles | 1 bottle no price available

### UROLOGICAL ANTI-INFLAMMATORY DRUGS

#### Dimethyl sulfoxide

- **INDICATIONS AND DOSE**

Symptomatic relief in interstitial cystitis (Hunner’s ulcer)

- **BY INTRAVESICAL INSTALLATION**

- **Adult:** 50 mL every 2 weeks retained for 15 minutes then voided by the patient, 50% solution is used and instilled into the bladder

- **SIDE-EFFECTS** Bladder spasm • Hypersensitivity

- **MONITORING REQUIREMENTS** Ophthalmic, renal and hepatic assessments at intervals of 6 months are required in long-term treatment.

#### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

#### Liquid

- **RIMSO-50 (Thornton & Ross Ltd)**

Dimethyl sulfoxide 500 mg per 1 ml RIMSO-50 solution for installation | 50 ml | Poun £324.00

### Catheter maintenance solutions

#### CATHETER MAINTENANCE SOLUTIONS

OptiFlo R citric acid 6% catheter maintenance solution (Bard Ltd) 50 mL • NHS indicative price = £3.60 • Drug Tariff (Part IXa) 100 mL • NHS indicative price = £3.60 • Drug Tariff (Part IXa)

Uro-Tainer Twin Solution R citric acid 6% catheter maintenance solution (B. Braun Medical Ltd) 60 mL • NHS indicative price = £4.81 • Drug Tariff (Part IXa)

OptiFlo S saline 0.9% catheter maintenance solution (Bard Ltd) Sodium chloride 9 mg per 1 mL 50 mL • NHS indicative price = £3.39 • Drug Tariff (Part IXa) 100 mL • NHS indicative price = £3.39 • Drug Tariff (Part IXa)

Uro-Tainer M sodium chloride 0.9% catheter maintenance solution (B. Braun Medical Ltd) Sodium chloride 9 mg per 1 mL 50 mL • No NHS indicative price available • Drug Tariff (Part IXa) 100 mL • No NHS indicative price available • Drug Tariff (Part IXa)
3 Contraception

Contraceptives, hormonal

Overview
The Fraser Guidelines (Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health, available at www.tinyurl.com/bpg16) should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at www.fsrh.org) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

Hormonal contraception is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women. Hormonal contraception should only be used by adolescents after menarche.

Intra-uterine devices are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity, but are less appropriate for those with an increased risk of pelvic inflammatory disease.

Barrier methods alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a spermicide. Occasionally sensitivity reactions occur. A female condom (Femidom®) is also available; it is pre-lubricated but does not contain a spermicide.

Combined hormonal contraceptives

Oral contraceptives containing an oestrogen and a progestogen (‘combined oral contraceptives’) are effective preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhoea and menorrhagia;
- reduced incidence of premenstrual tension;
- less symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed ‘monophasic’; those with varying amounts of the two hormones are termed ‘phasic’. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

Choice

The majority of combined oral contraceptives contain ethinylestradiol p. 715 as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen. It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age since more suitable alternatives exist.

- **Low strength preparations** (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.
- **Standard strength preparations** (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram phased preparations) are appropriate for standard use. Phased preparations are generally reserved for women who either do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens ethinylestradiol with desogestrel p. 751, ethinylestradiol with drospirenone p. 752, and ethinylestradiol with gestodene p. 753 may be considered for women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

Dienogest with estradiol valerate p. 751 is in the combined oral contraceptive Qlaira®. Nomegestrol is the progestogen contained in the combined oral contraceptive Zoely®, in combination with estradiol.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (Evra®). The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (NuvaRing®).

Surgery

Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

Reason to stop immediately
