Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg; (in adolescents stop if blood pressure very high);
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment.
Progestogen-only contraceptives

Oral progestogen-only contraceptives

Oral progestogen-only preparations after cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Progestogen-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contra-indicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura).

Parenteral progestogen-only contraceptives

Medroxyprogesterone acetate p. 763 (Depo-Provera®, SAYANA PRESS®) is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without full counselling backed by the patient information leaflet. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased).

- In adolescents, medroxyprogesterone acetate (Depo-Provera®, SAYANA PRESS®) should be used only when other methods of contraception are inappropriate;
- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

Norethisterone enantate (Noristerat®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An etonogestrel-releasing implant (Nexplanon®) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant.

Intra-uterine progestogen-only device

The progestogen-only intra-uterine systems Mirena®, Jaydess® and Levosert® release levonorgestrel p. 759 directly into the uterine cavity. Mirena® is licensed for use as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen replacement therapy. Jaydess® and Levosert® are licensed for contraception, and Levosert® is additionally licensed for the treatment of menorrhagia. These may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time.

Surgery

All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Emergency contraception

Hormonal methods

Hormonal emergency contraceptives include levonorgestrel and ulipristal acetate p. 757; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse (unlicensed use), but efficacy decreases with time. Ulipristal acetate, a progestosterone receptor modulator, is effective if taken within 120 hours (5 days) of unprotected intercourse.

Levonorgestrel is less effective than insertion of an intra-uterine device. Ulipristal acetate is as effective as levonorgestrel, but its efficacy compared to an intra-uterine device is not yet known.

Intra-uterine device

Insertion of an intra-uterine device is more effective than oral levonorgestrel for emergency contraception. A copper intra-uterine contraceptive device can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted infections should be tested for and insertion of the device should usually be covered by antibacterial prophylaxis (e.g. azithromycin p. 507). If intercourse has occurred more than 5 days previously, the device can still be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle.

Contraceptives, interactions

Overview

The effectiveness of combined oral contraceptives, progestagen-only oral contraceptives, contraceptive patches, vaginal rings, and emergency hormonal contraception can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine p. 297, eslicarbazepine acetate p. 299, nevirapine p. 609, oxcarbazepine p. 306, phenytoin p. 308, phenobarbital p. 318,
Combined hormonal contraceptives interactions

Women using combined hormonal contraceptive patches, vaginal rings or oral tablets who require enzyme-inducing drugs or griseofulvin should be advised to change to a reliable contraceptive method that is unaffected by enzyme-inducers, such as some parenteral progesteron-only contraceptives (medroxyprogesterone acetate p. 763 and norethisterone p. 720) or intra-uterine devices (levonorgestrel p. 759; see also Contraceptives, non-hormonal p. 749). This should be continued for the duration of treatment and for four weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed: 

Short course (2 months or less) of an enzyme-inducing drug

Continuing the combined hormonal contraceptive method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug. 

Long-term course (over 2 months) of an enzyme-inducing drug (except rifampicin or rifabutin) or a course of griseofulvin

Use a monophasic combined oral contraceptive at a dose of ethinylestradiol 50 micrograms or more daily [unlicensed use] and use either an extended or a ‘tricycling’ regimen (i.e. taking three packets of monophasic tablets without a break followed by a shortened tablet-free interval of four days [unlicensed use]); continue for the duration of treatment with the interacting drug and for four weeks after stopping. 

If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use] on specialist advice, or to use additional precautions, or to change to a method unaffected by the interacting drugs. 

Use of contraceptive patches and vaginal rings (including concurrent use of two patches or two vaginal rings) is not recommended for women taking enzyme-inducing drugs over a long period. 

Long-term course (over 2 months) of rifampicin or rifabutin

An alternative method of contraception (such as an IUD) is always recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for four weeks after stopping the enzyme-inducing drug. 

Antibacterials that do not induce liver enzymes

It is recommended that no additional contraceptive precautions are required when combined oral contraceptives, contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur. These recommendations should be discussed with the woman. 

There had been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin p. 520, doxycycline p. 534) reduce the efficacy of combined oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel. However, there is a lack of evidence to support this interaction. 

Oral progestogen-only contraceptives interactions

Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. 

The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an interacting drug and for at least 4 weeks afterwards. 

For a short course of an enzyme-inducing drug (less than two months), continuing the progestogen-only oral method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug. 

Parenteral progestogen-only contraceptives interactions

Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. 

The effectiveness of intramuscular norethisterone injection and intramuscular and subcutaneous medroxyprogesterone acetate injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs. 

Effectiveness of the etonogestrel-releasing implant p. 762 may be reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the interacting drug and for at least 4 weeks after stopping. 

For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, continued contraception with the implant may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for 4 weeks after stopping the enzyme-inducing drug. 

Hormonal emergency contraception interactions

The effectiveness of levonorgestrel and ulipristal acetate p. 757 is reduced in women taking enzyme-inducing drugs or griseofulvin (and for at least 4 weeks after stopping). 

A copper intra-uterine device can be offered instead. If the copper intra-uterine device is declined or unsuitable, the dose of levonorgestrel should be increased (See Dose adjustments due to interactions under levonorgestrel). There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers. 

The effectiveness of ulipristal acetate for emergency contraception may be reduced by drugs that increase gastric pH (such as regular use of antacids, H₂ receptor antagonists and proton pump inhibitors). 

Levonorgestrel or a copper intra-uterine device should be considered as alternatives. 

Hormonal contraception should not be newly initiated in a patient until five days after administration of ulipristal acetate as emergency hormonal contraception— the contraceptive effect of ulipristal acetate will be reduced. Consistent and careful use of condoms is recommended. Ulipristal acetate can be used as emergency hormonal contraception more than once in the same cycle. 

Conversely, manufacturer advises that use of levonorgestrel as emergency contraception more than once in the same cycle is not advisable due to increased risk of side-effects (such as menstrual irregularities). 

Levonorgestrel should not be used (as emergency hormonal contraception) within 5 days of administration of ulipristal acetate (as emergency hormonal contraception), as the contraceptive effect of ulipristal acetate may be reduced by progestogens. 

Ulipristal acetate is not recommended for use in women who have severe asthma treated by oral corticosteroids, due to the antiglucocorticoid effect of ulipristal acetate. 

Useful Resources

Contraceptives, non-hormonal

Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do not give adequate protection if used alone unless fertility is already significantly diminished. They have two components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol-9 p. 764 has been associated with genital lesions, which may increase the risk of acquiring these infections.

Contraceptive devices

Intra-uterine devices

The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease e.g. women under 25 years.

The most effective intra-uterine devices have at least 380 mm² of copper and have banded copper on the arms. Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

Fertility declines with age and therefore a copper intra-uterine device which is fitted in a woman over the age of 40, may remain in the uterus until menopause.

A frameless, copper-bearing intra-uterine device (GyneFix™) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus.

Caution with oil-based lubricants

Products such as petroleum jelly (Vaseline®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

3.1 Contraception, combined

OESTROGENS COMBINED WITH PROGESTOGENS

Combined hormonal contraceptives

- CONTRA-INDICATIONS Acute porphyrias p. 969 • gallstones • heart disease associated with pulmonary hypertension or risk of embolus • history during pregnancy of cholestatic jaundice • history during pregnancy of choorea • history during pregnancy of pempigoid gestationis • history during pregnancy of pruritus • history of breast cancer (but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable) • history of haemolytic uraemic syndrome • migraine with aura • personal history of venous or arterial thrombosis • sclerosing treatment for varicose veins • severe or multiple risk factors for arterial disease • severe or multiple risk factors for venous thromboembolism • systemic lupus erythematosus with (or unknown) antiphospholipid antibodies • transient ischaemic attacks without headaches • undiagnosed vaginal bleeding

- CAUTIONS Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice • Crohn’s disease • gene mutations associated with breast cancer (e.g. BRCA 1) • history of severe depression especially if induced by hormonal contraceptive • hyperprolactinaemia (seek specialist advice) • inflammatory bowel disease • migraine • personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) • risk factors for arterial disease • risk factors for venous thromboembolism • sickle-cell disease • undiagnosed breast mass

- Risk of venous thromboembolism There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Combined hormonal contraceptives also slightly increase the risk of arterial thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

- Risk factors for venous thromboembolism Use with caution if any of following factors present but avoid if two or more factors present:
  - family history of venous thromboembolism in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
  - obesity; body mass index ≥ 30 kg/m² (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
  - long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
  - history of superficial thrombophlebitis;
  - age over 35 years (avoid if over 50 years);
  - smoking.

- **Risk factors for arterial disease** Use with caution if any one of following factors present but avoid if two or more factors present:
  - family history of arterial disease in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
  - diabetes mellitus (avoid if diabetes complications present);
  - hypertension; blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg); (in adolescents, avoid if blood pressure very high);
  - smoking (avoid if smoking 40 or more cigarettes daily);
  - age over 35 years (avoid if over 50 years);
  - obesity (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
  - migraine without aura (avoid if migraine with aura (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

- **Migraine** Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

  Combined hormonal contraceptives should be stopped (pending investigation and treatment), if serious neurological effects occur, including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body.

- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives

- **SIDE-EFFECTS**
  - **Rare** Gallstones, systemic lupus erythematosus
  - **Frequency not known** Abdominal cramps, absence of withdrawal bleeding, amenorrhoea after discontinuation, breast enlargement, breast secretion, breast tenderness, cervical erosion, changes in libido, changes in lipid metabolism, changes in vaginal discharge, chloasma, chorea, contact lenses may irritate, depression, fluid retention, headache, hepatic tumours, hypertension, irritability, leg cramps, liver impairment, nausia, nervousness, photosensitivity, reduced menstrual loss, skin reactions, thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB), visual disturbances, vomiting, spotting, in early cycles

### SIDE-EFFECTS, FURTHER INFORMATION

- **Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years.

- **Cervical cancer** Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years.

  The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).

- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), liver tumours.

### DIRECTIONS FOR ADMINISTRATION

- **With oral use** Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost. 21-day combined preparations, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days. **Every day (ED) combined preparations**, 1 active tablet daily for 21 days, followed by 1 inactive tablet daily for 7 days; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets are being taken); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days.

  Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately. See individual monographs for requirements of specific preparations.

  Changing from progestogen-only tablet If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days. Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for Qlaira®).

- **After childbirth (not breast-feeding)** Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for Qlaira®).

- **After abortion or miscarriage** Start same day.

- **PATIENT AND CARER ADVICE**

  **Missed pill** The critical time for loss of contraceptive protection is when a pill is omitted at the beginning or end of a cycle (which lengthens the pill-free interval).
If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary. If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of ordinary (ED) pills, omitting the 7 inactive tablets).

Emergency contraception is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet. Travel. Women taking oral contraceptives are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery. Diarrhoea and vomiting. Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days after recovery. If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).

**Dienogest with estradiol valerate**

**INDICATIONS AND DOSE**

Contraception with 28-day combined preparations

| Menstrual symptoms with 28-day combined preparations |
|BY MOUTH |
| Females of childbearing potential: 1 active tablet once daily for 26 days, followed by 1 inactive tablet daily for 2 days, withdrawal bleeding may occur during the 2-day interval of inactive tablets, should be taken at approximately the same time each day

**DIRECTIONS FOR ADMINISTRATION** Changing to *Qlaira®*: start the first active *Qlaira®* tablet on the day after taking the last active tablet of the previous brand

**PATIENT AND CARER ADVICE**

Missed doses

A missed pill for a patient taking *Qlaira®* is one that is 12 hours or more late; for information on how to manage missed pills in women taking *Qlaira®, refer to product literature.

Diarrhoea and vomiting In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking *Qlaira®, refer to product literature.

**Estradiol with nomegestrol**

**INDICATIONS AND DOSE**

Contraception

| BY MOUTH |
| Females of childbearing potential: 1 active tablet daily for 24 days, followed by 1 inactive tablet daily for 4 days, to be started on day 1 of cycle with first active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval

**PREGNANCY** Toxicity in animal studies.

**DIRECTIONS FOR ADMINISTRATION** Changing to *Zoely®*: start the first active *Zoely®* tablet on the day after taking the last active tablet of the previous brand or, at the latest, the day after the tablet-free or inactive tablet interval of the previous brand

**PATIENT AND CARER ADVICE**

Missed doses

A missed pill for a patient taking *Zoely®* is one that is 12 hours or more late; for information on how to manage missed pills in women taking *Zoely®, refer to product literature.

Diarrhoea and vomiting In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking *Zoely®, refer to product literature.

**Ethinylestradiol with desogestrel**

**INDICATIONS AND DOSE**

Contraception with 21-day combined preparations

| Menstrual symptoms with 21-day combined preparations |
|BY MOUTH |
| Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day

---

**Ethinylestradiol with etonogestrel**

### Indications and Dose

**Contraception | Menstrual symptoms**

- **By Vagina**
  - Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs)

### Directions for Administration

Changing method of contraception to vaginal ring

Changing from combined hormonal contraception Insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle.

Changing from progestogen-only method From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, inject ring when next injection due; from oral preparation, given advice removed; from an injection, insert ring when next

### Patient and Carer Advice

Patients or carers should be given advice on how to administer vaginal ring.

Counselling The presence of the ring should be checked regularly.

Missed doses

Expulsion, delayed insertion or removal, or broken vaginal ring If the vaginal ring is expelled for less than 3 hours, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for more than 3 hours or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;

---

**Ethinylestradiol with drospirenone**

### Indications and Dose

**Contraception with 21-day combined preparations | Menstrual symptoms with 21-day combined preparations**

- **By Mouth**
  - Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Ethinylestradiol with drospirenone (Non-proprietary)**
  - Ethinylestradiol 30 microgram, Drospirenone 3 mg Ethinylestradiol 30 microgram / Drospirenone 3 mg tablets | £63 tablet | no price available DT price = £14.70

---

**Ethinylestradiol with etonogestrel**

**Indications and Dose**

Contraception | Menstrual symptoms

- **By Vagina**
  - Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs)

**Directions for Administration**

Changing method of contraception to vaginal ring Changing from combined hormonal contraception Insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle. Changing from progestogen-only method From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, inject ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

**Patient and Carer Advice**

Patients or carers should be given advice on how to administer vaginal ring. Counselling The presence of the ring should be checked regularly. Missed doses Expulsion, delayed insertion or removal, or broken vaginal ring If the vaginal ring is expelled for less than 3 hours, rinse the ring with cool water and reinsert immediately; no additional contraception is needed. If the ring remains outside the vagina for more than 3 hours or if the user does not know when the ring was expelled, contraceptive protection may be reduced: If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered. No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

### Ethinylestradiol with levonorgestrel

#### INDICATIONS AND DOSE
**Contraception with 21-day combined preparations**

- **Menstrual symptoms with 21-day combined preparations**
  - **BY MOUTH**
    - Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day.

**Contraception with 28-day combined preparations**

- **Menstrual symptoms with 28-day combined preparations**
  - **BY MOUTH**
    - Females of childbearing potential: 1 active tablet once daily for 21 days, followed by 1 inactive tablet daily for 7 days; subsequent courses repeated without interval, withdrawal bleeding occurs during the 7-day interval of inactive tablets being taken, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day.

### Ethinylestradiol with norelgestromin

#### INDICATIONS AND DOSE

**Contraception | Menstrual symptoms**

- **BY TRANSDERMAL APPLICATION**
  - Females of childbearing potential: Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle, subsequent courses repeated after a 7-day patch free interval (during which withdrawal bleeding occurs)

- **DIRECTIONS FOR ADMINISTRATION**
  - Adhesives or bandages should not be used to hold patch in place. If no longer sticky do not reapply but use a new patch.
  - Changing to a transdermal combined hormonal contraceptive Changing from combined oral contraception Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days.
  - **Changing from progestogen-only method**
    - from an implant, apply first patch on the day implant removed
    - from an injection, apply first patch when next injection due
    - from an oral progestogen, first patch may be applied on any day after stopping pill.
  - **After childbirth (not breast-feeding)**
    - Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days.
  - **After abortion or miscarriage**
    - Before 20 weeks’ gestation start immediately; no additional contraception required if started immediately. After 20 weeks’ gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch.

- **PATIENT AND CARER ADVICE**
  - Patients and carers should be given advice on how to administer patches.
  - **Travel**
    - Women using patches are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

- **Missed doses**
  - **Delayed application or detached patch**
    - If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual ‘change day’. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new ‘Day 1’; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.
  - If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new ‘Day 1’; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):
    - for up to 48 hours, apply a new patch immediately; next patch ‘change day’ remains the same and no additional contraception is required;
    - for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new ‘Day 1’; additional non-hormonal contraception should be used for the first 7 days of the new cycle. If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on...
the usual ‘change day’, the day after day 28; no additional contraception is required.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (September 2003) that Evra® patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives.

3.2 Contraception, devices

**CONTRACEPTIVE DEVICES**

**Intra-uterine contraceptive devices (copper)**

- **INDICATIONS AND DOSE**
  - **Contraception**
  - **Females of childbearing potential**: (consult product literature)

- **INDICATIONS**
  - Active trophoblastic disease (until return to normal of urine and plasma-gonadotrophin concentration)
  - Distorted uterine cavity
  - Established or marked immunosuppression
  - Genital malignancy
  - Medical diathermy
  - Pelvic inflammatory disease
  - Recent sexually transmitted infection
  - Severe anaemia
  - Small uterine cavity
  - Unexplained uterine bleeding
  - Wilson’s disease

- **CAUTIONS**
  - Anaemia
  - Anticoagulant therapy
  - Diabetes
  - Disease-induced immunosuppression
  - Drug-induced immunosuppression
  - Epilepsy
  - Endometriosis
  - Fertility problems
  - History of pelvic inflammatory disease
  - Increased risk of expulsion if inserted before uterine involution
  - Menorrhagia (progestogen intra-uterine system might be preferable)
  - Nulliparity
  - Severe cervical stenosis
  - Severe primary dysmenorrhoea
  - Severely scarred uterus

- **CONTRA-INDICATIONS**
  - Active trophoblastic disease (until return to normal of urine and plasma-gonadotrophin concentration)
  - Distorted uterine cavity
  - Established or marked immunosuppression
  - Genital malignancy
  - Medical diathermy
  - Pelvic inflammatory disease
  - Recent sexually transmitted infection (if not fully investigated and treated)
  - Severe anaemia
  - Small uterine cavity
  - Unexplained uterine bleeding
  - Wilson’s disease

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Allergy
  - Bleeding (on insertion)
  - Cervical perforation
  - Displacement
  - Dysmenorrhoea
  - Menorrhagia
  - Occasional epileptic seizure
  - Pain (on insertion, alleviated by NSAID such as ibuprofen 30 minutes before insertion)
  - Pelvic infection

- **UTERINE PERFORATION**
  - Uterine perforation most often occurs during insertion.
  - Consider this if there is severe pain following insertion.
  - Uterine perforation may occur even if the threads can be seen.

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Presence of significant symptoms (especially pain). Advise the patient to seek medical attention promptly in case of significant symptoms.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Contra-indicated if the patient has a copper allergy.

- **PREGNANCY**
  - If an intra-uterine device fails the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Remove device if pregnancy occurs, increased likelihood that it may be ectopic.

- **BREAST FEEDING**
  - Not known to be harmful.

- **MONITORING REQUIREMENTS**
  - Gynaecological examination before insertion, 6–8 weeks after insertion, then annually.

- **DIRECTIONS FOR ADMINISTRATION**
  - The timing and technique of fitting an intra-uterine device are critical for its subsequent performance.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - **UT380 STANDARD**
    - For uterine length 6.5–9 cm; replacement every 5 years.
  - **NOVAPLUS T 380 A G**
    - ‘Mini’ size for minimum uterine length 5 cm; ‘Normal’ size for uterine length 6.5–9 cm; replacement every 5 years.
  - **GYNEFIX**
    - Suitable for all uterine sizes; replacement every 5 years.
  - **UT380 SHORT**
    - For uterine length 5–7 cm; replacement every 5 years.
  - **NOVA-T 380**
    - For uterine length 6.5–9 cm; replacement every 5 years.
  - **FLEXI-T 380**
    - For uterine length over 6 cm; replacement every 5 years.
  - **NOVAPLUS T 380 CU**
    - ‘Mini’ size for minimum uterine length 5 cm; ‘Normal’ size for uterine length 6.5–9 cm; replacement every 5 years.
  - **LOAD 375**
    - For uterine length over 7 cm; replacement every 5 years.
  - **ANCORA 375 CU**
    - For uterine length over 6.5 cm; replacement every 5 years.
  - **T-SAFE 380A QL**
    - For uterine length 6.5–9 cm; replacement every 10 years.
MULTILOAD® CU375 For uterine length 6–9 cm; replacement every 5 years.
MINI TT380® SLIMLINE For minimum uterine length 5 cm; replacement every 5 years.
COPPER T380 A® For uterine length 6.5–9 cm; replacement every 10 years.
TT380® SLIMLINE For uterine length 6.5–9 cm; replacement every 10 years.
NEO-SAFE® T380 For uterine length 6.5–9 cm; replacement every 5 years.
MULTI-SAFE® 375 For uterine length 6–9 cm; replacement every 5 years.

3.3 Contraception, emergency

Other drugs used for Contraception, emergency Intra-uterine contraceptive devices (copper), p. 756 • Levonorgestrel, p. 759

PROGESTERONE RECEPTOR MODULATORS

Ulipristone acetate
- DRUG ACTION Ulipristone acetate is a progesterone receptor modulator with a partial progesterone antagonist effect.

INDICATIONS AND DOSE
Pre-operative and intermittent treatment of moderate to severe symptoms of uterine fibroids
- BY MOUTH
  - Adult: 5 mg once daily for up to 3 months starting during the first week of menstruation, courses may be repeated if necessary, re-treatment should start no sooner than during the first week of the second menstruation following completion of the first course; max. 4 courses

Emergency contraception
- BY MOUTH
  - Females of childbearing potential: 30 mg for 1 dose, to be taken as soon as possible after coitus, but no later than after 120 hours

CONTRA-INDICATIONS
GENERAL CONTRA-INDICATIONS
Repeated use as an emergency contraceptive within a menstrual cycle
SPECIFIC CONTRA-INDICATIONS
- When used for uterine fibroids Breast cancer - cervical cancer - ovarian cancer - undiagnosed vaginal bleeding - uterine cancer - vaginal bleeding not caused by uterine fibroids
- CAUTIONS Uncontrolled severe asthma
- INTERACTIONS → Appendix 1: ulipristal
Genito-urinary system

SIDE-EFFECTS
- Common or very common
  - When used for emergency contraception: Abdominal pain, back pain, diarrhoea, dizziness, fatigue, gastro-intestinal disturbances, headache, menstrual irregularities, muscle spasms, nausea, vomiting.
  - When used for uterine fibroids: Abdominal pain, acne, breast pain, dizziness, endometrial thickening, headache, hot flushes, hyperhidrosis, malaise, menstrual disturbances, myalgia, nausea, oedema, ovarian cyst (including rupture), pelvic pain, uterine haemorrhage.
- Uncommon
  - When used for emergency contraception: Blurred vision, breast tenderness, dry mouth, hot flushes, pruritus, rash, tremor, uterine spasm.
  - When used for uterine fibroids: Anxiety, constipation, dry mouth, dyspepsia, epistaxis, flatulence, urinary incontinence.

CONCEPTION AND CONTRACEPTION
When ulipristal is given as an emergency contraceptive the effectiveness of combined hormonal and progestogen-only contraceptives may be reduced—additional precautions (barrier methods) required for 14 days for combined and parenteral progestogen-only hormonal contraceptives (16 days for Qlaira®) and 9 days for oral progestogen-only contraceptives. When ulipristal is given for uterine fibroids non-hormonal contraceptive methods (barrier methods or intra-uterine device) should be used both during treatment and for 12 days after stopping, if required.

PREGNANCY
Limited information available when used as an emergency contraceptive. Manufacturer advises avoid for uterine fibroids—no information available.

BREAST FEEDING
In emergency contraception manufacturer advises avoid for 1 week after administration—present in milk. When used for uterine fibroids, manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT
- When used for Emergency contraception: Manufacturer advises avoid in severe impairment—no information available.
- When used for Uterine fibroids: Manufacturer advises avoid in moderate to severe impairment unless patient is closely monitored—no information available.

RENAL IMPAIRMENT
- When used for Uterine fibroids: Manufacturer advises avoid in severe impairment unless patient is closely monitored—no information available.

MONITORING REQUIREMENTS
- When used for Uterine fibroids: Periodic monitoring of the endometrium is recommended following repeated intermittent treatment.

PATIENT AND CARER ADVICE
- When used for Emergency contraception: If vomiting occurs within 3 hours of taking a dose, a replacement dose should be given. When prescribing or supplying hormonal emergency contraception, women should be advised:
  - that their next period may be early or late;
  - that a barrier method of contraception needs to be used until the next period;
  - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
  - to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).
- Treatment free intervals
- When used for Uterine fibroids: The prescriber should explain the requirement for treatment free intervals.

Missed doses
- When used for Uterine fibroids: If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
- EllaOne (HRA Pharma UK Ltd) Ulipristal acetate 30 mg EllaOne 30mg tablets | 1 tablet £14.05
- Esmya (Gedeon Richter (UK) Ltd) Ulipristal acetate 5 mg Esmya 5mg tablets | 28 tablet £13.14

3.4 Contraception, oral progestogen-only

Other drugs used for Contraception, oral progestogen-only Norethisterone, p. 720

PROGESTOGENS

Desogestrel

INDICATIONS AND DOSE
Contraception
- BY MOUTH
- Females of childbearing potential: 75 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 12 hours or more it should be regarded as a ‘missed pill’.

CONTRA-INDICATIONS
Acute porphyrias p. 969 · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding.

CAUTIONS
Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies.

CAUTIONS, FURTHER INFORMATION
- Other conditions: The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

INTERACTIONS
- Appendix 1: desogestrel

SIDE-EFFECTS
Breast discomfort · changes in libido · depression · disturbance of appetite · dizziness · headache · menstrual irregularities · nausea · skin disorders · vomiting.

SIDE-EFFECTS, FURTHER INFORMATION
Breast cancer: There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

PREGNANCY
Not known to be harmful.

BREAST FEEDING
Progestogen-only contraceptives do not affect lactation.
Hepatic impairment

Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

Patient and carer advice

Missed pill The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 12 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days'. The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more tablets are missed or taken more than 12 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Surgery All progestogen-only contraceptives are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Starting routine One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 12 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if desogestrel is started up to 7 days postpartum, additional contraceptive precautions are required for 2 days.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days. Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking desogestrel, another pill should be taken as soon as possible. If a replacement pill is not taken within 12 hours of the normal time for taking desogestrel, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

National funding/access decisions

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2003) that Cerazette® should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Levonorgestrel

Indications and dose

Emergency contraception

By mouth

Females of childbearing potential: 1.5 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours but no later than after 72 hours

Contraception

By mouth

Females of childbearing potential: 1 tablet daily starting on day 1 of the cycle then continuously, dose is to be taken at the same time each day, if administration delayed for 3 hours or more it should be regarded as a ‘missed pill’

Jaydess® 13.5mg Intra-uterine device

Contraception

By vagina

Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester termination; postpartum insertions should be delayed until at least 6 weeks after delivery (12 weeks if uterus involution is substantially delayed); effective for 3 years

Levosert® 20micrograms/24hours Intra-uterine device

Contraception | Menorrhagia

By intra-uterine administration

Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester abortion; postpartum insertions should be delayed until at least 6 weeks after delivery; effective for 3 years

Mirena® 20micrograms/24hours Intra-uterine device

Contraception | Menorrhagia

By intra-uterine administration

Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester termination by curettage; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

Prevention of endometrial hyperplasia during oestrogen replacement therapy

By intra-uterine administration

Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoeic; effective for 4 years continued →
DOSE ADJUSTMENTS DUE TO INTERACTIONS
When used orally as an emergency contraceptive, the effectiveness of levonorgestrel is reduced in women taking enzyme-inducing drugs (and for up to 4 weeks after stopping); a copper intra-uterine device should preferably be used instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]; pregnancy should be excluded following use, and medical advice sought if pregnancy occurs. There is no need to increase the dose for emergency contraception if the patient is taking antibiotics that are not enzyme inducers. With the progestogen-only intra-uterine device, levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) and therefore progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

■ UNLICENSED USE
  ■ With oral use in children Consult product literature for licensing status of individual preparations.
  ■ With vaginal use in children Not licensed for use in women under 18 years.

IMPORTANT SAFETY INFORMATION
MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS
Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:
  ■ severe pelvic pain after insertion (worse than period cramps);
  ■ pain or increased bleeding after insertion which continues for more than a few weeks;
  ■ sudden changes in periods;
  ■ pain during intercourse;
  ■ unable to feel the threads.
Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

■ CONTRA-INDICATIONS
  ■ With intra-uterine use Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration—acute cervicitis; acute vaginitis—distorted uterine cavity—established immunosuppression—genital malignancies—history of breast cancer but can be considered for a woman in long-term remission who has menorrhagia and requires effective contraception—infected abortion during the previous three months—marked immunosuppression—not suitable for emergency contraception—pelvic inflammatory disease—postpartum endometritis—recent sexually transmitted infection (if not fully investigated and treated)—severe anaemia—small uterine cavity—unexplained uterine bleeding
  ■ With oral use Acute porphyrias p. 969
  ■ With oral use for contraception History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding

■ CAUTIONS
  ■ With intra-uterine use Disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · anaemia · anticoagulant therapy (avoid if possible) · diabetes · drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · endometriosis · epilepsy (risk of seizure at time of insertion) · fertility problems · history of pelvic inflammatory disease · increased risk of expulsion if inserted before uterine involution · menorrhagia (progestogen intra-uterine system might be preferable) · nulliparity · severe cervical stenosis · severe primary dysmenorrhoea · severely scarred uterus (including after endometrial resection) · young age
  ■ With oral use for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
  ■ When used for emergency contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · past ectopic pregnancy · severe malabsorption syndromes

CAUTIONS, FURTHER INFORMATION
An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.
Risk of infection with intra-uterine devices The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
  ■ they are under 25 years old or
  ■ they are over 25 years old and
  ■ have a new partner or
  ■ have had more than one partner in the past year or
  ■ their regular partner has other partners.
In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, Neisseria gonorrhoeae) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.
Use as a contraceptive in co-morbidities
With oral use The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.
MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE Advanced uterine atrophy
■ INTERACTIONS → Appendix 1: levonorgestrel

■ SIDE-EFFECTS
GENERAL SIDE-EFFECTS
  ■ Common or very common Depression (sometimes severe) · headache · nausea
  ■ Frequency not known Vomiting
SPECIFIC SIDE-EFFECTS
  ■ Common or very common
  ■ With intra-uterine use Changes in the pattern and duration of menstrual bleeding (spotting or prolonged bleeding) · abdominal pain · acne · alopecia · back pain · breast pain · expulsion · hirsutism · migraine · nervousness · pelvic pain · peripheral oedema · salpingitis
With intra-uterine use Abdominal distension · cervicitis · eczema · pelvic inflammatory disease · pruritus · skin hyperpigmentation

Rare

With intra-uterine use Rash · uterine perforation

Frequency not known

With intra-uterine use Functional ovarian cysts (usually asymptomatic and usually resolve spontaneously—ultrasound monitoring recommended) · allergy · bleeding (on insertion) · cervical perforation · displacement · dysmenorrhoea · epileptic seizures (on insertion) · menorrhagia · pain (on insertion, alleviated by NSAID such as ibuprofen 30 minutes before insertion) · pelvic infection may be exacerbated · vasovagal attack (on insertion)

With oral use Breast discomfort · breast tenderness · changes in libido · disturbances of appetite · dizziness · fatigue · menstrual irregularities · skin disorders

Rare

With intra-uterine use

**SIDE-EFFECTS, FURTHER INFORMATION**

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

Although the progestogen-only intra-uterine system produces little systemic progestogenic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception.

With intra-uterine use Endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and in the bleeding pattern may often become very light or absent. Removal of the intra-uterine system should be considered if the patient experiences migraine or severe headache, jaundice, marked increase of blood pressure, or severe arterial disease.

**PREGNANCY**

With oral use Not known to be harmful.

With vaginal use If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Avoid; if pregnancy occurs remove intra-uterine system.

**BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.

**HEPATIC IMPAIRMENT** Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

**MONITORING REQUIREMENTS**

With intra-uterine use Gynaecological examination before insertion, 4–6 weeks after insertion, then annually.

**DIRECTIONS FOR ADMINISTRATION**

With intra-uterine use The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

**PRESCRIBING AND DISPENSING INFORMATION**

With intra-uterine use Levonorgestrel-releasing intra-uterine devices vary in licensed indication, duration of use and insertion technique—the MHRA recommends to prescribe and dispense by brand name to avoid inadvertent switching.

**MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE** When system is removed (and not immediately replaced) and pregnancy is not desired, remove during the first few days of menstruation, otherwise additional precautions (e.g. barrier methods) should be used for at least 7 days before removal.

**JAYDESS® 13.5MG INTRA-UTERINE DEVICE** When system is removed (and not immediately replaced) and pregnancy is not desired, remove within 7 days of the onset of menstruation; additional precautions (e.g. barrier methods) should be used if the system is removed at some other time during the cycle and there is intercourse within 7 days.

**LEVONELLE® ONE STEP** Can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

**PATIENT AND CARER ADVICE**

Diarrhoea and vomiting with use as an oral contraceptive Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Starting routine

With oral use for contraception One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if levonorgestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones). After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

With intra-uterine use Counsel women to seek medical attention promptly in case of significant symptoms, especially pain. Patient counselling advised. Patient information leaflet to be provided.

With oral use for emergency contraception If vomiting occurs within 2 hours of taking levonorgestrel, a replacement dose should be given.

When prescribing or supplying hormonal emergency contraception, women should be advised:

- that their next period may be early or late;
- that a barrier method of contraception needs to be used until the next period;
- to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
- to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).

**Missed doses**

When used as an oral contraceptive, the following advice is recommended ‘If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not
protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days’.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

● EXCEPTIONS TO LEGAL CATEGORY Levonelle® One Step can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Contraception (postpartum)

- **BY SUBDERMAL IMPLANTATION**
  - Females of childbearing potential: 1 implant to be inserted 21–28 days after delivery (delay until 28 days postpartum if breast-feeding), implant should be removed within 3 years of insertion

### Contraception following abortion or miscarriage in the second trimester

- **BY SUBDERMAL IMPLANTATION**
  - Females of childbearing potential: 1 implant to be inserted 21–28 days after abortion or miscarriage, implant should be removed within 3 years of insertion

### Contraception following abortion or miscarriage in the first trimester

- **BY SUBDERMAL IMPLANTATION**
  - Females of childbearing potential: 1 implant to be inserted within 5 days after abortion or miscarriage, implant should be removed within 3 years of insertion

### Contraception (changing from other hormonal contraceptive)

- **BY SUBDERMAL IMPLANTATION**
  - Females of childbearing potential: Implant should be removed within 3 years of insertion (consult product literature)

### UNLICENSED USE

Nexplanon® not licensed for use in females outside of the age range 18–40 years.

**IMPORTANT SAFETY INFORMATION**

**MRHA/CHM ADVICE (JUNE 2016): NEXPLANON® (ETONOGESTREL) CONTRACEPTIVE IMPLANTS: REPORTS OF DEVICE IN VASCULATURE AND LUNG**

There have been rare reports of Nexplanon® implants reaching the lung via the pulmonary artery. An implant that cannot be palpated at its insertion site should be located and removed as soon as possible; if unable to locate implant within the arm, the MRHA recommends using chest imaging. Correct subdermal insertion reduces the risk of these events.

### CONTRA-INDICATIONS

Acute porphyria - history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable - severe arterial disease - undiagnosed vaginal bleeding

### CAUTIONS

Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice - arterial disease - disturbances of lipid metabolism - history during pregnancy of deterioration of otosclerosis - history during pregnancy of pruritus - history of jaundice in pregnancy - malabsorption syndromes - possible risk of breast cancer - sex-steroid dependent cancer - systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

### INTERACTIONS

Appendix 1: etonogestrel

### SIDE-EFFECTS

Breast discomfort - changes in libido - depression - disturbance of appetite - dizziness - headache - injection - site reactions - menstrual irregularities - nausea - vomiting

### SIDE-EFFECTS, FURTHER INFORMATION

Cervical cancer - Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

Breast cancer - There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the

### PROGESTOGENS

#### Etonogestrel

- **INDICATIONS AND DOSE**

  - **Contraception (no hormonal contraceptive use in previous month)**
    - **BY SUBDERMAL IMPLANTATION**
    - Females of childbearing potential: 1 implant inserted during first 5 days of cycle, implant should be removed within 3 years of insertion

contraceptive is stopped gradually rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

- **Pregnancy** Not known to be harmful, remove implant if pregnancy occurs.
- **Breast Feeding** Progestogen-only contraceptives do not affect lactation.
- **Directions for Administration** The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.
- **Patient and Carer Advice** Full counselling backed by patient information leaflet required before administration.

**Medroxyprogesterone Acetate**

- **INDICATIONS AND DOSE**
  - Dysfunctional uterine bleeding
    - **By Mouth**
    - Adult: 2.5–10 mg daily for 5–10 days, repeated for 2 cycles, begin treatment on day 16–21 of cycle
  - Secondary amenorrhoea
    - **By Mouth**
    - Adult: 2.5–10 mg daily for 5–10 days, repeated for 3 cycles, begin treatment on day 16–21 of cycle
  - Mild to moderate endometriosis
    - **By Mouth**
    - Adult: 10 mg 3 times a day for 90 consecutive days, begin treatment on day 1 of cycle
  - Progestogenic opposition of oestrogen HRT
    - **By Mouth**
    - Adult: 10 mg daily for the last 14 days of each 28-day oestrogen HRT cycle
  - Endometrial cancer | Renal cell cancer
    - **By Mouth**
    - Adult: 200–600 mg daily
  - Breast cancer
    - **By Mouth**
    - Adult: 0.4–1.5 g daily
  - Contraception
    - **By Deep Intramuscular Injection**
    - Females of childbearing potential: 150 mg, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
    - **By Subcutaneous Injection**
    - Females of childbearing potential: 104 mg, to be administered within the first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month
  - Long-term contraception
    - **By Deep Intramuscular Injection**
    - Females of childbearing potential: 150 mg every 12 weeks, first dose to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
    - **By Subcutaneous Injection**
    - Females of childbearing potential: 104 mg, to be administered within the first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

**Contraception (When Patient Changing from Other Hormonal Contraceptive)**

- **By Subcutaneous Injection**
  - Females of childbearing potential: 104 mg every 13 weeks, first dose to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

**Side-Effects**

- **General Side-Effects**
  - Breast discomfort
  - Changes in libido
  - Depression
  - Dizziness
  - Headache
  - Indigestion
  - Loss of vision during treatment (discontinue treatment if papilloedema or retinal vascular lesions)
  - Menstrual irregularities
  - Nausea
  - Pruritus
  - Vomiting
  - Weight gain

**Specific Side-Effects**

- **Rare**
  - With intramuscular use or subcutaneous use
  - Osteoporosis
  - Osteoporotic fractures
  - Frequency not known
  - With intramuscular use or subcutaneous use
  - Disturbance of appetite
  - Injection site-reactions
  - Reduced bone mineral density
  - Skin disorders
  - With oral use
    - Acne
    - Adrenergic-like effects (when used for malignant disease)
    - Alopecia
    - Anaphylactoid reactions
    - Bloating
    - Breast tenderness
    - Cervical erosions
    - Confusion (when used for malignant disease)
Genito-urinary system

RENAL IMPAIRMENT
- When used for mild to moderate endometriosis or Progestogen
  opposition of oestrogen HRT or dysfunctional uterine bleeding or
  secondary amenorrhoea. Use with caution.

PATIENT AND CARER ADVICE
- With intramuscular use or subcutaneous use. Full counselling
  backed by patient information leaflet required before
  administration—likelihood of menstrual disturbance and
  the potential for a delay in return to full fertility. Delayed
  return of fertility and irregular cycles may occur after
  discontinuation of treatment but there is no evidence of
  permanent infertility.

Gel
- Excipients: May contain hydroxybenzoates (parabens), propylene
  glycol, sorbic acid.
- Gygel (Marlborough Pharmaceuticals Ltd)
  Nonoxinol-9 20 mg per 1 ml Gygel 2% contraceptive jelly | 30
  gram | £4.25 | 81 gram | £11.00

■ MEDICINAL FORMS
- There can be variation in the licensing of different medicines
  containing the same drug. Forms available from special-order
  manufacturers include: oral suspension, oral solution.

Tablet
- Climanor (Resourcing Medical Ltd)
  Medroxyprogesterone acetate 5 mg Climanor 5 mg tablets | 28
  tablet | £3.27
- Provera (Pfizer Ltd)
  Medroxyprogesterone acetate 5 mg Provera 5 mg tablets | 10
  tablet | £1.23 DT price = £1.84
  Medroxyprogesterone acetate 5 mg Provera 5 mg tablets | 10
  tablet | £1.23 DT price = £1.23 | 100 tablet | £12.32
  Provera 10 mg tablets | 10
  tablet | £2.47 | 90 tablet | £22.16 DT price = £22.16 | 100
  tablet | £24.73
  Provera 20 mg tablets | 10
  tablet | £29.59 | 100 tablet | £49.94 DT price = £49.94
  Medroxyprogesterone acetate 200 mg Provera 200 mg tablets | 30
  tablet | £29.65 DT price = £29.65
  Provera 400 mg tablets | 30
  tablet | £58.67 DT price = £58.67

Suspension for injection
- Depo-Provera (Pfizer Ltd)
  Medroxyprogesterone acetate 150 mg per 1 ml Depo-Provera
  150 mg/mL suspension for injection pre-filled syringes | 1 pre-filled
  disposable injection | £6.01 DT price = £6.01
- Sayana Press (Pfizer Ltd)
  Medroxyprogesterone acetate 160 mg per 1 ml Sayana Press
  104 mg/0.65 ml suspension for injection pre-filled disposable devices
  | 1 pre-filled disposable injection | £6.90

SIDES-EFFECTS, FURTHER INFORMATION
- With intramuscular use or subcutaneous use. Use of injectable
  progesterone-only contraceptives may be associated with
  a small increased risk of cervical cancer, similar to that seen
  with combined oral contraceptives. The risk of cervical cancer
  with other progesterone-only contraceptives is not yet
  known.
- With intramuscular use or subcutaneous use. Reduction in bone
  mineral density occurs in the first 2–3 years of use then
  stabilises.

CONCEPTION AND CONTRACEPTION
- With intramuscular use. If interval between dose is greater
  than 12 weeks and 5 days (long-term contraception),
  rule out pregnancy before next injection, and advise
  patient to use additional contraceptive measures (e.g.
  barrier) for 14 days after the injection.
- With subcutaneous use. If interval between dose is greater
  than 13 weeks and 7 days (long-term contraception),
  rule out pregnancy before next injection.

PREGNANCY
- With oral use. Avoid—genital malformations and cardiac
defects reported.
- With intramuscular use or subcutaneous use. Not known to be
  harmful.

BREAST FEEDING
- Present in milk—no adverse effects reported. Progestogen-only
  contraceptives do not affect lactation.
- With intramuscular use or subcutaneous use. The
  manufacturers advise that in women who are breast-
  feeding, the first dose should be delayed until 6 weeks after
  birth; however, evidence suggests no harmful effect to
  infant if given earlier. The benefits of using
  medroxyprogesterone acetate in breast-feeding women
  outweigh any risks.

HEPATIC IMPAIRMENT
- Avoid in liver tumour.
- With oral use. Avoid in hepatic impairment.
- With intramuscular use or subcutaneous use. Caution in severe
  liver disease and recurrent cholestatic jaundice.

RENAL IMPAIRMENT
- When used for mild to moderate endometriosis or Progestogen
  opposition of oestrogen HRT or dysfunctional uterine bleeding or
  secondary amenorrhoea. Use with caution.

PATIENT AND CARER ADVICE
- With intramuscular use or subcutaneous use. Full counselling
  backed by patient information leaflet required before
  administration—likelihood of menstrual disturbance and
  the potential for a delay in return to full fertility. Delayed
  return of fertility and irregular cycles may occur after
  discontinuation of treatment but there is no evidence of
  permanent infertility.

3.6 Contraception, spermicidal SPERMICIDALS

Nonoxinol

INDICATIONS AND DOSE
Spermicidal contraceptive in conjunction with barrier
methods of contraception such as diaphragms or caps
- By Vagina
- Females of childbearing potential: (consult product
  literature)

SIDE-EFFECTS
Genital lesions

SIDE-EFFECTS, FURTHER INFORMATION
High frequency use of the spermicide nonoxinol 9 has
been associated with genital lesions, which may increase the
risk of acquiring these infections.

CONCEPTION AND CONTRACEPTION
No evidence of harm to latex condoms and diaphragms.

PREGNANCY
Toxicity in animal studies.

BREAST FEEDING
Present in milk in animal studies.

MEDICINAL FORMS
There can be variation in the licensing of different medicines
containing the same drug. Forms available from special-order
manufacturers include: oral suspension, oral solution.
4 Erectile and ejaculatory conditions

4.1 Erectile dysfunction

Erectile dysfunction

06-Mar-2017

Description of condition

Erectile dysfunction (impotence) is the persistent inability to attain and maintain an erection that is sufficient to permit satisfactory sexual performance. It can have physical or psychological causes. Erectile dysfunction can also be a side-effect of drugs such as antihypertensives, antidepressants, antipsychotics, cytotoxic drugs and recreational drugs (including alcohol).

Risk factors for erectile dysfunction include sedentary lifestyle, obesity, smoking, hypercholesterolaemia and metabolic syndrome. Erectile dysfunction increases the risk of cardiovascular disease. All men with unexplained erectile dysfunction should be evaluated for the presence of cardiovascular disease. All men with erectile dysfunction should be evaluated for the presence of cardiovascular risk factors and any identified risk should be addressed.

Drug treatment

The recommended approach for the management of erectile dysfunction is a combination of drug treatment and lifestyle changes (including regular exercise, reduction in body mass index, smoking cessation, and reduced alcohol consumption).

An oral phosphodiesterase type-5 inhibitor is the first-line drug treatment for erectile dysfunction, regardless of the cause. These drugs act by increasing the blood flow to the penis. They do not initiate an erection—sexual stimulation is required.

The choice of oral phosphodiesterase type-5 inhibitor depends on the frequency of intercourse and response to treatment. Avanafil below, sildenafil p. 766 and vardenafil p. 768 are short-acting drugs and are suitable for occasional use as required. Tadalafil p. 767 is a longer-acting drug. It can be used as required, but can also be used as a regular lower daily dose to allow for spontaneous (rather than scheduled) sexual activity or in those who have frequent sexual activity. A patient with erectile dysfunction should receive six doses of an individual phosphodiesterase type-5 inhibitor at the maximum dose (with sexual stimulation) before being classified as a non-responder. Patients who fail to respond to the maximum dose of at least two different phosphodiesterase type-5 inhibitors should be referred to a specialist.

Intracavernosal, intraurethral or topical application of alprostadil p. 769 (prostaglandin E1) is recommended as second-line therapy under careful medical supervision. Intracavernosal or intraurethral preparations can also be used to aid diagnosis.

Priapism associated with alprostadil

Manufacturers advise that patients should seek medical help if a prolonged erection lasting four hours or more occurs; application of an ice pack to the upper-inner thigh (alternating between the left and right thighs every two minutes for up to ten minutes) may result in reflex opening of the venous valves.

If priapism has lasted more than six hours, treatment should not be delayed; manufacturer advises management as follows:

- Initial therapy by penile aspiration: using aseptic technique, 20–50mL of blood should be aspirated using a 19–21 gauge butterfly needle inserted into the corpus cavernosum; if necessary the procedure may be repeated on the opposite side;
- Lavage: if initial aspiration is unsuccessful, a second 19–21 gauge butterfly needle can be inserted into the opposite corpus cavernosum; sterile physiological saline can be injected through the first needle and drained through the second;
- If aspiration and lavage of are unsuccessful, intracavernosal injection of a sympathomimetic with action on alpha-adrenergic receptors can be given, with continuous monitoring of blood pressure and pulse—see phenylephrine hydrochloride p. 772 [unlicensed indication], adrenaline/epinephrine p. 771 [unlicensed indication], and metaraminol p. 772 [unlicensed indication]. Extreme caution is required in patients with coronary heart disease, hypertension, cerebral ischaemia and in patients taking a monoamine-oxidase inhibitor (facilities for managing hypertensive crisis should be available when administered to patients taking MAOIs);
- If necessary the sympathomimetic injections can be followed by further aspiration of blood through the same butterfly needle;
- If administration of a sympathomimetic drug is unsuccessful, urgent referral for surgical management is required.

Prescribing on the NHS

PHOSPHODIESTERASE TYPE-5 INHIBITORS

Avanafil

- INDICATIONS AND DOSE

Erectile dysfunction

- BY MOUTH

- Adult: Initially 100 mg, to be taken approximately 15–30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

Erectile dysfunction in patients on alpha-blocker therapy

- BY MOUTH

- Adult: Initially 50 mg, to be taken approximately 15–30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises max. 100 mg once every 48 hours with concurrent use of moderate inhibitors of CYP3A4.

- CONTRA-INDICATIONS Avoid if systolic blood pressure below 90 mmHg (no information available) • blood pressure >170/100 mmHg • hereditary degenerative retinal disorders • history of non-arteritic anterior ischaemic optic neuropathy • life-threatening arrhythmia in previous 6 months • mild to severe heart failure • patients in whom vasodilation or sexual activity are inadvisable • recent history of myocardial infarction • recent history of stroke • recent unstable angina
Erectile and ejaculatory conditions

**Genito-urinary system**

**Genito-urinary system**

### NATIONAL FUNDING/ACCESS DECISIONS

**PATIENT AND CARER ADVICE**

**INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors

**SIDE-EFFECTS**

- **Common or very common** Back pain, dizziness, dyspepsia, flushing, headache, migraine, myalgia, nasal congestion, nausea, visual disturbances, vomiting
- **Uncommon** Drowsiness, epistaxis, hypertension, hypotension, malaïse, painful red eyes, palpitation, tachycardia
- **Rare** Abdominal pain, diarrhoea, dry mouth, facial oedema, gastritis, genital irritation, gout, haematuria, hyperactivity, hyperbilirubinaemia, hypersensitivity reactions, increased serum creatinine, insomnia, muscle spasms, peripheral oedema, polliakiuria, priapism, rash, Stevens-Johnson syndrome, syncope, weight gain
- **Frequency not known** Arrhythmia, myocardial infarction, non-artertiar anterior ischaemic optic neuropathy (stop drug if sudden visual impairment occurs), retinal vascular occlusion, seizures, serious cardiovascular events, sudden hearing loss (discontinue drug and seek medical advice), unstable angina

**HEPATIC IMPAIRMENT** Use lowest effective initial dose in mild to moderate impairment, adjusted according to response. Manufacturer advises avoid in severe impairment—no information available.

**RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

**NATIONAL FUNDING/ACCESS DECISIONS**

**NHS restrictions** Spedra® is not prescribable under the NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII B of the Drug Tariff (Part XI b of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’.

The Drug Tariffs can be accessed online at: National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm; Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm; Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Spedra® (A. Menarini Farmaceutica Internazionale SRL) ▼
  - **Avanafil 50 mg** Spedra® 50mg tablets | 4 tablet | £10.94 DT price = £10.94 | 8 tablet | £19.70 DT price = £19.70
  - **Avanafil 100 mg** Spedra® 100mg tablets | 4 tablet | £14.08 DT price = £14.08 | 8 tablet | £26.26 DT price = £26.26
  - **Avanafil 200 mg** Spedra® 200mg tablets | 4 tablet | £21.90 DT price = £21.90 | 8 tablet | £39.40 DT price = £39.40

**Sildenafil**

**INDICATIONS AND DOSE**

**Pulmonary arterial hypertension (initiated under specialist supervision)**

- **BY MOUTH**
  - Adult: 20 mg 3 times a day

- **BY INTRAVENOUS INJECTION**
  - Adult: 10 mg 3 times a day, use intravenous route when the oral route is not appropriate

**Erectile dysfunction**

- **BY MOUTH**
  - Adult: Initially 50 mg, to be taken approximately 1 hour before sexual activity, adjusted according to response to 25–100 mg (max. per dose 100 mg) as required, to be taken as a single dose; maximum 1 dose per day

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- When used for Erectile dysfunction Manufacturer advises a starting dose of 25 mg with concurrent use of moderate and potent inhibitors of CYP3A4. Manufacturer advises if concurrent use of ritonavir is unavoidable, the max. dose should not exceed 25 mg within 48 hours.
- With oral use for Pulmonary arterial hypertension Manufacturer advises reduce dose to 20 mg twice daily with concurrent use of moderate inhibitors of CYP3A4. Manufacturer advises reduce dose to 20 mg once daily with concurrent use of some potent inhibitors of CYP3A4 (avoid with ketoconazole, itraconazole and ritonavir).
- With intravenous use for Pulmonary arterial hypertension Manufacturer advises reduce dose to 10 mg twice daily with concurrent use of moderate inhibitors of CYP3A4. Manufacturer advises reduce dose to 10 mg once daily with concurrent use of some potent inhibitors of CYP3A4 (avoid with ketoconazole, itraconazole and ritonavir).

**CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS**

Hereditary degenerative retinal disorders - history of non-arterior anterior ischaemic optic neuropathy - recent history of myocardial infarction - recent history of stroke

**SPECIFIC CONTRA-INDICATIONS**

- When used for erectile dysfunction Avoid if systolic blood pressure below 90 mmHg (no information available) • patients in whom vasodilation or sexual activity are inadvisable - recent unstable angina
- When used for pulmonary arterial hypertension Sickle-cell anaemia

**CAUTIONS**

**GENERAL CAUTIONS**

Active peptic ulceration - bleeding disorders - cardiovascular disease - left ventricular outflow obstruction

**SPECIFIC CAUTIONS**

- When used for erectile dysfunction Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease) - predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)
- When used for pulmonary arterial hypertension Anatomical deformation of the penis - autonomic dysfuncin - hypotension (avoid if systolic blood pressure below 90 mmHg) - intravascular volume depletion - predisposition to priapism - pulmonary veno-occlusive disease

**INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors

**SIDE-EFFECTS** → Appendix 1: phosphodiesterase type-5 inhibitors

- **Common or very common** Back pain, dyspepsia, flushing, migraine, myalgia, nasal congestion, visual disturbances
- **Frequency not known** Non-arterior anterior ischaemic optic neuropathy (discontinue if sudden visual impairment occurs) • sudden hearing loss (advise patient to seek medical help)
Tadalafil

- **INDICATIONS AND DOSE**

  - **Pulmonary arterial hypertension (initiated under specialist supervision)**
    - **BY MOUTH**
    - Adult: 40 mg once daily

  - **Erectile dysfunction**
    - **BY MOUTH**
    - Adult: Initially 10 mg once daily (max. per dose 20 mg), to be taken at least 30 minutes before sexual activity, subsequent doses adjusted according to response, the effect of intermittent dosing may persist for longer than 24 hours, daily dose of 10–20 mg not recommended; maximum 1 dose per day

  - **Erectile dysfunction; for patients who anticipate sexual activity at least twice a week**
    - **BY MOUTH**
    - Adult: 5 mg once daily, reduced to 2.5 mg once daily, adjusted according to response, the effect continued

---

**SPECIFIC SIDE-EFFECTS**
- **Common or very common**
  - When used for erectile dysfunction Nausea, dizziness, vomiting
  - When used for pulmonary arterial hypertension Abdominal distension, alopecia, anaemia, anxiety, bronchitis, cellulitis, cough, diarrhoea, dry mouth, epistaxis, fever, gastritis, gastro-oesophageal reflux, haemorrhoids, headache, influenza-like symptoms, insomnia, limb pain, night sweats, oedema, painful red eyes, parasthesia, photophobia, retinal haemorrhage, tremor, vertigo
- **Uncommon**
  - When used for erectile dysfunction Chest pain, drowsiness, dry mouth, epistaxis, fatigue, hypertension, hypoaesthesia, hypotension, painful red eyes, palpitation, tachycardia, tinnitus, vertigo
  - When used for pulmonary arterial hypertension Gynaecomastia, haematuria, penile haemorrhage, priapism
- **Rare**
  - When used for erectile dysfunction Atrial fibrillation, cerebrovascular accident, facial oedema, hypersensitivity reactions, priapism, rash, Stevens-Johnson syndrome, syncope
- **Frequency not known**
  - When used for erectile dysfunction Arrhythmia, myocardial infarction, seizures, unstable angina
  - When used for pulmonary arterial hypertension Rash, retinal vascular occlusion

**PREGNANCY**
Use only if potential benefit outweighs risk—no evidence of harm in animal studies.

**BREAST FEEDING**
Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**
In pulmonary arterial hypertension, if usual dose not tolerated, reduce oral dose to 20 mg daily and intravenous dose to 10 mg twice daily. For erectile dysfunction, use initial dose of 25 mg. Manufacturer advises avoid in severe impairment.

**RENAL IMPAIRMENT**
Use initial dose of 25 mg in erectile dysfunction if eGFR less than 30 mL/minute/1.73 m².

In pulmonary hypertension, if usual dose not tolerated, reduce oral dose to 20 mg twice daily and intravenous dose to 10 mg twice daily.

**TREATMENT CESSATION**
- When used for Pulmonary arterial hypertension Consider gradual withdrawal.

**PATIENT AND CARER ADVICE**
- When used for erectile dysfunction Onset of effect may be delayed if taken with food.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (January 2010 and February 2011) that sildenafil tablets (Revatio®) should be initiated for patients with pulmonary arterial hypertension only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists and that sildenafil injection (Revatio®) should be prescribed only on the advice of specialists in the Scottish Pulmonary Vascular Unit or the Scottish Adult Congenital Cardiac Service.

NHS restrictions Viagra® is not prescribable under NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIb of the Drug Tariff (Part Xib of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SL’S’. For more information see Prices in the BNF, under How to use the BNF.

**MEDICINAL FORMS**

CONTRA-INDICATIONS

General Contra-Indications

History of non-arteritic anterior ischaemic optic neuropathy

Specific Contra-Indications

- When used for benign prostatic hyperplasia or erectile dysfunction: Hypotension (avoid if systolic blood pressure below 90 mmHg) - mild to severe heart failure - myocardial infarction - patients in whom vasodilatation or sexual activity are inadvisable - recent stroke - uncontrolled arhythmias - uncontrolled hypertension - unstable angina

- When used for pulmonary arterial hypertension: Acute myocardial infarction in past 90 days

Cautions

- When used for benign prostatic hyperplasia or erectile dysfunction: Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease) - cardiovascular disease - left ventricular outflow obstruction - predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)

- When used for pulmonary arterial hypertension: Anatomical deformation of the penis - aortic and mitral valve disease - congestive cardiomyopathy - coronary artery disease - hereditary degenerative retinal disorders - hypertension (avoid if systolic blood pressure below 90 mmHg) - left ventricular dysfunction - life-threatening arhythmias - pericardial constriction - predisposition to priapism - pulmonary veno-occlusive disease - uncontrolled hypertension

Interactions

Appendix 1: Phosphodiesterase type-5 inhibitors

Side Effects

General Side-Effects

- Common or very common: Back pain - dyspepsia - flushing - headache - myalgia - nausea - vomiting

- Uncommon: Hypertension - tachycardia

- Frequency not known: Arrhythmia - myocardial infarction - non-arteritic anterior ischaemic optic neuropathy (stop drug if sudden visual impairment occurs) - retinal vascular occlusion - sudden hearing loss (discontinue drug and seek medical advice) - unstable angina

Specific Side-Effects

- Common or very common

- When used for benign prostatic hyperplasia or erectile dysfunction: Dizziness - migraine - nasal congestion - visual disturbances

- When used for pulmonary arterial hypertension: Blurred vision - chest pain - epistaxis - facial oedema - gastro-oesophageal reflux - hypotension - increased uterine bleeding - limb pain - nasopharyngitis - palpitation - rash

- Uncommon

- When used for benign prostatic hyperplasia or erectile dysfunction: Epistaxis - hypotension - painful red eyes - palpitation

- When used for pulmonary arterial hypertension: Amnesia - hyperhidrosis - priapism - seizures

- Rare

- When used for benign prostatic hyperplasia or erectile dysfunction: Facial oedema - hypersensitivity reactions - priapism - rash - Stevens-Johnson syndrome - syncope

- Frequency not known

- When used for benign prostatic hyperplasia or erectile dysfunction: Abdominal pain - increased sweating - seizures - serious cardiovascular events - transient amnesia

- When used for pulmonary arterial hypertension: Stevens-Johnson syndrome - stroke - visual field defect

Pregnancy

Manufacturer advises avoid.

Breast Feeding

Manufacturer advises avoid—present in milk in animal studies.

Hepatic Impairment

For pulmonary arterial hypertension use initial dose of 20 mg once daily in mild to moderate impairment. Use maximum dose of 10 mg in erectile dysfunction and benign prostatic hyperplasia. When used for pulmonary arterial hypertension, avoid in severe impairment. Manufacturer advises caution in severe impairment and for regular once–daily dosing in erectile dysfunction and benign prostatic hyperplasia—no information available.

Renal Impairment

In pulmonary arterial hypertension for patients with mild to moderate impairment, initially use 20 mg once daily, increased to 40 mg once daily if tolerated. For erectile dysfunction and benign prostatic hyperplasia, maximum dose 10 mg if eGFR less than 30 mL/minute/1.73 m² (avoid regular once–daily dosing). In pulmonary arterial hypertension, avoid in severe impairment.

National Funding/Access Decisions

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2012) that tadalafil (Adcirca®) should be initiated only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

NHS restrictions

Cialis® is not prescribable under the NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIB of the Drug Tariff (Part XIB of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’. For more information see Prices in the BNF, under How to use the BNF.

Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Adcirca (Eli Lilly and Company Ltd)
  - Tadalafil 20 mg
  - Price: £49.12
- Cialis (Eli Lilly and Company Ltd)
  - Tadalafil 2.5 mg
  - Price: £54.99
  - Tadalafil 5 mg
  - Price: £54.99
  - Tadalafil 10 mg
  - Price: £28.88
  - Tadalafil 20 mg
  - Price: £28.88

Vardenafil

Indications and Dose

Erectile dysfunction

- By mouth using tablets

  - Adult: Initially 10 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

  - By mouth using orodispersible tablet

  - Adult: 10 mg, to be taken approximately 25–60 minutes before sexual activity; maximum 10 mg per day

Erectile dysfunction (patients on alpha-blocker therapy)

- By mouth using tablets

  - Adult: Initially 5 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response,
Erectile dysfunction

for whom an orodispersible tablet is an appropriate formulation.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Orodispersible tablet
EXCIPIENTS: May contain Aspartame

Vardenafil (as Vardenafil hydrochloride trihydrate) 10 mg Levitra 10mg orodispersible tablets sugar-free | 4 tablet (Pom) £19.67 DT price = £19.67

Tablet

Levitra (Bayer Plc)

Vardenafil (as Vardenafil hydrochloride trihydrate) 5 mg Levitra 5mg tablets | 4 tablet (Pom) £8.32 DT price = £8.32 | 8 tablet (Pom) £16.63

Vardenafil (as Vardenafil hydrochloride trihydrate) 10 mg Levitra 10mg tablets | 4 tablet (Pom) £14.78 DT price = £14.78 | 8 tablet (Pom) £29.57

Vardenafil (as Vardenafil hydrochloride trihydrate) 20 mg Levitra 20mg tablets | 4 tablet (Pom) £24.30 DT price = £24.30 | 8 tablet (Pom) £48.60

PROSTAGLANDIN ANALOGUES AND PROSTAMIDES » PROSTAGLANDINS

Alprostadil

● INDICATIONS AND DOSE
Erectile dysfunction (initiated under specialist supervision)

BY URETHRAL APPLICATION

Adult: Initially 250 micrograms, adjusted according to response; usual dose 0.125–1 mg; maximum 2 doses per day; maximum 7 doses per week

Aid to diagnosis of erectile dysfunction

BY URETHRAL APPLICATION

Adult: 500 micrograms for 1 dose

Erectile dysfunction

TO THE SKIN

Adult: Apply 300 micrograms, to the tip of the penis, 5–30 minutes before sexual activity; max 1 dose in 24 hours not more than 2–3 times per week

Cavrject®

Erectile dysfunction

BY INTRACAVERNOSAL INJECTION

Adult: Initially 2.5 micrograms for 1 dose (first dose), followed by 5 micrograms for 1 dose (second dose), to be given if some response to first dose, alternatively 7.5 micrograms for 1 dose (second dose), to be given if no response to first dose, then increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Erectile dysfunction associated with neurological dysfunction

BY INTRACAVERNOSAL INJECTION

Adult: Initially 1.25 micrograms for 1 dose (first dose), then 2.5 micrograms for 1 dose (second dose), then 5 micrograms for 1 dose (third dose), increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; continued →

● CONTRA-INDICATIONS Avoid if systolic blood pressure below 90 mmHg; hereditary degenerative retinal disorders - myocardial infarction - patients in whom vasodilatation or sexual activity are inadvisable - previous history of non-arteritic anterior ischaemic optic neuropathy - recent stroke - unstable angina

● CAUTIONS Active peptic ulceration - anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease) - bleeding disorders - cardiovascular disease - elderly - left ventricular outflow obstruction - predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia) - susceptibility to prolongation of QT interval

● INTERACTIONS → Appendix 1: phosphodiesterase type-5 inhibitors

● SIDE-EFFECTS

Common or very common Back pain - dizziness - dyspepsia - flushing - headache - migraine - myalgia - nasal congestion - nausea - visual disturbances - vomiting

Uncommon Drowsiness - dyspnoea - epistaxis - hypertension - hypotension - increased lacrimation - painful red eyes - palpitation - photosensitivity - tachycardia

Rare Anxiety - facial oedema - hypersensitivity reactions - hypotonia - priapism - raised intra-ocular pressure - rash - Stevens-Johnson syndrome - syncope - transient amnesia

Frequency not known Arrhythmia - myocardial infarction - non-arteritic anterior ischaemic optic neuropathy (stop drug if sudden visual impairment occurs) - retinal vascular occlusion - seizures - serious cardiovascular events - sudden hearing loss (discontinue drug and seek medical advice) - unstable angina

● HEPATIC IMPAIRMENT Initial dose 5 mg in mild to moderate impairment, increased subsequently according to response (max. 10 mg in moderate impairment). Manufacturer advises avoid in severe impairment. Orodispensible tablets not suitable for patients with moderate hepatic impairment.

● RENAL IMPAIRMENT Initial dose 5 mg if eGFR less than 30 mL/minute/1.73 m². Orodispensible tablets not suitable if eGFR less than 30 mL/minute/1.73 m².

● PRESCRIBING AND DISPENSING INFORMATION
Orodispisable tablets not suitable for initiation of therapy in patients taking alpha-blockers.

● NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (September 2011) that vardenafil orodispersible tablets (Levitra®) are accepted for restricted use within NHS Scotland for men for whom an orodispersible tablet is an appropriate formulation.

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (September 2011) that vardenafil orodispersible tablets (Levitra®) are accepted for restricted use within NHS Scotland for men who meet the criteria listed in part XVIIIB of the Drug Tariff (Part XIb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’. For more information see Prices in the BNF, under How to use the BNF.

Levitra® Orodispensible Tablets

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (September 2011) that vardenafil orodispersible tablets (Levitra®) are accepted for restricted use within NHS Scotland for men who meet the criteria listed in part XVIIIB of the Drug Tariff (Part XIb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’. For more information see Prices in the BNF, under How to use the BNF.

Levitra® Orodispensible Tablets

Orodispensible tablets are not bioequivalent.

Dose equivalence and conversion

● Levitra® 10 mg orodispersible tablets and Levitra® 10 mg film coated tablets are not bioequivalent.

Onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

Downloaded from www.medicalbr.com | 769

Genito-urinary system
usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Aid to diagnosis
- BY INTRACAVERNOSAL INJECTION
- Adult: 10–20 micrograms for 1 dose (consult product literature)

Aid to diagnosis where evidence of neurological dysfunction
- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 5 micrograms (max. per dose 10 micrograms) for 1 dose, (consult product literature)

CAVERJET® DUAL CHAMBER

Erectile dysfunction
- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 2.5 micrograms for 1 dose (first dose), followed by 5 micrograms for 1 dose (second dose), to be given if same response to first dose, alternatively 7.5 micrograms for 1 dose (second dose), to be given if no response to first dose, then increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Erectile dysfunction associated with neurological dysfunction
- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 1.25 micrograms for 1 dose (first dose), then 2.5 micrograms for 1 dose (second dose), then 5 micrograms for 1 dose (third dose), increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Aid to diagnosis
- BY INTRACAVERNOSAL INJECTION
- Adult: 10–20 micrograms for 1 dose (consult product literature)

Aid to diagnosis where evidence of neurological dysfunction
- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 5 micrograms (max. per dose 10 micrograms) for 1 dose, (consult product literature)

VIRIDAL® DUO CONTINUATION PACK

Erectile dysfunction
- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

Neurogenic erectile dysfunction
- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 2.5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

VIRIDAL® DUO STARTER PACK

Neurogenic erectile dysfunction
- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 2.5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS
Not for use in patients with penile implants or when sexual activity medically inadvisable (e.g. orthostatic hypotension, myocardial infarction, and syncope) • not for use with other agents for erectile dysfunction • predisposition to prolonged erection (as in thrombocytopenia, polycythemia, sickle cell anaemia, multiple myeloma or leukaemia) • urethral application contra-indicated in balanitis • urethral application contra-indicated in severe curvature • urethral application contra-indicated in severe hypospadia • urethral application contra-indicated in urethral stricture • urethral application contra-indicated in urethritis

SPECIFIC CONTRA-INDICATIONS
- With topical use Balanitis • severe curvature • severe hypospadia • urethral stricture • urethritis

CAUTIONS
Anatomical deformations of penis (painful erection more likely) — follow up regularly to detect signs of penile fibrosis (consider discontinuation if angulation, cavernosal fibrosis or Peyronie’s disease develop) • priapism (patients should be instructed to report any erection lasting 4 hours or longer)

INTERACTIONS
- Appendix 1: alprostadil

SIDE-EFFECTS
- Common or very common Dizziness • haematoma • haemosiderin deposits • headache • hypertension • hypotension • influenza-like syndrome • injection site reactions • other localised pain (buttoks, leg, testicular, abdominal) • penile fibrosis • penile oedema • penile pain • penile rash • urethral bleeding • urethral burning
- Uncommon Abnormal ejaculation • asthenia • balanitis • dry mouth • haematuria • irritation • leg cramps • local reactions • micturation difficulties • mydriasis • nausea • pelvic pain • penile numbness or sensitivity • penile warmth • phimosis • priapism • pruritus • rapid pulse • scrotal erythema • scrotal oedema • scrotal pain • supraventricular extrasystole • sweating • syncope • testicular oedema • testicular thickening • urethral stenosis • vasodilatation
- Rare Anaphylaxis • erythema • hypersensitivity reactions • rash • urinary-tract infection • urticaria • vertigo
Erectile dysfunction

**CONCEPTION AND CONTRACEPTION**
- With urethral use: If partner is pregnant, barrier contraception should be used. No evidence of harm to latex condoms and diaphragms.
- With topical use: Condoms should be used to avoid exposure to women of child-bearing age, pregnant or lactating women. No evidence of harm to latex condoms.

**DIRECTIONS FOR ADMINISTRATION**
- With intracavernosal use: The first dose of the intracavernosal injection must be given by medically trained personnel; self-administration may only be undertaken after proper training.
- With urethral use: During initiation of treatment the urethral application should be used under medical supervision; self-administration may only be undertaken after proper training.

**PATIENT AND CARER ADVICE**
Patients should be instructed to report any erection lasting 4 hours or longer.
With topical use: Counsel patients that condoms should be used to avoid local reactions and exposure of alprostadil to women. No evidence of harm to latex condoms. Condoms should be used to avoid exposure and angle-closure glaucoma.

**NATIONAL FUNDING/ACCESS DECISIONS**
- **NHS restrictions**: Caverject®, Viridal® Duo, Vitaros® and MUSE® are not prescribable under the NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIIB of the Drug Tariff (Part XII of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’. For more information see Prices in the BNF, under How to use BNF publications.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

- **Stick**
  - Muse (Meda Pharmaceuticals Ltd)
    - Alprostadil 250 microgram: Muse 250 microgram urethral sticks | 1 applicator (POM) £11.30 DT price = £11.30 | 6 applicator (POM) £67.79
    - Alprostadil 500 microgram: Muse 500 microgram urethral sticks | 1 applicator (POM) £11.30 DT price = £11.30 | 6 applicator (POM) £67.79
    - Alprostadil 1 mg: Muse 1000 microgram urethral sticks | 1 applicator (POM) £11.56 DT price = £11.56 | 6 applicator (POM) £65.67

- **Cream**
  - Vitaros (Ferring Pharmaceuticals Ltd)
    - Alprostadil 3 mg per 1 gram: Vitaros 3 mg/g cream | 4 applicator (POM) £40.00

- **Powder and solvent for solution for injection**
  - Caverject (Pfizer Ltd)
    - Alprostadil 10 microgram: Caverject 10 microgram powder and solvent for solution for injection vials | 1 vial (POM) £9.24 DT price = £9.24
    - Alprostadil 20 microgram: Caverject 20 microgram powder and solvent for solution for injection vials | 1 vial (POM) £11.94 DT price = £11.94
    - Alprostadil 40 microgram: Caverject 40 microgram powder and solvent for solution for injection vials | 1 vial (POM) £21.58 DT price = £21.58
  - Caverject Dual Chamber (Pfizer Ltd)
    - Alprostadil 10 microgram: Caverject Dual Chamber 10 microgram powder and solvent for solution for injection | 2 pre-filled disposable injection (POM) £14.70
    - Alprostadil 20 microgram: Caverject Dual Chamber 20 microgram powder and solvent for solution for injection | 2 pre-filled disposable injection (POM) £19.00

- **Viridal** (UCB Pharma Ltd)
  - Alprostadil 10 microgram: Viridal Duo Starter Pack 10 microgram powder and solvent for solution for injection cartridges | 2 cartridge (POM) £20.13 (Hospital only)
  - Viridal Duo Continuation Pack 10 microgram powder and solvent for solution for injection cartridges | 2 cartridge (POM) £16.55
  - Alprostadil 20 microgram: Viridal Duo Starter Pack 20 microgram powder and solvent for solution for injection cartridges | 2 cartridge (POM) £24.54 (Hospital only)
  - Viridal Duo Continuation Pack 20 microgram powder and solvent for solution for injection cartridges | 2 cartridge (POM) £21.39

- **Alprostadil 40 microgram**: Viridal Duo Starter Pack 40 microgram powder and solvent for solution for injection cartridges with device | 2 cartridge (POM) £29.83 (Hospital only)
- Viridal Duo Continuation Pack 40 microgram powder and solvent for solution for injection cartridges | 2 cartridge (POM) £27.22

**SYMPTOMIMETICS → VASOCONSTRICTOR**

**Adrenaline/epinephrine**

- **DRUG ACTION**: Acts on both alpha and beta receptors and increases both heart rate and contractility (beta1 effects); it can cause peripheral vasodilation (a beta2 effect) or vasoconstriction (an alpha effect).

- **INDICATIONS AND DOSE**
  - Priapism associated with alprostadil, if aspiration and lavage of corpora are unsuccessful (alternative to phenylephrine or metaraminol)
  - By intracavernosal injection
    - Adult: 10–20 micrograms every 5–10 minutes, using a 20 microgram/mL solution, Important: if suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the adrenaline 1 in 1000 (1 mg/mL) injection to 5 mL with sodium chloride 0.9%, continuously monitor blood pressure and pulse; maximum 100 micrograms per course

- **UNLICENSED USE**: The use of adrenaline for the treatment of priapism is an unlicensed indication.

- **CAUTIONS**

- **INTERACTIONS**: Appendix 1: sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS**

- **RENAI IMPAIRMENT**
  - Manufacturers advise use with caution in severe impairment.

- **MONITORING REQUIREMENTS**
  - Monitor blood pressure and ECG.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

- Excipients: May contain Sulfites
  - Adrenaline/epinephrine (Non-proprietary)
    - Adrenaline (as Adrenaline acid tartrate) 1 mg per 1 mL Adrenaline (base) 5mg/Snl (1 in 1000) solution for injection ampoules | 10 ampoule (POM) £77.34
    - Adrenaline (base) 50 micrograms/0.5 mL (1 in 1000) solution for injection ampoules | 10 ampoule (POM) £59.87–£61.33 DT price = £59.87
    - Adrenaline (base) 1 mg/L (1 in 1000) solution for injection ampoules | 10 ampoule (POM) £66.01 DT price = £66.01
### Metaraminol

**INDICATIONS AND DOSE**

- **Priapism (alternative to intracavernosal injections of phenylephrine and adrenaline)**
  - **BY INTRACAVERNOSAL INJECTION**
  - Adult: 1 mg every 15 minutes

**UNLICENSED USE** Use for priapism is an unlicensed indication.

**CONTRA-INDICATIONS** Hypertension

**CAUTIONS** Associated with fatal hypertensive crises - cirrhosis - coronary vascular thrombosis - diabetes mellitus - elderly - extravasation at injection site may cause necrosis - following myocardial infarction - hypercapnia - hyperthyroidism - hypoxia - mesenteric vascular thrombosis - peripheral vascular thrombosis - Prinzmetal’s variant angina - uncorrected hypovolaemia

**INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

**SIDE-EFFECTS** Angle-closure glaucoma - anorexia - anxiety - arrhythmias - bradycardia - confusion - dyspnoea - fatal ventricular arrhythmia reported in Laennec’s cirrhosis - headache - hypertension - hypoxia - insomnia - nausea - palpitation - peripheral ischaemia - psychosis - tachycardia - tremor - urinary retention - vomiting - weakness

**MONITORING REQUIREMENTS** Monitor blood pressure and rate of flow frequently.

**DIRECTIONS FOR ADMINISTRATION** For intracavernosal injection, dilute 1 mg (0.1 mL of 10 mg/mL metaraminol injection to 50 mL with Sodium chloride injection 0.9% and give carefully by slow injection into the corpora in 5 mL injections.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

- **Metaraminol (Non-proprietary)**
  - Metaraminol (as Metaraminol tartrate) 10 mg per 1 mL Metaraminol 10mg/1ml solution for injection ampoules | 10 ampoule (POM) £31.97

### Phenylephrine hydrochloride

**INDICATIONS AND DOSE**

- **Priapism associated with alprostadil, if aspiration and lavage of the corpora are unsuccessful (alternative to adrenaline or metaraminol)**
  - **BY INTRACAVERNOSAL INJECTION**
  - Adult: 100–200 micrograms every 5–10 minutes, dose to be administered using a 200 micrograms/mL solution; maximum 1 mg per course

**UNLICENSED USE** Use of phenylephrine hydrochloride injection in priapism is an unlicensed indication.

**CONTRA-INDICATIONS** Hypertension

**INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor

**SIDE-EFFECTS** Arrhythmias - hypertension - palpitation - tachycardia

**DIRECTIONS FOR ADMINISTRATION** For intracavernosal injection, if suitable strength of phenylephrine injection is not available, it may be specially prepared by diluting 0.1 mL of the phenylephrine 1% (10 mg/mL) injection to 5 mL with sodium chloride 0.9%.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

- **Phenylephrine hydrochloride (Non-proprietary)**
  - Phenylephrine (as Phenylephrine hydrochloride) 50 microgram per 1 mL Phenylephrine 500micrograms/10ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (POM) £15.00 | 10 pre-filled disposable injection (POM) £150.00
  - Phenylephrine hydrochloride 100 microgram per 1 mL Phenylephrine 1mg/10ml solution for injection ampoules | 10 ampoule (POM) £40.00
  - Phenylephrine hydrochloride 10mg per 1 mL Phenylephrine 10mg/1ml solution for injection ampoules | 10 ampoule (POM) £99.12

### Aviptadil with phentolamine mesilate

09-Feb-2017

**DRUG ACTION** Phentolamine is a short-acting α-adrenoceptor antagonist that acts directly on vascular smooth muscle, resulting in vasodilatation; aviptadil is a vasoactive intestinal polypeptide that acts as a smooth muscle relaxant.

**INDICATIONS AND DOSE**

- **Erectile dysfunction**
  - **BY INTRACAVERNOSAL INJECTION**
  - Adult: 25/2000 micrograms, frequency of injection should not exceed once daily or three times weekly, duration of erection should not exceed 1 hour

**DOSE EQUIVALENCE AND CONVERSION**

- Dose expressed as x/y micrograms of aviptadil/phentolamine.

**CONTRA-INDICATIONS** Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease) - not for use with other agents for erectile dysfunction - patients for whom sexual activity is inadvisable - penile implants - predisposition to priapism (e.g. in sickle cell anaemia or trait, multiple myeloma, or leukaemia)

**CAUTIONS** Concomitant treatment with anticoagulants (potential increased risk of bleeding) - history of psychiatric disorder or addiction (potential for abuse) - severe cardiovascular disease - severe cerebrovascular disease

**SIDE-EFFECTS**

- **Common or very common** Flushing
  - **Uncommon** Dizziness - headache - palpitation - tachycardia
  - **Rare** Penile fibrosis (following multiple injections) - priapism
  - **Very rare** Angina - myocardial infarction

**MONITORING REQUIREMENTS** Manufacturer advises monitor regularly (e.g. every 3 months), particularly in the initial stages of self-injection therapy; careful examination of the penis is recommended to detect signs of penile fibrosis or Peyronie’s disease—discontinue treatment in patients who develop penile angulation, cavernosal fibrosis, or Peyronie’s disease.

**DIRECTIONS FOR ADMINISTRATION** Manufacturer advises that the initial injections of Invicorp® must be administered by medically trained personnel; self-administration may only be undertaken after proper training.

**HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C).

**PATIENT AND CARER ADVICE** Manufacturer advises that patients should be instructed to report any erection lasting 4 hours or longer.
4.2 Premature ejaculation

**SELECTIVE SEROTONIN RE-UPTAKE INHIBITORS**

**Dapoxetine**

- **DRUG ACTION** Dapoxetine is a short-acting selective serotonin re-uptake inhibitor.

- **INDICATIONS AND DOSE**
  Premature ejaculation in men who meet all the following criteria:
  - poor control over ejaculation, a history of premature ejaculation over the past 6 months, marked distress or interpersonal difficulty as a consequence of premature ejaculation, and an intravaginal ejaculatory latency time of less than two minutes

  - **BY MOUTH**
    - Adult: Initially 30 mg, to be taken approximately 1–3 hours before sexual activity, subsequent doses adjusted according to response; review treatment after 4 weeks (or 6 doses) and at least every 6 months thereafter, not recommended for adults 65 years and over; maximum 1 dose per day; maximum 60 mg per day

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  Manufacturer advises max. dose 30 mg with concurrent use of moderate inhibitors of CYP3A4 except in patients verified to be extensive CYP2D6 metabolisers where manufacturer recommends max. dose 60 mg. Manufacturer advises avoid with concurrent use of potent inhibitors of CYP3A4 except in patients verified to be extensive CYP2D6 metabolisers where manufacturer recommends max. dose 30 mg.

- **CONTRA-INDICATIONS** History of bipolar disorder · history of mania · history of severe depression · history of syncope · significant cardiac disease · uncontrolled epilepsy

- **CAUTIONS** Bleeding disorders · epilepsy (discontinue if convulsions develop) · susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1: SSRIs

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal distension · abdominal pain · abnormal dreams · agitation · anxiety · constipation · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · flushing · headache · hypertension · impaired attention · irritability · malaise · nausea · paraesthesia · sexual dysfunction · sleep disturbances · sweating · tinnitus · tremor · visual disturbances · vomiting
  - **Uncommon** Abnormal thoughts · bradycardia · bruxism · confusion · depression · eye pain · hypotension · mood disturbances · mydriasis · postural hypotension · pruritus · restlessness · sinus arrest · syncope · tachycardia · taste disturbances · vertigo
  - **Rare** Defaecation urgency · sudden onset of sleep

**SIDE-EFFECTS, FURTHER INFORMATION**
Discontinue if psychiatric disorder develops. Avoid if postural hypotension occurs during test dose.

**HEPATIC IMPAIRMENT** Avoid in moderate to severe impairment.

**RENAL IMPAIRMENT** Use with caution if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m².

**PRE-TREATMENT SCREENING** Test for postural hypotension before starting treatment.

**PATIENT AND CARER ADVICE**
Postural hypotension and syncope Patients should be advised to maintain hydration and to sit or lie down until prodromal symptoms such as nausea, dizziness, and sweating abate.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

5 **Obstetrics**

**Prostaglandins and oxytocics**

Prostaglandins and oxytocics are used to induce abortion or induce or augment labour and to minimise blood loss from the placental site. They include oxytocin p. 775, carbocetin p. 776, ergometrine maleate p. 776, and the prostaglandins. All induce uterine contractions with varying degrees of pain according to the strength of contractions induced.

**Induction of abortion**

Gemeupro p. 778, a prostaglandin administered vaginally as pessaries, is suitable for the medical induction of late therapeutic abortion; gemeupro is also used to ripen the cervix before surgical abortion, particularly in primigravids. The prostaglandin misoprostol p. 778 is given by mouth, buccally, sublingually, or vaginally, to induce medical abortion or to augment labour and to minimise blood loss from the placental site. They include oxytocin p. 775, carbocetin p. 776, ergometrine maleate p. 776, and the prostaglandins.

**Induction and augmentation of labour**

Dinoprostone is available as vaginal tablets, pessaries and vaginal gels for the induction of labour. The intravenous solution is rarely used; it is associated with more side-effects.

- **Oxytocin** (Syntocinon®) is administered by slow intravenous infusion, using an infusion pump, to induce or augment labour, usually in conjunction with amniotomy. Uterine activity must be monitored carefully and hyperstimulation avoided. Large doses of oxytocin may result in excessive fluid retention.
- Misoprostol is given orally or vaginally for the induction of labour [unlicensed indication].

**NICE Guidance, Induction of labour (updated July 2008), available at www.nice.org.uk/guidance/CG70.**
Prevention and treatment of haemorrhage
Bleeding due to incomplete miscarriage or abortion can be controlled with ergometrine maleate and oxytocin (Syntometrine®) given intramuscularly, the dose is adjusted according to the patient’s condition and blood loss. This is commonly used before surgical evacuation of the uterus, particularly when surgery is delayed. Oxytocin and ergometrine maleate combined are more effective in early pregnancy than either drug alone.

Active management of the third stage of labour reduces the risk of postpartum haemorrhage; oxytocin is given by intramuscular injection [unlicensed] on delivery of the anterior shoulder or, at the latest, immediately after the baby is delivered. Alternatively, ergometrine maleate with oxytocin (Syntometrine®) can be given by intramuscular injection in the absence of hypertension; oxytocin alone causes less nausea, vomiting, and hypertension than when given with ergometrine maleate.

In excessive uterine bleeding, any placental products remaining in the uterus should be removed. Oxytocic drugs are used to treat postpartum haemorrhage caused by uterine atony; treatment options are as follows:
- oxytocin by slow intravenous injection, followed in severe cases by intravenous infusion of oxytocin at a rate that controls uterine atony or
- ergometrine by intramuscular injection or
- ergometrine by slow intravenous injection (use with caution—risk of hypertension) or
- ergometrine with oxytocin (Syntometrine®) by intramuscular injection

Carboprost p. 776 has an important role in severe postpartum haemorrhage unresponsive to ergometrine maleate and oxytocin.

Misoprostol [unlicensed] can be used in postpartum haemorrhage when oxytocin, ergometrine maleate, and carboprost are not available or are inappropriate.

Mifepristone
For termination of pregnancy, a single dose of mifepristone is followed by administration of a prostaglandin (gemeprost or misoprostol [unlicensed]). Guidelines of the Royal College of Obstetricians and Gynaecologists (November 2011) include [unlicensed] regimens for inducing medical abortion.

Myometrial relaxants
Tocolytic drugs postpone premature labour and they are used with the aim of reducing harm to the child. However, there is no satisfactory evidence that the use of these drugs reduces mortality. The greatest benefit is gained by using the delay to administer corticosteroid therapy or to implement other measures which improve perinatal health (including transfer to a unit with neonatal intensive care facility).

The oxytocin receptor antagonist, atosiban p. 777, is licensed for the inhibition of uncomplicated premature labour between 24 and 33 weeks of gestation. Atosiban may be preferable to a beta, agonist because it has fewer side effects. The dihydroyproline calcium-channel blocker nifedipine p. 157 also has fewer side-effects than a beta₂ agonist.

The beta, agonists salbutamol p. 244 and terbutaline sulfate p. 246 are licensed for inhibiting uncomplicated premature labour between 22 and 37 weeks of gestation to permit a delay in delivery of up to 48 hours. Use of high-dose short acting beta, agonists in obstetric indications has been associated with serious, sometimes fatal cardiovascular events in the mother and fetus, particularly when used for a prolonged period of time. Oral therapy is no longer recommended and parenteral therapy should be restricted to a maximum duration of 48 hours, given under the supervision of a specialist, and with close monitoring.

Indometacin p. 1043, a cyclo-oxygenase inhibitor, also inhibits labour [unlicensed indication] and it can be useful in situations where a beta, agonist is not appropriate; however, there are concerns about neonatal complications such as transient impairment of renal function and premature closure of ductus arteriosus.

5.1 Induction of labour

PROSTAGLANDINS AND OXYTOCICS

Dinoprostone

- **INDICATIONS AND DOSE**

  **PROPESS®**
  - **Cervical ripening and induction of labour at term**
    - **BY VAGINA**
      - Adult: 1 pessary, insert pessary (in retrieval device) high into posterior fornix and remove when cervical ripening adequate; if oxytocin necessary, remove 30 minutes before oxytocin infusion; remove if cervical ripening inadequate after 24 hours (dose not to be repeated)

  **PROSTIN E2® VAGINAL GEL**
  - **Induction of labour**
    - **BY VAGINA**
      - Adult: 1 mg, inserted high into the posterior fornix (avoid administration into the cervical canal), followed by 1–2 mg after 6 hours if required; maximum 3 mg per course

  **Induction of labour (unfavourable primigravida)**
    - **BY VAGINA**
      - Adult: 2 mg, inserted high into the posterior fornix (avoid administration into the cervical canal), followed by 1–2 mg if required, after 6 hours; maximum 4 mg per course

  **PROSTIN E2® VAGINAL TABLETS**
  - **Induction of labour**
    - **BY VAGINA**
      - Adult: 3 mg, inserted high into the posterior fornix, followed by 3 mg after 6–8 hours, to be given if labour not established; maximum 6 mg per course

  **DOSE EQUIVALENCE AND CONVERSION**
  - Prostin E2 Vaginal tablets and Vaginal Gel are not bioequivalent.

- **CONTRA-INDICATIONS**
  - Active cardiac disease • active pulmonary disease • avoid extra-amniotic route in cervicitis or vaginitis • fetal distress • fetal malpresentation • grand multiparas • history of caesarean section • history of difficult or traumatic delivery • history of major uterine surgery • major cephalopelvic disproportion • multiple pregnancy • placenta praevia or unexplained vaginal bleeding during pregnancy • ruptured membranes • untreated pelvic infection

- **CAUTIONS**
  - Effect of oxytocin enhanced • history of asthma • history of epilepsy • history of glaucoma and raised intraocular pressure • hypertension • risk factors for disseminated intravascular coagulation • uterine rupture • uterine scarring

- **SIDE-EFFECTS**
  - Abruptio placenta • amniotic fluid embolism • backache • bronchospasm • cardiac arrest • diarrhoea • disseminated intravascular coagulation • fetal distress • fever • low Apgar scores • maternal hypertension • nausea • pulmonary embolism • rapid cervical dilatation • severe uterine contractions • stillbirth or neonatal death • uterine hypercontractility with or without fetal bradycardia • uterine hypertonus • uterine rupture • vaginal symptoms (warmth, irritation, pain) • vomiting
HEPATIC IMPAIRMENT  Manufacturers advise avoid.
RENAL IMPAIRMENT  Manufacturers advise avoid.

MONITORING REQUIREMENTS
- Monitor for disseminated intravascular coagulation after parturition.
- Monitor uterine activity and fetal status (particular care if history of uterine hypertony)
- Care needed in monitoring uterine activity when used in sequence following oxytocin.

PRESCRIBING AND DISPENSING INFORMATION
Important: Do not confuse dose of Prostin E2® vaginal gel with that of Prostin E2® vaginal tablets—no bioequivalent.

LESS SUITABLE FOR PRESCRIBING
Intravenous solution rarely used and is considered less suitable for prescribing. Extra-amniotic solution less commonly used and is considered less suitable for prescribing.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Pessary
- Prostin E2® (Pfizer Ltd)
  - Dinoprostone 3 mg Prostin E2 3mg vaginal tablets | 8 pessary (Pack) £110.23 (Hospital only)

Vaginal gel
- Prostin E2® (Pfizer Ltd)
  - Dinoprostone 400 microgram per 1 ml Prostin E2 1mg vaginal gel | 2.5 ml (Pack) £13.28 (Hospital only)
  - Dinoprostone 800 microgram per 1 ml Prostin E2 2mg vaginal gel | 2.5 ml (Pack) £13.28 (Hospital only)

Vaginal device
- Propess (Ferring Pharmaceutical Ltd)
  - Dinoprostone 10 mg Propess 10mg vaginal delivery system | 5 device (Pack) £150.00

Induction of labour | Stimulate of labour in hypotonic uterine inertia

INDICATIONS AND DOSE

- BY INTRAVENOUS INFUSION
  - Adult: Initially 0.001–0.004 unit/minute, not to be started for at least 6 hours after administration of vaginal prostaglandin, dose increased at intervals of at least 30 minutes until a maximum of 3–4 contractions occur every 10 minutes (0.01 unit/minute is often adequate) up to max. 0.02 units/minute, if regular contractions not established after a total 5 units, stop induction attempt (may be repeated next day starting again at 0.001–0.004 units/minute).

CAESAREAN SECTION
- BY SLOW INTRAVENOUS INJECTION
  - Adult: 5 units immediately after delivery

PREVENTION OF POSTPARTUM HAEMORRHAGE AFTER DELIVERY OF PLACENTA
- BY SLOW INTRAVENOUS INJECTION
  - Adult: 5 units, if infusion previously used for induction or enhancement of labour, increase rate during third stage and for next few hours

- BY INTRAMUSCULAR INJECTION
  - Adult: 10 units, can be used instead of oxytocin with ergometrine (Syntometrine®).

TREATMENT OF POSTPARTUM HAEMORRHAGE
- BY SLOW INTRAVENOUS INJECTION
  - Adult: 5 units, repeated if necessary

TREATMENT OF SEVERE CASES OF POSTPARTUM HAEMORRHAGE (FOLLOWING INTRAVENOUS INJECTION)
- BY INTRAVENOUS INFUSION
  - Adult: 40 units, given in 500 mL infusion fluid given at a rate sufficient to control uterine atony

Incomplete, inevitable, or missed miscarriage
- INITIALLY BY SLOW INTRAVENOUS INJECTION
  - Adult: 5 units, followed by (by intravenous infusion) 0.02–0.04 unit/minute if required, the rate of infusion can be faster if necessary

UNLICENSED USE
Oxytocin doses in the BNF may differ from those in the product literature. Administration by Intramuscular injection is an unlicensed use.

IMPORTANT SAFETY INFORMATION
Prolonged intravenous administration at high doses with large volume of fluid (which is possible in inevitable or missed miscarriage or postpartum haemorrhage) may cause water intoxication with hyponatraemia. To avoid: use electrolyte-containing diluent (i.e. not glucose), increase oxytocin concentration to reduce fluid, restrict fluid intake by mouth; monitor fluid and electrolytes.

CONTRA-INDICATIONS
Any condition where spontaneous labour inadvisable—any condition where vaginal delivery inadvisable—avoid intravenous injection during labour—avoid prolonged administration in oxytocin-resistant uterine inertia—avoid rapid intravenous injection (may transiently reduce blood pressure)—fetal distress (discontinue immediately if this occurs)—hypertonic uterine contractions (discontinue immediately if this occurs)—severe cardiovascular disease—severe pre-eclamptic toxaemia

CAUTIONS
Avoid large infusion volumes and restrict fluid intake by mouth (risk of hyponatraemia and water-intoxication) - enhancement of labour—presence of borderline cephalopelvic disproportion (avoid if significant)—history of lower-uterine segment caesarean section—induction of labour—presence of borderline cephalopelvic disproportion (avoid if significant)—mild pregnancy-induced cardiac disease—mild pregnancy-induced hypertension—moderate pregnancy-induced cardiac disease—moderate pregnancy-induced hypertension—risk factors for disseminated intravascular coagulation—secondary uterine inertia—women over 35 years

SIDE-EFFECTS
- Common or very common  Arrhythmia • headache • nausea • vomiting
- Rare  Anaphylactoid reactions (with dyspnoea, hypotension, or shock) • disseminated intravascular coagulation • hyponatraemia associated with high doses with large infusion volumes of electrolyte-free fluid • rash • uterine hyperstimulation (usually with excessive doses—may cause fetal distress, asphyxia, and death, or may lead to hypertonicity, tetanic contractions, soft-tissue damage or uterine rupture) • uterine spasm (may occur at low doses) • water intoxication associated with high doses with large infusion volumes of electrolyte-free fluid

SIDE-EFFECTS, FURTHER INFORMATION
Avoid rapid intravenous injection (may transiently reduce blood pressure).

OVERDOSE
Placental abruption and amniotic fluid embolism reported on overdose.

MONITORING REQUIREMENTS
- Careful monitoring of fetal heart rate and uterine motility essential for dose titration.
- Monitor for disseminated intravascular coagulation after parturition.

DIRECTIONS FOR ADMINISTRATION
- For intravenous infusion (Syntocinon®), give continuously in Glucose 5% or Sodium chloride 0.9%. Preferably given via a variable-speed infusion pump in a concentration appropriate to the pump; if given by drip infusion for induction or
enforcement of labour, dilute 5 units in 500 mL infusion fluid or for higher doses, 10 units in 500 mL; for treatment of postpartum uterine haemorrhage dilute 40 units in 500 mL; if high doses given for prolonged period (e.g. for inevitable or missed abortion or for postpartum haemorrhage), use low volume of an electrolyte-containing infusion fluid (not Glucose 5%) given at higher concentration than for induction or enhancement of labour; close attention to patient’s fluid and electrolyte status essential.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

  **Solution for injection**
  - Pabal (Ferring Pharmaceuticals Ltd)
    - Carbetocin 100 microgram per 1 ml Pabal 100micrograms/1ml solution for injection ampoules | 5 ampoule £88.20 (Hospital only)

- **SIDE-EFFECTS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  - Hemabate (Pfizer Ltd)
    - Carboprost (as Carboprost trometamol) 250 microgram per 1 ml Hemabate 250micrograms/1ml solution for injection ampoules | 10 ampoule £162.01 (Hospital only)

### 5.2 Postpartum haemorrhage

**Other drugs used for Postpartum haemorrhage** Oxytocin, p. 775

#### PROSTAGLANDINS AND OXYTOCICS

### Carbetocin

- **INDICATIONS AND DOSE**
  - Prevention of uterine atony after caesarean section
    - **BY SLOW INTRAVENOUS INJECTION**
    - Adult: 100 micrograms for 1 dose, to be given over 1 minute, administer as soon as possible after delivery, preferably before removal of placenta

- **CONTRA-INDICATIONS**
  - Eclampsia · epilepsy · pre-eclampsia

- **CAUTIONS**
  - Asthma · cardiovascular disease (avoid if severe) · hyponatraemia · migraine

- **SIDE-EFFECTS**
  - Abdominal pain · anaemia · back pain · chest pain · chills · diarrhoea · dizziness · dyspnoea · feeling of warmth · flushing · headache · hypotension · metallic taste · nausea · pruritus · sweating · tachycardia · tremor · vomiting

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises avoid.

- **RENAL IMPAIRMENT**
  - Manufacturer advises avoid.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  - Pabal (Ferring Pharmaceuticals Ltd)
    - Carbetocin 100 microgram per 1 ml Pabal 100micrograms/1ml solution for injection ampoules | 5 ampoule £88.20 (Hospital only)

### Carboprost

- **INDICATIONS AND DOSE**
  - Postpartum haemorrhage due to uterine atony in patients unresponsive to ergometrine and oxytocin
    - **BY DEEP INTRAMUSCULAR INJECTION**
    - Adult: 250 micrograms, repeated if necessary, to be given at intervals of not less than 15 minutes. Total dose should not exceed 2 mg (8 doses)

- **CONTRA-INDICATIONS**
  - Cardiac disease · pulmonary disease · untreated pelvic infection

- **CAUTIONS**
  - Excessive dosage may cause uterine rupture · history of anaemia · history of asthma · history of diabetes · history of epilepsy · history of glaucoma · history of hypertension · history of hypotension · history of jaundice · history of raised intra-ocular pressure · uterine scars

- **SIDE-EFFECTS**
  - Bronchospasm · cardiovascular collapse · chill · diarrhoea · dizziness · dyspnoea · erythema at injection site · flushing · headache · hyperthermia · nausea · pain at injection site · pulmonary oedema · raised blood pressure · vomiting

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises avoid.

- **RENAL IMPAIRMENT**
  - Manufacturer advises avoid.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  - Ergometrine maleate (Non-proprietary)
    - Ergometrine maleate 500 microgram per 1 ml Ergometrine 500micrograms/1ml solution for injection ampoules | 10 ampoule £12.00–£15.00
Ergometrine with oxytocin

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergometrine maleate p. 776, oxytocin p. 775.

**INDICATIONS AND DOSE**

Active management of the third stage of labour

Postpartum haemorrhage caused by uterine atony

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 1 mL for one dose
  - Adult: No longer recommended

Bleeding due to incomplete miscarriage or abortion

- **BY INTRAMUSCULAR INJECTION**
  - Adult: Adjusted according to response to, the patient’s condition and blood loss

**INTERACTIONS** → Appendix 1: ergometrine

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Syntometrine (Alliance Pharmaceuticals Ltd)**
  - Ergometrine maleate 500 microgram per 1 mL, Oxytocin 5 unit per 1 mL Syntometrine 500micrograms/1ml solution for injection ampoules | 5 ampoule £7.87

**BY INTRAMUSCULAR INJECTION**

Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Atosiban 6.75mg/0.9ml solution for injection vials | 1 vial £18.41 (Hospital only)

Tractocile (Ferring Pharmaceuticals Ltd)

Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Tractocile 6.75mg/0.9ml solution for injection vials | 1 vial £18.41 (Hospital only)

**Solution for infusion**

- **Atosiban (Non-proprietary)**
  - Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Atosiban 37.5mg/5ml concentrate for solution for infusion vials | 1 vial £52.82 (Hospital only)
  - Atosiban 37.5mg/5ml solution for infusion vials | 1 vial £51.09 (Hospital only)

**BY MOUTH**

Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Tractocile 37.5mg/5ml solution for infusion vials | 1 vial £52.82 (Hospital only)

**5.3 Premature labour**

Other drugs used for Premature labour Nifedipine, p. 157
- Salbutamol, p. 244 - Terbutaline sulfate, p. 246

**OXYTOCIN RECEPTOR ANTAGONISTS**

**Atosiban**

**INDICATIONS AND DOSE**

Uncomplicated premature labour between 24 and 33 weeks of gestation

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 6.75 mg over 1 minute, then (by intravenous infusion) 18 mg/hour for 3 hours, then (by intravenous infusion) reduced to 6 mg/hour for up to 45 hours. Maximum duration of treatment is 48 hours

**CONTRA-INDICATIONS** Abruptio placentae - antepartum haemorrhage (requiring immediate delivery) - eclampsia - intra-uterine fetal death - intra-uterine infection - intra-uterine growth restriction with abnormal fetal heart rate - placenta praevia - premature rupture of membranes after 50 weeks’ gestation - severe pre-eclampsia

**CAUTIONS** Abnormal placental site - intra-uterine growth restriction

**SIDE-EFFECTS**

- Common or very common Dizziness - headache - hot flushes - hyperglycaemia - hypotension - injection-site reaction - nausea - tachycardia - vomiting
- Uncommon Fever - insomnia - pruritus - rash
- **HEPATIC IMPAIRMENT** No information available.
- **RENAL IMPAIRMENT** No information available.
- **MONITORING REQUIREMENTS** Monitor blood loss after delivery.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Tractocile® concentrate for intravenous infusion), give continuously in Glucose 5% or Sodium chloride 0.9%. Withdraw 10 mL infusion fluid from 100-mL bag and replace with 10 mL atosiban concentrate (7.5 mg/mL) to produce a final concentration of 750 micrograms/mL.

**5.4 Termination of pregnancy**

**PROGESTERONE RECEPTOR MODULATORS**

**Mifepristone**

**INDICATIONS AND DOSE**

Cervical ripening before mechanical cervical dilatation for termination of pregnancy of up to 84 days gestation (under close medical supervision)

- **BY MOUTH**
  - Adult: 200 mg for 1 dose, to be taken 36–48 hours before procedure

Labour induction in fetal death in utero where prostaglandin or oxytocin inappropriate (under close medical supervision)

- **BY MOUTH**
  - Adult: 600 mg once daily for 2 days, if labour not started within 72 hours of first dose, another method should be used

Medical termination of intra-uterine pregnancy of up to 49 days gestation (under close medical supervision)

- **BY MOUTH**
  - Adult: 600 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina or misoprostol 400 micrograms by mouth, alternatively 200 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

Medical termination of intra-uterine pregnancy of 50–63 days gestation (under close medical supervision)

- **BY MOUTH**
  - Adult: 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding continued →
Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin) (under close medical supervision)

- **BY MOUTH**
  - Adult: 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36–48 hours later by gemeprost 1 mg by vagina every 3 hours up to max. 5 mg or misoprostol; if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended.

- **CONTRA-INDICATIONS**
  - Acute porphyrias p. 969 · chronic adrenal failure · suspected ectopic pregnancy (use other specific means of termination) · uncontrolled severe asthma

- **CAUTIONS**
  - Adrenal suppression (may require corticosteroid) · anticoagulant therapy · asthma (avoid if severe and uncontrolled) · existing cardiovascular disease · haemorrhagic disorders · history of endocarditis · prostatic heart valve · risk factors for cardiovascular disease

- **SIDE-EFFECTS**
  - Common or very common: Gastro-intestinal cramps · uterine contractions · vaginal bleeding (sometimes severe) may occur between administration of mifepristone and surgery (and rarely abortion may occur before surgery)
  - Uncommon: Hypersensitivity reactions · rash · urticaria
  - Rare: Chills · dizziness · fever · headache · hot flushes · hypotension · malaise
  - Frequency not known: Infections · toxic shock syndrome

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises avoid.

- **Renal Impairment**
  - Manufacturer advises avoid.

- **MONITORING REQUIREMENTS**
  - Careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension).

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Supplied to NHS hospitals and premises approved under Abortion Act 1967.

- **PATIENT AND CARER ADVICE**
  - Patient information leaflet to be provided.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**

  - **CAUTIONARY AND ADVISORY LABELS**
    - 10
  - Mifepristone (Non-proprietary)
    - Mifepristone 200 mg Mifepristone 200mg tablets | 1 tablet [PBCM]
    - no price available (Hospital only)
  - Mifegyne (Nordic Pharma Ltd)
    - Mifepristone 200 mg Mifepristone 200mg tablets | 3 tablet [PBCM]
    - £52.66 (Hospital only)

**PROSTAGLANDINS AND OXYTOCICS**

**Gemeprost**

- **INDICATIONS AND DOSE**
  - **Cervical ripening prior to first trimester surgical abortion**
    - **BY VAGINA**
    - Adult: 1 mg, dose to be inserted into posterior fornix 3 hours before surgery
  - **Second trimester abortion**
    - **BY VAGINA**
    - Adult: 1 mg every 3 hours for maximum 5 administrations, to be inserted into posterior fornix,

  - Second course may begin 24 hours after start of treatment (if treatment fails, pregnancy should be terminated by another method)

- **SECOND TRIMESTER INTRA-UTERINE DEATH**
  - **BY VAGINA**
  - Adult: 1 mg every 3 hours for maximum 5 administrations only, to be inserted into posterior fornix

- **MEDICAL TERMINATION OF INTRA-UTERINE PREGNANCY OF UP TO 49 DAYS GESTATION FOLLOWING MIFEPRISTONE**
  - **BY VAGINA**
  - Adult: 1 mg every 3 hours, if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended, careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension); maximum 5 mg per course

- **CONTRA-INDICATIONS**
  - Placenta praevia · unexplained vaginal bleeding · uterine scarring

- **CAUTIONS**
  - Cardiovascular insufficiency · cervicitis · obstructive airways disease · raised intra-ocular pressure · vaginitis

- **SIDE-EFFECTS**
  - Backache · chest pain · chills · coronary artery spasm · diarrhoea · dizziness · dyspnoea · flushing · headache · mild pyrexia · muscle weakness · myocardial infarction · nausea · palpitation · severe hypotension · uterine pain · uterine rupture (most commonly in multiparas or if history of uterine surgery or if given with intravenous oxytocics) · vaginal bleeding · vomiting

- **RENAL IMPAIRMENT**
  - Manufacturer advises avoid.

- **MONITORING REQUIREMENTS**
  - If used in combination with mifepristone, carefully monitor blood pressure and pulse for 3 hours.
  - When used for second trimester intra-uterine death, monitor for coagulopathy during treatment.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Pessary**

  - Gemeprost (Non-proprietary)
    - Gemeprost 1 mg Gemeprost 1mg pessaries | 5 pessary [PBCM] no price available

**Misoprostol**

- **INDICATIONS AND DOSE**
  - **Termination of pregnancy following mifepristone (gestation up to 49 days)**
    - **BY MOUTH**
    - Adult: 400 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone

- **DRUG ACTION**
  - Misoprostol acts as a potent uterine stimulant.
6 Vaginal and vulval conditions

Vaginal and vulval conditions

Management

Symptoms are often restricted to the vulva, but infections almost invariably involve the vagina which should also be treated. Applications to the vulva alone are likely to give only symptomatic relief without cure. Aqueous medicated douches may disturb normal vaginal acidity and bacterial flora.

Topical anaesthetic agents give only symptomatic relief and may cause sensitivity reactions. They are indicated only in cases of pruritus where specific local causes have been excluded.

Systemic drugs are required in the treatment of infections such as gonorrhoea and syphilis.

Preparations for vaginal and vulval changes

Topical HRT for vaginal atrophy

A cream containing an oestrogen may be applied on a short-term basis to improve the vaginal epithelium in menopausal atrophic vaginitis. It is important to bear in mind that topical oestrogens should be used in the smallest effective amount to minimise systemic effects. Modified-release vaginal tablets and an impregnated vaginal ring are now also available.

The risk of endometrial hyperplasia and carcinoma is increased when systemic oestrogens are administered alone for prolonged periods. The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

Topical oestrogens are also used in postmenopausal women before vaginal surgery for prolapse when there is epithelial atrophy.

Non-hormonal preparations for vaginal atrophy

Several non-hormonal vaginal moisturisers are available and some are prescribable on the NHS (consult Drug Tariff).

Vaginal and vulval infections

Effective specific treatments are available for the common vaginal infections.

Fungal infections

Candidal vaginitis can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. Vaginal candidiasis is treated primarily with antifungal pessaries or cream inserted high into the vagina (including during menstruation). Single-dose preparations offer an advantage when compliance is a problem. Local irritation may occur on application of vaginal antifungal products.

Imidazole drugs ( clotrimazole p. 781, econazole nitrate p. 781, fenticonazole nitrate p. 782, and miconazole p. 782) are effective against candida in short courses of 1 to 14 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with fluconazole p. 562 or itraconazole p. 564 is also effective.

Vulvovaginal candidiasis in pregnancy

Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

Recurrent vulvovaginal candidiasis

Recurrence of vulvovaginal candidiasis is particularly likely if there are predisposing factors, such as antibacterial therapy, pregnancy, diabetes mellitus, or possibly oral contraceptive use. Reservoirs of infection may also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus as well as the gastro-intestinal tract and the bladder. The partner may also be the source of reinfection and, if symptomatic, should be treated with a topical imidazole cream at the same time.
Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis.

### Other infections

**Trichomonal infections** commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole p. 512 or tinidazole p. 514. **Bacterial infections** with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially *Bacteroides* spp. and can be used prophylactically in gynaecological surgery.

Clindamycin below cream and metronidazole gel are indicated for bacterial vaginosis.

Vaginal preparations intended to restore normal acidity may prevent recurrence of vaginal infections and permit the re-establishment of the normal vaginal flora.

The antiviral drugs aciclovir p. 599, famciclovir p. 601, and valaciclovir p. 602 can be used in the treatment of genital infection due to *herpes simplex virus*, the HSV type 2 being a major cause of genital ulceration; they have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms.

#### 6.1 Vaginal and vulval infections

##### 6.1a Vaginal and vulval bacterial infections

Other drugs used for Vaginal and vulval bacterial infections Metronidazole, p. 512

### ANTIBACTERIALS

**DOSE EQUIVALENCE AND CONVERSION**

1 applicatorful delivers a 5 g dose of clindamycin 2%.

- **SIDE-EFFECTS**
  - Cervicitis - irritation - vaginitis

**SIDE-EFFECTS**

**FURTHER INFORMATION**

Clindamycin 2% cream is poorly absorbed into the blood—low risk of systemic effects.

- **CONCEPTION AND CONTRACEPTION**
  - Damages latex condoms and diaphragms.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**EXCIPIENTS:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

- Dalacin (Pfizer Ltd)
  - Clindamycin (as Clindamycin phosphate) 20 mg per 1 gram Dalacin 2% cream | 40 gram | POM | £10.86 DT price = £10.86

### ANTISEPTICS AND DISINFECTANTS

#### Dequalinium chloride

**DRUG ACTION** Dequalinium chloride is a bactericidal anti-infective which causes bacterial cell death by increasing cell permeability and reducing enzyme activity.

- **CONTRA-INDICATIONS**
  - Vaginal ulceration

- **SIDE-EFFECTS**
  - Common or very common: Vaginal candidiasis - vulvovaginal burning sensation - vulvovaginal pruritus
  - Uncommon: Headache - nausea - vaginal haemorrhage - vaginal pain
  - Frequency not known: Cystitis - fever - uterine bleeding - vaginal dryness - vaginal ulceration

- **CONCEPTION AND CONTRACEPTION**
  - Does not affect efficacy of latex condoms; however, manufacturer advises avoid use of non-latex condoms and intravaginal devices—no information available

- **PREGNANCY**
  - Manufacturer advises avoid unless essential—limited information available.

### NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (November 2016) that dequalinium chloride (*Fluomizin®*) is accepted for restricted use within NHS Scotland for treatment of bacterial vaginosis in patients for whom the initial treatment is not effective or well tolerated.

#### All Wales Medicines Strategy Group (AWMSG) Decisions

The All Wales Medicines Strategy Group has advised (November 2016) that dequalinium chloride (*Fluomizin®*) is recommended as an option for restricted use within NHS Wales for the treatment of bacterial vaginosis only after initial treatment is ineffective or not tolerated, as an alternative option to clindamycin vaginal cream.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Fluomizin (KoRa Healthcare)
  - Dequalinium chloride 10 mg | Fluomizin 10mg vaginal tablets | 6 tablet | POM | £6.95

6.1b Vaginal and vulval fungal infections

Other drugs used for Vaginal and vulval fungal infections
Fluconazole, p. 562. Itraconazole, p. 564

ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

Clotrimazole

● INDICATIONS AND DOSE
Superficial sites of infection in vaginal and vulval candidiasis (dose for 1% or 2% cream)
▷ BY VAGINA USING CREAM
▷ Adult: Apply 2–3 times a day, to be applied to anogenital area
Vaginal candidiasis (dose for 10% intravaginal cream)
▷ BY VAGINA USING VAGINAL CREAM
▷ Adult: 5 g for 1 dose, one applicatorful to be inserted into the vagina at night, dose can be repeated once if necessary
Vaginal candidiasis
▷ BY VAGINA USING VAGINAL CREAM
▷ Adult: 200 mg for 3 nights, course can be repeated once if necessary, alternatively 100 mg for 6 nights, course can be repeated once if necessary, alternatively 500 mg for 1 night, dose can be repeated once if necessary
Recurrent vulvovaginal candidiasis
▷ BY VAGINA USING VAGINAL CREAM
▷ Adult: 500 mg every week for 6 months, dose to be administered following topical imidazole for 10–14 days

● INTERACTIONS → Appendix 1: antifungals, imidazole

● SIDE-EFFECTS Local irritation

● CONCEPTION AND CONTRACEPTION

CONCEPTION AND CONTRACEPTION
Cream and pessaries may damage latex condoms and diaphragms.

PREGNANCY
Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection.

● MEDICINAL FORMS

CONCEPTION AND CONTRACEPTION

There can be variation in the licensing of different medicines containing the same drug.

Pessary
EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates
Clotrimazole (Non-proprietary)
Clotrimazole 500 mg
3 pessaries | £3.75 DT price = £2.88
782 Vaginal and vulval conditions

Fenticonazole nitrate

- **INDICATIONS AND DOSE**
  - **Vaginal and vulval candidiasis**
    - **BY VAGINA USING CAPSULES**
    - Adult: 200 mg daily for 3 days, alternatively 600 mg daily for 1 dose, to be inserted at night
    - **BY VAGINA USING CREAM**
    - Adult: 1 applicatorful twice daily for 3 days

- **DOSE EQUIVALENCE AND CONVERSION**
  - With topical use
  - 1 applicatorful delivers a 5 g dose of fenticonazole 2%.

- **SIDE-EFFECTS**
  - Local irritation

- **CONCEPTION AND CONTRACEPTION**
  - Intravaginal cream and vaginal capsules damage latex condoms and diaphragms.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Cream**
    - **EXCIPIENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol, wool fat and related substances including lanolin
    - **Gyno-Daktarin®** (Janssen-Cilag Ltd)
      - Fenticonazole nitrate 20 mg per 1 gram
      - Gyno-Daktarin® 2% vaginal cream 30 gram
      - **Price:** £3.74

  - **Capsule**
    - **EXCIPIENTS:** May contain Hydroxybenzoates (parabens)
    - **Gyno-Daktarin®** (Janssen-Cilag Ltd)
      - Fenticonazole nitrate 200 mg
      - Gyno-Daktarin® 2% vaginal capsules 3 capsule
      - **Price:** £2.42
    - **Fenticonazole nitrate 600 mg**
      - Gyno-Daktarin® 2% vaginal capsules 1 capsule
      - **Price:** £2.62

Ketoconazole

- **INDICATIONS AND DOSE**
  - **Vaginal and vulval candidiasis**
    - **BY VAGINA USING CREAM**
    - Adult: Apply 1–2 times a day, to be applied to the anogenital area

- **SIDE-EFFECTS**
  - Occasional local irritation

- **CONCEPTION AND CONTRACEPTION**
  - Effects on latex condoms and diaphragms not yet known.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Cream**
    - **EXCIPIENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol, wool fat and related substances including lanolin
    - **Nizoral®** (Janssen-Cilag Ltd)
      - Ketoconazole 20 mg per 1 gram
      - Nizoral® 2% cream 30 gram
      - **Price:** £4.24

Miconazole

- **INDICATIONS AND DOSE**
  - **Vaginal and vulval candidiasis**
    - **BY VAGINA USING CAPSULES**
      - Child: 1 capsule daily, ovule to be inserted at night as a single dose, dose can be repeated once if necessary
      - Adult: 1 capsule daily, ovule to be inserted at night as a single dose, dose can be repeated once if necessary
    - **BY VAGINA USING CREAM**
      - Adult: Apply 1 applicatorful daily for 10 to 14 days, alternatively apply 1 applicatorful twice daily for 7 days, course can be repeated once if necessary

- **SIDE-EFFECTS**
  - Common or very common
    - Nausea, rash, vomiting
  - Frequency not known
    - Occasional local irritation
  - **CONCEPTION AND CONTRACEPTION**
    - **Gyno-Daktarin®**
      - Damages latex condoms and diaphragms.
  - **PREGNANCY**
    - Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection.
  - **BREAST FEEDING**
    - Manufacturer advises caution—no information available.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Capsule**
    - **EXCIPIENTS:** May contain Hydroxybenzoates (parabens)
    - **Gyno-Daktarin®** (Janssen-Cilag Ltd)
      - Miconazole nitrate 12 gram
      - Gyno-Daktarin® 1200 mg vaginal capsules 1 capsule
      - **Price:** £2.94
    - **Cream**
      - **EXCIPIENTS:** May contain Butylated hydroxyanisole
      - **Gyno-Daktarin®** (Janssen-Cilag Ltd)
      - Miconazole nitrate 20 mg per 1 gram
      - Gyno-Daktarin® 2% vaginal cream 78 gram
      - **Price:** £4.33

6.2 Vaginal atrophy

OESTROGENS

Estradiol

- **INDICATIONS AND DOSE**
  - **ESTRING®**
    - Postmenopausal urogenital conditions (not suitable for vasomotor symptoms or osteoporosis prophylaxis)
    - **BY VAGINA**
    - Adult: To be inserted into upper third of vagina and worn continuously; replace after 3 months; max. duration of continuous treatment 2 years

  - **VAGIFEM®**
    - Improve the vaginal epithelium in menopausal atrophic vaginitis
    - **BY VAGINA**
    - Adult: 1 tablet daily for 2 weeks, then reduced to 1 tablet twice weekly

- **CONTRA-INDICATIONS**
  - Active arterial thromboembolic disease (e.g. angina or myocardial infarction) – active thrombophlebitis – Dubin-Johnson syndrome (or monitor closely) – history of breast cancer – history of recurrent venous thromboembolism (unless already on anticoagulant treatment) – oestrogen-dependent cancer – recent arterial thromboembolic disease (e.g. angina or myocardial infarction) – Rotor syndrome (or monitor closely) – thrombophilic disorder – undiagnosed vaginal bleeding – untreated endometrial hyperplasia – venous thromboembolism

- **CAUTIONS**
  - Acute porphyrias p. 969 – diabetes (increased risk of heart disease) – history of breast nodules—closely monitor breast status (risk of breast cancer) – history of endometrial hyperplasia; factors predisposing to thromboembolism – history of fibrocystic disease—closely monitor breast status (risk of breast cancer) – hypophysel tumours – increased risk of gall–bladder disease – interrupt treatment periodically to assess need for continued treatment - migraine (or migraine-like headaches) –...
presence of antiphospholipid antibodies (increased risk of thrombotic events) - prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer - risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) - symptoms of endometriosis may be exacerbated - uterine fibroids may increase in size

CAUTIONS, FURTHER INFORMATION

- **Risk of breast cancer** It is estimated that using all types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

- **Risk of endometrial cancer** The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.

  In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

- **Risk of ovarian cancer** Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

- **Risk of venous thromboembolism** Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

  In **women who have predisposing factors** (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. **Travel** involving prolonged immobility further increases the risk of deep vein thrombosis.

- **Risk of stroke** Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

- **Risk of coronary heart disease** HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

  Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **SIDE-EFFECTS** Abdominal bloating - abdominal cramps - altered blood lipids (may lead to pancreatitis, rashes and chloasma) - breast enlargement - breast tenderness - changes in libido - cholesterol jaundice - contact lenses may irritate - depression - dizzyiness - fluid retention - glucose intolerance - headache - headache (on vigorous exercise) - leg cramps (rule out venous thrombosis) - local irritation - migraine - mood changes - nausea - premenstrual-like syndrome - sodium retention - vaginal candidiasis - vomiting - weight changes

SIDE-EFFECTS, FURTHER INFORMATION

- **Withdrawal bleeding** Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in **regular withdrawal bleeding** towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding; but **irregular bleeding** may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

- **CONCEPTION AND CONTRACEPTION** HRT does **not** provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

VAGIFEM ® No evidence of damage to latex condoms and diaphragms.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Avoid; adverse effects on lactation.

- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

- **MONITORING REQUIREMENTS**

  - History of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer).
  - The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Pessary**

| Vagifem® (Novo Nordisk Ltd) | Estradiol 10 microgram Vagifem®10microgram vaginal tablets | 24 pessary | £16.72 DT price = £16.72 |

**Vaginal delivery system**

| CAUTIONARY AND ADVISORY LABELS | 10 |

| Estrin® (Pfizer Ltd) | Estradiol (as Estradiol hemihydrate) 7.5 microgram per 24 hour Estrin® 7.5micrograms/24hours vaginal delivery system | 1 device | £31.42 |

**Estriol**

- **INDICATIONS AND DOSE**

OVESTIN ®

Improve the vaginal epithelium in menopausal atrophic vaginitis (short-term use)

- **BY VAGINA**

  - Adult: Apply 1 applicatorful daily for 2–3 weeks, then reduced to 1 applicatorful twice weekly, continued →
discontinue every 2–3 months for 4 weeks to assess need for further treatment

**Vaginal surgery for prolapse when there is epithelial atrophy in postmenopausal women (before surgery)**

**BY VAGINA**
- Adult: Apply 1 applicatorful daily for 2 weeks before surgery, resume 2 weeks after surgery

**CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) - active thrombophlebitis - Dubin-Johnson syndrome (or monitor closely) - history of breast cancer - history of recurrent venous thromboembolism (unless already on anticoagulant treatment) - oestrogen-dependent cancer - recent arterial thromboembolic disease (e.g. angina or myocardial infarction) - Rotor syndrome (or monitor closely) - thrombophilic disorder - undiagnosed vaginal bleeding - untreated endometrial hyperplasia - venous thromboembolism

**CAUTIONS** Acute porphyrrias p. 969 - diabetes (increased risk of heart disease) - factors predisposing to thromboembolism - history of breast nodules - closely monitor breast status (risk of breast cancer) - history of endometrial hyperplasia - history of fibrocystic disease - closely monitor breast status (risk of breast cancer) - hypophyseal tumours - increased risk of gall-bladder disease - interrupt treatment periodically to assess need for continued treatment - migraine (or migraine-like headaches) - presence of antiphospholipid antibodies (increased risk of thrombotic events) - prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer - risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) - symptoms of endometriosis may be exacerbated - uterine fibroids may increase in size

**CAUTIONS, FURTHER INFORMATION**
- Risk of breast cancer It is estimated that using all types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. 6 Targeted therapy responsive malignancy

Immune system

1 Immune system disorders and transplantation

Immune response

Inflammatory bowel disease
Azathioprine p. 787, ciclosporin p. 788, mercaptopurine p. 844, and methotrexate p. 844 have a role in the treatment of inflammatory bowel disease.

Folic acid p. 937 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid is usually given weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mercaptopurine), calcineurin inhibitors (ciclosporin or tacrolimus), corticosteroids, or sirolimus. Choice is dependent on the type of organ, time after transplantation, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

Impaired immune responsiveness

Modification of tissue reactions caused by corticosteroids and other immunosuppressants may result in the rapid spread of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised—important: normal immunoglobulin administration should be considered as soon as possible after measles exposure, and varicella—zoster immunoglobulin (VZIG) is recommended for individuals who have significant chickenpox (varicella) exposure. Specialist advice should be sought on the use of live vaccines for those being treated with immunosuppressive drugs.

Antiproliferative immunosuppressants
Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced when allopurinol p. 1021 is given concurrently.

Mycophenolate mofetil is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine.

There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil reduces the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher.

Cyclophosphamide p. 830 is less commonly prescribed as an immunosuppressant.

Corticosteroids and other immunosuppressants
Prednisolone p. 639 is widely used in oncology. It has a marked antitumour effect in acute lymphoblastic leukaemia, Hodgkin’s disease, and the non-Hodgkin lymphomas. It has a role in the palliation of symptomatic end-stage malignant disease when it may enhance appetite and produce a sense of well-being.

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-myelotoxic but markedly nephrotoxic. It has an important role in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart—lung transplantation, and for prophylaxis and treatment of graft—versus—host disease.

Sirolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects, but the incidence of neurotoxicity appears to be greater; cardiomyopathy has also been reported. Disturbance of glucose metabolism also appears to be significant.

Sirolimus is a non—calcineurin inhibiting immunosuppressant licensed for renal transplantation. Basiliximab p. 795 is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppression regimens; its use should be confined to specialist centres.

Belatacept p. 797 is a fusion protein and co-stimulation blocker that prevents T-cell activation; it is licensed for prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein—Barr virus. It is used with interleukin—2 receptor antagonist.
Induction, in combination with corticosteroids and a mycophenolic acid.

Antithymocyte immunoglobulin (rabbit) below is licensed for the prophylaxis of organ rejection in renal and heart allograft recipients and for the treatment of corticosteroid-resistant allograft rejection in renal transplantation. Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

**NICE technology appraisals (TAs)**

Immunosuppressive therapy for renal transplantation in adults (September 2004) NICE TAs5

When selecting immunosuppressive therapy for induction therapy in the prophylaxis of organ rejection following renal transplantation in adults, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects.

Mycophenolate mofetil [mycophenolic acid also available but not licensed for use in children] is recommended as part of an immunosuppressive regimen only if:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; or
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Sirolimus is recommended as a component of immunosuppressive regimen only if intolerance necessitates the withdrawal of a calcineurin inhibitor. These recommendations may not be consistent with the marketing authorisation of some of the products.

www.nice.org.uk/TAs5

When selecting immunosuppressive therapy for renal transplantation in children and adolescents, NICE has recommended that for induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects. Mycophenolate mofetil is recommended as part of an immunosuppressive regimen only if:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; or
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Mycophenolic acid is not recommended as part of an immunosuppressive regimen for renal transplantation in children or adolescents.

Sirolimus [not licensed for use in children] is recommended as a component of immunosuppressive regimen only if intolerance necessitates the withdrawal of a calcineurin inhibitor.

These recommendations may not be consistent with the marketing authorisation of some of the products.

www.nice.org.uk/TAs99

---

**Antithymocyte immunoglobulin (rabbit)**

- **INDICATIONS AND DOSE**
  - Prophylaxis of organ rejection in heart allograft recipients
    - **BY INTRAVENOUS INFUSION**
      - Adult: 1–2.5 mg/kg daily for 3–5 days, to be given over at least 6 hours
  - Prophylaxis of organ rejection in renal allograft recipients
    - **BY INTRAVENOUS INFUSION**
      - Adult: 1–1.5 mg/kg daily for 3–9 days, to be given over at least 6 hours
  - Treatment of corticosteroid-resistant allograft rejection in renal transplantation
    - **BY INTRAVENOUS INFUSION**
      - Adult: 1.5 mg/kg daily for 7–14 days, to be given over at least 6 hours

- **DOSES AT EXTREMS OF BODY-WEIGHT**
  - To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

- **CONTRA-INDICATIONS**
  - Infection

- **SIDE-EFFECTS**
  - Anaphylaxis - cytokine release syndrome - diarrhoea - dysphagia - fever - hypotension - increased susceptibility to infection - increased susceptibility to malignancy - infusion-related reactions - lymphopenia - myalgia - nausea - neutropenia - pruritus - rash - serum sickness - shivering - thrombocytopenia - vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Tolerability is increased by pretreatment with an antipyretic drug such as paracetamol may also be beneficial.

- **PREGNANCY**
  - Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS**
  - Monitor blood count.

- **DIRECTIONS FOR ADMINISTRATION**
  - For **continuous intravenous infusion** (Thymoglobuline®) in Glucose 5% or Sodium chloride 0.9%; reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with infusion fluid to a total volume of 50–500 mL (usually 50 mL/vial); begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); not to be given with unfractionated heparin and hydrocortisone in glucose infusion—precipitation reported.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Solution for infusion**
  - **Antithymocyte immunoglobulin (rabbit) (Non-proprietary)**
    - **Antithymocyte immunoglobulin (rabbit) 20 mg per 1 ml** Grafalon
      - 100mg/5ml concentrate for solution for infusion vials | 1 vial [POM] no price available

- **Powder and solvent for solution for infusion**
  - **Thymoglobuline (Sanofi)**
    - **Antithymocyte immunoglobulin (rabbit) 25 mg** Thymoglobuline
      - 25mg powder and solvent for solution for infusion vials | 1 vial [POM] £158.77 (Hospital only)

---

Other drugs used for Immune system disorders and transplantation

Chloroquine, p. 582·Ereverolimus, p. 900·Hydroxychloroquine sulfate, p. 1001·Rituximab, p. 820

---

**Immune system and malignant disease**
Azathioprine

- **DRUG ACTION** Azathioprine is metabolised to mercaptopurine.

- **INDICATIONS AND DOSE**
  - **Severe acute Crohn’s disease | Maintenance of remission of Crohn’s disease | Maintenance of remission of acute ulcerative colitis**
    - **BY MOUTH**
    - **Adult:** 2–2.5 mg/kg daily, some patients may respond to lower doses
  - **Rheumatoid arthritis that has not responded to other disease-modifying drugs | Severe systemic lupus erythematosus and other connective tissue disorders | Polymyositis in cases of corticosteroid resistance**
    - **BY MOUTH**
    - **Adult:** Initially up to 2.5 mg/kg daily in divided doses, adjusted according to response, rarely more than 3 mg/kg daily; maintenance 1–3 mg/kg daily, consider withdrawal if no improvement within 3 months
  - **Autoimmune conditions**
    - **BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - **Adult:** 1–3 mg/kg daily, adjusted according to response, consider withdrawal if no improvement within 3 months, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion
  - **Suppression of transplant rejection**
    - **BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - **Adult:** 1–2.5 mg/kg daily, adjusted according to response, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion
  - **Severe refractory eczema, normal or high TPMT activity**
    - **BY MOUTH**
    - **Adult:** 1–3 mg/kg daily
  - **Severe refractory eczema, intermediate TPMT activity**
    - **BY MOUTH**
    - **Adult:** 0.5–1.5 mg/kg daily
  - **Generalised myasthenia gravis**
    - **BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - **Adult:** Initially 0.5–1 mg/kg daily, then increased to 2–2.5 mg/kg daily, dose is increased over 3–4 weeks, azathioprine is usually started at the same time as the corticosteroid and allows a lower maintenance dose of the corticosteroid to be used, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  - Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

- **UNLICENSED USE** Azathioprine doses given in BNF for suppression of transplant rejection and autoimmune conditions may differ from those in product literature. Use for severe refractory eczema is unlicensed.

- **CONTRA-INDICATIONS**
  - When used for severe refractory eczema: absent thiopurine methyltransferase (TPMT) activity | very low thiopurine methyltransferase (TPMT) activity
  - **CAUTIONS** Reduce dose in elderly | reduced thiopurine methyltransferase activity

- **INTERACTIONS** → Appendix 1: azathioprine

- **SIDE-EFFECTS**
  - **Rare** Hepatic veno-occlusive disease | lymphoma | pancreatitis | pneumonitis | red cell aplasia
  - **Frequency not known** Arthralgia | cholestatic jaundice | colitis in patients also receiving corticosteroids | diarrhoea | dizziness | dose-related bone marrow suppression | fever | hair loss | herpes zoster infection | hypersensitivity reactions | hypotension | increased susceptibility to infections in patients also receiving corticosteroids | interstitial nephritis | liver impairment | malaise | myalgia | neutropenia | rash | rigors | thrombocytopenia | vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **Red cell aplasia** Cases of pure red cell aplasia have been reported with azathioprine; dose reduction or discontinuation should be considered under specialist supervision.
  - **Neutropenia and thrombocytopenia** Usually resolved by reducing the dose.
  - **Hypersensitivity reactions** Hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and interstitial nephritis) call for immediate withdrawal.
  - **Nausea, vomiting and diarrhea** Nausea, vomiting and diarrhoea may occur, usually starting early during the course of treatment, and in rheumatoid arthritis it may be appropriate to withdraw the drug.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in hypersensitivity to mercaptopurine.

- **PREGNANCY** Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in animal studies. The use of azathioprine during pregnancy needs to be supervised in specialist units. Treatment should not generally be initiated during pregnancy.

- **BREAST FEEDING** Present in milk in low concentration. No evidence of harm in small studies—use if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Reduce dose. Monitor liver function.

- **RENAL IMPAIRMENT** Reduce dose.

- **PRE-TREATMENT SCREENING** Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

- **MONITORING REQUIREMENTS**
  - Monitor for toxicity throughout treatment.
  - Monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.
  - Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment.
Immune system and malignant disease

DIRECTIONS FOR ADMINISTRATION

With intravenous use  For intravenous injection, give over at least 1 minute (followed by 50 mL sodium chloride intravenous infusion). For intravenous infusion (Imuran®), give intermittently in glucose 5% or sodium chloride 0.9%. Reconstitute 50 mg with 5–15 mL water for injections; dilute requisite dose to a volume of 20–200 mL with infusion fluid. Intravenous injection is alkaline and very irritant, intravenous route should therefore be used only if oral route not feasible.

PATIENT AND CARER ADVICE
Bone marrow suppression  Patients and their carers should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

IMMUNOSUPPRESSANTS  CALCINEURIN INHIBITORS AND RELATED DRUGS

Ciclosporin  (Cyclosporin)

DRUG ACTION  Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

INDICATIONS AND DOSE

Severe acute ulcerative colitis refractory to corticosteroid treatment

BY CONTINUOUS INTRAVENOUS INFUSION
Adult: 2 mg/kg, to be given over 24 hours, dose adjusted according to blood-ciclosporin concentration and response

Severe active rheumatoid arthritis when conventional second-line therapy inappropriate or ineffective (administered on expert advice)

BY MOUTH
Adult: Initially 2.5 mg/kg daily in 2 divided doses, increased if necessary up to 4 mg/kg daily after 6 weeks, if dose increases are necessary they should be made gradually, discontinue if response insufficient after 3 months, dose adjusted according to response for maintenance and treatment reviewed after 6 months (continue only if benefits outweigh risks)

Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

BY MOUTH
Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usual maximum duration of 8 weeks but may be used for longer under specialist supervision

Short-term treatment of very severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

BY MOUTH
Adult: 2.5 mg/kg twice daily usual maximum duration of 8 weeks but may be used for longer under specialist supervision

Severe psoriasis where conventional therapy ineffective or inappropriate (administered on expert advice)

BY MOUTH
Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily), increased gradually to maximum if no improvement within 1 month, initial dose of 2.5 mg/kg twice daily justified if condition requires rapid improvement; discontinue if inadequate response after 3 months at the optimum dose; maximum duration of treatment usually 1 year unless other treatments cannot be used

Organ transplantation (used alone)

BY MOUTH
Adult: 10–15 mg/kg, to be administered 4–12 hours before transplantation, followed by 10–15 mg/kg daily for 1–2 weeks postoperatively, then maintenance 2–6 mg/kg daily, reduce dose gradually to maintenance. Dose should be adjusted according to blood-ciclosporin concentration and renal function; dose is lower if given concomitantly with other immunosuppressant therapy (e.g. corticosteroids); if necessary one-third corresponding oral dose can be given by intravenous infusion over 2–6 hours

Bone-marrow transplantation | Prevention and treatment of graft-versus-host disease

INITIALLY BY INTRAVENOUS INFUSION
Adult: 3–5 mg/kg daily, to be administered over 2–6 hours from day before transplantation to 2 weeks postoperatively, alternatively (by mouth) initially 12.5–15 mg/kg daily, then (by mouth) 12.5 mg/kg daily for 3–6 months and then tailed off (may take up to a year after transplantation)

Nephrotic syndrome

BY MOUTH
Adult: 5 mg/kg daily in 2 divided doses, for maintenance reduce to lowest effective dose according to proteinuria and serum creatinine measurements; discontinue after 3 months if no improvement in glomerulonephritis or glomerulosclerosis (after 6 months in membranous glomerulonephritis)

DOSE ADJUSTMENTS DUE TO INTERACTIONS

With oral use  Manufacturer advises increase dose by 50% or switch to intravenous administration with concurrent use of octreotide.

UNLICENSED USE  Not licensed for use in severe acute ulcerative colitis refractory to corticosteroid treatment

IMPORTANT SAFETY INFORMATION
MHRA/CHM ADVICE: CICLOSPORIN MUST BE PRESCRIBED AND DISPENSED BY BRAND NAME (DECEMBER 2009)

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration.

CONTRA-INDICATIONS  Abnormal baseline renal function (in non-transplant indications) - malignancy (in non-transplant indications) - uncontrolled hypertension (in non-transplant indications) - uncontrolled infections (in non-transplant indications)
CAUTIONS  Elderly—monitor renal function - hyperuricaemia - in atopic dermatitis, active herpes simplex infections—allow infection to clear before starting (if they occur during treatment withdraw if severe) - in atopic dermatitis, Staphylococcus aureus skin infections— not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative) - in psoriasis treat, patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option) - in uveitis, Behcet’s syndrome (monitor neurological status) - lymphoproliferative disorders (discontinue treatment) - malignancy

CAUTIONS, FURTHER INFORMATION

Malignancy
In psoriasis, exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis) and treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option); discontinue if lymphoproliferative disorder develops.

INTERACTIONS  ▶ Appendix 1: ciclosporin

SIDE-EFFECTS

Common or very common
Abdominal pain  ·  acne  ·  anorexia  ·  convulsion  ·  diarrhoea  ·  fatigue  ·  flushing  ·  gingival hyperplasia  ·  headache  ·  hepatic dysfunction  ·  hirsutism  ·  hyperglycaemia  ·  hyperkalaemia  ·  hyperlipidaemia  ·  hypertension  ·  hypertrichosis  ·  hyperuricaemia  ·  hyperglycaemia  ·  hypomagnesaemia  ·  leucopenia  ·  muscle cramps  ·  myalgia  ·  nausea  ·  paraesthesia  ·  peptic ulcer  ·  pyrexia  ·  renal dysfunction (renal structural changes on long-term administration)  ·  tremor  ·  vomiting

Uncommon
Anaemia  ·  oedema  ·  signs of encephalopathy  ·  thrombocytopenia  ·  weight gain

Rare
Gynaecomastia  ·  haemolytic uraemic syndrome  ·  menstrual disturbances  ·  micro-angiopathic haemolytic anaemia  ·  motor polyneuropathy  ·  muscle weakness  ·  myopathy  ·  pancreatitis

Very rare
Visual disturbances secondary to benign intracranial hypertension

Frequency not known
With intravenous use  ·  Anaphylaxis
With systemic use  ·  Migraine  ·  pain in lower extremities

PREGNANCY
Crosses placenta; manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.

NURSING AND MIDWIFE

Breast feeding
Manufacturer advises avoid—present in milk.

HEPATIC IMPAIRMENT
Extensively metabolised by the liver—manufacturer advises consider dose adjustment based on bilirubin and liver enzyme levels.

RENAL IMPAIRMENT
In non-transplant indications, manufacturer advises establishing baseline renal function before initiation of treatment; if baseline function is impaired in non-transplant indications, except nephrotic syndrome—avoid. In nephrotic syndrome, manufacturer advises initial dose should not exceed 2.5 mg/kg daily in patients with baseline renal impairment. During treatment for non-transplant indications, manufacturer recommends if eGFR decreases by more than 25% below baseline on more than one measurement, reduce dose by 25–50%. If the eGFR decrease from baseline exceeds 35%, further dose reduction should be considered (even if within normal range); discontinue if reduction not successful within 1 month.

MONITORING REQUIREMENTS
Monitor whole blood ciclosporin concentration (trough level dependent on indication—consult local treatment protocol for details).

Dermatological and physical examination, including blood pressure and renal function measurements required at least twice before starting treatment for psoriasis or atopic dermatitis.

Monitor liver function.

Monitor serum potassium, especially in renal dysfunction (risk of hyperkalaemia).

Monitor serum magnesium.

Measure blood lipids before treatment and after the first month of treatment.

In psoriasis and atopic dermatitis monitor serum creatinine every 2 weeks for first 3 months then every month.

Investigate lymphadenopathy that persists despite improvement in atopic dermatitis.

Monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate dose reduction in transplant patients (exclude rejection if kidney transplant) or discontinuation in non-transplant patients.

Monitor blood pressure—discontinue if hypertension develops that cannot be controlled by antihypertensives.

In long-term management of nephrotic syndrome, perform renal biopsies at yearly intervals.

In rheumatoid arthritis measure serum creatinine at least twice before treatment. During treatment, monitor serum creatinine every 2 weeks for first 3 months, then every month for a further 3 months, then every 4–8 weeks depending on the stability of the disease, concomitant medication, and concomitant diseases (or more frequently if dose increased or concomitant NSAIDs introduced or increased).

Monitor hepatic function if concomitant NSAIDs given.

DIRECTIONS FOR ADMINISTRATION

With oral use  Mix solution with orange or apple juice, or other soft drink (to improve taste) immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. Total daily dose should be taken in 2 divided doses.

With intravenous use  For intravenous infusion (Sandimmun ®), give intermittently or continuously in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 50 mg in 20–100 mL; give intermittent infusion over 2–6 hours; not to be used with PVC equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.

PRESCRIBING AND DISPENSING INFORMATION
Brand name prescribing  Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum creatinine, blood pressure, and transplant function (for transplant indications).

Sandimmun ® capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation.

PATIENT AND CARER ADVICE
Patients and carers should be counselled on the administration of different formulations of ciclosporin. Manufacturer advises avoid excessive exposure to UV light, including sunlight. In psoriasis and atopic dermatitis, avoid use of UVB or PUVA.
Sirolimus

**DRUG ACTION** Sirolimus is a non-calcineurin inhibiting immunosuppressant.

**INDICATIONS AND DOSE**

Prophylaxis of organ rejection in kidney allograft recipients

- **BY MOUTH**
  - Adult: Initially 6 mg for 1 dose, to be given after surgery once wound has healed, then 2 mg once daily; to be given in combination with ciclosporin and corticosteroid for 2–3 months (sirolimus doses should be given 4 hours after ciclosporin). Ciclosporin should then be withdrawn over 4–8 weeks (if not possible, sirolimus should be discontinued and an alternate immunosuppressive regimen used), dose to be adjusted according to whole blood-sirolimus trough concentration.

**DOSE EQUIVALENCE AND CONVERSION**

- The 500 microgram tablet is not bioequivalent to the 1 mg and 2 mg tablets. Multiples of 500 microgram tablets should not be used as a substitute for other tablet strengths.

**CAUTIONS** Hyperlipidaemia, increased susceptibility to infection (especially urinary-tract infection), increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light).

**SIDE-EFFECTS**

- Common or very common Abdominal pain • acne • anaemia • arthralgia • ascites • constipation • diarrhoea • epistaxis • haemolytic uraemic syndrome • headache • hypercholesterolaemia • hyperglycaemia • hypertension • hypertriglyceridaemia • hypokalaemia • hypophosphataemia • impaired healing • leucopenia • lymphocoele • nausea • neutropenia • oedema • osteonecrosis • pleural effusion • pneumonitis • proteinuria • pyrexia • rash • stomatitis • tachycardia • thrombocytopenia • thrombotic thrombocytopenic purpura • venous thromboembolism

- Uncommon Nephrotic syndrome • pancreatitis • pancytopenia • pericardial effusion • pulmonary embolism • pulmonary haemorrhage

- Rare Alveolar proteinosis • anaphylactic reactions • angioedema • exfoliative dermatitis • hepatic necrosis • hypersensitivity reactions • hypersensitivity vasculitis • interstitial lung disease • lymphoedema

- Frequency not known Focal segmental glomerulosclerosis • reversible impairment of male fertility

**CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment and for 12 weeks after stopping.

**PREGNANCY** Avoid unless essential—toxicity in animal studies.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** In severe impairment decrease dose by 50% and monitor whole blood-sirolimus trough concentration every 5–7 days until 3 consecutive measurements have shown stable blood-sirolimus concentration. Clearance reduced in mild to moderate impairment. Monitor whole blood-sirolimus level closely and consult local treatment protocol in hepatic impairment.

**MONITORING REQUIREMENTS**

- Monitor whole blood-sirolimus trough concentration (Afro–Caribbean patients may require higher doses).
- Manufacturer advises pre-dose (‘trough’) whole blood-sirolimus concentration (using chromatographic assay) when used with ciclosporin should be 4–12 micrograms/litre (local treatment protocols may differ); after withdrawal of ciclosporin pre-dose whole blood-sirolimus concentration should be 12–20 micrograms/litre (local treatment protocols may differ).
- Close monitoring of whole blood-sirolimus concentration required if concomitant treatment with potent inducers or inhibitors of metabolism and after discontinuing them, or if ciclosporin dose reduced significantly or stopped.
- When changing between oral solution and tablets, measurement of whole blood ‘trough’ sirolimus concentration after 1–2 weeks is recommended.
- Therapeutic drug monitoring assays Sirolimus whole-blood concentration is measured using either high performance
Tacrolimus is a calcineurin inhibitor.

**INDICATIONS AND DOSE**

**ADOPORT®**

*Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation*
- **BY MOUTH**
  - Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

*Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation*
- **BY MOUTH**
  - Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

*Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation*
- **BY MOUTH**
  - Adult: Initially 75 micrograms/kg daily in 2 divided doses

*Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation*
- **BY MOUTH**
  - Adult: Initially 75 micrograms/kg daily in 2 divided doses

**Allograft rejection resistant to conventional immunosuppressive therapy**
- **BY MOUTH**
  - Adult: Seek specialist advice

**ENVARSUS® MODIFIED-RELEASE TABLETS**

*Prophylaxis of graft rejection following liver transplantation, starting within 24 hours of transplantation*
- **BY MOUTH**
  - Adult: Initially 110–130 micrograms/kg once daily, to be taken in the morning

*Prophylaxis of graft rejection following renal transplantation, starting within 24 hours of transplantation*
- **BY MOUTH**
  - Adult: Initially 170 micrograms/kg once daily, to be taken in the morning

**Rejection therapy**
- **BY MOUTH**
  - Adult: Seek specialist advice

**MODIGRAF®**

*Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation*
- **BY MOUTH**
  - Adult: Initially 100–200 micrograms/kg daily in 2 divided doses
Immune system and malignant disease

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation
▶ BY MOUTH
Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation
▶ BY MOUTH
Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ORAL TACROLIMUS PRODUCTS: PRESCRIBE AND DISPENSE BY BRAND NAME ONLY. TO MINIMISE THE RISK OF INADVERTENT SWITCHING BETWEEN PRODUCTS, WHICH HAS BEEN ASSOCIATED WITH REPORTS OF TOXICITY AND GRAFT REJECTION (JUNE 2012)

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- Adoport®, Prograf®, Capexion®, Tacni®, and Vivadex® are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;
- Modgraf® granules are used to prepare an immediate-release oral suspension which is taken twice daily, once in the morning and once in the evening;
- Advagraf® is a prolonged-release capsule that is taken once daily in the morning.

Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist.

Important: Envarsus® is not interchangeable with other oral tacrolimus containing products; the MHRA has advised (June 2012) that oral tacrolimus products should be prescribed and dispensed by brand only.

- CAUTIONS Increased risk of infections.
  lymphoproliferative disorders, malignancies, neurotoxicity, QT-interval prolongation, UV light (avoid excessive exposure to sunlight and sunlamps)
- INTERACTIONS ➔ Appendix 1: tacrolimus
- SIDE-EFFECTS

  - Common or very common Acne, alopecia, anaemia, anorexia, anxiety, arthralgia, ascites, bile-duct abnormalities, bloating, blood disorders, cholestasis, confusion, constipation, depression, diarrhoea, dizziness, dyspepsia, dysphonia, electrolyte disturbances, flatulence, gastro-intestinal inflammation, gastro-intestinal perforation, gastro-intestinal ulceration, haemorrhage, headache, hepatic dysfunction, hyperglycaemia, hyperkalaemia, hypertension, hyperuricaemia, hypokalaemia, impaired hearing, ischaemic events, jaundice, leucopenia, mood changes, muscle cramp, nausea, oedema, pancytopenia, paraesthesia, parenchymal lung disorders, peripheral neuropathy, photophobia, pleural effusion, psychosis, renal failure, renal impairment, renal tubular necrosis, seizures, sleep disturbances, sweating, tachycardia, thrombocytopenia, thromboembolic events, tinnitus, tremor, urinary abnormalities, visual disturbances, vomiting, weight changes

  - Uncommon Anaemia, arrhythmia, cardiac arrest, cardiomyopathy, cataract, cerebrovascular accident, coagulation disorders, coma, dermatitis, dysmenorrhoea, encephalopathy, gastro-intestinal reflux disease, heart failure, hypotonia, hypoglycaemia, influenza-like symptoms, palpitation, pancreatitis, paralysis, paralytic ileus, peritonitis, photosensitivity, respiratory failure, speech disorder

  - Rare Blindness, dehydration, hirsutism, pericardial effusion, posterior reversible encephalopathy syndrome, respiratory distress syndrome, thrombotic thrombocytopenic purpura, toxic epidermal necrolysis

  - Very rare Haemorrhagic cystitis, myasthenia, Stevens-Johnson syndrome

  - Frequency not known Agranulocytosis, haemolytic anaemia, pure red cell aplasia

SIDE-EFFECTS, FURTHER INFORMATION

- Cardiomyopathy Cardiomyopathy has been reported in children. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur.
- ALLERGY AND CROSS-SENSITIVITY Contra-indicated if history of hypersensitivity to macrolides.

- CONCEPTION AND CONTRACEPTION Exclude pregnancy before treatment.
- PREGNANCY Avoid unless potential benefit outweighs risk—crosses the placenta and risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia.

- BREAST FEEDING Avoid—present in breast milk (following systemic administration).

- HEPATIC IMPAIRMENT Dose reduction may be necessary in severe impairment.

- MONITORING REQUIREMENTS

  - After initial dosing, and for maintenance treatment, tacrolimus doses should be adjusted according to whole-blood concentration. Monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details.
  - Monitor blood pressure, ECG (for hypertrophic changes—risk of cardiomyopathy), fasting blood-glucose concentration, haematological and neurological (including visual) and coagulation parameters, electrolytes, hepatic and renal function.

- DIRECTIONS FOR ADMINISTRATION

  - For intravenous infusion (Prograf®); give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute concentrate in infusion fluid to a final concentration of 4–100 micrograms/mL; give over 24 hours. Tacrolimus is incompatible with PVC.

- PATIENT AND CARER ADVICE

  - Avoid excessive exposure to UV light including sunlight.
  - Driving and skilled tasks

    - May affect performance of skilled tasks (e.g. driving).

- NATIONAL FUNDING/ACCESS DECISIONS

  - Scottish Medicines Consortium (SMC) Decisions

    - With oral use The Scottish Medicines Consortium has advised (November 2010) that tacrolimus granules for oral suspension (Modgraf®) are accepted for restricted use within NHS Scotland in patients for whom tacrolimus is an appropriate choice of immunosuppressive therapy and where small changes (less than 500 micrograms) in dosing increments are required (such as, in paediatric patients) or in seriously ill patients who are unable to swallow tacrolimus capsules.

- MEDICINAL FORMS

  - There can be variation in the licensing of different medicines containing the same drug.

  - Modified-release tablet

    - Envarsus (Chiesi Ltd)
    - Tacrolimus (as Tacrolimus monohydrate)
    - 750 microgram Envarsus 750 microgram modified-release tablets | 30 tablet | £44.33
    - Tacrolimus (as Tacrolimus monohydrate) 1 mg Envarsus 1 mg modified-release tablets | 30 tablet | £59.10
    - Tacrolimus (as Tacrolimus monohydrate) 4 mg Envarsus 4 mg modified-release tablets | 30 tablet | £236.40
Canakinumab

**Drug action** Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding.

**Indications and dose**

Acute gout in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine, or who are intolerant of them

- **By subcutaneous injection**
  - **Adult:** 150 mg for 1 dose, dose may be repeated at least 12 weeks after initial response if symptoms recur, patients who do not respond to initial dose should not be retreated.

**Treatment of cryopyrin-associated periodic syndromes, including severe forms of familial cold auto-inflammatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory syndrome (also known as chronic infantile neurological cutaneous and articular syndrome)**

- **By subcutaneous injection**
- **Adult:** (consult product literature)

**Contra-indications**

- Active infection - leucopenia - neutropenia

**Cautions**

- History of recurrent infection - latent and active tuberculosis - predisposition to infection

**Cautions, further information**

- Vaccinations Patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information.

**Interactions**

- Appendix 1: monoclonal antibodies

**Side-effects**

- Common or very common Back pain - increased susceptibility to infection (including serious infection) - injection-site reactions - malaise - neutropenia - vertigo

- Uncommon Gastro-oesophageal reflux

- Frequency not known Malignancy - vomiting

**Conception and contraception**

- Effective contraception required during treatment and for up to 3 months after last dose.

**Pregnancy**

- Manufacturer advises avoid unless potential benefit outweighs risk.

**Breast feeding**

- Consider if benefit outweighs risk—not known if present in human milk.

**Hepatic impairment**

- No information available.

**Renal impairment**

- Limited information available but manufacturer advises no dose adjustment required.

**Pre-treatment screening**

- Patients should be evaluated for latent and active tuberculosis before starting treatment.

**Monitoring requirements**

- Monitor full blood count including neutrophil count for latent and active tuberculosis before starting treatment, and periodically thereafter.
- Monitor for signs and symptoms of tuberculosis during and after treatment.

**Medicinal forms**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Ilaris (Novartis Pharmaceuticals UK Ltd)**
  - Canakinumab 150 mg Ilaris 150mg powder for solution for injection vials | 1 vial (Pom) £9,927.80
**Basiliximab**

- **Drug Action** Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation.

- **Indications and Dose** Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with cyclosporin and corticosteroid-containing immunosuppression regimens (specialist use only)
  - By intravenous injection, or by intravenous infusion
  - Adult: Initially 20 mg, administered within 2 hours before transplant surgery, followed by 20 mg after 4 days, dose to be administered after surgery, withhold second dose if severe hypersensitivity or graft loss occurs.

- **Caution** Off-label use in cardiac transplantation—increased risk of serious cardiac side-effects.

- **Interactions** → Appendix 1: monoclonal antibodies.

- **Side-effects** Atrial flutter · cardiac arrest · cytokine release syndrome · palpitations · severe hypersensitivity reactions.

- **Conception and contraception** Adequate contraception must be used during treatment and for 16 weeks after last dose.

- **Pregnancy** Manufacturer advises avoid—no information available.

- **Breast feeding** Manufacturer advises avoid—no information available.

- **Directions for administration** For intravenous infusion (Simulect®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute 10 mg with 2.5 mL water for injections then dilute to at least 25 mL with infusion fluid; reconstitute 20 mg with 5 mL water for injections then dilute to at least 50 mL with infusion fluid; give over 20-30 minutes.

- **Medicinal forms** There can be variation in the licensing of different medicines containing the same drug.

- **Powder and solvent for solution for injection**
  - Simulect (Novartis Pharmaceuticals UK Ltd)
    - Basiliximab 10 mg Simulect 10mg powder and solvent for solution for injection vials | 1 vial (£24.92) (Hospital only)
    - Basiliximab 20 mg Simulect 20mg powder and solvent for solution for injection vials | 1 vial (£42.38) (Hospital only)

---

**Belimumab**

24-Oct-2016

- **Indications and Dose** Adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy
  - By intravenous infusion
  - Adult: 10 mg/kg every 2 weeks for 3 doses, then 10 mg/kg every 4 weeks, review treatment if no response within 6 months.

- **Caution** Do not initiate until active infections controlled · history or development of malignancy · predisposition to infection.

- **Interactions** → Appendix 1: monoclonal antibodies.

- **Side-effects** Common or very common: Infusion-related reactions · Frequency not known: Depressions · diarrhoea · hypersensitivity reactions · infections · insomnia · leucopenia · migraine · nausea · pain in extremities · pyrexia · vomiting.

**Side-effects, further information** Infusion-related side-effects are reported commonly, including severe or life-threatening hypersensitivity and infusion reactions. Premedication with an antihistamine, with or without an antipyretic may be considered.

- **Conception and contraception** Manufacturer advises adequate contraception during treatment and for at least 4 months after last dose.

- **Pregnancy** Avoid unless essential.

- **Breast feeding** Avoid—present in milk in animal studies.

- **Renal impairment** Caution in severe impairment—no information available.

- **Monitoring requirements** Delay in the onset of acute hypersensitivity reactions has been observed; patients should remain under clinical supervision for several hours following at least the first 2 infusions.

- **Directions for administration** For intravenous infusion (Benlysta®), give intermittently in Sodium chloride 0.9%; reconstitute with water for injections (120 mg in 1.5 mL, 400 mg in 4.8 mL) to produce a solution containing 80 mg/mL; gently swirl vial for 60 seconds, then allow to stand; swirl vial (without shaking) for 60 seconds every 5 minutes until dissolved; dilute requisite dose with infusion fluid to a final volume of 250 mL and give over 1 hour.

- **National funding/access decisions**

**NICE technology appraisals (TAs)**

- Belimumab for treating active autoantibody-positive systemic lupus erythematosus (June 2016) NICE TA397

  Belimumab is recommended as an add-on treatment option in adults with active autoantibody-positive systemic lupus erythematosus, only if all of the following criteria are met:
  - There is evidence for serological disease activity (defined as positive anti-double-stranded DNA and low complement) and a Safety of Estrogen in Lupus National Assessment – Systemic Lupus Erythematosus Disease Activity Index (SELENA-SLEDAI) score of greater than or equal to 10 despite standard therapy;
  - Treatment with belimumab is continued after 24 weeks only if the SELENA-SLEDAI score has improved by 4 points or more;
  - The manufacturer provides belimumab with the discount agreed in the patient access scheme; and
  - Under the conditions specified in the NICE managed access agreement documentation.

Patients whose treatment was started before this guidance was published should continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA397

**Scottish medicines consortium (SMC) decisions**

The Scottish Medicines Consortium (SMC) has advised (May 2017) that belimumab (Benlysta®) is accepted for restricted use within NHS Scotland as adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy, and who have evidence of serological disease activity and a Safety of Estrogens in Lupus Erythematosus National Assessment-Systemic Lupus Erythematosus Disease Activity Index (SELENA-SLEDAI) score of 10 or greater. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.
Immune system disorders and transplantation

796

Mycophenolate mofetil

**INDICATIONS AND DOSE**

**Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and ciclosporin) (under expert supervision)**

- **By mouth**
  - Adult: 1 g twice daily, to be started within 72 hours of transplantation
  - By intravenous infusion
  - Adult: 1 g twice daily for maximum 14 days, then transfer to oral therapy, to be started within 24 hours of transplantation

**Prophylaxis of acute rejection in cardiac transplantation (in combination with ciclosporin and corticosteroids) (under expert supervision)**

- **By mouth**
  - Adult: 1.5 g twice daily, to be started within 5 days of transplantation

**Prophylaxis of acute rejection in hepatic transplantation (in combination with ciclosporin and corticosteroids) (under expert supervision)**

- **Initially by intravenous infusion**
  - Adult: 1 g twice daily for 4 days, up to a maximum of 14 days, to be started within 24 hours of transplantation, then (by mouth) 1.5 g twice daily; the dose route should be changed as soon as is tolerated

**MYFORTIC®**

Renal transplantation

- **By mouth**
  - Adult: 720 mg twice daily, to be started within 72 hours of transplantation

**DOSE EQUIVALENCE AND CONVERSION**

- For Myfortic®: Mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences.

**CAUTIONS**

Active serious gastrointestinal disease (risk of haemorrhage, ulceration and perforation) - children (higher incidence of side-effects may call for temporary reduction of dose or interruption) - delayed graft function - elderly (increased risk of infection, gastro-intestinal haemorrhage and pulmonary oedema) - increased susceptibility to skin cancer (avoid exposure to strong sunlight) - risk of hypogammaglobulinaemia or bronchiectasis when used in combination with other immunosuppressants

**CAUTIONS, FURTHER INFORMATION**

- Hypogammaglobulinaemia or bronchiectasis
  - Measure serum immunoglobulin levels if recurrent infections develop, and consider bronchiectasis or pulmonary fibrosis if persistent respiratory symptoms such as cough and dyspnoea develop.

**INTERACTIONS** → Appendix 1: mycophenolate

**SIDE-EFFECTS**

- Frequency not known Interstitial lung disease - intestinal villous atrophy - progressive multifocal leucoencephalopathy - pulmonary fibrosis

**SIDE-EFFECTS, FURTHER INFORMATION**

Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or discontinuation should be considered under specialist supervision.

**CONCEPTION AND CONTRACEPTION**

Pregnancy prevention In females of child-bearing potential, exclude pregnancy immediately before and during treatment.

- Women should use 2 methods of effective contraception during treatment, and for 6 weeks after discontinuation. Men should use condoms during treatment and for at least 90 days after discontinuation of treatment; female partners of male patients should also use effective contraception during treatment and for 90 days after discontinuation.

**MYFORTIC®**

Manufacturer advises that men should use condoms during treatment and for 13 weeks after last dose.

**PREGNANCY**

Avoid unless no suitable alternative—congenital malformations and spontaneous abortions reported.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**RENAI IMPAIRMENT**

No data available in cardiac or hepatic transplant patients with renal impairment.

**MONITORING REQUIREMENTS**

Monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops).

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion (CellCept®), give intermittently in Glucose 5%; reconstitute each 500 mg vial with 14 mL glucose 5% and dilute the contents of 2 vials in 140 mL infusion fluid; give over 2 hours.

**PATIENT AND CARER ADVICE**

Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Gastro-resistant tablet**

CAUTIONARY AND ADVISORY LABELS 25

- Myfortic (Novartis Pharmaceuticals UK Ltd) Mycophenolic acid (as Mycophenolate sodium) 180 mg Myfortic 180 mg gastro-resistant tablets | 120 tablet | £96.72
  - Mycophenolic acid (as Mycophenolate sodium) 360 mg Myfortic 360 mg gastro-resistant tablets | 120 tablet | £193.43

**Tablet**

- Mycophenolate mofetil (Non-proprietary)
  - Mycophenolate mofetil 500 mg Mycophenolate mofetil 500 mg tablets | 50 tablet | £42.50 DT price | £6.17

---

Medicines, vaccines and treatments can change. Always check the product information leaflet (PIL) or consult with a healthcare professional before using any medicine. Information from: www.medicinescomplete.com

Downloaded from www.medicalbr.com
Belatacept

INDICATIONS AND DOSE
Prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein-Barr virus

BY INTRAVENOUS INFUSION

Adult: (consult product literature)

CAUTIONS
Increased risk of acute graft rejection—with tapering of corticosteroid, particularly in patients with high immunologic risk—increased risk of infection—latent and active tuberculosis—risk factors for post-transplant lymphoproliferative disorder

INTERACTIONS → Appendix 1: belatacept

SIDE-EFFECTS

Common or very common Anaemia·constipation·cough·dehydration·diarrhoea·headache·hypertension·hypophosphataemia·infection·leucopenia·malignancy·nausea·peripheral oedema·pyrexia·vomiting

Uncommon Infusion related reactions—progressive multifocal leucoencephalopathy

SIDE-EFFECTS, FURTHER INFORMATION
Side effects are reported when used in combination with basiliximab, mycophenolate motefil and corticosteroids.

CONCEPTION AND CONTRACEPTION

Adequate contraception must be used during treatment and for up to 8 weeks after last dose.

PREGNANCY
Use only if essential.

BREAST FEEDING
Avoid—no information available.

PRE-TREATMENT SCREENING
Patients should be evaluated for latent and active tuberculosis before starting treatment.

MONITORING REQUIREMENTS
Patients should be monitored for signs and symptoms of tuberculosis during and after treatment.

PATIENT AND CARER ADVICE

Patients should be advised to avoid excessive exposure to UV light including sunlight.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Belatacept 250 mg

Belatacept 250 mg Nulojix 250 mg powder for concentrate for solution for infusion vials | 1 vial POM £354.52 (Hospital only) | 2 vial POM £709.04 (Hospital only)

1.1 Multiple sclerosis

Description of condition

Multiple sclerosis is a chronic, immune-mediated, demyelinating inflammatory condition of the central nervous system, which affects the brain, optic nerves and spinal cord, and leads to progressive severe disability.

Relapsing-remitting multiple sclerosis is the most common pattern of the disease. It is characterised by periods of exacerbation of symptoms (relapses) followed by unpredictable periods of stability (remission). The severity and frequency of relapses varies greatly between patients, but on average occur once or twice per year. This clinical pattern often develops into secondary-progressive multiple sclerosis, with progressive disability unrelated to relapses. Most patients develop secondary progressive disease 6–10 years after onset.

Primary-progressive multiple sclerosis follows a gradual course, with the development of symptoms that worsen over time, without relapses and remissions.

Progressive-relapsing multiple sclerosis follows a course of steadily worsening neurological function from onset, in addition to acute relapses.

Disease activity in relapsing-remitting multiple sclerosis

Active disease is defined as at least two clinically significant relapses occurring within the last 2 years. Highly active disease is characterised by an unchanged/increased relapse rate or by ongoing severe relapses compared with the previous year, despite treatment with interferon beta p. 799. Rapidly-evolving severe relapsing–remitting multiple sclerosis is defined by two or more disabling relapses in 1 year, and one or more gadolinium–enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

Aims of treatment

There is no cure for multiple sclerosis. The overall aims of treatment are to modify the course of the disease and manage symptoms, in order to improve quality of life. Treatment is aimed at reducing the frequency and duration of relapses and at preventing or slowing disability.

Drug treatment

Shared decision-making between the patient and their clinicians is particularly important in the treatment of multiple sclerosis, due to the unpredictability of the condition and the lack of evidence of long-term benefit of treatments. A discussion about treatment options, disease activity, risk, and benefit should take place to ensure that treatment choices are right for the patient and their circumstances. The choice of drug also depends on the patient’s disability status, individual tolerance, disease severity and disease activity (see Disease activity in relapsing-remitting multiple sclerosis above). ECG Treatment should be initiated as early as possible, under the supervision of a specialist.
Note: NHS England (May 2014) has provided guidance on the use of interferon beta, glatiramer acetate p. 801, fingolimod p. 802 and natalizumab p. 805 for the treatment of multiple sclerosis in England, see Useful resources below. This Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing these treatment options. See also National funding/access decisions, under individual monographs for teriflunomide p. 806, dimethyl fumarate p. 801 and alemtuzumab p. 804.

Low levels of vitamin D are believed to be a risk factor for developing multiple sclerosis. Patients with diagnosed multiple sclerosis are usually given regular vitamin D after assessment of their serum levels of vitamin D, but there is insufficient evidence to support its use as a treatment for multiple sclerosis. Patients should not be offered vitamin D solely for the purpose of treating multiple sclerosis.

Relapsing-remitting multiple sclerosis

Disease-modifying drugs are the recommended treatment for patients presenting with active relapsing-remitting multiple sclerosis. Interferon beta and glatiramer acetate may be the preferred choice for some patients, due to their established safety profile, and the long term clinical experience associated with their use. Peginterferon beta-1a p. 800 requires less frequent administration and is available as an alternative to the non-pegylated interferon beta therapies.

Teriflunomide and dimethyl fumarate are treatment options for patients with active disease. They may be preferred due to their oral route of administration. There is insufficient evidence for the use of either drug to treat highly active or rapidly-evolving severe relapsing-remitting multiple sclerosis.

More active disease may be treated with natalizumab or alemtuzumab. Natalizumab may be preferred due to the complex safety profile associated with alemtuzumab. Natalizumab is only recommended for the treatment of rapidly-evolving severe relapsing-remitting multiple sclerosis. Although licensed as a treatment option in all patients with active disease, alemtuzumab may be used more frequently in patients for whom other disease-modifying treatments have not been effective, due to the risk of serious side effects associated with its use.

Fingolimod is also taken by the oral route and is the recommended treatment for patients with highly active disease. The NHS England Clinical Commissioning Policy advises that fingolimod is a suitable alternative for patients receiving natalizumab who are at high risk of developing progressive multifocal leuкоencephalopathy (defined as patients previously exposed to the JC virus or who are receiving immunosuppressants or who have been receiving treatment with natalizumab for more than 2 years).

Secondary progressive multiple sclerosis

Currently, only interferon beta 1b is licensed for use in secondary progressive multiple sclerosis. Interferon beta 1b reduces the risk of relapse and of short-term relapse-related disability, but does not prevent the development of permanent physical disability or retard progression once it is established. Therefore its role in secondary progressive disease is limited.

Primary progressive multiple sclerosis

Currently there are no effective disease-modifying treatments licensed for primary progressive multiple sclerosis. Interferon beta [unlicensed indication] has been used, but there is limited evidence to support its use due to the lack of a significant reduction in disability progression.

Progressive-relapsing multiple sclerosis

There are no specific treatment options for this type of multiple sclerosis. None of the currently licensed disease-modifying drugs are recommended in non-relapsing progressive disease.

Management of symptoms

Other than episodes of neurological dysfunction, chronic symptoms (such as fatigue, spasticity, visual problems, and emotional lability) produce much of the disability in multiple sclerosis. Smoking may increase the progression of disability in multiple sclerosis, and cessation should be encouraged.

Relapses

Suspected relapses should be referred to a specialist for diagnosis and treatment. Corticosteroids are recommended for reducing inflammation and accelerating recovery in acute relapses of relapsing-remitting multiple sclerosis. Oral methylprednisolone p. 638 is recommended as the first-line option. Intravenous methylprednisolone should be considered as an alternative if oral methylprednisolone has failed or is not tolerated or if hospitalisation is required.

Fatigue and impaired mobility

Regular exercise may have beneficial effects on mobility and fatigue in patients with multiple sclerosis, and should be encouraged. Cognitive behavioural techniques for fatigue should also be considered in combination with exercise. Amantadine hydrochloride p. 397 [unlicensed indication] may be used to treat fatigue related to multiple sclerosis. Vitamin B12 injections are not recommended as a treatment for fatigue in patients with multiple sclerosis.

Fampridine p. 799 is licensed for the improvement of walking in patients with multiple sclerosis who have a walking disability. NICE do not consider it to be a cost-effective treatment and do not recommend its use.

Spasticity

Many factors may aggravate spasticity in multiple sclerosis, including constipation, infection, poor mobility aids, pressure ulcers, posture and pain. These causes should be managed appropriately. The first-line options for managing spasticity in multiple sclerosis are baclofen p. 1026 or gabapentin p. 301 [unlicensed indication]. They may be used cautiously in combination if the individual drugs are ineffective or if side effects prevent an increase in the dose of either drug. Tizanidine p. 1027 or dantrolene sodium p. 1236 are second-line options; benzodiazepines may be used as third-line therapy and may also be effective in treating nocturnal spasms. A cannabis extract p. 1026 containing dronabinol and cannabidiol is licensed as an adjunct treatment for moderate-to-severe spasticity associated with multiple sclerosis in patients who have not responded adequately to other skeletal muscle relaxants. NICE do not consider it to be a cost-effective treatment and do not recommend its use.

Oscillopsia

Gabapentin [unlicensed indication] is the first-line treatment for oscillopsia; memantine hydrochloride p. 291 [unlicensed indication] is the second-line option.

Emotional lability

Amitriptyline hydrochloride p. 355 [unlicensed indication] may be used to treat emotional lability in patients with multiple sclerosis.

Useful Resources

CHOLINERGIC RECEPTOR STIMULATING DRUGS

Fampyra

INDICATIONS AND DOSE

Improvement of walking disability in multiple sclerosis (specialist use only)

- By mouth
  - Adult: 10 mg every 12 hours, discontinue treatment if no improvement within 2 weeks

CONTRA-INDICATIONS

History of seizures (discontinue treatment if seizures occur)

CAUTIONS

- Atrioventricular conduction disorders - predisposition to seizures - sinoatrial conduction disorders - symptomatic cardiac rhythm disorders

SIDE-EFFECTS

- Common or very common: Anxiety, back pain, constipation, dizziness, dyspepsia, dyspnoea, headache, insomnia, malaise, nausea, paraesthesia, pharyngolaryngeal pain, tremor, urinary tract infection, vomiting

- Uncommon: Seizures

PREGNANCY

Avoid – toxicity in animal studies.

BREAST FEEDING

Avoid – no information available.

RENAI IMPAIRMENT

Avoid if eGFR less than 80 ml/minute/1.73 m².

PRESCRIBING AND DISPENSING INFORMATION

Dispense in original container (pack contains a desiccant) and discard any tablets remaining 7 days after opening.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium (November 2016) that fampyra (Fampyra®) is not recommended for use within NHS Scotland for the improvement of walking in adult patients with multiple sclerosis (MS) with walking disability (EDSS [expanded disability status scale] 4 to 7) as the economic case was not demonstrated.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 23, 25

- Fampyra (Biogen Idec Ltd)

  Fampyra 10 mg Fampyra 10mg modified-release tablets | 28 tablet [PO] £181.00 | 56 tablet [PO] £362.00

IMMUNOSTIMULANTS

Interferon beta

INDICATIONS AND DOSE

AVONEX® INJECTION

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

- By intramuscular injection

  - Adult: (consult product literature)

CONTRA-INDICATIONS

Decompensated liver disease · severe depressive illness

CONTRA-INDICATIONS, FURTHER INFORMATION

Consult product literature for further information on contra-indications.

CAUTIONS

History of cardiac disorders · history of depressive disorders (avoid in severe depression or in those with suicidal ideation) · history of seizures · history of severe myelosuppression
Interferon beta

INTERACTIONS ▶ Appendix 1: interferons

SIDE-EFFECTS
Alopecia  anaphylaxis  blood disorders  chills  confusion  convulsions  fever  hepatitis  hypersensitivity reactions  influenza-like symptoms  (decreasing over time) — irritation at injection site (including inflammation, hypersensitivity, necrosis)— malaise— menstrual disorders — mood and personality changes— myalgia— nausea— nephrotic syndrome — suicide attempts— thrombotic microangiopathy — thyroid dysfunction — urticaria — vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Also consult product literature for all side effects.

CONCEPTION AND CONTRACEPTION
Effective contraception required during treatment—consult product literature.

PREGNANCY
Avoid unless potential benefit outweighs risks (toxicity in animal studies).

BREAST FEEDING
Avoid—no information available.

HEPATIC IMPAIRMENT
Caution in severe hepatic impairment.

RENAL IMPAIRMENT
Caution in severe renal impairment.

MONITORING REQUIREMENTS
▷ Monitor for signs of hepatic injury—hepatic failure has been reported rarely.

Patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed, interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).

Patients should also be monitored for signs and symptoms of nephrotic syndrome, including oedema, proteinuria, and impaired renal function—monitor renal function periodically. If nephrotic syndrome develops, treat promptly and consider stopping interferon beta treatment.

PRESCRIBING AND DISPENSING INFORMATION
REBIF ® CARTRIDGE
Cartridges for use with RebiSmart ® auto-injector device.

BETAFERON ® INJECTION
An auto-injector device (Betaject ® Light) is available from Bayer Schering.

EXTAVIA ®
An auto-injector device (ExtaviPro ® 30G) is supplied as part of the ExtaviPro ® 30G kit.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
▷ Interferon beta and glatiramer acetate for multiple sclerosis (January 2002) NICE TA32

Interferon beta and glatiramer acetate are not recommended for the treatment of multiple sclerosis in the NHS in England and Wales.

Patients who are currently receiving interferon beta or glatiramer acetate for multiple sclerosis, whether as routine therapy or as part of a clinical trial, should have the option to continue treatment until they and their consultant consider it appropriate to stop, having regard to the established criteria for withdrawal from treatment. www.nice.org.uk/TA32

Betaseron (Bayer Plc)
Interferon beta-1b 300 microgram Betaseron 300micrograms powder and solvent for solution for injection vials ▶ 15 vial (Ps) £596.63 (Hospital only)

Extavia (Novartis Pharmaceuticals UK Ltd)
Interferon beta-1b 300 microgram Extavia 300micrograms powder and solvent for solution for injection vials ▶ 15 vial (Ps) £596.63

Peginterferon beta-1a

DRUG ACTION
Peginterferon beta-1a is a polyethylene glycol-conjugated (‘pegylated’) derivative of interferon beta; pegylation increases the persistence of interferon in the blood.

INDICATIONS AND DOSE
Treatment of relapsing, remitting multiple sclerosis
▷ BY SUBCUTANEOUS INJECTION
▷ Adult: (consult product literature)

CONTRA-INDICATIONS
Severe depression — suicidal ideation

CAUTIONS
History of cardiac disorders — history of depressive disorders (avoid in severe depression or in those with suicidal ideation) — history of seizures — history of severe myelosuppression

FURTHER INFORMATION
Consult product literature for further information about cautions.

INTERACTIONS ▶ Appendix 1: peginterferon beta-1a

SIDE-EFFECTS
SIDE-EFFECTS, FURTHER INFORMATION
Consult product literature for information about side effects.

CONCEPTION AND CONTRACEPTION
Effective contraception required during treatment—consult product literature.

PREGNANCY
Do not initiate during pregnancy. Avoid unless potential benefit outweighs risks.

BREAST FEEDING
Avoid—no information available.
**Hepatic Impairment**  Caution in severe hepatic impairment.

**Renal Impairment**  Caution in severe renal impairment.

**Monitoring Requirements**
- Monitor for signs of hepatic injury—hepatic failure has been reported rarely.
- Thrombotic microangiopathy  Patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed, interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).
- Nephrotic syndrome  Patients should also be monitored for signs and symptoms of nephrotic syndrome, including oedema, proteinuria, and impaired renal function—monitor renal function periodically. If nephrotic syndrome develops, treat promptly and consider stopping interferon beta treatment.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for Injection**
- **Plergyd (Biogen Idec Ltd)**
  - Peginterferon beta-1a 126 microgram per 1 ml  Peginterferon beta-1a 126 microgram per 1 ml solution for injection (Pfsi) £654.00
  - Peginterferon beta-1a 188 microgram per 1 ml  Peginterferon beta-1a 188 microgram per 1 ml solution for injection (Pfsi) £654.00
  - Peginterferon beta-1a 250 microgram per 1 ml  Peginterferon beta-1a 250 microgram per 1 ml solution for injection (Pfsi) £654.00

**IMMUNOSTIMULANTS**

**Glaltiramer Acetate**

**Drug Action**  Glaltiramer is an immunomodulating drug comprising synthetic polypeptides.

**Indications and Dose**

Treatment of initial symptoms in patients at high risk of developing multiple sclerosis (initiated under specialist supervision). Reducing frequency of relapses in ambulatory patients with relapsing remitting multiple sclerosis who have had at least 2 clinical relapses in the past 2 years (initiated under specialist supervision).

**By Subcutaneous Injection**
- Adult: 20 mg daily

**Caution**  Cardiac disorders

**Interactions**  + Appendix 1: glatiramer

**Side-Effects**
- Common or very common  Anxiety, arthralgia, asthenia, back pain, chest pain, constipation, depression, dyspepsia, dyspnœa (may occur within minutes of injection), flushing, headache, hypersensitivity reactions, hypertonía, influenza-like symptoms, injection-site reactions, lymphenadonopathy, nausea, oedema, palpitatio, rash, sweating, syncope, tachycardia, tremor
- Rare  Seizures

**Pregnancy**  Manufacturer advises avoid—no information available.

**Breast Feeding**  Manufacturer advises caution—no information available.

**Renal Impairment**  No information available—manufacturer advises caution.

**National Funding/Access Decisions**

**NICE Technology Appraisals (TAs)**
- Interferon beta and glatiramer acetate for multiple sclerosis (January 2002)  NICE TA32
  - Interferon beta and glatiramer acetate are not recommended for the treatment of multiple sclerosis in the NHS in England and Wales.
  - Patients who are currently receiving interferon beta or glatiramer acetate for multiple sclerosis, whether as routine therapy or as part of a clinical trial, should have the option to continue treatment until they and their consultant consider it appropriate to stop, having regard to the established criteria for withdrawal from treatment. [www.nice.org.uk/TA32](http://www.nice.org.uk/TA32)

**NHS Restrictions**

**IMMUNOSUPPRESSANTS**

**IMMUNOMODULATING DRUGS**

**Dimethyl Fumarate**

**Drug Action**  Dimethyl fumarate has immunomodulatory and anti-inflammatory properties.

**Indications and Dose**

Treatment of adults with relapsing remitting multiple sclerosis (initiated by a specialist).

**By Mouth**
- Adult: 120 mg twice daily for 7 days, then increased to 240 mg twice daily, for dose adjustment due to side effects—consult product literature.

**Caution**  Reduced lymphocyte count, risk of serious infections (do not start treatment until resolved and consider suspending treatment if infection develops during treatment), severe active gastro-intestinal disease

**Interactions**  + Appendix 1: dimethyl fumarate

**Side-Effects**
- Abdominal pain, burning sensation, diarrhoea, dyspepsia, erythema, flushing (may be severe and indicate hypersensitivity), gastritis, gastroenteritis, leucopenia, lymphopenia, nausea, proteinuria, pruritus, rash, vomiting

**Side-Effects, Further Information**
- Progressive multifocal leukoencephalopathy (PML)  Severe prolonged lymphopenia reported, and patients are exposed to a potential risk of PML. Treatment should be stopped immediately if PML is suspected.
- Conception and Contraception  Contraception required in women of child-bearing potential (consider non-hormonal methods).
- Pregnancy  Manufacturer advises avoid unless essential and potential benefit outweighs risk—toxicity in animal studies.
Immune system and malignant disease

- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **MONITORING REQUIREMENTS**
  - Monitor full blood count (including lymphocytes) before treatment (within 6 months before initiation), then every 6 to 12 months thereafter, and as clinically indicated.
  - Monitor patient closely for features of progressive multifocal leukoencephalopathy (PML) (e.g. signs and symptoms of neurological dysfunction) and other opportunistic infections.
  - Monitor renal and hepatic function before treatment, after 3 and 6 months of treatment, then every 6 to 12 months thereafter, and as clinically indicated.
- **PATIENT AND CARER ADVICE** Patient information leaflet should be provided.
- Counselling is advised on progressive multifocal leukoencephalopathy.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - NICE technology appraisals (TAs)
    - Dimethyl fumarate for treating relapsing-remitting multiple sclerosis (August 2014) NICE TA320
      - Dimethyl fumarate is recommended for the treatment of active relapsing-remitting multiple sclerosis, only if:
        1. the patient does not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis and
        2. the manufacturer provides dimethyl fumarate with the discount agreed in the patient access scheme
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Gastro-resistant capsule**
    - CAUTIONARY AND ADVISORY LABELS 21, 25
      - **Tecfidera** (Biogen Idec Ltd)
        - Dimethyl fumarate 120 mg Tecfidera 120mg gastro-resistant capsules | 14 capsule (PO) £343.00
        - Dimethyl fumarate 240 mg Tecfidera 240mg gastro-resistant capsules | 66 capsule (PO) £1,373.00

Fingolimod

- **DRUG ACTION** Fingolimod is an immunomodulating drug.
- **INDICATIONS AND DOSE**
  - Treatment of highly active relapsing-remitting multiple sclerosis in patients who have high disease activity despite treatment with at least one disease modifying therapy or in those with rapidly evolving severe relapsing-remitting multiple sclerosis (initiated under specialist supervision)
    - **BY MOUTH**
    - Adult: 500 micrograms once daily

- **ADVERSE EFFECTS**
  - Heart rate
    - Patients with the following medical conditions:
      - 2nd degree Mobitz Type II or higher degree atrioventricular block, sick sinus syndrome, or sino-atrial heart block
      - Significant QT prolongation (QT-interval greater than 470 milliseconds in women, or greater than 450 milliseconds in men)
      - History of symptomatic bradycardia or recurrent syncope, known ischaemic heart disease, cerebrovascular disease, history of myocardial infarction, congestive heart failure, history of cardiac arrest, uncontrolled hypertension, or severe sleep apnoea.
    - Patients receiving the following antiarrhythmic or heart-rate lowering drugs:
      - Class la or class III antiarrhythmics
      - Beta blockers
      - Heart rate-lowering calcium channel blockers
      - Other substances which may decrease heart rate (e.g. digoxin, anticholinesteratic drugs or pilocarpine).
    - All patients receiving fingolimod should be monitored at treatment initiation, (first dose monitoring), and after treatment interruption (see note below); monitoring should include:
      - **Pre-treatment**
        - A 12-lead ECG and blood pressure measurement before starting
      - **During the first 6 hours of treatment**
        - Continuous ECG monitoring for 6 hours
        - Blood pressure and heart rate measurement every hour
      - **After 6 hours of treatment**
        - A further 12-lead ECG and blood pressure measurement
        - If heart rate at the end of the 6 hour period is at its lowest since fingolimod was first administered, monitoring should be extended by at least 2 hours and until heart rate increases.
        - Extended monitoring, (at least overnight), should be performed in patients with evidence of clinically important cardiac effects during first dose monitoring. Monitoring in patients requiring pharmacological intervention for bradycardia-related symptoms during first dose monitoring should be extended at least overnight, and first dose monitoring should be repeated after the second dose.
      - **Note**
        - First dose monitoring as above should be repeated in all patients whose treatment is interrupted for:
          - 1 day or more during the first 2 weeks of treatment
          - More than 7 days during weeks 3 and 4 of treatment
          - More than 2 weeks after one month of treatment
        - If the treatment interruption is of shorter duration than the above, repeated monitoring is not required and treatment should be continued with the next dose as planned.

- **CONTRA-INDICATIONS** Active malignancies • immunosuppression • severe active infection

---

**IMPORTANT SAFETY INFORMATION**

- **MHRA/CHM ADVICE: MULTIPLE SCLEROSIS THERAPIES: SIGNAL OF REBOUND EFFECT AFTER STOPPING OR SWITCHING THERAPY (APRIL 2017)**
  - A signal of rebound syndrome in multiple sclerosis patients whose treatment with fingolimod was stopped or switched to other treatments has been reported in two recently published articles. The MHRA advise to be vigilant for such events and report any suspected adverse effects relating to fingolimod, or other treatments for multiple sclerosis, via the Yellow Card Scheme, while this report is under investigation.

- **MHRA/CHM ADVICE: FINGOLIMOD—NOT RECOMMENDED FOR PATIENTS AT KNOWN RISK OF CARDIOVASCULAR EVENTS, ADVICE FOR EXTENDED MONITORING FOR THOSE WITH SIGNIFICANT BRADYCARDIA OR HEART BLOCK AFTER THE FIRST DOSE AND FOLLOWING TREATMENT INTERRUPTION (JANUARY 2013)**
  - Fingolimod is known to cause transient bradycardias and heart block after the first dose. Fingolimod is not recommended in the following patient groups who are at high risk of cardiovascular events unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist is sought before initiation:
    - Patients with the following medical conditions:
      - 2nd degree Mobitz Type II or higher degree atrioventricular block, sick sinus syndrome, or sino-atrial heart block
      - Significant QT prolongation (QT-interval greater than 470 milliseconds in women, or greater than 450 milliseconds in men)
      - History of symptomatic bradycardia or recurrent syncope, known ischaemic heart disease, cerebrovascular disease, history of myocardial infarction, congestive heart failure, history of cardiac arrest, uncontrolled hypertension, or severe sleep apnoea.
    - Patients receiving the following antiarrhythmic or heart-rate lowering drugs:
      - Class ia or class III antiarrhythmics
      - Beta blockers
      - Heart rate-lowering calcium channel blockers
      - Other substances which may decrease heart rate (e.g. digoxin, anticholinesteratic drugs or pilocarpine).
    - All patients receiving fingolimod should be monitored at treatment initiation, (first dose monitoring), and after treatment interruption (see note below); monitoring should include:
      - **Pre-treatment**
        - A 12-lead ECG and blood pressure measurement before starting
      - **During the first 6 hours of treatment**
        - Continuous ECG monitoring for 6 hours
        - Blood pressure and heart rate measurement every hour
      - **After 6 hours of treatment**
        - A further 12-lead ECG and blood pressure measurement
        - If heart rate at the end of the 6 hour period is at its lowest since fingolimod was first administered, monitoring should be extended by at least 2 hours and until heart rate increases.
        - Extended monitoring, (at least overnight), should be performed in patients with evidence of clinically important cardiac effects during first dose monitoring. Monitoring in patients requiring pharmacological intervention for bradycardia-related symptoms during first dose monitoring should be extended at least overnight, and first dose monitoring should be repeated after the second dose.
      - **Note**
        - First dose monitoring as above should be repeated in all patients whose treatment is interrupted for:
          - 1 day or more during the first 2 weeks of treatment
          - More than 7 days during weeks 3 and 4 of treatment
          - More than 2 weeks after one month of treatment
        - If the treatment interruption is of shorter duration than the above, repeated monitoring is not required and treatment should be continued with the next dose as planned.

- **CONTRA-INDICATIONS** Active malignancies • immunosuppression • severe active infection

**CAUTIONS, FURTHER INFORMATION**

- **PREGNANCY**
  - **CONCEPTION MONITORING REQUIREMENTS**
    - Manufacturer advises eye examination recommended
  - **HEPATIC IMPAIRMENT AND CONTRACEPTION**
    - Progressive multifocal leukoencephalopathy (PML) and other basal-cell carcinoma. Progressive multifocal leukoencephalopathy (PML) and other opportunistic infections. Suspension of treatment should be considered if a patient develops a severe infection, taking into consideration the risk-benefit.
  - **UNCOMMON**
    - Maculopapular rash, pruritus
  - **RARE**
    - Lymphoma
  - **FREQUENCY NOT KNOWN**
    - Haemophagocytic syndrome.
    - Lymphoma.
    - Progressive multifocal leukoencephalopathy.

**SIDE-EFFECTS, FURTHER INFORMATION**

- **BASAL-CELL CARCINOMA**
  - Patients should be advised to seek medical advice if they have any signs of basal-cell carcinoma including skin nodules, patches or open sores that do not heal within weeks.
  - Progressive multifocal leukoencephalopathy (PML) and other opportunistic infections. Suspension of treatment should be considered if a patient develops a severe infection, taking into consideration the risk-benefit.

**CONCESSION AND CONTRACEPTION**

Exclude pregnancy before treatment. Ensure effective contraception during and for at least 2 months after treatment.

**PREGNANCY**

Avoid (toxicity in animal studies).

**BREAST FEEDING**

Avoid.

**HEPATIC IMPAIRMENT**

Use with caution in mild to moderate impairment. Avoid in severe impairment.

**MONITORING REQUIREMENTS**

- Manufacturer advises eye examination recommended 3–4 months after initiation of treatment (and before initiation of treatment in patients with diabetes or history of uveitis).
- Manufacturer advises skin examination for signs of basal-cell carcinoma before starting treatment and then at least yearly thereafter.
- Monitor hepatic transaminases before treatment, then every 3 months for 1 year, then periodically thereafter.
- Monitor full blood count before treatment, at 3 months, then at least yearly thereafter and if signs of infection—interrupt treatment if lymphocyte count reduced—consult product literature.
- Monitor for signs and symptoms of haemophagocytic syndrome (including pyrexia, asthenia, hepato—splenomegaly and adenopathy)—may be associated with hepatic failure and respiratory distress; also progressive cytopenia, elevated serum ferritin concentrations, hypertriglyceridaemia, hypofibrinogenaeemia, coagulopathy, hepatic cytolysis, hyponatraemia)—initiate treatment immediately.
- Manufacturer advises to monitor routine MRI for lesions suggestive of progressive multifocal leukoencephalopathy (PML), particularly in patients considered at increased risk.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- **Fingolimod for the treatment of highly active relapsing-remitting multiple sclerosis (April 2012) NICE TA254**
  - Fingolimod is recommended as an option for the treatment of highly active relapsing-remitting multiple sclerosis in adults, only if:
    - they have an unchanged or increased relapse rate or ongoing severe relapses compared with the previous year despite treatment with interferon beta, and
    - the manufacturer provides fingolimod with the discount agreed as part of the patient access scheme.
  - Patients currently receiving fingolimod whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.
  - www.nice.org.uk/TA254

**Scottish Medicines Consortium (SMC) Decisions**

The **Scottish Medicines Consortium** (SMC) has advised (August 2012) that fingolimod (Gilenya®) is accepted for restricted use within NHS Scotland as single disease modifying therapy in highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta, with an unchanged or increased relapse rate or ongoing severe relapses, as compared to the previous year.

- All Wales Medicines Strategy Group (AWMSG) Decisions
  - The **All Wales Medicines Strategy Group** (AWMSG) has advised (January 2017) that fingolimod (Gilenya®) is recommended as an option for use within NHS Wales as a single disease modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous recent MRI, only if the manufacturer provides fingolimod with the discount agreed as part of the patient access scheme or where the list price is equivalent or lower.

**NHS restrictions**

- **NHS England Clinical Commissioning Policy**

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **Gilenya®** (Novartis Pharmaceuticals UK Ltd)
  - Fingolimod (as Fingolimod hydrochloride)
  - 500 microgram
  - Gilenya 0.5mg capsules | 7 capsule [PoM] £367.50
  - 28 capsule [PoM] £1,470.00

**IMMUNOSUPPRESSANTS > INTERLEUKIN INHIBITORS**

**Daclizumab**

25-Apr-2017

**DRUG ACTION**

Daclizumab is a humanised monoclonal antibody that inhibits interleukin-2 receptor binding.

**INDICATIONS AND DOSE**

Relapsing multiple sclerosis (initiated by a specialist)

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 150 mg once a month, to be administered into the thigh, abdomen or upper arm.
**CAUTIONS** History of depressive disorders, patients over 55 years—limited information available, severe active infection (consider delaying treatment initiation)

**INTERACTIONS** → Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**
- **Common or very common** Abnormal liver function tests, acne, anaemia, decreased lymphocyte count, depression, dermatitis, diarrhoea, eczema, erythema, folliculitis, hepatitis, influenza, lymphadenopathy, nasopharyngitis, oropharyngeal pain, pruritus, psoriasis, pyrexia, rash, respiratory tract infection, rhinitis
- **Uncommon** Collitis, serious skin reactions

**SIDE-EFFECTS, FURTHER INFORMATION**
- Serious skin reactions. Serious skin reactions (including exfoliative rash or dermatitis, and toxic skin eruption) have been reported; if a diffuse or highly inflammatory rash develops—manufacturer advises referral to a dermatologist and discontinuation may be required.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment or when serum transaminases are greater than 2 times the upper limit of normal range.

**MONITORING REQUIREMENTS**
- Manufacturer advises monitor liver function before treatment, monthly during treatment and for up to 4 months after the last dose—treatment interruption or discontinuation may be required if serum transaminases are greater than 3 times the upper limit of normal range (consult product literature).
- Manufacturer advises monitor full blood count every 3 months.

**HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C). May be stored at room temperature up to 30°C for up to 30 days.

**PATIENT AND CARER ADVICE**
- Patients should be provided with a patient card.
- Manufacturer advises patients and their carers should be advised to report any signs of hepatic injury, or symptoms of new or worsening depression and/or suicidal ideation. Patients or carers should also be given advice on how to administer daclizumab injection.

**MEDICINAL FORMS**
- Daclizumab 150 mg per 1 ml Zinbryta (Biogen Idec Ltd) ▼
- Daclizumab 150 mg/1 ml solution for injection pre-filled pen 1 pre-filled disposable injection £1,596.67

**IMMUNOSUPPRESSANTS > MONOClonAL ANTIBodies > ANTI-LYMPHOCYTE**

**Anti-lymphocyte monoclonal antibodies**

**DRUG ACTION** The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

**IMPORTANT SAFETY INFORMATION**
- All anti-lymphocyte monoclonal antibodies should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities are immediately available.

**SIDE-EFFECTS**
- **Common or very common** Allergic reactions, angioedema, bronchospasm, chills, cytokine release syndrome, dyspnoea, fever, flushing, nausea, pruritus, rash, tumour pain, vomiting
- **Frequency not known** Cardiac events

**SIDE-EFFECTS, FURTHER INFORMATION**
- Infusion-related side-effects In rare cases infusion reactions may be fatal.
- Infusion-related side-effects occur predominantly during the first infusion. Patients should receive premedication before administration of anti-lymphocyte monoclonal antibodies to reduce these effects—consult product literature for details of individual regimens.
- The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management.
- Evidence of pulmonary infiltration and features of tumour lysis syndrome should be sought if infusion-related effects occur.
- Cytokine release syndrome. Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

**PRE-TREATMENT SCREENING** All patients should be screened for hepatitis B before treatment.

**MONITORING REQUIREMENTS** Patients should also be monitored for cytopenias—consult product literature for specific recommendations.

**Alemtuzumab**

**INDICATIONS AND DOSE**
- Treatment of adults with relapsing-remitting multiple sclerosis with active disease defined by clinical or imaging features
- **BY INTRAVENOUS INFUSION**
- **Adult:** (consult product literature)

**UNLICENSED USE** Although no longer licensed for oncological and transplant indications, alemtuzumab is
also available through a patient access programme for these indications.

**IMPORTANT SAFETY INFORMATION**
Alemtuzumab should be given under the care of a specialist with facilities for the management of hypersensitivity and anaphylactic reactions.

### CONTRA-INDICATIONS
- Human immunodeficiency virus
- Hepatitis B carriers
- Hepatitis C carriers
- in patients with active infection

### CAUTIONS
- Hepatitis B carriers
- Hepatitis C carriers
- in patients with active infection
- A delay in initiation of alemtuzumab treatment should be considered until the infection is fully controlled
- not recommended for inactive disease
- not recommended for stable disease
- patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course
- patients with previous autoimmune conditions other than multiple sclerosis
- pretreatment before administration is required (consult product literature)

### PRE-TREATMENT SCREENING
For full details of cautions, consult product literature.
- Autoimmune mediated conditions
- Patients with active infection
- A delay in initiation of treatment should be considered until the infection is fully controlled
- Patients with previous autoimmune conditions other than multiple sclerosis
- Pretreatment before administration is required (consult product literature).

### INTERACTIONS
- Appendix 1: monoclonal antibodies

### SIDE-EFFECTS

**SIDE-EFFECTS, FURTHER INFORMATION**
For full side effects details (including monitoring and management) consult product literature

### CONCEPTION AND CONTRACEPTION
- Women of childbearing potential should use effective contraception

### PREGNANCY
- Manufacturer advises avoid unless potential benefit outweighs risk—tocicity in animal studies
- Autoimmune thyroid disease during treatment may affect fetus (consult product literature)

### BREAST FEEDING
- Manufacturer advises avoid during and for 4 months after each treatment course unless potential benefit outweighs risk.

### PRE-TREATMENT SCREENING
- Screening patients at high risk of hepatitis B or C is recommended before treatment
- All patients should be evaluated for active or latent tuberculosis before starting treatment.

### MONITORING REQUIREMENTS
- HPV screening should be carried out annually in female patients.

### PRESCRIBING AND DISPENSING INFORMATION
- All patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course.

### PATIENT AND CARER ADVICE
- Patients should be provided with a patient alert card and patient guide.

### NATIONAL FUNDING/ACCESS DECISIONS

**NICE technology appraisals (TAs)**
- Alemtuzumab for treating relapsing-remitting multiple sclerosis (May 2014) NICE TA312
- Alemtuzumab is recommended as an option, within its marketing authorisation, for treating adults with active relapsing-remitting multiple sclerosis.
  - www.nice.org.uk/TA312

### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.
- **Solution for infusion**
  - **Lemtrada** (Genzyme Therapeutics Ltd) ▼
  - Alemtuzumab 10 mg per 1 ml
  - Lemtrada 12mg/1.2ml concentrate for solution for infusion vials
  - 1 vial (£7,045.00) (Hospital only)

### NATALIZUMAB

#### DRUG ACTION
- Natalizumab is a monoclonal antibody that inhibits the migration of leucocytes into the central nervous system, hence reducing inflammation and demyelination.

#### INDICATIONS AND DOSE
- **Highly active relapsing-remitting multiple sclerosis**
  - despite treatment with interferon beta or glatiramer acetate, or those patients with rapidly evolving severe relapsing-remitting multiple sclerosis (initiated under specialist supervision)
  - **BY INTRAVENOUS INFUSION**
    - Adult 18–65 years: 300 mg every 4 weeks, treatment should be discontinued if no response after 6 months

#### CONTRA-INDICATIONS
- Active infection
- Active malignancies
- Immunosuppression
- Progressive multifocal leucoencephalopathy

#### CAUTIONS

**CAUTIONS, FURTHER INFORMATION**
For information on cautions consult product literature.
- Progressive Multifocal Leucoencephalopathy
- Natalizumab is associated with an increased risk of opportunistic infection and progressive multifocal leucoencephalopathy (PML) caused by JC virus.
- The risk of developing PML increases with the presence of anti-JCV antibodies, previous use of immunosuppressant therapy, and treatment duration (especially beyond 2 years of treatment); the risk beyond 4 years of treatment is not known.
- Patients with all three risk factors should only be treated with natalizumab if the benefits of treatment outweigh the risks.

### SIDE-EFFECTS

- **Common or very common**
  - Arthralgia
  - Arthralgia (during infusion)
  - Autoantibodies
  - Dizziness (during infusion)
  - Fatigue (during infusion)
  - Headache (during infusion)
  - Nasopharyngitis
  - Nausea (during infusion)
  - Pyrexia
  - Rigors (during infusion)
  - Urinary-tract infection
  - Urticaria (during infusion)
  - Vomiting

- **Uncommon**
  - Hypersensitivity reactions (discontinue permanently)
  - Progressive Multifocal Leukoencephalopathy (PML)

- **Frequency not known**
  - Flushing (during infusion)
  - Increased risk of opportunistic infection
  - Liver toxicity

### SIDE-EFFECTS, FURTHER INFORMATION
- Progressive Multifocal Leukoencephalopathy
  - If Progressive Multifocal Leukoencephalopathy (PML) is suspected, treatment should be suspended until PML has been excluded.
  - If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

### INTERACTIONS
- Appendix 1: monoclonal antibodies

### BREAST FEEDING
- Present in milk in animal studies—avoid.
**PRE-TREATMENT SCREENING**
Progressive Multifocal Leucoencephalopathy A magnetic resonance image (MRI) scan is recommended before starting treatment with natalizumab.

Testing for serum anti-JCV antibodies before starting treatment or in those with unknown antibody status already receiving natalizumab is recommended and should be repeated every 6 months (consult product literature for full details).

**MONITORING REQUIREMENTS**
- Progressive Multifocal Leucoencephalopathy A magnetic resonance image (MRI) scan is recommended annually. Patients should be monitored for new or worsening neurological symptoms, and for cognitive and psychiatric signs of PML.
- All patients should continue to be monitored for signs and symptoms that may be suggestive of PML for approximately 6 months following discontinuation of treatment.

**DIRECTIONS FOR ADMINISTRATION**
For intravenous infusion (Tysabri®), give intermittently in Sodium chloride 0.9%; dilute 300 mg in 100 mL infusion fluid; gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour.

**PATIENT AND CARER ADVICE**
A patient alert card should be provided.

**NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
- Natalizumab for the treatment of adults with highly active relapsing-remitting multiple sclerosis (August 2007) NICE TAI27

Natalizumab is an option for the treatment only of rapidly evolving severe relapsing-remitting multiple sclerosis (RES). RES is defined by 2 or more disabling relapses in 1 year, and 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (August 2007) that natalizumab is accepted for restricted use as single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

NHS England Clinical Commissioning Policy

**MEDIINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**
- Tysabri (Biogen Idec Ltd)

Natalizumab 20 mg per 1 ml Tysabri 300mg/15ml concentrate for solution for infusion vials 1 vial £1,130.00 (Hospital only)

**IMMUNOSUPPRESSANTS**

**Teriflunomide**

**DRUG ACTION**
Teriflunomide is a metabolite of leflunomide which has immunomodulating and anti-inflammatory properties.

**INDICATIONS AND DOSE**
Treatment of relapsing-remitting multiple sclerosis (initiated under specialist supervision)
- **BY MOUTH**
  - Adult: 14 mg once daily

**CONTRA-INDICATIONS**
Anaemia • leucopenia • neutropenia • serious infection • severe hypoprothaeinaemia • severe immunodeficiency • significantly impaired bone-marrow function • thrombocytopenia

**CAUTIONS**
Adult over 65 years • anaemia • dyspnoea— assess for interstitial lung disease and consider suspending treatment • hypoprothaeinaemia (avoid if severe) • impaired bone-marrow function (avoid if severe) • latent tuberculosis • leucopenia • persistent cough—assess for interstitial lung disease and consider suspending treatment • severe infection—delay or suspend treatment until resolved • significant alcohol consumption • signs or symptoms of serious skin reactions (including ulcerative stomatitis, Stevens-Johnson syndrome, and toxic epidermal necrolysis)—discontinue treatment • switching between other immunomodulating drugs • thrombocytopenia

**INTERACTIONS**
Appendix 1: teriflunomide

**SIDE-EFFECTS**
- **Common or very common** Acne • alopecia • anxiety • carpal tunnel syndrome • cystitis • diarrhoea • elevated liver enzymes • gastroenteritis • hyperaesthesia • hypertension • laryngitis • leucopenia • menorrhagia • musculoskeletal pain • myalgia • nausea • neuralgia • neutropenia • oral infection • paraesthesia • peripheral neuropathy • poliakuria • rash • respiratory tract infection • sciatica • tinea pedis • urinary tract infection • vomiting • weight loss
- **Uncommon** Anaemia • thrombocytopenia
- **Very rare** Interstitial lung disease • pancreatitis

**SIDE-EFFECTS, FURTHER INFORMATION**
- Accelerated elimination procedure Important: accelerated elimination procedure recommended following discontinuation due to serious adverse effects (consult product literature).
- Hepatic injury Discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.

**CONCEPTION AND CONTRACEPTION**
Effective contraception essential for women of child-bearing potential during treatment and for up to 2 years after treatment. In patients undergoing treatment with teriflunomide that are planning to conceive, the accelerated elimination procedure should be used prior to conception. Use of non-oral contraception is
Malignant disease

1 Antibody responsive malignancy

ANTINEOPLASTIC DRUGS > MONOCLONAL ANTIBODIES

Bevacizumab

- **DRUG ACTION** Bevacizumab is a monoclonal antibody that inhibits vascular endothelial growth factor.

- **INDICATIONS AND DOSE**
  - Treatment of metastatic colorectal cancer in combination with fluoropyrimidine-based chemotherapy
  - First-line treatment of metastatic breast cancer in combination with paclitaxel when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate
  - First-line treatment of metastatic breast cancer in combination with capcitabine when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate (patients who have received adjuvant taxane or anthracycline-containing regimens in the previous 12 months should not be treated with bevacizumab in combination with capcitabine)
  - Advanced or metastatic renal cell carcinoma in combination with interferon alfa-2a
  - First-line treatment of unresectable advanced, metastatic or recurrent non-small cell lung cancer other than predominantly squamous cell histology (in combination with platinum-based chemotherapy)
  - First-line treatment of advanced (FIGO stages IIIB, IIC and IV) epithelial ovarian, fallopian tube, or primary peritoneal cancer (in combination with carboplatin and paclitaxel)
  - First recurrence of platinum-sensitive epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who have not been treated previously with bevacizumab or other drugs that target vascular endothelial growth factor (in combination with carboplatin and gemcitabine)

- **BY INTRAVENOUS INFUSION**
- **Adult:** (consult local protocol)

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: BEVACIZUMAB AND SUNITINIB: RISK OF OSTEOONECROSIS OF THE JAW (JANUARY 2011)

Treatment with bevacizumab or sunitinib may be a risk factor for the development of osteonecrosis of the jaw. Patients treated with bevacizumab or sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.

- Dental examination and appropriate preventive dentistry should be considered before treatment with bevacizumab or sunitinib.
- If possible, invasive dental procedures should be avoided in patients treated with bevacizumab or sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

- **CAUTIONS** Elective surgery (withhold treatment and avoid for at least 28 days after major surgery or until wound fully healed) - history of arterial thromboembolism - history of cardiovascular disease (increased risk of cardiovascular events, especially in the elderly) - history of hypertension (increased risk of proteinuria—discontinue if nephrotic syndrome) - increased risk of fistulas (discontinue...
permanently if tracheo-oesophageal or grade 4 fistula develops). Increased risk of haemorrhage. Increased risk of tumour-associated haemorrhage. Intra-abdominal inflammation (risk of gastro-intestinal perforation and gall bladder perforation) uncontrolled hypertension. Ununtreated CNS metastases.

Interactions → Appendix 1: monoclonal antibodies.

Side-effects Abdominal pain, alopecia, anaemia, anorexia, arterial thromboembolism, asthma, bone marrow suppression, chest pain, congestive heart failure, constipation, dehydration, diarrhoea, drowsiness, dry skin, dysarthria, dyspnoea, exfoliative dermatitis, extravasation, eye disorders, fistulas, flushing, gall bladder perforation, gastro-intestinal perforation, haemorrhage, hand-foot syndrome, headache, hypersensitivity reactions, hypertension, hyperuricaemia, hypotension, hypoxia, impaired wound healing, infection, intestinal obstruction, lethargy, mucocutaneous bleeding, nausea, necrotising fascitis (discontinue and initiate treatment promptly). Neutropenia, oral mucositis, osteonecrosis of the jaw, peripheral neuropathy, posterior reversible encephalopathy syndrome, proteinuria, pulmonary hypertension, pyrexia, rash, rhinitis, rigors, skin discoloration, supraventricular tachycardia, syncope, taste disturbances, thrombocytopenia, thromboembolism, tumour lysis syndrome, vomiting.

Conception and Contraception Effective contraception required during and for at least 6 months after treatment in women.

Pregnancy Avoid toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

Breast Feeding Manufacturer advises avoid breast-feeding and for at least 6 months after treatment.

Monitoring requirements
- Monitor for necrotising fascitis (usually secondary to wound healing complications, gastrointestinal perforation or fistula formation)—discontinue and initiate treatment promptly.
- Monitor blood pressure.
- Monitor for congestive heart failure.
- Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, headache, altered mental status, visual disturbance or cortical blindness, with or without hypertension).
- Consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw).

National funding/access decisions

NICE technology appraisals (TAs)
- Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA285
- Bevacizumab in combination with paclitaxel and carboplatin is not recommended within its marketing authorisation, that is, for the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.
- Bevacizumab in combination with capcitabine for the first-line treatment of metastatic breast cancer (August 2012) NICE TA263
- Bevacizumab in combinations with capcitabine is not recommended within its marketing authorisation for the first-line treatment of metastatic breast cancer, that is, when treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or when taxanes or anthracyclines have been used as part of adjuvant treatment in the previous 12 months.
- Bevacizumab in combination with a taxane for the first-line treatment of metastatic breast cancer (February 2011) NICE TA214
- Bevacizumab in combination with a taxane is not recommended for the first-line treatment of metastatic breast cancer.
- Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capcitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212
- Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capcitabine is not recommended for the treatment of metastatic colorectal cancer.
- Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007) NICE TA118
- Bevacizumab in combination with fluorouracil plus folinic acid, with or without irinotecan, is not recommended for the first-line treatment of metastatic colorectal cancer; see also NICE guidance Bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy.
- Bevacizumab (first-line), sorafenib (first and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009) NICE TA178
- Bevacizumab, sorafenib, and temsirolimus are not recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma. Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma.

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (April 2012) that bevacizumab (Avastin®) is not recommended for use within NHS Scotland for the first line treatment of patients with metastatic breast cancer in whom treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate.

The Scottish Medicines Consortium has advised (August 2015) that bevacizumab (Avastin®) is accepted for restricted use within NHS Scotland in combination with paclitaxel for the treatment of adult patients with platinum-resistant recurrent epithelial ovarian, fallopian
tube, or primary peritoneal cancer who received no more than two prior chemotherapy regimens and who have not received prior therapy with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.

The Scottish Medicines Consortium has advised (October 2015) that bevacizumab (Avastin®) is accepted for restricted use within NHS Scotland in combination with carboplatin and paclitaxel for the first-line treatment of advanced FIGO stage IV epithelial ovarian, fallopian tube, or primary peritoneal cancer.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for infusion**

- **Avastin** (Roche Products Ltd)
  - Bevacizumab 25 mg per 1 ml Avastin 400mg/16ml solution for infusion vials | 1 vial £924.40 (Hospital only)
  - Avastin 100mg/4ml solution for infusion vials | 1 vial £242.66 (Hospital only)

<table>
<thead>
<tr>
<th>Blinatumomab</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>01-Feb-2017</strong></td>
</tr>
</tbody>
</table>

**INDICATIONS AND DOSE**

**Relapsed or refractory Philadelphia chromosome-negative acute lymphoblastic leukaemia**

- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Adult (body-weight 45 kg and above): Initially 9 micrograms/24 hours on days 1–7 of first cycle, followed by 28 micrograms/24 hours on days 8–28, first cycle is followed by a 2 week treatment-free interval, then 28 micrograms/24 hours for days 1–28 of second and subsequent cycles—patients who achieve complete remission after 2 treatment cycles may receive up to 3 additional cycles of consolidation treatment, for dose adjustments due to side-effects and infusion-related reactions or patients with high tumour burden—consult product literature

**CAUTIONS**

- Aphasia · brain injuries (severe) · cerebellar disease · dementia · elderly—limited information available · epilepsy · paresis · Parkinson’s disease · patients may need pre-medication to minimise adverse reactions · psychosis · seizure · severe hepatic impairment · severe renal impairment · stroke

**CAUTIONS, FURTHER INFORMATION**

- Pre-medication Manufacturer advises pre-medication with intravenous dexmethylazone and an anti-pyretic—consult product literature.
- Neurological events There is potentially a higher risk of neurological events in patients with clinically relevant CNS pathology—manufacturer advises caution.

**INTERACTIONS**

- **Appendix 1: monoclonal antibodies**

**SIDE-EFFECTS**

- **Common or very common** Anaemia · aphasia · arthralgia · chills · cognitive disorder · confusion · constipation · convulsion · cough · cytokine release syndrome · decreased appetite · diarrhoea · disorientation · dizziness · electrolyte disturbances · encephalopathy · fatigue · headache · hypoalbuminemia · hypotension · infusion-related reactions · insomnia · leukocytosis · leucopenia · lymphopenia · memory impairment · nausea · neutropenia · oedema · pain (including abdominal, bone and back) · paraesthesia · peripheral oedema · pneumonia · pyrexia · rash · sepsis · tachycardia · thrombocytopenia · tremor · tumour lysis syndrome · vomiting
- **Uncommon** Pancreatitis

- **Frequency not known** Bone marrow suppression · leukoencephalopathy (including progressive multifocal leukoencephalopathy)

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Pancreatitis** Life-threatening or fatal cases of pancreatitis have been reported; manufacturer advises monitor for signs and symptoms of pancreatitis during treatment—temporary interruption or discontinuation may be required (consult product literature).
- **Cytokine release syndrome, infusion-reactions and tumour lysis syndrome** Life-threatening (including fatal) cases of cytokine release syndrome and tumour lysis syndrome have been reported in patients taking blinatumomab. Manufacturer advises monitor signs and symptoms of cytokine release syndrome and infusion reactions during treatment; temporary interruption or discontinuation may be required—consult product literature.

**CONCEPTION AND CONTRACEPTION**

- Manufacturer advises effective contraception during treatment and for at least 48 hours after treatment in women of child-bearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**PREGNANCY**

- Manufacturer advises avoid unless potential benefit outweighs risk—no information available; if exposed during pregnancy, monitor infant for B-cell depletion. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING**

- Manufacturer advises avoid during and for at least 48 hours after treatment—no information available.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution in severe impairment—no information available.

**RENAL IMPAIRMENT**

- Manufacturer advises caution in severe impairment—no information available.

**MONITORING REQUIREMENTS**

- Manufacturer advises neurological examination prior to the initiation of treatment and continued monitoring during treatment—consult product literature.

**HANDLING AND STORAGE**

- Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after reconstitution and dilution.

**PATIENT AND CARER ADVICE**

- A patient alert card should be provided.

- Educational materials should be provided to patients, carers and healthcare professionals to ensure blinatumomab is used in a safe and effective way, and to prevent the risk of medication errors and neurological events—consult product information.

**Driving and skilled tasks**

- Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of confusion, disorientation, co-ordination and balance disorders, seizures and disturbances in consciousness.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- **Blinicyto** (Amgen Ltd)

<table>

Brentuximab vedotin

- **INDICATIONS AND DOSE**
  Treatment of relapsed or refractory CD-30 positive Hodgkin’s disease following autologous stem cell transplant or following at least two prior therapies, when autologous stem cell transplant or multi-agent chemotherapy is not a treatment option. Relapsed or refractory systemic anaplastic large cell lymphoma
  - **BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature)

- **CAUTIONS** Elevated BMI—risk of hyperglycaemia, high tumour burden—risk of tumour lysis syndrome, rapidly proliferating tumours—risk of tumour lysis syndrome

- **INTERACTIONS** 
  - Appendix 1: monoclonal antibodies

- **SIDE-EFFECTS**
  - Common or very common: Anaphylaxis, arthralgia, back pain, constipation, cough, demyelinating polyneuropathy, diarrhoea, dizziness, dysphonia, fatigue, hyperglycaemia, infusion-related reactions, myalgia, peripheral neuropathy, pruritus, rash
  - Uncommon: Stevens-Johnson syndrome
  - Frequency not known: Alopecia, bone-marrow suppression, extravasation, hyperuricaemia, infusion related side-effects, nausia, oral mucositis, progressive multifocal leuкоencephalopathy, thromboembolism, tumour lysis syndrome, vomiting

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for 6 months after treatment in men and women.

- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).

- **BREAST FEEDING** Avoid—no information available.

- **MONITORING REQUIREMENTS**
  - Monitor for symptoms of progressive multifocal leuкоencephalopathy (presenting as new or worsening neurological, cognitive or behavioural signs or symptoms).
  - Monitor for new or worsening abdominal pain—investigate and withhold treatment if acute pancreatitis suspected and discontinue if confirmed (fatal cases reported).
  - Monitor for pulmonary toxicity—treat symptoms promptly.
  - Routinely monitor hepatic function.
  - Monitor for infusion-related (including anaphylactic) reactions.
  - Monitor for signs of peripheral neuropathy—consult product literature for treatment adjustment.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Powder for solution for infusion
    - Electrolytes: May contain Sodium
    - Adcetris (Takeda UK Ltd)
      - Brentuximab vedotin 50 mg: Adcetris 50mg powder for concentrate for solution for infusion vials | 1 vial (£2,500.00)

Cetuximab

- **INDICATIONS AND DOSE**
  Treatment of wild-type RAS metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor, as combination therapy, or as monotherapy if oxaliplatin- and irinotecan-based therapy has failed or if irinotecan is not tolerated. Treatment of locally advanced squamous cell cancer of the head and neck (in combination with radiotherapy). Treatment of recurrent or metastatic squamous cell cancer of the head and neck (in combination with platinum-based chemotherapy)
  - **BY INTRAVENOUS INFUSION**
  - Adult (initiated by a specialist): (consult product literature or local protocols)

- **SIDE-EFFECTS**
  - Common or very common: Abdominal pain, anorexia, anxiety, arthralgia, cholangitis, constipation, cough, dehydration, diarrhoea, dizziness, dyspepsia, dysphonia, electrolyte disturbances, flatulence, flushing, haematuria, headache, hyperglycaemia, hypertension, hypotension, hypoxia, ileus, infection, insomnia, leucocyturia, myalgia, pleural effusion, proteinuria, rash, skin reactions, sweating, tachycardia, vertigo
  - Uncommon: Acute renal failure, gastro-intestinal haemorrhage, intestinal obstruction, seizures

- **FREQUENCY NOT KNOWN**
  - Alopecia, bone-marrow suppression, extravasation, hyperuricaemia, infusion related side-effects, nausia, oral mucositis, thromboembolism, tumour lysis syndrome, vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Infusion-related side-effects: Infusion-related side-effects have been reported with catumaxomab; premedication with analgesics, antipyretics, or NSAIDs is recommended by the manufacturer.

- **CONCEPTION AND CONTRACEPTION**
  - Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **PREGNANCY**
  - Avoid—limited information available.

- **BREAST FEEDING**
  - Avoid—limited information available.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Solution for infusion**
  - **Removab** (Neovii Biotech GmbH)
    - Catumaxomab 100 microgram per 1 ml: Removab 50micrograms/0.5ml concentrate for solution for infusion pre-filled syringes | 1 pre-filled disposable injection (£550.00) (Hospital only)
    - Removab 10micrograms/0.1ml concentrate for solution for infusion pre-filled syringes | 1 pre-filled disposable injection (£10.00) (Hospital only)

Catumaxomab

- **INDICATIONS AND DOSE**
  Treatment of malignant ascites in patients with epithelial cell adhesion molecule (EpCAM) positive carcinomas, where standard therapy is not available or no longer feasible
  - **BY INTRAPERITONEAL INFUSION**
  - Adult: (consult product literature)

- **CAUTIONS** Haemodynamic insufficiency, hypoproteinaemia, oedema

- **INTERACTIONS** 
  - Appendix 1: monoclonal antibodies

- **MEDICAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder for solution for infusion**
    - Electrolytes: May contain Sodium
    - **Adcetris** (Takeda UK Ltd)
      - Brentuximab vedotin 50 mg: Adcetris 50mg powder for concentrate for solution for infusion vials | 1 vial (£2,500.00)

- **IMPORTANT SAFETY INFORMATION**
  - MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)
    - Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative
Cetuximab for metastatic colorectal cancer

**CONTRA-INDICATIONS** Combination of cetuximab with oxaliplatin-containing chemotherapy is contra-indicated in patients with metastatic colorectal cancer who have mutant or unknown RAS status. RAS mutated colorectal tumours (or if RAS tumour status unknown)

**CAUTIONS** Cardiopulmonary disease, cardiovascular disease, history of keratitis, pulmonary disease—discontinue if interstitial lung disease, risk factors for keratitis, severe dry eye, ulcerative keratitis (including contact lens use)

**INTERACTIONS** → Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**

- Common or very common: Acne, aseptic meningitis, blepharitis, bronchospasm, chill, conjunctivitis, desquamation, diarrhoea, dizziness, dry skin, dyspnoea, fever, headache, hypertension, hypertrichosis, hypocalcaemia, hypomagnesaemia, hypotension, infusion-related reactions, keratitis, nail disorders, nausea, pruritus, rash, severe (sometimes fatal) hypersensitivity reactions (possibly delayed onset), shock, skin reactions, urticaria, vomiting

- Very rare: Stevens-Johnson syndrome, toxic epidermal necrolysis

**CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytoxic drugs p 825

**PREGNANCY** Use only if potential benefit outweighs risk—no information available. See also Pregnancy and reproductive function in Cytoxic drugs p 825

**BREAST FEEDING** Avoid breast-feeding during and for 2 months after treatment—no information available.

**PRE-TREATMENT SCREENING** Evidence of non-mutated (wild-type) RAS status (at exons 2, 3 and 4 of KRAS and NRAS) is required before cetuximab is initiated for the treatment of metastatic colorectal cancer, and should be determined by an experienced laboratory using a validated test method.

**DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Cetuximab for the treatment of locally advanced squamous cell cancer of the head and neck (June 2008) NICE TA145
  Cetuximab in combination with radiotherapy is an option for the treatment of locally advanced squamous cell cancer of the head and neck in patients who have a Karnofsky performance status of 90% or greater and when all forms of platinum-based chemoradiotherapy treatment are contra-indicated.
  www.nice.org.uk/TA145

- Cetuximab for the treatment of recurrent or metastatic squamous cell cancer of the head and neck (June 2009) NICE TA172
  Cetuximab in combination with platinum-based chemotherapy is not recommended for the treatment of recurrent or metastatic squamous cell cancer of the head and neck.
  www.nice.org.uk/TA172

- Cetuximab for the first-line treatment of metastatic colorectal cancer (August 2009) NICE TA176
  Cetuximab in combination with fluorouracil, folinic acid and oxaliplatin is an option for the first-line treatment of metastatic colorectal cancer under the following circumstances:
  - the primary tumour has been resected or is potentially resectable;
  - the metastatic disease is confined to the liver and is unresectable; and
  - the patient is fit to undergo surgery to resect the primary colorectal tumour and to undergo liver surgery if the metastases become resectable after treatment with cetuximab.

In patients unable to tolerate oxaliplatin, or in whom oxaliplatin is contra-indicated, cetuximab in combination with fluorouracil, folinic acid and irinotecan can be used as an alternative.

In addition, the manufacturer is required to rebate 16% of the amount of cetuximab used per patient when used in combination with fluorouracil, folinic acid, and oxaliplatin.

Patients who meet the above criteria should receive cetuximab for no more than 16 weeks. At 16 weeks, cetuximab should be stopped and the patient should be assessed for resection of liver metastases.

www.nice.org.uk/TA176

- Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242
  Cetuximab monotherapy or combination chemotherapy is not recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy.
  www.nice.org.uk/TA242

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium (SMC) has advised (December 2014) that cetuximab (Erbitux®) is accepted for restricted use within NHS Scotland, in combination with irinotecan or oxaliplatin-based chemotherapy, for the treatment of RAS wild-type metastatic colorectal cancer in patients who have not previously received chemotherapy for their metastatic disease (first-line treatment).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- Erbitux (Merck Serono Ltd)
  Cetuximab 5 mg per 1 ml Erbitux 100mg/20ml solution for infusion vials | 1 vial (PoMr £178.10 (Hospital only))
  Erbitux 500mg/100ml solution for infusion vials | 1 vial (PoMr £890.50 (Hospital only))

**Daratumumab**

12-Apr-2017

- **DRUG ACTION** Daratumumab is a monoclonal antibody that binds to CD38, a cell-surface protein, resulting in tumour cell death by immune-mediated actions and apoptosis.

- **INDICATIONS AND DOSE**
  **Treatment of relapsed and refractory multiple myeloma**
  (as monotherapy after failure of a proteasome inhibitor and an immunomodulatory agent) (specialist use only)
  - **BY INTRAVENOUS INFUSION**
    - Adult: 16 mg/kg once weekly for weeks 1 to 8, then 16 mg/kg every 2 weeks for weeks 9 to 24, then 16 mg/kg every 4 weeks for week 25 onwards until disease progression, for dose adjustments due to side-effects and infusion-related reactions—consult product literature

- **CAUTIONS** History of obstructive pulmonary disorder (consider additional post-medication—consult product literature); patients may need pre-medication to minimise adverse reactions; risk of herpes zoster reactivation (consider antiviral prophylaxis)
Elotuzumab

07-Apr-2017

**DRUG ACTION** Elotuzumab is a monoclonal antibody that targets the signalling lymphocytic activation molecule family member 7 (SLAMF7) protein, thereby activating natural killer cells and mediating myeloma cell death.

**INDICATIONS AND DOSE**

Multiple myeloma in patients who have received at least one prior therapy (in combination with lenalidomide and dexamethasone) (specialist use only)

- **BY INTRAVENOUS INFUSION**
  - Adult: 10 mg/kg every week, on days 1, 8, 15 and 22 of cycles 1 and 2, then 10 mg/kg every 2 weeks, on days 1 and 15 of subsequent cycles

**CAUTIONS**

Pre-medication must be administered to minimise the development of infusion-related reactions—consult product literature; secondary primary malignancies

**CAUTIONS, FURTHER INFORMATION**

Secondary primary malignancies. Manufacturer advises to monitor for the development of secondary primary malignancy before and during treatment with elotuzumab.

**INTERACTIONS** → Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**

- Common or very common Chest pain, cough, deep vein thrombosis, diarrhoea, fatigue, headache, herpes zoster, hypoaesthesia, infusion-related reactions, lymphopenia, mood changes, nasopharyngitis, night sweats, oropharyngeal pain, pneumonia, pyrexia, upper respiratory tract infection, weight loss

**SIDE-EFFECTS, FURTHER INFORMATION**

Side-effects reported when used in combination with lenalidomide and dexamethasone.

Infusion-related reactions. Manufacturer advises for mild-to-moderate infusion reactions interrupt treatment or reduce infusion rate, and monitor closely (consult product literature); permanently discontinue therapy in severe infusion reactions.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men and women of childbearing potential; male patients should continue effective contraceptive measures for 180 days after stopping treatment if their partner is pregnant or of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**PREGNANCY** Manufacturer advises avoid unless essential—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**EFFECT ON LABORATORY TESTS** Possible positive indirect Coombs test (may affect antibody screening).

**HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage advice following dilution.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (January 2017) that daratumumab (Darzalex) is not recommended for use within NHS Scotland as monotherapy for the treatment of adult patients with relapsed and refractory multiple myeloma, whose prior therapy included a proteasome inhibitor and an immunomodulatory agent and who have demonstrated disease progression on the last therapy, as insufficient clinical analysis was submitted and the economic case was not demonstrated. This advice takes account of the views from a Patient and Clinician Engagement (PACE) meeting.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

**EXCIPIENTS:** May contain Polysorbates, sucrose  
**ELECTROLYTES:** May contain Sodium  
**Darzalex (Janssen-Cilag Ltd)**  
Darzatumab 20mg per 1ml Darzalex 100mg/5ml concentrate for solution for infusion vials | 1 vial (£360.00)

**Ipilimumab**

- **DRUG ACTION** Ipilimumab causes T-cell activation.

- **INDICATIONS AND DOSE**
  - Treatment of unresectable or metastatic advanced melanoma
    - **BY INTRAVENOUS INFUSION**
    - **Adult:** (consult product literature)

- **CAUTIONS, FURTHER INFORMATION**
  - For full details consult product literature.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

- **SIDE-EFFECTS** Infusion-related side-effects

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - For further information on side-effects, (including monitoring and management of side effects) consult product literature.
  - Immune-related reactions: A corticosteroid can be used after starting ipilimumab, to treat immune-related reactions.

- **CONCEPTION AND CONTRACEPTION** Use effective contraception.

- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).

- **BREAST FEEDING** Discontinue breast-feeding—no information available.

- **HEPATIC IMPAIRMENT** Use with caution if plasma-bilirubin concentration greater than 3 times upper limit of normal range or if plasma-transaminase concentration 5 times or greater than the upper limit of normal range.

- **MONITORING REQUIREMENTS** For information on monitoring of side effects, consult product literature.

- **PRESCRIBING AND DISPENSING INFORMATION** Infusion-related side-effects have been reported; premedication with paracetamol and an antihistamine is recommended.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  NICE technology appraisals (TAs)
  - Ipilimumab for previously untreated advanced (unresectable or metastatic) melanoma (July 2014) NICE TA319
    - Ipilimumab is recommended, within its marketing authorisation, as an option for treating adults with previously untreated advanced (unresectable or metastatic) melanoma, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.
    - [www.nice.org.uk/TA319](http://www.nice.org.uk/TA319)
  - Ipilimumab for previously treated advanced (unresectable or metastatic) melanoma (December 2012) NICE TA268
    - Ipilimumab is recommended as an option for the treatment of advanced (unresectable or metastatic) melanoma in patients who have received prior therapy, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.
    - [www.nice.org.uk/TA268](http://www.nice.org.uk/TA268)
  - Nivolumab in combination with ipilimumab for treating advanced melanoma (July 2016) NICE TA400
    - Nivolumab in combination with ipilimumab is recommended, within its marketing authorisation, as a treatment option for advanced (unresectable or metastatic) melanoma in adults, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.
    - [www.nice.org.uk/TA400](http://www.nice.org.uk/TA400)

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (March 2013) that ipilimumab (Yervoy®) is accepted for restricted use within NHS Scotland for the treatment of advanced (unresectable or metastatic) melanoma in adults who have received prior therapy, only whilst ipilimumab is available at the price agreed in the patient access scheme.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Solution for infusion**

  **ELECTROLYTES:** May contain Sodium

  ▶ Yervoy (Bristol-Myers Squibb Pharmaceuticals Ltd)
    - Ipilimumab 5 mg per 1 ml Yervoy 50mg/10ml concentrate for solution for infusion vials | 1 vial (£150.00 (Hospital only))
    - Yervoy 200mg/40ml concentrate for solution for infusion vials | 1 vial (£15,000.00 (Hospital only))

---

**Necitumumab**

21-Feb-2017

- **DRUG ACTION** Necitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR).

- **INDICATIONS AND DOSE**
  - Locally advanced or metastatic epidermal growth factor receptor expressing squamous non-small-cell lung cancer, in patients who have not received previous chemotherapy (in combination with gemcitabine and cisplatin) (specialist use only)
    - **BY INTRAVENOUS INFUSION**
      - Adult: 800 mg once daily on days 1 and 8 of a 3-week cycle, for up to 6 cycles, patients whose disease has not progressed after combination therapy may continue with necitumumab monotherapy, for dose adjustments due to infusion-related reactions or skin reactions—consult product literature

- **CAUTIONS, FURTHER INFORMATION**
  - Cardiorespiratory disorders (no information available) - history of thromboembolic events - patients may need pre-medication to minimise the development of infusion-related and skin reactions (consult product literature) - risk factors for thromboembolic events

  **CAUTIONS, FURTHER INFORMATION**
  - Thromboembolic events
    - Manufacturer advises that necitumumab should not be administered to patients with multiple risk factors for thromboembolic events unless the benefits outweigh the risks. Thromboprophylaxis should be considered after assessment of a patient’s risk factors.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

- **SIDE-EFFECTS**
  - Common or very common: Conjunctivitis - dysphagia - dysuria - electrolyte disturbances - epistaxis - haemoptysis - headache - hypomagnesaemia (severe) - infusion-related reactions - mouth ulceration - muscle spasms - oropharyngeal pain - phlebitis - pyrexia - skin reactions - stomatitis - taste disturbance - thromboembolic events - urinary tract infection - vomiting - weight loss
  - Frequency not known: Cardiorespiratory arrest - eyelash growth

- **CONCEPTION AND CONTRACEPTION**
  - Manufacturer advises women of child-bearing potential should use effective contraception during and for 3 months after treatment.

- **PREGNANCY**
  - Manufacturer advises avoid unless potential benefit outweighs risk—limited information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- **BREAST FEEDING**
  - Manufacturer advises avoid during treatment and for at least 4 months after the last dose—no information available.

- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor patients during and following each infusion for signs of hypersensitivity and infusion-related reactions; monitor electrolytes (including magnesium, potassium and calcium) prior to each infusion and after completion of treatment, until within normal limits—correct any electrolyte disturbance promptly.
Nivolumab is a human immunoglobulin G monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor thereby potentiating an immune response to tumour cells.

**INDICATIONS AND DOSE**

**Treatment of unresectable or metastatic advanced melanoma in combination with ipilimumab**

- **BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature)

**Treatment of unresectable or metastatic advanced melanoma (as monotherapy)**

- **TREATMENT OF LOCAL ADVANCED OR METASTATIC NON- small-cell lung cancer after prior chemotherapy**

- **TREATMENT OF ADVANCED RENAL CELL CARCINOMA AFTER PRIOR THERAPY (AS MONOTHERAPY)**

- **BY INTRAVENOUS INFUSION**
  - Adult: 3 mg/kg every 2 weeks, consult product literature for information on dose adjustments based on individual patient safety and tolerability

**CAUTIONS**

Patients may need pre-medications to minimise the development of infusion-related reactions

**INTERACTIONS**

- Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, alopecia, arthralgia, blurred vision, constipation, cough, decreased appetite, diarrhoea, dizziness, dry eyes, dry mouth, dry skin, dyspnoea, erythema, headache, hyperglycaemia, hypertension, infusion-related reactions

- **Common or very common** Malaise, musculoskeletal pain, nausée, oedema, peripheral neuropathy, pneumonitis, pruritus, pyrexia, rash, stomatitis, thyroid disorders, upper respiratory tract infection, vitiligo, vomiting

- **Uncommon** Adrenal insufficiency, anaphylactic reaction, arthritis, chest pain, dehydration, diabetic ketoacidosis, eosinophilia, erythema multiforme, hepatitis, hyperbilirubinaemia, hypophysitis, hypopituitarism, metabolic acidosis, pancreatitis, pleural effusion, polymyalgia rheumatica, polyneuropathy, psoriasis, renal failure, rosacea, tachycardia, tubulointerstitial nephritis, urticaria, uraemia, vasculitis

- **Rare** Arrhythmias, autoimmune neuropathy, cholestasis, demyelination, diabetes mellitus, duodenal ulcer, gastritis, Guillain-Barré syndrome, histiocytic necrotising lymphadenitis, lung infiltration, myasthenic syndrome, myopathy, toxic epidermal necrolysis

- **Frequency not known** Cardiac adverse events

**SIDE-EFFECTS, FURTHER INFORMATION**

Side effects listed are reported when nivolumab is used as monotherapy; if combination therapy used, consult product literature for further information.

**Immune-related reactions**

Manufacturer advises that most immune-related adverse reactions improved or resolved with appropriate management, including initiation of corticosteroids and treatment modiftings—consult product literature for further information.

**Infusion-related reactions**

Manufacturer advises that patients with mild or moderate infusion reactions may continue treatment with close monitoring and use of premedication according to local guidelines; discontinue treatment if severe infusion reactions occur.

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises effective contraception required during treatment and for at least 5 months after treatment in women of childbearing potential.

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

Manufacturer advises use with caution in moderate to severe impairment—limited information available.

**MONITORING REQUIREMENTS**

Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions, cardiac and pulmonary reactions, and electrolyte disturbances before and periodically during treatment. Patients should be monitored for adverse reactions for at least 5 months after the last dose.

**DIRECTIONS FOR ADMINISTRATION**

Manufacturer advises for intermittent intravenous infusion, give undiluted or dilute to a concentration of not less than 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 60 minutes through an in-line filter (pore size 0.2–1.2 micron).

**HANDLING AND STORAGE**

Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for storage conditions after preparation of the infusion.

**PATIENT AND CARER ADVICE**

Patients should be provided with a patient alert card with each prescription.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Nivolumab for treating advanced (unresectable or metastatic) melanoma (February 2016) NICE T384

  Nivolumab as monotherapy is recommended, within its marketing authorisation, as a treatment option for advanced (unresectable or metastatic) melanoma in adults.

  - Nivolumab 16 mg per 1 ml Portrazza 800mg/50ml concentrate for solution for infusion vials | 1 vial (Polv) £1,450.00 (Hospital only)

**Nivolumab 23-Mar-2017**
Nivolumab in combination with ipilimumab for treating advanced melanoma (July 2016) NICE TA400

Nivolumab in combination with ipilimumab is recommended, within its marketing authorisation, as a treatment option for advanced (unresectable or metastatic) melanoma in adults, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.

http://www.nice.org.uk/TA400

Nivolumab for previously treated advanced renal cell carcinoma (November 2016) NICE TA417

Nivolumab is recommended, within its marketing authorisation, as a treatment option for previously treated advanced renal cell carcinoma in adults, only if the manufacturer provides nivolumab with the discount agreed in the patient access scheme.

http://www.nice.org.uk/TA417

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (July 2016) that nivolumab (Opdivo®) is accepted for use within NHS Scotland for the treatment of locally advanced or metastatic squamous non-small cell lung cancer after prior chemotherapy in adults; it has also advised (August 2016) that nivolumab (Opdivo®) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults previously untreated with ipilimumab and (October 2016) for restricted use for the treatment of locally advanced or metastatic non-squamous non-small cell lung cancer after prior chemotherapy in adults, subject to a 2-year clinical stopping rule. It has also advised (November 2016) that nivolumab (Opdivo®) is accepted for restricted use within NHS Scotland in combination with ipilimumab for the first-line treatment of advanced (unresectable or metastatic) melanoma in adults. This advice is contingent upon the continuing availability of the Patient Access Scheme (PAS) in NHS Scotland or a list price that is equivalent or lower.

The Scottish Medicines Consortium has advised (November 2016) that nivolumab (Opdivo®) is not recommended within NHS Scotland as monotherapy for the treatment of advanced renal cell carcinoma after prior therapy in adults as the economic case was not demonstrated.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

Obinutuzumab

21-Apr-2017

- **INDICATIONS AND DOSE**
  - Treatment of previously untreated chronic lymphocytic leukaemia in patients for whom full-dose fludarabine-based therapy is unsuitable due to co-morbidities
  - By INTRavenous INFUSION
  - Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS**
  - For obinutuzumab contra-indications, consult product literature.

- **CAUTIONS**
  - CAUTIONS, FURTHER INFORMATION
  - For full details on the cautions of obinutuzumab, consult product literature.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Hepatitis B infection and reactivation
  - Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking obinutuzumab. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).
  - INTERACTIONS ▶ Appendix 1: monoclonal antibodies
  - SIDE-EFFECTS For full side effect details for obinutuzumab (including monitoring and management), consult product literature.
  - CONCEPTION AND CONTRACEPTION Use effective contraception during and for 18 months after treatment.
  - PREGNANCY Avoid unless potential benefit outweighs risk of B-lymphocyte depletion in fetus.
  - BREAST FEEDING Avoid breast-feeding during and for 18 months after treatment—present in milk in animal studies.
  - MONITORING REQUIREMENTS Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).
  - PRESCRIBING AND DISPENSING INFORMATION Infusion related side-effects have been reported; Patients should receive premedication with paracetamol, an antihistamine, and a corticosteroid before each dose—consult product literature for details.

Scottish Medicines Consortium (SMC) Decisions

NICE technology appraisals (TAs)

- Obinutuzumab in combination with chlorambucil for untreated chronic lymphocytic leukaemia (June 2015) NICE TA343
  - Obinutuzumab, in combination with chlorambucil, is an option for untreated chronic lymphocytic leukaemia in patients who have comorbidities that make full-dose fludarabine-based therapy unsuitable for them, only if: bendamustine-based therapy is not suitable and the manufacturer provides obinutuzumab with the discount agreed in the patient access scheme.
  - Patients currently receiving obinutuzumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.
  - http://www.nice.org.uk/TA343

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (March 2017) that obinutuzumab (Gazyvaro®) is accepted for use within NHS Scotland in combination with bendamustine followed by obinutuzumab maintenance for the treatment of patients with follicular lymphoma who did not respond or who progressed during or up to six months after treatment with rituximab or a rituximab-containing regimen. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Gazyvaro (Roche Products Ltd) ▼
  - Obinutuzumab 25 mg per 1 ml Gazyvaro 1000mg/40ml concentrate for solution for infusion vials | 1 vial [POW] £3,312.00 (Hospital only)
**Ofatumumab**

**INDICATIONS AND DOSE**
Treatment of chronic lymphocytic leukaemia (CLL) in patients refractory to fludarabine and alemtuzumab | Treatment of CLL in patients who have not received prior therapy and who are not eligible for fludarabine based therapy (in combination with chlorambucil or bendamustine)

- BY INTRAVENOUS INFUSION
- Adult: Premedication must be given 30 minutes to 2 hours before each dose—consult product literature for details

**CONTRA-INDICATIONS** For full details on the contra-indications for ofatumumab, consult product literature.

**CAUTIONS** History of cardiac disease—monitor closely and discontinue treatment if cardiac arrhythmias occur

**CAUTIONS, FURTHER INFORMATION** For full details about the cautions for ofatumumab, consult product literature

- Hepatitis B infection and reactivation: Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking ofatumumab. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

**INTERACTIONS** → Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related side-effects (including cytokine release syndrome) have been reported with ofatumumab; premedication with paracetamol, an antihistamine, and a corticosteroid must be given—consult product literature.

For full details (including monitoring and management of side-effects) consult product literature.

**CONCEPTION AND CONTRACEPTION** Use effective contraception during and for 12 months after treatment.

**PREGNANCY** Avoid unless potential benefit outweighs risk.

**BREAST FEEDING** Discontinue breast-feeding during and for 12 months after treatment—no information available.

**RENAL IMPAIRMENT** No information available for creatinine clearance less than 30 mL/minute.

**MONITORING REQUIREMENTS**
- Monitor electrolytes (including potassium and magnesium) before and during administration and correct if abnormal.
- Patients must be monitored closely during each infusion for the onset of infusion reactions.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Ofatumumab for the treatment of chronic lymphocytic leukaemia refractory to fludarabine and alemtuzumab (October 2010) NICE TA202

Ofatumumab is not recommended for the treatment of chronic lymphocytic leukaemia that is refractory to fludarabine and alemtuzumab.

Patients currently receiving ofatumumab for this condition should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA202

- Ofatumumab in combination with chlorambucil or bendamustine for untreated chronic lymphocytic leukaemia (June 2015) NICE TA344

Ofatumumab in combination with chlorambucil is an option for untreated chronic lymphocytic leukaemia only if:
- the person is ineligible for fludarabine-based therapy and
- bendamustine is not suitable and
- the manufacturer provides ofatumumab with the discount agreed in the patient access scheme.

Patients currently receiving ofatumumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA344

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (April 2015) that ofatumumab (Arzerra®) is accepted for restricted use within NHS Scotland for the treatment of chronic lymphocytic leukaemia in patients who have not received prior therapy and who are not eligible for fludarabine-based therapy. It is restricted to use in patients who would not be considered for bendamustine therapy and who would receive chlorambucil-based therapy.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

**ELECTROLYTES:** May contain Sodium
- Arzerra (Novartis Pharmaceuticals UK Ltd)
  - Ofatumumab 20 mg per 1 ml Arzerra 100mg/5ml concentrate for solution for infusion vials | 3 vial(s) £54.00 (Hospital only)
  - Arzerra 1000mg/50ml concentrate for solution for infusion vials | 1 vial(s) £1,820.00 (Hospital only)
- Panitumumab
  - BY INTRAVENOUS INFUSION
  - Adult: (consult product literature)

**Panitumumab**

**DRUG ACTION** Panitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR).

**INDICATIONS AND DOSE**
Treatment of non-mutated RAS metastatic colorectal cancer (combination therapy) | Treatment of non-mutated RAS metastatic colorectal cancer (monotherapy after failure of fluoropyrimidine-, oxaliplatin-, and irinotecan-containing chemotherapy regimens)

- BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: SEVERE SKIN REACTIONS**
Severe skin reactions have been reported very commonly in patients treated with panitumumab. Patients receiving panitumumab who have severe skin reactions or develop worsening skin reactions should be monitored for the development of inflammatory or infectious sequelae (including cellulitis, sepsis, and necrotising fasciitis). Appropriate treatment should be promptly initiated and panitumumab withheld or discontinued.

**MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS**

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and
symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

**CONTRA-INDICATIONS** Interstitial pulmonary disease - the combination of panitumumab with oxaliplatin-containing chemotherapy is contra-indicated in patients with mutant RAS metastatic colorectal cancer or for whom RAS status is unknown.

**CAUTIONS** History of keratitis - history of severe dry eye - history of ulcerative keratitis - pulmonary disease—discontinue if interstitial lung disease develops - risk factors for keratitis - risk factors for severe dry eye - risk factors for ulcerative keratitis (including contact lens use)

**INTERACTIONS** → Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**
- **Common or very common** Anorexia - anxiety - back pain - biochemical disturbances - cellulitis - chills - cough - deep vein thrombosis - dyspepsia - dysphagia - electrolyte disturbances - epistaxis - eyelash growth - flushing - folliculitis - gastro-oesophageal reflux disease - hyperhydrosis - insulinoma - malaise - pain in extremities - peripheral oedema - pulmonary embolism - pyrexia - rectal haemorrhage - severe hypersensitivity reactions (possibly delayed) - urinary tract infection - weight loss
- **Uncommon** Bronchospasm - cyanosis - hirsutism - infusion-related reactions - nasal dryness
- **Rare** Keratitis - skin necrosis - Stevens-Johnson syndrome - toxic epidermal necrolysis

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 6 months after treatment.

**PREGNANCY** Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

** BREAST FEEDING** Manufacturer advises avoid breastfeeding during and for 2 months after treatment.

**PRE-TREATMENT SCREENING** Evidence of non-mutated RAS status (at exons 2, 3 and 4 of KRAS and NRAS) is required before panitumumab treatment is initiated, and should be determined by an experienced laboratory using a validated test method.

**MONITORING REQUIREMENTS**
- Monitor for hypomagnesaemia.
- Monitor for hypocalcaemia.
- Monitor for dermatological reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis (consult product literature).

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (Tas)**
- Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242
Panitumumab monotherapy is not recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy. www.nice.org.uk/TA242

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**
- ELECTROLYTES: May contain Sodium
  - Vectibix (Amgen Ltd)
  - Panitumumab 20 mg per 1 ml
    - Vectibix 400mg/20ml concentrate for solution for infusion vials | 1 vial (PST) £1,517.16 (Hospital only)
  - Vectibix 100mg/5ml concentrate for solution for infusion vials | 1 vial (PST) £379.29 (Hospital only)

**Pembrolizumab**

**DRUG ACTION** Pembrolizumab is a monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor, thereby potentiating an immune response to tumour cells.

**INDICATIONS AND DOSE**
- **Treatment of unresectable or metastatic advanced melanoma**
  - **BY INTRAVENOUS INFUSION**
  - **Adult:** 2 mg/kg every 3 weeks

**CAUTIONS** Patients may need pretreatment to minimise the development of adverse reactions (consult product literature)

**INTERACTIONS** → Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain - alopecia - arthritis - blood dyscrasia - changes in hair colour - chills - colitis - constipation - cough - decreased appetite - depigmentation - diarrhoea - dizziness - dry eye - dry mouth - dry skin - eczema - erythema - headache - hepatitis - influenza-like symptoms - infusion-related reactions - insomnia - malaise - musculoskeletal pain - myositis - nausea - oedema - peripheral neuropathy - pneumonitis - pruritus - pyrexia - rash - shortness of breath - taste disturbances - thyroid dysfunction - vomiting
- **Rare** Guillain–Barré syndrome - myasthenic syndrome - small intestinal perforation

**SIDE-EFFECTS, FURTHER INFORMATION**
- Immune-related reactions: Most immune-related adverse reactions are reversible and managed by temporarily stopping treatment and administration of a corticosteroid—consult product literature for further information.
- Infusion-related reactions: Manufacturer advises to permanently discontinue treatment in patients with severe infusion reactions.

**CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment and for at least 4 months after treatment in women of childbearing potential.

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available

** BREAST FEEDING** Manufacturer advises avoid—no information available.

**MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Keytruda®), give intermittently in Sodium chloride 0.9% or Glucose 5%. Reconstitute each 50 mg vial with 2.3 mL water for injection, to produce a 25 mg/mL solution. Gently swirl without shaking to dissolve, and allow up to 5 minutes for the bubbles to clear. Withdraw the required
818 Antibody responsive malignancy

handling and storage
Manufacturer advises store in a refrigerator at 2–8°C.

patient and carer advice
Patients should be provided with an alert card and advised to keep it with them at all times.

national funding/access decisions

NICe technology appraisals (TAs)

Pembrolizumab for treating advanced melanoma after disease progression with ipilimumab (October 2015) NICe TA357

Pembrolizumab is recommended as an option for treating advanced (unresectable or metastatic) melanoma only if:
- the disease has progressed with ipilimumab and, for BRAF V600 mutation-positive disease, a BRAF or MEK inhibitor and
- the manufacturer provides pembrolizumab with the discount agreed in the patient access scheme.

NICe.org.uk/guidance/TA357

Pembrolizumab for advanced melanoma not previously treated with ipilimumab (November 2015) NICe TA366

Pembrolizumab is recommended as an option for treating advanced (unresectable or metastatic) melanoma that has not been previously treated with ipilimumab, only if the manufacturer provides pembrolizumab with the discount agreed in the patient access scheme.

NICe.org.uk/guidance/TA366

Pembrolizumab for treating PD-L1-positive non-small-cell lung cancer after chemotherapy (January 2017) NICe TA428

Pembrolizumab is recommended as an option for treating locally advanced or metastatic PD-L1-positive non-small-cell lung cancer in adults who have had at least one chemotherapy (and targeted treatment) if they have an epidermal growth factor receptor (EGFR)- or anaplastic lymphoma kinase (ALK)-positive tumour, only if:
- pembrolizumab is stopped at 2 years of uninterrupted treatment and no documented disease progression, and
- the manufacturer provides pembrolizumab with the discount agreed in the patient access scheme, which has been revised in the context of this appraisal. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they or their clinician consider it appropriate to stop.

NICe.org.uk/guidance/TA428

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (November 2015) that pembrolizumab (Keytruda®) is accepted for use within NHS Scotland as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults previously untreated with ipilimumab. The advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

The Scottish Medicines Consortium has advised (December 2016) that pembrolizumab (Keytruda®) is not recommended for use within NHS Scotland as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults previously treated with ipilimumab as the economic case was not demonstrated.

The Scottish Medicines Consortium has advised (January 2017) that pembrolizumab (Keytruda®) is accepted for restricted use within NHS Scotland for the treatment of locally advanced or metastatic non-small cell lung carcinoma (NSCLC) in adults whose tumours express programmed death ligand 1 (PD-L1) and who have received at least one prior chemotherapy regimen, subject to a two-year clinical stopping rule. The advice is contingent upon the continuing availability of pembrolizumab at the price agreed in the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

NICe.org.uk/guidance/TA428

Pembrolizumab 50 mg Keytruda 50mg powder for concentrate for solution for infusion vials | 1 vial (£815.00 (Hospital only)

Pertuzumab

Drug action
Pertuzumab is a recombinant humanised monoclonal antibody, and acts by inhibiting human epidermal growth factor receptor 2 protein (HER2) dimerisation.

indications and dose
Treatment of HER2-positive metastatic or locally recurrent unresectable breast cancer in combination with trastuzumab and docetaxel, in patients who have not received previous anti-HER2 therapy or chemotherapy (initiated by a specialist)

By intravenous infusion

Adult: (consult product literature)

Caution
Conditions that could impair left ventricular function - history of congestive heart failure - impaired left ventricular function - prior anthracycline exposure - radiotherapy to the chest area - recent myocardial infarction - serious cardiac arrhythmia - uncontrolled hypertension

Interactions
Appendix 1: monoclonal antibodies

Side-effects
Common or very common

Uncommon
- Interstitial lung disease
- Frequency not known
- Alopecia - bone-marrow suppression • extravasation • hyperuricaemia • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting

Side-effects, further information
Side effects mostly described for pertuzumab in combination with trastuzumab and docetaxel.

Conception and contraception
Ensure effective contraception during and for six months after treatment in women of childbearing potential.

Pregnancy
Avoid (toxicity in animal studies). Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Breast feeding
Avoid—no information available.

Hepatic impairment
Caution—no information available.

Renal impairment
Caution in severe impairment—no information available.

Monitoring requirements
Assess for signs and symptoms of congestive heart failure (including left ventricular ejection fraction) before and

818 Antibody responsive malignancy BNF 74

Immune system and malignant disease

downloaded from www.medicalbr.com
Monitor for febrile neutropenia.
- **DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Pertuzumab for the neoadjuvant treatment of HER2-positive breast cancer (December 2016) NICE TA424
      Pertuzumab, in combination with trastuzumab and chemotherapy, is recommended, within its marketing authorisation, as an option for neoadjuvant treatment in adults with human epidermal growth factor receptor 2 (HER2-positive), locally advanced, inflammatory or early-stage breast cancer at high risk of recurrence, only if the manufacturer provides it with the discount agreed in the patient access scheme.
    - **Scottish Medicines Consortium (SMC) Decisions**
      - The Scottish Medicines Consortium (SMC) has advised (December 2016) that pertuzumab (Perjeta®) is not recommended for use within NHS Scotland in combination with trastuzumab and chemotherapy for the neoadjuvant treatment of patients with human epidermal growth factor receptor 2 (HER2)-positive, locally advanced, inflammatory, or early stage breast cancer at high risk of recurrence, as the economic case was not demonstrated.
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
- **Solution for infusion**
  - **Perjeta** (Roche Products Ltd)
    - Pertuzumab 30 mg per 1 ml
  - **NICE TA424**
    - Adult: 8 mg/kg every 2 weeks, dose to be administered prior to FOLFIRI administration, consult product literature for dose adjustments due to side-effects and infusion-related reactions
    - Adult: 10 mg/kg on day 1 of a 21 day cycle, dose to be administered prior to docetaxel infusion, consult product literature for dose adjustments due to side-effects and infusion-related reactions

---

**Treatment of metastatic colorectal cancer, in combination with FOLFIRI (irinotecan, fluorouracil and folinic acid), in patients with disease progression on, or after, prior therapy with bevacizumab, oxaliplatin and a fluoropyrimidine**
- **BY INTRAVENOUS INFUSION**
  - Adult: 8 mg/kg every 2 weeks, dose to be administered prior to FOLFIRI administration, consult product literature for dose adjustments due to side-effects and infusion-related reactions

**Treatment of locally advanced or metastatic non-small cell lung cancer, in combination with docetaxel, in patients with disease progression after platinum-based chemotherapy**
- **BY INTRAVENOUS INFUSION**
  - Adult: 10 mg/kg on day 1 of a 21 day cycle, dose to be administered prior to docetaxel infusion, consult product literature for dose adjustments due to side-effects and infusion-related reactions

- **CAUTIONS** Elective surgery—discontinue treatment for at least 4 weeks prior to surgery; hypertension—must be controlled before initiation; impaired wound healing—discontinue treatment until wound fully healed; pre-treatment is recommended to minimise the development of adverse reactions (consult product literature) risk of bleeding
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain; diarrhoea; epistaxis; gastro-intestinal haemorrhage; headache; hypertension; hypoalbuminaemia; hypokalaemia; hyponatraemia; leucopenia; malaise; mucosal inflammation; neutropenia; palmar-plantar erythrodysoaesthesia syndrome; peripheral oedema; proteinuria; stomatitis; thrombocytopenia
  - **Frequency not known** Arterial thromboembolic events (permanently discontinue if severe); fistula (permanently discontinue); gastro-intestinal perforation (permanently discontinue); infusion-related reactions; intestinal obstruction; rash; sepsis (in combination with paclitaxel)
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Infusion-related reactions Infusion-related hypersensitivity reactions have been reported with ramucirumab, particularly during or following the first or second infusion; if the patient experiences a grade 1 or 2 infusion-related reaction, the manufacturer advises to reduce rate of infusion by 50% and give premedication for all subsequent infusions—consult product literature. Manufacturer advises to permanently discontinue treatment in the event of a grade 3 or 4 infusion-related reaction.
  - **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for up to 3 months after treatment in women of childbearing potential.
  - **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
  - **BREAST FEEDING** Manufacturer advises discontinue breast-feeding during treatment and for at least 3 months after treatment—no information available.
  - **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe cirrhosis, cirrhosis with hepatic encephalopathy, cirrhosis with clinically significant ascites, or hepatorenal syndrome—use only if potential benefit outweighs risk of progressive hepatic failure.
  - **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs of infusion-related hypersensitivity reactions; monitor blood pressure prior to each infusion; monitor for development or worsening of proteinuria
during treatment—consult product literature; monitor blood counts and coagulation parameters in patients at risk of bleeding.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Cyramza®), give intermittently in Sodium chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and invert gently to mix. Do not exceed a rate of 25 mg/minute, and give over approximately 60 minutes via an infusion pump using a separate infusion line with a protein sparing 0.22 micron filter.

- **PRESCRIBING AND DISPENSING INFORMATION** For Cyramza®, each 10 mL vial contains sodium 17 mg (equivalent to Na⁺ 0.74 mmol).

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Ramucirumab for treating advanced gastric cancer or gastro-oesophageal junction adenocarcinoma previously treated with chemotherapy (January 2016) NICE TA378
    - Ramucirumab alone or in combination with paclitaxel is not recommended for the treatment of advanced gastric cancer or gastro-oesophageal junction adenocarcinoma previously treated with chemotherapy.
    - Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment until they and their clinicians consider it appropriate to stop.
    - www.nice.org.uk/TA378

  - **Ramucirumab for previously treated locally advanced or metastatic non-small-cell lung cancer (August 2016)** NICE TA403
    - Ramucirumab, in combination with docetaxel, is not recommended for treating locally advanced or metastatic non-small-cell lung cancer in patients whose disease has progressed after platinum-based chemotherapy.
    - Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinicians consider it appropriate to stop.
    - www.nice.org.uk/TA403

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for infusion**
    - **ELECTROLYTES:** May contain Sodium
      - **Cyramza** (Eli Lilly and Company Ltd)
        - Ramucirumab 10 mg per 1 ml: Cyramza 100 mg/10 ml concentrate for solution for infusion vials | 1 vial (£10.50) / £50.00 (Hospital only)
        - Cyramza 500 mg/50 ml concentrate for solution for infusion vials | 1 vial (£50.00) / £250.00 (Hospital only)

- **Rituximab**

  - **INDICATIONS AND DOSE**
    - Treatment of previously untreated stage III–IV follicular lymphoma (in combination with other chemotherapy) | Maintenance therapy in patients with follicular non-Hodgkin’s lymphoma that has responded to induction therapy (in combination with other chemotherapy) | Treatment of diffuse large B-cell non-Hodgkin’s lymphoma (in combination with other chemotherapy) | Treatment of chemotherapy-resistant or relapsed stage III–IV follicular non-Hodgkin’s lymphoma | Previously untreated or relapsed chronic lymphocytic leukaemia | Induction of remission in patients with severe, active granulomatosis with polyangiitis (Wegener’s) and microscopic polyangiitis (in combination with glucocorticoids)
    - **BY INTRAVENOUS INFUSION**
      - Adult: Patients should receive premedication before each dose (consult product literature for details)

  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Associated with infections, sometimes severe, including tuberculosis, sepsis, and hepatitis B reactivation.
For full details, including management of side-effects, consult product literature.

- **Progressive multifocal leucoencephalopathy**
  - Progressive multifocal leucoencephalopathy (which is usually fatal or causes severe disability) has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded.

- **CONCEPTION AND CONTRACEPTION**
  - Effective contraception (in both sexes) required during and for 12 months after treatment.

- **PREGNANCY**
  - Avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus.

- **BREAST FEEDING**
  - Avoid breast-feeding during and for 12 months after treatment.

- **MONITORING REQUIREMENTS**
  - For full details on monitoring requirements consult product literature.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion (MabThera®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to 1–4 mg/mL and gently invert bag to avoid foaming.

- **PATIENT AND CARER ADVICE**
  - Alert card: Patients treated for granulomatosis with polyangiitis and microscopic polyangiitis or rheumatoid arthritis should be provided with a patient alert card with each infusion.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE technology appraisals (TAs)**
    - **Rituximab in combination with glucocorticoids for treating anti-neutrophil cytoplasmic antibody-associated vasculitis (March 2014)** NICE TA308
      - This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with glucocorticoids, is recommended as an option for inducing remission in adults with anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (severely active granulomatosis with polyangiitis [Wegener’s] and microscopic polyangiitis), only if:
        - further cyclophosphamide treatment would exceed the maximum cumulative cyclophosphamide dose, or
        - cyclophosphamide is contra-indicated or not tolerated, or
        - the patient has not completed their family, and
        - treatment with cyclophosphamide may materially affect their fertility, or
        - the disease has remained active or progressed despite a course of cyclophosphamide lasting 3–6 months or
        - the patient has had uroepithelial malignancy.
      - [www.nice.org.uk/TA308](http://www.nice.org.uk/TA308)

    - **Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010)** NICE TA195
      - Rituximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or are intolerant of, other disease-modifying antirheumatic drugs (DMARDs), including at least 1 tumour necrosis factor (TNF) inhibitor. Repeat courses of rituximab should be given no more frequently than every 6 months, and should only be continued if an adequate response is achieved and maintained.
      - [www.nice.org.uk/TA195](http://www.nice.org.uk/TA195)

    - **Rituximab for the first-line treatment of stage III-IV follicular lymphoma (January 2012)** NICE TA243
      - This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with:
        - cyclophosphamide, vincristine and prednisolone (CVP); or
        - cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP); or
        - mitoxantrone, chlorambucil and prednisolone (MCP); or
        - cyclophosphamide, doxorubicin, etoposide, prednisolone and interferon-alpha (CHVP); or
        - chlorambucil is recommended as an option for the treatment of symptomatic stage III and IV follicular lymphoma in previously untreated patients.
      - [www.nice.org.uk/TA243](http://www.nice.org.uk/TA243)

- **Rituximab for the treatment of relapsed or refractory stage III or IV follicular non-Hodgkin’s lymphoma (February 2008)** NICE TA137

  - This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with chemotherapy, is an option for the induction of remission in patients with relapsed stage III or IV follicular non-Hodgkin’s lymphoma.

  - Rituximab monotherapy as maintenance therapy is an option for the treatment of patients with relapsed stage III or IV follicular non-Hodgkin’s lymphoma in remission induced with chemotherapy (with or without rituximab).

  - Rituximab monotherapy is an option for the treatment of patients with relapsed or refractory stage III or IV follicular non-Hodgkin’s lymphoma, when all alternative treatment options have been exhausted (that is, if there is resistance to or intolerance of chemotherapy).

  - [www.nice.org.uk/TA137](http://www.nice.org.uk/TA137)

- **Rituximab for the treatment of relapsed or refractory chronic lymphocytic leukaemia (July 2010)** NICE TA193

  - This NICE guidance was issued for rituximab by intravenous infusion. Rituximab in combination with fludarabine and cyclophosphamide is recommended as a treatment option for people with relapsed or refractory chronic lymphocytic leukaemia except when the condition:
    - is refractory to fludarabine (that is, it has not responded to fludarabine, or has relapsed within 6 months of treatment), or
    - has previously been treated with rituximab, unless it was in the context of a clinical trial, at a dose lower than the dose currently licensed for chronic lymphocytic leukaemia or with chemotherapy other than fludarabine and cyclophosphamide.

  - Rituximab in combination with fludarabine and cyclophosphamide is recommended only in the context of research for patients with relapsed or refractory chronic lymphocytic leukaemia that has previously been treated with rituximab, unless rituximab has been given as specified above.

  - [www.nice.org.uk/TA193](http://www.nice.org.uk/TA193)

- **Rituximab for the first-line maintenance treatment of follicular non-Hodgkin’s lymphoma (June 2011)** NICE TA226

  - This NICE guidance was issued for rituximab by intravenous infusion. Rituximab maintenance therapy is recommended as an option for the treatment of people with follicular non-Hodgkin’s lymphoma that has responded to first-line induction therapy with rituximab in combination with chemotherapy.

  - [www.nice.org.uk/TA226](http://www.nice.org.uk/TA226)

- **Rituximab for the first-line treatment of chronic lymphocytic leukaemia (July 2009)** NICE TA174

  - This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with fludarabine and cyclophosphamide, is recommended as an option for the first-line treatment of chronic lymphocytic leukaemia.

  - [www.nice.org.uk/TA174](http://www.nice.org.uk/TA174)

- **Idelalisib for treating chronic lymphocytic leukaemia (October 2015)** NICE TA359

  - Rituximab, in combination with idelalisib, is recommended as an option for treatment in adults:
    - who have untreated chronic lymphocytic leukaemia or
822 Antibody responsive malignancy

- who have chronic lymphocytic leukaemia when the disease has been treated but has relapsed within 24 months and
- if the manufacturer provides idelalisib with the discount agreed in the simple discount agreement.

Patients who are already receiving idelalisib should continue treatment until they or their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA359

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (August 2013) that Rituximab (MabThera®) is accepted for restricted use within NHS Scotland, in combination with glucocorticoids for the induction of remission in adult patients with severe, active granulomatosis with polyangitis (Wegener's) and microscopic polyangiitis. It is restricted to use in patients who have relapsed following treatment with cyclophosphamide or who are intolerant to or unable to receive cyclophosphamide.

The Scottish Medicines Consortium has advised (June 2014) that subcutaneous rituximab (MabThera®) is accepted for restricted use within NHS Scotland, in accordance with UK licensing, except in the maintenance setting, where use is restricted to patients who have responded to induction therapy with rituximab plus chemotherapy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- MabThera (Roche Products Ltd)
  - Rituximab 10 mg per 1 ml MabThera 100mg/10ml concentrate for solution for infusion vials | 2 vial (Pom) £349.25
  - MabThera 500mg/50ml concentrate for solution for infusion vials | 1 vial (Pom) £873.15

**Siltuximab**

**DRUG ACTION**

Siltuximab is a monoclonal antibody that inhibits interleukin-6 receptor binding.

**INDICATIONS AND DOSE**

Treatment of multicentric Castleman’s disease (MCD) in patients who are human immunodeficiency virus (HIV) negative and human herpesvirus-8 (HHV-8) negative

- BY INTRAVENOUS INFUSION

- Adult: 11 mg/kg every 3 weeks

**CAUTIONS**

Patients at increased risk of gastrointestinal perforation—promptly investigate those presenting with symptoms suggestive of gastrointestinal perforation • severe infection— withhold treatment until resolved • treatment prior to treatment

**CAUTIONS, FURTHER INFORMATION**

- Hypersensitivity reactions Infusion-related side-effects are reported commonly with siltuximab; resuscitation facilities should be available during treatment.
  - Consult product literature for further information about siltuximab cautions.

**INTERACTIONS**

→ Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**

- Common or very common Infusion related side effects
  - Frequency not known Abdominal pain • anaphylaxis • hepatitis B reactivation • hypersensitivity reactions • hypertension • hypertriglyceridaemia • hypoglycaemia • increased haemoglobin levels • infections • localised oedema • maculopapular rash • nasopharyngitis • neutropenia • pruritus • renal impairment • thrombocytopenia • upper respiratory tract infection • weight gain

**SIDE-EFFECTS, FURTHER INFORMATION**

Infusion-related side effects Siltuximab therapy should be discontinued permanently in the event of a severe infusion-related reaction, anaphylaxis, a severe allergic reaction, or the occurrence of cytokine-release syndrome. Mild to moderate infusion-related reactions may improve by temporarily reducing the rate or stopping the infusion. When restarting treatment, a reduced infusion rate and the administration of antihistamines, paracetamol, and corticosteroids should be considered. Consider discontinuation of siltuximab if more than 2 doses are delayed due to treatment-related toxicities during the first 48 weeks—for full details consult product literature.

**CONCEPTION AND CONTRACEPTION**

Women of childbearing potential should use effective contraception during and for 3 months after treatment.

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

Use with caution in hepatic impairment.

**MONITORING REQUIREMENTS**

- Monitor neutrophil and platelet count, and haemoglobin levels prior to each dose of siltuximab treatment for the first 12 months and thereafter prior to every third dosing cycle. Consider delaying treatment if required neutrophil, platelet, and haemoglobin levels not achieved—consult product literature for details.

- Monitor for infection during treatment.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Sylvant®), give intermittently in Glucose 5%. Allow vials to reach room temperature over approximately 30 minutes, then reconstitute each 100 mg vial with 5.2 mL of water for injection, and each 400 mg vial with 20 mL of water for injection, to produce a 20 mg/mL solution. Gently swirl without shaking to dissolve. Further dilute to 250 mL with glucose 5% and gently mix. Use within 6 hours of dilution and give over 60 minutes using an administration set lined with polyvinyl chloride or polyurethane, through a low-protein binding in-line 0.2 micron filter.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- Sylvant (Janssen-Cilag Ltd)
  - Siltuximab 100 mg Sylvant 100mg powder for concentrate for solution for infusion vials | 1 vial (Pom) £415.00 (Hospital only)
  - Siltuximab 400 mg Sylvant 400mg powder for concentrate for solution for infusion vials | 1 vial (Pom) £1,661.00 (Hospital only)
Trastuzumab

**INDICATIONS AND DOSE**

Treatment of early breast cancer which overexpresses human epidermal growth factor receptor-2 (HER2) (initiated by a specialist) | Treatment of metastatic breast cancer in patients with HER2-positive tumours who have not received chemotherapy for metastatic breast cancer and in whom anthracycline treatment is inappropriate (in combination with paclitaxel or docetaxel) (initiated by a specialist) | Treatment of metastatic breast cancer in postmenopausal patients with hormone-receptor positive HER2-positive tumours not previously treated with trastuzumab (in combination with an aromatase inhibitor)  

**CONTRA-INDICATIONS** Severe dyspnoea at rest

**CAUTIONS** Coronary artery disease | history of hypertension | symptomatic heart failure | uncontrolled arrhythmias

**SIDE-EFFECTS** Acne | alopecia | anaphylaxis | angioedema | anxiety | arthralgia | arthritis | asthenia | bone pain | bone marrow suppression | cardiotoxicity | chest pain | chills | depression | dizziness | drowsiness | dry eye | dry skin | ecchymosis | extravasation | fever | gastrointestinal symptoms | headache | hepatitis | hypersensitivity reactions | hypertension | hyperthermia | hyperuricaemia | hypotension | increased lacrimation | infection | infusion-related side-effects (possibly delayed onset) | insomnia | leg cramps | malaise | mastitis | myalgia | nail disorders | nausea | oedema | oral mucositis | paraesthesia | paresis | peripheral neuropathy | pruritus | pulmonary events (possibly delayed onset) | rash | sweating | taste disturbance | thromboembolism | tremor | tumour lysis syndrome | urticaria | vomiting | weight loss

**CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**PREGNANCY** Manufacturer advises avoid—oligohydramnios reported. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING** Avoid breast-feeding during treatment and for 7 months afterwards.

**MONITORING REQUIREMENTS** Cardiotoxicity | Monitor cardiac function before and during treatment—for details of monitoring and managing cardiotoxicity, consult product literature.

**DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available during administration of trastuzumab.

**PRESCRIBING AND DISPENSING INFORMATION** When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab is not interchangeable with trastuzumab emtansine.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2 (June 2012) NICE TA257
  
- Lapatinib or trastuzumab in combination with an aromatase inhibitor is not recommended for first-line treatment in postmenopausal women of metastatic hormone-receptor-positive breast cancer that overexpresses human epidermal growth factor receptor 2 (HER2).

  Postmenopausal women currently receiving lapatinib or trastuzumab in combination with an aromatase inhibitor for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA257

- Guidance on the use of trastuzumab for the treatment of advanced breast cancer (March 2002) NICE TA34

  Trastuzumab in combination with paclitaxel is recommended as an option for patients with tumours expressing human epidermal growth factor receptor 2 (HER2) scored at levels of 3+ who have not received chemotherapy for metastatic breast cancer, and in whom anthracycline treatment is inappropriate.

  Trastuzumab monotherapy is recommended as an option for patients with tumours expressing HER2 scored at levels of 3+ who have received at least two chemotherapy regimens for metastatic breast cancer. Prior chemotherapy must have included at least an anthracycline and a taxane where these treatments are appropriate. It should also have included hormonal therapy in suitable oestrogen-receptor-positive patients. www.nice.org.uk/TA34

- Trastuzumab for the adjuvant treatment of early-stage HER2-positive breast cancer (August 2006) NICE TA107

  Trastuzumab, given at 3-week intervals for 1 year or until disease recurrence (whichever is the shorter period), is recommended as an option for women with early-stage HER2-positive breast cancer following surgery, chemotherapy (neoadjuvant or adjuvant) and radiotherapy (if applicable). www.nice.org.uk/TA107

- Trastuzumab for the treatment of HER2-positive metastatic gastric cancer (November 2010) NICE TA208

  Trastuzumab in combination with cisplatin and capecitabine or fluorouracil is recommended for human epidermal growth factor receptor-2-positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction in patients who:

  - have not received treatment for metastatic disease and
  - have tumours expressing high levels of HER2 as defined by a positive immunohistochemistry score of 3. www.nice.org.uk/TA208

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (December 2013) that subcutaneous trastuzumab injection (Herceptin®) is accepted for restricted use within NHS Scotland for the treatment of adults with HER2 positive metastatic breast cancer and early breast cancer, when used within licensed indications excluding use in combination with an aromatase inhibitor for the treatment of postmenopausal patients with hormone-receptor positive metastatic breast cancer, not previously treated with trastuzumab.

The Scottish Medicines Consortium has advised (September 2015) that trastuzumab solution for infusion
**824 Antibody responsive malignancy**

(Herceptin®) is accepted for restricted use within NHS Scotland in combination with capecitabine or fluorouracil and cisplatin for the treatment of patients with HER2 positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction, who have not received prior anti-cancer treatment for their metastatic disease. It is restricted to patients with metastatic gastric cancer whose tumours have HER2 over-expression, as determined by an accurate and validated assay.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - Herceptin (Roche Products Ltd)
      - Trastuzumab 120 mg per 1 ml Herceptin 600mg/5ml solution for injection vials | 1 vial (PoS) £1222.20 (Hospital only)
  - **Powder for solution for infusion**
    - Herceptin (Roche Products Ltd)
      - Trastuzumab 150 mg Herceptin 150mg powder for solution for infusion vials | 1 vial (PoS) £407.40

- **Trastuzumab emtansine 15-Apr-2016**

- **DRUG ACTION**
  - Trastuzumab emtansine is an antibody-drug conjugate that contains trastuzumab covalently linked to DM1, a cytotoxic microtubule inhibitor.

- **INDICATIONS AND DOSE**
  - Monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have previously received trastuzumab and a taxane separately or in combination (initiated by a specialist)
  - Monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have developed disease recurrence during or within 6 months of completing adjuvant therapy (initiated by a specialist)

- **BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature or local protocols)

- **CAUTIONS**
  - Dyspnoea at rest—increased risk of pulmonary events: history of congestive heart failure, patients over 75 years, peripheral neuropathy (temporarily discontinue treatment—consult product literature: recent history of myocardial infarction: recent history of unstable angina: risk of left ventricular dysfunction—consult product literature for specific risks with trastuzumab treatment: serious arrhythmias

- **INTERACTIONS**
  - Appendix 1: monoclonal antibodies

- **SIDE-EFFECTS**
  - **Common or very common**
    - Abdominal pain
    - Arthralgia
    - Blurred vision
    - Chills
    - Conjunctivitis
    - Constipation
    - Cough
    - Diarrhoea
    - Dizziness
    - Dry eye
    - Dry mouth
    - Dysgeusia
    - Dyspepsia
    - Dyspnoea
    - Epistaxis
    - Gingival bleeding
    - Haemorrhage
    - Hand-foot syndrome
    - Headache
    - Hypersensitivity
    - Hypokalaemia
    - Increased lactic acidosis
    - Infusion-related reactions
    - Insomnia
    - Left ventricular dysfunction
    - Malaise
    - Memory impairment
    - Myalgia: nail disorder
    - Peripheral neuropathy
    - Peripheral oedema
    - Pruritus
    - Pyrexia
    - Rash
    - Thrombocytopenia
    - Urinary tract infection
    - Urticaria
  - **Uncommon**
  - **Frequency not known**
    - Alopecia
    - Bone-marrow suppression
    - Extravasation
    - Hyperuricaemia
    - Nausea: oral mucositis: thromboembolism: tumour lysis syndrome: vomiting

- **CONCEPTION AND CONTRACEPTION**
  - Effective contraception must be used during and for 6 months after stopping treatment in women and men.

- **PREGNANCY**
  - Manufacturer advises avoid—oligohydranmios reported with trastuzumab. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- **BREAST FEEDING**
  - Manufacturer advises avoid—feeding during and for 6 months after treatment.

- **HEPATIC IMPAIRMENT**
  - Consult product literature for dose modification in cases of abnormal liver function tests.

- **RENAL IMPAIRMENT**
  - No information available—manufacturer advises caution in severe impairment.

- **MONITORING REQUIREMENTS**
  - Monitor hepatic function before each dose.
  - Monitor for signs and symptoms of neurotoxicity.
  - Monitor closely for infusion-related and hypersensitivity reactions.
  - Monitor platelet count before each dose and as clinically indicated (consult product literature for treatment modification in thrombocytopenia).
  - Test cardiac function before treatment and regularly during treatment—delay or discontinue treatment in cases of left ventricular dysfunction.
  - Monitor for dyspnoea, cough: fatigue and pulmonary infiltrates—discontinue if interstitial lung disease or pneumonitis confirmed (fatal cases reported).

- **DIRECTIONS FOR ADMINISTRATION**
  - Resuscitation facilities should be available during administration of trastuzumab emtansine.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab emtansine and trastuzumab are not interchangeable.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - NICE technology appraisals (TAs)
    - Trastuzumab emtansine for treating HER2-positive, unresectable locally advanced or metastatic breast cancer after treatment with trastuzumab and a taxane (December 2015) NICE TA371
    - Trastuzumab emtansine is not recommended for treating adults with human epidermal growth factor 2 (HER2) positive, unresectable locally advanced or metastatic breast cancer previously treated with trastuzumab and a taxane.
    - www.nice.org.uk/TA371

- **Scottish Medicines Consortium (SMC) Decisions**
  - The Scottish Medicines Consortium has advised (April 2017) that trastuzumab emtansine (Kadcyla®) is accepted for use within NHS Scotland as monotherapy for the treatment of patients with human epidermal growth factor type 2 (HER2)-positive, unresectable locally advanced or metastatic breast cancer who previously received trastuzumab and a taxane, separately or in combination, and have either received prior therapy for locally advanced or metastatic disease or developed disease recurrence during or within six months of completing adjuvant therapy. This advice is contingent on the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS**

      - Trastuzumab emtansine 160 mg Kadcyla 160mg powder for concentrate for solution for infusion vials | 1 vial (PoS) £2,625.62
2 Cytotoxic responsive malignancy

Cytotoxic drugs

Overview
The chemotherapy of cancer is complex and should be confined to specialists in oncology. Cytotoxic drugs have both anti-cancer activity and the potential to damage normal tissue; most cytotoxic drugs are teratogenic. Chemotherapy may be given with a curative intent or it may aim to prolong life or to palliate symptoms. In an increasing number of cases chemotherapy may be combined with radiotherapy or surgery or both as either neoadjuvant treatment (initial chemotherapy aimed at shrinking the primary tumour, thereby rendering local therapy less destructive or more effective) or as adjuvant treatment (which follows definitive treatment of the primary disease, when the risk of subclinical metastatic disease is known to be high). All cytotoxic drugs cause side-effects and a balance has to be struck between likely benefit and acceptable toxicity.

Combinations of cytotoxic drugs, as continuous or pulsed cycles of treatment, are frequently more toxic than single drugs but have the advantage in certain tumours of enhanced response, reduced development of drug resistance and increased survival. However for some tumours, single-agent chemotherapy remains the treatment of choice.

Cytotoxic drugs fall into a number of classes, each with characteristic antitumour activity, sites of action, and toxicity. A knowledge of sites of metabolism and excretion is important because impaired drug handling as a result of disease is not uncommon and may result in enhanced toxicity.

Guidelines for handling cytotoxic drugs
- Trained personnel should reconstitute cytotoxics
- Reconstitution should be carried out in designated pharmacy areas
- Protective clothing (including gloves, gowns, and masks) should be worn
- The eyes should be protected and means of first aid should be specified
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard)
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material
- Staff exposure to cytotoxic drugs should be monitored

Intrathecal chemotherapy
A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available. Copies, and further information may be obtained from: Department of Health PO Box 777 London SE1 6XH Fax: 01623 724524 It is also available from the Department of Health website (www.dh.gov.uk).

Safe systems for cytotoxic medicines
NHS cancer networks have been established across the UK to bring together all stakeholders in all sectors of care, to work collaboratively to plan and deliver high quality cancer services for a given population. NHS cancer networks have websites containing information on local chemotherapy services and treatment.

Safe system requirements:
- cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care coordinated by a multidisciplinary team
- cytotoxic drugs should be prescribed, dispensed, and administered only in the context of a written protocol or treatment plan
- injectable cytotoxic drugs should only be dispensed if they are prepared for administration
- oral cytotoxic medicines should be dispensed with clear directions for use

IMPORTANT SAFETY INFORMATION
RISK OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy.
- non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital.

Doses
Doses of cytotoxic drugs are determined using a variety of different methods including body-surface area or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient’s neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from some of the drug entries in this chapter. However, even where dose statements have been provided, detailed specialist literature, individual hospital chemotherapy protocols, or local cancer networks should be consulted before prescribing, dispensing, or administering cytotoxic drugs.

Prescriptions should not be repeated except on the instructions of a specialist.

Side-effects of cytotoxic drugs
Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers’ product literature, hospital-trust protocols, and cancer-network protocols should be consulted for full details of side-effects associated with individual drugs and specific chemotherapy regimes.

Many side-effects of cytotoxic drugs often do not occur at the time of administration, but days or weeks later. It is therefore important that patients and healthcare professionals can identify symptoms that cause concern and can contact an expert for advice. Toxicities should be
accurately recorded using a recognised scoring system such as the Common Toxicity Criteria for Adverse Events (CTCAE) developed by the National Cancer Institute.

Extravasation of intravenous drugs
A number of cytotoxic drugs will cause severe local tissue necrosis if leakage into the extravascular compartment occurs. To reduce the risk of extravasation injury it is recommended that cytotoxic drugs are administered by appropriately trained staff. See information on the prevention and management of extravasation injury.

Oral mucositis
A sore mouth is a common complication of cancer chemotherapy; it is most often associated with fluorouracil p. 842, methotrexate p. 844, and the anthracyclines. It is best to prevent the complication. Good oral hygiene (rinsing the mouth frequently and effective brushing of the teeth with a soft brush 2–3 times daily) is probably beneficial. For fluorouracil p. 842, sucking ice chips during short infusions of the drug is also helpful.

Once a sore mouth has developed, treatment is much less effective. Saline mouthwashes should be used but there is no good evidence to support the use of antiseptic or anti-inflammatory mouthwashes. In general, mucositis is self-limiting but with poor oral hygiene it can be a focus for blood-borne infection.

Tumour lysis syndrome
Tumour lysis syndrome occurs secondary to spontaneous or treatment-related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin’s lymphoma (especially if high grade and bulky disease), Burkitt’s lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration, and renal impairment are also predisposing factors. Features include hyperkalaemia, hyperuricaemia (see below), and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early identification of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Hyperuricaemia
Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure. Allopurinol p. 1021 should be started 24 hours before treating such tumours and patients should be adequately hydrated. The dose of mercaptopurine p. 844 or azathioprine p. 787 should be reduced if allopurinol needs to be given concomitantly. Febuxostat p. 1021 may also be used and should be started 2 days before cytotoxic therapy is initiated.

Rasburicase p. 870, a recombinant urate oxidase, is licensed for hyperuricaemia in patients with haematological malignancy. It rapidly reduces plasma-uric acid concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

Bone-marrow suppression
All cytotoxic drugs except vincristine sulfate p. 858 and bleomycin p. 849 cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as carmustine p. 529, lomustine p. 832, and melphalan p. 833. Peripheral blood counts must be checked before each treatment, and doses should be reduced or therapy delayed if bone-marrow has not recovered.

Cytotoxic drugs may be contra-indicated in patients with acute infection; any infection should be treated before, or when starting, cytotoxic drugs.

Fever in a neutropenic patient (neutrophil count less than 1.06 × 10^9/litre) requires immediate broad-spectrum antibacterial therapy. Appropriate bacteriological investigations should be conducted as soon as possible. Patients taking cytotoxic drugs who have signs or symptoms of infection should be advised to seek prompt medical attention. All patients should initially be investigated and treated under the supervision of the appropriate oncology or haematology specialist.

In selected patients, the duration and the severity of neutropenia can be reduced by the use of recombinant human granulocyte-colony stimulating factors. Symptomatic anaemia is usually treated with red blood cell transfusions. For guidance on the use of erythropoietins in patients with cancer, see MHRA/CHM advice and NICE guidance.

See advice on the use of live vaccines in individuals with impaired immune response, see Vaccines.

Alopecia
Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients. No pharmacological methods of preventing this are available.

Thromboembolism
Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

Pregnancy and reproductive function
Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Exclude pregnancy before treatment with cytotoxic drugs. Contraceptive advice should be given before cytotoxic therapy begins—women of childbearing age should use effective contraception during and after treatment.

Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

Nausea and vomiting
Nausea and vomiting cause considerable distress to many patients who receive chemotherapy and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Patients vary in their susceptibility to drug-induced nausea and vomiting; those affected more often include women, patients under 50 years of age, anxious patients, and those who experience motion sickness. Susceptibility also increases with repeated exposure to the cytotoxic drug. Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered and to the individual’s susceptibility to emetogenic stimuli.

Mildly emetogenic treatment—fluorouracil, etoposide p. 853, methotrexate p. 844 (less than 100 mg/m^2, low dose
in children), the vinca alkaloids, and abdominal radiotherapy.

**Moderately emetogenic treatment**—the taxanes, doxorubicin hydrochloride p. 835, intermediate and low doses of cyclophosphamide p. 830, mitoxantrone p. 837, and high doses of methotrexate (0.1 – 1.2 g/m²).

**Highly emetogenic treatment**—cisplatin p. 852, dacarbazine p. 831, and high doses of cyclophosphamide.

**Prevention of acute symptoms**
For patients at low risk of emesis, pretreatment with dexamethasone p. 635 or lorazepam p. 322 may be used.
For patients at high risk of emesis, a SHT3-receptor antagonist, usually given by mouth in combination with dexamethasone and the neurokinin receptor antagonist aprepitant p. 412 is effective.

**Prevention of delayed symptoms**
For delayed symptoms associated with moderately emetogenic chemotherapy, a combination of dexamethasone and SHT3-receptor antagonist is effective; for highly emetogenic chemotherapy, a combination of dexamethasone and aprepitant is effective. Metoclopramide hydrochloride p. 411 is also licensed for delayed chemotherapy-induced nausea and vomiting.

**Prevention of anticipatory symptoms**
Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesic, sedative, and anxiolytic effects.

**Treatment for cytotoxic-induced side effects**

** Anthracycline side-effects**

**Anthracycline-induced cardiotoxicity**
The anthracycline cytotoxic drugs are associated with dose-related, cumulative, and potentially life-threatening cardiotoxic side-effects.

**Anthracycline extravasation**
Local guidelines for the management of extravasation should be followed or specialist advice sought.

See further information on the prevention and management of extravasation injury.

**Chemotherapy-induced mucositis and myelosuppression**
Folinic acid p. 869 (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate p. 844 and thus speed recovery from methotrexate-induced mucositis or myelosuppression (‘folinic acid rescue’).

Folinic acid is also used in the management of methotrexate overdose, together with other measures to maintain fluid and electrolyte balance, and to manage possible renal failure.

Folinic acid does not counteract the antibacterial activity of folate antagonists such as trimethoprim p. 542.

When folinic acid and fluorouracil p. 842 are used together in metastatic colorectal cancer the response-rate improves compared to that with fluorouracil alone.

The calcium salt of levofoolic acid p. 870, a single isomer of folinic acid, is also used for rescue therapy following methotrexate administration, for cases of methotrexate overdose, and for use with fluorouracil for colorectal cancer. The dose of calcium levofoilate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofoolic acid are also used for rescue therapy following methotrexate therapy, and for use with fluorouracil for colorectal cancer.

**Urothelial toxicity**
Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide p. 830 and ifosfamide p. 832; it is caused by the metabolite acrolein. Mesna p. 869 reacts specifically with this metabolite in the urinary tract, preventing toxicity. Mesna is used routinely (preferably by mouth) in patients receiving ifosfamide, and in patients receiving cyclophosphamide by the intravenous route at a high dose (e.g. more than 2 g) or in those who experienced urothelial toxicity when given cyclophosphamide previously.

**Antimetrabolics**
Antimetabolites are incorporated into new nuclear material or combine irreversibly with cellular enzymes, preventing normal cellular division.

**Alkylating drugs**
Extensive experience is available with these drugs, which are among the most widely used in cancer chemotherapy. They act by damaging DNA, thus interfering with cell replication. Cyclophosphamide is used mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours.
It is given by mouth or intravenously; it is inactive until metabolised by the liver.
Ifosfamide is related to cyclophosphamide and is given intravenously.
Melphalan p. 833 is licensed for the treatment of multiple myeloma, polycythaemia vera, childhood neuroblastoma, advanced ovarian adenocarcinoma, and advanced breast cancer. However, in practice, melphalan is rarely used for ovarian adenocarcinoma; it is no longer used for advanced breast cancer. Melphalan is also licensed for regional arterial perfusion in localised malignant melanoma of the extremities and localised soft-tissue sarcoma of the extremities.

Lomustine p. 832 is a lipid-soluble nitrosourea and the drug is given at intervals of 4 to 6 weeks.

Carmustine implants are also licensed for high-grade recurrent glioblastoma multiforme as an adjunct to surgery. Carmustine implants are also given to patients with multiple myeloma, non-Hodgkin’s lymphomas, and brain tumours. Carmustine implants are licensed for intralesional use in adults for the treatment of recurrent glioblastoma multiforme as an adjunct to surgery. Carmustine implants are also licensed for high-grade malignant glioma as adjunctive treatment to surgery and radiotherapy.

Estramustine phosphate p. 831 is a combination of an oestrogen and chlormethine used predominantly in prostate cancer. It is given by mouth and has both an antimitotic effect and (by reducing testosterone concentration) a hormonal effect.

Mitobronitol is occasionally used to treat chronic myeloid leukaemia; it is available on a named-patient basis from specialist importing companies.

**ANTINEOPLASTIC DRUGS > ALKYLATED AGENTS**

### Bendamustine hydrochloride

- **INDICATIONS AND DOSE**
  - Treatment of chronic lymphocytic leukaemia | Treatment of non-Hodgkin's lymphoma | Treatment of multiple myeloma
  - **BY INTRAVENOUS INFUSION**
    - **Adult:** (consult local protocol)

- **CONTRA-INDICATIONS**
  - Jaundice • low leucocyte count • low platelet count • major surgery less than 30 days before start of treatment • severe bone marrow suppression

- **CAUTIONS**
  - Avoid in Acute porphyrias p. 969 • cardiac disorders—monitor serum potassium and ECG

- **INTERACTIONS**
  - **Appendix 1:** alkylating agents

- **SIDE-EFFECTS**
  - Common or very common
    - Amenorrhea • angina • anorexia • arthralgias • chills • constipation • dehydration • diarrhoea • electrolyte disturbances • haemorrhage • hypertension • hypokalaemia • hypotension • infection • insomnia • malaise • pain • palpitation • pyrexia • respiratory dysfunction
  - Uncommon
    - Pericardial effusion
  - Rare
    - Acute circulatory failure • drowsiness • sweating • voice changes
  - Very rare
    - Anticholinergic syndrome • ataxia • cardiac failure • encephalitis • haemolysis • multiple organ failure • myocardial infarction • neurological disorders • paraesthesia • peripheral neuropathy • phlebitis • pulmonary fibrosis • tachycardia • taste disturbance
  - Frequency not known
    - Alopecia • bone-marrow suppression • extravasation • hyperuricaemia • male sterility • nausea • oral mucositis • premature menopause • secondary malignancy • Stevens-Johnson syndrome • thromboembolism • toxic epidermal necrolysis • tumour lysis syndrome • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Secondary malignancy
  - Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

- **CONCEPTION AND CONTRACEPTION**
  - Effective contraception is required during treatment in men or women, and for 6 months after treatment in men. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- **PREGNANCY**
  - Avoid (teratogenic and mutagenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Consider a 30% dose reduction in moderate impairment. Avoid in severe impairment.

- **RENAL IMPAIRMENT**
  - No information available on use in patients with creatinine clearance less than 10 mL/minute.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NICE technology appraisals (TAs)**
  - Bendamustine for the first-line treatment of chronic lymphocytic leukaemia (February 2011) NICE TA216
  - Bendamustine is recommended as an option for the treatment of chronic lymphocytic leukaemia in patients for whom fludarabine combination chemotherapy is not appropriate.
  - [www.nice.org.uk/TA216](http://www.nice.org.uk/TA216)

  **Scottish Medicines Consortium (SMC) Decisions**
  - The Scottish Medicines Consortium has advised (March 2011) that bendamustine (Levact®) is accepted for restricted use within NHS Scotland for the treatment of chronic lymphocytic leukaemia in patients for whom fludarabine combination chemotherapy is not appropriate.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Powder for solution for infusion**
  - **Bendamustine hydrochloride (Non-proprietary)**
    - Bendamustine hydrochloride 25 mg
      - Bendamustine 25mg powder for concentrate for solution for infusion vials | 1 vial (Pom) £6.85–£65.98 | 5 vial (Pom) £312.53–£347.26 (Hospital only) | 20 vial (Pom) £1,241.14 (Hospital only)
    - Bendamustine hydrochloride 100 mg
      - Bendamustine 100mg powder for concentrate for solution for infusion vials | 1 vial (Pom) £27.77–£262.02 | 5 vial (Pom) £1,241.14–£1,379.04 (Hospital only)
    - **Levact** (Napp Pharmaceuticals Ltd)
      - Bendamustine hydrochloride 25 mg
        - Levact 25mg powder for concentrate for solution for infusion vials | 5 vial (Pom) £347.26 (Hospital only)
      - Bendamustine hydrochloride 100 mg
        - Levact 100mg powder for concentrate for solution for infusion vials | 5 vial (Pom) £1,379.04 (Hospital only)

### Busulfan

**Busulphan**

- **INDICATIONS AND DOSE**
  - Chronic myeloid leukaemia, induction of remission
    - **BY MOUTH**
      - Adult: 60 micrograms/kg daily (max. per dose 4 mg); maintenance 0.5–2 mg daily
  - Conditioning treatment before haematopoietic progenitor cell transplantation
    - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
      - Adult: (consult local protocol)
  - Conditioning treatment before haematopoietic progenitor cell transplantation in patients who are candidates for a reduced-intensity conditioning (RIC) regimen
    - **BY INTRAVENOUS INFUSION**
      - Adult: (consult local protocol)
DOSES AT EXTREMES OF BODY-WEIGHT
Dose may need to be calculated based on body surface area or adjusted ideal body weight in obese patients—consult product literature.

IMPORTANT SAFETY INFORMATION
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 825.

● CAUTIONS Avoid in Acute porphyrias p. 969 · high dose (anti-epileptic prophylaxis required) · history of seizures (anti-epileptic prophylaxis required) · ineffective once in blast crisis phase · previous progenitor cell transplant (increased risk of hepatic veno-occlusive disease) · previous radiation therapy (increased risk of hepatic veno-occlusive disease) · risk of second malignancy · three or more cycles of chemotherapy (increased risk of hepatic veno-occlusive disease)

● INTERACTIONS Appendix 1: alkylating agents

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

● Common or very common Cardiac tamponade in thalassaemia · hepatic fibrosis · hepatic veno-occlusive disease · hepatotoxicity · hyperbilirubinaemia · jaundice · pneumonia · skin hyperpigmentation
● Rare Aplastic anaemia · seizures · visual disturbances
● Very rare Gynaecomastia · myasthenia gravis

● Frequency not known Alopecia · bone-marrow suppression · hyperuricaemia · irreversible bone-marrow aplasia · lung toxicity · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

SPECIFIC SIDE-EFFECTS

● With intravenous use Extravasation

SIDE-EFFECTS, FURTHER INFORMATION

● Lung toxicity Discontinue if lung toxicity develops.
● Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

● CONCEPTION AND CONTRACEPTION Manufacturers advise effective contraception during treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

● PREGNANCY Avoid (teratogenic and embryotoxic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

● BREAST FEEDING Discontinue breast-feeding.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

● Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007) NICE TA121 Carmustine implants are an option for the treatment of newly diagnosed high-grade (Grade 3 or 4) glioma only for patients in whom at least 90% of the tumour has been resected. Carmustine implants should only be used within specialist centres.

www.nice.org.uk/TA121

● MEDICIAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

● Busulfan (Non-proprietary)
  Busulfan 2 mg Busulfan 2mg tablets | 25 tablet £69.02

Solution for infusion

● BusilveX (Pierre Fabre Ltd)
  Busulfan 6 mg per 1 ml BusilveX 60mg/10ml concentrate for solution for infusion ampoules | 8 ampoule £1,610.00 (Hospital only)
Chlorambucil

- **INDICATIONS AND DOSE**
  - Some lymphomas and chronic leukaemias (used either alone or in combination therapy)
    - **BY MOUTH**
    - Adult: (consult local protocol)

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 825.

- **CAUTIONS**
  - Avoid in Acute porphyrias p. 969· children with nephrotic syndrome (increased seizure risk)· history of epilepsy (increased seizure risk)
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
  - Uncommon Skin rash
  - Very rare Male sterility (in prepubertal and pubertal males)
  - Frequency not known Alopecia· bone-marrow suppression· hyperuricaemia· nausea· oral mucositis· premature menopause· secondary malignancy· Stevens-Johnson syndrome· thromboembolism· toxic epidermal necrolysis· tumour lysis syndrome· vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.
- Skin reactions If a rash occurs further chlorambucil is contra-indicated and cyclophosphamide is substituted.
- **CONCEPTION AND CONTRACEPTION**
  - Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **PREGNANCY**
  - Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **BREAST FEEDING**
  - Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
  - Manufacturer advises consider dose reduction in severe impairment—limited information available.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Otinubuzumab in combination with chlorambucil for untreated chronic lymphocytic leukaemia (June 2015) NICE TA343
  - Otinubuzumab, in combination with chlorambucil, is an option for untreated chronic lymphocytic leukaemia in patients who have comorbidities that make full-dose fludarabine-based therapy unsuitable for them, only if:
    - bendamustine-based therapy is not suitable and
    - the manufacturer provides otinubuzumab with the discount agreed in the patient access scheme.
  - Patients currently receiving obinutuzumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA344

- Ofatumumab in combination with chlorambucil or bendamustine for untreated chronic lymphocytic leukaemia (June 2015) NICE TA344
  - Ofatumumab in combination with chlorambucil is an option for untreated chronic lymphocytic leukaemia only if:
    - the person is ineligible for fludarabine-based therapy and
    - bendamustine is not suitable and
    - the manufacturer provides ofatumumab with the discount agreed in the patient access scheme.

**Cyclophosphamide**

- **INDICATIONS AND DOSE**
  - Rheumatoid arthritis with severe systemic manifestations
    - **BY MOUTH**
    - Adult: 1–1.5 mg/kg daily
  - Severe systemic rheumatoid arthritis / Other connective tissue diseases (especially with active vasculitis)
    - **BY INTRAVENOUS INJECTION**
    - Adult: 0.5–1 g every 2 weeks, then reduced to 0.5–1 g every month, frequency adjusted according to clinical response and haematological monitoring. To be given with prophylactic mesna
  - Used, mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours
    - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
    - Adult: (consult local protocol)

- **UNLICENSED USE**
  - Not licensed for rheumatoid arthritis with severe systemic manifestations.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS**
  - Haemorrhagic cystitis
- **CAUTIONS**
  - Avoid in Acute porphyrias p. 969· diabetes mellitus· previous or concurrent mediastinal irradiation—risk of cardiotoxicity
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Common or very common Anorexia· cardiotoxicity at high doses· disturbances of carbohydrate metabolism· inappropriate secretion of anti-diuretic hormone· interstitial pulmonary fibrosis· pancreatitis· pigmentation of nails· pigmentation of palms· pigmentation of soles· urothelial toxicity
- Rare Hepatotoxicity· renal dysfunction
- Frequency not known Alopecia· bone-marrow suppression· haemorrhagic cystitis· hyperuricaemia· male sterility· nausea· oral mucositis· premature menopause· secondary malignancy· thromboembolism· tumour lysis syndrome· vomiting

**SPECIFIC SIDE-EFFECTS**

- With intravenous use Extravasation

**SIDE-EFFECTS, FURTHER INFORMATION**

- Haemorrhagic cystitis A urinary metabolite of cyclophosphamide, acrolein, can cause haemorrhagic cystitis; this is a rare but serious complication; increased fluid intake for 24–48 hours after intravenous injection, can prevent this complication. When high-dose therapy (e.g. more than 2 g intravenously) is used or when the patient is considered to be at high risk of cystitis (e.g. because of pelvic irradiation), mesna (given initially

Patients currently receiving ofatumumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA344
intravenously then by mouth) can also help prevent cystitis.

- Secondary malignancy  Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

**CONCEPTION AND CONTRACEPTION**  Manufacturer advises effective contraception during and for at least 3 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- **PREGNANCY**  Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **BREAST FEEDING**  Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**  Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.
- **RENAI IMPAIRMENT**  Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.

**INDICATIONS AND DOSE**

**Prostate cancer**

- **BY MOUTH**
  - Adult: Initially 560–840 mg daily in divided doses; maintenance 140–1400 mg daily in divided doses

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS**  Peptic ulceration - severe cardiovascular disease  - thromboembolic disorders
- **CAUTIONS**  Avoid in Acute porphyrias p. 969  - cardiovascular disease  - cerebrovascular disease - conditions which might be aggravated by fluid retention (such as epilepsy or migraine)  - congestive heart failure  - diabetes  - hypercalcaemia  - hypertension
- **INTERACTIONS**  → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
  - Rare  Angioedema
  - **Frequency not known**  Alopecia  - bone-marrow suppression  - extravasation  - hyperuricaemia  - myelosuppression  - oral mucositis  - severe nausea  - severe vomiting  - tumour lysis syndrome  - vomiting

**Dacarbazine**

- **INDICATIONS AND DOSE**
  - **Metastatic melanoma**  |  **Soft-tissue sarcomas (combination therapy)**  |  **Hodgkin’s disease (combination therapy)**
  - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - **Adult:** (consult local protocol)

- **CAUTIONS**  Caution in handling—irritant to tissues
- **INTERACTIONS**  → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
  - Rare  Irritant to skin  - irritant to tissues  - liver necrosis due to hepatic vein thrombosis
  - **Frequency not known**  Alopecia  - bone-marrow suppression  - extravasation  - hyperuricaemia  - myelosuppression  - oral mucositis  - severe nausea  - severe vomiting  - tumour lysis syndrome  - vomiting

**CONCEPTION AND CONTRACEPTION**  Ensure effective contraception during and for at least 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**PRECAUTIONS**  → Appendix 1: alkylating agents

**DIRECTIONS FOR ADMINISTRATION**

- For **intravenous infusion**  (cyclophosphamide injection; **Baxter**)
  - **Give via drip tubing in Glucose 5% or Sodium chloride 0.9%**; reconstitute 1 g with 50 mL sodium chloride 0.9%.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, solution for injection, solution for infusion

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 25, 27**
  - **Cyclophosphamide (Non-proprietary)**
    - Cyclophosphamide (as Cyclophosphamide monohydrate) 50 mg: Cyclophosphamide 50mg tablets  |  100 tablet  [POM] £139.00
  - **Cytoxan** (Imported (United States))
    - **Cyclophosphamide 25 mg**  |  Cytoxan 25mg tablets  |  100 tablet  [POM] no price available

**Powder for solution for injection**

- **Cyclophosphamide (Non-proprietary)**
  - **Cyclophosphamide (as Cyclophosphamide monohydrate)**
    - 500 mg: Cyclophosphamide 500mg powder for solution for injection vials  |  1 vial  [POM] £9.66
    - 1 gram: Cyclophosphamide 1g powder for solution for injection vials  |  1 vial  [POM] £17.91
  - **Cyclophosphamide (as Cyclophosphamide monohydrate)**
    - 2 gram: Cyclophosphamide 2g powder for solution for injection vials  |  1 vial  [POM] £34.12

**Powder for solution for infusion**

- **Cyclophosphamide (Non-proprietary)**
  - **Cyclophosphamide (as Cyclophosphamide monohydrate)**
    - 500 mg: Cyclophosphamide 500mg powder for solution for infusion vials  |  1 vial  [POM] £9.66
    - 100 mg: Cyclophosphamide 100mg powder for solution for infusion vials  |  1 vial  [POM] £9.66

**Powder for solution for infusion (cytoxan)**

- **Cytoxan** (Imported): Cyclophosphamide 25 mg: Cyclophosphamide 25mg vials  |  500 mg  [POM] £19.95

**Estramustine phosphate**

- **INDICATIONS AND DOSE**
  - **Prostate cancer**
    - **BY MOUTH**
      - Adult: Initially 560–840 mg daily in divided doses; maintenance 140–1400 mg daily in divided doses
### Ifosfamide

#### INDICATIONS AND DOSE

**Malignant disease**
- BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)

#### CONTRA-INDICATIONS

- Acute infection · urinary-tract infection · urinary-tract obstruction · urothelial damage

#### CAUTIONS

- Avoid in Acute porphyrias p. 969 · diabetes mellitus

#### INTERACTIONS

- Appendix 1: alkylating agents

#### SIDE-EFFECTS

- Common or very common: Confusion · disorientation · drowsiness · psychosis · renal toxicity (may lead to tubular dysfunction, Fanconi’s syndrome, or diabetes insipidus) · restlessness · urothelial toxicity
- Uncommon: Severe encephalopathy
- Rare: Anorexia · constipation · convulsions · diarrhoea
- Very rare: Jaundice · syndrome of inappropriate antidiuretic hormone secretion · thrombophlebitis

#### Frequency not known

- Acute pancreatitis · alopecia · arrhythmias · bone-marrow suppression · extravasation · heart failure · hyperuricaemia · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

- Urothelial toxicity: Mesna is routinely given with ifosfamide to reduce urothelial toxicity.
- Secondary malignancy: Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

#### CONCESSION AND CONTRACEPTION

- Manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

#### PREGNANCY

- Avoid (teratogenic and carcinogenic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

#### BREAST FEEDING

- Discontinue breast-feeding.

#### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for injection

- **Ifosfamide (Non-proprietary)**
  - **Ifosfamide 1 gram** Ifosfamide 1g powder for concentrate for solution for injection vials | 1 vial [POSM] £19.32
  - **Ifosfamide 2 gram** Ifosfamide 2g powder for concentrate for solution for injection vials | 1 vial [POSM] £17.88

### Lomustine

#### DRUG ACTION

Lomustine is a lipid-soluble nitrosourea.

#### INDICATIONS AND DOSE

- **Hodgkin’s disease resistant to conventional therapy**
- **Malignant melanoma**
- **Certain solid tumours**

- BY MOUTH
  - Adult: 120–130 mg/m² every 6–8 weeks, dose is for when lomustine is used alone

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 825.

#### CONTRA-INDICATIONS

- Coeliac disease

#### CAUTIONS

- Avoid in Acute porphyrias p. 969

#### INTERACTIONS

- Appendix 1: alkylating agents

#### SIDE-EFFECTS

- Alopecia · bone-marrow suppression (delayed) · hyperuricaemia · male sterility · nausea · oral mucositis · permanent bone marrow damage (with prolonged use) · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

- Secondary malignancy: Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

#### CONCEPTION AND CONTRACEPTION

- Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

#### PREGNANCY

- Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

#### BREAST FEEDING

- Discontinue breast-feeding.

#### MEDICATIONS

- Avoid in severe impairment. In hepatic impairment, manufacturer advises regular liver function tests.

#### HEPATIC IMPAIRMENT

- Manufacturer advises caution.

#### RENAL IMPAIRMENT

- Manufacturer advises caution.

#### DIRECTIONS FOR ADMINISTRATION

- Each dose should be taken not less than 1 hour before or 2 hours after meals and should not be taken with products containing calcium, magnesium or aluminium, including dairy products and antacid medication.

#### PATIENT AND CARER ADVICE

- Patients should be given advice on how to administer estramustine capsules.

#### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

- **CAUTIONARY AND ADVISORY LABELS 5, 23**
  - Estracyt (Pfizer Ltd)
    - Estramustine phosphate (as Estramustine sodium phosphate)
      - 140 mg Estracyt 140mg capsules | 100 capsule [POSM] £171.28

### Appendix 1

The brand name CCNU® has been used for lomustine capsules.
Melphalan

**INDICATIONS AND DOSE**

Multiple myeloma
- **BY MOUTH**
  - Adult: 150 micrograms/kg daily for 4 days, dose to be repeated every 6 weeks, dose may vary according to regimen
- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature)

Polycythaemia vera
- **BY MOUTH**
  - Adult: Initially 6–10 mg daily for 5–7 days, then reduced to 2–4 mg daily until satisfactory response, then reduced to 2–6 mg once weekly

Localised malignant melanoma of the extremities
- **BY REGIONAL ARTERIAL PERFUSION**
  - Adult: (consult local protocol)

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Rare
  - Intestinal pneumatosis
  - Life threatening pulmonary fibrosis
- Frequency not known
  - Alopecia
  - Bone-marrow suppression (delayed)
  - Hyperuricaemia
  - Male sterilisation
  - Nausea
  - Oral mucositis
  - Premature menopause
  - Secondary malignancy
  - Thromboembolism
  - Tumour lysis syndrome
  - Vomiting

**SPECIFIC SIDE-EFFECTS**
- With intravenous use
  - Extravasation

**INTERACTIONS**
- Monitor liver function before treatment initiation, after each treatment cycle and midway through treatment cycles
- Monitor bone-marrow suppression

**CONCESSION AND CONTRACEPTION**
- Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**PRECAUTIONS**
- Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**CAUTIONS**
- Avoid in Acute porphyrias p. 969
- **INTERACTIONS**
  - Appendix 1: alkylating agents

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- **Melphalan (Non-proprietary)**
  - Melphalan (as Melphalan hydrochloride) 50 mg
  - Melphalan 50 mg powder and solvent for solution for injection vials
  - 1 vial
  - **£137.37**

**Tablet**
- **Melphalan (Non-proprietary)**
  - Melphalan 2 mg
  - Melphalan 2 mg tablets
  - 25 tablet
  - **£45.38 DT**
  - price = £45.38

Temozolomide

**DRUG ACTION**
- Temozolomide is structurally related to dacarbazine.

**INDICATIONS AND DOSE**
- Newly diagnosed glioblastoma multiforme in adults (in combination with radiotherapy) and subsequently as monotherapy
- Second-line treatment of malignant glioma in adults
  - **BY MOUTH**
  - Adult: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
- See Cytotoxic drugs p. 825.

**CAUTIONS**
- Pneumocystis jirovecii pneumonia—consult product literature for monitoring and prophylaxis requirements

**INTERACTIONS**
- Appendix 1: alkylating agents

**SIDE-EFFECTS**
- Alopecia
- Bone-marrow suppression
- Hyperuricaemia
- Nausea
- Oral mucositis
- Thromboembolism
- Tumour lysis syndrome
- Vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
- For further information on side-effects consult product literature.

**CONCESSION AND CONTRACEPTION**
- Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**PRECAUTIONS**
- Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**CAUTIONS**
- Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
- Use with caution in severe impairment—no information available.

**RENAI IMPAIRMENT**
- Manufacturer advises caution—no information available.

**MONITORING REQUIREMENTS**
- Monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles—consider the balance of benefits and risks of treatment if results are abnormal at any point (fateful liver injury reported).
- Monitor for myelodysplastic syndrome.
- Monitor for secondary malignancies.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
  - Temozolomide may be considered for the treatment of recurrent malignant glioma, which has not responded to first-line chemotherapy.
  - www.nice.org.uk/TA23

- Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007) NICE TA121
  - Temozolomide is an option for the treatment of newly diagnosed glioblastoma multiforme in patients with a WHO performance status of 0 or 1.
  - www.nice.org.uk/TA121

downloaded from www.medicalbr.com
**Immune system and malignant disease**

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Capsule**

**Breastfeeding** Discontinue breast-feeding.

**National funding/access decisions**

The **Scottish Medicines Consortium (SMC) Decisions**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (June 2012) that thiopeta (Tepadina®) is not recommended for use within NHS Scotland in combination with other chemotherapy as conditioning treatment in adults or children with haematological diseases, or solid tumours prior to haematopoietic stem cell transplantation.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

▶ **Tepadina (Adieenne Pharma & Biotech)**
  - Thiopeta 15 mg Tepadina 15mg powder for concentrate for solution for infusion vials | 1 vial 
    
  | no price available
  - Thiopeta 100 mg Tepadina 100mg powder for concentrate for solution for infusion vials | 1 vial 
    
  | no price available

**Temozolomide (Non-proprietary)**

▶ **Thiotepa**

**INDICATIONS AND DOSE**

Ovarian cancer

▶ BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAPERITONEAL INSTALLATION

▶ Adult: (consult product literature)

**INTERACTIONS**

▶ Appendix 1: alkylating agents

**SIDE-EFFECTS**

▶ Common or very common Skin pigmentation

▶ Rare Allergic alveolitis · haemorrhagic cystitis · pulmonary fibrosis

▶ Frequency not known Alopecia · bone-marrow suppression · extravasation of intravenous drugs · hyperuricaemia · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

▶ Secondary malignancy Prolonged use of alkylyating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

**Conception and contraception** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**Pregnancy** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**Breastfeeding** Discontinue breast-feeding.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 25

**Powder for solution for injection**

▶ **Treosulfan (Non-proprietary)**
  - Treosulfan 1 gram Treosulfan 1g powder for solution for injection vials | 5 vial 
    
  | POM £269.17
  - Treosulfan 5 gram Treosulfan 5g powder for solution for injection vials | 5 vial 
    
  | POM £1,040.17

**Thiotepa**

**INDICATIONS AND DOSE**

Conditioning treatment before haematopoietic stem cell transplantation in the treatment of haematological disease or solid tumours, in combination with other chemotherapy

▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult local protocol)

**CAUTIONS**

Avoid in Acute porphyrias p. 969

**INTERACTIONS**

▶ Appendix 1: alkylating agents

**SIDE-EFFECTS**

▶ Alopecia · bone-marrow suppression · extravasation of intravenous drugs · hyperuricaemia · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

▶ Secondary malignancy Prolonged use of alkylyating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

**Conception and contraception** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**Pregnancy** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**Breastfeeding** Discontinue breast-feeding.
ANTINEOPLASTIC DRUGS › ANTHRACYCLINES AND RELATED DRUGS

Daunorubicin

**INDICATIONS AND DOSE**

Acute myelogenous leukaemia | Acute lymphocytic leukaemia

- **BY INTRAVENOUS INFUSION**
  - Adult: (consult local protocol)

Advanced AIDS-related Kaposi’s sarcoma (liposomal formulation only)

- **BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature)

**CONTRA-INDICATIONS** Myocardial insufficiency - previous treatment with maximum cumulative doses of daunorubicin or other anthracycline - recent myocardial infarction - severe arhythmia

**CAUTIONS** Caution in handling—irritant to tissues

**INTERACTIONS** → Appendix 1: anthracyclines

**SIDE-EFFECTS** Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Cardiotoxicity All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible

**CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**PREGNANCY** Avoid (teratogenic and carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Reduce dose according to serum bilirubin concentration—consult local protocol for details. Avoid in severe impairment.

**RENAL IMPAIRMENT** Reduce dose by 25% if serum creatinine 105–265 micromol/litre. Reduce dose by 50% if serum creatinine greater than 265 micromol/litre. Avoid in severe impairment.

**MONITORING REQUIREMENTS** Cardiac monitoring essential.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Emulsion for infusion**

- DaunoXome (Galen Ltd)
  - Daunorubicin (as Daunorubicin hydrochloride citrate) 50 mg DaunoXome 50mg emulsion for infusion vials | 1 vial £250.00

**Powder for solution for infusion**

- Daunorubicin (Non-proprietary)
  - Daunorubicin hydrochloride 20 mg Daunorubicin 20mg powder for solution for infusion vials | 10 vial £550.00 (Hospital only)

Doxorubicin hydrochloride

**INDICATIONS AND DOSE**

Acute leukaemias | Hodgkin’s lymphoma | Non-Hodgkin’s lymphoma | Some solid tumours including breast cancer

- **BY INTRAVENOUS INJECTION**
  - Adult: (consult product literature)

Some papillary bladder tumours (bladder instillation) | Recurrent superficial bladder tumours (bladder instillation) | Transitional cell carcinoma (bladder instillation) | Carcinoma in situ (bladder instillation)

- **BY INTRAVERSICAL INSTALLATION**
  - Adult: (consult product literature)

**CAELYX®**

For AIDS-related Kaposis’s sarcoma in patients with low CD4 count and extensive mucocutaneous or visceral disease | Advanced ovarian cancer when platinum-based chemotherapy has failed | Progressive multiple myeloma (in combination with bortezomib) in patients who have received at least one prior therapy and who have undergone or are unsuitable for bone-marrow transplantation | Monotherapy for metastatic breast cancer in patients with increased cardiac risk

- **BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature)

**MYOCET®**

For use with cyclophosphamide for metastatic breast cancer

- **BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature)

**CONTRA-INDICATIONS** Consult product literature

**CAUTIONS** Cardiac disease - caution in handling—irritant to tissues - consult product literature - elderly - hypertension - previous myocardial irradiation

**INTERACTIONS** → Appendix 1: anthracyclines

**SIDE-EFFECTS**

- **Common or very common** Dehydration - diarrhoea - red colouration of the urine

- **Uncommon** Supraventricular tachycardia (related to drug administration)

- **Frequency not known** Alopecia - bone-marrow suppression - cardiomyopathy (with higher cumulative doses) - consult product literature - extravasation - heart failure (potentially fatal) - hyperuricaemia - nausea - oral mucositis - renal damage - thromboembolism - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Extravasation Extravasation can cause severe tissue necrosis.

- Cardiomyopathy Higher cumulative doses are associated with cardiomyopathy and it is usual to limit total cumulative doses to 450 mg/m² because symptomatic and potentially fatal heart failure is common above this dose.

- Cardiotoxic Some evidence suggests that weekly low-dose administration may be less cardiotoxic.

- Liposomal formulations Liposomal formulations of doxorubicin may reduce the incidence of cardiotoxicity and lower the potential for local necrosis, but infusion reactions, sometimes severe, may occur. Hand-foot syndrome (painful, macular reddening skin eruptions) occurs commonly with liposomal doxorubicin and may be dose limiting. It can occur after 2–3 treatment cycles and may be prevented by cooling hands and feet and avoiding socks, gloves, or tight-fitting footwear for 4–7 days after treatment.

- Elevated bilirubin concentration Doxorubicin is largely excreted in the bile and an elevated bilirubin concentration is an indication for reducing the dose.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

**PREGNANCY** Avoid (teratogenic and toxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING** Discontinue breast-feeding.
Hepatic Impairment
Reduce dose according to bilirubin concentration—consult product literature or local treatment protocol for details. Avoid in severe impairment.

Renal Impairment
Consult product literature in severe impairment.

Monitoring Requirements
Patients should be assessed before treatment, by echocardiography. Cardiac monitoring during treatment may assist in determining safe dosage.

Directions for Administration
Conventional doxorubicin is given by injection into a fast-running infusion, commonly at 21-day intervals.

Prescribing and Dispensing Information
Doxorubicin is available as both conventional and liposomal formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable.

National Funding/Access Decisions
NICE Technology Appraisals (TAs)
- Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389
Pegylated liposomal doxorubicin hydrochloride (PLDH) monotherapy or in combination with platinum, is recommended as an option for treating recurrent ovarian cancer.
PLDH, in combination with trabectedin, is not recommended for treating the first recurrence of platinum-sensitive ovarian cancer.
Patients currently receiving PLDH in combination with trabectedin should have the option to continue their treatment until they and their clinician consider it appropriate to stop.
www.nice.org.uk/TA389

Medicinal Forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for Injection
- Doxorubicin hydrochloride (Non-proprietary)
  - Doxorubicin hydrochloride 2 mg per 1 ml
  Doxorubicin 10mg/5ml solution for injection vials 1 vial £18.84 (Hospital only)
  Doxorubicin 50mg/25ml solution for injection Cytosafe vials 1 vial £103.00
  Doxorubicin 50mg/25ml solution for infusion vials 1 vial £103.00 (Hospital only)
  Doxorubicin 10mg/5ml solution for injection Cytosafe vials 1 vial £20.60
  Doxorubicin 10mg/5ml solution for infusion vials 1 vial £20.60 (Hospital only)
  Doxorubicin 10mg/5ml solution for infusion vials 1 vial no price available
  Doxorubicin 50mg/25ml solution for infusion vials 1 vial £92.70 (Hospital only)
  Doxorubicin 50mg/25ml solution for infusion vials 1 vial no price available

Solution for Infusion
- Doxorubicin hydrochloride (Non-proprietary)
  - Doxorubicin hydrochloride 0.5 mg per 1 ml
  Doxorubicin 200mg/100ml solution for injection Cytosafe vials 1 vial £412.00
  Doxorubicin 200mg/100ml solution for infusion vials 1 vial £370.80/£412.00 (Hospital only)
  Doxorubicin 200mg/100ml solution for infusion vials 1 vial no price available
  - Caelyx (Janssen-Cilag Ltd)
  Doxorubicin hydrochloride (as Doxorubicin hydrochloride liposomal pegylated) 2 mg per 1 ml
  Caelyx 50mg/25ml concentrate for solution for infusion vials 1 vial £712.40
  Caelyx 20mg/10ml concentrate for solution for infusion vials 1 vial £360.23

Powder for solution for injection
- Doxorubicin (medac UK)
  - Doxorubicin hydrochloride 10 mg
    Doxorubicin 10mg powder for solution for infusion vials 1 vial £182.00
  - Doxorubicin hydrochloride 50 mg
    Doxorubicin 50mg powder for solution for infusion vials 1 vial £914.00

Powder and solvent for suspension for infusion
ELECTROLYTES: May contain Sodium
- Myocet (Teva UK Ltd)
  - Doxorubicin hydrochloride 50 mg
    Myocet 50mg powder and solvent for suspension for infusion vials 2 vial £912.26 (Hospital only)

Epirubicin hydrochloride

Indications and Dose
Treatment of breast cancer | Treatment and prophylaxis of certain forms of superficial bladder cancer
- By Intravenous infusion, or by Intravesical Instillation
- Adult: consult product literature or local protocols

Contra-Indications
Bladder inflammation or contraction (when used as a bladder instillation) - catheterisation difficulties (when used as a bladder instillation) - haematuria (when used as a bladder instillation) - invasive tumours penetrating the bladder (when used as a bladder instillation) - myocardopathy - previous treatment with maximum cumulative doses of epirubicin or other anthracycline - recent myocardial infarction - severe arrhythmia - severe myocardial insufficiency - unstable angina - urinary tract infections (when used as a bladder instillation)

Caution
Caution in handling—irritant to tissues

Interactions
Appendix 1: anthracyclines

Side-Effects
Alopecia - bone-marrow suppression - cardiotoxicity - extravasation - hyperpigmentation of nails - hyperpigmentation of oral mucosa - hyperpigmentation of skin - hyperuricaemia - nausea - oral mucositis - red colouration of the urine - thromboembolism - tumour lysis syndrome - vomiting

Side-Effects, Further Information
Cardiotoxicity A maximum cumulative dose of 0.9–1 g/m² is recommended to help avoid cardiotoxicity.

Conception and Contraception
Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

Pregnancy
Avoid (carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

Breast Feeding
Discontinue breast-feeding.

Hepatic Impairment
Reduce dose according to bilirubin concentration—consult local treatment protocol for details. Avoid in severe impairment.

Renal Impairment
Dose reduction may be necessary in severe impairment.

Medicinal Forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for Injection
- Epirubicin hydrochloride (Non-proprietary)
  Epirubicin hydrochloride 2 mg per 1 ml
  Epirubicin 50mg/25ml solution for injection vials 1 vial £100.88
  Epirubicin 10mg/5ml solution for injection vials 1 vial £17.38
  - Pharmorubicin (Pfizer Ltd)
  Epirubicin hydrochloride 2 mg per 1 ml
  Pharmorubicin 50mg/25ml solution for injection Cytosafe vials 1 vial £106.19
  Pharmorubicin 10mg/5ml solution for injection Cytosafe vials 1 vial £21.24

Downloaded from www.medicalbr.com
Idarubicin hydrochloride

**INDICATIONS AND DOSE**

- **Acute non-lymphocytic leukaemias monotherapy**
  - **BY MOUTH**
  - Adult: 30 mg/m² daily for 3 days; maximum 400 mg/m² per course

- **Acute non-lymphocytic leukaemias in combination therapy**
  - **BY MOUTH**
  - Adult: 15–30 mg/m² daily for 3 days; maximum 400 mg/m² per course

- **Advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines)—monotherapy**
  - **BY MOUTH**
  - Adult: 45 mg/m² for 1 dose, repeat treatment every 3–4 weeks, alternatively 15 mg/m² daily for 3 consecutive days, repeat treatment every 3–4 weeks; maximum 400 mg/m² per course

- **Acute leukaemias/Advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines)**
  - **BY INTRAVENOUS INJECTION**
  - Adult: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Previous treatment with maximum cumulative dose of idarubicin or other anthracycline · recent myocardial infarction · severe arrhythmias · severe myocardial insufficiency
- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1: anthracyclines
- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - **Common or very common** Abdominal pain · cardiac disorders · diarrhoea · haemorrhage · rash · red pigmentation of the urine
    - **Uncommon** Nail hyperpigmentation · skin hyperpigmentation
    - **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
  - **SPECIFIC SIDE-EFFECTS**
    - With intravenous use Extravasation
    - **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.
    - **PREGNANCY** Avoid (teratogenic and toxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.
    - **BREAST FEEDING** Discontinue breast-feeding.
    - **HEPATIC IMPAIRMENT** Reduce dose according to serum bilirubin concentration. Avoid in severe impairment.
    - **RENAL IMPAIRMENT** Reduce dose. Avoid in severe impairment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **CAUTIONARY AND ADVISORY LABELS** 25
  - **Zavedos** (Pfizer Ltd)
    - Idarubicin hydrochloride 5 mg Zavedos 5mg capsules | 1 vial £91.47
    - Idarubicin hydrochloride 10 mg Zavedos 10mg capsules | 1 capsule £69.12

**Powder for solution for injection**

- **Zavedos** (Pfizer Ltd)
  - Idarubicin hydrochloride 5 mg Zavedos 5mg powder for solution for injection vials | 1 vial £97.36
  - Idarubicin hydrochloride 10 mg Zavedos 10mg powder for solution for injection vials | 1 vial £174.72

**Mitoxantrone**

(Mitozantrone)

**INDICATIONS AND DOSE**

- **Metastatic breast cancer** · Non-Hodgkin’s lymphoma · Adult acute non-lymphocytic leukaemia · Non-resectable primary hepatocellular carcinoma
  - **BY INTRAVENOUS INFUSION**
  - Adult: (consult local protocol)

- **CAUTIONS** Intrathecal administration not recommended
- **INTERACTIONS** → Appendix 1: anthracyclines
- **SIDE-EFFECTS** Abdominal pain · alopoeia · amenorrhoea · anorexia · anxiety · blue discoloration of nails · blue discoloration of skin · bone-marrow suppression · confusion · constipation · diarrhoea · dose-related cardiotoxicity · drowsiness · dyspnoea · extravasation · gastro-intestinal bleeding · hyperuricaemia · myelosuppression · nausea · oral mucositis · paraesthesia · thromboembolism · transient blue-green discoloration of urine · tumour lysis syndrome · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Cardiotoxicity Cardiac examinations are recommended after a cumulative dose of 160 mg/m².

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution—consult local treatment protocol.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Mitoxantrone (Non-proprietary)**
  - Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Mitoxantrone 20mg/10ml concentrate for solution for infusion vials | 1 vial £121.85
  - **Onkotrone** (Baxter Healthcare Ltd)
    - Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Onkotrone 20mg/10ml solution for infusion vials | 1 vial no price available
    - Onkotrone 25mg/12.5ml solution for infusion vials | 1 vial no price available

- **Onkotrone (Non-proprietary)**
  - Mitoxantrone 2 mg per 1 ml Mitoxantrone 20mg/10ml concentrate for solution for infusion vials | 1 vial £121.85
  - **Pharmorubicin** (Pfizer Ltd)
    - Mitoxantrone hydrochloride 2 mg per 1 ml Pharmorubicin 200mg/100ml solution for infusion Cytosafe vials | 1 vial £386.16
Pixantrone

**INDICATIONS AND DOSE**
Treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas (monotherapy)

- BY INTRAVENOUS INFUSION
  - Adult: (consult product literature)

**CONTRA-INDICATIONS**
Active severe infection - risk factors for severe infection

**CAUTIONS**
Active cardiovascular disease - cardiac risk factors - caution in handling - irritant to tissues - concurrent radiotherapy to the mediastinal area - history of cardiovascular disease - previous radiotherapy to the mediastinal area - previous therapy with anthrancenides - previous therapy with anthracyclines

**INTERACTIONS**
Appendix 1: anthracyclines

**SIDE-EFFECTS**

- **Common or very common**
  - Abdominal pain
  - Abnormal liver function tests
  - Biochemical disturbances
  - Bone pain
  - Cardiac disorders (dysrhythmia, congestive heart failure, pericardial effusion)
  - Cardiac toxicity (dysrhythmia, congestive heart failure, pericardial effusion)
  - Cough
  - Diarrhoea
  - Drowsiness
  - Dry mouth
  - Dyspepsia
  - Dysphagia
  - Electrolyte disturbances (transient)
  - Fatigue
  - Headache
  - Hypertension
  - Infection
  - Loss of appetite
  - Malaise
  - Nail disorder
  - Oedema
  - Pallor
  - Paraesthesia
  - Photo sensitivity
  - Pruritus
  - Pyrexia
  - Severe myelosuppression
  - Skin discoloration
  - Tachycardia
  - Taste disturbances
  - Venin discoloration
  - Weight loss

- **Uncommon**
  - Anxiety
  - Arrhythmia
  - Arthralgia
  - Arthritis
  - Dizziness
  - Dry eye
  - Keratitis
  - Musculoskeletal pain
  - Musculoskeletal weakness
  - Night sweats
  - Oesophagitis
  - Oliguria
  - Petechiae
  - Pleural effusion
  - Pneumonitis
  - Rash
  - Rectal haemorrhage
  - Rhinorhoea
  - Skin ulcer
  - Sleep disorder
  - Spontaneous erection
  - Tumour progression
  - Vein disorder
  - Vertigo

- **Frequency not known**
  - Alopecia
  - Bone-marrow suppression
  - Extravasation
  - Hyperuricaemia
  - Nausea
  - Oral mucositis
  - Photosensitivity (thromboembolism, tumour lysis syndrome, vomiting

**CONCEPTION AND CONTRACEPTION**
Ensure effective contraception during and for at least 6 months after treatment in men or women.

**PREGNANCY**
Manufacturer advises avoid — toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING**
Manufacturer advises avoid — no information available.

**HEPATIC IMPAIRMENT**
No information available — manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

**RENAL IMPAIRMENT**
No information available — manufacturer advises caution.

**MONITORING REQUIREMENTS**
Baseline investigations should include a full blood count, assessment of cardiac function measured by left ventricular ejection fraction, and measurement of serum concentrations of total bilirubin and total creatinine.

- Full blood count and cardiac function should be monitored throughout treatment.

**PATIENT AND CARER ADVICE**
Photosensitivity. Photosensitivity is a theoretical risk and patients should be advised to follow sun protection strategies.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Pixantrone monotherapy for treating multiply relapsed or refractory aggressive non-Hodgkin's B-cell lymphoma (February 2014) NICE TA306
  - Pixantrone monotherapy is recommended as an option for treating adults with multiply relapsed or refractory aggressive non-Hodgkin’s B-cell lymphoma in patients:

  - who have previously been treated with rituximab and
  - who are receiving third- or fourth-line treatment and
  - if the manufacturer provides pixantrone with the discount agreed in the patient access scheme.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

ELECTROLYTES: May contain Sodium
- Pixuvri (CTI Life Sciences Ltd) ▼
- Pixantrone (as Pixantrone dimaleate) 29 mg
  - 29 mg powder for concentrate for solution for infusion via 1 vial (POD) no price available

**ANTINEOPLASTIC DRUGS > ANTIMETABOLITES**

Azacitidine

**DRUG ACTION**
Azacitidine is a pyrimidine analogue.

**INDICATIONS AND DOSE**
Treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, and acute myeloid leukaemia, in adults who are not eligible for haematopoietic stem cell transplantation

- BY SUBCUTANEOUS INJECTION
  - Adult: (consult local protocol)
Monitor full blood count before initiation of treatment, before each treatment cycle, and as clinically indicated. Monitor for bleeding.

### NATIONAL FUNDING/ACCESS DECISIONS

**NICE technology appraisals (TAs)**

- **Azacitidine for treating acute myeloid leukaemia with more than 30% bone marrow blasts** (July 2016) NICE TA399
  - Azacitidine is not recommended, within its marketing authorisation, for treating acute myeloid leukaemia with greater than 30% bone marrow blasts in patients aged 65 years or above who are not eligible for haematopoietic stem cell transplant.
  - Patients whose treatment was started before this guidance was published should continue treatment until they and their clinician consider it appropriate to stop. [www.nice.org.uk/TA399](http://www.nice.org.uk/TA399)

- **Azacitidine for the treatment of myelodysplastic syndromes, chronic myelomonocytic leukaemia and acute myeloid leukaemia** (March 2011) NICE TA218
  - Azacitidine is recommended in adults who are not eligible for haematopoietic stem cell transplantation as an option for the treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, or acute myeloid leukaemia. [www.nice.org.uk/TA218](http://www.nice.org.uk/TA218)

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Powder for suspension for injection**

- Vidaza (Celsogen Ltd)
  - **Azacitidine 100 mg** Vidaza 100 mg powder for suspension for injection vials | 1 vial [£321.00](https://www.nice.org.uk/TA399)

### Capecitabine

**DRUG ACTION**

Capecitabine is metabolised to fluorouracil.

**INDICATIONS AND DOSE**

**Stage III colon cancer, adjuvant following surgery (monotherapy)**

- **BY MOUTH**
  - Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, recommended duration of treatment is 6 months, adjust dose according to tolerability—consult product literature

**Stage III colon cancer, adjuvant following surgery (combination therapy)**

- **BY MOUTH**
  - Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, recommended duration of treatment is 6 months, adjust dose according to tolerability—consult product literature

**Metastatic colorectal cancer (monotherapy)**

- **BY MOUTH**
  - Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

**Metastatic colorectal cancer (combination therapy)**

- **BY MOUTH**
  - Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

**Advanced gastric cancer (first-line treatment in combination with a platinum based regimen)**

- **BY MOUTH**
  - Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, alternatively 625 mg/m² twice daily given continuously, adjust dose according to tolerability—consult product literature

**IN DICATIONS AND DOSE**

Capecitabine is metabolised to fluorouracil.

**SIDE-EFFECTS**

- Alopecia—bone-marrow suppression—hyperuricaemia—nausea—oral mucositis—thromboembolism—tumour lysis syndrome—vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

For further information on side-effects, consult product literature.

**CONCEPTION AND CONTRACEPTION**

Contraceptive advice required, see [Pregnancy and reproductive function](#) in Cytotoxic drugs p. 825.

**PREGNANCY**

Avoid (teratogenic in animal studies). See also [Pregnancy and reproductive function](#) in Cytotoxic drugs p. 825.

**BREAST FEEDING**

Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

Manufacturer advises monitor liver function in mild to moderate impairment—consult product literature for guidance on treatment interruption; avoid in severe impairment.

**RENAL IMPAIRMENT**

Reduce starting dose of 1.25 g/m² to 75% if creatinine clearance 30–50 mL/minute. Avoid if creatinine clearance less than 30 mL/minute.

**MONITORING REQUIREMENTS**

- Monitor plasma—calcium concentration.
- Monitor for eye disorders (including keratitis and corneal disorders).
- Monitor for symptoms of hand-foot syndrome. Monitor for symptoms of severe skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolys)—permanently discontinue treatment immediately if symptoms occur.
- Monitor for symptoms of hand-foot syndrome—interrupt treatment if significant syndrome occurs and refer to product literature.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- **Bevacizumab in combination with capecitabine for the first-line treatment of metastatic breast cancer** (August 2012) NICE TA263
  - Bevacizumab in combinations with capcitabine is not recommended within its marketing authorisation for the first-line treatment of metastatic breast cancer, that is, when treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or when taxanes or anthracyclines have been used as part of adjuvant treatment in the previous 12 months. [www.nice.org.uk/TA263](http://www.nice.org.uk/TA263)

**CONTRA-INDICATIONS**

- Dihydropyrimidine dehydrogenase deficiency

**CAUTIONS**

- Diabetes mellitus—diarrhoea or dehydration—consult product literature for guidance on dose modification and treatment interruption—electrolyte disturbances—history of angina pectoris—history of arrhythmias—history of significant cardiovascular disease—nervous system disease

**INTERACTIONS**

- Appendix 1: capecitabine

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS**
  - Dihydropyrimidine dehydrogenase deficiency

- **CAUTIONS**
  - Diabetes mellitus—diarrhoea or dehydration—consult product literature for guidance on dose modification and treatment interruption—electrolyte disturbances—history of angina pectoris—history of arrhythmias—history of significant cardiovascular disease—nervous system disease

- **SIDE-EFFECTS**
  - Alopecia—bone-marrow suppression—hyperuricaemia—nausea—oral mucositis—thromboembolism—tumour lysis syndrome—vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - For further information on side-effects, consult product literature.

- **CONCEPTION AND CONTRACEPTION**
  - Contraceptive advice required, see [Pregnancy and reproductive function](#) in Cytotoxic drugs p. 825.

- **PREGNANCY**
  - Avoid (teratogenic in animal studies). See also [Pregnancy and reproductive function](#) in Cytotoxic drugs p. 825.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises monitor liver function in mild to moderate impairment—consult product literature for guidance on treatment interruption; avoid in severe impairment.

- **RENAL IMPAIRMENT**
  - Reduce starting dose of 1.25 g/m² to 75% if creatinine clearance 30–50 mL/minute. Avoid if creatinine clearance less than 30 mL/minute.

- **MONITORING REQUIREMENTS**
  - Monitor plasma—calcium concentration.
  - Monitor for eye disorders (including keratitis and corneal disorders).
  - Monitor for symptoms of severe skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolys)—permanently discontinue treatment immediately if symptoms occur.
  - Monitor for symptoms of hand-foot syndrome—interrupt treatment if significant syndrome occurs and refer to product literature.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - **Bevacizumab in combination with capecitabine for the first-line treatment of metastatic breast cancer** (August 2012) NICE TA263
      - Bevacizumab in combinations with capcitabine is not recommended within its marketing authorisation for the first-line treatment of metastatic breast cancer, that is, when treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or when taxanes or anthracyclines have been used as part of adjuvant treatment in the previous 12 months. [www.nice.org.uk/TA263](http://www.nice.org.uk/TA263)
**Cladribine**

**INDICATIONS AND DOSE**

**LEUSTAT®**

B-cell chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent | **Hairy cell leukaemia**

- **BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature or local protocols)

**LITAK®**

Hairy cell leukaemia | **BY SUBCUTANEOUS INJECTION**

- Adult: (consult product literature or local protocols)

**CAUTIONS** Use irradiated blood only

**FURTHER INFORMATION**

Immunosuppressive effect of cladribine. Cladribine has a potent and prolonged immunosuppressive effect. Patients treated with cladribine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

**INTERACTIONS** → Appendix 1: cladribine

**SIDE-EFFECTS** Abdominal pain - acute renal failure (with high doses) - alopecia - anxiety - arthralgia - asthenia - bone-marrow suppression - chills - constipation - cough - diarrhoea - dizziness - dysphoea - extravasation - flatulence - haemolytic anaemia - headache - hyperuricaemia - insomnia - malaise - myalgia - nausea - oedema - oral mucositis - pruritus - purpura - rash - severe myelosuppression (with neutropenia, anaemia and thrombocytopenia) - severe neurotoxicity (with high doses) - sweating - tachycardia - thromboembolism - tumour lysis syndrome - vomiting

**CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

**PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Regular monitoring recommended in hepatic impairment.

**RENAL IMPAIRMENT** Regular monitoring recommended in renal impairment.

**DIRECTIONS FOR ADMINISTRATION** Litak® for subcutaneous use only — no dilution required.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Litak (Lipomed GmbH)** Cladribine 2 mg per 1 ml Litak 10mg/5ml solution for injection vials | 1 vial POM £165.00 (Hospital only) | 5 vial POM £320.00 (Hospital only)

**Solution for infusion**

- **Leustat (Janssen-Cilag Ltd)** Cladribine 1 mg per 1 ml Leustat 10mg/10ml solution for infusion vials | 1 vial POM £159.70

---

**Clofarabine**

**INDICATIONS AND DOSE** Relapsed or refractory acute lymphoblastic leukaemia in patients who have received at least two previous regimens

- **BY INTRAVENOUS INFUSION**
  - Adult 18-20 years: (consult local protocol)

**CAUTIONS** Cardiac disease

**INTERACTIONS** → Appendix 1: clofarabine

**CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

**PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.
**RENAL IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**
- **Electrolytes:** May contain Sodium
- **Evotra** (Sanofi) 
  Clofarabine 1 mg per 1 ml Evotra 20 mg/20 ml concentrate for solution for infusion vials | 1 vial [Pom] £1.326.18 (Hospital only)

### Cytarabine

**DRUG ACTION** Cytarabine acts by interfering with pyrimidine synthesis.

**INDICATIONS AND DOSE**

**Induction of remission of acute myeloblastic leukaemia**
- By intravenous infusion, or by intravenous injection, or by subcutaneous injection
- Adult: (consult local protocol)

**Lymphomatous meningitis**
- By intrathecal injection
- Adult: (consult local protocol)

---

**IMPORTANT SAFETY INFORMATION** Not all cytarabine preparations can be given by intrathecal injection—consult product literature.

**INTERACTIONS** → Appendix 1: cytarabine

**SIDE-EFFECTS** Alopecia, bone-marrow suppression, extravasation, hyperuricaemia, nausea, oral mucositis, thromboembolism, tumour lysis syndrome, vomiting

**CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**PREGNANCY** Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Reduce dose—consult product literature.

**MONITORING REQUIREMENTS** Haematological monitoring, Cytarabine is a potent myelosuppressant and requires careful haematological monitoring.

**NATIONAL FUNDING/ACCESS DECISIONS**

**DEPOCYTE**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium (SMC) has advised (July 2007) that liposomal cytarabine suspension (DepoCyte®) is not recommended for use within NHS Scotland for the intrathecal treatment of lymphomatous meningitis.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**
- **Cytarabine (Non-proprietary)**
  - Cytarabine 20 mg per 1 ml Cytarabine 500 mg/25 ml solution for injection vials | 1 vial [Pom] £19.50
  - Cytarabine 100 mg/5 ml solution for injection vials | 5 vial [Pom] £20.98-£30.00
  - Cytarabine 100 mg per 1 ml Cytarabine 1 g/10 ml solution for injection vials | 1 vial [Pom] £40.00
  - Cytarabine 500 mg/5 ml solution for injection vials | 5 vial [Pom] £100.00
  - Cytarabine 4 g/40 ml solution for injection vials | 1 vial [Pom] no price available

---

### Fludarabine phosphate

**INDICATIONS AND DOSE**

Initial treatment of advanced B-cell chronic lymphocytic leukaemia (CLL) or after first line treatment in patients with sufficient bone-marrow reserves
- By mouth
- Adult: 40 mg/m² for 5 days every 28 days, usually given for 6 cycles
- By intravenous injection, or by intravenous infusion
- Adult: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 825.

**CONTRA-INDICATIONS** Haemolytic anaemia

**CAUTIONS** Increased susceptibility to skin cancer—worsening of existing skin cancer

**CAUTIONS, FURTHER INFORMATION** Co-trimoxazole is used to prevent pneumocystis infection.
Cytotoxic responsive malignancy

- Immunosuppression Fludarabine has a potent and prolonged immunosuppressive effect. Patients treated with fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

- **INTERACTIONS** → Appendix 1: fludarabine

- **SIDE-EFFECTS**
  - Common or very common Acute myeloid leukaemia - anorexia - chills - cough - diarrhoea - fever - immunosuppression - malaise - myelodysplastic syndrome - myelosuppression (may be cumulative) - oedema - peripheral neuropathy - pneumonia - rash - visual disturbances - weakness
  - Uncommon Autoimmune disorder - confusion - fibrosis - haemorrhage - immune-mediated haemolytic anaemia - neutropenia - pneumonitis - pulmonary toxicity - thrombocytopenia
  - Rare Agitation - arrhythmia - blindness - coma - heart failure - optic neuropathy - seizures - skin cancer - Stevens-Johnson syndrome - toxic epidermal necrolysis
  - Frequency not known Alopecia - bone marrow suppression - extravasation - haemorrhagic cystitis - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

- **PREGNANCY** Avoid (embryotoxic and teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Discontinue breast-feeding.

- **RENAL IMPAIRMENT** Reduce dose by up to 50% if creatinine clearance 30–70 mL/minute. Avoid if creatinine clearance less than 30 mL/minute.

- **MONITORING REQUIREMENTS**
  - Monitor for signs of haemolysis.
  - Monitor for neurological toxicity.
  - Assess creatinine clearance in patients over 65 years before treatment initiation.

- **DIRECTIONS FOR ADMINISTRATION** Concentrate for intravenous injection or infusion must be diluted before administration (consult product literature).

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NICE technology appraisals (TAs)**
  - Fludarabine monotherapy for the first-line treatment of chronic lymphocytic leukaemia (February 2007) NICE TA119
    Fludarabine monotherapy is not recommended for the first-line treatment of chronic lymphocytic leukaemia.
    [www.nice.org.uk/TA119](http://www.nice.org.uk/TA119)
  - Fludarabine for the treatment of B-cell chronic lymphocytic leukaemia (September 2001) NICE TA29
    Oral fludarabine is recommended for the second-line treatment of B-cell chronic lymphocytic leukaemia in patients who have either failed, or are intolerant of, first line chemotherapy, and who would otherwise have received combination chemotherapy of either:
    - cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP)
    - cyclophosphamide, doxorubicin and prednisolone (CAP)
    or
    - cyclophosphamide, vincristine and prednisolone (CVP)
    Intra-venous fludarabine should only be used when oral fludarabine is contra-indicated.
    [www.nice.org.uk/TA29](http://www.nice.org.uk/TA29)

- **Scottish Medicines Consortium (SMC) Decisions**
  - The Scottish Medicines Consortium has advised (October 2006) that fludarabine is accepted for restricted use for the treatment of B-cell chronic lymphocytic leukaemia (CLL) in patients with sufficient bone marrow reserves. First-line treatment should only be initiated in patients with advanced disease, Rai stages III/IV (Binet stage C), or Rai stages I/II (Binet stage A/B) where the patient has disease-related symptoms or evidence of progressive disease.

  **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  - Fludarabine phosphate (Non proprietary)
    Fludarabine phosphate 25 mg per 1 ml Fludarabine phosphate 50mg/2ml concentrate for solution for injection vials | 1 vial [POM] £156.00 (Hospital only) | 1 vial [POM] £155.00

  **Tablet**
  - Fludara (Sanofi)
    Fludarabine phosphate 10 mg Fludara 10mg tablets | 15 tablet [POM] £302.48 (Hospital only) | 20 tablet [POM] £403.31 (Hospital only)

  **Powder for solution for injection**
  - Fludarabine phosphate (Non proprietary)
    Fludarabine phosphate 50 mg Fludarabine phosphate 50mg powder for solution for injection vials | 1 vial [POM] £155.00 (Hospital only)
  - Fludara (Sanofi)
    Fludarabine phosphate 50 mg Fludara 50mg powder for solution for injection vials | 5 vial [POM] £735.34 (Hospital only)

Fluorouracil

- **INDICATIONS AND DOSE**
  - Treatment of some solid tumours including gastro-intestinal tract cancers and breast cancer in combination with folinic acid in advanced colorectal cancer
    - By intravenous injection, or by intravenous infusion.
    - Or by intra-arterial infusion
    - Adult: (consult product literature)

  **INTERACTIONS** → Appendix 1: fluorouracil

  **SIDE-EFFECTS**
  - Rare Cerebellar syndrome
  - Frequency not known Alopecia - bone marrow suppression - desquamative hand-foot syndrome (on prolonged infusion) - extravasation - hyperuricaemia - mucositis - myelosuppression - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

  **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- **PREGNANCY** Avoid (teratogenic). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **HANDLING AND STORAGE** Caution in handling—irritant to tissues.

  **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

  **Solution for injection**
  - Fluorouracil (Non proprietary)
    Fluorouracil (as Fluorouracil sodium) 25 mg per 1 ml Fluorouracil 500mg/20ml solution for injection vials | 10 vial [POM] £64.00
    Fluorouracil 250mg/10ml solution for injection vials | 5 vial [POM] £24.00
  - Fluorouracil (as Fluorouracil sodium) 50 mg per 1 ml Fluorouracil 1g/20ml solution for injection vials | 1 vial [POM] £12.80
    Fluorouracil 500mg/10ml solution for injection vials | 1 vial [POM] £6.40 | 5 vial [POM] £32.00
Gemcitabine

INDICATIONS AND DOSE
First-line treatment for locally advanced or metastatic non-small cell lung cancer (as monotherapy in elderly patients and in palliative treatment; otherwise in combination with cisplatin) | Treatment of locally advanced or metastatic pancreatic cancer | Treatment of advanced or metastatic bladder cancer (in combination with cisplatin) | Treatment of locally advanced or metastatic epithelial ovarian cancer which has relapsed after a recurrence-free interval of at least 6 months following previous platinum-based therapy (in combination with carboplatin) | Treatment of metastatic breast cancer which has relapsed after previous chemotherapy including an anthracycline (in combination with paclitaxel)

BY INTRAVENOUS INFUSION
Adult: (consult local protocol)

INTERACTIONS
Appendix 1: gemcitabine

SIDE-EFFECTS
Rare: Haemolytic uraemic syndrome
Frequency not known: Alopecia, bone-marrow suppression, extravasation, hyperuricaemia, influenza-like symptoms, microangiopathic haemolytic anaemia, mild gastrointestinal side-effects, musculoskeletal pain, nausea, oral mucositis, pulmonary toxicity, rash, renal impairment, thromboembolism, tumour lysis syndrome, vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Microangiopathic haemolytic anaemia. Gemcitabine should be discontinued if signs of microangiopathic haemolytic anaemia occur.

CONCEPTION AND CONTRACEPTION
Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.

PREGNANCY
Avoid (teratogenic in animal studies). See Pregnancy and reproductive function in Cytotoxic drugs p. 825.

BREAST FEEDING
Discontinue breast-feeding.

HEPATIC IMPAIRMENT
Manufacturer advises caution.

RENAL IMPAIRMENT
Manufacturer advises caution.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
Gemcitabine is an option for first-line chemotherapy for patients with advanced or metastatic adenocarcinoma of the pancreas and a Karnofsky score of at least 50 [Karnofsky score is a measure of the ability to perform ordinary tasks].

Gemcitabine is not recommended for patients who can have potentially curative surgery. There is insufficient evidence about its use for second-line treatment of pancreatic adenocarcinoma.

www.nice.org.uk/TA25

Gemcitabine, in combination with paclitaxel, is an option for the treatment of metastatic breast cancer only when docetaxel monotherapy or docetaxel plus capcitabine are also considered appropriate.

www.nice.org.uk/TA116

Solution for infusion

Gemcitabine (as Gemcitabine hydrochloride) 200 mg

Gemcitabine 200mg/5.3ml concentrate for solution for infusion vials | 1 vial (£2.00) £32.00

Gemcitabine 200mg/5ml concentrate for solution for infusion vials | 1 vial (£2.00) £6.40

Gemcitabine 200mg/2ml concentrate for solution for infusion vials | 1 vial (£2.00) no price available

Gemcitabine (as Gemcitabine hydrochloride) 1 gram

Gemcitabine 1g/26.3ml concentrate for solution for infusion vials | 1 vial (£2.00) £162.00 (Hospital only)

Gemcitabine 1g/25ml concentrate for solution for infusion vials | 1 vial (£2.00) £13.09

Gemcitabine 1g/10ml concentrate for solution for infusion vials | 1 vial (£2.00) no price available

Gemcitabine (as Gemcitabine hydrochloride) 2 gram

Gemcitabine 2g/50ml concentrate for solution for infusion vials | 1 vial (£2.00) £26.86

Gemcitabine 2g/20ml concentrate for solution for infusion vials | 1 vial (£2.00) no price available

Gemcitabine 2g/52.6ml concentrate for solution for infusion vials | 1 vial (£2.00) £32.40 (Hospital only)

Gemcitabine (as Gemcitabine hydrochloride) 10 mg per 1 ml

Gemcitabine 1.6g/160ml infusion bags | 1 bag (£2.00) £140.00

Gemcitabine 2.2g/220ml infusion bags | 1 bag (£2.00) £200.00

Gemcitabine 2g/200ml infusion bags | 1 bag (£2.00) £180.00

Gemcitabine 1.2g/120ml infusion bags | 1 bag (£2.00) £120.00

Gemcitabine 1.8g/180ml infusion bags | 1 bag (£2.00) £160.00

Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013) NICE TA285

Bevacizumab in combination with gemcitabine and carboplatin is not recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor–targeted agents.

www.nice.org.uk/TA285

Paclitaxel as albumin-bound nanoparticles in combination with gemcitabine for previously untreated metastatic pancreatic cancer (October 2015) NICE TA360

Gemcitabine in combination with albumin-bound paclitaxel (nab–paclitaxel, Abraxane®) is not recommended for the treatment of previously untreated metastatic adenocarcinoma of the pancreas.

Patients whose treatment was started before this guidance was published should continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA360

Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389

Gemcitabine, in combination with carboplatin, is not recommended for treating the first recurrence of platinum-sensitive ovarian cancer.

Patient currently receiving gemcitabine in combination with carboplatin should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA389

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (November 2006) that gemcitabine is accepted for restricted use for the treatment of metastatic breast cancer, which has relapsed following previous chemotherapy including an anthracycline (unless contra-indicated).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

Gemcitabine (as Gemcitabine hydrochloride) 200 mg

Gemcitabine 200mg/5.3ml concentrate for solution for infusion vials | 1 vial (£2.00) £32.00 (Hospital only)

Gemcitabine 200mg/5ml concentrate for solution for infusion vials | 1 vial (£2.00) £6.40

Gemcitabine 200mg/2ml concentrate for solution for infusion vials | 1 vial (£2.00) no price available

Gemcitabine (as Gemcitabine hydrochloride) 1 gram

 Gemcitabine 1g/26.3ml concentrate for solution for infusion vials | 1 vial (£2.00) £162.00 (Hospital only)

 Gemcitabine 1g/25ml concentrate for solution for infusion vials | 1 vial (£2.00) £13.09

 Gemcitabine 1g/10ml concentrate for solution for infusion vials | 1 vial (£2.00) no price available

Gemcitabine (as Gemcitabine hydrochloride) 2 gram

 Gemcitabine 2g/50ml concentrate for solution for infusion vials | 1 vial (£2.00) £26.86

 Gemcitabine 2g/20ml concentrate for solution for infusion vials | 1 vial (£2.00) no price available

 Gemcitabine 2g/52.6ml concentrate for solution for infusion vials | 1 vial (£2.00) £32.40 (Hospital only)

Gemcitabine (as Gemcitabine hydrochloride) 10 mg per 1 ml

 Gemcitabine 1.6g/160ml infusion bags | 1 bag (£2.00) £140.00

 Gemcitabine 2.2g/220ml infusion bags | 1 bag (£2.00) £200.00

 Gemcitabine 2g/200ml infusion bags | 1 bag (£2.00) £180.00

 Gemcitabine 1.2g/120ml infusion bags | 1 bag (£2.00) £120.00

 Gemcitabine 1.8g/180ml infusion bags | 1 bag (£2.00) £160.00
Mercaptopurine (6-Mercaptopurine)

**INDICATIONS AND DOSE**
- **Severe acute Crohn's disease** | **Maintenance of remission of Crohn's disease** | **Ulcerative colitis**
  - **BY MOUTH**
    - Adult: 1 – 1.5 mg/kg daily, some patients may respond to lower doses

- **Acute leukaemias** | **Chronic myeloid leukaemia**
  - **BY MOUTH USING TABLETS**
    - Adult: Initially 2.5 mg/kg daily, adjusted according to response, alternatively initially 50 – 75 mg/m² daily, adjusted according to response
  - **BY MOUTH USING ORAL SUSPENSION**
    - Adult: Initially 25 – 75 mg/m² daily, adjusted according to response

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

**DOSE EQUIVALENCE AND CONVERSION**
- Mercaptopurine tablets and Xaluprine® oral suspension are not bioequivalent, haematological monitoring is advised when switching formulations.

**UNLICENSED USE**
Not licensed for use in severe ulcerative colitis and Crohn’s disease.

**IMPORTANT SAFETY INFORMATION**
**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
See Cytotoxic drugs p. 825.

**CONTRA-INDICATIONS**
- Absent thiopurine methyltransferase activity

**CAUTIONS**
- Reduced thiopurine methyltransferase activity

**CAUTIONS, FURTHER INFORMATION**
- Thiopurine methyltransferase
  - The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

**INTERACTIONS**
- Appendix 1: mercaptopurine

**SIDE-EFFECTS**
- **Rare** Pancreatitis, transient oligospermia
- **Very rare** Intestinal ulceration, lymphoma

**FREQUENCY NOT KNOWN**
- Alopecia, anorexia, bone-marrow suppression, hepatotoxicity, hyperuricaemia, nausea, oral mucositis, thromboembolism, tumour lysis syndrome, vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
- Gastro-intestinal side-effects
  - Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine.

**CONCEPTION AND CONTRACEPTION**
Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

**PREGNANCY**
- Avoid (teratogenic). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

**BREAST FEEDING**
- Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
- May need dose reduction.

**RENAL IMPAIRMENT**
- Reduce dose.

**PRE-TREATMENT SCREENING**
- Consider measuring thiopurine methyltransferase (TPMT) activity before starting mercaptopurine therapy.

**MONITORING REQUIREMENTS**
- Monitor liver function.

**PRESCRIBING AND DISPENSING INFORMATION**
- Flavours of oral liquid formulations may include raspberry.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

**Oral suspension**
- **EXCIPIENTS:** May contain Aspartame
  - **Xaluprine** (Nova Laboratories Ltd)
    - Mercaptopurine 20 mg per 1 ml
    - Xaluprine 20mg/ml oral suspension
      - 100 ml [POD] £170.00
  - **Mercaptopurine (Non-proprietary)**
    - Mercaptopurine 50 mg
    - Mercaptopurine 50mg tablets | 25 tablet [POD] £49.15 DT price = £49.15

**Methotrexate**

**DRUG ACTION**
Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines.

**INDICATIONS AND DOSE**
- **Severe Crohn's disease**
  - **BY INTRAMUSCULAR INJECTION**
    - Adult: Initially 25 mg once weekly until remission induced; maintenance 15 mg once weekly

**Maintenance of remission of severe Crohn's disease**
- **BY MOUTH**
  - Adult: 10 – 25 mg once weekly

**Moderate to severe active rheumatoid arthritis**
- **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Adult: 7.5 mg once weekly, adjusted according to response; maximum 20 mg per week

**Severe active rheumatoid arthritis**
- **BY INTRAVENOUS INJECTION, OR BY INTRACHEAL INJECTION, OR BY INTRA-ARTERIAL INFUSION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION, OR BY MOUTH**
  - Adult: (consult product literature)
Severe psoriasis unresponsive to conventional therapy (specialist use only)

- By mouth, or by intramuscular injection, or by intravenous injection, or by subcutaneous injection
- Adult: Initially 2.5–10 mg once weekly, then increased in steps of 2.5–5 mg, adjusted according to response, dose to be adjusted at intervals of at least 1 week; usual dose 7.5–15 mg once weekly, stop treatment if inadequate response after 3 months at the optimum dose; maximum 30 mg per week

**Unlicensed use** Not licensed for use in severe Crohn’s disease.

**Important Safety Information**

Note that the dose is a weekly dose. To avoid error with low-dose methotrexate, it is recommended that:

- the patient is carefully advised of the dose and frequency and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

**Contraindications** Active infection (in non-malignant conditions) · ascites · immunodeficiency syndromes (in non-malignant conditions) · significant pleural effusion

**Caution** Acute porphyrias p. 969 · photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported) · diarrhoea · extreme caution in blood disorders (avoid if severe) · peptic ulceration · risk of accumulation in pleural effusion or ascites—drain before treatment · ulcerative colitis · ulcerative stomatitis

**CAUTIONS, FURTHER INFORMATION**

- Blood count Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another anti-folate drug (e.g. trimethoprim). A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy.
- Gastro-intestinal toxicity Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.
- Liver toxicity Liver cirrhosis reported. Treatment should not be started or should be discontinued if any abnormality of liver function tests or liver biopsy is present or develops during therapy. Abnormalities can return to normal within 2 weeks after which treatment may be recommenced if judged appropriate.
- Pulmonary toxicity Pulmonary toxicity may be a special problem in rheumatoid arthritis (patient to seek medical attention if dyspnoea, cough or fever); monitor for symptoms at each visit—discontinue if pneumonitis suspected.

**INTERACTIONS** 

- Appendix 1: methotrexate
- Rare Pneumonitis
- Frequency not known Abdominal discomfort · acne · alopecia · anaphylactic reactions · anorexia · arthralgia · blood disorders · changes in nail pigmentation · changes in skin pigmentation · chills · chronic pulmonary fibrosis · confusion · conjunctivitis · cystitis · diarrhoea · dizziness · drowsiness · dyspepsia · dysuria · ecchymosis · fever · furunculosis · gastro-intestinal bleeding · gastro-intestinal ulceration · haematuria · headache · hepatotoxicity · hypotension · impotence · injection-site reactions · insomnia · interstitial pneumonitis · malaise · menstrual disturbances · mood changes · mucositis · myalgia · myelosuppression · nausea · neurotoxicity · osteoporosis · paraesthesia · pericardial tamponade · pericarditis · photosensitivity · pleuritic pain · precipitation of diabetes · pruritus · pulmonary fibrosis · pulmonary oedema · rash · reduced libido · renal failure · Stevens-Johnson syndrome · telangiectasia · thrombosis · toxic epidermal necrolysis · toxic megacolon · urticaria · vaginitis · vasculitis · visual disturbance · vomiting

**Side-effects, Further Information**

In patients taking methotrexate for non-malignant conditions who experience side-effects, folic acid given on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.

Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

**Conception and Contraception** Effective contraception required during and for at least 3 months after treatment in men or women.

**Pregnancy** Avoid (teratogenic; fertility may be reduced during therapy but this may be reversible).

**Breast Feeding** Discontinue breast-feeding—present in milk.

**Hepatic Impairment** When used for malignancy, avoid in severe hepatic impairment—consult local treatment protocol for details. Avoid with hepatic impairment in non-malignant conditions—dose-related toxicity.

**Renal Impairment** Reduce dose. Risk of nephrotoxicity at high doses. Avoid in severe impairment.

**Pre-Treatment Screening** Exclude pregnancy before treatment. Patients should have full blood count and renal and liver function tests before starting treatment.

**Monitoring Requirements**

- In view of reports of blood dyscrasias (including fatalities) and liver cirrhosis with low-dose methotrexate patients should:
  - have full blood count and renal and liver function tests repeated every 1–2 weeks until therapy stabilised, thereafter patients should be monitored every 2–3 months.
  - be advised to report all symptoms and signs suggestive of infection, especially sore throat
- Local protocols for frequency of monitoring may vary.
- Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

**Prescribing and Dispensing Information**

Folinic acid following methotrexate administration helps to prevent methotrexate-induced mucositis and myelosuppression.

The licensed routes of administration for parenteral preparations vary—further information can be found in the product literature for the individual preparations.

**Patient and Carer Advice**

Patients and their carers should be warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath).

Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen.

Patients should be counselled on the dose, treatment booklet, and the use of NSAIDs.

**Methotrexate treatment booklets** Methotrexate treatment booklets should be issued where appropriate.
In England, Wales, and Northern Ireland, they are available for purchase from:
Gorse Street, Chadderton
Oldham
OL3 9QH
Tel: 0845 610 1112
GP practices can obtain supplies through their Local Area Team stores.
NHS Hospitals can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com.

In Scotland, treatment books can be obtained by emailing stockorders.dppas@theapsgroup.com or by fax on 0131 629 9967.
These books include advice for adults taking oral methotrexate for inflammatory conditions, and a section for recording results of blood tests and dosage information.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

**Table**

- **Methotrexate (Non-proprietary)**
  - Methotrexate 2.5 mg: Methotrexate 2.5mg tablets | 24 tablet | £3.75 | 28 tablet | £3.82 DT price | £1.77 | 100 tablet | £14.19
  - Methotrexate 10 mg: Methotrexate 10mg tablets | 100 tablet | £57.21 DT price | £33.97

- **Maxtrex** (Pfizer Ltd)
  - Methotrexate 2.5 mg: Maxtrex 2.5mg tablets | 24 tablet | £2.39 | 100 tablet | £9.96
  - Methotrexate 10 mg: Maxtrex 10mg tablets | 100 tablet | £45.16 DT price | £37.97

**Solution for injection**

- **Methotrexate (as Methotrexate sodium)** 2.5 mg per 1 ml
  - Methotrexate 5mg/2ml solution for injection vials | 5 vial | £35.00
  - Methotrexate (as Methotrexate sodium) 25 mg per 1 ml
    - Methotrexate 5g/200ml solution for infusion vials | 1 vial | £100.57
  - Methotrexate (as Methotrexate sodium) 100 mg per 1 ml
    - Methotrexate 5g/50ml solution for infusion vials | 1 vial | £400.00

**Oral solution**

- **Methotrexate (as Methotrexate sodium)** 2 mg per 1 ml
  - Methotrexate 2mg/ml oral solution sugar free sugar-free | 35 ml | £95.00–£114.00 DT price | £95.00 sugar-free | 65 ml | £125.00–£145.00 DT price | £125.00

**Nelarabine**

- **INDICATIONS AND DOSE**

  **T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in patients who have relapsed or who are refractory after receiving at least two previous regimens**

  - **BY INTRAVENOUS INFUSION**
  - **Adult:** (consult local protocol)

  - **CAUTIONS**
  - Previous or concurrent craniospinal irradiation (increased risk of neurotoxicity)
  - Previous or concurrent intrathecal chemotherapy (increased risk of neurotoxicity)

- **INTERACTIONS** → Appendix 1: nelarabine

- **SIDE-EFFECTS**

  - **Common or very common**
  - Neurotoxicity (discontinue)
  - Frequency not known Abdominal pain, alopecia, amnesia, anorexia, arthralgia, asthenia, ataxia, benign and malignant tumours, blurred vision, bone-marrow suppression, confusion, constipation, cough, demyelination, diarrhoea, dizziness, drowsiness, dryness, electrolyte disturbances, extravasation, fatigue, headache, hyperuricaemia, hypoesthesia, hypotension, muscle weakness, myalgia, nausea, oedema, oral mucositis, paraesthesia, peripheral neurological disorders, pleural effusion, pyrexia, seizures, taste disturbance, thromboembolism, tremor, tumour lysis syndrome, vomiting, wheezing

- **CONCEPTION AND CONTRACEPTION**

  Manufacturer advises effective contraception during and for at least 3 months after treatment in men and women.
Pregnancy
Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

Breastfeeding
Discontinue breast-feeding.

Monitoring requirements
- Neurotoxicity: Close monitoring for neurological events is strongly recommended—discontinue if neurotoxicity occurs.

Patient and carer advice
Driving and skilled tasks
Drowsiness may affect performance of skilled tasks (e.g., cycling or driving).

National funding/access decisions
Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (March 2008) that the use of nelarabine (Atriance®) within NHS Scotland is restricted to bridging treatment before stem cell transplantation.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
Electrolytes: May contain Sodium
- Atriance (Novartis Pharmaceuticals UK Ltd) ▼
  Nelarabine 5 mg per 1 ml
  Atriance 250mg/50ml solution for infusion
  vials | 6 vial (Path) £1,332.00

Pemetrexed

Drug action
Pemetrexed inhibits thymidylate transferase and other folate-dependent enzymes.

Indications and dose
Treatment of unresectable malignant pleural mesothelioma which has not previously been treated with chemotherapy (in combination with cisplatin) | First-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (in combination with cisplatin) | Second-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (monotherapy) | Maintenance treatment in locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following platinum-based chemotherapy (monotherapy)
- By intravenous infusion
- Adult: (consult local protocol)

Cautions
Diabetes • history of cardiovascular disease • prophylactic folic acid supplementation required (consult product literature) • prophylactic vitamin B12 supplementation required (consult product literature)

Interactions ➔ Appendix 1: pemetrexed

Side-effects
- Common or very common
  Conjunctivitis • dehydration • gastro-intestinal disturbances • increased lacrimation • neuropathy • oedema • skin disorders
- Uncommon
  Arrhythmias • colitis • interstitial pneumonitis
- Rare
  Acute renal failure • hepatitis • peripheral ischaemia
- Frequency not known
  Alopecia • bone-marrow suppression • extravasation • hyperuricaemia • nausea • oral mucositis • Stevens–Johnson syndrome • thromboembolism • toxic epidermal necrolysis • tumour lysis syndrome • vomiting

Conception and contraception
Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.

Pregnancy
Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

Breastfeeding
Discontinue breast-feeding.

Renal impairment
Manufacturer advises avoid if creatinine clearance less than 45 mL/minute—no information available.

National funding/access decisions
NICE technology appraisals (TAs)
- Pemetrexed for the treatment of non-small cell lung cancer (June 2010) NICE TA190
  Pemetrexed is an option for the maintenance treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following combination therapy of a platinum compound with either gemcitabine, paclitaxel, or docetaxel.
  www.nice.org.uk/TA190

  www.nice.org.uk/TA124
- Pemetrexed for the first-line treatment of non-small cell lung cancer (September 2009) NICE TA181
  Pemetrexed, in combination with cisplatin, is an option for the first-line treatment of locally advanced or metastatic non-small cell lung cancer only if the histology of the tumour has been confirmed as adenocarcinoma or large-cell carcinoma.
  www.nice.org.uk/TA181
- Pemetrexed maintenance treatment for non-squamous non-small-cell lung cancer after pemetrexed and cisplatin (August 2016) NICE TA402
  Pemetrexed is recommended as an option for the maintenance treatment of locally advanced or metastatic non-squamous non-small-cell lung cancer when: a patient’s disease has not progressed immediately after 4 cycles of pemetrexed and cisplatin induction therapy; their Eastern Cooperative Oncology Group (ECOG) performance status is 0 or 1 at the start of maintenance treatment; the company provides the drug according to the terms of the commercial access agreement as agreed with NHS England.
  Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinicians consider it appropriate to stop.
  www.nice.org.uk/TA402
- Pemetrexed for the treatment of malignant pleural mesothelioma (January 2008) NICE TA135
  Pemetrexed is an option for the treatment of malignant pleural mesothelioma only in patients who have a WHO performance status of 0 or 1 [WHO performance status is a measure of the ability to perform ordinary tasks], who are considered to have advanced disease and for whom surgical resection is considered inappropriate.
  www.nice.org.uk/TA135

Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (August 2008) that pemetrexed (Alimta®) is accepted for restricted use within NHS Scotland as monotherapy for the second-line treatment of locally advanced or metastatic non-small cell lung cancer without predominantly squamous cell histology; it is restricted for use in patients with good performance status who would otherwise be eligible for docetaxel treatment.

The Scottish Medicines Consortium has advised (January 2010) that pemetrexed (Alimta®) is accepted for restricted use within NHS Scotland in combination with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology; it is restricted to patients in...
whom the histology of the tumour has been confirmed as adenocarcinoma or large cell carcinoma.

The Scottish Medicines Consortium has advised (July 2005) that pemetrexed (Alimta®) in combination with cisplatin is accepted for restricted use within NHS Scotland for previously untreated patients with stage III/IV unresectable malignant pleural mesothelioma.

### Tioguanine (Thioguanine)

#### INDICATIONS AND DOSE

Acute leukaemia | Chronic myeloid leukaemia

- **BY MOUTH**
- Adult: 100–200 mg/m² daily, can be given at various stages of treatment in short-term cycles

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity
- **CAUTIONS** Thiopurine methyltransferase status

**CAUTIONS, FURTHER INFORMATION**

- Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.
- Long-term therapy Long-term therapy is no longer recommended because of the high risk of liver toxicity.

#### INTERACTIONS

- Appendix 1: tioguanine
- **SIDE-EFFECTS**
  - Rare Intestinal necrosis | intestinal perforation
  - Frequency not known Allopecia | bone-marrow suppression | hyperuricaemia | nausea | neuropathy | ocular toxicity | oral mucositis | thromboembolism | tumour lysis syndrome | vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Gastro-intestinal side-effects Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine.
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men or women.
- **PREGNANCY** Avoid (teratogenicity reported when men receiving tioguanine have fathered children). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
Trifluridine with tipiracil 24-Apr-2017

**INDICATIONS AND DOSE**
Metastatic colorectal cancer, in patients previously treated with (or unsuitable for treatment with) available therapies including fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapies, or anti-vascular endothelial growth factor (VEGF) agents, or anti-epidermal growth factor receptor (EGFR) agents (specialist use only)

▶ **BY MOUTH**
Adult: Initially 35 mg/m² twice daily (max. per dose 80 mg), given on days 1 to 5 and days 8 to 12 of each 28-day cycle, consult product literature for further information on dose adjustment.

**IMPORTANT SAFETY INFORMATION**
**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
See Cytotoxic drugs p. 825.

**SIDE-EFFECTS**
▶ Common or very common Abdominal pain, bone-marrow suppression, constipation, cough, diarrhoea, dizziness, dysgeusia, dysphonia, flushing, headache, hypoalbuminaemia, nausea, palmar-plantar erythrodysaesthesia, peripheral neuropathy, proteinuria, pruritus, rash, stomatitis, vomiting.
▶ Uncommon Acute pancreatitis, angina, arthralgia, blood pressure changes, blood-electrolyte concentration changes, blurred vision, buccal polyp, cataract, dehydration, diplopia, dry eye, dyspepsia, dysphonia, embolism, epistaxis, erythema, gastritis, gastro-oesophageal reflux disease, gout, haematuria, haemorrhage, hepatotoxicity, hyperglycaemia, lethargy, leukocyturia, muscle spasm, neurotoxicity, oesophagitis, palpitations, paraesthesia, photosensitivity reaction, pulmonary embolism, renal failure, septic shock (fatal cases have been reported), syncope, urticaria, vertigo.

**CONCEPTION AND CONTRAINDICATION**
Manufacturer advises effective contraception in women of child-bearing potential and in men as a partner of child-bearing potential, during treatment and for 6 months after stopping treatment. Manufacturer also advises use of an additional barrier method in women using hormonal contraceptives—effect of trifluridine with tipiracil on hormonal contraception unknown.

**PREGNANCY**
Manufacturer advises avoid unless essential—reproductive toxicity in animal studies.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule
- **Tablet**
  - Tioguanine (Non-proprietary)
    - Tioguanine 40 mg Tioguanine 40mg tablets | 25 tablet

**Milk**
Manufacturer advises avoid in breast feeding.

**BREAST FEEDING**
Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**
Manufacturer advises avoid in moderate-to-severe impairment—no information available.

**RENAI IMPAIRMENT**
Manufacturer advises caution if eGFR 30–59 mL/minute/1.73 m²—monitor for haematological toxicities; manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m²—no information available.

**MONITORING REQUIREMENTS**
Manufacturer advises obtain baseline blood cell counts before and during treatment; monitor closely for myelosuppression.

**NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
- Trifluridine with tipiracil for previously treated metastatic colorectal cancer (August 2016) NICE TA405
  Trifluridine with tipiracil is recommended, within its marketing authorisation, as an option for treating metastatic colorectal cancer in adults, only when provided by the manufacturer with the discount agreed in the patient access scheme.
  www.nice.org.uk/guidance/TA405

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (February 2017) that trifluridine with tipiracil (Lonsurf™) is accepted for use within NHS Scotland for the treatment of adults with metastatic colorectal cancer who have been previously treated with, or are not considered candidates for, available therapies including fluoropyrimidine-, oxaliplatin- and irinotecan-based chemotherapies, anti-vascular endothelial growth factor agents, and anti-epidermal growth factor receptor agents.

This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
- **Tablet**
  - CAUTIONARY AND ADVISORY LABELS, 21
  - Lonsurf (Servier Laboratories Ltd) ▼
    - Tipiracil (as Tipiracil hydrochloride) 6.14 mg, Trifluridine
      - 15 mg Lonsurf 15mg/6.14mg tablets | 20 tablet | £500.00 | £1,500.00
      - Tipiracil (as Tipiracil hydrochloride) 8.19 mg, Trifluridine
        - 20 mg Lonsurf 20mg/8.19mg tablets | 20 tablet | £666.67 | £2,000.00

**ANTINEOPLASTIC DRUGS**
**CYTOTOXIC ANTIBIOTICS AND RELATED SUBSTANCES**

**Bleomycin**

**INDICATIONS AND DOSE**
Squamous cell carcinoma | Metastatic germ cell cancer | Non-Hodgkin’s lymphoma

▶ **BY INTRAVENOUS INJECTION, OR BY LOCAL INFILTRATION, OR BY INTRA-ARTERIAL INFUSION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**
Adult: (consult product literature or local protocols)

**CAUTIONS**
Caution in handling—irritant to tissues

**INTERACTIONS**
Appendix 1: bleomycin

**SIDE-EFFECTS**
Common or very common Dermatological toxicity, mucositis

**CONCEPTION AND CONTRAINDICATION**
Manufacturer advises effective contraception in women of child-bearing potential and in men as a partner of child-bearing potential, during treatment and for 6 months after stopping treatment. Manufacturer also advises use of an additional barrier method in women using hormonal contraceptives—effect of trifluridine with tipiracil on hormonal contraception unknown.

**PREGNANCY**
Manufacturer advises avoid unless essential—reproductive toxicity in animal studies.

**Milk**
Manufacturer advises avoid in breast feeding.
Mitomycin 10 mg powder for solution for injection | 1 vial (Pom) £75.98

Mitomycin 20 mg powder for solution for injection | 1 vial (Pom) £39.94

Mitomycin 40 mg powder for solution for injection | 1 vial (Pom) £79.88

As containing the same drug.

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

**Medicinal forms**

**INDICATIONS AND DOSE**

Hairy cell leukaemia (initiated in specialist centres)

- By intravenous injection, or by intravenous infusion

Adult: To be given on alternate weeks (consult product literature)

**INTERACTIONS** → Appendix 1: pentostatin

**SIDE-EFFECTS**

Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · lung fibrosis · nausea · oral mucositis · renal damage · thromboembolism · tumour lysis syndrome · vomiting

**SPECIFIC SIDE-EFFECTS**

- With intravenous use Extravasation

**SIDE-EFFECTS, FURTHER INFORMATION**

- Bone-marrow toxicity. Mitomycin is usually administered at 6-weekly intervals because it causes delayed bone-marrow toxicity. Prolonged use may result in a permanent effect.

**CONCEPTION AND CONTRACEPTION**

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**PREGNANCY**

Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING**

Discontinue breast-feeding.

**MEDICINAL FORMS**

Theoretically, there can be variation in the licensing of different medicines containing the same drug. Manufacturers include: eye drops

**Pentostatin**

**INDICATIONS AND DOSE**

Hairy cell leukaemia (initiated in specialist centres)

- By intravenous injection, or by intravenous infusion

Adult: To be given on alternate weeks (consult product literature)

**INTERACTIONS** → Appendix 1: pentostatin

**SIDE-EFFECTS**

Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · immunosuppression · myelosuppression · nausea · neurotoxicity (withhold or discontinue) · oral mucositis · severe rash (withhold treatment) · thromboembolism · tumour lysis syndrome · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Pentostatin can cause myelosuppression, immunosuppression, and a number of other side-effects that may be severe. Treatment should be withheld in patients who develop a severe rash, and withheld or discontinued in patients showing signs of neurotoxicity.

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises that men should not father children during and for 6 months after treatment.

**PREGNANCY**

Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING**

Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution—limited information available.

**RENAL IMPAIRMENT**

Avoid if creatinine clearance less than 60 ml/minute.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

Pentostatin 10 mg Nipent 10mg powder for solution for injection vials | 1 vial (Pom) £75.21 (Hospital only)
Trabectedin

10-Jun-2016

> INDICATIONS AND DOSE

Treatment of advanced soft-tissue sarcoma when treatment with anthracyclines and ifosfamide has failed or is contra-indicated. Treatment of relapsed platinum-sensitive ovarian cancer (in combination with pegylated liposomal doxorubicin)

- By Intravenous infusion
- Adult: (consult product literature or local protocols)

- CONTRA-INDICATIONS - Elevated creatine phosphokinase (consult product literature)
- INTERACTIONS - Appendix 1: trabectedin
- SIDE-EFFECTS - Rare Rhabdomyolysis (with raised creatine phosphokinase)

SIDE-EFFECTS, FURTHER INFORMATION
A corticosteroid, such as dexamethasone by intravenous infusion, must be given 30 minutes before therapy for its antiemetic and hepatoprotective effects (consult product literature).

- CONCEPTION AND CONTRACEPTION - Effective contraception recommended during and for at least 3 months after treatment in women and during and for at least 5 months after treatment in men.
- PREGNANCY - See Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- BREAST FEEDING - Manufacturer advises avoid breast-feeding during and for 3 months after treatment.
- RENAL IMPAIRMENT - Avoid monotherapy if creatinine clearance less than 60 mL/minute. Avoid combination regimens if creatinine clearance less than 60 mL/minute.
- MONITORING REQUIREMENTS - Specific haematological, renal and hepatic parameters must be monitored and within certain ranges prior to starting treatment and repeated weekly during the first 2 cycles and at least once between treatments in subsequent cycles—consult product literature for full details.
- Monitor for signs and symptoms of rhabdomyolysis (including myelotoxicity, severe liver function disorder, renal failure, muscle weakness or pain)—monitor creatine phosphokinase closely and discontinue treatment (consult product literature).

- NATIONAL FUNDING / ACCESS DECISIONS

NICE technology appraisals (TAs)
- Trabectedin for the treatment of advanced soft tissue sarcoma (February 2010) NICE TA185

Trabectedin is an option for advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed, is inappropriate or is not tolerated. The cost of trabectedin for treatment after the fifth cycle is met by the manufacturer.

www.nice.org.uk/TA185

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- Yondelis (Pharma Mar, S.A.)
  - Trabectedin 250 microgram Yondelis 0.25mg powder for concentrate for solution for infusion vials | 1 vial (£63.00 (Hospital only)
  - Trabectedin 1 mg Yondelis 1mg powder for concentrate for solution for infusion vials | 1 vial (£1.366.00 (Hospital only)

Carboplatin

10-Jun-2016

> INDICATIONS AND DOSE

Treatment of advanced ovarian cancer and lung cancer (particularly the small cell type)

- By Intravenous infusion
- Adult: The dose of carboplatin is determined according to renal function rather than body surface area (consult product literature)

INTERACTIONS - Appendix 1: platinum compounds

SIDE-EFFECTS, FURTHER INFORMATION
Carboplatin is better tolerated than cisplatin; nausea and vomiting are reduced in severity and nephrotoxicity, neurotoxicity, and ototoxicity are much less of a problem than with cisplatin. It is, however, more myelosuppressive than cisplatin.

CONCEPTION AND CONTRACEPTION - Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

PREGNANCY - Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

BREAST FEEDING - Discontinue breast-feeding.

RENAI IMPAIRMENT - Reduce dose. Avoid if creatinine clearance less than 20 mL/minute. Monitor haematological parameters in renal impairment. Monitor renal function in renal impairment.

PRESCRIBING AND DISPENSING INFORMATION - Carboplatin can be given in an outpatient setting.

NATIONAL FUNDING / ACCESS DECISIONS

NICE technology appraisals (TAs)
- Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284

Bevacizumab in combination with paclitaxel and carboplatin is not recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer).
Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013) NICE TA285

Bevacizumab in combination with gemcitabine and carboplatin is not recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents. www.nice.org.uk/TA285

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- **Carboplatin (Non-proprietary)**
  - **Carboplatin 10 mg per 1 ml** Carboplatin 50mg/5ml concentrate for solution for infusion vials | 1 vial POM £22.04 (Hospital only) | 1 vial POM £20.00

  - Carboplatin 150mg/15ml concentrate for solution for infusion vials | 1 vial POM £65.83
  - Carboplatin 50mg/5ml solution for infusion vials | 1 vial POM £22.86

Cisplatin

- **INDICATIONS AND DOSE**
  - Treatment of testicular, lung, cervical, bladder, head and neck, and ovarian cancer (alone or in combination)
  - **BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature)

- **CAUTIONS**
  - **CAUTIONS, FURTHER INFORMATION**
  - Hydration Cisplatin requires intensive intravenous hydration and treatment may be complicated by severe nausea and vomiting.

- **INTERACTIONS** → Appendix 1: platinum compounds

- **SIDE-EFFECTS**
  - Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - hypomagnesaemia - myelosuppression - nephrotoxicity - oral mucositis - ototoxicity - peripheral neuropathy - severe nausea - severe vomiting - thromboembolism - tumour lysis syndrome

- **CONCEPTION AND CONTRACEPTION**
  - Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

- **PREGNANCY**
  - Avoid (teratogenic and toxic in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **RENAL IMPAIRMENT**
  - Avoid if possible — nephrotoxic.

- **MONITORING REQUIREMENTS**
  - Monitor full blood count.
  - Monitor audiometry.
  - Monitor plasma electrolytes.
  - Nephrotoxicity Monitoring of renal function is essential.

- **DIRECTIONS FOR ADMINISTRATION**
  - Cisplatin is increasingly given in a day care setting.

Oxaliplatin

- **INDICATIONS AND DOSE**
  - Treatment of metastatic colorectal cancer (in combination with fluorouracil and folinic acid) - Treatment of colon cancer after resection of the primary tumour (adjuvant treatment)
  - **BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature)

- **CONTRA-INDICATIONS**
  - Peripheral neuropathy with functional impairment

- **INTERACTIONS** → Appendix 1: platinum compounds

- **SIDE-EFFECTS**
  - Alopecia - bone-marrow suppression - extravasation - gastro-intestinal disturbances - hyperuricaemia - myelosuppression - nausea - neurotoxicity (dose limiting) - ototoxicity - posterior reversible encephalopathy syndrome (associated with oxaliplatin combination chemotherapy) - sensory peripheral neuropathy (dose limiting) - thromboembolism - transient vision loss (reversible on discontinuation) - tumour lysis syndrome - vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Respiratory symptoms - If unexplained respiratory symptoms occur, oxaliplatin should be discontinued until investigations exclude interstitial lung disease and pulmonary fibrosis.

- **CONCEPTION AND CONTRACEPTION**
  - Effective contraception required during and for 4 months after treatment in women and 6 months after treatment in men.

- **PREGNANCY**
  - Manufacturer advises avoid — toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **RENAL IMPAIRMENT**
  - Reduce dose in mild to moderate impairment (consult product literature). Avoid if creatinine clearance less than 30 ml/minute.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes’ C) colon cancer (April 2006) NICE TA100
    - Capecitabine alone or oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes’ C) colon cancer.
    - www.nice.org.uk/TA100
  - Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005) NICE TA93
    - A combination of fluorouracil and folinic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer.
Irinotecan alone or fluorouracil and folinic acid with oxaliplatin are options for patients who require further treatment subsequently.

  - Oxaliplatin 50 mg Oxaliplatin 50mg powder for solution for infusion vials | 1 vial (POM) £156.75
  - Oxaliplatin 100 mg Oxaliplatin 100mg powder for solution for infusion vials | 1 vial (POM) £313.50

**ANCINEOPLASTIC DRUGS ＞ PODOPHYLLOTOXIN DERIVATIVES**

**Etoposide**

- **INDICATIONS AND DOSE**
  - Small cell carcinoma of the bronchus, the lymphomas and testicular cancer
  - BY MOUTH
  - Adult: 120–240 mg/m² daily for 5 days
  - BY INTRAVENOUS INFUSION
  - Adult: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
See Cytotoxic drugs p. 825.

- **INTERACTIONS**
  - Appendix 1: etoposide
- **SIDE-EFFECTS**
  - Alopecia - bone-marrow suppression - hyperuricaemia - irritant to tissues - nausea - oral mucositis (more common if given with doxorubicin) - thromboembolism - tumour lymph syndrome - vomiting
- **CONCEPTION AND CONTRACEPTION**
  - Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **PREGNANCY**
  - Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **BREAST FEEDING**
  - Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
  - Avoid in severe impairment.
- **RENAL IMPAIRMENT**
  - Consider dose reduction—consult local treatment protocol for details.
- **DIRECTIONS FOR ADMINISTRATION**
  - Etoposide may be given orally or by slow intravenous infusion, the oral dose being double the intravenous dose. A preparation containing etoposide phosphate can be given by intravenous injection or infusion. Etoposide is usually given daily for 3–5 days and courses should not be repeated more frequently than at intervals of 21 days.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Solution for infusion**

  - **Etoposide (Non-proprietary)**
    - Etoposide 20 mg per 1 ml Etoposide 100mg/5ml concentrate for solution for infusion vials | 1 vial (POM) no price available (Hospital only) | 1 vial (POM) £11.50 | 10 vial (POM) £115.00

**ANTINEOPLASTIC DRUGS ＞ TAXANES**

**Cabazitaxel**

- **INDICATIONS AND DOSE**
  - Treatment of hormone refractory metastatic prostate cancer in patients who have previously been treated with a docetaxel-containing regimen (in combination with prednisone or prednisolone)
  - BY INTRAVENOUS INFUSION
  - Adult: (consult product literature or local protocols)
- **CAUTIONS**
  - Avoid in acute porphyrias p. 969
- **INTERACTIONS**
  - Appendix 1: taxanes
- **SIDE-EFFECTS**
  - Common or very common
    - Hypersensitivity reactions
    - Frequency not known
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - For further information on side-effects, consult product literature.
  - Hypersensitivity reactions
    - Routine premedication with a corticosteroid, an antihistamine, and a histamine H₂-receptor antagonist is recommended to prevent severe hypersensitivity reactions.
  - CONCEPTION AND CONTRACEPTION
    - Ensure effective contraception during treatment (women) and for up to 6 months after treatment (men).
- **PREGNANCY**
  - See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **BREAST FEEDING**
  - Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
  - Avoid.
- **RENAL IMPAIRMENT**
  - Use with caution if creatinine clearance less than 50 mL/minute.
- **MONITORING REQUIREMENTS**
  - Monitor electrolytes—correct dehydration.
- **DIRECTIONS FOR ADMINISTRATION**
  - Intravenous infusion incompatible with PVC.

**Powder for solution for injection**

- **Etopophos** (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Etoposide (as Etoposide phosphate) 100 mg Etopophos 100mg powder for solution for injection vials | 10 vial (POM) £201.58 (Hospital only)

**Capsule**

- **CAUTIONARY AND ADVISORY LABELS**
  - 23

- **Vepsid** (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Etoposide 50 mg Vepsid 50mg capsules | 20 capsule (POM) £99.82 (Hospital only)

- **Etoposide 100 mg** Vepsid 100mg capsules | 10 capsule (POM) £87.23 (Hospital only)
NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Cabazitaxel for hormone-related metastatic prostate cancer treated with docetaxel (updated August 2016) NICE TA391
  - Cabazitaxel in combination with prednisone or prednisolone is recommended as an option for treating metastatic hormone-related prostate cancer in patients whose disease has progressed during or after docetaxel chemotherapy, only if the following criteria are met:
    - the patient has an eastern cooperative oncology group (ECOG) performance status of 0 or 1
    - the patient has had 225 mg/m² or more of docetaxel
    - treatment with cabazitaxel is stopped when the disease progresses or after a maximum of 10 cycles
    - the manufacturer provides cabazitaxel with the discount agreed in the patient access scheme
    - NHS trusts purchase cabazitaxel in accordance with the commercial access agreement, either in vials (at a reduced price to reflect the average cost of waste per patient), or in pre-prepared intravenous infusion bags.
  - Patients currently receiving cabazitaxel that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.
  - www.nice.org.uk/TA391

Scottish Medicines Consortium (SMC) Decisions
- The Scottish Medicines Consortium (SMC) has advised (December 2016) that cabazitaxel (Jevtana®) in combination with prednisone or prednisolone is accepted for restricted use within NHS Scotland for the treatment of adult patients with hormone refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen (patients who have received at least 225 mg/m² (three cycles) of docetaxel and have an Eastern Cooperative Oncology Group (ECOG) performance status of 0 or 1). This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
- EXCIPIENTS: May contain Ethanol
  - Jevtana (Sanofi)
    - Cabazitaxel 40 mg per 1 ml JEVITANA 60mg/1.5ml concentrate and solvent for solution for infusion vials | 1 vial (£75) £3,696.00
      (Hospital only)

Docetaxel

INDICATIONS AND DOSE
- Adjuvant treatment of operable node-positive and operable node-negative breast cancer (in combination with doxorubicin and cyclophosphamide) | Initial chemotherapy of locally advanced or metastatic breast cancer (with doxorubicin) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline or an alkylating drug has failed (monotherapy) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline has failed (with capcetabine) | Initial chemotherapy of metastatic breast cancer which overexpresses human epidermal growth factor-2 (with trastuzumab) | Locally advanced or metastatic non-small cell lung cancer where previous chemotherapy has failed | Initial chemotherapy of unresetable, locally advanced or metastatic non-small cell lung cancer (with cisplatin) | Hormone-resistant metastatic prostate cancer (in combination with prednisone or prednisolone) | Initial treatment of metastatic gastric adenocarcinoma, including adenocarcinoma of the gastro-oesophageal junction (with cisplatin and fluorouracil) | Induction treatment of locally advanced squamous cell carcinoma of the head and neck (with cisplatin and fluorouracil)
- BY INTRAVENOUS INFUSION
- Adult: (consult product literature or local protocols)

CAUTIONS
- Avoid in acute porphyrias p. 969 - consult product literature

SIDE-EFFECTS
- Alopecia | bone-marrow suppression | cytoid maculae oedema | extravasation | fatal respiratory disorders | gastro-intestinal toxicity | heart failure | hypersensitivity reactions | hyperuricaemia | nausea | oral mucositis | peripheral neurotoxicity | persistent fluid retention (commonly as leg oedema that worsens during treatment) can be resistant to treatment | severe skin reactions | thromboembolism | tumour lysis syndrome | vomiting

SIDE-EFFECTS, FURTHER INFORMATION
- Consult product literature for monitoring and management of side effects.
- Hypersensitivity reactions and fluid retention | Pretreatment with dexamethasone by mouth is recommended for reducing fluid retention and hypersensitivity reactions (consult product literature).

CONCEPTION AND CONTRACEPTION
- Manufacturer advises effective contraception for men and women during treatment, and for at least 6 months after stopping treatment in men.

PREGNANCY
- Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

BREAST FEEDING
- Discontinue breast-feeding.

HEPATIC IMPAIRMENT
- Reduce dose according to liver enzymes (consult product literature). Avoid in severe impairment. Monitor liver function in hepatic impairment.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Docetaxel for the treatment of hormone-refractory metastatic prostate cancer (June 2006) NICE TA101
  - Docetaxel is an option for hormone-refractory metastatic prostate cancer and a Karnofsky score of at least 60% [Karnofsky score is a measure of the ability to perform ordinary tasks].
  - www.nice.org.uk/TA101
- Docetaxel for the adjuvant treatment of early node-positive breast cancer (September 2006) NICE TA109
  - Docetaxel, when given concurrently with doxorubicin and cyclophosphamide (TAC regimen), is recommended as an option for the adjuvant treatment of women with early node-positive breast cancer.
  - www.nice.org.uk/TA109

Scottish Medicines Consortium (SMC) Decisions
- The Scottish Medicines Consortium has advised that docetaxel (Taxotere®) in combination with cisplatin and fluorouracil is accepted for restricted use within NHS Scotland for the induction treatment of patients with unresectable (May 2007) and resectable (June 2008) locally advanced squamous cell carcinoma of the head and neck.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
- EXCIPIENTS: May contain Ethanol
  - Docetaxel (Non-proprietary)
    - Docetaxel 10 mg per 1 ml Docetaxel 80mg/8ml concentrate for solution for infusion vials | 1 vial (£43.75) £534.75 (Hospital only)
    - Docetaxel 160mg/16ml concentrate for solution for infusion vials | 1 vial (£75) £1,069.50 (Hospital only)
Docetaxel 20mg/2ml concentrate for solution for infusion vials | 1 vial (medic) £162.75 (Hospital only)
Docetaxel 20 mg per 1 ml Docetaxel 80mg/4ml concentrate for solution for infusion vials | 1 vial (medic) £590.00
Docetaxel 160mg/8ml concentrate for solution for infusion vials | 1 vial (medic) no price available
Docetaxel 140mg/7ml concentrate for solution for infusion vials | 1 vial (medic) £900.00
Docetaxel 20mg/1ml concentrate for solution for infusion vials | 1 vial (medic) £160.00

Taxotere (medac UK)
Docetaxel 20 mg per 1 ml Taxotere 80mg/4ml concentrate for solution for infusion vials | 1 vial (product) £508.01
Taxotere 140mg/7ml concentrate for solution for infusion vials | 1 vial (product) £720.10
Taxotere 20mg/1ml concentrate for solution for infusion vials | 1 vial (product) £154.61

Taxotere (Sanofi)
Docetaxel 20 mg per 1 ml Taxotere 20mg/1ml concentrate for solution for infusion vials | 1 vial (product) £53.47 (Hospital only)
Taxotere 160mg/8ml concentrate for solution for infusion vials | 1 vial (product) £1,008.54 (Hospital only)
Taxotere 80mg/4ml concentrate for solution for infusion vials | 1 vial (product) £504.27 (Hospital only)

Paclitaxel

**DRUG ACTION** Paclitaxel is a member of the taxane group of drugs.

**INDICATIONS AND DOSE**

- Treatment of ovarian cancer (advanced or residual disease following laparotomy) in combination with cisplatin (conventional paclitaxel only)
- Treatment of metastatic ovarian cancer where platinum-containing therapy has failed (conventional paclitaxel only)
- Treatment of locally advanced or metastatic breast cancer (in combination with other cytotoxics or alone if other cytotoxics have failed or are inappropriate) (conventional paclitaxel only)
- Adjuvant treatment of node-positive breast cancer following treatment with anthracycline and cyclophosphamide (conventional paclitaxel only)
- Treatment of non-small cell lung cancer (in combination with cisplatin) when surgery or radiotherapy not appropriate (conventional paclitaxel only)
- Treatment of advanced AIDS-related Kaposis sarcoma where liposomal anthracycline therapy has failed (conventional paclitaxel only)
- First-line treatment of metastatic adenocarcinoma of the pancreas (in combination with gemcitabine) (conventional paclitaxel only)
- Monotherapy of metastatic breast cancer when first-line treatment has failed and standard, anthracycline-containing therapy is not indicated (albumin-bound paclitaxel only)
- In combination with gemcitabine for the first-line treatment of metastatic adenocarcinoma of the pancreas (albumin-bound paclitaxel only)

**BY INTRAVENOUS INFUSION**

- Adult: (consult product literature or local protocols)

**CAUTIONS**

- Avoid in acute porphyrias p. 969 - consult product literature - patients aged over 75 years with metastatic adenocarcinoma of the pancreas

**INTERACTIONS**

- Common or very common: Arrhythmia, arthralgia, febrile neutropenia, gastro-intestinal disorders, myalgia, peripheral neuropathy, sensory neuropathy, tachycardia
- Rare: Bradycardia, cardiac arrest, congestive heart failure, left ventricular dysfunction
- Frequency not known: Alopecia, arrhythmias (nearly always asymptomatic), asymptomatic hypotension, bone-marrow suppression, bradycardia, cardiac conduction defects, extravasation, hypersensitivity reactions

- hyperuricaemia, muscle pain, myelosuppression, nausea, neutropenia, oral mucositis, pneumonitis, Stevens-Johnson syndrome, thromboembolism, toxic epidermal necrolysis, tumour lysis syndrome, vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hypersensitivity reactions: Routine premedication with a corticosteroid, an antihistamine and a histamine H2-receptor antagonist is recommended to prevent severe hypersensitivity reactions; hypersensitivity reactions may occur rarely despite premedication.

**CONCEPTION AND CONTRACEPTION**

- Ensure effective contraception during and for at least 6 months after treatment in men or women.

**PREGNANCY**

- Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING**

- Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

- Avoid in severe impairment.

**MONITORING REQUIREMENTS**

- Cardiac monitoring should be undertaken, particularly if patients have underlying cardiac disease or previous exposure to antracyclines.
- Patients should be monitored for signs and symptoms of pneumonitis and sepsis.

**PRESCRIBING AND DISPENSING INFORMATION**

- Paclitaxel is available as both conventional and albumin-bound formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable.
- Prescribers should specify the brand to be dispensed.

**NATIONAL FUNDING/ACCESS DECISIONS**

- NICE technology appraisals (TAs)
  - Paclitaxel for ovarian cancer (January 2003) NICE TA55
    - Either paclitaxel in combination with a platinum compound (cisplatin or carboplatin) or a platinum compound alone are alternatives for the first-line treatment of ovarian cancer (usually following surgery). www.nice.org.uk/TA55
  - Paclitaxel for the adjuvant treatment of early node-positive breast cancer (September 2006) NICE TA108
    - Paclitaxel, within its licensed indication, is not recommended for the adjuvant treatment of women with early node-positive breast cancer. www.nice.org.uk/TA108
  - Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284
    - Bevacizumab in combination with paclitaxel and carboplatin is not recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer). www.nice.org.uk/TA284
  - Paclitaxel as albumin-bound nanoparticles in combination with gemcitabine for previously untreated metastatic pancreatic cancer (October 2015) NICE TA360
    - Albumin-bound paclitaxel (Abraxane®) with gemcitabine, within its licensed indication, is not recommended for the treatment of previously untreated metastatic adenocarcinoma of the pancreas.

- Patients whose treatment was started before this guidance was published should continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA360
- Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389
  - Paclitaxel, in combination with platinum or as monotherapy, is recommended as an option for treating recurrent ovarian cancer. www.nice.org.uk/TA389
Drugs: irinotecan hydrochloride

**Indications and Dose**
Metastatic colorectal cancer in combination with fluorouracil and folinic acid or as monotherapy when treatment containing fluorouracil has failed. Treatment of epidermal growth factor receptor-expressing metastatic colorectal cancer after failure of chemotherapy that has included irinotecan (in combination with cetuximab). First-line treatment of metastatic carcinoma of the colon or rectum (in combination with fluorouracil, folinic acid and bevacizumab). First-line treatment of metastatic colorectal carcinoma in combination with capcitabine with or without bevacizumab.

- **By Intravenous Infusion**
- **Adult:** (consult product literature or local protocols)

Metastatic adenocarcinoma of the pancreas in patients who have progressed following gemcitabine based therapy (in combination with fluorouracil and leucovorin) (specialist use only).

- **By Intravenous Infusion Using Lipid Formulation**
- **Adult:** (consult product literature or local protocols)

**Contra-Indications**
Bowel obstruction, chronic inflammatory bowel disease.

**Caution**
Raised plasma-bilirubin concentration, risk factors for cardiac disease, risk factors for pulmonary toxicity, underweight patients—increased risk of adverse events.

**Interactions**
Appendix 1: irinotecan

**Side-effects**
- Uncommon: Intestinal obstruction
- Frequency not known: Acute cholinergic syndrome (with early diarrhoea) and delayed diarrhoea (consult product literature), alopecia, anorexia, asthenia, bone-marrow suppression, extravasation, gastrointestinal effects (delayed diarrhoea requiring prompt treatment may follow irinotecan treatment), hyperuricaemia, myelosuppression (dose limiting), nausea, oral mucositis, thromboembolism, tumour lysis syndrome, vomiting.

**Concept and Contraception**
For conventional formulations, manufacturer advises effective contraception during treatment and for up to 1 month after treatment in women of child-bearing potential, and up to 3 months after treatment in men. For liposomal formulations, manufacturer advises effective contraception during treatment and for up to 1 month after treatment in women of child-bearing potential, and up to 4 months after treatment in men.

**Pregnancy**
Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**Breast Feeding**
For conventional formulations, manufacturer advises avoid. For liposomal formulations, manufacturer advises avoid until one month after the last dose—no information available.

**Hepatic Impairment**
For conventional formulations, manufacturer advises dose adjustment—consult product literature. Manufacturer advises monitor liver function at baseline and before each cycle; also monitor complete blood counts weekly if plasma-bilirubin concentration 1.5–3 times the upper limit of normal; avoid if plasma-bilirubin concentration greater than 3 times the upper limit of normal.

For liposomal formulations, manufacturer advises use with caution; avoid if bilirubin greater than 2 mg/dL or if plasma-transaminase greater than 2.5 times the upper limit of normal (greater than 5 times the upper limit of normal if liver metastasis present)—limited information available.

**Renal Impairment**
For conventional formulations, manufacturer advises avoid—no information available. For liposomal formulations, manufacturer advises avoid in severe impairment—no information available.

**Monitoring Requirements**
Monitor respiratory function.

**Prescribing and Dispensing Information**
Irinotecan is available as both conventional and liposomal formulations. Manufacturers advise that the different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable.

**National Funding/Access Decisions**
NICE technology appraisals (TAs)
- Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005) NICE TA93
  A combination of fluorouracil and folinic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer. Irinotecan alone or fluorouracil and folinic acid with oxaliplatin are options for patients who require further treatment subsequently.
  www.nice.org.uk/TA93
- Pegylated liposomal irinotecan for treating pancreatic cancer after gemcitabine (April 2017) NICE TA440
  Pegylated liposomal irinotecan, in combination with fluorouracil and leucovorin, is not recommended for treating metastatic adenocarcinoma of the pancreas in adults whose disease has progressed following gemcitabine-based therapy.
  Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.
  www.nice.org.uk/guidance/TA440

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (March 2017) that liposomal irinotecan (Onivyde®) is not recommended for use within NHS Scotland for the treatment of metastatic adenocarcinoma of the pancreas, in combination with fluorouracil and leucovorin (folinic acid), in patients who have progressed following gemcitabine based therapy as there was insufficient evidence submitted.
Topotecan

**DRUG ACTION**
Topotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

**INDICATIONS AND DOSE**
- Metastatic ovarian cancer when first-line or subsequent treatment has failed
- Treatment of recurrent carcinoma of the cervix, after radiotherapy, and for patients with stage IVB disease (in combination with cisplatin)
  - **BY INTRAVENOUS INFUSION**
  - **Adult:** (consult product literature or local protocols)
- Relapsed small-cell lung cancer when retreatment with the first-line regimen is considered inappropriate
  - **BY INTRAVENOUS INFUSION, OR BY MOUTH**
  - **Adult:** (consult product literature or local protocols)

**NATIONAL FUNDING/ACCESS DECISIONS**
**NICE technology appraisals (TAs)**
- Topotecan for the treatment of recurrent and stage IVB cervical cancer (October 2009) NICE TA183
  Topotecan in combination with cisplatin is recommended as a treatment option for recurrent or stage IVB cervical cancer in patients who have not previously received cisplatin.
  [www.nice.org.uk/TA183](http://www.nice.org.uk/TA183)
- Topotecan for the treatment of relapsed small-cell lung cancer (November 2009) NICE TA184
  Oral topotecan is recommended as an option for treatment in patients with relapsed small-cell lung cancer only if retreatment with the first-line regimen is not considered appropriate, and the combination of cyclophosphamide, doxorubicin and vincristine is contra-indicated.
  Intravenous topotecan is not recommended for people with relapsed small-cell lung cancer.
  [www.nice.org.uk/TA184](http://www.nice.org.uk/TA184)
- Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389
  Topotecan is **not** recommended for treating first recurrence of platinum-sensitive ovarian cancer, recurrent platinum-resistant ovarian cancer, or platinum-refractory ovarian cancer.
  Patients currently receiving topotecan should have the option to continue their treatment until they or their clinician consider it appropriate to stop.
  [www.nice.org.uk/TA389](http://www.nice.org.uk/TA389)

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (November 2007) that topotecan (Hyacintin®) is accepted for restricted use in combination with cisplatin for treatment of recurrent carcinoma of the cervix after radiotherapy and for stage IVB disease; it is restricted to patients who have not previously received cisplatin treatment.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**
- **ELECTROLYTES:** May contain Sodium
- **Irinotecan hydrochloride (Non-proprietary)**
  - Irinotecan hydrochloride trihydrate 20 mg per 1 ml
  - Irinotecan 500mg/25ml concentration for solution for infusion vials | 1 vial (Pom) £601.25–650.00 (Hospital only)
  - Irinotecan 40mg/2ml concentration for solution for infusion vials | 1 vial (Pom) £40.03–53.00 (Hospital only) | 1 vial (Pom) £47.37–50.35
  - Irinotecan 300mg/15ml concentration for solution for infusion vials | 1 vial (Pom) £390.00 (Hospital only) | 1 vial (Pom) £345.42–390.00
  - Irinotecan 100mg/5ml concentration for solution for infusion vials | 1 vial (Pom) £120.25–130.00 (Hospital only) | 1 vial (Pom) £116.15–£123.50
- **Campto (Pfizer Ltd)**
  - Irinotecan hydrochloride trihydrate 20 mg per 1 ml
  - Campto 100mg/5ml concentration for solution for infusion vials | 1 vial (Pom) £130.00 (Hospital only)
  - Campto 40mg/2ml concentration for solution for infusion vials | 1 vial (Pom) £53.00 (Hospital only)
  - Campto 300mg/15ml concentration for solution for infusion vials | 1 vial (Pom) £390.00 (Hospital only)
- **Onivyde (Baxalta UK Ltd)**
  - Irinotecan hydrochloride trihydrate 5 mg per 1 ml
  - Onivyde 50mg/10ml concentration for solution for infusion vials | 1 vial (Pom) £615.35 (Hospital only)

**Topotecan**
10-Jun-2016

- **Indications and Dose**
  - Metastatic ovarian cancer when first-line or subsequent treatment has failed
  - Treatment of recurrent carcinoma of the cervix, after radiotherapy, and for patients with stage IVB disease (in combination with cisplatin)
    - **By Intravenous Infusion**
    - **Adult:** (consult product literature or local protocols)
  - Relapsed small-cell lung cancer when retreatment with the first-line regimen is considered inappropriate
    - **By Intravenous Infusion, or by Mouth**
    - **Adult:** (consult product literature or local protocols)

**Important Safety Information**
**Risks of incorrect dosing of oral anti-cancer medicines**
See Cytotoxic drugs p. 825.

**Interactions**
- Appendices 1: topotecan

**Side-effects**
- Alopecia · anorexia · asthenia · bone-marrow suppression · extravasation · gastro-intestinal effects · hyperuricaemia · myelosuppression (dose-limiting) · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

**Conception and Contraception**
Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**Pregnancy**
Avoid (teratogenicity and fetal loss in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**Breast Feeding**
Discontinue breast-feeding.

**Hepatic Impairment**
Avoid in severe impairment.

**Renal Impairment**
Reduce dose. Avoid infusion if creatinine clearance less than 20 mL/minute. Avoid oral route if creatinine clearance less than 60 mL/minute.

**Powder for solution for infusion**
- **Topotecan (as Topotecan hydrochloride) 1 mg per 1 ml**
  - **Topotecan 4mg/4ml concentration for solution for infusion vials | 1 vial (Pom) £226.55 (Hospital only) | 1 vial (Pom) no price available | 5 vial (Pom) £1,453.10 (Hospital only)
  - **Topotecan 1mg/1ml concentration for solution for infusion vials | 1 vial (Pom) £87.88 (Hospital only) | 1 vial (Pom) no price available | 5 vial (Pom) £488.25 (Hospital only)

**Capsule**
**Cautionary and Advisory Labels**
- **Hycamitn (Novartis Pharmaceuticals UK Ltd)**
  - **Topotecan (as Topotecan hydrochloride) 1 mg**
    - **Hycamitn 1mg powder for concentrate for solution for infusion vials | 1 vial (Pom) £97.65
    - **Topotecan (as Topotecan hydrochloride) 4 mg**
      - **Hycamitn 4mg powder for concentrate for solution for infusion vials | 1 vial (Pom) £348.76
    - **Potactasol (Actavis UK Ltd)**
      - **Topotecan (as Topotecan hydrochloride) 1 mg**
        - **Potactasol 1mg powder for concentrate for solution for infusion vials | 1 vial (Pom) £97.00 (Hospital only)
      - **Topotecan (as Topotecan hydrochloride) 4 mg**
        - **Potactasol 4mg powder for concentrate for solution for infusion vials | 1 vial (Pom) £290.00 (Hospital only)

- **Topotecan (as Topotecan hydrochloride) 1 mg**
  - **Hycamitn 1mg capsules | 10 capsule (Pom) £75.00
  - **Topotecan (as Topotecan hydrochloride) 1 mg**
    - **Hycamitn 1mg capsules | 10 capsule (Pom) £360.00
downloaded from www.medicalbr.com
Vinblastine sulfate

**INDICATIONS AND DOSE**
Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)
- Adult: (consult product literature)

**SIDE-EFFECTS, FURTHER INFORMATION**
- Neurotoxicity: Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids; it occurs less often with vinblastine than with vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced.
- Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

**CONTRA-INDICATIONS**
- Contra-indications, further information
- Intrathecal injection contra-indicated.

**CAUTIONS**
- Caution in handling—irritant to tissues

**INTERACTIONS**
- Appendix 1: vinca alkaloids

**CONCEPTION AND CONTRACEPTION**
- Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**PREGNANCY**
- Avoid (limited experience suggests fetal harm; teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING**
- Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
- Dose reduction may be necessary—consult local treatment protocol for details.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- Solution for injection
  - Vinblastine sulfate (non-proprietary)
    - Vinblastine sulfate 1 mg per 1 ml Vinblastine 10mg/10ml solution for injection vials | 5 vial | £58.00

**IMPORTANT SAFETY INFORMATION**
- Vinblastine is for intravenous administration only. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

- The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

**Vincristine sulfate**

**INDICATIONS AND DOSE**
Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)
- Adult: (consult product literature)

**SIDE-EFFECTS, FURTHER INFORMATION**
- Neurotoxicity: Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced.
- Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

**CONTRA-INDICATIONS**
- Contra-indications, further information
- Intrathecal injection contra-indicated.

**CAUTIONS**
- Caution in handling—irritant to tissues

**INTERACTIONS**
- Appendix 1: vinca alkaloids

**CONCEPTION AND CONTRACEPTION**
- Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**PREGNANCY**
- Avoid (teratogenicity and fetal loss in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING**
- Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
- Dose reduction may be necessary—consult local treatment protocol for details.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- Solution for injection
  - Vincristine sulfate (non-proprietary)
    - Vincristine sulfate 1 mg per 1 ml Vincristine 1mg/1ml solution for injection vials | 1 vial | £13.47 (Hospital only) | 5 vial | £67.35
Vindesine sulfate

**INDICATIONS AND DOSE**
Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)
- Adult: (consult local protocol)

**IMPORTANT SAFETY INFORMATION**
Vindesine injections are for intravenous administration only. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

**CONTRA-INDICATIONS**
CONTRA-INDICATIONS, FURTHER INFORMATION
Intrathecal injection contra-indicated.

**CAUTIONS**
Caution in handling—irritant to tissues • neuromuscular disease

**INTERACTIONS**
→ Appendix 1: vinca alkaloids

**SIDE-EFFECTS, FURTHER INFORMATION**
- Neurotoxicity Neurotoxicity, usually as peripheral or autonomic neuropathy; it occurs less often with vindesine than with vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur, and increasing motor weakness calls for dose reduction or discontinuation. Recovery from neurotoxic effects is usually slow but complete.

- CONCEPTION AND CONTRACEPTION
  Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- PREGNANCY
  Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- BREAST FEEDING
  Discontinue breast-feeding.

- HEPATIC IMPAIRMENT
  Dose reduction may be necessary.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- Eldisine (Genus Pharmaceuticals Ltd)
  Vindesine sulfate 5 mg Eldisine 5mg powder for solution for injection vials | 1 vial £66.55 (Hospital only)

**CONTRA-INDICATIONS, FURTHER INFORMATION**
Intrathecal injection contra-indicated.

**CAUTIONS**
Cardiovascular disease • QT-interval prolongation (avoid hypokalaemia)

**INTERACTIONS**
- Common or very common
  Anorexia • cutaneous reactions • dehydration • diarrhoea • dyspepsia • fatigue • hypertension • hypotension • insomnia • oedema • sweating • tachycardia • thrombosis

- Uncommon
  Increased weight • myocardial infarction • renal failure

- Frequency not known
  Alopecia • autonomic neuropathy • blurred vision • extravasation • hyperuricaemia • inappropriate anti-diuretic hormone secretion • myelosuppression (dose-limiting) • nausea • neurotoxicity • oral mucositis • peripheral neuropathy • QT-interval prolongation • severe bronchospasm following administration (more commonly when used in combination with mitomycin-C) • severe local irritation (if extravasated) • thromboembolism • tumour lysis syndrome • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
- Neurotoxicity Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vindesine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur and increasing motor weakness calls for dose reduction or discontinuation. Recovery from neurotoxic effects is usually slow but complete.

- CONCEPTION AND CONTRACEPTION
  Manufacturer advises effective contraception during and for up to 3 months after treatment.

- PREGNANCY
  Avoid unless essential—teratogenicity and embryotoxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- BREAST FEEDING
  Discontinue breast-feeding.

- HEPATIC IMPAIRMENT
  Reduce dose—consult product literature.

- RENAL IMPAIRMENT
  Reduce dose if creatinine clearance less than 60 mL/minute—consult product literature.
Vinorelbine

**Indications and Dose**

Vinorelbine is a semi-synthetic vinca alkaloid.

**Advanced breast cancer | Advanced non-small cell lung cancer**

- **By mouth**
  - Adult: 60 mg/m² once weekly for 3 weeks, then increased if tolerated to 80 mg/m² once weekly (max. per dose 160 mg once weekly)
  - **By intravenous injection, or by intravenous infusion**
  - Adult: (consult product literature)

**Important Safety Information**

Vinorelbine injections are for intravenous administration only. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

**Risks of Incorrect Dosing of Oral Anti-Cancer Medicines**

See Cytotoxic drugs p. 825.

**Contra-Indications**

- With oral use concurrent radiotherapy if treating the liver - long-term oxygen therapy - previous significant surgical resection of small bowel - previous significant surgical resection of stomach

**Contra-Indications, Further Information**

Intrathecal injection contra-indicated.

**Caution**

- Caution in handling — irritant to tissues - ischaemic heart disease

**Interactions**

- Appendix 1: vinca alkaloids

**Side-Effects**

- Rare: Pancreatitis
- Frequency not known: Alopecia - autonomic neuropathy - extravasation - hyperuricaemia - hypoaetraemia - inappropriate secretion of antidiuretic hormone - irritant to tissues - motor weakness - myelosuppression (dose-limiting) - nausea - neurotoxicity - oral mucositis - peripheral neuropathy - severe bronchospasm following administration of the vinca alkaloids (more commonly when used in combination with mitomycin-C) - severe local irritation (if extravasated) - thromboembolism - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, Further Information**

- Neurotoxicity: Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids; it occurs less often with vinorelbine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced.

- Motor weakness can also occur, and increasing motor weakness calls for dose reduction or discontinuation of these drugs. Recovery from neurotoxic effects is usually slow but complete.

**Conception and Contraception**

Manufacturer advises effective contraception during and for 3 months after treatment; men must avoid fathering a child during and for at least 3 months after treatment.

**Pregnancy**

Avoid unless essential (teratogenicity, and fetal loss in animal studies). See also Pregnancy and Reproductive function in Cytotoxic drugs p. 825.

**Breast Feeding**

Discontinue breast-feeding.

**Hepatic Impairment**

- With oral use: Reduce oral dose in moderate impairment. Avoid oral use in severe impairment.

- With injectable use: Reduce intravenous dose in severe impairment. Consult product literature.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for Infusion**

- [Javelor (Pierre Fabre Ltd)](https://www.medicines.org.uk/emc/medicine/16062) (Non-proprietary) Vinorelbine (as Vinorelbine tartrate) 80 mg/2ml concentrate for solution for infusion | 1 vial £1,221.50

- Javelor (Pierre Fabre Ltd) Vinorelbine (as Vinorelbine tartrate) 30 mg/1ml concentrate for solution for infusion | 1 vial £100.50

- Javelor (Pierre Fabre Ltd) Vinorelbine (as Vinorelbine tartrate) 20 mg/1ml concentrate for solution for infusion | 1 vial £100.50

**Capsule**

- [Navelbine](https://www.medicines.org.uk/emc/medicine/16079) (Pierre Fabre Ltd)
  - Navelbine (as Vinorelbine tartrate) 30 mg Navelbine 30mg capsules | 1 capsule £65.98 (Hospital only)
  - Navelbine (as Vinorelbine tartrate) 10 mg Navelbine 10mg capsules | 1 capsule £43.98 (Hospital only)

**Antineoplastic Drugs > Other**

**Amsacrine**

**Indications and Dose**

Acute leukaemia (refractory to anthracycline chemotherapy used alone or in combination with other chemotherapy agents) (specialist use only)

- **By Intravenous Infusion**
  - Adult: (consult product literature)

**Caution**

- Hypokalaemia — increased risk of ventricular fibrillation (correct hypokalaemia before initiating treatment)

**Interactions**

- Appendix 1: amsacrine

**Side-Effects**

- Common or very common: Abdominal pain - alopecia - arrhythmias - bone marrow suppression - cardiotoxicity - congestive heart failure - diarrhoea - dyspnoea - emotional
lability • Grand mal seizure • haematuria • haemorrhage • hepatic insufficiency • hepatitis • hypokalaemia • hypotension • infection • jaundice • nausea • pancytopenia • purpura • raised hepatic enzymes • rash • stomatitis • thrombocytopenia • urticaria • vomiting

- Rare Acute renal insufficiency • anaemia • anuria • confusion • dizziness • granulocytopenia • headache • hypoaesthesia • lethargy • leucopenia • peripheral neuropathy • proteinuria • reduced ejection fraction • visual disturbances • weight changes

- Frequency not known Cardiac arrest • hyperuricaemia

- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for 3 months after treatment in women of child-bearing potential, and during and for 6 months after treatment in men.

- PREGNANCY Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- BREAST FEEDING Discontinue breast-feeding.

- HEPATIC IMPAIRMENT Manufacturer advises caution—limited information available.

- RENAL IMPAIRMENT Manufacturer advises caution—limited information available.

- MONITORING REQUIREMENTS
  - Manufacturer advises monitor full blood count, liver function and renal function regularly; electrolytes should be re-evaluated prior to each treatment.
  - Manufacturer advises monitor for cardiotoxicity during treatment.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  Solution for infusion
  - Amsidine (Eurocept International bv)
    - Amsacrine 50 mg per 1 ml Amsidine 75mg/1.5ml solution for infusion ampoules and diluent | 6 ampoule (£1,200.00 (Hospital only))

Arsenic trioxide

- INDICATIONS AND DOSE
  - Acute promyelocytic leukaemia in patients who have relapsed or failed to respond to previous treatment with a retinoid and chemotherapy
    - BY INTRAVENOUS INFUSION
      - Adult: (consult local protocol)

- CAUTIONS
  - Hypokalaemia (correct before treatment) • hypomagnesaemia (correct before treatment) • previous treatment with anthracyclines (increased risk of QT interval prolongation)

- INTERACTIONS
  - Common or very common • Atrial fibrillation • atrial flutter • diarrhoea • fatigue • haemorrhage • hyperglycaemia • hypokalaemia • leucocyte activation syndrome • musculoskeletal pain • paraesthesia • pleuritic pain • QT interval prolongation
  - Uncommon • Abdominal pain • blurred vision • hypotension • oedema • pneumonitis • rash • renal failure • seizures • tachycardia • vasculitis
  - Frequency not known • Alopecia • bone-marrow suppression • extravasation • hyperuricaemia • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting

- SIDE-EFFECTS, FURTHER INFORMATION
  - Leucocyte activation syndrome • Signs and symptoms of leucocyte activation syndrome include unexplained fever, dyspnoea, weight gain, pulmonary infiltrates, pleural or pericardial effusions, with or without leucocytosis—treat with high dose corticosteroids, consult product literature.

- CONCEPTION AND CONTRACEPTION
  - Manufacturer advises effective contraception during treatment in men and women.

- PREGNANCY
  - Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- BREAST FEEDING
  - Discontinue breast-feeding.

- HEPATIC IMPAIRMENT
  - Manufacturer advises caution—limited information available.

- RENAL IMPAIRMENT
  - Manufacturer advises caution—limited information available.

- MONITORING REQUIREMENTS
  - ECG required before and during treatment—consult product literature.

Asparaginase

- DRUG ACTION
  - Asparaginase is an enzyme which acts by breaking down L-asparagine to aspartic acid and ammonia, this disrupts protein synthesis of tumour cells.

- INDICATIONS AND DOSE
  - Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)
    - BY INTRAVENOUS INFUSION
      - Adult: 5000 units/m² every 3 days

- CONTRA-INDICATIONS
  - History of pancreatitis related to asparaginase therapy • history of serious haemorrhage related to asparaginase therapy • history of serious thrombosis related to asparaginase therapy • pancreatitis • pre-existing known coagulopathy

- CAUTIONS
  - Diabetes (may raise blood glucose) • hypersensitivity reactions • hypertriglyceridaemia (severe)—increased risk of acute pancreatitis

- CAUTIONS, FURTHER INFORMATION
  - Hypersensitivity reactions
    - Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur—asparaginase should only be administered when appropriately trained staff and resuscitation facilities are immediately available; in the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated. Manufacturer advises an intracutaneous or small intravenous test dose can be used but is of limited value for predicting which patients will experience an allergic reaction.

- INTERACTIONS
  - Appendix 1: asparaginase

- SIDE-EFFECTS
  - Common or very common • Abdominal pain • acute pancreatitis—discontinue if suspected and do not re-start if confirmed • agitation • anaemia • confusion • decreased appetite • decreased clotting factors • decreased fibrinogen • depression • diarrhoea • dizziness • elevated blood lipids • haemorrhage • hallucination • hyperglycaemia • hypersensitivity reactions • hypoalbuminaemia • hypoglycaemia • myelosuppression • nausea • oedema • pain • somnolence • thrombosis • vomiting • weight loss
Cytotoxic responsive malignancy

- **Uncommon** Headache • hyperammonaemia • hyperuricaemia
- **Rare** Convulsion • diabetic ketoacidosis • disturbances in consciousness (including coma) • hepatotoxicity • ischaemic stroke • parotitis • reversible posterior leucoencephalopathy syndrome
- **Very rare** Hypoparathyroidism • hypothyroidism (secondary) • tremor

**SIDE-EFFECTS, FURTHER INFORMATION**
- Hepatotoxicity. There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome; manufacturer advises interrupt treatment if these symptoms develop.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises monitor trough serum asparaginase and contraception during treatment; in addition, monitor plasma and urinary levels containing the same drug.
- **INTERACTIONS** Cytotoxic drugs p. 825.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid. See also, Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **DIRECTIONS FOR ADMINISTRATION** Facilities for the management of anaphylaxis should be available.

**SIDE-EFFECTS**
- **Common or very common** Coagulation disorders • confusion • convulsions • diarrhoea • dizziness • drowsiness • headache • lethargy • liver dysfunction • neurotoxicity • pancreatitis
- **Uncommon** Anaphylaxis • changes in blood lipids • hyperglycaemia
- **Rare** CNS depression
- **Very rare** Abdominal pain • hypertension • myalgia
- Frequency not known Alopecia • bone-marrow suppression • extravasation • hyperuricaemia • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- **Eribulin** (EUSA Pharma Ltd)
  - **Crisantaspase 10000 unit** Erwinase 10,000 unit powder for solution for injection vials | 5 vial | £3,065.00

---

**Crisantaspase**

**DRUG ACTION** Crisantaspase is the enzyme asparaginase produced by Erwinia chrysanthemi.

**INDICATIONS AND DOSE**
- **Acute lymphoblastic leukaemia**
  - **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION**
  - Adult: (consult product literature)

**CONTRA-INDICATIONS** History of pancreatitis related to asparaginase therapy
- **CAUTIONS** Diabetes (may raise blood glucose)
- **INTERACTIONS** → Appendix 1: crisantaspase

---

**Eribulin**

**INDICATIONS AND DOSE**
- Treatment of locally advanced or metastatic breast cancer when the disease has progressed after treatment with at least 1 chemotherapy regimen for advanced disease
- **BY INTRAVENOUS INJECTION**
  - Adult: Give on day 1 and day 8 of a 21-day cycle, previous therapy should have included an anthracycline and a taxane in either the adjuvant or metastatic setting unless the patient is unsuitable for these treatments (consult local protocol)

**CONTRA-INDICATIONS** Congenital long QT syndrome
- **CAUTIONS** Bradycardias (increased susceptibility to QT-interval prolongation) • congestive heart failure (increased susceptibility to QT-interval prolongation) • electrolyte disturbances (increased susceptibility to QT-interval prolongation) • susceptibility to QT-interval prolongation
- **INTERACTIONS** → Appendix 1: eribulin
- **SIDE-EFFECTS** Alopecia • bone-marrow suppression • extravasation • hyperuricaemia • myelosuppression • nausea • oral mucositis • peripheral neuropathy • QT-interval prolongation • thromboembolism • tumour lysis syndrome • vomiting

---

**Cytotoxic responsive malignancy**

**Takeout**

- Uncommon Headache • hyperammonaemia • hyperuricaemia
- Rare Convulsion • diabetic ketoacidosis • disturbances in consciousness (including coma) • hepatotoxicity • ischaemic stroke • parotitis • reversible posterior leucoencephalopathy syndrome
- Very rare Hypoparathyroidism • hypothyroidism (secondary) • tremor

**SIDE-EFFECTS, FURTHER INFORMATION**
- Hepatotoxicity. There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome; manufacturer advises interrupt treatment if these symptoms develop.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises monitor trough serum asparaginase and contraception during treatment; in addition, monitor plasma and urinary levels containing the same drug.
- **INTERACTIONS** Cytotoxic drugs p. 825.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid. See also, Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **DIRECTIONS FOR ADMINISTRATION** Facilities for the management of anaphylaxis should be available.

**SIDE-EFFECTS**
- Common or very common Coagulation disorders • confusion • convulsions • diarrhoea • dizziness • drowsiness • headache • lethargy • liver dysfunction • neurotoxicity • pancreatitis
- Uncommon Anaphylaxis • changes in blood lipids • hyperglycaemia
- Rare CNS depression
- Very rare Abdominal pain • hypertension • myalgia
- Frequency not known Alopecia • bone-marrow suppression • extravasation • hyperuricaemia • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- **Eribulin** (EUSA Pharma Ltd)
  - **Crisantaspase 10000 unit** Erwinase 10,000 unit powder for solution for injection vials | 5 vial | £3,065.00

---

**Crisantaspase**

**DRUG ACTION** Crisantaspase is the enzyme asparaginase produced by Erwinia chrysanthemi.

**INDICATIONS AND DOSE**
- **Acute lymphoblastic leukaemia**
  - **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION**
  - Adult: (consult product literature)

**CONTRA-INDICATIONS** History of pancreatitis related to asparaginase therapy
- **CAUTIONS** Diabetes (may raise blood glucose)

- **SIDE-EFFECTS** Alopecia • bone-marrow suppression • extravasation • hyperuricaemia • myelosuppression • nausea • oral mucositis • peripheral neuropathy • QT-interval prolongation • thromboembolism • tumour lysis syndrome • vomiting

---
Monitor electrolytes periodically.

ECG monitoring recommended in patients prescribed Halaven.

Monitor for signs of peripheral neuropathy—severe peripheral neuropathy requires treatment delay or dose reduction (consult product literature).

Monitor electrolytes periodically.

NICE technology appraisals (TAs)

Eribulin is recommended for the treatment of locally advanced or metastatic breast cancer after 2 or more chemotherapy regimens (December 2016) NICE TA423.

Eribulin is recommended for the treatment of locally advanced or metastatic breast cancer, only if:

- the condition has progressed after at least 2 chemotherapy regimens (which may include an anthracycline or a taxane, and capecitabine), and
- the manufacturer provides eribulin with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA423

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (March 2016) that eribulin (Halaven®) is accepted for restricted use within NHS Scotland for the treatment of patients with locally advanced or metastatic breast cancer that has progressed after at least two prior chemotherapy regimens for advanced disease, which includes capetitabine if indicated.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Ethanol

- Halaven (Eisai Ltd)

  Eribulin 4.4 mg per 1 ml Halaven 0.88mg/2ml solution for injection vials | 1 vial (PPh) £361.00 (Hospital only)

  Halaven 1.32mg/3ml solution for injection vials | 1 vial (PPh) £541.50 (Hospital only)

Hydroxyurea (Hydroxyurea)

INDICATIONS AND DOSE

Treatment of chronic myeloid leukaemia | Treatment of cancer of the cervix in conjunction with radiotherapy | Polycythaemia

- BY MOUTH

  Adult: 20–30 mg/kg daily, alternatively 80 mg/kg every 3 days

Sickle-cell disease — consult with a specialist centre

- BY MOUTH

  Adult: Initially 15 mg/kg daily, increased in steps of 2.5–5 mg/kg daily, dose to be increased every 12 weeks according to response; usual dose 15–30 mg/kg daily; maximum 35 mg/kg per day

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 825.

CAUTIONS

Leg ulcers (review treatment if cutaneous vasculitic ulcerations develop).

INTERACTIONS

- Appendix 1: hydroxyurea

SIDE-EFFECTS

- Common or very common Headache · myelosuppression · skin reactions

- Rare Amenorrhoea (in sickle-cell disease) · fever (in sickle-cell disease)

- Frequency not known Alopecia · bleeding (in sickle-cell disease) · bone–marrow suppression · dizziness · hyperuricaemia · hypomagnesaemia (in sickle-cell disease) · nausea · oral mucositis · rash · reduced sperm count and activity · skin cancers (particularly in elderly patients) · thromboembolism · tumour lysis syndrome · vomiting

CONCEPTION AND CONTRACEPTION

Manufacturer advises effective contraception before and during treatment.

PREGNANCY

Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

BREAST FEEDING

Discontinue breast-feeding.

HEPATIC IMPAIRMENT

Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment, unless used for malignant conditions.

RENAL IMPAIRMENT

In sickle-cell disease, reduce initial dose by 50% if eGFR less than 60 mL/minute/1.73 m². In sickle-cell disease, avoid if eGFR less than 30 mL/minute/1.73 m². Use with caution in malignant disease.

MONITORING REQUIREMENTS

- Monitor renal and hepatic function before and during treatment.

- Monitor full blood count before treatment, and repeatedly throughout use; in sickle-cell disease monitor every 2 weeks for the first 2 months and then every 2 months thereafter (or every 2 weeks if on maximum dose).

- Patients receiving long-term therapy for malignant disease should be monitored for secondary malignancies.

PATIENT AND CARER ADVICE

Patients receiving long-term therapy with hydroxyurea should be advised to protect skin from sun exposure.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

- Siklos (Nordic Pharma Ltd)

  Hydroxyureamide 100 mg Siklos 100mg tablets | 60 tablet (PPh) £100.00 DT price = £100.00

  Hydroxyureamide 1 gram Siklos 1000mg tablets | 30 tablet (PPh) £500.00

Capsule

- Hydroxyureamide (Non-proprietary)

  Hydroxyureamide 500 mg Hydroxyureamide 500mg capsules | 100 capsule (PPh) £86.00 DT price = £12.12

  Dragia (Imported (United States))

  Hydroxyureamide 300 mg Dragia 300mg capsules | 60 capsule (PPh) no price available

- Hydrea (Bristol-Myers Squibb Pharmaceuticals Ltd)

  Hydroxyureamide 500 mg Hydrea 500mg capsules | 100 capsule (PPh) £10.47 DT price = £12.12

Mitotane

DRUG ACTION

Mitotane selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy.

INDICATIONS AND DOSE

Symptomatic treatment of advanced or inoperable adrenocortical carcinoma

- BY MOUTH

  Adult: Initially 2–3 g daily in 2–3 divided doses adjusted according to plasma-concentration monitoring, in severe illness initial dose continued →

downloaded from www.medicalbr.com
Panobinostat

DRUG ACTION Panobinostat is a histone deacetylase inhibitor, which promotes cell-cycle arrest and apoptosis of tumour cells via multiple pathways.

INDICATIONS AND DOSE
Treatment of relapsed or refractory multiple myeloma (in combination with bortezomib and dexamethasone), in patients who have received at least two prior regimens, including bortezomib and an immunomodulatory agent

BY MOUTH
Adult 18–74 years: 20 mg once daily, on days 1, 3, 5, 8, and 10 of a 21-day cycle for 8 cycles. Patients with clinical benefit should continue treatment for 8 additional cycles; total duration 16 cycles (48 weeks), for doses of dexamethasone and bortezomib, or dose adjustment due to side-effects—consult product literature

Adult 75 years and over: 20 mg once daily, on days 1, 3, 5, 8, 10, and 12 of a 21-day cycle for 8 cycles. Patients with clinical benefit should continue treatment for 8 additional cycles; total duration 16 cycles (48 weeks), alternatively initially 15 mg once daily, on days 1, 3, 5, 8, 10, and 12 of a 21-day cycle for 1 cycle, increased if tolerated to 20 mg once daily, on days 1, 3, 5, 8, 10, and 12 of a 21-day cycle for 7 subsequent cycles, patients with clinical benefit should continue treatment for 8 additional cycles; total duration 16 cycles (48 weeks), lower dose may be used for the first cycle depending on patient’s condition and co-morbidities, for doses of dexamethasone and bortezomib, or dose adjustment due to side-effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Manufacturer advises reduce dose to 10 mg with concurrent use of potent inhibitors of CYP3A4; if the potent inhibitor of CYP3A4 is to be continued, consider increasing the dose to 15 mg if tolerated.
Manufacturer advises avoid potent inhibitors of CYP3A4 if possible in patients taking a reduced panobinostat dose due to side-effects, or in those with hepatic impairment.
Cytotoxic responsive malignancy

**SIDE-EFFECTS, FURTHER INFORMATION**

Side-effects are reported when used in combination with bortezomib and dexamethasone.

- Gastro-intestinal disorders  Manufacturer advises that patients are treated with anti-diarrhoeals, or any additional treatment, in accordance with local treatment guidelines at the first sign of abdominal cramping or onset of diarrhoea.

**CONCEPTION AND CONTRACEPTION**  Manufacturer advises monitor full blood count before emergency and contraception used during treatment and for 3 months after last dose.

**PREGNANCY**  Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING**  Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**  Manufacturer advises reduce initial dose to 15 mg during the first treatment cycle in mild impairment—dose may be increased to 20 mg based on patient tolerability; reduce initial dose to 10 mg during the first treatment cycle in moderate impairment—dose may be increased to 15 mg based on patient tolerability. Manufacturer advises frequent monitoring of hepatic function in mild and moderate impairment, particularly during the dose escalation phase; avoid in severe impairment—no information available.

**MONITORING REQUIREMENTS**

- Manufacturer advises monitor full blood count before treatment, then frequently during treatment; reduce dose or interrupt treatment if thrombocytopenia or neutropenia occur—consult product literature.
- Manufacturer advises monitor ECG before treatment and repeat periodically before each treatment cycle; QTcF should be <480 milliseconds before treatment initiation—consult product literature.
- Manufacturer advises monitor electrolytes before treatment and periodically as clinically indicated, especially in patients with diarrhoea; monitor thyroid and pituitary function (free T4 and TSH) as clinically indicated; monitor hepatic function before treatment and regularly during treatment as clinically indicated.
- Manufacturer advises monitor patients over 65 years more frequently, especially for thrombocytopenia and gastrointestinal toxicity.

**PATIENT AND CARER ADVICE**

Manufacturer advises that patients and their carers should be told to seek medical advice if severe gastro-intestinal toxicity occurs.

**Missed doses**

Manufacturer advises if a dose is missed, it can be taken up to 12 hours after the specified dose time.

**Driving and skilled tasks**

Dizziness may affect performance of skilled tasks (e.g. driving).

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Panobinostat for treating multiple myeloma after at least 2 previous treatments (January 2016) NICE TA380

Panobinostat, in combination with bortezomib and dexamethasone, is recommended as an option for treating relapsed or refractory multiple myeloma in patients who have received at least 2 prior regimens including bortezomib and an immunomodulatory agent when the manufacturer provides panobinostat with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA380](http://www.nice.org.uk/TA380)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**CAUTIONARY AND ADVISORY LABELS**

- Farydak (Novartis Pharmaceuticals UK Ltd) ▼
- Panobinostat (as Panobinostat lactate anhydrous)
  - 10 mg  Farydak 10mg capsules 6 capsule £3,492.00
  - Panobinostat (as Panobinostat lactate anhydrous) 15 mg  Farydak 15mg capsules 6 capsule £3,492.00
- Panobinostat (as Panobinostat lactate anhydrous)
  - 20 mg  Farydak 20mg capsules 6 capsule £4,656.00

**Pegasparagase**

**DRUG ACTION**

Pegasparagase breaks down the amino acid L-asparagine, thereby interfering with the growth of malignant cells, which are unable to synthesise L-asparagine.

**INDICATIONS AND DOSE**

**Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)**

- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult 18–21 years: 2500 units/m² every 14 days
  - Adult 22 years and over: 2000 units/m² every 14 days

**CONTRA-INDICATIONS**

History of pancreatitis • History of serious haemorrhagic event with previous L-asparaginase therapy • History of serious thrombosis with previous L-asparaginase therapy

**CAUTIONS**

Concomitant use of other hepatotoxic drugs (particularly in pre-existing hepatic impairment)—monitor hepatic function • Diabetes (may raise blood glucose) • Hypersensitivity reactions—marked decrease of leukocyte count at start of treatment is possible—may be associated with significant rise in serum uric acid and development of uric acid nephropathy

**CAUTIONS, FURTHER INFORMATION**

- Hypersensitivity reactions  Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur—pegasparagase should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises patients should be closely monitored for signs of hypersensitivity during treatment and for an hour after administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

**INTERACTIONS**

▶ Appendix 1: pegasparagase

**SIDE-EFFECTS**

- **Common or very common**
  - Abdominal pain • convulsion • diarrhoea • elevated blood lipids • hyperglycaemia • hypersensitivity reactions • hypoxia • myelosuppression • pain in extremities • pancreatitis—discontinue if suspected and do not re-start if confirmed • peripheral motor neuropathy • rash • stomatitis • syncope • thrombosis—dissociate treatment • vomiting

- **Rare**
  - Acute renal failure • reversible posterior leukoencephalopathy syndrome

- **Very rare**
  - Tremor

- **Frequency not known**
  - Confusion • decreased clotting factors • decreased fibrinogen • diabetic ketoacidosis • hepatobiliary disorders • hyperammonaemia—monitor if symptoms present • somnolence • toxic epidermal necrolysis
SIDE-EFFECTS, FURTHER INFORMATION

- Hepatobiliary disorders There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome.

CONCEPT AND CONCEPTION Manufacturer advises effective contraception in men and women of childbearing potential during treatment and for at least 6 months after discontinuing treatment; pegaspargase may reduce effectiveness of oral contraceptives—additional precautions (e.g. barrier method) are required, see also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

PREGNANCY Manufacturer advises avoid unless essential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

BREAST FEEDING Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment.

MONITORING REQUIREMENTS
- Manufacturer advises trough serum asparaginase activity levels may be measured before the next administration of pegaspargase; consider switching to a different asparaginase preparation if target levels not reached—seek expert advice.
- Manufacturer advises monitor plasma and urine glucose levels during treatment; monitor coagulation profile at baseline and periodically during and after treatment (particularly with concomitant use of other drugs that inhibit coagulation); monitor serum amylase.

DIRECTIONS FOR ADMINISTRATION Manufacturer advises for intramuscular injection, volumes over 3 mL must be divided between more than one site.

HANDLING AND STORAGE Manufacturer advises store in a refrigerator between 2–8°C.

PATIENT AND CARER ADVICE
Pancreatitis Manufacturer advises patients and carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.

Driving and skilled tasks
Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of confusion and somnolence.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Pegaspargase for treating acute lymphoblastic leukaemia (September 2016) NICE TA408

Pegaspargase, as part of antineoplastic combination therapy, is recommended as an option for treating acute lymphoblastic leukaemia only in patients with untreated newly diagnosed disease.

Patients whose treatment was started within the NHS before this guidance was published may continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta408

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (October 2016) that pegaspargase (Onasca®) is accepted for use within NHS Scotland as a component of antineoplastic combination therapy in acute lymphoblastic leukaemia.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Pegaspargase (non-proprietary) Pegaspargase 750 unit per 1 ml

Solution for injection vials | 1 vial £373.95

Procarbazine

- DRUG ACTION Procarbazine is a mild monoamine-oxidase inhibitor.

- INDICATIONS AND DOSE

- Hodgkin’s lymphoma
  - BY MOUTH
  - Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

Risks of incorrect dosing of oral anti-cancer medicines

CONCEPT AND CONCEPTION

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

CONTRA-INDICATIONS

- Pre-existing severe leucopenia
- pre-existing severe thrombocytopenia

CAUTIONS

- Cardiovascular disease
- cerebrovascular disease
- epilepsy
- phaeochromocytoma
- procarbazine is a mild monoamineoxidase inhibitor (dietary restriction is rarely considered necessary)

INTERACTIONS → Appendix 1: procarbazine

SIDE-EFFECTS

- Common or very common Loss of appetite
- Frequency not known Alopecia
- bone-marrow suppression
- hypersensitivity rash (discontinue treatment)
- hyperuricaemia
- jaundice
- myelosuppression
- nausea
- oral mucositis
- thromboembolism
- tumour lysis syndrome
- vomiting

CONCEPT AND CONCEPTION

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

PREGNANCY

- Avoid (teratogenic in animal studies and isolated reports in humans). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

BREAST FEEDING

Discontinue breast-feeding.

HEPATIC IMPAIRMENT

Caution in mild to moderate impairment. Avoid in severe impairment.

RENAL IMPAIRMENT

Caution in mild to moderate impairment. Avoid in severe impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 4

- Procarbazine (Non-proprietary)

Procarbazine (as Procarbazine hydrochloride)

50 mg

Procarbazine 50mg capsules | 50 capsule £373.95

Raltitrexed

- DRUG ACTION Raltitrexed is a thymidylate synthase inhibitor.

- INDICATIONS AND DOSE

Palliation of advanced colorectal cancer when fluorouracil and folinic acid cannot be used

- BY INTRAVENOUS INFUSION

- Adult: (consult local protocol)

INTERACTIONS → Appendix 1: raltitrexed

SIDE-EFFECTS

Alopecia
- bone-marrow suppression
- extravasation
- gastro-intestinal effects
- hyperuricaemia
- myelosuppression
- nausea
- oral mucositis
- thromboembolism
- tumour lysis syndrome
- vomiting

CONCEPT AND CONCEPTION

Ensure effective contraception during and for at least 6 months after treatment in men or women.

PREGNANCY

See Pregnancy and reproductive function in Cytotoxic drugs p. 825.
BREAST FEEDING  Discontinue breast-feeding.

HEPATIC IMPAIRMENT  Caution in mild to moderate impairment. Avoid in severe impairment.

RENAL IMPAIRMENT  Reduce dose and increase dosing interval if creatinine clearance less than 65 mL/minute (consult product literature). Avoid if creatinine clearance less than 25 mL/minute.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005) NICE TA93
- Raltitrexed is not recommended for the treatment of advanced colorectal cancer. Its use should be confined to clinical studies.
  
  www.nice.org.uk/TA93

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion
- Tomudex (Hospira UK Ltd)
  - Raltitrexed 2 mg  Tomudex 2mg powder for solution for infusion vials
  | 1 vial (£93)  £148.75

RETINOID AND RELATED DRUGS

Bexarotene

DRUG ACTION  Bexarotene is an agonist at the retinoid X receptor, which is involved in the regulation of cell differentiation and proliferation. Bexarotene can cause regression of cutaneous T-cell lymphoma.

INDICATIONS AND DOSE
Skin manifestations of cutaneous T-cell lymphoma refractory to previous systemic treatment

BY MOUTH
- Adult: Initially 300 mg/m² once daily, adjusted according to response, to be taken with a meal

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 825.

CONTRA-INDICATIONS  History of pancreatitis · hypervitaminosis A · uncontrolled hyperlipidaemia · uncontrolled hypothyroidism

CAUTIONS  Avoid in acute porphyrias p. 969 · hyperlipidaemia · hypothyroidism

INTERACTIONS  ▶ Appendix 1: retinoids

SIDE-EFFECTS  Alopecia · anxiety · arrhythmias · benign intracranial hypertension (children particularly susceptible—consider dose reduction if intractable headache in children) · bone pain · chelitis · chest pain · confusion · depression · dizziness · dry mucous membranes · dry skin · erythema · flushing · gastro-intestinal disturbances · genital ulceration · headache · hearing disturbances · hypercalcemia · insomnia · oedema · pancreatitis · paraesthesia · pruritus · raised lipids · raised liver enzymes · raised serum creatinine · rash · retinoic acid syndrome · shivering · sweating · thromboembolism · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION  Retinoic acid syndrome Fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure requires immediate treatment—consult product literature.

CONCEPTION AND CONTRACEPTION  Effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen—only contraceptives not considered effective).

PREGNANCY  Teratogenic. See Pregnancy and reproductive function in Cytotoxic drugs p. 825.

BREAST FEEDING  Avoid (discontinue breast-feeding).

HEPATIC IMPAIRMENT  Reduce dose to 25 mg/m².

RENAL IMPAIRMENT  Reduce dose to 25 mg/m².

MONITORING REQUIREMENTS  Monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment.

PRESCRIBING AND DISPENSING INFORMATION  Tretinoin is the acid form of vitamin A.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Capsule
- Targretin (Eisai Ltd)
  - Bexarotene 75 mg  Targretin 75mg capsules  | 100 capsule (£93) £937.50

Tretinoin

INDICATIONS AND DOSE
Induction of remission in acute promyelocytic leukaemia (used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it)

BY MOUTH
- Adult: 45 mg/m² daily in 2 divided doses maximum duration of treatment is 90 days, consult product literature for details of concomitant chemotherapy

CAUTIONS  Increased risk of thromboembolism during first month of treatment

INTERACTIONS  ▶ Appendix 1: retinoids

SIDE-EFFECTS  Alopecia · anxiety · arrhythmias · benign intracranial hypertension (children particularly susceptible—consider dose reduction if intractable headache in children) · bone pain · chelitis · chest pain · confusion · depression · dizziness · dry mucous membranes · dry skin · erythema · flushing · gastro-intestinal disturbances · genital ulceration · headache · hearing disturbances · hypercalcemia · insomnia · oedema · pancreatitis · paraesthesia · pruritus · raised lipids · raised liver enzymes · raised serum creatinine · rash · retinoic acid syndrome · shivering · sweating · thromboembolism · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION  Retinoic acid syndrome Fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure requires immediate treatment—consult product literature.

CONCEPTION AND CONTRACEPTION  Effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen—only contraceptives not considered effective).

PREGNANCY  Teratogenic. See Pregnancy and reproductive function in Cytotoxic drugs p. 825.

BREAST FEEDING  Avoid (discontinue breast-feeding).

HEPATIC IMPAIRMENT  Reduce dose to 25 mg/m².

RENAL IMPAIRMENT  Reduce dose to 25 mg/m².

MONITORING REQUIREMENTS  Monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment.

PRESCRIBING AND DISPENSING INFORMATION  Tretinoin is the acid form of vitamin A.

Capsule
- Targretin (Eisai Ltd)
  - Bexarotene 75 mg  Targretin 75mg capsules  | 100 capsule (£93) £937.50

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (November 2002) that bexarotene is recommended for restricted use as a second-line treatment for patients with advanced cutaneous T-cell lymphoma.
2.1 Cytotoxic drug-induced side effects

ANTIDOTES AND CHELATORS > IRON CHELATORS

Dexrazoxane

- **DRUG ACTION**: Dexrazoxane is an iron chelator.

- **INDICATIONS AND DOSE**

  **CARDIOXANE®**: Prevention of chronic cumulative cardiotoxicity caused by doxorubicin or epirubicin treatment in advanced or metastatic breast cancer patients who have received a prior cumulative dose of 300 mg/m² of doxorubicin or a prior cumulative dose of 540 mg/m² of epirubicin when further anthracycline treatment is required.
  - **BY INTRAVENOUS INFUSION**
    - Adult: Administer 10 times the doxorubicin-equivalent dose or 10 times the epirubicin-equivalent dose, dose to be given 30 minutes before anthracyline administration.

  **SAVENE®**: Anthracycline extravasation.
  - **BY INTRAVENOUS INFUSION**
    - Adult: Initially 1 g/m² daily (max. per dose 2 g) for 2 days, then 500 mg/m² for 1 day, first dose to be given as soon as possible and within 6 hours after injury.

- **CONTRA-INDICATIONS**: Children

- **CAUTIONS**: Myelosuppression (effects may be additive to those of chemotherapy).

  **CARDIOXANE®**: Manufacturer advises caution in patients with heart failure—no information available. Manufacturer advises caution in patients with myocardial infarction in previous 12 months—no information available. Manufacturer advises caution in patients with symptomatic valvular heart disease—no information available. Manufacturer advises caution in patients with uncontrolled angina—no information available.

- **SIDE-EFFECTS**

  **CARDIOXANE®**:  
  - Common or very common: Anorexia, asthenia, diarrhoea, dizziness, dry mouth, dyspnoea, erythema, infection, malaise, nausea, oedema, paraesthesia, peripheral neuropathy, stomatitis, syncope, vomiting.
  - Uncommon: Abdominal pain, acute myeloid leukaemia, constipation, cough, dyspepsia, headache, lymphoedema, nail disorder, reduced ejection fraction, tachycardia, thromboembolism when given with cytotoxic drugs.
  - Frequency not known: Alopecia, anaemia, blood disorders, fatigue, injection-site reactions, leucopenia, phlebitis, pruritus, pyrexia, thrombocytopenia.

  **SAVENE®**:  
  - Common or very common: Alopecia, anaemia, anorexia, blood disorders, diarrhoea, dizziness, drowsiness, dry mouth, dyspnoea, erythema, fatigue, injection-site reactions, leucopenia, malaise, nausea, oedema, peripheral neuropathy, peripheral oedema, phlebitis, pruritus, pyrexia, stomatitis, syncope, thrombocytopenia, tremor, vaginal haemorrhage, vomiting.
  - Uncommon: Drowsiness, myalgia, thromboembolism (when given with cytotoxic drugs), weight loss.

- **CONCEPTION AND CONTRACEPTION**: Ensure effective contraception during and for at least 3 months after treatment in men and women.
**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

**DETOXIFYING DRUGS | UROPROTECTIVE DRUGS**

**Mesna**

**INDICATIONS AND DOSE**

Cytotoxic induced urethral toxicity

- **BY MOUTH, OR BY INTRAVENOUS INJECTION**
- **Adult:** Dose to be calculated according to oxazaphosphorine (cyclophosphamide or ifosfamide) treatment (consult product literature)

**SIDE-EFFECTS**

Common or very common

- Colic
- Depression
- Diarrhoea
- Fatigue
- Headache
- Hypotension
- Irritability
- Joint pains
- Limb pains
- Nausea
- Rash
- Tachycardia
- Vomiting

Rare

- Hypersensitivity reactions (more common in patients with auto-immune disorders)

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to thiol-containing compounds.

**PREGNANCY** Not known to be harmful. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**EFFECT ON LABORATORY TESTS** False positive urinary ketones. False positive or false negative urinary erythrocytes.

**DIRECTIONS FOR ADMINISTRATION** For oral administration of the injection, contents of ampoule are taken in a flavoured drink such as orange juice or cola which may be stored in a refrigerator for up to 24 hours in a sealed container.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Solution for injection**

- **Mesna (Non-proprietary)**
  - Mesna 100 mg per 1 ml Mesna 1g/10ml solution for injection ampoules | 15 ampoule Pdm £441.15
  - Mesna 400mg/4ml solution for injection ampoules | 5 ampoule Pdm no price available

- **Tablet**
  - **Mesna (Non-proprietary)**
    - Mesna 400 mg Mesna 400mg tablets | 10 tablet Pdm £134.30
    - Mesna 600 mg Mesna 600mg tablets | 10 tablet Pdm £190.60

**VITAMINS AND TRACE ELEMENTS | FOLATES**

**Folinic acid**

**INDICATIONS AND DOSE**

Prevention of methotrexate-induced adverse effects

- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- **Adult:** 15 mg every 6 hours for 24 hours, to be started usually 12–24 hours after start of methotrexate infusion, dose may be continued by mouth, consult local treatment protocol for further information

Suspected methotrexate overdosage

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- **Adult:** Initial dose equal to or exceeding dose of methotrexate, to be given at a maximum rate of 160 mg/minute, consult poisons information centres for advice on continuing management

**CONTRA-INDICATIONS** Intrathecal injection

**CAUTIONS** Avoid simultaneous administration of methotrexate - not indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B_{12} deficiency

**INTERACTIONS** → Appendix 1: folates

**SIDE-EFFECTS**

- **Rare** Agitation (after high doses) - depression (after high doses) - insomnia (after high doses) - pyrexia (after parenteral use)

- **PREGNANCY** Not known to be harmful; benefit outweighs risk.

- **BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capcitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212

Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capcitabine is not recommended for the treatment of metastatic colorectal cancer.

[www.nice.org.uk/TA212](http://www.nice.org.uk/TA212)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Solution for injection**

- **Folinic acid (Non-proprietary)**
  - Folinic acid (as Calcium folinate) 7.5 mg per 1 ml Calcium folinate 15mg/2ml solution for injection ampoules | 5 ampoule Pdm £39.00
  - DT price = £39.00
  - Folinic acid (as Calcium folinate) 10 mg per 1 ml Calcium folinate 50mg/5ml solution for injection vials | 1 vial Pdm £20.00 (Hospital only) | 1 vial Pdm £37.50 (Hospital only)
  - Folinic acid (as Disodium folinate) 50 mg per 1 ml Disodium folinate 50mg/1ml solution for injection vials | 1 vial Pdm £24.70
  - Disodium folinate 200mg/4ml solution for injection vials | 1 vial Pdm £80.40

- **Refolinon** (Pfizer Ltd)
  - Folinic acid (as Calcium folinate) 3 mg per 1 ml Refolinon 30mg/10ml solution for injection ampoules | 5 ampoule Pdm £23.12
  - **Sodionfolin** (medac UK)
  - Folinic acid (as Disodium folinate) 50 mg per 1 ml Sodionfolin 400mg/8ml solution for injection vials | 1 vial Pdm £126.25 (Hospital only)
  - Sodionfolin 100mg/2ml solution for injection vials | 1 vial Pdm £35.09 (Hospital only)

- **Tablet**
  - **Folinic acid (Non-proprietary)**
    - Folinic acid (as Calcium folinate) 15 mg Folinic acid 15mg tablets | 10 tablet Pdm £49.06 DT price = £49.05
  - **Refolinon** (Pfizer Ltd)
    - Folinic acid (as Calcium folinate) 15 mg Refolinon 15mg tablets | 30 tablet Pdm £85.74
Levofolinic acid

**DRUG ACTION**  Levofolinic acid is an isomer of folinic acid.

**INDICATIONS AND DOSE**

- Prevention of methotrexate-induced adverse effects
  - By intramuscular injection, or by intravenous injection, or by intravenous infusion
  - Adult: Usual dose 7.5 mg every 6 hours for 10 doses, usually started 12–24 hours after beginning of methotrexate infusion

**Suspected methotrexate overdosage**

- By intravenous infusion, or by intravenous injection
  - Adult: Initial dose at least 50% of the dose of methotrexate, intravenous infusion to be administered at a maximum rate of 160 mg/minute, consult poisons information centres for advice on continuing management

**Adjunct to fluorouracil in colorectal cancer**

- By slow intravenous injection
  - Adult: (consult product literature)

**CONTRA-INDICATIONS**  Intrathecal injection

**CAUTIONS**  Avoid simultaneous administration of methotrexate - not indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B12 deficiency

**INTERACTIONS**  → Appendix 1: folates

**SIDE-EFFECTS**

- Rare: Agitation (after high doses) - depression (after high doses) - insomnia (after high doses) - pyrexia (after parenteral use)

**PREGNANCY**  Not known to be harmful; benefit outweighs risk.

**BREAST FEEDING**  Presence in milk unknown but benefit outweighs risk.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**
  - Isovorin (Pfizer Ltd)
    - Levofolinic acid (as Calcium levofolinate) 10 mg per 1 ml Isovorin 175mg/17.5ml solution for injection vials  | 1 vial £1.13
      (Hospital only)
    - Isovorin 25mg/2.5ml solution for injection vials  | 1 vial £11.62
      (Hospital only)

**SIDE-EFFECTS**

- Common or very common: Fever
- Uncommon: Anaphylaxis - bronchospasm - diarrhoea - haemolytic anaemia - headache - hypersensitivity reactions - methaemoglobinemia - nausea - rash - vomiting

**PREGNANCY**  Manufacturer advises avoid — no information available.

**BREAST FEEDING**  Manufacturer advises avoid — no information available.

**MONITORING REQUIREMENTS**  Monitor closely for hypersensitivity.

**EFFECT ON LABORATORY TESTS**  May interfere with test for uric acid—consult product literature.

**DIRECTIONS FOR ADMINISTRATION**  For intravenous infusion (Fasturtec®), give intermittently in Sodium chloride 0.9%; reconstitute with solvent provided; gently swirl vial without shaking to dissolve; dilute requisite dose to 50 mL with infusion fluid and give over 30 minutes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Powder and solvent for solution for infusion**
  - Fasturtec (Sanofi)
    - Rasburicase 1.5 mg  Fasturtec 1.5mg powder and solvent for solution for infusion vials  | 3 vial £20.83 (Hospital only)
      (Hospital only)
    - Rasburicase 7.5 mg  Fasturtec 7.5mg powder and solvent for solution for infusion vials  | 1 vial £347.32 (Hospital only)

3  **Hormone responsive malignancy**

**Breast cancer**  01-Jun-2016

**Description of condition**

Breast cancer is the most common form of malignancy in women. The causes of breast cancer are complex and there are several risk factors. Established risk factors include age, early onset of menstruation, late menopause, greater age at first completed pregnancy, and a family history. The use of oral contraceptives and postmenopausal HRT are also associated with a small excess risk.

Non-invasive breast cancer, also known as ductal carcinoma in situ, is when the cancer remains localised in the ducts. However, in most cases, the cancer is invasive at the time of diagnosis, which means that malignant cells are liable to spread beyond the immediate area of the tumour. Invasive breast cancer, where malignant cells spread beyond the ducts, can be defined as early breast cancer (operable, primary, stage I/II), locally advanced disease (inoperable local, stage III) and advanced disease (metastatic, stage IV).

**Aims of treatment**

Reducing mortality, increasing progression-free and disease-free survival and improving quality of life are the main aims of the available treatments for breast cancer and are dependant on the stage of the disease.

Surgery and radiotherapy aim to remove the tumour mass, while adjuvant drug therapy aims to reduce the risk of recurrence and the risk of developing invasive disease. Advanced breast cancer is not curable and treatment aims to achieve remission, to prolong the disease free survival, to relieve symptoms and improve quality of life.

**Treatment**

The course of the disease and the therapeutic approach vary depending on the characteristics of the cancer; factors such as patient age and menopausal status, tumour size and...
grade, involvement of axillary lymph nodes or skin, and presence of hormone receptors within the tumour may inform the extent and aggressiveness of the disease. The management of patients with breast cancer involves surgery, radiotherapy, drug therapy, or a combination of these.

**Early and locally advanced breast cancer**

For operable breast cancer, primary treatment is surgical using breast-conserving surgery or mastectomy, followed by adjuvant therapy to eradicate the micro-metastases that cause relapses. Radiotherapy is recommended after breast conserving surgery, as it reduces local recurrence rates. It is also used after mastectomy if there is a high risk of recurrence.

Drug therapy can be used after surgery (adjuvant therapy) or may be offered before surgery (neoadjuvant therapy) to achieve local tumour downsizing in order to make breast-conserving surgery possible. The choice of adjuvant therapy is determined by the safety and efficacy of the drugs, the oestrogen-receptor status, and the human epidermal growth factor 2 (HER2) status of the primary tumour.

Adjuvant chemotherapy or radiotherapy should be considered for all patients, irrespective of age, and it should be started as soon as clinically possible within 31 days of surgery.

A high-dose anthracycline-based chemotherapy regimen is usually preferred to a low-dose anthracycline-based regimen or to a non-anthracycline-based regimen. Choice of chemotherapy regimen is usually guided by local policy, Clinical Cancer Networks, and funding arrangements.

Adjuvant anthracycline-taxane combination chemotherapy should be considered in patients where the additional benefit outweighs risk. For patients with lymph node-positive breast cancer, docetaxel p. 854 can be added as part of an adjuvant chemotherapy regimen; paclitaxel p. 855 is not recommended.

Following surgery, tamoxifen p. 879, alone or in combination with chemotherapy, can be given to premenopausal women with oestrogen-receptor-positive early invasive breast cancer. If chemotherapy has not been selected, tamoxifen can be used in combination with ovarian ablation or suppression. Tamoxifen is not recommended for non-invasive (ductal carcinoma in situ) early breast cancer.

Premenopausal women with oestrogen-receptor-positive breast cancer who decline chemotherapy may benefit from treatment with goserelin p. 695 or ovarian ablation.

For postmenopausal women with oestrogen-receptor-positive early invasive breast cancer, not considered to be low risk, an aromatase inhibitor, such as anastrozole p. 880 or letrozole p. 881, is first-line therapy. Tamoxifen is an alternative if an aromatase inhibitor is not tolerated or is contra-indicated. An aromatase inhibitor should be given as initial adjuvant therapy for 5 years, or by switching to an aromatase inhibitor after 2–3 years of tamoxifen for a total of 5 years. Postmenopausal women who have already received tamoxifen for 5 years may be considered for extended therapy (5 years) with letrozole.

Adjuvant trastuzumab p. 823 is recommended as an option in patients with HER2 positive breast cancer following surgery, chemotherapy (neoadjuvant or adjuvant) and radiotherapy. Trastuzumab should not be given concurrently with anthracycline-containing regimens (because of the risk of congestive heart failure) but it may be given either concurrently with taxane-based regimens or sequentially.

**Advanced breast cancer**

Treatment of advanced breast cancer depends on the patient’s drug history, disease severity, and oestrogen receptor and HER2 status.

For the majority of patients with oestrogen-receptor-positive advanced breast cancer, endocrine therapy is first-line treatment. Aromatase inhibitors, such as anastrozole, letrozole and exemestane p. 880, may be offered to patients with no previous history of endocrine treatment or in those previously treated with tamoxifen.

Tamoxifen should be considered as first-line treatment for pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen. Ovarian suppression is used in pre- and perimenopausal women who have had disease progression despite treatment with tamoxifen.

In patients with advanced breast cancer that is imminently life-threatening or with visceral organ involvement, which requires early relief of symptoms, an anthracycline-based chemotherapy regimen is the preferred treatment. If anthracyclines are not suitable, the alternative is docetaxel monotherapy as first-line treatment, vinorelbine p. 860 or capecitabine p. 839 as second-line treatment or, for third-line treatment, whichever of the two drugs was not used second line. Gemcitabine p. 843 in combination with paclitaxel is recommended for the treatment of metastatic breast cancer only when docetaxel monotherapy or docetaxel with capecitabine are also considered appropriate.

Trastuzumab is recommended for the treatment of HER2-positive advanced breast cancer. It is used in combination with paclitaxel in those who have not received chemotherapy for metastatic breast cancer and as monotherapy for patients who have received at least two chemotherapy regimens for metastatic breast cancer (see trastuzumab National funding/access decisions).

Lapatinib p. 905 in combination with an aromatase inhibitor, fulvestrant p. 878, trastuzumab emtansine p. 824, and toremifene p. 879 are all licensed for use in patients with metastatic breast cancer, however their use is not recommended (see drug monographs for Indications and National funding/access decisions).

The gonadorelin analogue, goserelin is licensed for advanced breast cancer in pre- and perimenopausal women suitable for hormone manipulation. Some progesterone preparations, such as medroxyprogesterone acetate p. 763, norethisterone p. 720, megestrol acetate p. 878 are also licensed for the treatment of breast cancer (see drug monographs).

The use of bisphosphonates in patients with metastatic breast cancer may reduce pain and prevent skeletal complications of bone metastases.

**Familial breast cancer**

Chemoprevention should be offered to all women who have been identified as high-risk of developing breast cancer. For women at moderate-risk, chemoprevention should only be considered. Other strategies should also be considered to reduce the risk.

Chemoprevention should not be given to patients at high-risk of developing breast cancer who have had a risk-reducing bilateral mastectomy.

**Treatment options for chemoprevention**

Chemoprevention should only be continued for 5 years.

Tamoxifen p. 879 [unlicensed indication] is recommended for premenopausal women who do not have a history or increased risk of thromboembolic disease or endometrial cancer.

In post-menopausal women (who do not have severe osteoarthritis), anastrozole p. 880 [unlicensed indication] is recommended. Women who have severe osteoarthritis, or who do not wish to take anastrozole, can be treated with tamoxifen provided there is no history or risk of thromboembolic disease or endometrial cancer. Alternatively, raloxifene hydrochloride p. 709 is an option [unlicensed indication] in post-menopausal women with a uterus who do not wish to take tamoxifen, unless there is a history or increased risk of thromboembolic disease.

**Breast cancer in men**

Breast cancer in men is rare. Although, not fully understood, risk factors may be associated with sex hormone metabolism,
Prostate Cancer

31-May-2016

Description of condition
Prostate cancer is the most common form of cancer affecting men. The main risk factors are age (most cases being diagnosed in men over 65 years of age), ethnicity (more common in black African–Caribbean men), and a familial component. Prostate cancer is usually slow-growing and asymptomatic at diagnosis, however, the presenting symptoms of advanced disease are usually urinary outflow obstruction, or, pelvic or back pain due to bone metastases. Treatment decisions are guided by baseline prostate specific antigen (PSA) levels, tumour grade (Gleason score), the stage of the tumour, the patient’s life expectancy (based on age and comorbid conditions), treatment morbidity, and patient preference.

Aims of treatment
In early or locally advanced prostate cancer, radical treatment aims to eliminate the malignancy. In metastatic disease, drug therapy is aimed at prolonging survival and reducing symptoms.

Drug treatment
Treatment options for patients with prostate cancer include active monitoring, radical prostatectomy, external beam radiotherapy, and brachytherapy. Hormone therapy (androgen deprivation or anti-androgens) is the primary treatment for metastatic prostate cancer, but is also increasingly being used for patients with locally advanced, non-metastatic disease.

In patients with localised prostate cancer, the choice of treatment is guided by whether the disease is considered low, intermediate, or high risk according to the Gleason score, the serum PSA level, and the tumour stage.

Localised or locally advanced prostate cancer

In patients with low-risk localised prostate cancer, and those at intermediate risk who decline radical treatments (prostatectomy or radiotherapy), active monitoring is a suitable option. This involves close monitoring to avoid unnecessary treatment until disease progression occurs (or until the patient requests treatment).

In patients with intermediate-risk or high-risk localised prostate cancer (when there is a realistic prospect of long-term disease control) and in those with locally advanced disease, radical prostatectomy or radical radiotherapy should be offered. Other treatment options include a combination of radical radiotherapy and androgen deprivation therapy, consisting of 6 months of androgen deprivation therapy before, during or after radiotherapy. Pelvic radiotherapy should be considered in those with locally advanced prostate cancer who have a higher than 15% risk of pelvic lymph node involvement and are to receive neoadjuvant hormonal therapy.

Androgen deprivation therapy involves the use of a luteinising hormone-releasing hormone (LHRH) agonist (buserelin p. 694, goserelin p. 695, leuprorelin acetate p. 696, or triptorelin p. 698), or bilateral orchidectomy, which removes the supply of endogenous hormone. Androgen deprivation therapy may be continued for up to 3 years in patients with high-risk localised prostate cancer.

Patients should be informed about the side-effects of treatment, particularly urinary and sexual dysfunction, loss of fertility, radiation-induced enteropathy, and hot flushes. Although there is limited evidence, intermittent therapy may be considered for patients who are having long-term androgen deprivation therapy, to reduce drug toxicity. Tumour flare, due to an initial surge in testosterone concentrations, has been reported in the initial stages of treatment with androgen deprivation therapy and prophylactic anti-androgen therapy (such as cyproterone acetate p. 725) may be added.

Medroxyprogesterone acetate p. 763 [unlicensed indication] can be used, initially for up to 10 weeks, to manage troublesome hot flushes caused by long-term androgen suppression; cyproterone acetate is an alternative if medroxyprogesterone acetate is not effective or not tolerated.

Patients who experience a reduction in libido and loss of sexual function should have access to specialist erectile dysfunction services and be considered for treatment with a phosphodiesterase type 5 inhibitor.

Osteoporosis and fatigue may also be a problem with androgen deprivation therapy. A biphosphonate can be offered to men who have osteoporosis; denosumab p. 691 is an alternative if biphosphonates are not appropriate. Gynaecomastia can occur with long-term (longer than 6 months) bicalutamide p. 874 treatment. Prophylactic radiotherapy (within the first month of treatment), or weekly tamoxifen p. 879 [unlicensed indication], if radiotherapy is unsuccessful, can be considered.

Metastatic prostate cancer

Bilateral orchidectomy should be offered to all patients with metastatic prostate cancer as an alternative to continuous LHRH agonist treatment. Anti-androgen monotherapy with bicalutamide [unlicensed indication] can be offered to those who are willing to accept the adverse impact on overall survival and gynaecomastia in the hope of retaining sexual function. However, if satisfactory sexual function is not maintained, stop bicalutamide and start androgen deprivation therapy.

Abiraterone acetate p. 873 (in combination with prednisone p. 641 or prednisolone p. 639) and enzalutamide p. 874 are both recommended as options for the treatment of castration-resistant metastatic prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel-containing p. 854 chemotherapy regimen.

In patients who develop hormone-relapsed metastatic tumour, chemotherapy with docetaxel can be used. It is recommended to stop the treatment with docetaxel after 10 cycles, or if severe adverse events occurred, or if there is evidence of disease progression.

Abiraterone acetate (in combination with prednisone or prednisolone) is also recommended as an option for treating...
metastatic hormone-relapsed prostate cancer in patients who have no or mild symptoms after androgen deprivation therapy has failed, and before chemotherapy is indicated.

In patients with hormone-relapsed prostate cancer, a corticosteroid, such as dexamethasone p. 635, can be offered as third line therapy, after androgen deprivation therapy and anti-androgen therapy. (A)

ANTINEOPLASTIC DRUGS › ANTI-ANDROGENS

Abiraterone acetate
31-May-2016

- INDICATIONS AND DOSE
Metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel-containing chemotherapy regimen (in combination with prednisone or prednisolone) | Metastatic castration-resistant prostate cancer in patients who are asymptomatic or mildly symptomatic after failure of androgen deprivation therapy in whom chemotherapy is not yet clinically indicated (in combination with prednisone or prednisolone)
- BY MOUTH
- Adult: 1 g once daily, for dose of concurrent prednisone or prednisolone—consult product literature

- CAUTIONS
Diabetes (increased risk of hyperglycaemia—monitor blood sugar frequently) | history of cardiovascular disease

CAUTIONS, FURTHER INFORMATION
- Cardiovascular disease | Correct hypertension and hypokalaemia before treatment (if significant risk of congestive heart failure, such as history of cardiac failure, uncontrolled hypertension or cardiac events, consult product literature for management and increased monitoring).

- INTERACTIONS ➔ Appendix 1: abiraterone
- SIDE-EFFECTS
- Common or very common
  - Angina | arrhythmia | atrial fibrillation | diarrhoea | dyspepsia | fractures | haematuria | heart failure | hepatotoxicity | hypertension | hypertriglyceridaemia | hypokalaemia | peripheral oedema | rash | sepsis | tachycardia | urinary tract infection
- Uncommon
  - Adrenal insufficiency | myopathy | rhabdomyolysis
- Rare
  - Allergic alveolitis

- CONCEPTION AND CONTRACEPTION
  - Men should use condoms if their partner is pregnant, and use condoms in combination with another effective contraceptive method if their partner is of child-bearing potential—toxicity in animal studies.

- HEPATIC IMPAIRMENT
  - Use with caution in moderate impairment and only if benefit clearly outweighs risk.
  - Avoid in severe impairment.

- RENAL IMPAIRMENT
  - Use with caution in severe impairment—no information available.

- MONITORING REQUIREMENTS
  - Monitor blood pressure, serum potassium concentration, and fluid balance before treatment, and at least monthly during treatment—consult product literature for management of hypertension, hypokalaemia and oedema.
  - Monitor liver function before treatment, then every 2 weeks for the first 3 months of treatment, then monthly thereafter—interrupt treatment if serum alanine aminotransferase or aspartate aminotransferase greater than 5 times the upper limit (consult product literature for details of restarting treatment at a lower dose) and discontinue permanently if 20 times the upper limit.

NICE technology appraisals (TAs)
- Abiraterone for castration-resistant metastatic prostate cancer previously treated with a docetaxel-containing regimen (June 2012) NICE TA259
  - Abiraterone in combination with prednisone or prednisolone is recommended as an option for the treatment of castration-resistant metastatic prostate cancer only if:
    - their disease has progressed on or after one docetaxel-containing chemotherapy regimen, and
    - the manufacturer provides abiraterone with the discount agreed in the patient access scheme.

  - Patients currently receiving abiraterone in combination with prednisone or prednisolone whose disease does not meet the first criteria should be able to continue therapy until they and their clinician consider it appropriate to stop.
  - www.nice.org.uk/TA259

- Abiraterone for treating metastatic hormone-relapsed prostate cancer before chemotherapy is indicated (April 2016) NICE TA387
  - Abiraterone, in combination with prednisone or prednisolone, is recommended as an option for treating metastatic hormone-relapsed prostate cancer in patients who have mild or no symptoms after androgen deprivation therapy has failed, and before chemotherapy is indicated. In addition, the manufacturer is required to rebate the cost of abiraterone from the 11th month until the end of treatment for patients who remain on treatment for more than 10 months.
  - www.nice.org.uk/TA387

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (July 2012) that abiraterone (Zytiga®), in combination with prednisone or prednisolone, is accepted for restricted use within NHS Scotland for the treatment of metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with docetaxel-containing chemotherapy regimen, and have received only one prior chemotherapy regimen.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Tablet
CAUTIONARY AND ADVISORY LABELS 23
- Zytiga (Janssen-Cilag Ltd)
  - Abiraterone acetate 250 mg Zytiga 250mg tablets | 120 tablet pack £2,930.00
  - Abiraterone acetate 500 mg Zytiga 500mg tablets | 56 tablet pack £2,735.00
Immune system and malignant disease

### Bicalutamide

**INDICATIONS AND DOSE**

Locally advanced prostate cancer at high risk of disease progression either alone or as adjuvant treatment to prostatectomy or radiotherapy | Locally advanced, non-metastatic prostate cancer when surgical castration or other medical intervention inappropriate

- **BY MOUTH**
- Adult: 150 mg once daily

Advanced prostate cancer, in combination with gonadorelin analogue or surgical castration

- **BY MOUTH**
- Adult: 50 mg once daily, to be started at the same time as surgical castration or at least 3 days before gonadorelin therapy

Prostate cancer (metastatic) with the aim of retaining sexual function.

- **BY MOUTH**
- Adult: 150 mg once daily

**UNLICENSED USE**

Not licensed for use in prostate cancer (metastatic), with the aim of retaining sexual function. 

**CAUTIONS**

Risk of photosensitivity—avoid excessive exposure to UV light and sunlight

**INTERACTIONS** → Appendix 1: bicalutamide

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain · alopecia · anaemia · asthenia · breast tenderness · chest pain · cholestasis · constipation · decreased appetite · decreased libido · depression · dizziness · dry skin · dyspepsia · flatulence · gynaecomastia · haematuria · hepatotoxicity · hirsutism · hot flushes · impotence · jaundice · nausea · oedema · pruritus · rash · somnolence · weight gain

- **Uncommon** Angioedema · hypersensitivity reactions · interstitial lung disease · urticaria

- **Rare** Hepatic failure · photosensitivity reactions

- **HEPATIC IMPAIRMENT** Increased accumulation possible in moderate to severe impairment—manufacturer advises caution.

- **MONITORING REQUIREMENTS** Consider periodic liver function tests.

- **PATIENT AND CARER ADVICE**

Risk of photosensitivity. Patients should be advised to consider the use of sunscreen.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- **Bicalutamide (Non-proprietary)**
  - Bicalutamide 50 mg (Bicalutamide 50mg tablets | 28 tablet | POM)
    - £128.00 DT price = £1.79
  - Bicalutamide 150 mg (Bicalutamide 150mg tablets | 28 tablet | POM)
    - £240.00 DT price = £4.48
  - Casodex (AstraZeneca UK Ltd)
    - Bicalutamide 50 mg (Casodex 50mg tablets | 28 tablet | POM)
      - £115.79 DT price = £1.79
    - Bicalutamide 150 mg (Casodex 150mg tablets | 28 tablet | POM)
      - £240.00 DT price = £4.48

---

### Enzalutamide

**INDICATIONS AND DOSE**

Metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after docetaxel therapy

- **BY MOUTH**
- Adult: 160 mg once daily, for dose adjustments due to side-effects, consult product literature

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises if concurrent use of potent inhibitors of CYP2C8 is unavoidable, reduce dose to 80 mg daily.

**CAUTIONS**

- Alcoholism · bradycardia · brain injury · brain metastases · brain tumours · history of QT-interval prolongation · history or risk of seizure · recent cardiovascular disease · risk factors for QT-interval prolongation · stroke · uncontrolled hypertension

**INTERACTIONS** → Appendix 1: enzalutamide

**SIDE-EFFECTS**

- **Common or very common** Anxiety · cognitive disorder · dry skin · falls · fractures · headache · hot flush · hypertension · memory impairment · neutropenia · pruritus · visual hallucinations

- **Uncommon** Leucopenia · seizure

- **CONCEPTION AND CONTRACEPTION**

Men should use condoms during treatment and for 3 months after stopping treatment if their partner is pregnant, and use condoms in combination with another effective contraceptive method if their partner is of child-bearing potential—toxicity in animal studies.

- **HEPATIC IMPAIRMENT**

Manufacturer advises caution in moderate impairment. Avoid in severe impairment.

- **RENAL IMPAIRMENT**

Caution in severe impairment—no information available.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- Enzalutamide for treating metastatic hormone-relapsed prostate cancer before chemotherapy is indicated (January 2016) NICE TA377

Enzalutamide is recommended as an option for treating metastatic hormone-relapsed prostate cancer in patients who have mild or no symptoms after androgen deprivation therapy has failed, and before chemotherapy is indicated, and only if the manufacturer provides enzalutamide with the discount agreed in the patient access scheme.

[wwww.nice.org.uk/TA377](www.nice.org.uk/TA377)

- Enzalutamide for metastatic hormone relapsed prostate cancer previously treated with a docetaxel containing regimen (July 2014) NICE TA316

Enzalutamide is recommended, within its marketing authorisation, as an option for treating metastatic hormone-relapsed prostate cancer in adults only if, their disease has progressed during or after docetaxel-containing chemotherapy, and the manufacturer provides enzalutamide with the discount agreed in the patient access scheme. This guidance does not cover the use of enzalutamide for metastatic hormone-relapsed prostate cancer previously treated with abiraterone.

[wwww.nice.org.uk/TA316](www.nice.org.uk/TA316)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **Xtandi** (Astellas Pharma Ltd)
  - Enzalutamide 40 mg (Xtandi 40mg capsules | 112 capsule | POM)
    - £2,734.67
**Flutamide**

- **INDICATIONS AND DOSE**
  - Advanced prostate cancer | Metastatic prostate cancer refractory to gonadorelin analogue therapy (monotherapy)
    - **BY MOUTH**
      - Adult: 250 mg 3 times a day

- **CAUTIONS**
  - Avoid excessive alcohol consumption - avoid in acute porphyrias p. 969 - cardiac disease (oedema reported)
  - **SIDE-EFFECTS**
  - **HEPATIC IMPAIRMENT**
    - Use with caution (hepatoxic).
  - **MONITORING REQUIREMENTS**
    - Liver function tests, monthly for first 4 months, periodically thereafter and at the first sign or symptom of liver disorder (e.g. pruritus, dark urine, persistent anorexia, jaundice, abdominal pain, unexplained influenza-like symptoms).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - **Flutamide (Non-proprietary)**
      - Flutamide 250 mg tablets | £0.106.24 DT price = £106.24

**OESTROGENS**

**Diethylstilbestrol**

- **(Stilboestrol)**

- **INDICATIONS AND DOSE**
  - Breast cancer in postmenopausal women
    - **BY MOUTH**
      - Adult: 10–20 mg daily
  - Prostate cancer
    - **BY MOUTH**
      - Adult: 1–3 mg daily

- **CAUTIONS**
  - Cardiovascular disease
  - **SIDE-EFFECTS**
  - **PREGNANCY**
    - In first trimester, high doses associated with vaginal carcinoma, urogenital abnormalities, and reduced fertility in female offspring. Increased risk of hypospadias in male offspring.
  - **HEPATIC IMPAIRMENT**
    - Avoid. Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

**Flutamide**

- **MEDICATION FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - **Diethylstilbestrol (Non-proprietary)**
      - Diethylstilbestrol 1 mg tablets | 28 tablet [Pom] £123.00 DT price = £120.34
      - Diethylstilbestrol 5 mg tablets | 28 tablet [Pom] £185.00–£208.00 DT price = £208.00

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > ANTI-GONADOTROPHIN-RELEASING HORMONES**

**Degarelix**

- **INDICATIONS AND DOSE**
  - Advanced hormone-dependent prostate cancer
    - **BY SUBCUTANEOUS INJECTION**
      - Adult: Initially 240 mg, to be administered as 2 injections of 120 mg, then 80 mg every 28 days, dose to be administered into the abdominal region

- **CAUTIONS**
  - Diabetes - susceptibility to QT-interval prolongation
  - **SIDE-EFFECTS**
    - Common or very common: Asthenia - dizziness - drowsiness - headache - hot flushes - influenza-like symptoms - injection-site reactions - insomnia - nausea - night sweats - sweating - weight gain
  - **HEPATIC IMPAIRMENT**
    - Manufacturer advises caution in severe impairment — no information available.
  - **RENAL IMPAIRMENT**
    - Manufacturer advises caution in severe impairment — no information available.
  - **MONITORING REQUIREMENTS**
    - Monitor bone density.
  - **NATIONAL FUNDING/ACCESS DECISIONS**
    - NICE technology appraisals (TAs)
      - Degarelix for treating advanced hormone-dependent prostate cancer (August 2016) NICE TA404
      - Degarelix is recommended as an option for treating advanced hormone-dependent prostate cancer in patients with spinal metastases, only if at least the same discounted drug cost which was available to the NHS in June 2016 is achieved by the commissioner.
      - Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.
      - [www.nice.org.uk/guidance/TA404](http://www.nice.org.uk/guidance/TA404)

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder and solvent for solution for injection**
    - **Firmagon (Ferring Pharmaceuticals Ltd)**
      - Degarelix (as Degarelix acetate) 80 mg | Firmagon 80mg powder and solvent for solution for injection vials | 1 vial [Pom] £129.37
      - Degarelix (as Degarelix acetate) 120 mg | Firmagon 120mg powder and solvent for solution for injection vials | 2 vial [Pom] £260.00

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES  > SOMATOSTATIN ANALOGUES

Somatostatin analogues, malignant disease

Overview
Lanreotide below, octreotide p. 877 and pasireotide p. 878 are analogues of the hypothalamic release-inhibiting hormone somatostatin. Lanreotide and octreotide are indicated for the relief of symptoms associated with neuroendocrine (particularly carcinoid) tumours and acromegaly. Additionally, lanreotide is licensed for the treatment of thyroid tumours and octreotide is also licensed for the prevention of complications following pancreatic treatment of thyroid tumours and octreotide is also licensed for acromegaly. Additionally, lanreotide is licensed for the treatment of unresectable locally advanced or metastatic gastroenteropancreatic neuroendocrine tumours of midgut, pancreatic or unknown origin where hindgut sites of origin have been excluded. Octreotide long-acting depot injection is licensed for treatment of advanced neuroendocrine tumours of the midgut, or treatment where primary origin is not known but non-midgut sites of origin have been excluded. Octreotide long-acting depot injection may be valuable in reducing vomiting in palliative care and in stopping variceal bleeding [unlicensed indication]—see also vasopressin p. 630 and terlipressin acetate p. 87. Pasireotide is licensed for the treatment of Cushing’s disease when surgery has failed or is inappropriate.

Somatostatin analogues

● CAUTIONS Diabetes mellitus (antidiabetic requirements may be reduced) • insulinoma (increased depth and duration of hypoglycaemia may occur) • observe patients and monitor blood glucose levels when initiating treatment and changing doses) • may cause growth hormone-secreting pituitary tumour expansion during treatment (causing serious complications)

● SIDE-EFFECTS
  ▶ Rare Pancreatitis (shortly after administration)
  ▶ Frequency not known Abdominal pain • anorexia • bloating • diarrhoea • flatulence • gallstones (after long-term treatment) • gastro-intestinal disturbances • hyperglycaemia (with chronic administration) • hypoglycaemia • impaired postprandial glucose tolerance (with chronic administration) • irritation at the injection site • nausea • pain at the injection site • steatorrhoea • vomiting

● MONITORING REQUIREMENTS
  ▶ Monitor for signs of tumour expansion (e.g. visual field defects).
  ▶ Ultrasound examination of the gallbladder is recommended before treatment and at intervals of 6–12 months during treatment.

● DIRECTIONS FOR ADMINISTRATION Injection sites should be rotated.

Lanreotide

● INDICATIONS AND DOSE

SOMATULINE AUTOGEL ®

Acromegaly (if somatostatin analogue not given previously)
▶ BY DEEP SUBCUTANEOUS INJECTION
  ▶ Adult: Initially 60 mg every 28 days, adjusted according to response, (consult product literature), for patients treated previously with somatostatin analogue, consult product literature for initial dose, dose to be given in the gluteal region

Neuroendocrine (particularly carcinoid) tumours
▶ BY DEEP SUBCUTANEOUS INJECTION
  ▶ Adult: Initially 60–120 mg every 28 days, adjusted according to response, dose to be given in the gluteal region

Unresectable locally advanced or metastatic gastroenteropancreatic neuroendocrine tumours of midgut, pancreatic or unknown origin where hindgut sites of origin have been excluded
▶ BY DEEP SUBCUTANEOUS INJECTION
  ▶ Adult: 120 mg every 28 days

SOMATULINE LA ®

Acromegaly and neuroendocrine (particularly carcinoid) tumours
▶ BY INTRAMUSCULAR INJECTION
  ▶ Adult: Initially 30 mg every 14 days, increased to 30 mg every 7–10 days, adjusted according to response

Thyroid tumours
▶ BY INTRAMUSCULAR INJECTION
  ▶ Adult: Initially 30 mg every 14 days, increased to 30 mg every 10 days, adjusted according to response

● CAUTIONS Cardiac disorders (including bradycardia) • patients with carcinoid tumours—exclude the presence of an obstructive intestinal tumour before treatment

● INTERACTIONS  ▶ Appendix 1: lanreotide

● SIDE-EFFECTS
  ▶ Common or very common Alopecia • biliary dilatation • bradycardia • constipation • dizziness • dyspepsia • headache • lethargy • malaise • musculoskeletal pain • myalgia • raised bilirubin
  ▶ Uncommon Hot flushes • insomnia
  ▶ Rare Hypothyroidism

● PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.

● BREAST FEEDING Manufacturer advises caution—no information available.

● MONITORING REQUIREMENTS Monitor for hypothyroidism when clinically indicated.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
▶ Somatuline Autogel (Ipsen Ltd)
  Lanreotide (as Lanreotide acetate) 120 mg per 1 ml
  Somatuline Autogel 60mg/0.5ml solution for injection pre-filled syringes with safety system  ▶ £551.00
  Lanreotide (as Lanreotide acetate) 180 mg per 1 ml
  Somatuline Autogel 90mg/0.5ml solution for injection pre-filled syringes with safety system  ▶ £736.00
  Lanreotide (as Lanreotide acetate) 240 mg per 1 ml
  Somatuline Autogel 120mg/0.5ml solution for injection pre-filled syringes with safety system  ▶ £937.00
  Powder and solvent for suspension for injection
▶ Somatuline LA (Ipsen Ltd)
  Lanreotide (as Lanreotide acetate) 30 mg Somatuline LA 30mg powder and solvent for suspension for injection vials  ▶ £323.00
Octreotide

**INDICATIONS AND DOSE**

Symptoms associated with carcinoid tumours with features of carcinoid syndrome, VIPomas, glucagonomas

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 50 micrograms 1–2 times a day, adjusted according to response; increased to 200 micrograms 3 times a day, higher doses may be required exceptionally; maintenance doses are variable; in carcinoid tumours, discontinue after 1 week if no effect, if rapid response required, initial dose may be given by intravenous injection (with ECG monitoring and after dilation)

Acromegaly, short-term treatment before pituitary surgery or long-term treatment in those inadequately controlled by other treatment or until radiotherapy becomes fully effective

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 100–200 micrograms 3 times a day, discontinue if no improvement within 3 months

Prevention of complications following pancreatic surgery

- **BY SUBCUTANEOUS INJECTION**
  - Adult: (consult product literature)

Test dose before use of depot preparation

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Test dose 50–100 micrograms for 1 dose, test dose should be given if subcutaneous octreotide not previously given

Acromegaly / Neuroendocrine (particularly carcinoid) tumour adequately controlled by subcutaneous octreotide

- **BY DEEP INTRAMUSCULAR INJECTION USING DEPOT INJECTION**
  - Adult: Initially 20 microg every 4 weeks for 3 months then adjusted according to response, increased if necessary up to 30 mg every 4 weeks, to be administered into the gluteal muscle, for acromegaly, start depot 1 day after the last dose of subcutaneous octreotide, for neuroendocrine tumours, continue subcutaneous octreotide for 2 weeks after first dose of depot octreotide

Advanced neuroendocrine tumours of the midgut, or tumours of unknown primary origin where non-midgut sites of origin have been excluded

- **BY DEEP INTRAMUSCULAR INJECTION USING DEPOT INJECTION**
  - Adult: 30 mg every 4 weeks

Reduce intestinal secretions in palliative care | Reduce vomiting due to bowel obstruction in palliative care

- **BY CONTINUOUS SUBCUTANEOUS INFUSION**
  - Adult: 0.25–0.5 mg/24 hours (max. per dose 0.75 mg/24 hours), occasionally doses higher than the maximum are sometimes required

**INTERACTIONS**

- Appendix 1: octreotide

**SIDE-EFFECTS**

- Alopecia  |  arrhythmias  |  biliary colic (associated with abrupt withdrawal of subcutaneous octreotide)  |  bradycardia  |  dehydration  |  dizziness  |  dyspnoea  |  headache  |  hepatitis  |  pancreatitis (associated with abrupt withdrawal of subcutaneous octreotide)  |  rash

**SIDE-EFFECTS, FURTHER INFORMATION**

- Gastro-intestinal side-effects  |  Administering non-depot injections of octreotide between meals and at bedtime may reduce gastro-intestinal side-effects.

**CONCEPTION AND CONTRACEPTION**

Effective contraception required during treatment.

**PREGNANCY**

Possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Adjustment of maintenance dose of non-depot preparations may be necessary in patients with liver cirrhosis.

**MONITORING REQUIREMENTS**

- Monitor thyroid function on long-term therapy.
- Monitor liver function.
- With intravenous use  |  ECG monitoring required with intravenous administration.

**TREATMENT CESSATION**

Avoid abrupt withdrawal of short-acting subcutaneous octreotide (associated with biliary colic and pancreatitis).

**DIRECTIONS FOR ADMINISTRATION**

For intravenous injection or intravenous infusion, dilute with Sodium Chloride 0.9% to a concentration of 10–50%.

**PRESCRIBING AND DISPensing INFORMATION**

Palliative care

For further information on the use of octreotide in palliative care, see www.palliativecare.org.uk/oc/centre-strategy.html.

**MEdICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Octreotide (Non-proprietary)**
  - Octreotide (as Octreotide acetate) 50 microgram per 1 ml
    - Octreotide 50 micrograms/1ml solution for injection pre-filled syringes  |  5 pre-filled disposable injection (PDP)  |  £18.35 DT price = £18.85
    - Octreotide 50 micrograms/1ml solution for injection ampoules  |  5 ampoule (PMP)  |  £14.85–£18.60
    - Octreotide 50 micrograms/1ml solution for injection vials  |  5 vial (PVP)  |  £14.97–£19.00 DT price = £18.00
  - Octreotide (as Octreotide acetate) 100 microgram per 1 ml
    - Octreotide 100 micrograms/1ml solution for injection ampoules  |  5 ampoule (PMP)  |  £32.65 DT price = £37.97
    - Octreotide 100 micrograms/1ml solution for injection pre-filled syringes  |  5 pre-filled disposable injection (PDP)  |  £28.90–£32.90
    - Octreotide 100 micrograms/1ml solution for injection vials  |  5 vial (PVP)  |  £37.97–£43.60
  - Octreotide (as Octreotide acetate) 200 microgram per 1 ml
    - Octreotide 1 mg/5 ml solution for injection vials  |  1 vial (PMP)  |  £65.00–£69.66
  - Octreotide (as Octreotide acetate) 500 microgram per 1 ml
    - Octreotide 500 micrograms/1ml solution for injection vials  |  5 vial (PVP)  |  £135.47–£158.25
    - Octreotide 500 micrograms/1ml solution for injection ampoules  |  5 ampoule (PMP)  |  £169.35 DT price = £175.47
    - Octreotide 500 micrograms/1ml solution for injection pre-filled syringes  |  5 pre-filled disposable injection (PDP)  |  £139.43–£169.00
  - Sandostatin (Novartis Pharmaceuticals UK Ltd)
    - Octreotide (as Octreotide acetate) 50 microgram per 1 ml
      - Sandostatin 50 micrograms/1ml solution for injection ampoules  |  5 ampoule (PMP)  |  £14.87
    - Octreotide (as Octreotide acetate) 100 microgram per 1 ml
      - Sandostatin 100 micrograms/1ml solution for injection ampoules  |  5 ampoule (PMP)  |  £27.97 DT price = £27.97
    - Octreotide (as Octreotide acetate) 200 microgram per 1 ml
      - Sandostatin 1 mg/5 ml solution for injection vials  |  1 vial (PMP)  |  £55.73
  - Octreotide (as Octreotide acetate) 500 microgram per 1 ml
    - Sandostatin 500 micrograms/1ml solution for injection ampoules  |  1 ampoule (PMP)  |  £135.47
  - Powder and solvent for suspension for injection
    - **Sandostatin LAR** (Novartis Pharmaceuticals UK Ltd)
      - Octreotide (as Octreotide acetate) 10 mg
        - Sandostatin LAR 10mg powder and solvent for suspension for injection vials  |  1 vial (PDP)  |  £549.71
      - Octreotide (as Octreotide acetate) 20 mg
        - Sandostatin LAR 20mg powder and solvent for suspension for injection vials  |  1 vial (PDP)  |  £799.33
      - Octreotide (as Octreotide acetate) 30 mg
        - Sandostatin LAR 30mg powder and solvent for suspension for injection vials  |  1 vial (PDP)  |  £998.41
## Hormone responsive breast cancer

### Fulvestrant

**INDICATIONS AND DOSE**

Treatment of oestrogen-receptor-positive metastatic or locally advanced breast cancer in postmenopausal women in whom disease progresses or relapses while on, or after, other anti-oestrogen therapy

- **BY DEEP INTRAMUSCULAR INJECTION**
- **Adult:** 500 mg every 2 weeks for the first 3 doses, then 500 mg every month, to be administered into the buttock

**INTERACTIONS**

- Appendix 1: fulvestrant
Tamoxifen

**DRUG ACTION** An anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin release in the hypothalamus, thereby interfering with feedback mechanisms.

**INDICATIONS AND DOSE**

**Pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen**

- **BY MOUTH**
  - Adult: 20 mg daily

**Anovulatory infertility**

- **BY MOUTH**
  - Adult: Initially 20 mg daily on days 2, 3, 4 and 5 of cycle, if necessary the daily dose may be increased to 40 mg then 80 mg for subsequent courses; if cycles irregular, start initial course on any day, with subsequent course starting 45 days later or on day 2 of cycle if menstruation occurs

**CONTRA-INDICATIONS** Treatment of infertility contra-indicated if personal or family history of idiopathic venous thromboembolism or genetic predisposition to thromboembolism

**CAUTIONS** Porphyria

**INTERACTIONS** → Appendix 1: tamoxifen

**SIDE-EFFECTS**

- **Rare** Anorexia · bullous pemphigoid · cholestasis · fatty liver · hepatitis · hypersensitivity reactions · hypertriglyceridaemia · interstitial pneumonitis · neutropenia · Stevens-Johnson syndrome

- **Frequency not known** Alopecia · anaemia · cataracts · corneal changes · decreased platelet counts · endometrial changes · gastrointestinal disturbances · headache · hot flushes · hypercalcaemia if bony metastases · increased risk of thromboembolic events, especially when used with cytotoxics · leucopenia · light-headedness · liver enzyme changes · occasional cystic ovarian swellings in premenopausal women · occasionally oedema · pancreatitis · pruritus vulvae · rashes · retinopathy · suppression of menstruation in some premenopausal women · thrombocytopenia · thromboembolic events · tumour flare · uterine fibroids · vaginal bleeding · vaginal discharge · visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Endometrial changes** Increased endometrial changes, including hyperplasia, polyps, cancer, and uterine sarcoma reported; prompt investigation required if abnormal vaginal bleeding including menstrual irregularities, vaginal discharge, and pelvic pain or pressure in those receiving (or who have received) tamoxifen.

- **Risk of thromboembolism** Tamoxifen can increase the risk of thromboembolism particularly during and immediately after major surgery or periods of immobility (consider interrupting treatment to initiate anticoagulant measures).

- **CONCEPTION AND CONTRACEPTION** Unless being used in the treatment of female infertility, effective contraception must be used during treatment and for 2 months after stopping. Patients being treated for infertility should be warned that there is a risk of multiple pregnancy (rarely more than twins).

- **PREGNANCY** Avoid—possible effects on fetal development.

- **BREAST FEEDING** Suppresses lactation. Avoid unless potential benefit outweighs risk.

- **PATIENT AND CARER ADVICE** Endometrial changes Patients should be informed of the risk of endometrial cancer and told to report relevant symptoms promptly. Thromboembolism Patients should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness and any pain in the calf of one leg.

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Faslodex** (AstraZeneca UK Ltd)
  - Fulvestrant 50 mg per 1 ml Faslodex 250mg/5ml solution for injection pre-filled syringes | 2 pre-filled disposable injection £522.41

---

**Toremifene**

**INDICATIONS AND DOSE**

Hormone-dependent metastatic breast cancer in postmenopausal women

- **BY MOUTH**
  - Adult: 60 mg daily

**CONTRA-INDICATIONS** Bradycardia · electrolyte disturbances (particularly uncorrected hypokalaemia) · endometrial hyperplasia · heart failure with reduced
left-ventricular ejection fraction • history of arrhythmias • QT prolongation

**CAUTIONS** Avoid in acute porphyrrias p. 969 • history of severe thromboembolic disease

**INTERACTIONS** → Appendix 1: toremifene

**SIDE-EFFECTS**
- **Common or very common** Depressions • dizziness • fatigue • hot flushes • nausea • oedema • rash • sweating • vaginal bleeding • vaginal discharge • vomiting
- **Uncommon** Anorexia • constipation • dyspnoea • endometrial hypertrophy • headache • increased weight • insomnia • thromboembolic events
- **Very rare** Alopecia • jaundice • transient corneal opacity
- **Frequency not known** Hypercalcaemia (especially if bone metastases and usually at beginning of treatment)

**SIDE-EFFECTS, FURTHER INFORMATION**
- Endometrial changes • Increased endometrial changes, including hyperplasia, polyps and cancer reported. Abnormal vaginal bleeding including menstrual irregularities, vaginal discharge and symptoms such as pelvic pain or pressure should be promptly investigated.

**PREGNANCY** Avoid.

**BREAST FEEDING** Avoid.

**HEPATIC IMPAIRMENT** Elimination decreased in hepatic impairment—avoid if severe.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Fareston** (Orion Pharma (UK) Ltd) 
  Toremifene (as Toremifene citrate) 60 mg  |  30 tablet *PO* £23.00

**HORMONE ANTAGONISTS AND RELATED AGENTS**  >  **AROMATASE INHIBITORS**

### **Anastrozole**

**INDICATIONS AND DOSE**
Adjuvant treatment of oestrogen-receptor-positive early invasive breast cancer in postmenopausal women | Adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy | Advanced breast cancer in postmenopausal women which is oestrogen-receptor-positive or responsive to tamoxifen

**BY MOUTH**
- Adult: 1 mg daily

**CONTRA-INDICATIONS** Not indicated for premenopausal women

**CAUTIONS** Susceptibility to osteoporosis

**SIDE-EFFECTS**
- **Very rare** Allergic reactions • anaphylaxis • angioedema
- **Frequency not known** Anorexia • arthralgia • arthritis • asthenia • bone fractures • bone pain • cutaneous vasculitis • diarrhoea • drowsiness • hair thinning • headache • hot flushes • nausea • rash • slight increases in total cholesterol levels • Stevens-Johnson syndrome • vaginal bleeding • vaginal dryness • vomiting
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid in moderate to severe impairment.
- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 20 mL/minute.
- **PRE-TREATMENT SCREENING** Laboratory test for menopause if doubt.

**MONITORING REQUIREMENTS**
- Osteoporosis Assess bone mineral density before treatment and at regular intervals.

**PATIENT AND CARER ADVICE**
- Driving and skilled tasks
  - Asthenia and drowsiness may initially affect ability to drive or operate machinery.

**NATIONAL FUNDING/ACCESS DECISIONS**

**ARIMIDEX®**

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (August 2005 and October 2006) that anastrozole (Arimidex®) is accepted for restricted use within NHS Scotland, within the licensed indications, for early breast cancer and early invasive breast cancer.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Anastrozole (Non-proprietary)**
  Anastrozole 1 mg  |  28 tablet *PO* £65.13 DT price = £1.08
- **Arimidex** (AstraZeneca Uk Ltd)
  Anastrozole 1 mg  |  28 tablet *PO* £68.56 DT price = £1.08

### **Exemestane**

**INDICATIONS AND DOSE**
Adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy | Advanced breast cancer in postmenopausal women in whom anti-oestrogen therapy has failed

**BY MOUTH**
- Adult: 25 mg daily

**CONTRA-INDICATIONS**
- Not indicated for premenopausal women

**INTERACTIONS** → Appendix 1: exemestane

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain • alopecia • anorexia • constipation • depression • dizziness • dyspepsia • fatigue • headache • hot flushes • insomnia • nausea • rash • sweating • vomiting
- **Uncommon** Asthenia • drowsiness • peripheral oedema
- **Rare** Leucopenia • thrombocytopenia
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (October 2005) that exemestane (Aromasin®) is accepted for restricted use within NHS Scotland as an adjuvant treatment in postmenopausal women with oestrogen-receptor-positive invasive early breast cancer, following 2–3 years of initial adjuvant tamoxifen therapy.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **CAUTIONARY AND ADVISORY LABELS 21**
  - Exemestane (Non-proprietary)
  - Exemestane 25 mg  |  30 tablet *PO* £88.80 DT price = £5.71 |  90 tablet *PO* no price available
Letrozole

**INDICATIONS AND DOSE**
First-line treatment in postmenopausal women with hormone-dependent advanced breast cancer | Adjunct treatment of oestrogen-receptor-positive invasive early breast cancer in postmenopausal women | Advanced breast cancer in postmenopausal women (naturally or artificially induced menopause) in whom another oestrogen therapy has failed | Extended adjuvant treatment of hormone-dependent invasive breast cancer in postmenopausal women who have received standard adjuvant tamoxifen therapy for 5 years | Neo-adjuvant treatment in postmenopausal women with localised hormone-receptor-positive, human epidermal growth factor-2 negative breast cancer where chemotherapy is not suitable and surgery not yet indicated

- **BY MOUTH**
  - Adult: 2.5 mg daily

- **CONTRA-INDICATIONS** Not indicated for premenopausal women
- **CAUTIONS** Susceptibility to osteoporosis
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · alopecia · anorexia · appetite increase · arthralgia · bone fracture · constipation · depression · diarrhea · dizziness · dry skin · dyspepsia · fatigue · headache · hot flushes · hypercholesterolaemia · hypertension · increased sweating · musculoskeletal pain · nausea · osteoporosis · peripheral oedema · rash · vaginal bleeding · vomiting · weight changes
  - **Uncommon** Anxiety · arthritis · blurred vision · breast pain · cardiac events · cataract · cerebrovascular events · cough · dysaesthesia · dyspnoea · eye irritation · general oedema · insomnia · leucopenia · memory impairment · mucosal dryness · palpitation · pruritus · pyrexia · stomatitis · tachycardia · taste disturbance · thrombophlebitis · tumour pain · urinary frequency · urinary-tract infection · urticaria · vaginal discharge
  - **Frequency not known** Hepatitis · toxic epidermal necrolysis
  - **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required until postmenopausal status fully established (return of ovarian function reported in postmenopausal women)
- **PREGNANCY** Avoid (isolated cases of birth defects reported)
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 10 mL/minute.
- **MONITORING REQUIREMENTS**
  - Osteoporosis Assess bone mineral density before treatment and at regular intervals.
- **MEDICINAL FORMS**
  - **Tablet**
    - Letrozole (Non-proprietary)
      - Letrozole 2.5 mg Letrozole 2.5mg tablets | 14 tablet | £49.90
      - DT price = £1.26 | 28 tablet | £73.24
    - Femara (Novartis Pharmaceuticals UK Ltd)
      - Letrozole 2.5 mg Femara 2.5mg tablets | 30 tablet | £90.92

**DRUG ACTION**
Talimogene laherparevvec is an oncolytic immunotherapy derived from herpes simplex virus type-1 which causes tumour lysis and the release of tumour-derived antigens.

**INDICATIONS AND DOSE**
Unresectable metastatic melanoma with no bone, brain, or visceral disease
  - **BY INTRALESIONAL INJECTION**
  - Adult: (consult product literature)

**CONTRA-INDICATIONS**
Severely immunocompromised patients

**CONTRA-INDICATIONS, FURTHER INFORMATION**
Manufacturer advises avoid in patients who are severely immunocompromised, for example, those with severe congenital or acquired cellular and/or humoral immune deficiency—may be at increased risk of disseminated herpetic infection.

**CAUTIONS**
Administration of antivirals (may interfere with effectiveness of Imlygic® · autoimmune disease · immunocompromised patients · multiple myeloma (risk of plasmacytoma at injection site)

**CAUTIONS, FURTHER INFORMATION**
Immunocompromised patients Manufacturer advises caution in patients who are immunocompromised, for example, those with HIV/AIDS, leukaemia, lymphoma, common variable immunodeficiency, or in those who require chronic high-dose steroids or other immunosuppressive agents—risk of disseminated herpetic infection.

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain · anaemia · anxiety · arthralgia · cellulitis · confusion · constipation · cough · deep vein thrombosis · dehydration · depression · dermatitis · diarrhea · dizziness · dyspnoea · flushing · glomerulonephritis · headache · hypertension · injection-site reactions · insomnia · malaise · myalgia · nausea · oral herpes infection · oropharyngeal pain · pain in extremity · peripheral oedema · pneumonitis · pyrexia · rash · tachycardia · tumour pain · upper respiratory tract infection · vasculitis · vitiligo · vomiting · worsening psoriasis
- **Uncommon** Herpetic keratitis · plasmacytoma at injection site

**SIDE-EFFECTS, FURTHER INFORMATION**
Injection-site reactions Necrosis or ulceration of tumour tissue may occur, and impaired healing at the injection site has been reported. Manufacturer advises careful wound care and injection precautions; if persistent infection or delayed healing develops, the risks and benefits of continuing treatment should be considered.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises use of latex condoms.

**PREGNANCY** Manufacturer advises avoid—no information available.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**DIRECTIONS FOR ADMINISTRATION** Consult product literature for information on injection technique.

**HANDLING AND STORAGE** Manufacturer advises caution in handling—risk of accidental exposure; avoid preparation.
or administration if immunocompromised or pregnant. For further information, see the Physician's Brochure provided by the manufacturer. Store and transport frozen at -90°C to -70°C—consult product literature for further information on thawing and storage after thawing.

**PATIENT AND CARER ADVICE**

Provide patient alert card—record batch number for each administration of Imlygic®.

Manufacturer advises that patients and carers should be informed about the risks of treatment, advised to avoid touching or scratching injection sites, and to keep these sites covered with occlusive dressings. Close contacts should avoid direct contact with injected lesions or body fluids of treated patients during treatment and for up to 30 days after last treatment—if exposed, clean the affected area and seek medical attention if symptoms of herpetic infection develop; close contacts who are immunocompromised or pregnant should not be exposed to potentially contaminated materials. For further information, see the Information for Patients and Close Contacts provided by the manufacturer.

**Driving and skilled tasks**

Manufacturer advises that patients and their carers should be counselled on the effects on driving and performance of skilled tasks—risk of dizziness and confusion.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

† Talimogene laherparepvec for treating unresectable metastatic melanoma (September 2016)

Talimogene laherparepvec is recommended as an option for treating unresectable, regionally or distantly metastatic (Stage III B, IIIC or IVM1a) melanoma that has not spread to bone, brain or other internal organs, only if:

- treatment with systemically administered immunotherapies is not suitable and,
- the manufacturer provides talimogene laherparepvec with the discount agreed in the patient access scheme. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop. [www.nice.org.uk/TA410](http://www.nice.org.uk/TA410)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**EXCIPIENTS:** May contain Sorbitol

**ELECTROLYTES:** May contain Sodium

† Imlygic (Amgen Ltd) ▼

Talimogene laherparepvec 1 mega u per 1 ml Imlygic 1 million plaque forming units/1ml solution for injection vials | 1 vial £1,670.00

Talimogene laherparepvec 100 mega u per 1 ml Imlygic 100 million plaque forming units/1ml solution for injection vials | 1 vial £1,670.00

**IMMUNOSTIMULANTS † INTERFERONS**

**Interferon alfa**

**DRUG ACTION** Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours.

**INDICATIONS AND DOSE**

**INTRONA® PEN**

Chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine) | Hairy cell leukaemia | Follicular lymphoma | Lymph or liver metastases of carcinoid tumour | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | Maintenance of remission in multiple myeloma

‡ BY SUBCUTANEOUS INJECTION

‡ Adult: (consult local protocol)

**INTRONA® VIALS**

Chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine) | Hairy cell leukaemia | Follicular lymphoma | Lymph or liver metastases of carcinoid tumour | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | Maintenance of remission in multiple myeloma

‡ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION

‡ Adult: (consult local protocol)

**ROFERON-A®**

Chronic myelogenous leukaemia | Hairy cell leukaemia | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | AIDS-related Kaposi’s sarcoma | Advanced renal cell carcinoma | Progressive cutaneous T-cell lymphoma | Follicular non-Hodgkin’s lymphoma

‡ BY SUBCUTANEOUS INJECTION

‡ Adult: (consult local protocol)

**CONTRA-INDICATIONS** For contra-indications consult product literature and local treatment protocol.

**CAUTIONS** For cautions consult product literature and local treatment protocol.

**INTERACTIONS** Appendix 1: interferons

**SIDE-EFFECTS**

† Common or very common

Anorexia | diarrhoea | influenza-like symptoms | lethargy | nausea

† Frequency not known

Alopecia | arrhythmias | cardiovascular problems | coma (usually with high doses in the elderly) | confusion | depression | hepatotoxicity | hyperglycaemia | hypersensitivity reactions | hypertension | hypertriglyceridaemia | (sometimes severe) | hypotension | myelosuppression (particularly affecting granulocyte counts) | nephrotoxicity | ocular side-effects | palpitation | psoriasiform rash | seizures (usually with high doses in the elderly) | suicidal behaviour | thyroid abnormalities

**SIDE-EFFECTS, FURTHER INFORMATION**

Consult product literature and local treatment protocols for information on side-effects

**CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.

**PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).

**BREAST FEEDING** Unlikely to be harmful.

**HEPATIC IMPAIRMENT** Avoid in severe hepatic impairment. Close monitoring required in mild to moderate hepatic impairment.

**RENAL IMPAIRMENT** Avoid in severe renal impairment. Close monitoring required in mild to moderate renal impairment.

**MONITORING REQUIREMENTS** Monitoring of lipid concentration is recommended.
**INDICATIONS AND DOSE**

To reduce the frequency of serious infection in chronic granulomatous disease

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 50 micrograms/m² 3 times a week

To reduce the frequency of serious infection in severe malignant osteopetrosis

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 50 micrograms/m² 3 times a week

**CONTRA-INDICATIONS** Simultaneous administration of foreign proteins including immunological products (such as vaccines)—risk of exaggerated immune response

**CAUTIONS** Arrhythmias, cardiac disease, congestive heart failure, ischaemia, seizure disorders (including seizures associated with fever)

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, arthralgia, chills, depression, diarrhoea, fatigue, fever, headache, injection-site reactions, myalgia, nausea, rash, vomiting
  - Rare: Confusion, systemic lupus erythematosus

- **Frequency not known** Neutropenia, proteinuria, raised liver enzymes, thrombocytopenia

**CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.

**PREGNANCY** Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in animal studies).

**BREAST FEEDING** Manufacturers advise avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—risk of accumulation.

**RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—risk of accumulation.

**MONITORING REQUIREMENTS** Monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis.

**IMMUNOSTIMULANTS >/ INTERLEUKINS**

**Aldesleukin**

**DRUG ACTION** Aldesleukin produces tumour shrinkage in a small proportion of patients, but it has not been shown to increase survival.

**INDICATIONS AND DOSE**

Metastatic renal cell carcinoma (specialist use only)

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature)

**UNLICENSED USE** Aldesleukin is not licensed for use in patients in whom all three of the following prognostic factors are present: performance status of Eastern Cooperative Oncology Group of 1 or greater, more than one organ with metastatic disease sites, and a period of less than 24 months between initial diagnosis of primary tumour and date of evaluation of treatment.

**CONTRA-INDICATIONS** Consult product literature for information about aldesleukin contra-indications.

**CAUTIONS** Consult product literature for information about aldesleukin cautions.

**SIDE-EFFECTS**

- **Common or very common** Bone-marrow toxicity, CNS toxicity, hepatic toxicity, renal toxicity, thyroid toxicity
  - **Frequency not known** Alopecia, bone-marrow suppression, extravasation, hyperuricaemia, nausea, oral mucositis, thromboembolism, tumour lysis syndrome, vomiting
  - **SIDE-EFFECTS, FURTHER INFORMATION** Also consult product literature.

**CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.

**PREGNANCY** Use only if potential benefit outweighs risk (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING** Discontinue breast-feeding.

**DIRECTIONS FOR ADMINISTRATION** Aldesleukin is now rarely given by intravenous infusion because of an increased risk of capillary leak syndrome, which can cause pulmonary oedema and hypotension.
Immunotherapy responsive malignancy

**Bacillus Calmette-Guérin**

**INDICATIONS AND DOSE**
Bladder instillation for the treatment of primary or recurrent bladder carcinoma and for the prevention of recurrence following transurethral resection
- **BY INTRAVESICAL INSTILLATION**
- Adult: (consult product literature)

**SIDE-EFFECTS**
- Rare Arthralgia - bladder contracture - hypersensitivity reactions - orchitis - rash - renal abscess - transient urethral obstruction
- Frequency not known Cystitis - dysuria - fever - haematuria - influenza-like syndrome - malaise - ocular symptoms - systemic BCG infection (with fatalities) - consult product literature - urinary frequency

**PREPARATIONS**
- Immucyst (Alliance Pharmaceuticals Ltd)
  - Connaught strain Bacillus Calmette-Guérin 81 mg Immucyst 81mg powder for reconstitution for instillation vials | 1 vial (£18.73) (Hospital only)
  - OncoTICE (Merck Sharp & Dohme Ltd)
  - TICE strain Bacillus of Calmette-Guérin 12.5 mg OncoTICE 12.5mg powder for reconstitution for instillation vials | 1 vial (£71.61) (Hospital only)

**Mifamurtide**

**INDICATIONS AND DOSE**
Treatment of high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection (in combination with chemotherapy)
- **BY INTRAVENOUS INFUSION**
- Adult: Infusion to be given over 1 hour (consult product literature or local protocols)

**SIDE-EFFECTS**

**CONCEPTION AND CONTRACEPTION**
Effective contraception required.

**PREPARATIONS**
- Ceplene
  - No licensed medicines listed.

**Histamine dihydrochloride**

**INDICATIONS AND DOSE**
Maintenance therapy, in combination with aldesleukin, in patients with acute myeloid leukaemia in first remission
- **BY SUBCUTANEOUS INJECTION**
- Adult: (consult local protocol)

**CONTRA-INDICATIONS**
Consult product literature for information about histamine dihydrochloride contra-indications.

**CAUTIONS**
Consult product literature for information about histamine dihydrochloride cautions.

**INTERACTIONS**
- Appendix 1: histamine

**SIDE-EFFECTS**
Consult product literature for side effects.

**CONCEPTION AND CONTRACEPTION**
Ensure effective contraception during treatment in men and women.
DRUG ACTION
Mifamurtide for CAUTIONS— Lenalidomide syndrome.

IMMUNOSUPPRESSANTS ▶ THALIDOMIDE AND RELATED ANALOGUES

Lenalidomide

DRUG ACTION Lenalidomide is an immunomodulating drug with anti-neoplastic, anti-angiogenic, and pro-erythropoietic properties.

INDICATIONS AND DOSE
Multiple myeloma (newly diagnosed) in patients not eligible for transplant, given in combination with dexamethasone until disease progression
▶ BY MOUTH
Adult: 25 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature

Multiple myeloma (newly diagnosed) in patients not eligible for transplant, given in combination with melphalan and prednisone followed by maintenance monotherapy
▶ BY MOUTH
Adult: 10 mg once daily for 21 consecutive days of repeated 28-day cycles for up to 9 cycles, for doses of melphalan and prednisone, and dose adjustments due to side-effects, consult product literature

Multiple myeloma in patients who have received at least one prior therapy, given in combination with dexamethasone
▶ BY MOUTH
Adult: 25 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature

Treatment of transfusion-dependent anaemia due to low- or intermediate-1-risk myelodysplastic syndromes (MDS) associated with an isolated deletion 5q cytogenetic abnormality when other treatment options are insufficient or inadequate
▶ BY MOUTH
Adult: 10 mg once daily for 21 consecutive days of repeated 28-day cycles, for dose adjustments due to side-effects, consult product literature

CAUTIONS  High tumour burden—risk of tumour lysis syndrome • patients with risk factors for myocardial infarction

CAUTIONS, FURTHER INFORMATION
▶ Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised and thromboprophylaxis should be considered in patients with multiple risk factors.

Second primary malignancy Patients should be carefully evaluated before and during treatment with lenalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.

INTERACTIONS ▶ Appendix 1: lenalidomide

SIDE-EFFECTS
▶ Common or very common Abdominal pain, anaemia, arthralgia, asthenia, ataxia, atrial fibrillation, bacterial infection, bradycardia, cardiac failure, cataract, cerebrovascular events, chest pain, cholestasis, constipation, decreased appetite, deep vein thrombosis, dehydration, depression, diarrhoea, dizziness, dry mouth, dyspepsia, dysphagia, dyspnoea, electrolyte disturbances, falls, flu-like illness, fungal infections, haematoma, haematuria, haemorrhagic disorders, headache, hearing disturbances, hyperglycaemia, hyperhidrosis, hypertension, hypotension, hypothyroidism, insomnia, iron-overload, lethargy, leucopenia, malaise, mood changes, musculoskeletal disorders, myalgia, myocardial infarction, nausea, oedema, peripheral neuropathy, pneumonia, pruritus, pulmonary embolism, pyrexia, rash, renal failure, respiratory distress, respiratory tract infections, sepsis, severe neutropenia, sexual dysfunction, sinusitis, skin disorders, stomatitis, syncope, tachycardia, taste disturbance, thrombocytopenia, tremor, urinary incontinence, urinary retention, vasculitis, viral infections, visual disturbances, vomiting

▶ Uncommon Acquired Fanconi syndrome, angiodema, blindness, caecitis, clotting disorders, colitis, haemolysis, hepatic failure, ischaemia, secondary malignancies

▶ Rare Stevens-Johnson syndrome, toxic epidermal necrolysis, tumour lysis syndrome

▶ Frequency not known Cholestatic hepatitis, cytolytic hepatitis, interstitial pneumonitis, leukocytoclastic vasculitis, pancreatitis, toxic hepatitis

SIDE-EFFECTS, FURTHER INFORMATION
For information on side effects consult product literature.

▶ Rash If rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation. Discontinue permanently if angioedema, exfoliative or bullous rash, or if Stevens-Johnson syndrome or toxic epidermal necrolysis is suspected.

CONCEPTION AND CONTRACEPTION For women of child-bearing potential, pregnancy must be excluded before starting treatment with lenalidomide (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer’s Pregnancy Prevention Programme.

PREGNANCY Important: teratogenic risk. Lenalidomide is structurally related to thalidomide and there is a risk of teratogenesis.

▶ BREAST FEEDING Discontinue breast-feeding—no information available.
Immune system and malignant disease

▪ RENAL IMPAIRMENT Reduce dose in moderate to severe impairment—consult product literature.

▪ MONITORING REQUIREMENTS
  ▪ Monitor full blood count (including differential white cell count, platelet count, haemoglobin, and haematocrit) and liver function before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia, thrombocytopenia or impaired liver function develop—consult product literature).
  ▪ Monitor for arterial or venous thromboembolism (if thromboembolic event occurs, discontinue lenalidomide and treat with standard anticoagulation therapy; lenalidomide may be restarted with continued anticoagulation therapy once thromboembolic event resolved—consult product literature).
  ▪ Monitor thyroid function.
  ▪ Monitor visual ability regularly (risk of cataract).
  ▪ Monitor for signs and symptoms of peripheral neuropathy.

▪ PRESCRIBING AND DISPENSING INFORMATION
  ▪ Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form.
  ▪ Patient advice required around conception and contraception

▪ PATIENT AND CARER ADVICE
  ▪ Thromboembolism Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.
  ▪ Neutropenia and thrombocytopenia Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.
  ▪ Patient advice required around conception and contraception

▪ NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
▪ Lenalidomide for treating myelodysplastic syndromes associated with an isolated deletion 5q cytogenetic abnormality (September 2014) NICE TA322
  ▪ Lenalidomide is recommended as an option, within its marketing authorisation, for treating transfusion-dependent anaemia caused by low or intermediate-1-risk myelodysplastic syndromes associated with an isolated deletion 5q cytogenetic abnormality when other therapeutic options are insufficient or inadequate, with the following condition:
    ▪ the drug cost of lenalidomide (excluding any related costs) for people who remain on treatment for more than 26 cycles (each of 28 days; normally a period of 2 years) will be met by the company. 
    www.nice.org.uk/TA322

▪ Lenalidomide for the treatment of multiple myeloma (June 2009) NICE TA171
  ▪ Lenalidomide in combination with dexamethasone is an option for the treatment of multiple myeloma in patients who have received two or more prior therapies. The drug cost of lenalidomide will be met by the manufacturer for patients who remain on treatment for more than 26 cycles. 
  www.nice.org.uk/TA171

Scottish Medicines Consortium (SMC) Decisions
  The Scottish Medicines Consortium has advised (April 2010) that lenalidomide, in combination with dexamethasone, is accepted for restricted use within NHS Scotland for patients with multiple myeloma who have received at least two prior therapies and (March 2014) for those who have received prior treatment with bortezomib and for whom thalidomide has not been tolerated or is contra-indicated.
  The Scottish Medicines Consortium has advised (December 2015) that lenalidomide is accepted for restricted use within NHS Scotland for patients with previously untreated multiple myeloma who are not eligible for transplant and when thalidomide-containing regimens are unsuitable.

▪ MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 25
  ▪ Revlimid
    ▪ Lenalidomide 2.5 mg Revlimid 2.5mg capsules | 21 capsule £3,426.00
    ▪ Lenalidomide 5 mg Revlimid 5mg capsules | 21 capsule £3,570.00
    ▪ Lenalidomide 7.5 mg Revlimid 7.5mg capsules | 21 capsule £3,675.00
    ▪ Lenalidomide 10 mg Revlimid 10mg capsules | 21 capsule £3,780.00
    ▪ Lenalidomide 15 mg Revlimid 15mg capsules | 21 capsule £3,969.00
    ▪ Lenalidomide 20 mg Revlimid 20mg capsules | 21 capsule £4,168.50
    ▪ Lenalidomide 25 mg Revlimid 25mg capsules | 21 capsule £4,368.00

Pomalidomide

02-Jun-2017

▪ DRUG ACTION Pomalidomide is structurally related to thalidomide and has immunomodulatory properties and direct anti-myeloma tumoricidal activity.

▪ INDICATIONS AND DOSE
  Treatment of relapsed and refractory multiple myeloma in patients who have received at least two prior treatment regimens, including both lenalidomide and bortezomib, and who have had disease progression during the last treatment (in combination with dexamethasone)
  ▪ BY MOUTH
    ▪ Adult: 4 mg once daily for 21 consecutive days of repeated 28—day cycles, for doses of dexamethasone and dose adjustment due to side effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS
  Manufacturer advises halve dose with concurrent use of potent inhibitors of CYP1A2 and ciprofloxacin.

IMPORANT SAFETY INFORMATION

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B REACTIVATION
  An EU wide review has concluded that pomalidomide can cause hepatitis B reactivation; the MHRA recommends to establish hepatitis B virus status in all patients before initiation of treatment.

▪ CAUTIONS
  ▪ Cardiac disease - cardiac risk factors - hepatitis B infection - high tumour burden—risk of tumour lysis syndrome - interstitial lung disease—discontinue if suspected - peripheral neuropathy

CAUTIONS, FURTHER INFORMATION
  ▪ Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thromboprophylaxis should be considered, particularly in patients with additional risk factors.
  ▪ Second primary malignancy Patients should be carefully evaluated before and during treatment with pomalidomide

downloaded from www.medicalbr.com
using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.

- Hepatitis B infection  The MHRA advises that those with a history of hepatitis B infection should be closely monitored for signs and symptoms of active infection throughout treatment; expert advice should be sought for patients who test positive for active infection.

- INTERACTIONS  → Appendix 1: pomalidomide

- SIDE-EFFECTS

- Common or very common  Anaemia  bone pain  cardiac failure  confusion  constipation  cough  decreased appetite  diarrhoea  dizziness  dysphonia  febrile neutropenia  hyperkalaemia  hyponatraemia  impaired consciousness  interstitial lung disease  leucopenia  malaise  muscle spasms  nasopharyngitis  nausea  neutropenia  neutropenic sepsis  pelvic pain  peripheral neuropathy  peripheral oedema  pneumonia  pruritus  pyrexia  rash  renal failure  respiratory tract infection  thrombocytopenia  thromboembolic events  tremor  urinary retention  vertigo  vomiting

- Uncommon

- Frequency not known  Atrial fibrillation  hepatitis B reactivation  pulmonary oedema

- CONCEPTION AND CONTRACEPTION  For women of childbearing potential, pregnancy must be excluded before starting treatment with pomalidomide (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer’s Pregnancy Prevention Programme.

- PREGNANCY  Important: teratogenic risk.

- BREAST FEEDING  Avoid—present in milk in animal studies.

- HEPATIC IMPAIRMENT  Manufacturer advises caution—no information available.

- RENAL IMPAIRMENT  Manufacturer advises caution—no information available.

- MONITORING REQUIREMENTS

- Manufacturer advises monitor full blood count before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop—consult product literature).

- Manufacturer advises monitor for arterial or venous thromboembolism.

- Manufacturer advises monitor for signs and symptoms of cardiac failure.

- Manufacturer advises monitor for acute onset or unexplained worsening of respiratory symptoms.

- Manufacturer advises monitor liver function for 6 months after initiation, then as clinically indicated.

- PRESCRIBING AND DISPENSING INFORMATION  Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form.

- PATIENT AND CARER ADVICE  Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb. Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

- NATIONAL FUNDING/ACCESS DECISIONS

- NICE technology appraisals (TAs)

- Pomalidomide for multiple myeloma previously treated with lenalidomide and bortezomib (January 2017) NICE TA427 Pomalidomide, in combination with low-dose dexamethasone, is recommended as an option for treating multiple myeloma in adults at third or subsequent relapse (that is, after three previous treatments including both lenalidomide and bortezomib), only when the manufacturer provides pomalidomide with the discount agreed in the patient access scheme. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA427

Thalidomide

- DRUG ACTION  Thalidomide has immunomodulatory and anti-inflammatory activity.

- INDICATIONS AND DOSE

First-line treatment for untreated multiple myeloma, in patients aged 65 years and over, for those not eligible for high-dose chemotherapy (for example, patients with significant co-morbidity such as cardiac risk factors) in combination with melphalan and prednisolone

- BY MOUTH

- Adult 18–75 years: 200 mg once daily for 6–week cycle for a maximum of 12 cycles, dose to be taken at bedtime

- Adult 76 years and over: 100 mg once daily for 6–week cycle for a maximum of 12 cycles, dose to be taken at bedtime

- CAUTIONS  High tumour burden—risk of tumour lysis syndrome  patients aged 76 years and over—increased risk of serious side-effects

- CAUTIONS, FURTHER INFORMATION

- Thromboembolism  Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thrombophrophylaxis is recommended for at least the first 5 months of treatment, especially in patients with additional thrombotic risk factors.

- Second primary malignancy  Patients should be carefully evaluated before and during treatment with thalidomide using routine cancer screening for occurrence of second
primary malignancy and treatment should be instituted as indicated.

- Peripheral neuropathy Patients with pre-existing peripheral neuropathy should not be treated with thalidomide unless the potential clinical benefits outweigh the risk.

- INTERACTIONS → Appendix 1: thalidomide

- SIDE-EFFECTS
- Common or very common Anaemia · asthenia · bradycardia · cardiac failure · confusion · constipation · deep vein thrombosis · depression · dizziness · drowsiness · dry mouth · dysaesthesis · dyspepsia · dyspnoea · interstitial lung disease · leucopenia · lymphopenia · neutropenia · paraesthesia · peripheral neuropathy · peripheral oedema · pneumonia · pulmonary embolism · pyrexia · skin reactions · Stevens-Johnson syndrome · syndrome · thrombocytopenia · tremor · vomiting
- Frequency not known Atrial fibrillation · atrioventricular block · cerebrovascular events · convulsions · gastro-intestinal haemorrhage · gastro-intestinal perforation · hearing loss · hepatic disorders · hypothyroidism · intestinal obstruction · menstrual disorders · myocardial infarction · renal failure · second primary malignancy · sexual dysfunction · toxic epidermal necrolysis · worsening of Parkinson’s disease symptoms

- MONITORING REQUIREMENTS
- Monitor patients for signs and symptoms of peripheral neuropathy such as paraesthesia, abnormal coordination, or weakness develop. Patients and their carers should be advised to seek medical advice if symptoms of peripheral neuropathy such as paraesthesia, abnormal coordination, or weakness develop.

- PATIENT AND CARER ADVICE
- Avoid in severe impairment.

- CONCEPTION AND CONTRACEPTION
- For women of child-bearing potential, pregnancy must be excluded before starting treatment with thalidomide (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer’s Pregnancy Prevention Programme.

- PREGNANCY
- Important: teratogenic risk.

- BREAST FEEDING
- Avoid—present in milk in animal studies.

- HEPATIC IMPAIRMENT
- Caution in severe impairment—no information available.

- RENAL IMPAIRMENT
- Caution in severe impairment—no information available.

- MONITORING REQUIREMENTS
- Monitor white blood cell count (including differential count) and platelet count (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop—consult product literature).
- Monitor for arterial or venous thromboembolism.
- Monitor patients for signs and symptoms of peripheral neuropathy.
- Hepatic disorder Liver function should be monitored, particularly when there is history of, or concurrent viral liver infection, or when thalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol).

- PRESCRIBING AND DISPENSING INFORMATION
- Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a complete Prescription Authorisation Form.

- PATIENT AND CARER ADVICE
- Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.

- NATIONAL FUNDING/ACCESS DECISIONS
- NICE technology appraisals (TAs)
- Bortezomib and thalidomide for the first-line treatment of multiple myeloma (July 2011) NICE TA228 Thalidomide in combination with an alkylating drug and a corticosteroid is recommended as an option for the first-line treatment of multiple myeloma in people for whom high-dose chemotherapy with stem cell transplantation is considered inappropriate.

- MEDIcular FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

- Capsule

- Porfimer sodium

- PHOTOSENSITISERS

- Photodynamic therapy responsive malignancy

- Photodynamic therapy responsive malignancy

- Porfimer sodium

- DRUG ACTION
- Photofrin accumulates in malignant tissue and is activated by laser light to produce a cytotoxic effect.

- INDICATIONS AND DOSE
- Photodynamic therapy of non-small cell lung cancer and obstructing oesophageal cancer
- By slow intravenous injection
- Adult: (consult product literature)

- CONTRA-INDICATIONS
- Acute porphyrias p. 969 · broncho-oesophageal fistula · tracheo-oesophageal fistula

- SIDE-EFFECTS
- Alopecia · bone-marrow suppression · constipation · extravasation · hyperuricaemia · nausea · oral mucositis · photosensitivity (sunscreens offer no protection) · thromboembolism · tumour lysis syndrome · vomiting

- PREGNANCY
- Manufacturer advises avoid unless essential.

- BREAST FEEDING
- No information available—manufacturer advises avoid.

- HEPATIC IMPAIRMENT
- Avoid in severe impairment.
6  Targeted therapy responsive malignancy

ANTINEOPLASTIC DRUGS  PROTEASOME INHIBITORS

Bortezomib

- **DRUG ACTION** Bortezomib is a proteasome inhibitor.

- **INDICATIONS AND DOSE**
  Treatment of multiple myeloma that has progressed despite the use of at least one therapy, and where the patient has already had, or is unable to have, haematopoietic stem cell transplantation (either as monotherapy, or in combination with pegylated liposomal doxorubicin or dexamethasone) | Treatment of previously untreated multiple myeloma in patients who are not eligible for high-dose chemotherapy with haematopoietic stem cell transplantation (in combination with melphalan and prednisolone) | Induction treatment of previously untreated multiple myeloma in patients who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation (in combination with dexamethasone, or with dexamethasone and thalidomide)
  - **BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - **Adult:** (consult local protocol)

**IMPORTANT SAFETY INFORMATION**
Bortezomib injection is for intravenous or subcutaneous administration only. Inadvertent intrathecal administration with fatal outcome has been reported.

- **CONTRA-INDICATIONS** Acute diffuse infiltrative pulmonary disease | pericardial disease
- **CAUTIONS** Amyloidosis | cardiovascular disease | consider antiviral prophylaxis for herpes zoster infection | dehydration | diabetes (may affect blood glucose) | history of syncope | pulmonary disease (discontinue if interstitial lung disease develops) | risk factors for seizures | risk of neuropathy—consult product literature
- **INTERACTIONS** Appendix 1: bortezomib
- **SIDE-EFFECTS**
  - **Common or very common** Constipation (cases of ileus reported) | decreased appetite | diarrhoea | dyspnoea | fatigue | headache | herpes zoster | hypotension | myalgia | paraesthesia | peripheral neuropathy | pyrexia | rash | reactivation of herpes zoster | sensory neuropathy
  - **Uncommon** Acute diffuse infiltrative pulmonary disorders | heart failure | posterior reversible encephalopathy syndrome (discontinue treatment) | pulmonary hypertension | seizures
  - **Rare** Autonomic neuropathy
  - **Very rare** Progressive multifocal leucoencephalopathy
- **FREQUENCY NOT KNOWN** Alopecia | bone-marrow suppression | extravasation | hyperuricaemia | nausea | oral mucositis | thromboembolism | tumour lysis syndrome | vomiting

**FURTHER INFORMATION**
For further information on side-effects, consult product literature.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 3 months after treatment in men or women.
- **PREGNANCY** Toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.

---

**Temoporfin**

- **DRUG ACTION** Temoporfin accumulates in malignant tissue and is activated by laser light to produce a cytotoxic effect.

- **INDICATIONS AND DOSE** Photodynamic therapy of advanced head and neck squamous cell carcinoma refractory to, or unsuitable for, other treatments
  - **BY SLOW INTRAVENOUS INJECTION**
  - **Adult:** (consult product literature)

- **CONTRA-INDICATIONS** Acute porphyrias p. 969 | concomitant photosensitising treatment | diseases exacerbated by light | elective surgery | ophthalmic slit-lamp examination for 30 days after administration

- **SIDE-EFFECTS**
  - Alopecia | blistering | bone-marrow suppression | constriction | dysphagia | erythema | extravasation | facial pain | giddiness | haemorrhage | hyperpigmentation | hyperuricaemia | injection site pain | nausea | oedema | oral mucositis | photosensitivity (sunscreens ineffective) | scarring | skin necrosis | thromboembolism | trismus | tumour lysis syndrome | vomiting

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid pregnancy for at least 3 months after treatment.

- **PREGNANCY** Toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Manufacturer advises avoid breastfeeding for at least 1 month after treatment—no information available.

- **PATIENT AND CARER ADVICE** Photosensitivity | Avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 30 days.

**Solution for Injection**

- **Foscan** (Biolitec Pharma Ltd)
  - **Temoporfin 1 mg per 1 ml** Foscan 3mg/3ml solution for injection vials | 1 vial (POM) £1,800.00 (Hospital only)
  - Foscan 6mg/6ml solution for injection vials | 1 vial (POM) £3,400.00 (Hospital only)

**CONTRA-INDICATIONS**

- Acute porphyrias p. 969
- Pregnancy and reproductive function in Cytotoxic drugs p. 969

**SIDE-EFFECTS**

- Alopecia
- Photosensitivity
- Dysphagia
- Erythema
- Facial pain
- Giddiness
- Haemorrhage
- Hyperpigmentation
- Hyperuricaemia
- Injection site pain
- Nausea
- Oedema
- Oral mucositis
- Photosensitivity (sunscreens ineffective)
- Scarring
- Skin necrosis
- Thromboembolism
- Trismus
- Tumour lysis syndrome
- Vomiting

**CONCEPTION AND CONTRACEPTION**

- Manufacturer advises avoid pregnancy for at least 3 months after treatment.

**PREGNANCY**

- Toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING**

- Discontinue breast-feeding.

---

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for Injection**

- **Foscan** (Biolitec Pharma Ltd)
  - **Temoporfin 1 mg per 1 ml** Foscan 3mg/3ml solution for injection vials | 1 vial (POM) £1,800.00 (Hospital only)
  - Foscan 6mg/6ml solution for injection vials | 1 vial (POM) £3,400.00 (Hospital only)

**CONTRA-INDICATIONS**

- Acute porphyrias p. 969
- Pregnancy and reproductive function in Cytotoxic drugs p. 969

**SIDE-EFFECTS**

- Alopecia
- Photosensitivity
- Dysphagia
- Erythema
- Facial pain
- Giddiness
- Haemorrhage
- Hyperpigmentation
- Hyperuricaemia
- Injection site pain
- Nausea
- Oedema
- Oral mucositis
- Photosensitivity (sunscreens ineffective)
- Scarring
- Skin necrosis
- Thromboembolism
- Trismus
- Tumour lysis syndrome
- Vomiting

**CONCEPTION AND CONTRACEPTION**

- Manufacturer advises avoid pregnancy for at least 3 months after treatment.

**PREGNANCY**

- Toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING**

- Discontinue breast-feeding.
**HEPATIC IMPAIRMENT** Reduce dose in moderate to severe impairment—consult product literature.

**RENAL IMPAIRMENT** No information available for creatinine clearance less than 20 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**
- Monitor blood-glucose concentration in patients on oral antidiabetics.
- Monitor for symptoms of progressive multifocal leuкоencephalopathy (presenting as new or worsening neurological signs or symptoms)—discontinue treatment if diagnosed.
- Chest x-ray recommended before treatment to monitor for pulmonary disease—discontinue if interstitial lung disease develops.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Bortezomib for previously untreated mantle cell lymphoma (December 2015) NICE TA370
Bortezomib is recommended as an option for the treatment of previously untreated mantle cell lymphoma in adults for whom haematopoietic stem cell transplantation is unsuitable.

www.nice.org.uk/TA370

- Bortezomib for induction therapy in multiple myeloma before high-dose chemotherapy and autologous stem cell transplantation (April 2014) NICE TA311
Bortezomib is recommended as an option within its marketing authorisation, in combination with dexamethasone, or with dexamethasone and thalidomide, for the induction treatment of adults with previously untreated multiple myeloma, who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.

www.nice.org.uk/TA311

- Bortezomib and thalidomide for the first-line treatment of multiple myeloma (July 2011) NICE TA228
Bortezomib in combination with an alkylating drug and a corticosteroid is recommended as an option for the first-line treatment of multiple myeloma if:
  - high-dose chemotherapy with stem cell transplantation is considered inappropriate and
  - the person is unable to tolerate or has contraindications to thalidomide.

www.nice.org.uk/TA228

- Bortezomib monotherapy for relapsed multiple myeloma (October 2007) NICE TA129
Bortezomib monotherapy is an option for the treatment of progressive multiple myeloma in patients who are at first relapse having received one prior therapy and who have undergone, or are unsuitable for, bone-marrow transplantation, under the following circumstances:
  - the response to bortezomib is measured using serum M protein after a maximum of four cycles of treatment, and treatment is continued only in patients who have a reduction in serum M protein of 50% or more (where serum M protein is not measurable, an appropriate alternative biochemical measure of response should be used) and
  - the manufacturer rebates the full cost of bortezomib if there is an inadequate response (as defined above) after four cycles of treatment.

www.nice.org.uk/TA129

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium, has advised (December 2013) that bortezomib (Velcade®) is accepted for restricted use within NHS Scotland in combination with dexamethasone and thalidomide for the induction treatment of adults with previously untreated multiple myeloma who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- **Velcade** (Janssen-Cilag Ltd)
  - Bortezomib 3.5 mg Velcade 3.5mg powder for solution for injection vials | 1 vial (Pow) | £762.38 (Hospital only)

**Carfilzomib**

17-Mar-2017

**DRUG ACTION** Carfilzomib is an irreversible selective proteasome inhibitor that disrupts tumour cell turnover and induces apoptosis.

**INDICATIONS AND DOSE**
Treatment of multiple myeloma in patients who have received at least one prior therapy (in combination with dexamethasone, or with dexamethasone and lenalidomide) (specialist use only)

- **BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature or local protocols)

**CAUTIONS**
- Elderly (over 75 years)—higher incidence of adverse effects—ensure adequate hydration—infusion-related reactions—recent history of myocardial infarction—risk of cardiac failure—risk of herpes zoster reactivation—uncontrolled angina—uncontrolled arrhythmias

**CAUTIONS, FURTHER INFORMATION**
- Infusion-related reactions Manufacturer advises premedication with dexamethasone to reduce incidence and severity of infusion-related reactions.
- Risk of herpes zoster reactivation Manufacturer advises consider antiviral prophylaxis for herpes zoster infection.

**INTERACTIONS** → Appendix 1: carfilzomib

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain, anxiety, atrial fibrillation, blood disorders, blurred vision, cardiac failure, cataract, constipation, decreased appetite, deep vein thrombosis, dehydration, diarrhoea, dizziness, dyspepsia, dysphonia, electrolyte disturbances, epistaxis, erythema, flushing, headache, hyperbilirubinaemia, hyperglycaemia, hyperhidrosis, hypertension, hypoaesthesia, hypoalbuminaemia, hypotension, infection, infusion-related reactions, insomnia, muscle spasm, muscular weakness, musculoskeletal pain, nausea, ophthalmalgia, pain, palpitations, paraesthesia, peripheral neuropathy, pruritus, pulmonary embolism, pulmonary hypertension, pulmonary oedema, renal failure, sepsis, tachycardia, vomiting
- **Uncommon** Acute respiratory distress syndrome, cardiac arrest, cerebrovascular accident, cholestasis, ejection fraction decreased, gastrointestinal perforation, haemolytic uraemic syndrome, haemorrhage, hepatic failure, hypertensive crisis, interstitial lung disease, myocardial infarction, myocardial ischaemia, pericardial effusion, pericarditis, pneumonitis, tumour lysis syndrome
- **Rare** Posterior reversible encephalopathy syndrome, thrombotic microangiopathy
- **Frequency not known** QT-interval prolongation

**SIDE-EFFECTS, FURTHER INFORMATION**
For further information on side-effects, including management of specific side-effects, consult product literature.

**CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during and for 1 month after treatment in women of childbearing potential; efficacy of oral contraceptives may be reduced, and hormonal contraceptives associated with a risk of thrombosis should be avoided. Male patients should use effective contraception during and for 3 months after
Ixazomib

- **DRUG ACTION** Ixazomib is a proteasome inhibitor.

- **INDICATIONS AND DOSE**

  - **Multiple myeloma in patients who have received at least one prior therapy, in combination with lenalidomide and dexamethasone (specialist use only)**
    - **BY MOUTH**
    - **Adult:** 4 mg once weekly on days 1, 8, and 15 of a 28-day treatment cycle, for dose adjustments due to side-effects, consult product literature

- **CAUTIONS** Risk of herpes zoster reactivation

- **CAUTIONS, FURTHER INFORMATION**

  - **Herpes zoster reactivation** Manufacturer advises consider concomitant antiviral prophylaxis to decrease the risk of herpes zoster reactivation.
  - **INTERACTIONS** → Appendix 1: ixazomib
  - **SIDE-EFFECTS**
    - **Common or very common** Back pain, constipation, diarrhoea, nausea, neutropenia, peripheral neuropathy (monitor for symptoms), peripheral oedema, rash, thrombocytopenia, vomiting
    - **Uncommon** Hepatotoxicity
    - **Rare** Acute febrile neutrophilic dermatosis (Sweet’s syndrome), pneumonia (including fatal cases), posterior reversible encephalopathy syndrome (PRES)—discontinue treatment, Stevens-Johnson syndrome, thrombotic thrombocytopenic purpura, transverse myelitis, tumour lysis syndrome
    - **Frequency not known** Blurred vision, dry eye
  - **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of child-bearing potential and in men with a partner of child-bearing potential, during treatment and for at least 90 days after stopping treatment; additional barrier method recommended in women using hormonal contraceptives.
  - **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.
  - **BREAST FEEDING** Manufacturer advises avoid—no information available.
  - **HEPATIC IMPAIRMENT** Manufacturer advises reduce dose to 3 mg in moderate-to-severe impairment.
  - **RENAL IMPAIRMENT** Manufacturer advises reduce dose to 3 mg in severe impairment (creatinine clearance less than 30 mL/min).
  - **MONITORING REQUIREMENTS** Manufacturer advises to monitor hepatic function regularly and adjust dose accordingly—consult product literature.
  - **PATIENT AND CARER ADVICE**
    - **Missed doses**
      - Manufacturer advises if less than 72 hours remain before the next scheduled dose, the missed dose should not be taken and the next dose should be taken at the normal time.

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises effective contraception in women of child-bearing potential and in men with a partner of child-bearing potential, during treatment and for at least 90 days after stopping treatment; additional barrier method recommended in women using hormonal contraceptives.

**PREGNANCY**

Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

Manufacturer advises reduce dose to 3 mg in moderate-to-severe impairment.

**RENAL IMPAIRMENT**

Manufacturer advises reduce dose to 3 mg in severe impairment (creatinine clearance less than 30 mL/min).

**MONITORING REQUIREMENTS**

Manufacturer advises to monitor hepatic function regularly and adjust dose accordingly—consult product literature.

**PATIENT AND CARER ADVICE**

**Missed doses**

Manufacturer advises if less than 72 hours remain before the next scheduled dose, the missed dose should not be taken and the next dose should be taken at the normal time.
Afatinib

**DRUG ACTION** Afatinib is a protein kinase inhibitor.

**INDICATIONS AND DOSE**

Treatment of locally advanced or metastatic non-small cell lung cancer with activating epidermal growth factor receptor (EGFR) mutations, in patients who have not previously been treated with EGFR tyrosine kinase inhibitor

- **BY MOUTH**
  - Adult: 40 mg once daily; increased if tolerated to up to 50 mg once daily, dose increase may be considered after 3 weeks at initial dose; consult product literature for details on dosing and dose adjustment due to side effects

**SIDE-EFFECTS**

- Common or very common: Acne · conjunctivitis · cystitis · decreased appetite · dehydration · diarrhoea · dry eyes · dry skin · dysgeusia · dyspnea · epistaxis · hand-foot syndrome · hypokalaemia · muscle spasms · paronychia · pruritus · pyrexia · rash (see Cautions) · renal failure · rhinorrhoea · weight loss
- Uncommon: Interstitial lung disease · keratitis
- Frequency not known: Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

**CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least one month after treatment in women of childbearing potential.

**PREGNANCY** Manufacturer advises avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Monitor hepatic function regularly and consult product literature for dose adjustment in worsening liver function. Manufacturer advises avoid in severe hepatic impairment.

**RENAL IMPAIRMENT** Manufacturer advises avoid in severe renal impairment.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES** See Cytotoxic drugs p. 825.

- **CAUTIONS** Cardiac risk factors · conditions which may affect left ventricular ejection fraction—consider cardiac monitoring, including assessment of left ventricular ejection fraction, at baseline and during treatment · diarrhoea—proactive management recommended (consult product literature) · exposure to sun (protect skin from exposure to sun) · history of keratitis · new pulmonary symptoms (including dyspnoea, cough, fever)—interrupt treatment if severe or if Stevens-Johnson syndrome suspected (consult product literature) · ulcerative keratitis · use of contact lenses · worsening pulmonary symptoms (including dyspnoea, cough, fever)—interrupt treatment until interstitial lung disease is excluded
- **INTERACTIONS** → Appendix 1: afatinib

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Axitinib

**DRUG ACTION** Axitinib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**

Treatment of advanced renal cell carcinoma following failure of previous treatment with sunitinib or a cytokine (aldesleukin or interferon alfa)

- **BY MOUTH**
  - Adult: (consult product literature)

**SIDE-EFFECTS**

- Common or very common: Abdominal pain · anal fistula · arthralgia · asthenia · cerebral haemorrhage · constipation · cough · decreased appetite · dehydration · diarrhoea · dizziness · dry skin · dysgeusia · dyspepsia · dysphonia · dyspnoea · erythema · fatigue · flatulence · gastro-intestinal haemorrhage · gastro-intestinal perforation ·
haemoptysis • haemorrhage • haemorrhoids • hand-foot syndrome • headache • hypercalcaemia • hyperkalaemia • hypertension • hyperthyroidism • hypothyroidism • myalgia • proteinuria • pruritus • rash • renal failure • tinnitus • weight loss

- Uncommon Hypertensive crisis • polycythaemia • posterior reversible encephalopathy syndrome
- Frequency not known Alopecia • bone-marrow suppression • hyperuricaemia • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting

CONCEPTION AND CONTRACEPTION Effective contraception required during and for up to 1 week after treatment.

- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- HEPATIC IMPAIRMENT Reduce starting dose in moderate impairment. Avoid in severe impairment—no information available.

MONITORING REQUIREMENTS
- Monitor for thyroid dysfunction.
- Monitor haemoglobin or haematocrit before and during treatment.
- Monitor for symptoms of gastro-intestinal perforation.
- Monitor for symptoms of fistula.
- Monitor for proteinuria before and during treatment.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Axitinib for treating advanced renal cell carcinoma after failure of prior systemic treatment (February 2015) NICE TA333

Axitinib is recommended as an option for treating adults with advanced renal cell carcinoma after failure of treatment with a first-line tyrosine kinase inhibitor or a cytokine, only if the company provides axitinib with the discount agreed in the patient access scheme. www.nice.org.uk/TA333

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Table

CAUTIONARY AND ADVISORY LABELS 25
- Inlyta (Pfizer Ltd) 
  - Axitinib 1 mg Inlyta 1mg tablets | 56 tablet £703.40 (Hospital only)
  - Axitinib 3 mg Inlyta 3mg tablets | 56 tablet £2,110.20 (Hospital only)
  - Axitinib 5 mg Inlyta 5mg tablets | 56 tablet £3,517.00 (Hospital only)
  - Axitinib 7 mg Inlyta 7mg tablets | 56 tablet £4,923.80 (Hospital only)

Targeted therapy responsive malignancy 893

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS

An EU wide review has concluded that bosutinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- CAUTIONS Cardiac disease • hepatitis B infection • history of pancreatitis—hold treatment if lipase elevated and abdominal symptoms occur • history of QT prolongation—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment • recent cardiac event—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment • risk factors for QT prolongation—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment • significant gastrointestinal disorder

CAUTIONS, FURTHER INFORMATION
- Hepatitis B infection The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

INTERACTIONS Appendix 1: bosutinib

SIDE-EFFECTS
- Common very common Abdominal pain • abnormal liver function • acne • arthralgia • biochemical disturbances • cough • decreased appetite • dehydration • diarrhoea • dizziness • dysgeusia • dysphonia • electrolyte disturbances • gastritis • headache • hepatotoxicity • infection • malaise • myalgia • oedema • pericardial effusion • pleural effusion • pruritus • pyrexia • QT prolongation • rash • renal failure • renal impairment • urticaria
- Uncommon Gastric haemorrhage • pancreatitis • pericarditis • pulmonary hypertension • pulmonary oedema • respiratory failure • tinnitus
- Frequency not known Alopecia • bone-marrow suppression • hepatic failure (fatal cases reported) • hepatitis • hepatitis B reactivation • hyperuricaemia • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting

CONCEPTION AND CONTRACEPTION Effective contraception required during treatment in women.

PREGNANCY Avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 826.

BREAST FEEDING Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT Caution—no information available.

MONITORING REQUIREMENTS
- Manufacturer advises monitor liver function before treatment initiation, then monthly for the first 3 months and thereafter as clinically indicated—consult product literature for management of raised transaminases.
- Manufacturer advises monitor full blood count weekly for the first month and then monthly thereafter or as clinically indicated.
- Manufacturer advises monitor for signs and symptoms of fluid retention (including pericardial effusion, pleural effusion and pulmonary oedema).

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Bosutinib for previously treated chronic myeloid leukaemia (August 2016) NICE TA401

Bosutinib is recommended as a treatment option, within its marketing authorisation, for chronic, accelerated and blast phase Philadelphia-chromosome-positive CML in adults, when:

- they have previously been treated with 1 or more tyrosine kinase inhibitor, and

Bosutinib

INDICATIONS AND DOSE

Treatment of chronic, accelerated and blast phase Philadelphia chromosome-positive chronic myeloid leukaemia, in those previously treated with one or more tyrosine kinase inhibitors, and for whom imatinib, nilotinib and dasatinib are not clinically appropriate

BY MOUTH
- Adult: 500 mg once daily, consult product literature for dose adjustment due to side effects, or incomplete haematologic response by week 8, or incomplete cytogenetic response by week 12

IMPORTANT SAFETY INFORMATION
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 825.
Cabozantinib

**DRUG ACTION** Cabozantinib is an inhibitor of several protein kinases.

**INDICATIONS AND DOSE**
Treatment of progressive, unresectable locally advanced or metastatic medullary thyroid carcinoma

- **BY MOUTH**
- **Adult:** 140 mg once daily, for dose adjustment or treatment interruption due to side effects, consult product literature (closely monitor for first 8 weeks of therapy)

**IMPORTANT SAFETY INFORMATION**
Risks of incorrect dosing of oral anti-cancer medicines

See Cytotoxic drugs p. 825.

**CONTRA-INDICATIONS** Reversible Posterior Leuкоencephalopathy Syndrome

**CAUTIONS** Hypertension—discontinue treatment if uncontrolled despite medical intervention — palmar-plantar erythrodysesthesia syndrome — consider treatment interruption if severe and restart at a lower dose when resolved to grade 1 • patients at increased risk of fistulas — consult product literature • patients at increased risk of gastro-intestinal perforation — consult product literature • patients at increased risk of intra-abdominal abscess — consult product literature • patients at risk of haemorrhage (including tumour involvement of the trachea or bronchi) — discontinue if symptoms develop • patients at risk of thromboembolic events including myocardial infarction — discontinue if symptoms develop • risk of osteonecrosis of the jaw — susceptibility to QT-interval prolongation (e.g. cardiac disease, electrolyte disturbances, bradycardia, concomitant use of drugs that prolong the QT interval) — monitor ECG and electrolytes periodically

**CAUTIONS, FURTHER INFORMATION**
- Elective surgery Withhold treatment for at least 28 days before elective surgery and restart only if adequate wound healing — discontinue in patients with wound healing complications requiring medical intervention.
- Risk of osteonecrosis of the jaw Discontinue treatment at least 28 days before elective invasive dental procedures — monitor for symptoms before and during treatment and discontinue if osteonecrosis develops.

**SIDE-EFFECTS**
- Common or very common Abdominal pain • abnormal hair growth • abscess • acne • alopecia • anal fissure • anxiety • arthralgia • aspiration • atrial fibrillation • blurred vision • chelitis • chills • cholelithiasis • constipation • decreased appetite • dehydration • depression • diaphoresis • dizziness • dry skin • dysgeusia • dyspepsia • dysphagia • dysphonia • dysuria • erythema • face oedema • folliculitis • fungal infection • gastro-intestinal perforation • gastrointestinal haemorrhage • glossodynia • haematuria • haemorrhoids • hair colour changes • headache • hyperbilirubinaemia • hyperkeratosis • hypertension • hypoalbuninaemia • hypocalcaemia • hypokalaemia • hypophosphataemia • hypotension • hypothyroidism • impaired wound healing • lymphopenia • mucosal inflammation • muscle spasms • musculoskeletal chest pain • nausea • neutropenia • non-gastro-intestinal fistula • oropharyngeal pain • osteonecrosis of jaw • pallor • palmar-plantar erythrodysesthesia syndrome • pancreatitis • paraesthesia • peripheral coldness • peripheral neuropathy • platelet disorders • pneumonia • proteinuria • pulmonary embolism • rash • respiratory tract haemorrhage • skin exfoliation • skin hypopigmentation • stomatitis • tinnitus • tremor • venous thrombosis • vomiting
- Uncommon Hypoacusis • acute renal failure • amenorrhoea • angina • arterial thrombosis • aspergillosis • ataxia • atelectasis • catarract • conjunctivitis • cyst • delirium • facial pain • gastrointestinal fistula • hepatic encephalopathy • loss of consciousness • oesophagitis • pharyngeal oedema • pneumonitis • posterior reversible encephalopathy syndrome • rhabdomyolysis • skin ulcer • speech disorder • supraventricular tachycardia • telangiectasia • transient ischaemic attack • vaginal haemorrhage
- Frequency not known Bone-marrow suppression • hyperuricaemia • oral mucositis • thromboembolism • tumour lysis syndrome
- Conception and Contraception Patients and their sexual partners must use effective contraception (in addition to barrier method) during treatment and for at least 4 months after the last dose.
- Pregnancy Manufacturer advises avoid unless potential benefit outweighs risk — toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- Breast Feeding Manufacturer advises discontinue breast-feeding during treatment and for at least 4 months after the last dose.
- Hepatic Impairment Manufacturer advises avoid.
- Renal Impairment Manufacturer advises caution in renal impairment. Avoid in severe impairment.
- Monitoring Requirements Monitor urine protein regularly and discontinue if nephrotic syndrome develops.
- Patient and Carer Advice
Food should not be consumed for at least 2 hours before and at least 1 hour after each dose.

Driving and skilled tasks
Fatigue and weakness may affect performance of skilled tasks e.g. driving.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**CAUTIONARY AND ADVISORY LABELS**

- **Cometriq** (Ipsen Ltd) ▼
  - Cabozantinib (as Cabozantinib s-malate) 20 mg Cometriq 20mg capsules | 7 capsule PSt £ no price available | 21 capsule PSt no price available | 84 capsule PSt £4,800.00
  - Cabozantinib (as Cabozantinib s-malate) 80 mg Cometriq 80mg capsules | 7 capsule PSt no price available
Ceritinib

**DRUG ACTION** Ceritinib is a tyrosine kinase inhibitor, with particular activity against anaplastic lymphoma kinase (ALK).

**INDICATIONS AND DOSE**

Treatment of anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer previously treated with crizotinib

- **BY MOUTH**
- Adult: 750 mg once daily, dose should be taken at the same time every day, temporary dose interruption or dose reduction may be required based on tolerability—consult product literature; discontinue treatment if patient unable to tolerate at least 300 mg daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce the dose by one-third (rounded to the nearest multiple of the 150 mg dosage form).

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, anaemia, bradycardia, constipation, decreased appetite, diarrhoea, dyspepsia, dysphagia, fatigue, gastro-oesophageal reflux disease, hyperglycaemia, hypophosphataemia, nausea, pericarditis, pneumonitis, QT-interval prolongation, rash, renal failure, renal impairment, visual disorders, vomiting
- **Uncommon** Hepatotoxicity, pancreatitis

**INTERACTIONS**

- **CONTRA-INDICATIONS** Congenital long QT syndrome
- **CAUTIONS** Diabetes mellitus, history or susceptibility to QT-interval prolongation
- **CAUTIONS, FURTHER INFORMATION** QT-interval prolongation—QT-interval prolongation has been observed in clinical studies, which may lead to an increased risk for ventricular tachyarrhythmias (e.g. torsade de pointes) or sudden death. Risk factors include pre-existing bradycardia, other relevant pre-existing cardiac disease or electrolyte disturbances; manufacturer advises to monitor ECG and electrolytes periodically.

**MONITORING REQUIREMENTS**

- Manufacturer advises to monitor fasting blood glucose concentration prior to initiation of treatment and periodically thereafter. Also monitor for amylase and lipase elevations periodically during treatment. Consider dose reduction, interruption or discontinuation of treatment if outside of normal range.
- In addition, manufacturer advises measure baseline liver function, then monitor every 2 weeks for the first month and monthly thereafter; consider discontinuation if severe changes in liver function occur—increased risk of hepatotoxicity. Monitor heart rate and blood pressure regularly; consider dose reduction or discontinuation if bradycardia is reported—consult product literature.

**DIRECTIONS FOR ADMINISTRATION**

Capsules should be taken on an empty stomach—no food should be eaten for 2 hours before or after dose.

**PATIENT AND CARER ADVICE**

Patients and carers should be counselled on the effects on driving and skilled tasks—increased risk of fatigue and vision disorders.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (Tas)**

- **Ceritinib for previously treated anaplastic lymphoma kinase-positive non small cell lung cancer (June 2016) NICE TA395**
- Ceritinib is recommended, within its marketing authorisation, as an option for treating advanced anaplastic lymphoma kinase-positive non-small cell lung cancer in adults previously treated with crizotinib; only if the manufacturer provides the discount agreed in the patient access scheme.

- www.nice.org.uk/guidance/ta395

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - **CAUTIONARY AND ADVISORY LABELS** 25
  - **EXCIPIENTS**: May contain Gelatin, propylene glycol
  - **Zykadia** (Novartis Pharmaceuticals UK Ltd)
    - Ceritinib 150 mg Zykadia 150mg capsules | 150 capsule pack £4,923.45

Cobimetinib

**DRUG ACTION** Cobimetinib is a mitogen-activated protein kinase (MAPK) inhibitor.

**INDICATIONS AND DOSE**

Treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma (in combination with vemurafenib) (specialist use only)

- **BY MOUTH**
- Adult: 60 mg once daily for 21 days; subsequent cycles repeated after a 7-day interval, for dose adjustment due to side-effects—consult product literature

**INTERACTIONS**

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception in women of childbearing potential during treatment and for up to 3 months after discontinuation of treatment.
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment—no information available but extensively metabolised by the liver.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

**CAUTIONS**

- Left ventricular dysfunction—risk factors for bleeding

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 825.
### Crizotinib

**Drug Action** Crizotinib is a tyrosine kinase inhibitor.

### Indications and Dose

**Treatment of previously treated anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer**

First-line treatment of anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer

- **By Mouth**
  - Adult: 250 mg twice daily, consult product literature for dose adjustments based on individual patient safety and tolerability

### Important Safety Information

**Risks of Incorrect Dosing of Oral Anti-Cancer Medicines**

See Cytotoxic drugs p. 825.

**MHRA/CHM Advice (November 2015): Risk of Cardiac Failure**

Severe, sometimes fatal cases of cardiac failure have been reported in patients treated with crizotinib.

The MHRA has issued the following advice:

- Monitor all patients for signs and symptoms of heart failure (including dyspnoea, oedema, or rapid weight gain from fluid retention)
- Consider reducing the dose, or interrupting or stopping treatment if symptoms of heart failure occur

### Caution

**History of diverticulitis** (risk of gastrointestinal perforation—discontinue treatment if gastrointestinal perforation occurs) - metastases of gastrointestinal tract (risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs) - patients with susceptibility to QT-prolongation (including bradycardia, history of cardiac disease, concomitant use of drugs that prolong QT interval, and electrolyte disturbances)—periodic renal monitoring required - risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs - vision disorders reported—consider full ophthalmological evaluation if vision disorder worsens or persists

### Caution, Further Information

- Fatal interstitial lung disease and pneumonitis
- Fatal interstitial lung disease and pneumonitis reported (monitor patients with pulmonary symptoms, withdraw treatment if suspected, and permanently discontinue treatment if diagnosed)

### Interactions

- Appendix 1: crizotinib

### Side-Effects

**Common or very common** Bone-marrow suppression - bradycardia - cardiac failure - constipation - decreased appetite - diarrhoea - dizziness - dyspepsia - fatigue - hypophosphataemia - interstitial lung disease - nausea - neuropathy - oedema - pneumonitis - pneumonitis - QT-interval prolongation - rash - renal cyst - syncope - taste disturbance - vision disorder - vomiting

**Uncommon** Gastrointestinal perforation (fatality reported) - hepatotoxicity (including fatal hepatic failure)

**Frequency not known** Alopecia - hyperuricaemia - oral mucositis - thromboembolism - tumour lysis syndrome

### Side-Effects, Further Information

- Cardiac failure
- Consider reducing the dose, or interrupting or stopping treatment if symptoms of cardiac failure occur

### Conception and Contraception

Ensure effective contraception during and for at least 90 days after treatment

**Pregnancy** Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

---

**Targeted therapy responsive malignancy**

**NICE Technology Appraisals (TAs)**

- **Cobimetinib in combination with vemurafenib for treating unresectable or metastatic BRAF V600 mutation-positive melanoma (October 2016)** NICE TA414 Cobimetinib in combination with vemurafenib is **not** recommended within its marketing authorisation for treating unresectable or metastatic melanoma with a BRAF V600 mutation.

  - Patients currently receiving cobimetinib may continue without change to prior funding arrangements, until they and their clinician consider it appropriate to stop.

  [www.nice.org.uk/TA414](http://www.nice.org.uk/TA414)

**Medicinal Forms**

**Tablet**

- **Cotellic** (Roche Products Ltd) ▼
  - **Cobimetinib (as Cobimetinib hemifumarate) 20 mg** Cotellic 20mg tablets  63 tablet  £427.57

---

**Side-Effects**

**Common or very common** Anaemia - basal cell carcinoma - blurred vision - chills - cutaneous squamous cell carcinoma - decreased ejection fraction - dermatitis acniform - diarrhoea - haemorrhage - hyperkeratosis - hypertension - keratoacanthoma - nausea - photosensitivity - pneumonitis - pyrexia - raised liver enzymes - rash - serious retinopathy - visual impairment - vomiting

**Uncommon** Rhabdomyolysis

**Conception and Contraception** Manufacturer advises use of two effective contraceptive methods during treatment and for at least 3 months after stopping treatment.

**Pregnancy** Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**Breast Feeding** Manufacturer advises caution.

**Hepatic Impairment** Manufacturer advises avoid—no information available.

**Renal Impairment** Manufacturer advises caution in severe impairment—limited information available.

**Monitoring Requirements**

- **Creatine kinase elevation** Manufacturer advises baseline creatine kinase and creatinine levels should be measured before starting treatment, and then at monthly intervals during treatment or as clinically indicated—consult product literature if elevated.

- **Left ventricular function** Manufacturer advises ejection fraction should be evaluated before initiation of treatment, then after the first month of treatment and at least every 3 months thereafter (or as clinically indicated) until treatment discontinuation.

- **Liver function** Manufacturer advises liver function should be evaluated before initiation of treatment and monthly thereafter (or more frequently as clinically indicated).

- **Visual disturbances** Manufacturer advises assess for new or worsening visual disturbances at each visit; if symptoms of new or worsening visual disturbances are identified, an ophthalmologic examination is recommended.

**Patient and Carer Advice**

**Vomiting** Manufacturer advises if vomiting occurs after taking tablets, no additional dose should be taken on that day and the next dose should be taken at the usual time.

**Missed doses**

Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**Driving and skilled tasks**

Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of visual disturbances.

**National Funding/Access Decisions**

**NICE Technology Appraisals (TAs)**

- **Cobimetinib in combination with vemurafenib for treating unresectable or metastatic BRAF V600 mutation-positive melanoma** (October 2016) NICE TA414

Cobimetinib in combination with vemurafenib is **not** recommended within its marketing authorisation for treating unresectable or metastatic melanoma with a BRAF V600 mutation.

Patients currently receiving cobimetinib may continue without change to prior funding arrangements, until they and their clinician consider it appropriate to stop.

896 Targeted therapy responsive malignancy

BNF 74

Immune system and malignant disease
Monitor for signs and symptoms of treatment emergent toxicity.

ECG and electrolytes (correct if abnormal) in all patients before starting treatment, then periodically and as clinically indicated.

For signs and symptoms of treatment emergent emergent bradycardia (including syncope, dizziness and hypotension)—monitor blood pressure and heart rate regularly.

Counsel all patients on the early signs and symptoms of side-effects, consult product literature.

Driving and skilled tasks
Symptomatic bradycardia (including syncope, dizziness and hypotension), vision disorder and fatigue may affect performance of skilled tasks (e.g. driving or operating machinery).

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Crizotinib for untreated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer (September 2016)
NICE TA406
Crizotinib is recommended, within its marketing authorisation, as an option for untreated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme.

www.nice.org.uk/TA406

Crizotinib for previously treated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer (December 2016)
NICE TA422
Crizotinib is recommended, within its marketing authorisation, as an option for previously treated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme.

Crisotinib 200 mg: Xalkori 200mg capsules | 60 capsule £4,689.00 (Hospital only)
Crisotinib 250 mg: Xalkori 250mg capsules | 60 capsule £4,689.00 (Hospital only)

Dabrafenib

DRUG ACTION
Dabrafenib is a BRAF kinase inhibitor, which inhibits BRAF V600 mutation-positive melanoma cell growth.

INDICATIONS AND DOSE
Unresectable or metastatic melanoma with a BRAF V600 mutation (as monotherapy or in combination with trametinib)

BY MOUTH
Adult: 150 mg every 12 hours, for dose adjustments due to side-effects, consult product literature.

CONTRA-INDICATIONS
BRAF wild-type melanoma

CAUTIONS
Elderly (more frequent dose adjustments may be required) - prior or concurrent cancer associated with RAS mutations—risk of secondary or recurrent malignancy

INTERACTIONS → Appendix 1: dabrafenib

SIDE-EFFECTS

Common or very common
Actinic keratosis · alopecia · arthralgia · basal cell carcinoma · constipation · cough · cutaneous squamous cell carcinoma · decreased appetite · decreased left ventricular ejection fraction · diarrhea · dry skin · erythema · hand-foot syndrome · headache · hyperglycaemia · hyperkeratosis · hypophosphataemia · influenza-like symptoms · malaise · myalgia · nausea · papilloma · pruritus · pyrexia · rash · seborrhoeic keratosis · skin lesions · skin tags · vomiting

Uncommon
Nephritis · new primary melanoma · pancreatitis · panniculitis · QT-interval prolongation · renal failure · uveitis

Frequency not known
Thromboembolism

SIDE-EFFECTS, FURTHER INFORMATION

Additional side-effects reported when used in combination with trametinib include dizziness, hyperhidrosis, hyponatraemia, hypotension, leucopenia, muscle spasms, myocardiitis, neutropenia, night sweats, and thrombocytopenia.

CONCEPTION AND CONTRACEPTION
Manufacturer advises avoid unless potential benefit outweighs risk— toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

PREGNANCY
Manufacturer advises avoid unless potential benefit outweighs risk— toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

BREAST FEEDING
Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT
Manufacturer advises caution in moderate to severe impairment.

RENAL IMPAIRMENT
Manufacturer advises caution in severe impairment—no information available.

MONITORING REQUIREMENTS

Manufacturer advises assess for cutaneous squamous cell carcinoma and new primary melanoma before treatment, monthly during treatment, and for 6 months after discontinuation or until initiation of alternative treatment; assess and monitor for non-cutaneous secondary or recurrent malignancy before, during, and for 6 months after discontinuation or until initiation of alternative treatment—consult product literature.

Monitor full blood count as clinically indicated.

Monitor for ophthalmologic reactions including uveitis, iridocyclitis and iritis.

Monitor serum creatinine.

IMPORTANT SAFETY INFORMATION
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 825.
DRUG ACTION

Dasatinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

BY MOUTH

Adult: 100 mg once daily, then increased if necessary up to 140 mg once daily

Accelerated and blast phase chronic myeloid leukaemia (consult product literature for details) · Acute lymphoblastic leukaemia (consult product literature for details)

BY MOUTH

Adult: 140 mg once daily, then increased if necessary up to 180 mg once daily

INDICATIONS AND DOSE

Chronic phase chronic myeloid leukaemia (consult product literature for details)

BY MOUTH

Adult: 100 mg once daily, then increased if necessary up to 140 mg once daily

CAUTIONS

Hepatitis B infection · risk of cardiac dysfunction (monitor closely) · susceptibility to QT-interval prolongation (correct hypokalaemia or hypomagnesaemia before starting treatment)

CAUTIONS, FURTHER INFORMATION

Pulmonary arterial hypertension Patients should be evaluated for signs and symptoms of underlying cardiopulmonary disease before starting treatment; echocardiography should be performed at the start of treatment in patients with symptoms of cardiac disease and considered for patients with risk factors for cardiac or pulmonary disease.

Treatment should be interrupted or the dose reduced in patients who develop dyspnoea or fatigue, while they are evaluated for signs of active infection.

If pulmonary arterial hypertension is confirmed, dasatinib should be permanently discontinued.

Patients who test positive for hepatitis B virus and in those patients who develop dyspnoea or fatigue, while they are evaluated for common aetiologies (e.g. pleural effusion, pulmonary oedema, anaemia or lung infiltration); pulmonary arterial hypertension should be considered in the absence of these conditions, and if there is no improvement following dose reduction or interruption.

Demand should be carried for hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

INTERACTIONS ▶ Appendix 1: dasatinib

SIDE-EFFECTS

Common or very common Abdominal pain · acne · anorexia · arrhythmias · chest pain · CNS haemorrhage · colitis · congestive heart failure · constipation · cough · depression · dermatitis · diarrhoea · dizziness · dry skin · dyspepsia · dyspnoea · flushing · gastritis · gastro-intestinal haemorrhage · haemorrhage · headache · hypertension · influenza-like symptoms · insomnia · musculoskeletal pain · neuropathy · oedema (more common in patients over 65 years old) · palpitation · pleural effusion · pruritus · pulmonary hypertension · sweating · taste disturbance · tinnitus · uticaria · visual disturbances · weight changes

Uncommon Amnesia · asthma · cholecytis · cholestasis · drowsiness · erythema nodosum · gynaecomastia · hepatitis · hypersensitivity reactions · hypocalcaemia · hypotension · irregular menstruation · nail disorders · oesophagitis · pancreatitis · photosensitivity · pigmentation · proteinuria · rhabdomyolysis · seizures · syncope · thrombophlebitis · transient ischaemic attack · tremor · urinary frequency

Rare Cor pulmonale

Frequency not known Alopecia · bone-marrow suppression · hepatic failure (fatal cases reported) · hepatitis B reactivation · hyperuricaemia · interstitial lung disease · nausea · oral mucositis · thromboembolism · thrombosis · tumour lysis syndrome · vomiting

CONCEPTION AND CONCEPTION Effective contraception required during treatment.

PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

BREAST FEEDING

Discontinue breast-feeding.

HEPATIC IMPAIRMENT

Manufacturer advises caution in hepatic impairment.
### NATIONAL FUNDING/ACCESS DECISIONS

**NICE technology appraisals (TAs)**

- Dasatinib, nilotinib and imatinib for untreated chronic myeloid leukaemia (CML) (December 2016) NICE TA426
  Dasatinib is recommended, within its marketing authorisation, as an option for untreated chronic phase Philadelphia-chromosome-positive CML, only if the manufacturer provides it with the discount agreed in the patient access scheme. [www.nice.org.uk/TA426](http://www.nice.org.uk/TA426)

- Dasatinib, nilotinib and high-dose imatinib for treating imatinib-resistant or intolerant chronic myeloid leukaemia (CML) (December 2016) NICE TA425
  Dasatinib is recommended as an option for treating chronic or accelerated phase Philadelphia-chromosome-positive CML in adults, if they cannot have imatinib, or their disease is imatinib-resistant and the manufacturer provides dasatinib with the discount agreed in the patient access scheme.

  Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop. [www.nice.org.uk/TA425](http://www.nice.org.uk/TA425)

---

### SCOTTISH MEDICINES CONSORTIUM (SMC) DECISIONS

**The Scottish Medicines Consortium has advised** (September 2016) that dasatinib (Sprycel®) is accepted for use within NHS Scotland for the treatment of adults with chronic, accelerated or blast phase chronic myelogenous leukaemia (CML) with resistance or intolerance to prior therapy including imatinib mesilate, only if the manufacturer provides dasatinib with the discount agreed in the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

The **Scottish Medicines Consortium has advised** (September 2016) that dasatinib (Sprycel®) is accepted for use within NHS Scotland for the treatment of adults with newly diagnosed Philadelphia chromosome positive (Ph+) chronic myelogenous leukaemia (CML) in the chronic phase, only if the manufacturer provides dasatinib with the discount agreed in the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

---

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Erlotinib

**DRUG ACTION** Erlotinib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**

- Treatment of locally advanced or metastatic non-small cell lung cancer after failure of previous chemotherapy
- Monotherapy for maintenance treatment of locally advanced or metastatic non-small cell lung cancer with stable disease after four cycles of platinum-based chemotherapy

**BY MOUTH**

- Adult: 150 mg once daily

---

### Treatment of metastatic pancreatic cancer (in combination with gemcitabine)

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises if concurrent use of potent inducers of CYP3A4 is unavoidable, increase dose to 300 mg daily, if well tolerated for more than 2 weeks, further increase to 450 mg daily could be considered with close monitoring.

**IMPORTANT SAFETY INFORMATION**

**EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)**

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 825.

**CAUTIONS, FURTHER INFORMATION**

- Smoking: Dose adjustment may be necessary if smoking started or stopped during treatment.

**INTERACTIONS**

- Common or very common: Abdominal pain, anorexia, conjunctivitis, depression, diarrhoea, dry skin, dyspepsia, fatigue, flatulence, headache, neuropathy, pruritus, rigor.

**SIDE-EFFECTS**

- Uncommon: Eyelash changes, gastro-intestinal perforation, interstitial lung disease—discontinue if unexplained symptoms such as dyspnoea, cough or fever occur.

- Rare: Hepatic failure.

**CONCEPTION AND CONTRACEPTION**

Effective contraception required during and for at least 2 weeks after treatment.

**PREGNANCY**

Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment. Monitor liver function in pre-existing liver disease.

**RENAL IMPAIRMENT**

Manufacturer advises avoid in severe impairment.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Erlotinib monotherapy for maintenance treatment of non-small-cell lung cancer (June 2011) NICE TA227
  Erlotinib monotherapy is not recommended for maintenance treatment in patients with locally advanced...
Erlotinib is recommended as an option in patients for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer that has progressed after non-targeted chemotherapy in patients with tumours of unknown epidermal growth factor receptor tyrosine kinase (EGFR-TK) mutation status, only if all of the following criteria are met:

- the result of an EGFR-TK mutation diagnostic test is unobtainable because of an inadequate tissue sample or poor-quality DNA,
- the treating clinician considers that the tumour is very likely to be EGFR-TK mutation-positive,
- the patient’s condition responds to the first 2 cycles of treatment with erlotinib, and,
- the manufacturer provides erlotinib with the discount agreed in the patient access scheme.

Erlotinib is not recommended for treating locally advanced or metastatic non-small-cell lung cancer that has progressed after non-targeted chemotherapy in patients with tumours that are EGFR-TK mutation-negative.

Patients who are already receiving erlotinib should continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA374

### Important Safety Information

  - **Common or very common** Abdominal pain, anorexia, arthralgia, asthenia, chest pain, convulsions, dehydration, diarrhoea, dry mouth, dysphagia, electrolyte disturbance, epistaxis, eyelid oedema, fatigue, hand-foot syndrome, headache, hypercholesterolaemia, hyperglycaemia, hyperlipidaemia, hypertension, hypoglycaemia, increased susceptibility to aspergillosis, increased susceptibility to candidiasis, increased...
susceptibility to infections · increased susceptibility to pneumonia · insomnia · interstitial lung disease · irritability · nail disorders · peripheral oedema · pneumonitis · renal failure · skin disorders · taste disturbance

- **Uncommon** Agitation · agitation · congestive heart failure · flushing · impaired wound healing · rhadomyolysis
- **Frequency not known** Alopecia · bone-marrow suppression · haemorrhage · hepatitis B reactivation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
Reduce dose or discontinue if severe side-effects occur—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during and for up to 8 weeks after treatment.
- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Consult product literature.
- **MONITORING REQUIREMENTS**
  - For Votubia® preparations: manufacturer advises everolimus blood concentration monitoring is required—consult product literature.
  - For Certican®: manufacturer advises pre-dose (‘tough’) whole blood everolimus concentration should be 3–8 nanograms/mL; monitoring should be performed every 4–5 days (using chromatographic assay) after initiation or dose adjustment until 2 consecutive stable concentrations; monitor patients with hepatic impairment taking concomitant strong CYP3A4 inducers and inhibitors when switching formulation, and/or if concomitant ciclosporin dose is reduced.
  - Monitor blood-glucose concentration, serum-triglycerides and serum-cholesterol before treatment and periodically thereafter.
  - Monitor renal function before treatment and periodically thereafter.

- **DIRECTIONS FOR ADMINISTRATION**
  - **VOTUBIA® DISPERSBLE TABLETS** Manufacturer advises tablets must be dispersed in water before administration—consult product literature for details.
  - **VOTUBIA® TABLETS** Tablets may be dispersed in approximately 30 mL of water by gently stirring, immediately before drinking. After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed.

- **PRESCRIBING AND DISPENSING INFORMATION** Votubia® is available as both tablets and dispersible tablets. These formulations vary in their licensed indications and are not interchangeable—consult product literature for information on switching between formulations.

- **PATIENT AND CARER ADVICE**
Pneumonitis Non-infectious pneumonitis reported. Patients should be advised to seek urgent medical advice if new or worsening respiratory symptoms occur.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE technology appraisals (TAs)**
    - Everolimus with exemestane for treating advanced breast cancer after endocrine therapy (December 2016) NICE TA421
    - Everolimus, in combination with exemestane, is recommended within its marketing authorisation for treating advanced human epidermal growth factor receptor 2 (HER2)-negative, hormone-receptor-positive breast cancer in postmenopausal women without symptomatic visceral disease that has recurred or progressed following treatment with a non-steroidal aromatase inhibitor. Everolimus is recommended only if the manufacturer provides it with the discount agreed in the patient access scheme.
    - www.nice.org.uk/TA421
  - **Everolimus for advanced renal cell carcinoma after previous treatment (February 2017) NICE TA432**
    - Everolimus is recommended within its marketing authorisation as an option for treating advanced renal cell carcinoma that has progressed during or after treatment with vascular endothelial growth factor targeted therapy. Everolimus is only recommended if the manufacturer provides it with the discount agreed in the patient access scheme.
    - www.nice.org.uk/TA432

  - **CERTICAN®**
    - **Scottish Medicines Consortium (SMC) Decisions**
      - The Scottish Medicines Consortium has advised (April 2012) that everolimus (Afinitor®) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic, well- or moderately-differentiated neuroendocrine tumours of pancreatic origin (pNET) in adults with progressive disease.
      - The Scottish Medicines Consortium has advised (February 2017) that everolimus (Afinitor®) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic, well-differentiated (Grade 1 or Grade 2) non-functional neuroendocrine tumours of gastrointestinal or lung origin in adults with progressive disease. The advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

  - **AFINITOR®**
    - **NICE technology appraisals (TAs)**
      - Everolimus for preventing organ rejection in liver transplantation (July 2015) NICE TA348
      - Everolimus (Certican®) is not recommended within its marketing authorisation for preventing organ rejection in patients who have undergone a liver transplant. Patients currently receiving everolimus for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop.
      - www.nice.org.uk/TA348

**Gefitinib**

27-May-2016

**INDICATIONS AND DOSE**

Treatment of locally advanced or metastatic non-small cell lung cancer with activating mutations of epidermal growth factor receptor

- **BY MOUTH**
  - Adult: 250 mg once daily

**INDICATIONS AND DOSE**

Treatment of locally advanced or metastatic non-small cell lung cancer with activating mutations of epidermal growth factor receptor

- **BY MOUTH**
  - Adult: 250 mg once daily

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM Advice: Epidermal Growth Factor Receptor (EGFR) Inhibitors: Serious Cases of Keratitis and Ulcerative Keratitis (May 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cefoxime, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 825.

**INTERACTIONS** → Appendix 1: gefitinib

**SIDE-EFFECTS**

- **Common or very common** Acne - anorexia - asthenia - blepharitis - conjunctivitis - diarrhea - dry eye - dry mouth - dry skin - epistaxis - haematuria - interstitial lung disease - discontinue if confirmed - nail disorder - proteinuria - pruritus - pyrexia - rash - skin reactions
- **Rare** Hepatitis - toxic epidermal necrosis
- **Frequency not known** Alopecia - bone-marrow suppression - hyperuricaemia - nausea - oral mucositis - thrombocytopenia - tumour lysis syndrome - vomiting

**CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment due to cirrhosis.

**RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 20 mL/minute.

**MONITORING REQUIREMENTS**

- Monitor for worsening of dyspnoea, cough and fever—discontinue if interstitial lung disease confirmed.
- Monitor liver function—consider discontinuing if severe changes in liver function occur.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Gefitinib for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer (July 2010) NICE TA192

Gefitinib is recommended as an option for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if the patient tests positive for the epidermal growth receptor tyrosine kinase (EGFR-TK) mutation and the manufacturer provides gefitinib at the fixed price agreed under the patient access scheme.

www.nice.org.uk/TA192

**ERLOTINIB AND GEFITINIB FOR TREATING NON-SMALL-CELL LUNG CANCER THAT HAS PROGRESSED AFTER PRIOR CHEMOTHERAPY (DECEMBER 2015) NICE TA374**

Gefitinib is not recommended for treating locally advanced or metastatic non-small-cell lung cancer that has progressed after non-targeted chemotherapy in patients with tumours that are EGFR-TK mutation-positive.

Patients who are already receiving gefitinib should continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA374

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (December 2015) that gefitinib (Iressa®) is accepted for restricted use within NHS Scotland for the treatment of adult patients with previously untreated locally advanced or metastatic non-small cell lung cancer (NSCLC) with activating mutations of epidermal growth factor receptor tyrosine kinase (EGFR-TK).

**MEDIICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Iressa** (AstraZeneca UK Ltd)
  - Gefitinib 250 mg
  - Iressa 250mg tablets | 30 tablet
  - **PO** £2,167.71

---

**Ibrutinib**

06-Jun-2017

**INDICATIONS AND DOSE**

Treatment of relapsed or refractory mantle cell lymphoma

- **BY MOUTH**
  - Adult: 560 mg once daily, for dose adjustments due to side effects consult product literature

Treatment of chronic lymphocytic leukaemia, in patients who have received at least one prior therapy, or as first-line treatment in patients with 17p deletion or TP53 mutation who are unsuitable for chemo-immunotherapy

- **BY MOUTH**
  - Adult: 420 mg once daily, for dose adjustments due to side effects consult product literature

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises if concurrent use of moderate inhibitors of CYP3A4 or ciprofloxacin is unavoidable, reduce dose to 140 mg once daily.

Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 140 mg once daily, or withhold ibrutinib for up to 7 days.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 825.

**INTERACTIONS** → Appendix 1: ibrutinib
Idelalisib

16-Nov-2016

**DRUG ACTION**

Idelalisib is a protein kinase inhibitor.

**INDICATIONS AND DOSE**

Treatment of chronic lymphocytic leukaemia in patients who have received at least one previous therapy, or as first-line treatment in the presence of 17p deletion or TP53 mutation in patients who are not eligible for any other therapies (in combination with rituximab)

**SIDE-EFFECTS**

Common or very common
- Arthralgia, atrial fibrillation, blurred vision, bruising, constipation, dehydration, diarrhoea, diziness, dry mouth, epistaxis, haemorrhage, headache, musculoskeletal pain, peripheral oedema, petechiae, pyrexia, rash, respiratory tract infection, sepsis, sinusitis, skin infection, subdural haematoma, urinary tract infection

Uncommon
- Alopecia, bone-marrow suppression, hyperuricaemia, nausea, oral mucositis, thromboembolism, tumour lysis syndrome, vomiting

**CONCEPTION AND CONTRACEPTION**

Highly effective contraception (must include a non-hormonal method) required during and for 3 months after stopping treatment.

**PREGNANCY**

Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING**

Manufacturer advises discontinue breastfeeding—no information available.

**HEPATIC IMPAIRMENT**

Reduce dose to 280 mg daily in mild impairment and reduce dose to 140 mg daily in moderate impairment—monitor for toxicity and adjust dose if necessary (consult product literature). Avoid in severe impairment.

**RENAI IMPAIRMENT**

Use in severe impairment only if benefit outweighs risk and with close monitoring for toxicity. Maintain hydration and monitor serum creatinine periodically in mild to moderate renal impairment.

**MONITORING REQUIREMENTS**

- Monitor full blood count once a month.
- Monitor for atrial fibrillation (increased risk in cardiac risk factors, acute infections and history of atrial fibrillation), monitor all patients periodically and complete ECG if arrhythmic symptoms or dyspnoea develop—consult product literature for treatment options.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Ibrutinib for previously treated chronic lymphocytic leukaemia and untreated chronic lymphocytic leukaemia with 17p deletion or TP53 mutation (January 2017) NICE TA429

Ibrutinib is recommended within its marketing authorisation as an option for treating chronic lymphocytic leukaemia in adults who have had at least one prior therapy or who have a 17p deletion or TP53 mutation, and in whom chemo-immunotherapy is unsuitable, only when the manufacturer provides ibrutinib with the discount agreed in the patient access scheme.

www.nice.org.uk/TA429

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (April 2017) that ibritunib (Imbruvica®) is accepted for restricted use within NHS Scotland for the treatment of relapsed or refractory chronic lymphocytic leukaemia in adults who have received at least one prior therapy and for whom fludarabine-based regimens are inappropriate. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

**CAUTIONS**

Active hepatitis, diarrhoea—symptomatic management recommended (consult product literature) · pneumonitis— withhold treatment (consult product literature)

**INTERACTIONS**

- Appendix 1: idelalisib

**SIDE-EFFECTS**

Alopecia, bone-marrow suppression, diarrhoea, hyperuricaemia, nausea, oral mucositis, neutropenia, oral mucositis, pneumonitis, pyrexia, rash, thromboembolism, tumour lysis syndrome, vomiting

**CONCEPTION AND CONTRACEPTION**

Highly effective contraception (in addition to barrier method) required during and for one month after treatment.

**PREGNANCY**

Manufacturer advises avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in hepatic impairment.

**MONITORING REQUIREMENTS**

- Manufacturer advises monitor liver function—consult product literature.

- Manufacturer advises monitor for signs and symptoms of infection, including cytomegalovirus infection and respiratory infections; new symptoms should be reported promptly. Neutrophil count should be monitored in all patients every 2 weeks for the first 6 months of treatment; patients with neutrophil count <1000 per mm³ should be monitored weekly.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Ibrutinib for treating chronic lymphocytic leukaemia (October 2015) NICE TA359

Ibrutinib, in combination with rituximab, is recommended as an option for treatment in adults:

- who have untreated chronic lymphocytic leukaemia
- who have chronic lymphocytic leukaemia when the disease has been treated but has relapsed within 24 months and

**IMPOR TANT SAFETY INFORMATION**

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

### INDICATIONS AND DOSE

- **Treatment of chronic myeloid leukaemia in chronic phase after failure with interferon alfa**
  - **BY MOUTH**
  - Adult: 400 mg once daily, increased if necessary up to 800 mg daily in 2 divided doses

- **Treatment of chronic myeloid leukaemia in accelerated phase, or in blast crisis**
  - **BY MOUTH**
  - Adult: 600 mg once daily, then increased if necessary up to 800 mg daily in 2 divided doses

- **Treatment of newly diagnosed acute lymphoblastic leukaemia (in combination with other chemotherapy)**
  - **BY MOUTH**
  - Adult: 600 mg once daily

- **Treatment of c-kit (CD117)-positive unresectable or metastatic malignant gastro-intestinal stromal tumours (GIST)**
  - **BY MOUTH**
  - Adult: 400 mg once daily

### SIDE-EFFECTS

- **Common** Abdominal pain, appetite changes, arthralgia, ascites, conjunctivitis, constipation, cough, cramps, diarrhoea, dizziness, dry eyes, dry mouth, dry skin, dyspnoea, epistaxis, fatigue, flatulence, flushing, gastro-oesophageal reflux, haemorrhage, headache, hypoaesthesia, increased lacrimation, influenza-like symptoms, insomnia, oedema, paraesthesia, photosensitivity, pleural effusion, pruritus, pulmonary oedema, rash, sweating, taste disturbance, visual disturbances, weight changes

- **Uncommon** Acute respiratory failure, anxiety, cold extremities, cough, depression, drowsiness, dysphagia, electrolyte disturbances, gastric ulceration, gout, gynaecomastia, haemoptysis, heart failure, hepatic dysfunction, hepatitis, hypertension, hypotension, impaired memory, irregular menstruation, menorrhagia, migraine, palpitation, pancreatitis, peripheral neuropathy, renal failure, sexual dysfunction, skin hyperpigmentation, syncope, tachycardia, tinnitus, tremor, urinary frequency, vertigo

- **Rare** Angina, angiodema, arthralgia, aseptic necrosis of bone, atrial fibrillation, cataract, confusion, convulsions, exfoliative dermatitis, gastro-intestinal perforation, glaucoma, haemolytic anaemia, hepatic failure, hepatic failure (fatal cases reported), hepatic necrosis, increased intracranial pressure, inflammatory bowel disease, intestinal obstruction, myocardial infarction, myopathy, pulmonary fibrosis, pulmonary hypertension, rhabdomyolysis, Stevens-Johnson syndrome

- **Frequency not known** Alopecia, bone marrow suppression, drug rash with eosinophilia and systemic symptoms (DRESS), growth retardation in children, hepatitis B reactivation, hyperuricaemia, menorrhagia, menorrhagia, myelodysplastic/myeloproliferative diseases associated with platelet-derived growth factor receptor gene rearrangement

### IMPORTANT SAFETY INFORMATION

- **RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES** See Cytotoxic drugs p. 825

- **MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS** An EU wide review has concluded that imatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

### CAUTIONS

- Cardiac disease
- Hepatitis B infection
- History of renal failure
- Risk factors for heart failure

### CONCEPTION AND CONTRACEPTION

Effective contraception required during treatment.

---

**Treatment of unresectable dermatofibrosarcoma protuberans | Recurrent or metastatic dermatofibrosarcoma protuberans, in patients who cannot have surgery**

- **BY MOUTH**

- Adult: 800 mg daily in 2 divided doses

**Treatment of advanced hypereosinophilic syndrome and chronic eosinophilic leukaemia**

- **BY MOUTH**

- Adult: 100–400 mg once daily

---

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (March 2015) that idelalisib (Zydelig<sup>®</sup>) is accepted for restricted use within NHS Scotland, in combination with rituximab, for the treatment of relapsed chronic lymphocytic leukaemia in patients who are unsuitable for chemotherapy and treatment naïve patients with 17p deletion or TP53 mutation who are unsuitable for chemo-immunotherapy, only whilst idelalisib is available at the price agreed in the patient access scheme.

**All Wales Medicines Strategy Group (AWMSG) Decisions**

The All Wales Medicines Strategy Group has advised (April 2017) that idelalisib (Zydelig<sup>®</sup>) is recommended as an option for use within NHS Wales as monotherapy for the treatment of patients with follicular lymphoma, that is refractory to two prior lines of treatment. The recommendation applies only if the approved Wales Patient Access Scheme (WPAS) is used or where the list price is equivalent or lower.
Imatinib for the treatment of unresectable and/or metastatic gastrointestinal stromal tumours (October 2004) NICE TA86

Imatinib 400 mg daily is recommended as first-line management of KIT (CD117)-positive unresectable or metastatic, or both, gastrointestinal stromal tumours. Continued therapy is recommended only if a response to initial treatment [as defined by Southwest Oncology Group criteria available at www.nice.org.uk/TA86] is achieved within 12 weeks. Patients who have responded should be assessed at 12-week intervals. Discontinue if tumour ceases to respond.

www.nice.org.uk/TA86

Imatinib for the treatment of unresectable and/or metastatic gastrointestinal stromal tumours (November 2010) NICE TA209

Imatinib 600 mg daily or 800 mg daily is not recommended for unresectable or metastatic, or both, gastrointestinal stromal tumours whose disease has progressed after treatment with imatinib 400 mg daily.

www.nice.org.uk/TA209

Dasatinib, nilotinib and imatinib for treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/TA425

Dasatinib, nilotinib and high-dose imatinib for treating imatinib-resistant or intolerant chronic myeloid leukaemia (CML) (December 2016) NICE TA425

High-dose imatinib (600 mg in the chronic phase or 800 mg in the accelerated and blast-crisis phases) is not recommended for treating Philadelphia-chromosome-positive CML in adults whose disease is imatinib-resistant.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

Dasatinib, nilotinib and imatinib for untreated chronic myeloid leukaemia (CML) (December 2016) NICE TA426

Imatinib is recommended as an option for untreated chronic phase Philadelphia-chromosome-positive CML in adults.

www.nice.org.uk/TA426

Lapatinib

Lapatinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

Treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2) with hormone-receptor-negative disease who have had previous treatment with trastuzumab in combination with chemotherapy (in combination with trastuzumab)

BY MOUTH

Adult: 1 g once daily
PREGNANCY

NATIONAL FUNDING/ACCESS DECISIONS

Treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2), for patients who have had previous treatment with an anthracycline, a taxane, and trastuzumab (in combination with capecitabine)

BY MOUTH
Adult: 1.25 g once daily

Treatment of advanced or metastatic breast cancer with tumours that overexpress human epidermal growth factor receptor-2 (HER2), for postmenopausal women with hormone-receptor-positive disease (in combination with an aromatase inhibitor)

BY MOUTH
Adult: 1.5 g once daily

CAUTIONS
Diarrhoea—withhold treatment if severe (consult product literature) • low gastric pH (reduced absorption) • susceptibility to QT-interval prolongation (including electrolyte disturbances)

INTERACTIONS
Appendix 1: lapatinib

SIDE-EFFECTS

Common or very common
Anorexia • cardiac failure (fatal cases reported) • decreased left ventricular ejection fraction • diarrhoea (treat promptly) • hepatotoxicity (discontinue permanently if severe) • hyperbilirubinaemia • malaise • nail disorders • rash

Uncommon
Interstitial lung disease

Frequency not known
Alopecia • bone-marrow suppression • hyperuricaemia • nausea • oral mucositis • respiratory failure (including fatal cases) • thromboembolism • tumour lysis syndrome • vomiting

CONCEPTION AND CONTRACEPTION
Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

PREGNANCY
Avoid unless potential benefit outweighs risk— toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

BREAST FEEDING
Discontinue breast-feeding.

HEPATIC IMPAIRMENT
Caution in moderate to severe impairment—metabolism reduced.

RENAL IMPAIRMENT
Caution in severe impairment—no information available.

MONITORING REQUIREMENTS
Monitor left ventricular function.
Monitor for pulmonary toxicity.
Monitor liver function before treatment and at monthly intervals.

DIRECTIONS FOR ADMINISTRATION
Always take at the same time in relation to food: either one hour before or one hour after food.

PATIENT AND CARER ADVICE
Counselling advised (administration). Patients should be advised to report any unexpected changes in bowel habit.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2 (June 2012) NICE TA257
Lapatinib or trastuzumab in combination with an aromatase inhibitor is not recommended for first-line treatment in postmenopausal women of metastatic hormone-receptor-positive breast cancer that overexpresses human epidermal growth factor receptor 2 (HER2).

Postmenopausal women currently receiving lapatinib or trastuzumab in combination with an aromatase inhibitor for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA257

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet

Tyverb (Novartis Pharmaceuticals UK Ltd)
Lapatinib difosylate monohydrate 250 mg Tyverb 250mg tablets
64 tablet PCD £35.15 | 100 tablet PCD £54.65

Lenvatinib

DRUG ACTION
Lenvatinib is a multireceptor tyrosine kinase inhibitor.

INDICATIONS AND DOSE

KISPLYX®
Advanced renal cell carcinoma following one prior vascular endothelial growth factor-targeted therapy (in combination with everolimus) (specialist use only)

BY MOUTH
Adult: 18 mg once daily, dose should be taken at the same time every day, for dose adjustment due to side-effects—consult product literature

LENVIMA®
Progressive, locally advanced, or metastatic, differentiated thyroid carcinoma that is refractory to radioactive iodine (specialist use only)

BY MOUTH
Adult: 24 mg once daily, dose should be taken at the same time every day, for dose adjustments due to side-effects—consult product literature

CONTRA-INDICATIONS
Fistulae

CAUTIONS
Arterial thromboembolism within the previous 6 months • elderly (75 years and over)—reduced tolerability • hypertension—blood pressure should be well-controlled prior to treatment

SIDE-EFFECTS

Common or very common
Abdominal pain • alopecia • anal fistula • arthralgia • asthenia • back pain • cardiac failure • cerebrovascular accident • constipation • decreased appetite • dehydration • diarrhoea • dizziness • dry mouth • dysgeusia • dyspepsia • dysphonia • electrolyte disturbances • fatigue • flatulence • haemorrhage (including fatal cases of intracranial haemorrhage) • hand-foot syndrome • headache • hepatotoxicity • hypercholesterolaemia • hyperkeratosis • hypertension • hypotension • hypothyroidism • insomnia • lymphopenia • malaise • muscularkeletal pain • myalgia • myocardial infarction • nausea • oral inflammation and pain • pain in extremity • peripheral oedema • prolonged QT interval • proteinuria • pulmonary embolism • rash • reduced ejection fraction • renal failure • renal impairment • thrombocytopenia • urinary tract infection • vomiting • weight loss

Uncommon
Hepatitis • hepatocellular damage • hand-foot syndrome • splenic infarction • transient ischaemic attack

Frequency not known
Gastro-intestinal perforation • non-gastrointestinal fistulae

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 825.

IMPORTANT SAFETY INFORMATION
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 825.

906 Targeted therapy responsive malignancy
BNF 74

Immune system and malignant disease
SIDE-EFFECTS, FURTHER INFORMATION
For further information on side-effects in special populations—consult product literature.

- Renal impairment and failure:
  Manufacturer advises gastrointestinal toxicity should be actively managed—dehydration and/or hypovolaemia caused by gastrointestinal toxicity are identified as primary risk factors for renal impairment or failure.

- CONCEPTION AND CONTRACEPTION:
  Manufacturer advises women of child-bearing potential should use highly effective contraception during treatment and for 1 month after the last dose, an additional barrier method of contraception should be used in women using oral hormonal contraceptives. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- PREGNANCY:
  Manufacturer advises avoid unless potential benefit outweighs risk—teratogenic in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- BREAST FEEDING:
  Manufacturer advises avoid—present in milk in animal studies.

- HEPATIC IMPAIRMENT:
  Kisplyx®
  Manufacturer advises reduce dose to 10 mg once daily in severe impairment; further dose adjustments may be necessary based on individual tolerability—consult product literature. Manufacturer advises use only if potential benefit outweighs risk in severe impairment.

  Lenvima®
  Manufacturer advises reduce dose to 14 mg once daily in severe impairment; further dose adjustments may be necessary based on tolerability—consult product literature.

- RENAL IMPAIRMENT:
  Kisplyx®
  Manufacturer advises reduce dose to 10 mg once daily in severe impairment; further dose adjustments may be necessary based on individual tolerability—consult product literature. Manufacturer advises avoid in end-stage renal disease.

  Lenvima®
  Manufacturer advises reduce dose to 14 mg once daily in severe impairment; further dose adjustments may be necessary based on tolerability—consult product literature. Manufacturer advises avoid in end-stage renal disease.

- MONITORING REQUIREMENTS:
  Manufacturer advises monitor blood pressure after 1 week of treatment, then every 2 weeks for the first 2 months, and then monthly thereafter; monitor for signs and symptoms of cardiac decompensation (adjust dose as necessary—consult product literature).

  Manufacturer advises monitor liver function before treatment, then every 2 weeks for the first 2 months, and then monthly thereafter; monitor urine protein regularly.

  Manufacturer advises monitor ECG and electrolytes before and periodically during treatment (calcium levels should be monitored at least monthly), correct electrolyte abnormalities prior to treatment; monitor thyroid function before and regularly during treatment.

- DIRECTIONS FOR ADMINISTRATION:
  Kisplyx®
  Manufacturer advises capsules should be swallowed whole, or alternatively, capsules may be dissolved in a tablespoon of water or apple juice (do not break or crush capsules), allow to sit for at least 10 minutes for capsule shell to dissolve.

- PATIENT AND CARER ADVICE:
  Missed doses:
  Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks:
Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue and dizziness.

- NATIONAL FUNDING/ACCESS DECISIONS:
  Lenvima®

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium (SMC) has advised (October 2016) that lenvatinib (Lenvima®) is accepted for use within NHS Scotland for treatment of adults with progressive, locally advanced or metastatic, differentiated (papillary/follicular/Hürthle cell) thyroid carcinoma, refractory to radioactive iodine. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- MEDICINAL FORMS:
  There can be variation in the licensing of different medicines containing the same drug.

Capsule:
CAUTIONARY AND ADVISORY LABELS—25

- Important Safety Information:
  Risks of incorrect dosing of oral anti-cancer medicines
  See Cytotoxic drugs p. 825.

- MHRA/CHM Advice (May 2016): Risk of Hepatitis B Virus Reactivation with Tyrosine Kinase Inhibitors
  An EU wide review has concluded that nilotinib can cause hepatitis B virus reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- CAUTIONS:
  Hepatitis B infection—history of pancreatitis—susceptibility to QT-interval prolongation (including electrolyte disturbances)

- CAUTIONS, FURTHER INFORMATION:
  - Hepatitis B infection
  The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

- INTERACTIONS:
  → Appendix 1: nilotinib

Nilotinib
27-Jul-2016

### Osimertinib

- **DRUG ACTION**
  - Osimertinib is a tyrosine kinase inhibitor.

- **INDICATIONS AND DOSE**
  - Locally advanced or metastatic epidermal growth factor receptor T790M mutation-positive non-small-cell lung cancer (specialist use only)
    - **BY MOUTH**
      - Adult: 80 mg once daily, for dose adjustment due to side-effects—consult product literature

- **IMPORTANT SAFETY INFORMATION**
  - **RISKS OF INCORRECT DOING OF ORAL ANTI-CANCER MEDICINES**
    - See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS**
  - Congenital long QT syndrome

- **CAUTIONS**
  - Elderly (more frequent dose adjustments may be required) — history of interstitial lung disease — radiation pneumonitis requiring steroid treatment — risk factors for QTc interval prolongation

- **INTERACTIONS**
  - Appendix 1: osimertinib

- **SIDE-EFFECTS**
  - Common or very common: Diarrhoea, dry skin disorders — interstitial lung disease (including pneumonitis) — nail disorders — pruritus — rash — stomatitis
  - Uncommon: QTc interval prolongation

- **CONCEPTION AND CONTRACEPTION**
  - Manufacturer advises use of effective, non-hormonal, contraception during and for 2 months after treatment in women, and 4 months after treatment in men.

- **PREGNANCY**
  - Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- **BREAST FEEDING**
  - Manufacturer advises avoid—may be present in milk based on animal studies.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in mild impairment. Avoid in moderate and severe impairment—limited information available.

- **RENAL IMPAIRMENT**
  - Manufacturer advises caution in severe and end-stage impairment—limited information available.

- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor ECG and electrolytes periodically in patients with risk factors for QTc interval prolongation; dose adjustment is advised if QTc interval is more than 500 milliseconds on at least 2 separate ECGs—consult product literature.

- **DIRECTIONS FOR ADMINISTRATION**
  - Manufacturer advises tablet may be dispersed in 50 mL of non-carbonated water, by stirring until dispersed and swallowed immediately (do not crush). The residue must then be re-dispersed in an additional half a glass of water and immediately swallowed. Manufacturer advises if administration via a nasogastric tube is required, the tablet may be dispersed in 15 mL of non-carbonated water, by stirring until dispersed and the residue re-dispersed in an additional 15 mL of water (do not crush). The total 30 mL of liquid should then be administered as per the nasogastric tube manufacturer’s instructions with appropriate water flushes; the solution should be administered within 30 minutes of adding the tablets to water.

- **PATIENT AND CARER ADVICE**
  - Missed doses
    - Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

---

**Osimertinib (as Osimertinib hydrochloride monohydrate)**

- 200 mg Tasigna 200mg capsules | 112 capsule (P) £2,432.85
NATIONAL FUNDING/ACCESS DECISIONS

Osimertinib for locally advanced or metastatic EGFR T790M mutation-positive non-small-cell lung cancer (October 2016) NICE TA416

Osimertinib is recommended as an option, for use within the Cancer Drugs Fund, for treating locally advanced or metastatic epidermal growth factor receptor (EGFR) T790M mutation-positive non-small-cell lung cancer in adults whose disease has progressed only:

- after first-line treatment with an EGFR tyrosine kinase inhibitor, and
- if the conditions in the managed access agreement for osimertinib are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA416

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium (Tagrisso®) is accepted for restricted use within NHS Scotland for the treatment of adult patients with locally advanced or metastatic epidermal growth factor receptor (EGFR) T790M mutation-positive non-small-cell lung cancer, only in patients who have received previous treatment with an EGFR tyrosine kinase inhibitor. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Tagrisso (AstraZeneca UK Ltd) 40 mg Tagrisso 40mg tablets | 30 tablet (Pom) £5,770.00
- Osimertinib (as Osimertinib mesylate) 80 mg Osimertinib 80mg tablets | 30 tablet (Pom) £5,770.00

Palbociclib

DRUG ACTION

Palbociclib is a highly selective inhibitor of cyclin–dependent kinases 4 and 6, which leads to disruption of cancer cell proliferation.

INDICATIONS AND DOSE

Locally advanced or metastatic breast cancer in patients with hormone-receptor positive, HER2-negative tumours, in combination with an aromatase inhibitor or fulvestrant (specialist use only)

- BY MOUTH
- Adult: 125 mg once daily for 21 consecutive days of repeated 28 day cycles, for dose adjustments due to side-effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS

If concomitant use with potent CYP3A4 inhibitors (such as clarithromycin, indinavir, itraconazole, ketoconazole, lopinavir boosted with ritonavir, posaconazole, saquinavir, telaprevir, or voriconazole) is unavoidable, reduce palbociclib dose to 75 mg once daily. If the CYP3A4 inhibitor is stopped, increase the palbociclib dose (after 3–5 half lives of the inhibitor) to the dose used before starting the CYP3A4 inhibitor.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 825.

INTERACTIONS

Appendix 1: palbociclib

SIDE-EFFECTS

- Common or very common Alopecia · anaemia · asthenia · blurred vision · decreased appetite · diarrhea · dry eye · dry skin · dysgeusia · epistaxis · fatigue · Increased lacrimation · infections · leukopenia · nausea · neutropenia · pyrexia · rash · stomatitis · thrombocytopenia · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects are reported when used in combination with letrozole or fulvestrant.

CONCEPTION AND CONTRACEPTION

Manufacturer advises effective contraception in women of childbearing potential during treatment and for at least 3 weeks after completing treatment. Male patients should use effective contraception during treatment and for at least 14 weeks after completing treatment if their partner is of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

PREGNANCY

Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

BREAST FEEDING

Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT

Manufacturer advises caution in moderate-to-severe impairment—no information available.

RENAL IMPAIRMENT

Manufacturer advises caution in severe impairment—no information available.

MONITORING REQUIREMENTS

Manufacturer advises monitor full blood count prior to starting therapy, at the start of each cycle, on day 14 of the first 2 cycles and as clinically indicated.

PATIENT AND CARER ADVICE

Missed doses

Manufacturer advises to take palbociclib at the same time each day; if a dose is missed, the missed dose should not be taken and the next dose should be taken at the usual time.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 1, 21, 25

Ibrance (Pfizer Ltd)

- Palbociclib 75 mg Ibrance 75mg capsules | 21 capsule (Pom) £2,950.00 (Hospital only)
- Palbociclib 100 mg Ibrance 100mg capsules | 21 capsule (Pom) £2,950.00 (Hospital only)
- Palbociclib 125 mg Ibrance 125mg capsules | 21 capsule (Pom) £2,950.00 (Hospital only)

Pazopanib

DRUG ACTION

Pazopanib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE

First-line treatment of advanced renal cell carcinoma

Treatment of advanced renal cell carcinoma in patients who have had previous treatment with cytokine therapy

- BY MOUTH
- Adult: 800 mg daily, adjust dose in steps of 200 mg according to tolerability; maximum 800 mg per day

Treatment of selective subtypes of advanced soft-tissue sarcoma

- BY MOUTH
- Adult: (consult product literature) continued

downloaded from www.medicalbr.com
DOSE ADJUSTMENTS DUE TO INTERACTIONS
Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 400 mg daily.

IMPORTANT SAFETY INFORMATION
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 825.

CONTRA-INDICATIONS
Cerebral haemorrhage • clinically significant gastro-intestinal haemorrhage • haemoptysis in the past 6 months

CAUTIONS
Cardiac disease • increased risk of gastro-intestinal fistulas • increased risk of gastro-intestinal perforation • increased risk of haemorrhage • increased risk of thrombosis microangiopathy—permanently discontinue if symptoms develop • ischaemic stroke • myocardial infarction • risk of thrombotic events • susceptibility to QT-interval prolongation (including electrolyte disturbances) • transient ischaemic attack

CAUTIONS, FURTHER INFORMATION
Elective surgery: Discontinue treatment 7 days before elective surgery and restart only if adequate wound healing.

SIDE-EFFECTS
Common or very common Abdominal distension • abdominal pain • anorexia • blood disorders • blurred vision • chest pain • cough • dehydration • diarrhoea • dizziness • dry mouth • dry skin • dyspepsia • dyspnoea • epistaxis • flatulence • flushing • hair discoloration • headache • hepatic dysfunction • hiccups • hyperalbuminaemia • hyperbilirubinaemia • hypertension • hypothyroidism • increased amylase • insomnja • malaise • muscle spasm • myalgia • nail disorders • oedema • paraesthesia • pneumothorax • proteinuria (discontinue if grade 4) • skin discoloration • skin reactions • sweating • taste disturbance • thrombocytopenia • venous thromboembolic events • voice changes • weight loss

Uncommon Arthralgia • bradycardia • cardiac dysfunction • fistula • gastro-intestinal perforation • haemorrhage • hepatic failure • hypertensive crisis • hypomagnesaemia • menstrual disturbances • myocardial infarction • myocardial ischaemia • oropharyngeal pain • pancreatitis • peripheral neuropathy • peritonitis • photosensitivity reactions • pulmonary embolism • QT-interval prolongation • stroke • transient ischaemic attack

Rare Thrombotic microangiopathy

Frequency not known Alopecia • bone-marrow suppression • hyperuricaemia • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting

CONCEPTION AND CONTRACEPTION
Effective contraception advised during treatment.

PREGNANCY
Avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

BREAST FEEDING
Discontinue breast-feeding.

HEPATIC IMPAIRMENT
Reduce dose to 200 mg once daily in moderate impairment. Use with caution in mild to moderate impairment. Avoid in severe impairment.

RENAL IMPAIRMENT
Use with caution if creatinine clearance less than 30 mL/minute—no information available.

MONITORING REQUIREMENTS
Monitor liver function before treatment and at weeks 3, 5, 7, and 9, then at months 3 and 4, and periodically thereafter as clinically indicated—consult product literature if elevated liver enzymes observed.

Monitor blood pressure within 1 week of treatment initiation, then frequently throughout treatment (consider dose reduction or interruption if hypertension uncontrolled despite anti-hypertensive therapy; discontinue if blood pressure persistently elevated despite anti-hypertensive therapy and pazopanib dose reduction—consult product literature).

Monitor for signs or symptoms of congestive heart failure—monitor left ventricular ejection fraction in patients at risk of heart failure before and during treatment.

Monitor for proteinuria.

Monitor thyroid function.

Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including headache, hypertension, seizure, lethargy, confusion, visual and neurological disturbances)—permanently discontinue treatment if symptoms occur.

PATIENT AND CARER ADVICE
Patients should be advised not to take antacids for at least 1 hour before or 2 hours after pazopanib.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (February 2011) that pazopanib (Votrient®) is accepted for restricted use within NHS Scotland for the first-line treatment of advanced renal cell carcinoma and (December 2012) is not recommended for use within NHS Scotland for the treatment of selective subtypes of advanced soft tissue sarcoma in patients who have received prior chemotherapy for metastatic disease, or who have progressed within 12 months after neoadjuvant therapy.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

910 Targeted therapy responsive malignancy

BNF 74

Immune system and malignant disease
**Ponatinib**

**INDICATIONS AND DOSE**

Treatment of chronic, accelerated, or blast phase chronic myeloid leukaemia in patients who have the T315I mutation or who have resistance to or intolerance of dasatinib or nilotinib, and for whom subsequent treatment with imatinib is not clinically appropriate.

Treatment of Philadelphia chromosome-positive acute lymphoblastic leukaemia in patients who have the T315I mutation or who have resistance to or intolerance of dasatinib, and for whom subsequent treatment with imatinib is not clinically appropriate.

- **BY MOUTH**
  - Adult: 45 mg once daily, for dose adjustments due to side-effects or dose reduction due to risk of vascular occlusive events, consult product literature.

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises consider a reduced initial dose of 30 mg daily with concurrent use of potent inhibitors of CYP3A4.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: PONATINIB: RISK OF VASCULAR OCCLUSIVE EVENTS—UPDATED ADVICE ON POSSIBLE DOSE REDUCTION (UPDATED APRIL 2017)**

The benefits and risks of ponatinib were reviewed by the European Medicines Agency’s Committee on Medicinal Products for Human Use in 2014, which recommended that strengthened warnings should be added to the product information aimed at minimising the risk of blood clots and blockages in the arteries. Additional long-term follow-up data are now available that supports new advice on dose modification to reduce this risk. The MHRA advise that although the recommended starting dose of ponatinib remains unchanged, prescribers should consider reducing the dose for patients with chronic phase chronic myeloid leukaemia (CP-CML) who have achieved a major cytogenetic response while on treatment. The following factors should be taken into account in the individual patient assessment:

- cardiovascular risk;
- side-effects of ponatinib therapy (including cardiovascular and other dose-related toxicity);
- time to cytogenetic response;
- BCR-ABL transcript levels.

The MHRA recommends close monitoring of response, if dose reduction is undertaken.

**MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS**

An EU wide review has concluded that ponatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 825.

**CAUTIONS**

- Alcohol abuse—increased risk of pancreatitis.
- Current severe hypertriglyceridaemia—increased risk of pancreatitis.
- Discontinue treatment if a complete haematologic response has not occurred within 3 months.
- Hepatitis B infection—history of myocardial infarction—do not use unless potential benefit outweighs potential risk.
- History of pancreatitis—history of stroke—do not use unless potential benefit outweighs potential risk.
- Hypertension—medically control during treatment and interrupt treatment if uncontrolled.

**CAUTIONS, FURTHER INFORMATION**

**SIDE-EFFECTS**

- Frequency not known Alopecia—bone—narrow suppression—hepatic failure (fatal cases reported)—hepatitis—hepatitis B reactivation—hyperuricaemia—jaundice—oral mucositis—thromboembolism—tumour lysis syndrome—vomiting.

**CONCESSION AND CONTRACEPTION**

Ensure effective contraception during treatment in men and women; effectiveness of hormonal contraception unknown—alternative or additional methods of contraception should be used.

**PREGNANCY**

Avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING**

Manufacturer advises discontinue breastfeeding—no information available.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in severe impairment.

**RENAL IMPAIRMENT**

No information available—manufacturer advises caution if creatinine clearance less than 50 mL/minute.

**MONITORING REQUIREMENTS**

- Manufacturer advises monitor serum lipase every 2 weeks for the first 2 months and periodically thereafter— withhold treatment if lipase elevated and abdominal symptoms occur.
- Manufacturer advises a full blood count every 2 weeks for the first 3 months and then monthly thereafter or as clinically indicated.
- Manufacturer advises monitor liver function periodically.
- Manufacturer advises monitor for vascular occlusion or thromboembolism—interrupt treatment immediately if this occurs.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 3, 25**

- **Iclusig (Incyte Biosciences UK Ltd)**
  - **Ponatinib (as Ponatinib hydrochloride) 15 mg** Iclusig 15mg tablets | 60 tablet | £5,050.00
  - **Ponatinib (as Ponatinib hydrochloride) 45 mg** Iclusig 45mg tablets | 30 tablet | £5,050.00

**Targeted therapy responsive malignancy 911**
Regorafenib

**DRUG ACTION** Regorafenib is an inhibitor of several protein kinases.

**INDICATIONS AND DOSE**
Treatment of metastatic colorectal cancer in patients who have previously been treated with, or who are unsuitable for standard treatment including fluoropyrimidine-based chemotherapy, a vascular endothelial growth factor inhibitor, and an epidermal growth factor receptor inhibitor | Treatment of unresectable or metastatic gastrointestinal stromal tumours in patients who progressed on or are intolerant to previous treatment with imatinib and sunitinib.

- **BY MOUTH**
  - Adult: 160 mg once daily for 21 consecutive days of repeated 28-day cycles, for dose adjustment due to side effects—consult product literature

**CAUTIONS** Ensure measures to prevent hand-foot skin reaction - Gilbert’s syndrome—risk of hyperbilirubinaemia - history of ischaemic heart disease—monitor for signs and symptoms of myocardial ischaemia and interrupt treatment if signs of ischaemia or infarction develop - hypertension—control blood pressure before treatment initiation and monitor as clinically indicated during treatment (review dose and consider treatment interruption if severe or persistent hypertension develops; discontinue treatment if hypertensive crisis occurs) - may impair wound healing—withdraw treatment for major surgical procedures - predisposition to bleeding

**INTERACTIONS** → Appendix 1: regorafenib

**SIDE-EFFECTS**
- **Common or very common** Abnormal international normalised ratio - biochemical disturbances - decreased appetite - diarrhoea - dry mouth - dry skin - dysphonia - electrolyte disturbances - gastro-enteritis - gastro-oesophageal reflux - haemorrhage (including fatal) - hand-foot skin reaction - headache - hypertension - hypothyroidism - infection - malaise - mucosal inflammation - musculoskeletal stiffness - nail disorder - pain - pancytopenia - rash - taste disorders - tremor - weight loss
- **Uncommon** Gastro-intestinal perforation (including fatal cases) and fistula—discontinue treatment - hypertensive crisis - myocardial infarction - myocardial ischaemia - severe (including fatal) liver injury
- **Rare** Keratoacanthoma - posterior reversible encephalopathy syndrome - squamous cell carcinoma of the skin - Stevens-Johnson syndrome - toxic epidermal necrolysis
- **Frequency not known** Alopecia - bone-marrow suppression - hyperuricaemia - nausea - oral mucositis - thrombocytopenia - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
- Hand-foot skin reaction Consult product literature if signs or symptoms develop.

**CONCEPTION AND CONTRACEPTION** Women of childbearing potential and men must use effective contraception during treatment and up to 8 weeks after last dose.

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment. Avoid in severe impairment.

**RENAL IMPAIRMENT** Caution in severe impairment—no information available.

**MONITORING REQUIREMENTS**
- Monitor blood count and coagulation parameters and consider permanent discontinuation in event of severe bleeding.
- Monitor hepatic function before treatment, then at least every two weeks for the first 2 months, then at least monthly thereafter and as clinically indicated—consult product literature if changes in liver function observed.
- Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including seizures, headache, altered mental status, visual disturbances or cortical blindness, with or without hypertension)—discontinue treatment if symptoms occur.
- Monitor biochemistry, electrolyte and metabolic parameters during treatment; ensure measures to prevent hand-foot skin reaction—consult product literature if signs or symptoms develop.

**DIRECTIONS FOR ADMINISTRATION** Tablets should be taken at the same time each day, swallowed whole with water after a light meal that contains less than 30% fat.

**PATIENT AND CARER ADVICE** Counselling advised (administration).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **CAUTIONARY AND ADVISORY LABELS** 21
- **ELECTROLYTES:** May contain Sodium
- **Stivarga** (Bayer Plc)
- Regorafenib 40 mg | 84 tablet
  - £3,744.00 (Hospital only)

Ruxolitinib

**DRUG ACTION** Ruxolitinib is a selective inhibitor of the Janus-associated tyrosine kinases JAK1 and JAK2.

**INDICATIONS AND DOSE**
Treatment of disease-related splenomegaly or symptoms in patients with primary myelofibrosis, post-polycythaemia vera myelofibrosis, or post-essential thrombocythaemia myelofibrosis

- **BY MOUTH**
  - Adult: (consult product literature or local protocols)

**CAUTIONS** Assess risk of developing infection before treatment—do not initiate until active serious infections are resolved

**SIDE-EFFECTS**
- **Common or very common** Dizziness - flatulence - headache - hypercholesterolaemia - weight gain
- **Uncommon** Tuberculosis
- **Frequency not known** Alopecia - bone-marrow suppression - hyperuricaemia - nausea - oral mucositis - progressive multifocal leucoencephalopathy - thromboembolism - tumour lysis syndrome - vomiting

**CONCEPTION AND CONTRACEPTION** Women of childbearing potential and men must use effective contraception during treatment and up to 8 weeks after last dose.

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING** Avoid—present in milk in animal studies.
CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

PREGNANCY Avoid—toxicity in animal studies.

BREAST FEEDING Avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT Reduce dose (consult product literature).

RENAL IMPAIRMENT Reduce dose in severe impairment (consult product literature).

MONITORING REQUIREMENTS
- Monitor full blood count (including differential white cell count) before treatment, then every 2–4 weeks until dose stabilised, then as clinically indicated.
- Monitor for infection during treatment.
- Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or psychiatric signs or symptoms)—withhold treatment if suspected.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Ruxolitinib for treating disease-related splenomegaly or symptoms in adults with myelofibrosis (March 2016) NICE TA386

Ruxolitinib is recommended as an option for treating disease-related splenomegaly or symptoms in patients with primary myelofibrosis (also known as chronic idiopathic myelofibrosis), post polycythaemia vera myelofibrosis or post essential thrombocythaemia myelofibrosis, only if the patient has intermediate-2 or high-risk disease, and if the manufacturer provides ruxolitinib with the discount agreed in the patient access scheme.

Patients currently receiving ruxolitinib whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA386

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet
- Jakavi (Novartis Pharmaceuticals UK Ltd) ▼
  - Ruxolitinib (as Ruxolitinib phosphate) 5 mg Jakavi 5mg tablets | 56 tablet box £1,428.00
  - Ruxolitinib (as Ruxolitinib phosphate) 10 mg Jakavi 10mg tablets | 56 tablet box £2,856.00
  - Ruxolitinib (as Ruxolitinib phosphate) 15 mg Jakavi 15mg tablets | 56 tablet box £2,856.00
  - Ruxolitinib (as Ruxolitinib phosphate) 20 mg Jakavi 20mg tablets | 56 tablet box £2,856.00

Sorafenib

27-May-2016

DRUG ACTION Sorafenib is an inhibitor of multiple kinases.

INDICATIONS AND DOSE
- Treatment of advanced renal cell carcinoma when treatment with interferon alfa or interleukin-2 has failed or is unsuitable | Treatment of progressive, locally advanced, or metastatic, differentiated thyroid carcinoma that is refractory to radioactive iodine | Treatment of hepatocellular carcinoma
- BY MOUTH
- Adult: 400 mg twice daily, for dose adjustments due to side effects, consult product literature

IMPORTANT SAFETY INFORMATION
RISK OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 825.

CAUTIONS
- Cardiac ischaemia | major surgical procedures | potential risk of bleeding—treat tracheal, bronchial, or oesophageal infiltration with localised therapy before initiating sorafenib in patients with differentiated thyroid carcinoma (DTC) and consider permanent withdrawal of sorafenib in any patient that requires medical intervention for bleeding | susceptibility to QT-interval prolongation

INTERACTIONS → Appendix 1: sorafenib

SIDE-EFFECTS
- Common or very common Acne | anorexia | arthralgia | asthenia | congestive heart failure | constipation | depression | dermatitis | desquamation | diarrhoea | dry skin | dysgeusia | dyspepsia | dysphagia | electrolyte disturbances | erectile dysfunction | erythema | fatigue | fever | flushing | gastro-oesophageal reflux disease | haemorrhage | hand-foot skin reaction | hoarseness | hyperkeratosis | hypertension | hypophosphataemia | hypophosphataemia | keratoacanthoma | malaise | muscle spasms | myalgia | myocardial infarction | myocardial ischaemia | peripheral neuropathy | proteinuria | pruritus | rash | renal failure | rhinorrhoea | thyroid dysfunction | tinnitus
- Uncommon Altered INR | altered prothrombin time | cholangitis | cholecytitis | dehydration | eczema | erythema multiforme | gastritis | gastro-intestinal perforations | gynaecomastia | hypertensive crisis | interstitial lung disease-like events | pancreatitis | posterior reversible encephalopathy syndrome
- Rare Hepatitis | leucocytoclastic vasculitis | nephrotic syndrome | QT-interval prolongation | rhabdomyolysis | Stevens-Johnson syndrome | toxic epidermal necrolysis
- Frequency not known Alopecia | bone-marrow suppression | hyperuricaemia | nausea | oral mucositis | thromboembolism | tumour lysis syndrome | vomiting

CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 825.

PREGNANCY Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

BREAST FEEDING Discontinue breast-feeding.

HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment—no information available.

MONITORING REQUIREMENTS
- Consider periodic monitoring of ECG and electrolytes in patients with severe impairment.
- Consider periodic monitoring of ECG and electrolytes in patients with severe impairment.
- Monitor blood pressure regularly and consider permanent discontinuation of sorafenib if resistant to antihypertensive therapy.
- Monitor plasma-calcium concentration (increased risk of hypercalcaemia if history of hypoparathyroidism).
- Monitor thyroid stimulating hormone in patients with differentiated thyroid carcinoma.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Sorafenib for the treatment of advanced hepatocellular carcinoma (May 2010) NICE TA189

Sorafenib is not recommended for the treatment of advanced hepatocellular carcinoma in patients for whom surgical or locoregional therapies have failed or are unsuitable.

www.nice.org.uk/TA189

Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma
- (August 2009) NICE TA178

Bevacizumab, sorafenib, and temsirolimus are not recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma.
Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma.

www.nice.org.uk/TA178

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (January 2016) that sorafenib (Nexavar®) is accepted for restricted use within NHS Scotland for the treatment of advanced hepatocellular carcinoma in patients where surgical or loco-regional therapies have failed or are unsuitable.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 23

Sorafenib (as Sorafenib tosylate) 200 mg Nexavar 200mg tablets 112 tablet (£3,576.56)

Sunitinib

DRUG ACTION Sunitinib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE
Treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours, after failure of imatinib
Treatment of advanced or metastatic renal cell carcinoma

BY MOUTH

Adult: 50 mg once daily for 4 weeks, followed by a 2-week treatment-free period to complete a 6-week cycle, adjusted in steps of 12.5 mg, doses adjusted according to tolerability; usual dose 25–75 mg daily

Treatment of unresectable or metastatic pancreatic neuroendocrine tumours

BY MOUTH

Adult: 37.5 mg once daily without treatment-free period; adjusted in steps of 12.5 mg, doses adjusted according to tolerability; maximum 50 mg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Manufacturer advises if concurrent use of potent inducers of CYP3A4 is unavoidable, dose may need to be increased in steps of 12.5 mg to a max. dose of 87.5 mg per day for gastro-intestinal stromal tumours or renal cell carcinoma, or to a max. dose of 62.5 mg per day for pancreatic neuroendocrine tumours.

Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, dose may need to be decreased to a minimum of 37.5 mg per day for gastrointestinal stromal tumours or renal cell carcinoma, or to a minimum of 25 mg per day for pancreatic neuroendocrine tumours.

IMPORTANT SAFETY INFORMATION
RISK OF OSTEONECROSIS OF THE JAW (JANUARY 2011)
Treatment with sunitinib may be a risk factor for the development of osteonecrosis of the jaw.

Patients treated with sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.

Dental examination and appropriate preventive dentistry should be considered before treatment with sunitinib.

If possible, invasive dental procedures should be avoided in patients treated with sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 825.

CAUTIONS Cardiovascular disease—discontinue if congestive heart failure develops. Hypertension. Increased risk of bleeding—susceptibility to QT-interval prolongation

INTERACTIONS ▶ Appendix 1: sunitinib

SIDE-EFFECTS

Risks
Rare Nephrotic syndrome

CONCEPTION AND CONTRACEPTION Effective contraception required during treatment.

PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

BREAST FEEDING Discontinue breast-feeding.

MONITORING REQUIREMENTS Monitor for thyroid dysfunction.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)

Sunitinib for advanced or metastatic renal cell carcinoma
(March 2009) NICE TA169
Sunitinib is recommended as first-line treatment for advanced or metastatic renal cell carcinoma in patients who are suitable for immunotherapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1.

www.nice.org.uk/TA169

Sunitinib for the treatment of gastrointestinal stromal tumours (September 2009) NICE TA179
Sunitinib is recommended as an option for treatment in patients with unresectable or metastatic gastrointestinal tumours if imatinib treatment has failed because of resistance or intolerance, and the cost of sunitinib for the first treatment cycle is met by the manufacturer.

www.nice.org.uk/TA179

Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009) NICE TA178
Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma.

www.nice.org.uk/TA178

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (October 2009 and April 2011) that sunitinib (Sutent®) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours after failure of imatinib and for unresectable or metastatic pancreatic neuroendocrine tumours.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 14

Sutent (Pfizer Ltd)
Sunitinib (as Sunitinib malate) 12.5 mg Sutent 12.5mg capsules 28 capsule (£784.70)
Sunitinib (as Sunitinib malate) 25 mg | Sunitin 25mg capsules | 28 capsule £1,569.40
Sunitinib (as Sunitinib malate) 50 mg | Sunitin 50mg capsules | 28 capsule £3,138.80

Temozolomide

**INDICATIONS AND DOSE**
First-line treatment of advanced renal cell carcinoma | Treatment of relapsed or refractory mantle cell lymphoma

- **BY INTRAVENOUS INFUSION**
- **Adult:** (consult product literature or local protocols)

**INTERACTIONS** → Appendix 1: temsirolimus

**SIDE-EFFECTS**
- Common or very common Abdominal pain • Acne • Anorexia • Anxiety • Arthralgia • Asthenia • Bowel perforation • Chest pain • Cough • Depression • Diarrhoea • Dizziness • Drowsiness • Dysphagia • Dyspnoea • Epistaxis • Eye disorders • Folliculitis • Gastro-intestinal haemorrhage • Hypercholesterolaemia • Hypersensitivity reactions • Hypertension • Hypokalaemia • Hypophosphataemia • Impaired wound healing • Increased susceptibility to infection • Increased susceptibility to pneumonia • Increased susceptibility to urinary tract infection • Insomnia • Intestinal lymphoma • Insulinoma • Intestinal tumours • Intestinal obstruction • Intestinal ulceration • Intussusception • Intracerebral bleeding • Interstitial lung disease • Irritation • Itching • Itching rash • Menstrual disorders • Migraine • Myalgia • Nausea • Nervousness • Nightmares • Oral mucositis • Ovarian hyperstimulation syndrome • Pruritus • Rash • Respiratory depression • Sodium retention • Sleep disorders • Skin disorder • Skin reactions • Soft tissue oedema • Skin ulcers • Stomatitis • Stomatitis painful • Stomatitis periorbital • Stomatitis perioral • Stomatitis perioral painful • Supraventricular tachycardia • Sympathetic stimulation • Syncope • Tactile hallucinations • Tachycardia • Tachypnoea • Tachypnoea painful • Thrombocytopenia • Thrombosis • Thrombophlebitis • Urinary tract infection • Urticaria • Vomiting

**CONCEPTION AND CONTRACEPTION**
Ensure effective contraception during treatment in men and women.

**PREGNANCY**
Manufacturer advises avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING**
Manufacturer advises discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
In renal cell carcinoma, reduce dose in severe impairment (consult product literature). Use with caution.
In mantle cell lymphoma, avoid in moderate or severe impairment.

**RENAI IMPAIRMENT**
Manufacturer advises caution in severe impairment — no information available.

**MONITORING REQUIREMENTS**
- Monitor respiratory function.
- Monitor blood lipids.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009) NICE TA178
Bevacizumab, sorafenib, and temsirolimus are not recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma.

[www.nice.org.uk/TA178](http://www.nice.org.uk/TA178)

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

**EXCIPIENTS:** May contain Ethanol, propylene glycol
- **Torisel (Pfizer Ltd)**
  Temozolomide 25 mg per 1 ml Torisel 30mg/1.2ml concentrate for solution for infusion vials and diluent | 1 vial [POD] £620.00 (Hospital only)

**Trametinib**

04-May-2017

**DRUG ACTION**
Trametinib is a protein kinase inhibitor.

**INDICATIONS AND DOSE**
Unresectable or metastatic melanoma with a BRAF V600 mutation (as monotherapy or in combination with dabrafenib)
- **BY MOUTH**
- **Adult:** 2 mg once daily, when used in combination with dabrafenib, the dose should be taken at the same time each day with either the morning or evening dose of dabrafenib, for dose adjustments due to side-effects, consult product literature

**SIDE-EFFECTS**
- Common or very common Abdominal pain • Alopecia • Anorexia • Anxiety • Anorexia • Asthenia • Cough • Depression • Diarrhoea • Dizziness • Drowsiness • Dysphagia • Dyspnoea • Epistaxis • Eye disorders • Folliculitis • Gastro-intestinal haemorrhage • Hypercholesterolaemia • Hypersensitivity reactions • Hypertension • Hypokalaemia • Hypophosphataemia • Impaired wound healing • Increased susceptibility to infection • Increased susceptibility to pneumonia • Increased susceptibility to urinary tract infection • Insomnia • Intestinal lymphoma • Insulinoma • Intestinal tumours • Intestinal obstruction • Intestinal ulceration • Intussusception • Intracerebral bleeding • Interstitial lung disease • Irritation • Itching • Itching rash • Menstrual disorders • Migraine • Myalgia • Nausea • Nervousness • Nightmares • Oral mucositis • Ovarian hyperstimulation syndrome • Pruritus • Rash • Respiratory depression • Sodium retention • Sleep disorders • Skin disorders • Skin reactions • Soft tissue oedema • Skin ulcers • Stomatitis • Stomatitis painful • Stomatitis periorbital • Stomatitis perioral • Stomatitis perioral painful • Supraventricular tachycardia • Sympathetic stimulation • Syncope • Tachycardia • Tachypnoea • Tachypnoea painful • Thrombocytopenia • Thrombosis • Thrombophlebitis • Urinary tract infection • Urticaria • Vomiting

**CONTRA-INDICATIONS**
History of retinal vein occlusion

**CAUTIONS**
Concomitant antiplatelet or anticoagulant therapy — increased risk of haemorrhage - conditions that could impair left ventricular function - elderly (more frequent dose adjustments may be required) - impaired left ventricular function - predisposing factors for retinal vein occlusion - risk factors for gastrointestinal perforation

**INTERACTIONS** → Appendix 1: trametinib

**SIDE-EFFECTS**
- Common or very common Abdominal pain • Alopecia • Anaemia • Bradycardia • Cellulitis • Constipation • Cough • Dehydration • Dermatitis acnineform • Diarrhoea • Dry mouth • Dry skin • Dysphagia • Dyspnoea • Epithema • Folliculitis • Haemorrhage • Hand-foot syndrome • Hypertension • Left ventricular dysfunction • Lymphoedema • Malaise • Mucosal inflammation • Nausea • Oedema • Paronychia • Periorbital oedema • Pneumonitis • Pruritus • Pyrexia • Rash • Skin fissures • Stomatitis • Visual disturbances • Vomiting
Uncommon Cardiac failure, chorioretinopathy, colitis, gastrointestinal perforation, interstitial lung disease, papillodema, retinal detachment, retinal vein occlusion, rhabdomyolysis

Frequency not known Thromboembolism

SPECIAL EFFECTS, FURTHER INFORMATION

Additional side-effects reported when used in combination with dabrafenib include dizziness, hyperhidrosis, hypotension, leucopenia, muscle spasms, myocarditis, neutropenia, night sweats, and thrombocytopenia.

CONCEPTION AND CONTRACEPTION
Manufacturer advises women of child-bearing potential should use highly effective non-hormonal contraception during, and for 4 months after stopping treatment.

PREGNANCY
Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

BREAST FEEDING
Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT
Manufacturer advises caution in moderate to severe impairment—no information available.

RENAL IMPAIRMENT
Manufacturer advises caution in severe impairment—no information available.

MONITORING REQUIREMENTS
- Manufacturer advises measure blood pressure at baseline and monitor during treatment; evaluate left ventricular ejection fraction before treatment, after one month of treatment, and then approximately every 3 months thereafter.
- Monitor liver function every 4 weeks for 6 months after treatment initiation, and thereafter as clinically indicated.

HANDLING AND STORAGE
Manufacturer advises store in refrigerator (2–8°C); once opened, bottle may be stored for 30 days at not more than 30°C.

PATIENT AND CARER ADVICE
Manufacturer advises patients and their carers should be told to seek immediate medical attention if symptoms of pulmonary embolism or deep vein thrombosis occur; patients and their carers should also be advised to report new visual disturbances.

Missed doses
Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks
Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—risk of dizziness and visual disturbances.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Trametinib in combination with dabrafenib for treating unresectable or metastatic melanoma (June 2016) NICE TA396
Trametinib in combination with dabrafenib is recommended, within its marketing authorisation, as an option for treating unresectable or metastatic melanoma in adults with a BRAF V600 mutation only when the company provides trametinib and dabrafenib with the discounts agreed in the patient access schemes.

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (August 2016) that trametinib (Mekinist®), in combination with dabrafenib, is accepted for restricted use within NHS Scotland for first-line treatment of adult patients with unresectable or metastatic melanoma with a BRAF V600 mutation.

MEDITICAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
CAUTIONARY AND ADVISORY LABELS 3, 23, 25
- Mekinist (Novartis Pharmaceuticals UK Ltd)
Trametinib 500 microgram Mekinist 0.5mg tablets 7 tablet £280.00 30 tablet £1200.00
Trametinib 2 mg Mekinist 2mg tablets 7 tablet £1120.00 30 tablet £4800.00

Vandetanib

DRUG ACTION
Vandetanib is a tyrosine kinase inhibitor.

INDICATIONS AND DOSE
Treatment of aggressive and symptomatic medullary thyroid cancer in patients with unresectable locally advanced or metastatic disease
- BY MOUTH
  - Adult: 300 mg once daily, for dose adjustment due to side effects—consult product literature

IMPORTANT SAFETY INFORMATION
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 825.

CONTRA-INDICATIONS
Congenital long QT syndrome—QT interval greater than 480 milliseconds

CAUTIONS
- Brain metastases (intracranial haemorrhage reported), electrolyte disturbances, history of torsades de pointes, hypertension, photosensitivity reactions reported (wear protective clothing and/or sunscreen), susceptibility to QT prolongation

INTERACTIONS
  → Appendix 1: vandetanib

SIDE-EFFECTS
- Common or very common Abdominal pain, alopecia, anxiety, asthenia, balance disorders, blurred vision, cholelithiasis, colitis, conjunctivitis, constipation, corneal changes (including opacity), corneal deposits, decreased appetite, dehydration, depression, diarrhoea, dizziness, dry eye, dry mouth, dysaesthesia, dyspepsia, dysphagia, dysuria, electrolyte disturbances, epistaxis, gastritis, gastrointestinal haemorrhage, glaucoma, haematuria, haemoptyisia, halo vision, hand-foot syndrome, headache, hyperglycaemia, hypertension, hypothyroidism, insomnia, ischaemic cerebrovascular conditions, keratopathy, lethargy, loss of consciousness, micturition urgency, nephrolithiasis, oedema, pain, paraesthesia, photopsia, photosensitivity reactions, pneumonitis, pollakiuria, proteinuria, pyrexia, QT-interval prolongation, taste disturbance, tremor
  - Uncommon Accommodation disorders, anuria, aspiration pneumonia, brain oedema, bullous dermatitis, cardiac arrest, cardiac conduction disorders, cardiac rate disorders, cardiac rhythm disorders, cataract, chromatoma, clonus, convulsions, crythema multiforme, faecal incontinence, heart failure, ileus, impaired healing, increased haemoglobin, interstitial lung disease (sometimes fatal), intestinal perforation, pancreatitis, peritonitis, posterior reversible encephalopathy syndrome, respiratory failure, Stevens-Johnson syndrome, ventricular arrhythmia

FREQUENCY not known
- Alopecia, bone-marrow suppression, hyperuricaemia, nausea, oral mucositis, thromboembolism, tumour lysis syndrome, vomiting

CONCEPTION AND CONTRACEPTION
Effective contraception required during and for at least 4 months after treatment.

PREGNANCY
Manufacturer advises avoid unless potential benefit outweighs risk. Most cytotoxic drugs are...
teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (serum bilirubin greater than 1.5 times the upper limit of normal).

- **RENAL IMPAIRMENT** Reduce dose to 200 mg if creatinine clearance 30–49 mL/minute. Avoid if creatinine clearance less than 30 mL/minute.

- **MONITORING REQUIREMENTS** Monitor ECG, serum potassium, calcium, magnesium and thyroid stimulating hormone before treatment, then 1, 3, 6 and 12 weeks after starting treatment and following dose adjustment or interruption, then every 3 months for at least 1 year.

- **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in half a glass of water by stirring until dispersed (approximately 10 minutes), immediately before drinking (do not crush). After solution has been swallowed, any residue must be re-dispersed in the same volume of water (approximately 10 minutes) and swallowed. The solution can also be administered via nasogastric or gastrostomy tubes.

- **PATIENT AND CARER ADVICE** Alert card should be provided. Patients or carers should be given advice on how to administer vandetanib tablets. Phototoxicity reactions Patients should be advised to wear protective clothing and/or sunscreen.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**

  - **Caprelsa** (Genzyme Therapeutics Ltd)

    - Vandetanib 100 mg Caprelsa 100mg tablets | 30 tablet £2,500.00
    - Vandetanib 300 mg Caprelsa 300mg tablets | 30 tablet £5,000.00

### Vemurafenib

- **DRUG ACTION** Vemurafenib is a BRAF kinase inhibitor.

  - **INDICATIONS AND DOSE**

    - **Monotherapy for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma**
      - **BY MOUTH**
      - **Adult:** 960 mg twice daily, for dose adjustment due to side effects—consult product literature

  **IMPORTANT SAFETY INFORMATION**

  **DRUG RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS SYNDROME)**

  DRESS syndrome has been reported in patients taking vemurafenib. DRESS syndrome starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal.

  Patients should be advised to stop taking vemurafenib and consult their doctor immediately if skin rash develops. Treatment with vemurafenib should not be restarted.

  **MHRA/CHM ADVICE (NOVEMBER 2015): RISK OF POTENTIATION OF RADIATION TOXICITY**

  Potentiation of radiation toxicity has been reported in patients treated with vemurafenib before, during, or after radiotherapy—use with caution.

  **RISKS OF INCORRECT DOZING OF ORAL ANTI-CANCER MEDICINES**

  See Cytotoxic drugs p. 825.

  - **CONTRA-INDICATIONS** Wild-type BRAF malignant melanoma

  - **CAUTIONS** Electrolyte disturbances • prior or concurrent cancer associated with RAS mutation—increased risk of tumour progression • susceptibility to QT-prolongation

  - **INTERACTIONS** → Appendix 1: vemurafenib

  - **SIDE-EFFECTS**

    ▶ **Common or very common** Actinic keratosis • alopecia • arthralgia • arthrosis • ataxia • basal cell carcinoma • Bell’s palsy • constipation • cough • cutaneous squamous cell carcinoma • decreased appetite • diarrhoea • dizziness • dry skin • erythema • erythema nodosum • fatigue • folliculitis • hand-foot syndrome • headache • hyperkeratosis • keratosis pilaris • musculoskeletal pain • myalgia • new primary melanoma • pain in extremities • peripheral oedema • photosensitivity reactions • pyrexia • QT-interval prolongation • seborrhoeic keratosis • skin papilloma • taste disturbance • uveitis

    ▶ **Uncommon** Non-cutaneous squamous cell carcinoma • peripheral neuropathy • retinal vein occlusion • Stevens-Johnson syndrome • toxic epidermal necrolysis • vasculitis

    ▶ **Rare** Progression of pre-existing NRAS mutated chronic myelomonocytic leukaemia

    ▶ **Frequency not known** Alopecia • bone-marrow suppression • hypersensitivity reactions • hyperuricaemia • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting

  - **CONCEPTION AND CONTRACEPTION** Effective contraception required during for at least 6 months after treatment.

  - **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

  - **BREAST FEEDING** Avoid—no information available.

  - **HEPATIC IMPAIRMENT** Manufacturer advises more frequent monitoring in moderate to severe hepatic impairment (including monthly ECG monitoring during first 3 months of treatment).

  - **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.

  - **MONITORING REQUIREMENTS**

    ▶ Monitor ECG and electrolytes before treatment, after one month and following dose adjustment (treatment not recommended if QT interval greater than 500 milliseconds at baseline).

    ▶ Monitor liver function before treatment and periodically thereafter.

    ▶ Monitor for uveitis, iritis and retinal vein occlusion.

    ▶ Monitor for cutaneous and non-cutaneous squamous cell carcinoma and new primary melanoma before, during and for up to 6 months after treatment—consult product literature.

  - **DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food).

  - **PATIENT AND CARER ADVICE** Counselling advised (administration).

    Drug rash with eosinophilia and systemic symptoms (DRESS syndrome) Patients should be advised to stop taking vemurafenib and consult their doctor immediately if skin rash develops.

  - **NATIONAL FUNDING/ACCESS DECISIONS**

    **NICE technology appraisals (TAs)**

    ▶ Vemurafenib for treating locally advanced or metastatic BRAF V600 mutation-positive malignant melanoma (December 2012) NICE TA269

    Vemurafenib is recommended as an option for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma only if the manufacturer provides
vemurafenib with the discount agreed in the patient access scheme.
www.nice.org.uk/TA269

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (November 2013) that vemurafenib (Zelboraf®) is accepted for restricted use within NHS Scotland as monotherapy for the first-line treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - CAUTIONARY AND ADVISORY LABELS 25
    - Zelboraf (Roche Products Ltd)
    - Vemurafenib 240 mg Zelboraf 240mg tablets | 56 tablet POM €1,750.00 (Hospital only)

**ANTINEOPLASTIC DRUGS > PROTEIN KINASE INHIBITORS > ANTIFIBROTICS**

**Nintedanib** 23-Feb-2016

- **DRUG ACTION** Nintedanib is a tyrosine protein kinase inhibitor.

- **INDICATIONS AND DOSE**
  - **OFEV®**
    - Treatment of idiopathic pulmonary fibrosis
      - **BY MOUTH**
        - Adult: 150 mg twice daily, reduced if not tolerated to 100 mg twice daily, for dose adjustments due to side-effects, consult product literature
  - **VARGATEF®**
    - Treatment of locally advanced, metastatic or locally recurrent non-small cell lung cancer of adenocarcinoma histology after first-line chemotherapy (in combination with docetaxel) (initiated under specialist supervision)
      - **BY MOUTH**
        - Adult: 200 mg twice daily on days 2–21 of a standard 21 day docetaxel cycle, for treatment following discontinuation of docetaxel and for dose adjustments due to side-effects, consult product literature

**IMPORTANT SAFETY INFORMATION FOR VARGATEF® — RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
See Cytotoxic drugs p. 825.

- **CAUTIONS** History of organ perforation - history or risk factors for QT prolongation - impaired wound healing - increased risk of bleeding - patients at high risk of cardiovascular disease - previous abdominal surgery - theoretical increased risk of gastrointestinal perforation - theoretical increased risk of venous thromboembolism

- **INTERACTIONS → Appendix 1: nintedanib**

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain - decreased appetite - diarrhoea - hyperbilirubinaemia - hypertension - nausea - raised hepatic enzymes - vomiting
    - **OFEV®**
  - **Common or very common** Epistaxis - weight loss
    - **VARGATEF®**
  - **Common or very common** Abscesses - bleeding - dehydration - electrolyte imbalance - mucositis - neutropenia - peripheral neuropathy - venous thromboembolism
  - **Uncommon** Gastrointestinal perforation

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with peanut or soya hypersensitivity.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before treatment and ensure contraception (in addition to barrier method) during treatment and for at least 3 months after last dose.

- **PREGNANCY** Manufacturer advises — toxicity in animal studies.

  - **VARGATEF®** See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Manufacturer advises — present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Consult product literature for dose adjustment in worsening liver function. Manufacturer advises in moderate to severe impairment — no information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment — no information available.

- **MONITORING REQUIREMENTS** For Vargatef®, monitor full blood count and hepatic function before each treatment cycle and regularly thereafter, monitor prothrombin time and INR if used concomitantly with anticoagulants and monitor for signs and symptoms of cerebral bleeding.

- **PRESCRIBING AND DISPENSING INFORMATION**

  - **VARGATEF®** Not to be taken on the same day as docetaxel therapy.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE technology appraisals (TAs)**
    - **Nintedanib for previously treated locally advanced, metastatic, or locally recurrent non-small cell lung cancer (July 2015) NICE TA347**
      - Nintedanib (Vargatef®), in combination with docetaxel is recommended as an option for the treatment of patients with locally advanced, metastatic, or locally recurrent non-small cell lung cancer of adenocarcinoma histology, that has progressed after first-line chemotherapy, only if the manufacturer provides nintedanib with the discount agreed in the patient access scheme.
      - www.nice.org.uk/TA347

    - **Nintedanib for treating idiopathic pulmonary fibrosis (January 2016) NICE TA379**
      - Nintedanib is recommended as an option for treating idiopathic pulmonary fibrosis, only if:
        - the patient has a forced vital capacity (FVC) between 50% and 80% of predicted,
        - the manufacturer provides nintedanib with the discount agreed in the patient access scheme, and,
        - treatment is stopped if disease progresses (a confirmed decline in percent predicted FVC of 10% or more) in any 12-month period.
      - www.nice.org.uk/TA379

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (September 2015) that nintedanib (Ofev®) is accepted for restricted use within NHS Scotland for the treatment of idiopathic pulmonary fibrosis in patients with a predicted forced vital capacity less than or equal to 80%.

- **MEDICINAL FORMS**

  - There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**
  - CAUTIONARY AND ADVISORY LABELS 25
    - EXCIPIENTS: May contain Lecithin
      - **Ofev** (Boehringer Ingelheim Ltd)
        - Nintedanib (as Nintedanib esilate) 100 mg | Ofev 100mg capsules | 60 capsule POM £2,151.10 (Hospital only)

Olaparib

**DRUG ACTION** Olaparib is a PARP inhibitor. PARP are enzymes that repair damaged DNA in cancer cells and, in the absence of functional BRCA, inhibition of PARP results in an inability of cancer cells to repair. Therefore inhibition of PARP results in an antineoplastic effect.

**INDICATIONS AND DOSE**

Monotherapy for the maintenance treatment of patients with platinum-sensitive relapsed BRCA-mutated (germline and/or somatic) high grade serous epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in response (complete or partial response) to platinum-based chemotherapy (initiated under specialist supervision)

- **BY MOUTH**
  - Adult: 400 mg twice daily; reduced if not tolerated to 200 mg twice daily, then reduced if not tolerated to 100 mg twice daily, take at least 1 hour after food and avoid food for 2 hours after taking, patients should start treatment within 8 weeks of receiving the final dose of their platinum-containing chemotherapy regimen

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises if concurrent use of moderate inhibitors of CYP3A4 is unavoidable, reduce dose to 200 mg twice daily.

Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 150 mg twice daily.

**PHARMACOKINETICS**

Peak plasma concentrations are typically achieved 1 to 3 hours after dosing; steady-state is achieved within 3 to 4 days.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 825.

**INTERACTIONS** → Appendix 1: olaparib

**SIDE-EFFECTS**

- **Common or very common** Anaemia · decreased appetite · diarrhoea · dizziness · dysgeusia · dyspepsia · fatigue · headache · lymphopaenia · nausea · neutropenia · stomatitis · thrombocytopenia · upper abdominal pain · vomiting

- **Frequency not known** Pneumonitis (occasionally fatal)

**SIDE-EFFECTS, FURTHER INFORMATION**

- Haematological toxicity: Withhold treatment if severe haematological toxicity develops; further analysis recommended if toxicity still present 4 weeks after treatment withdrawal.

- Pneumonitis: If dyspnoea, cough and fever, or radiological abnormalities develop, withhold treatment and investigate; if pneumonitis confirmed, discontinue.

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises effective contraception during treatment and for 1 month after receiving the last dose. Consider an additional non-hormonal method of contraception.

**PREGNANCY**

Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING**

Manufacturer advises avoid during treatment and for 1 month after last dose—no information available.

**HEPATIC IMPAIRMENT**

Manufacturer advises avoid—no information available.

**RENAL IMPAIRMENT**

Manufacturer advises avoid if creatinine clearance less than 50 mL/minute/1.73m² unless benefit outweighs potential risk—limited information available.

**MONITORING REQUIREMENTS**

Manufacturer advises monitor full blood count every month for the first 12 months of treatment and periodically thereafter.

**PATIENT AND CARER ADVICE**

- **Missed doses**
  - If a dose is missed, the missed dose should not be taken and the next dose should be taken at the usual time.

- **Driving and skilled tasks**
  - Malaise and dizziness may affect performance of skilled tasks e.g. driving or operating machinery.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Olaparib for maintenance treatment of relapsed, platinum-sensitive, BRCA mutation-positive ovarian, fallopian tube and peritoneal cancer after response to second-line or subsequent platinum-based chemotherapy (January 2016) NICE TA381

Olaparib is recommended as an option for treating adults with relapsed, platinum sensitive ovarian, fallopian tube or peritoneal cancer who have BRCA1 or BRCA2 mutations and whose disease has responded to platinum based chemotherapy only if:

- they have had 3 or more courses of platinum-based chemotherapy and;

- the drug cost of olaparib for people who remain on treatment after 15 months will be met by the company.

[www.nice.org.uk/guidance/ta381](http://www.nice.org.uk/guidance/ta381)

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (November 2016) that olaparib (Lynparza®) is accepted for use within NHS Scotland as monotherapy for the maintenance treatment of adults with platinum-sensitive relapsed BRCA-mutated (germline and/or somatic) high grade serous epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in response (complete response or partial response) to platinum-based chemotherapy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - **Lynparza** (AstraZeneca UK Ltd) ▼
  - Olaparib 50 mg Lynparza 50mg capsules | 448 capsule [PMP] £3,550.00

**Venetoclax**

**DRUG ACTION** Venetoclax is a potent, selective inhibitor of B-cell lymphoma-2 (BCL-2).

**INDICATIONS AND DOSE**

**Chronic lymphocytic leukaemia in the presence of 17p deletion or TP53 mutation when a B-cell receptor pathway inhibitor is unsuitable or ineffective (specialist use only)**

**Chronic lymphocytic leukaemia in the absence of 17p deletion or TP53 mutation when both chemotherapy and a B-cell receptor pathway inhibitor has been ineffective (specialist use only)**

**BY MOUTH**

- Adult: Initially 20 mg once daily for 7 days, then increased to 50 mg once daily for 7 days, then increased to 100 mg once daily for 7 days, then increased to 200 mg once daily for 7 days, then maintenance 400 mg once daily, dose to be taken in the morning during dose-titration phase; dose should be taken at the same time every day, for dose adjustment due to side effects—consult product literature continued →

[downloaded from www.medicalbr.com](http://www.medicalbr.com)
DOSE ADJUSTMENTS DUE TO INTERACTIONS
Avoid concomitant use of potent or moderate CYP3A4 inhibitors during initiation and dose-titration; once stable reduce dose by 75% with concomitant use of potent CYP3A4 inhibitors and by 50% with concomitant use of moderate CYP3A4 inhibitors.

IMPORTANT SAFETY INFORMATION
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 825.

**CAUTIONS**
Ensure adequate hydration.

**INTERACTIONS** → Appendix 1: venetoclax

**SIDE-EFFECTS**
- Common or very common Anaemia · constipation · diarrhoea · fatigue · febrile neutropenia · hyperkalaemia · hyperphosphataemia · hyperuricaemia · hypocalcaemia · lymphopenia · nausea · neutropenia · pneumonia · tumour lysis syndrome · upper respiratory tract infection · urinary tract infection · vomiting

**CONCEPTION AND CONTRACEPTION**
Manufacturer advises ensure effective, non-hormonal contraception during and for 30 days after treatment in women of child-bearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**PREGNANCY**
Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

**BREAST FEEDING**
Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**
Manufacturer advises close monitoring during initiation and dose titration in moderate impairment (increased risk of toxicity); avoid in severe impairment—no information available.

**RENAL IMPAIRMENT**
Manufacturer advises close monitoring (increased risk of tumour lysis syndrome); use only if potential benefit outweighs risk in severe impairment—no information available.

**MONITORING REQUIREMENTS**
Manufacturer advises monitor renal function before starting treatment.

**PATIENT AND CARER ADVICE**
Hydration  Manufacturer advises patients should drink 1.5–2 L of water daily, starting 2 days before and throughout the dose–titration phase; intravenous fluids should be administered for those who cannot maintain an adequate level of oral hydration with consideration of overall risk of tumour lysis syndrome.

Vomiting  Manufacturer advises that if vomiting occurs following dose administration, no additional doses should be taken on that day and the next dose should be taken at the normal time.

Missed doses  Manufacturer advises that if a dose is more than 8 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
CAUTIONARY AND ADVISORY LABELS 21, 25

- **Venclyxo (AbbVie Ltd)**
  - Venetoclax 10 mg Venclyxo 10mg tablets  | 14 tablet £59.87
  - Venetoclax 50 mg Venclyxo 50mg tablets  | 7 tablet £149.67
  - Venetoclax 100 mg Venclyxo 100mg tablets  | 7 tablet £299.34 | 14 tablet £598.68 | 112 tablet £4,789.47

**IMPORTANT SAFETY INFORMATION**
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 825.

**INTERACTIONS** → Appendix 1: vismodegib

**SIDE-EFFECTS**
- Common or very common Abdominal pain · abnormal hair growth · alopecia · amenorrhoea · arthralgia · constipation · decreased appetite · dehydration · diarrhoea · dyspepsia · hypoponatraemia · malaise · muscle spasms · musculoskeletal pain · nausea · pruritus · rash · taste disturbances · vomiting · weight loss

**CONCEPTION AND CONTRACEPTION**
For women of child-bearing potential, pregnancy must be excluded before initiation of treatment, and monthly during treatment. Women must use two contraceptive methods (including one highly effective method and one barrier method) during treatment and for 24 months after the final dose of vismodegib. Men must use a condom during treatment and for 2 months after the final dose.

**PREGNANCY**
Important: teratogenic risk—may cause severe birth defects and embryo-fetal death.

**BREAST FEEDING**
Avoid during treatment and for 24 months after final dose.

**HEPATIC IMPAIRMENT**
No information available—manufacturer advises caution in moderate to severe impairment.

**RENAL IMPAIRMENT**
No information available—manufacturer advises caution in severe impairment.

**PRESCRIBING AND DISPENSING INFORMATION**
Prescribers and pharmacists must comply with prescribing and dispensing restrictions as specified in the manufacturer’s Pregnancy Prevention Programme, and ensure that the patient fully acknowledges the programme’s pregnancy prevention measures—consult product literature for further information.

**PATIENT AND CARER ADVICE**
Patient advice required around conception and contraception Counselling on pregnancy and contraception advised. Patients must comply with the manufacturer’s pregnancy prevention programme.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Capsule**
CAUTIONARY AND ADVISORY LABELS 25

- **Erivedge (Roche Products Ltd)**
  - Vismodegib 150 mg Erivedge 150mg capsules  | 28 capsule £6,285.00 (Hospital only)
## Aflibercept

**DRUG ACTION**
Aflibercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PIGF). Aflibercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels that supply tumours with oxygen and nutrients.

### INDICATIONS AND DOSE
In combination with irinotecan, fluorouracil and folinic acid (FOLFIRI) chemotherapy, in metastatic colorectal cancer that is resistant to, or has progressed after, an oxaliplatin-containing regimen
- **BY INTRAVENOUS INFUSION**
  - Adult: (consult local protocol)

### CONTRA-INDICATIONS
Moderate or severe congestive heart failure - uncontrolled hypertension

### CAUTIONS
Fever, neutropenia - history of cardiovascular disease (may be exacerbated by hypertension) - increased risk of haemorrhage (including fatal events) - increased risk of hypertension - increased risk of thromboembolic events (consult product literature if event occurs) - may impair wound healing — withhold treatment for at least 4 weeks before elective surgery and for at least 4 weeks after major surgery, or until wound fully healed — neutropenic infection - risk of fistula formation (discontinue if fistula develops) — risk of neutropenia - risk of thrombocytopenia

### INTERACTIONS
- **Appendix 1: aflibercept**

### SIDE-EFFECTS
- **Common or very common** Abdominal pain — aphthous stomatitis — decreased appetite — dehydration — diarrhoea — dysphonia — dyspnoea — fistula — haemorrhage (including nasal, rectal and gastro-intestinal) — haemorrhoids — hand-foot syndrome — headache — hypertension — infection — leucopenia — malaise — nasopharyngitis — neutropenia (including febrile neutropenia) — oropharyngeal pain — proctalgia — proteinuria — rhinorrhoea — sepsis — skin hyperpigmentation — stomatitis — thrombocytopenia — thromboembolic events (arterial and venous) — toothache — urinary tract infection — weight loss
- **Uncommon** Gastro-intestinal perforation — impaired wound healing — nephrotic syndrome — posterior reversible encephalopathy syndrome — thrombotic microangiopathy

### CONCEPTION AND CONTRACEPTION
Exclude pregnancy before treatment. Effective contraception required during and for at least 6 months after treatment in men and women. Contraceptive advice should be given to men and women before therapy begins (and should cover the duration of contraception required after therapy has ended).

### PREGNANCY
Manufacturer advises avoid — toxicity in animal studies. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

### BREAST FEEDING
Manufacturer advises avoid — no information available.

### HEPATIC IMPAIRMENT
Caution in severe impairment — no information available.

### RENAL IMPAIRMENT
Caution in severe impairment — no information available.

### MONITORING REQUIREMENTS
- Monitor blood pressure at initiation and at least fortnightly during treatment (do not initiate treatment if pre-existing hypertension is uncontrolled) — consult product literature if hypertension develops during treatment.
- Monitor for signs of gastro-intestinal perforation (discontinue if perforation develops).
- Monitor full blood count, including differential count and platelets at baseline and before each treatment cycle.
- Monitor for proteinuria before each treatment administration (consult product literature if symptoms develop).
- Monitor for signs and symptoms of diarrhoea and dehydration, particularly in elderly — consult product literature if severe diarrhoea occurs.
- Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, altered mental status, nausea, vomiting, headache, or visual disturbance).

### NATIONAL FUNDING/ACCESS DECISIONS
**NICE technology appraisals (TAs)**
- Aflibercept in combination with irinotecan and fluorouracil-based therapy for treating metastatic colorectal cancer that has progressed following prior oxaliplatin-based chemotherapy (March 2014) **NICE TA307**
  - Aflibercept in combination with irinotecan and fluorouracil-based therapy is not recommended within its marketing authorisation for treating metastatic colorectal cancer that is resistant to or has progressed after an oxaliplatin-containing regimen.
  - [www.nice.org.uk/TA307](http://www.nice.org.uk/TA307)

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Blood and blood-forming organs

1 Anaemias

Anaemias

Initiation of treatment
Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

Sickle-cell anaemia
Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine, haemophilus influenzae type b vaccine, an annual influenza vaccine and prophylactic penicillin reduce the risk of infection. Hepatitis B vaccine should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary.

Hydroxycarbamide p. 863 can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease. The beneficial effects of hydroxycarbamide may not become evident for several months.

G6PD deficiency
Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, Vicia faba); this is termed favism and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies;
thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;
• manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
• the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common.

A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

Drugs with definite risk of haemolysis in most G6PD-deficient individuals
• Dapsone and other sulfones (higher doses for dermatitis herpetiformis more likely to cause problems)
• Methylthioninium chloride
• Nirmidazole (not on UK market)
• Nitrofurantoin
• Pamaquin (not on UK market)
• Primarquine (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people)
• Quinolones (including ciprofloxacin, moxifloxacin, nalidixic acid, norfloxacin, and ofloxacin)
• Rasburicase
• Sulfonamides (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

Drugs with possible risk of haemolysis in some G6PD-deficient individuals
• Aspirin (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)
• Chloroquine (acceptable in acute malaria and malaria chemoprophylaxis)
• Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)
• Quinidine (acceptable in acute malaria) [not on UK market]
• Quinine (acceptable in acute malaria)
• Sulfonylureas

Naphthalene in mothballs also causes haemolysis in individuals with G6PD deficiency.

Drugs used in hypoplastic, haemolytic, and renal anaemias
Anabolic steroids, pyridoxine hydrochloride p. 988, antilymphocyte immunoglobulin, and various corticosteroids are used in hypoplastic and haemolytic anaemias.

Antilymphocyte immunoglobulin given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired aplastic anaemia; the response rate may be increased when ciclosporin p. 788 is given as well. Severe reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from ‘special order’ manufacturers or specialist importing companies) can be used in aplastic anaemia for 3 to 6 months.

It is unlikely that dietary deprivation of pyridoxine hydrochloride produces clinically relevant haematological effects. However, certain forms of sideroblastic anaemia respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine hydrochloride is indicated in both idiopathic acquired and hereditary sideroblastic anaemias. Although complete cures have not been reported, some increase in haemoglobin can occur; the dose required is usually high. Reversible sideroblastic anaemias respond to treatment of the underlying cause but in pregnancy, haemolytic anaemias, and alcohol dependence, or during isoniazid p. 554 treatment, pyridoxine hydrochloride is also indicated.

Corticosteroids have an important place in the management of haematological disorders. They include conditions with an autoimmune haemolytic anaemia, immune thrombocytopenias and neutropenias, and major transfusion reactions. They are also used in chemotherapy schedules for many types of lymphoma, lymphoid leukemias, and paraproteinaemias, including multiple myeloma.

Erythropoietins (recombinant human erythropoietins) are used to treat the anaemia associated with erythropoietin deficiency in chronic renal failure, to increase the yield of autologous blood in normal individuals and to shorten the period of symptomatic anaemia in patients receiving cytotoxic chemotherapy.

Epoetin beta p. 927 is also used for the prevention of anaemia in preterm neonates of low birth-weight; only unpreserved formulations should be used in neonates because other preparations may contain benzyl alcohol.

Darbepoetin alfa p. 924 is a hyperglycosylated derivative of epoetin; it has a longer half life and can be administered less frequently than epoetin.

Mesotherapy polyethylene glycol-epoetin beta p. 929 is a continuous erythropoietin receptor activator that is licensed for the treatment of symptomatic anaemia associated with chronic kidney disease. It has a longer duration of action than epoetin.

1.1 Hypoplastic, haemolytic, and renal anaemias

Other drugs used for Hypoplastic, haemolytic, and renal anaemias Eltrombopag, p. 945

ANABOLIC STEROIDS ANDROSTAN DERIVATIVES

Oxymetholone

- INDICATIONS AND DOSE
  Aplastic anaemia
  - Adult: 1–5 mg/kg daily for 3 to 6 months

- INTERACTIONS Appendix 1: oxymetholone

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
  - Capsule
    - Oxymetholone (Non-proprietary)

EPOETINS

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE (DECEMBER 2007) ERYTHROPOIETINS—HAEMOGLOBIN CONCENTRATION**

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of death and serious cardiovascular events, and in patients with cancer may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy unless symptoms of anaemia are present
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL
- haemoglobin concentrations higher than 12 g/100 mL should be avoided

- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range)

**MHRA/CHM ADVICE (DECEMBER 2007 AND JULY 2008) ERYTHROPOIETINS—TUMOUR PROGRESSION AND SURVIVAL IN PATIENTS WITH CANCER**

Clinical trial data show an unexplained excess mortality and increased risk of tumour progression in patients with anaemia associated with cancer who have been treated with erythropoietins. Many of these trials used erythropoietins outside of the licensed indications (i.e. overcorrected haemoglobin concentration or given to patients who have not received chemotherapy):

- erythropoietins licensed for the treatment of symptomatic anaemia associated with cancer, are licensed only for patients who are receiving chemotherapy
- the decision to use erythropoietins should be based on an assessment of the benefits and risks for individual patients; blood transfusion may be the preferred treatment for anaemia associated with cancer chemotherapy, particularly in those with a good cancer prognosis

- ***CONTRA-INDICATIONS*** Patients unable to receive thromboprophylaxis · pure red cell aplasia following erythropoietin therapy · uncontrolled hypertension

- ***CAUTIONS*** Aluminium toxicity (can impair the response to erythropoietin) · concurrent infection (can impair the response to erythropoietin) · correct factors that contribute to the anaemia of chronic renal failure, such as iron or folate deficiency, before treatment · during dialysis (increase in unfractioinated or low molecular weight heparin dose may be needed) · epilepsy · inadequately treated or poorly controlled blood pressure—interrupt treatment if blood pressure uncontrolled · ischaemic vascular disease · malignant disease · other inflammatory disease (can impair the response to erythropoietin) · risk of thrombosis may be increased when used for anaemia before orthopaedic surgery—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident · risk of thrombosis may be increased when used for anaemia in adults receiving cancer chemotherapy · sickle-cell disease (lower target haemoglobin concentration may be appropriate) · sudden stabbing migraine–like pain (warning of a hypertensive crisis) · thrombocytosis (monitor platelet count for first 8 weeks)

- ***SIDE-EFFECTS***

  - **Common or very common** Aggravation of hypertension (dose-dependent) · cardiovascular events · diarrhea · dose-dependent increase in platelet count regressing during treatment (but thrombocytosis rare) · headache · hypertensive crisis (in isolated patients with normal or low blood pressure) · increase in blood pressure (dose-dependent) · influenza-like symptoms (may be reduced if intravenous injection given over 5 minutes) · nausea · shunt thrombosis especially if tendency to hypotension or arteriovenous shunt complications · vomiting

  - **Very rare** Sudden loss of efficacy because of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure

  - **Frequency not known** Anaphylaxis · angioedema · hyperkalaemia · hypersensitivity reactions · injection-site reactions · peripheral oedema · skin reactions

- ***SIDE-EFFECTS, FURTHER INFORMATION***

  - Hypertensive crisis · In isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention has occurred with epoetin.

  - Pure red cell aplasia · There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should not be switched to another form of erythropoietin.

- ***MONITORING REQUIREMENTS***

  - Monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes—interrupt treatment if blood pressure uncontrolled.

  - Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients.

---

**Darbepoetin alfa**

- ***INDICATIONS AND DOSE***

  - Symptomatic anaemia associated with chronic renal failure in patients on dialysis

    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION**

      - Adult: Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose to be given once weekly or once every 2 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

  - Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

    - **BY SUBCUTANEOUS INJECTION**

      - Adult: Initially 450 nanograms/kg once weekly, alternatively initially 750 nanograms/kg every 2 weeks, dose to be adjusted according to response by
If different erythropoiesis-stimulating agents are equally suitable, the product with the lowest acquisition cost for the course of treatment should be used.

**INDICATIONS AND DOSE**

**BINOCR® PRE-FILLED SYRINGES**

**Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis**

- BY INTRAVENOUS INJECTION
  - Adult: Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 25–100 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds...
2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis

- **BY INTRAVENOUS INJECTION**
  - Adult: Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis

- **BY INTRAVENOUS INJECTION**
  - Adult: Initially 50 units/kg 3 times a week, increased in steps of 25 units/kg 3 times a week, adjusted according to response, dose to be increased at intervals of at least 4 weeks; maintenance 17–33 units/kg 3 times a week (max. per dose 200 units/kg 3 times a week), intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia in adults receiving cancer chemotherapy

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 150 units/kg 3 times a week, alternatively initially 450 units/kg once weekly, increased to 300 units/kg 3 times a week, increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks; discontinue if inadequate response after 4 weeks at higher dose, subcutaneous injection maximum 1 mL per injection site, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery

- **BY INTRAVENOUS INJECTION**
  - Adult: 600 units/kg twice weekly for 3 weeks before surgery, consult product literature for details and advice on ensuring high iron stores, intravenous injection to be given over 1–5 minutes

Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 600 units/kg once weekly for 3 weeks before surgery and on day of surgery, alternatively 300 units/kg daily for 15 days starting 10 days before surgery, consult product literature for details, subcutaneous injection maximum 1 mL per injection site

EPREP® PRE-FILLED SYRINGES

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

- **BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 75–300 units/kg once weekly, intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, maintenance dose can be given as a single dose or in divided doses, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

**Epoetin alfa 80000 unit per 1 mL** Eprex 40,000 units/1 mL solution for injection pre-filled syringes | 6 pre-filled disposable injection | £941.92
dose to be given weekly as a single dose or in 3–7 divided doses, if adequate response obtained reduce dose by 25–50%, discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 8 weeks of therapy (response unlikely). Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy; maximum 60 000 units per week

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia when blood-conserving procedures are insufficient or unavailable

- BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)

- INTERACTIONS
  - Appendix 1: epoetin beta
- PREGNANCY
- BREAST FEEDING
  - Unlikely to be present in milk. Minimal effect on infant.
- HEPATIC IMPAIRMENT
  - Manufacturers advise caution in chronic hepatic failure.

- NATIONAL FUNDING/ACCESS DECISIONS

Epoetin zeta

- INDICATIONS AND DOSE
  - Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis
    - BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
    - Adult: Initially 50 units/kg 3 times a week, adjusted according to response, adjusted in steps of 25 units/kg 3 times a week, dose to be adjusted at intervals of at least 4 weeks; maintenance 25–50 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, if given by subcutaneous injection, a maximum of 1 mL can be given per injection site, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks
  - Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis
    - BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
    - Adult: Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous injection to be given over 1–5 minutes, if given by subcutaneous injection, a maximum of 1 mL can be given per injection site, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks
  - Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis
    - BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
    - Adult: Initially 50 units/kg 3 times a week, adjusted according to response, adjusted in steps of 25 units/kg 3 times a week, dose to be increased at intervals of at least 4 weeks; maintenance 17–33 units/kg 3 times a week (max. per dose 200 units/kg 3 times a week), intravenous injection to be given over 1–5 minutes, if given by subcutaneous injection, a maximum of 1 mL can be given per injection site, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks
  - Symptomatic anaemia in adults receiving cancer chemotherapy
    - BY SUBCUTANEOUS INJECTION
    - Adult: Initially 150 units/kg 3 times a week, alternatively initially 450 units/kg once weekly, increased to 300 units/kg 3 times a week, only increase dose if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks; discontinue if inadequate response after 4 weeks at higher dose, maximum 1 mL per injection site, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery

- BY INTRAVENOUS INJECTION
  - Adult: 600 units/kg twice weekly for 3 weeks before surgery, intravenous injection to be given over...
1–5 minutes, consult product literature for details and advice on ensuring high iron stores

**Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable**

- **BY SUBCUTANEOUS INJECTION**
- **Adult:** 600 units/kg every week for 3 weeks before surgery and on day of surgery, alternatively 300 units/kg daily for 15 days starting 10 days before surgery, maximum 1 mL per injection site, consult product literature for details.

**INTERACTIONS**  
> Appendix 1: epoetin zeta

**PREGNANCY**  
No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.

**BREAST FEEDING**  
Unlikely to be present in milk. Minimal effect on infant.

**HEPATIC IMPAIRMENT**  
Manufacturers advise caution in chronic hepatic failure.

**PRESCRIBING AND DISPENSING INFORMATION**  
Epoetin zeta is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

**NATIONAL FUNDING/ACCESS DECISIONS NICE technology appraisals (TAs)**

1.1a Atypical haemolytic uremic syndrome and paroxysmal nocturnal haemoglobinuria

**IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES**

### Eculizumab

- **DRUG ACTION** Eculizumab, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein and thereby reduces haemolysis and thrombotic microangiopathy.

- **INDICATIONS AND DOSE**
  
  Reduce haemolysis in paroxysmal nocturnal haemoglobinuria (PNH), in those with a history of blood transfusions (under expert supervision)
  
  - **BY INTRAVENOUS INFUSION**
    
    Adult: Initially 600 mg once weekly for 4 weeks, then increased to 900 mg once weekly for 1 week; maintenance 900 mg every 12–16 days

  Reduce thrombotic microangiopathy in atypical haemolytic uremic syndrome (aHUS) (specialist use only)
  
  - **BY INTRAVENOUS INFUSION**
    
    Adult: Initially 900 mg once weekly for 4 weeks, then increased to 1.2 g once weekly for 1 week; maintenance 1.2 g every 12–16 days

- **CONTRA-INDICATIONS** Patients unvaccinated against *Neisseria meningitidis* - unresolved *Neisseria meningitidis* infection

- **CAUTIONS** Active systemic infection

- **MEDICAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug.

- **SOLUTION FOR INFUSION**
  
  **ELECTROLYTES:** May contain Sodium

  - **Soliris** (Alexion Pharma UK Ltd)
    
    Eculizumab 10 mg per 1 ml Soliris 300mg/30ml concentrate for solution for infusion vials | 1 vial | £3,150.00 (Hospital only)

1.2 Iron deficiency anaemia

**Anaemia, iron deficiency**

### Treatment and prophylaxis

**Treatment** with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastric erosion, gastrointestinal cancer).

**Prophylaxis** with an iron preparation may be appropriate in malabsorption, menorrhagia, pregnancy, after subtotal or total gastrectomy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm neonates.

**Oral iron**

Iron salts should be given by mouth unless there are good reasons for using another route.
Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of preparation is thus usually decided by the incidence of side-effects and cost.

The oral dose of elemental iron for iron-deficiency anaemia should be 100 to 200 mg daily. It is customary to give this as dried ferrous sulfate; for prophylaxis of iron-deficiency anaemia, ferrous sulfate may be effective.

<table>

**Compound preparations**
Preparations containing iron and folic acid p. 937 are used during pregnancy in women who are at high risk of developing iron and folic acid deficiency; they should be distinguished from those used for the prevention of neural tube defects in women planning a pregnancy.

It is important to note that the small doses of folic acid contained in these preparations are inadequate for the treatment of megaloblastic anaemias.

Some oral preparations contain ascorbic acid p. 991 to aid absorption of the iron but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the B group of vitamins (except folic acid for pregnant women).

**Modified-release preparations**
Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

**Parenteral iron**
Iron can be administered parenterally as iron dextran p. 932, iron sucrose p. 933, ferric carboxymaltose below, or iron isomaltoside 1000 p. 932. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the patient cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption. Parenteral iron may also have a role in the management of chemotherapy-induced anaemia, when given with erythropoietins, in specific patient groups (see NIC methology). Many patients with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis.

With the exception of patients with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately. If parenteral iron is necessary, the dose should be calculated according to the patient’s body-weight and total iron deficit. Depending on the preparation used, parenteral iron is given as a total dose or in divided doses.

Further treatment should be guided by monitoring haemoglobin and serum iron concentrations.

**Iron (injectable)**

**MINERALS AND TRACE ELEMENTS > IRON, INJECTABLE**

**Iron-deficiency anaemia**

**INDICATIONS AND DOSE**

**Iron-deficiency anaemia**

- **By slow intravenous injection, or by intravenous infusion**
- **Adult:** Dose calculated according to body-weight and iron deficit (consult product literature)

**CAUTIONS**
Allergic disorders - asthma - eczema - hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available.

**SIDE-EFFECTS**
Hypersensitivity reactions

**SIDE-EFFECTS, FURTHER INFORMATION**

- Anaphylactic reactions Anaphylactic reactions can occur with parenteral administration of iron complexes and facilities for cardiopulmonary resuscitation must be available.

**Overdose**
For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 1249.

**Ferric carboxymaltose**

**INDICATIONS AND DOSE**

**Iron-deficiency anaemia**

- **By slow intravenous injection, or by intravenous infusion**
- **Adult:** Dose calculated according to body-weight and iron deficit (consult product literature)

**SIDE-EFFECTS**

- **Common or very common** Dizziness - gastro-intestinal disturbances - headache - injection-site reactions - rash
- **Uncommon** Anaphylaxis - arthralgia - back pain - chest pain - fatigue - flushing - hypertension - hypotension - malaise - myalgia - paraesthesia - peripheral oedema - pruritus - ptyrexia - rigors - urticaria
- **Rare** Dyspnoea
Blood and nutrition

**DIRECTIONS FOR ADMINISTRATION**

*For intravenous infusion (Ferinject®),* give immediately in Sodium chloride 0.9%, dilute 200–500 mg in up to 100 mL infusion fluid and give over at least 6 minutes; dilute 0.5–1 g in up to 250 mL infusion fluid and give over at least 15 minutes.

**PRESCRIBING AND DISPENSING INFORMATION**

A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**ELECTROLYTES:**

*Iron-deficiency anaemia* 50 mg per 1 ml Ferinject

1000 mg/20ml solution for injection vials | 1 vial £154.23

Ferinject 100mg/2ml solution for injection vials | 5 vial £81.18

Ferinject 50mg/10ml solution for injection vials | 5 vial £40.88

**Iron isomaltoside 1000**

**INDICATIONS AND DOSE**

Iron-deficiency anaemia

*Adult:* Doses calculated according to body-weight and iron deficit (consult product literature)

**SIDE-EFFECTS**

*Uncommon* Abdominal pain, anaphylaxis, blurred vision, constipation, cramps, dysphonia, flushing, headache, hypertension, impotence, nausea, numbness, pruritus, rash, vomiting

*Rare* Altered mental status, angioedema, arrhythmias, chest pain, diarrhoea, dizziness, epistaxis, flushing, injection-site reactions, malaise, myalgia, restlessness, seizures, sweating, tachycardia, tremor

*Very rare* Anaphylaxis, chest pain, convulsions, dizziness, epistaxis, flushing, hyperventilation, injection-site reactions, impotence, malaise, myalgia, restlessness, numbness, pruritus, restlessness, tachycardia, tremor, vomiting

**PREGNANCY**

Avoid in first trimester.

**HEPATIC IMPAIRMENT**

Avoid in decompensated liver disease and hepatitis.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Monofer®), give immediately in Sodium chloride 0.9%, dilute 100–200 mg in 100 mL infusion fluid; give 25mg over 15 minutes initially, then give at a rate not exceeding 6.67 mg/minute; *total dose infusion* diluted in 500 mL infusion fluid and given over 4–6 hours (initial dose 25 mg over 15 minutes).

**PRESCRIBING AND DISPENSING INFORMATION**

A complex of ferric hydroxide with dextran containing 5% (50 mg/mL) of iron.
Iron deficiency anaemia

**Iron sucrone**

- **INDICATIONS AND DOSE**
  - **Iron-deficiency anaemia**
    - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Adult: Doses calculated according to body-weight and iron deficit (consult product literature)
  - **CONTRA-INDICATIONS** Anaphylaxis · asthma · eczema · history of allergic disorders
  - **CAUTIONS** Hypersensitivity reactions can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available · infection (discontinue if ongoing bacteraemia · oral iron should not be given until 5 days after last injection
  - **INTERACTIONS** → Appendix 1: iron (injectable)
  - **SIDE-EFFECTS**
    - Common or very common Taste disturbances
    - Abdominal pain · bronchospasm · chest pain · diarrhoea · dizziness · dysphonia · fever · flushing · headache · hypotension · injection-site reactions · myalgia · nausea · palpititation · pruritus · rash · tachycardia · vomiting
    - Rare Anaphylaxis · asthenia · fatigue · hypertension · paraesthesia · peripheral oedema
    - Frequency not known Arthralgia · bradycardia · confusion · increased sweating
  - **PREGNANCY** Avoid in first trimester.
  - **HEPATIC IMPAIRMENT** Use with caution. Avoid in conditions where iron overload increases risk of impairment.
  - **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Venoferr®), give intermittently in Sodium chloride 0.9%, dilute 100 mg in up to 100 mL infusion fluid; give 25 mg over 15 minutes initially, then give at a rate not exceeding 3.33 mg/minute.
  - **PRESCRIBING AND DISPENSING INFORMATION** A complex of ferric hydroxide with sucrose containing 2% (20 mg/mL) of iron.
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Solution for injection**
      - Venoferr® (Vifor Pharma UK Ltd, Imported (United States))
      - Iron (as iron sucrose) 20 mg per 1 mL
      - Venoferr 100mg/5ml solution for injection vials | 5 vial | £43.52
      - Venoferr 50mg/2.5ml solution for injection vials | 5 vial | price available

**MINERALS AND TRACE ELEMENTS** › **IRON, ORAL**

**Iron (oral)**

- **SIDE-EFFECTS** Constipation · diarrhoea · epigastric pain (dose related) · faecal impaction · gastro-intestinal irritation · nausea (dose related)
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Managing side-effects If side-effects occur, the dose may be reduced; alternatively, another iron salt may be used, but an improvement in tolerance may simply be a result of a lower content of elemental iron. The incidence of side-effects due to ferrous sulfate is no greater than with other iron salts when compared on the basis of equivalent amounts of elemental iron.
  - Altered bowel habit Iron preparations taken orally can be constipating and occasionally lead to faecal impaction. Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory bowel disease; care is also needed in patients with intestinal strictures and diverticular disease.
  - The relationship between dose and altered bowel habit (constipation or diarrhoea) is less clear than for nausea and epigastric pain.
  - **Overdose** For details on the management of poisoning, see iron salts, under Emergency treatment of poisoning p. 1249.
    - In children Iron preparations are an important cause of accidental overdose in children and as little as 20 mg/kg of elemental iron can lead to symptoms of toxicity.
  - **MONITORING REQUIREMENTS**
    - Therapeutic response The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the normal range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.
  - **PRESCRIBING AND DISPENSING INFORMATION**
    - In children Express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription. The iron content of artificial formula feeds should also be considered. The most common reason for lack of response in children is poor compliance; poor absorption is rare in children.
  - **PATIENT AND CARER ADVICE** Although iron preparations are best absorbed on an empty stomach they can be taken after food to reduce gastro-intestinal side-effects. May discolour stools.

**Ferric maltol**

- **INDICATIONS AND DOSE**
  - **Treatment of iron-deficiency anaemia in patients with inflammatory bowel disease**
    - **BY MOUTH**
    - Adult: 30 mg twice daily continued until iron stores are replenished; usual duration at least 12 weeks
  - **CONTRA-INDICATIONS** Exacerbation of inflammatory bowel disease · haemochromatosis · haemoglobin less than 9.5 g/dL · iron overload syndromes · repeated blood transfusions
  - **INTERACTIONS** → Appendix 1: iron (oral)
  - **SIDE-EFFECTS**
    - Common or very common Abdominal distention · abdominal pain · flatulence
    - Uncommon Acne · erythema · headache · joint stiffness · pain in extremity · thirst · vomiting
  - **NATIONAL FUNDING/ACCESS DECISIONS**
    - Scottish Medicines Consortium (SMC) Decisions
      - The Scottish Medicines Consortium has advised (December 2016) that ferric maltol (Feraccru®) is not recommended for use within NHS Scotland for the treatment of iron deficiency anaemia in adults with inflammatory bowel disease as the economic case was not demonstrated.
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Capsule**
      - Feraccru® (Shield Therapeutics (UK) Ltd)
      - Iron (as Ferric maltol) 30 mg
      - Feraccru 30mg capsules | 56 capsule | £47.60
### Ferrous fumarate

#### INDICATIONS AND DOSE

**Iron-deficiency anaemia (prophylactic)**
- **BY MOUTH USING TABLETS**
  - Child 12-17 years: 210 mg 1–2 times a day
  - Adult: 210 mg 1–2 times a day
- **BY MOUTH USING SYRUP**
  - Child 12-17 years: 140 mg twice daily
  - Adult: 140 mg twice daily

**Iron-deficiency anaemia (therapeutic)**
- **BY MOUTH USING TABLETS**
  - Child 12-17 years: 210 mg 2–3 times a day
  - Adult: 210 mg 2–3 times a day
- **BY MOUTH USING SYRUP**
  - Child 12-17 years: 280 mg twice daily
  - Adult: 280 mg twice daily

**GALFER® CAPSULES**
- **Iron-deficiency anaemia (prophylactic)**
  - **BY MOUTH**
    - Child 12-17 years: 305 mg daily
    - Adult: 305 mg daily
  - **Iron-deficiency anaemia (therapeutic)**
    - **BY MOUTH**
      - Child 12-17 years: 305 mg twice daily
      - Adult: 305 mg twice daily

**GALFER® SYRUP**
- **Iron-deficiency anaemia (prophylaxis)**
  - **BY MOUTH**
    - Child 1 month–11 years: 0.25 mL/kilogram twice daily, the total daily dose may alternatively be given in 3 divided doses, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established; maximum 20 mL per day
    - Child 12-17 years: 10 mL once daily
    - Adult: 10 mL once daily
  - **Iron-deficiency anaemia (therapeutic)**
    - **BY MOUTH**
      - Child 1 month–11 years: 0.25 mL/kilogram twice daily, the total daily dose may alternatively be given in 3 divided doses; maximum 20 mL per day
      - Child 12-17 years: 10 mL 1–2 times a day
      - Adult: 10 mL 1–2 times a day

#### INTERACTIONS
Appendix 1: folates, iron (oral)

#### PRESCRIBING AND DISPENSING INFORMATION
Pregaday® contains ferrous fumarate 322 mg (100 mg iron), folic acid 350 micrograms; Galfer FA® contains ferrous fumarate 305 mg (100 mg iron), folic acid 350 micrograms.

### Ferrous fumarate with folic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, ferrous fumarate above, folic acid p. 937.

#### INDICATIONS AND DOSE

**Iron-deficiency anaemia**
- **BY MOUTH USING CAPSULES**
  - Adult: 1 capsule daily, to be taken before food
- **BY MOUTH USING TABLETS**
  - Adult: 1 tablet daily

#### INTERACTIONS

#### PRESCRIBING AND DISPENSING INFORMATION
Pregaday® contains ferrous fumarate 322 mg (100 mg iron), folic acid 350 micrograms; Galfer FA® contains ferrous fumarate 305 mg (100 mg iron), folic acid 350 micrograms.

### Ferrous gluconate

#### INDICATIONS AND DOSE

**Prophylaxis of iron-deficiency anaemia**
- **BY MOUTH USING TABLETS**
  - Child 6–11 years: 300–900 mg daily
  - Child 12–17 years: 600 mg daily
  - Adult: 600 mg daily

**Treatment of iron-deficiency anaemia**
- **BY MOUTH USING TABLETS**
  - Child 6–11 years: 300–900 mg daily
  - Child 12–17 years: 1.2–1.8 g daily in divided doses
  - Adult: 1.2–1.8 g daily in divided doses

#### INTERACTIONS
Appendix 1: iron (oral)

#### PRESCRIBING AND DISPENSING INFORMATION
Ferrous gluconate 300 mg contains 35 mg iron.
Iron-deficiency anaemia

**INDICATIONS AND DOSE**
- **Iron-deficiency anaemia (prophylactic)**
  - **By mouth using tablets**
  - Child 6–17 years: 200 mg daily
  - Adult: 200 mg daily
- **Iron-deficiency anaemia (therapeutic)**
  - **By mouth using tablets**
  - Child 6–17 years: 200 mg 2–3 times a day
  - Adult: 200 mg 2–3 times a day

**FEROGRAD**
- **Iron-deficiency anaemia (prophylactic and therapeutic)**
  - **By mouth**
  - Child 12–17 years: 1 tablet daily
  - Adult: 1 tablet daily

**IRONORM® DROPS**
- **Iron-deficiency anaemia (prophylactic)**
  - **By mouth**
  - Adult: 2.4–4.8 mL daily
- **Iron-deficiency anaemia (therapeutic)**
  - **By mouth**
  - Adult: 4 mL 1–2 times a day

**INTERACTIONS** → Appendix 1: iron (oral)

**PRESCRIBING AND DISPENSING INFORMATION**
- **Iron content**
  - Ferrous sulfate 200 mg is equivalent to 65 mg iron; **Ironorm® drops** contain ferrous sulfate 125 mg (equivalent to 25 mg iron)/mL; **Ferrosan®** spansules contain ferrous sulfate 150 mg (47 mg iron) (spanules = capsules m/v); **Ferrograd®** tablets contain ferrous sulfate 325 mg (105 mg iron).
- With oral use in adults Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

**PATIENT AND CARER ADVICE**
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - NHS restrictions **Feospan®** is not prescribable under the National Health Service.
  - **LESS SUITABLE FOR PRESCRIBING** **Feospan®** is less suitable for prescribing.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
  - **Modified-release tablet**
    - **CAUTIONARY AND ADVISORY LABELS 25**
      - Ferrograd (Teofarma)
        - Ferrous sulfate dried 325 mg Ferrograd 325 mg modified-release tablets | 30 tablet £2.58 DT price = £2.58
  - **Tablet**
    - **Ferrous sulfate (Non-proprietary)**
      - Ferrous sulfate dried 200 mg Ferrous sulfate 200 mg tablets | 28 tablet £3.35 DT price = £1.95 | 100 tablet £119.64

**Ferrous sulfate with ascorbic acid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ferrous sulfate above, ascorbic acid p. 991.

**INDICATIONS AND DOSE**
- **Iron-deficiency anaemia**
  - **By mouth using modified-release tablets**
  - Adult: 1 tablet daily, dose to be taken before food

**INTERACTIONS** → Appendix 1: ascorbic acid, iron (oral)

**NATIONAL FUNDING/ACCESS DECISIONS**
- NHS restrictions **Ferrograd C®** is not prescribable on the National Health Service.
- **LESS SUITABLE FOR PRESCRIBING** **Ferrograd C®** is less suitable for prescribing.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
  - **Modified-release tablet**
    - **CAUTIONARY AND ADVISORY LABELS 25**
      - Feospan Spansules (Intrapharm Laboratories Ltd)
        - Ferrous sulfate dried 150 mg Feospan 150 mg Spansules | 30 capsule £3.95
  - **Oral drops**
    - Ironorm (Wallace Manufacturing Chemists Ltd)
      - Ferrous sulfate 125 mg per 1 mL Ironorm 125 mg/mL oral drops sugar-free | 15 mL £30.00

**Ferrous sulfate with folic acid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ferrous sulfate above, folic acid p. 937.

**INDICATIONS AND DOSE**
- **Iron-deficiency anaemia**
  - **By mouth using modified-release capsules**
  - Adult: 1 capsule daily
  - **By mouth using modified-release tablets**
  - Child 12–17 years: 1 tablet daily, to be taken before food
  - Adult: 1 tablet daily, to be taken before food

**INTERACTIONS** → Appendix 1: folates, iron (oral)

**NATIONAL FUNDING/ACCESS DECISIONS**
- NHS restrictions **Fefol®** is not prescribable under the National Health Service.
- **LESS SUITABLE FOR PRESCRIBING** **Fefol®** is less suitable for prescribing. **Ferrograd Folic®** is less suitable for prescribing.
Polyascharide-iron complex

**INDICATIONS AND DOSE**

**Iron-deficiency anaemia (prophylactic)**
- **BY MOUTH**
  - Child 1 month–1 year: 1 drop (approximately 500 micrograms iron) per 450 g body-weight to be to be given 3 times a day, dose to be administered from dropper bottle, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established
  - Child 12–17 years: 2.5 mL daily
- **Adult:** 2.5 mL daily

**Iron-deficiency anaemia (therapeutic)**
- **BY MOUTH**
  - Child 2–5 years: 2.5 mL daily
  - Child 6–11 years: 5 mL daily
  - Child 12–17 years: 5 mL 1–2 times a day
  - Adult: 5 mL 1–2 times a day

**Iron-deficiency anaemia (therapeutic) if required during second and third trimester of pregnancy**
- **BY MOUTH**
  - Child 12–17 years: 5 mL once daily
  - Adult: 5 mL once daily

**INTERACTIONS** → Appendix 1: iron (oral)

**PATIENT AND CARER ADVICE** Counselling on the use of the dropper advised.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NHS restrictions** Nifexer® is not available on prescription under NHS, except 30–mL paediatric dropper bottle for prophylaxis and treatment of iron deficiency in infants born prematurely; endorse prescription ‘SLS’.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**
- Nifexer® (Tilled Laboratories Ltd)
  - Iron (as Polyascharide-iron complex) 100 mg Nifexer 100 mg/5 mL
elixir sugar-free | 30 mL £2.16 sugar-free | 240 mL £6.06

Sodium feredetate (Sodium ironedetate)

**INDICATIONS AND DOSE**

**Iron-deficiency anaemia (therapeutic)**
- **BY MOUTH USING ORAL SOLUTION**
  - Child 1–11 months: Up to 2.5 mL twice daily, smaller doses to be used initially
  - Child 1–4 years: 2.5 mL 3 times a day
  - Child 5–11 years: 5 mL 3 times a day
  - Child 12–17 years: 5 mL 3 times a day, increased to 10 mL 3 times a day, dose to be increased gradually

**INTERACTIONS** → Appendix 1: iron (oral)

**PRESCRIBING AND DISPENSING INFORMATION** Sytron® contains 190 mg sodium feredetate, which is equivalent to 27.5 mg of iron/5 mL.

**PATIENT AND CARER ADVICE**

Medications for Children leaflet: Sytron (sodium feredetate) for the treatment of anaemia www.medicinesforchildren.org.uk/sytron-sodium-feredetate-for-treatment-of-anaemia

- Sytron (Forum Health Products Ltd)
  - Sodium feredetate 38 mg per 1 mL Sytron oral solution sugar-free | 500 mL £14.95 DT price = £14.95

### 1.3 Megaloblastic anaemia

**Anaemia, megaloblastic**

**Overview**

Most megaloblastic anaemias result from a lack of either vitamin B₁₂ or folate, and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

One cause of megaloblastic anaemia in the UK is pernicious anaemia in which lack of gastric intrinsic factor resulting from an autoimmune gastritis causes malabsorption of vitamin B₁₂.

Vitamin B₁₂ is also needed in the treatment of megaloblastosis caused by prolonged nitrous oxide anaesthesia, which inactivates the vitamin, and in the rare syndrome of congenital transcobalamin II deficiency.

Vitamin B₁₂ should be given prophylactically after total gastrectomy or total ileal resection (or after partial gastrectomy if a vitamin B₁₂ absorption test shows vitamin B₁₂ malabsorption).

Apart from dietary deficiency, all other causes of vitamin B₁₂ deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B₁₂ orally and none for vitamin B₁₂ intrinsic factor complexes given by mouth. Vitamin B₁₂ in larger oral doses [unlicensed] may be effective.

Hydroxocobalamin p. 938 has completely replaced cyanocobalamin p. 938 as the form of vitamin B₁₂ of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B₁₂ neuropathy.

Folic acid p. 937 has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B₁₂ is
administered concurrently otherwise neuropathy may be precipitated.

In folate-deficient megaloblastic anaemia (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores.

For prophylaxis in chronic haemolytic states, malabsorption, or in renal dialysis, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

Folic acid is also used for the prevention of methotrexate-induced side-effects in severe Crohn’s disease, rheumatic disease, and severe psoriasis.

Folic acid p. 869 is also effective in the treatment of folic acid deficient megaloblastic anaemia but it is generally used in association with cytotoxic drugs; it is given as calcium folinate.

There is no justification for prescribing multiple ingredient vitamin preparations containing vitamin B₁₂ or folic acid.

For the use of folic acid before and during pregnancy, see Neural tube defects (prevention in pregnancy) p. .

VITAMINS AND TRACE ELEMENTS ➤ FOLATES

Folic Acid 09-Jun-2016

INDICATIONS AND DOSE

Folate-deficient megaloblastic anaemia ➤ BY MOUTH

Child 1-11 months: Initially 500 micrograms/kg once daily (max. per dose 5 mg) for up to 4 months, doses up to 10 mg daily may be required in malabsorption states

Child 1-17 years: 5 mg daily for 4 months (until term in pregnant women), doses up to 15 mg daily may be required in malabsorption states

Adult: 5 mg daily for 4 months (until term in pregnant women), doses up to 15 mg daily may be required in malabsorption states

Prevention of neural tube defects (in those at a low risk of conceiving a child with a neural tube defect see p. 997) ➤ BY MOUTH

Females of childbearing potential: 400 micrograms daily, to be taken before conception and until week 12 of pregnancy

Prevention of neural tube defects (in those in the high-risk group who wish to become pregnant or who are at risk of becoming pregnant see p. 997) ➤ BY MOUTH

Females of childbearing potential: 5 mg daily, to be taken before conception and until week 12 of pregnancy

Prevention of neural tube defects (in those with sickle-cell disease) ➤ BY MOUTH

Females of childbearing potential: 5 mg daily, patient should continue taking their normal dose of folic acid 5 mg daily (or increase the dose to 5 mg daily) before conception and continue this throughout pregnancy

Prevention of methotrexate-induced side-effects in rheumatic disease ➤ BY MOUTH

Adult: 5 mg once weekly, dose to be taken on a different day to methotrexate dose

Prevention of methotrexate side-effects in severe Crohn’s disease | Prevention of methotrexate side-effects in severe psoriasis ➤ BY MOUTH

Adult: 5 mg once weekly, dose to be taken on a different day to methotrexate dose

Prophylaxis in chronic haemolytic states ➤ BY MOUTH

Adult: 5 mg every 1–7 days, frequency dependent on underlying disease

Prophylaxis of folate deficiency in dialysis ➤ BY MOUTH

Child 1 month-11 years: 250 micrograms/kg once daily (max. per dose 10 mg)

Child 12-17 years: 5–10 mg once daily

Adult: 5 mg every 1–7 days

Prophylaxis of folate deficiency in patients receiving parenteral nutrition ➤ BY INTRAVENOUS INFUSION

Adult: 15 mg 1–2 times a week, usually given by intravenous infusion in the parenteral nutrition solution

CAUTIONS Should never be given alone for pernicious anaemia (may precipitate subacute combined degeneration of the spinal cord)

INTERACTIONS ➤ Appendix 1: folates

SIDE-EFFECTS ➤ Rare Gastro-intestinal disturbances

PATIENT AND CARER ADVICE

EXCEPTIONS TO LEGAL CATEGORY

With oral use Can be sold to the public provided daily doses do not exceed 500 micrograms.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for injection

VITAMINS AND TRACE ELEMENTS > VITAMIN B GROUP

Cyanocobalamin

- INDICATIONS AND DOSE
  Vitamin B<sub>12</sub> deficiency of dietary origin
  - BY MOUTH
    - Adult: 50–150 micrograms daily, dose to be taken between meals
  - BY INTRAMUSCULAR INJECTION
    - Adult: Initially 1 mg every 2–3 days for 11 doses; maintenance 1 mg every month

- PRESCRIBING AND DISPENSING INFORMATION
  The BP directs that when vitamin B<sub>12</sub> injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied. Currently available brands of the tablet may not be suitable for vegans.

- NATIONAL FUNDING/ACCESS DECISIONS
  NHS restrictions Cyanocobalamin liquid, Cytacon<sup>®</sup> tablets, and Cytacon<sup>®</sup> injection are not available on prescription under the NHS.

- LESS SUITABLE FOR PRESCRIBING
  Cyanocobalamin is less suitable for prescribing.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet
  - Cyanocobalamin (Non-proprietary)
    - Cyanocobalamin 50 microgram Cyanocobalamin 50microgram tablets | 50 tablet [P] £6.24 DT price = £8.99
    - Cytacon (AMCo)
      - Cyanocobalamin 50 microgram Cytacon 50microgram tablets | 50 tablet [P] £8.99 DT price = £8.99
  - Solution for injection
    - Cytacon (Focus Pharmaceuticals Ltd)
      - Cyanocobalamin 1 mg per 1 ml Cyanobal-H<sup>®</sup> tablets | 5 ampoule [P] 14.50 DT price = £14.50
  - Oral solution
    - Cyanocobalamin (Non-proprietary)
      - Cyanocobalamin 7 microgram per 1 ml Cyanocobalamin 7microgram/5ml oral solution | 200 ml [P] £8.75

Hydroxocobalamin

- INDICATIONS AND DOSE
  Prophylaxis of macrocytic anaemias associated with vitamin B<sub>12</sub> deficiency
  - BY INTRAMUSCULAR INJECTION
    - Adult: 1 mg every 2–3 months
  Pernicious anaemia and other macrocytic anaemias without neurological involvement
  - BY INTRAMUSCULAR INJECTION
    - Adult: Initially 1 mg 3 times a week for 2 weeks, then 1 mg every 3 months
  Pernicious anaemia and other macrocytic anaemias with neurological involvement
  - BY INTRAMUSCULAR INJECTION
    - Adult: Initially 1 mg once daily on alternate days until no further improvement, then 1 mg every 2 months
  Tobacco ambylopia
  - BY INTRAMUSCULAR INJECTION
    - Adult: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months

- PRESCRIBING AND DISPENSING INFORMATION
  Leber’s optic atrophy
  - BY INTRAMUSCULAR INJECTION
    - Adult: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months
  CYANOKIT<sup>®</sup>
  Poisoning with cyanides
  - BY INTRAVENOUS INFUSION
    - Child (body-weight 5 kg and above): Initially 70 mg/kg (max. per dose 5 g), to be given over 15 minutes, then 70 mg/kg (max. per dose 5 g) if required, this second dose can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability
    - Adult: Initially 5 g, to be given over 15 minutes, then 5 g if required, this second dose can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability

- CAUTIONS
  - With intramuscular use or oral use Should not be given before diagnosis fully established

- SIDE-EFFECTS
  GENERAL SIDE-EFFECTS
  Dizziness · headache · pruritus
  SPECIFIC SIDE-EFFECTS
  With intramuscular use Hypokalaemia (during initial treatment) · injection-site reactions · rash · thrombocytosis (during initial treatment) · With intramuscular use or oral use Chromaturia · fever · hypersensitivity reactions · nausea · With intravenous use Dyspnoea · eye disorders · gastrointestinal disturbances · hot flush · lymphocytopenia · memory impairment · peripheral oedema · pustular rashes · red coloration of urine · restlessness · reversible red coloration of skin and mucous membranes · throat disorders · transient hypertension

- BREAST FEEDING
  Present in milk but not known to be harmful.

- EFFECT ON LABORATORY TESTS
  With intravenous use Deep red colour of hydroxocobalamin may interfere with laboratory tests.

- DIRECTIONS FOR ADMINISTRATION
  With intravenous use For intravenous infusion (Cyanokit)<sup>®</sup>, given intermittently in Sodium chloride 0.9%, reconstitute 5 g vial with 200 mL Sodium Chloride 0.9%; gently invert vial for at least 1 minute to mix (do not shake).

- PRESCRIBING AND DISPENSING INFORMATION
  - With intramuscular use The BP directs that when vitamin B<sub>12</sub> injection is prescribed or demanded, hydroxocobalamin injection shall be dispensed or supplied. Poisoning by cyanides
  - With intravenous use Cyanokit<sup>®</sup> is the only preparation of hydroxocobalamin that is suitable for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

- NATIONAL FUNDING/ACCESS DECISIONS
  NHS restrictions Cobal-H<sup>®</sup> is not prescribable under National Health Service (NHS). Neo-Cytamen<sup>®</sup> is not prescribable under National Health Service (NHS).

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Solution for injection
  - Hydroxocobalamin (Non-proprietary)
    - Hydroxocobalamin 1 mg per 1 ml Hydroxocobalamin 1mg/1ml solution for injection ampoules | 5 ampoule [P] £12.49 DT price = £7.12
    - Hydroxocobalamin 2.5 mg per 1 ml Hepavit 5mg/2ml solution for injection ampoules | 2 ampoule [P] no price available
Iron overload

Overview
Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially thalassaemia major, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is used for patients who have received multiple transfusions, transfusion-related chronic iron overload may be given through the same cannula.

Iron excretion induced by desferrioxamine mesilate is enhanced by administration of ascorbic acid p. 991 (vitamin C) daily by mouth; it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to patients with cardiac dysfunction; in patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine mesilate.

Desferrioxamine mesilate infusion can be used to treat aluminium overload in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

ANTIDOTES AND CHELATORS

Deferasirox

Drug Action
Deferasirox is an oral iron chelator.

INDICATIONS AND DOSE

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells) (specialist use only)

BY MOUTH USING DISPERSIBLE TABLETS
Adult: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Dose equivalence and conversion
The bioavailability of dispersible tablets is lower than that of film-coated tablets; dispersible tablets are not interchangeable with film-coated tablets on a milligram-for-milligram basis—consult product literature for information on switching between formulations.

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with other anaemias (specialist use only)

BY MOUTH USING FILM-COATED TABLETS
Adult: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Chronic iron overload when desferrioxamine is contra-indicated or inadequate in non-transfusion-dependent thalassaemia syndromes (specialist use only)

BY MOUTH USING FILM-COATED TABLETS
Adult: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Chronic iron overload when desferrioxamine is contra-indicated or inadequate in non-transfusion-dependent thalassaemia syndromes (specialist use only)

BY MOUTH USING FILM-COATED TABLETS
Adult: Initially 10–30 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 5–10 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 40 mg/kg per day; Usual maximum 30 mg/kg
Blood and nutrition

● **CAUTIONS** Elderly (increased risk of side-effects) - history of liver cirrhosis - not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes) - platelet count less than 50x10^9/litre - risk of gastro-intestinal ulceration and haemorrhage - unexplained cytopenia - consider treatment interruption

● **INTERACTIONS** → Appendix 1: deferasirox

● **SIDE-EFFECTS**
  ▶ **Common or very common** Abdominal distension - abdominal pain - constipation - diarrhoea - dyspepsia - gastro-intestinal haemorrhage (including fatal cases) - gastro-intestinal ulceration - headache - nausea - proteinuria - pruritus - raised serum creatinine - raised transaminases - rash - vomiting
  ▶ **Uncommon** Anxieties - cataract - cholelithiasis - disturbances of hearing and vision - dizziness - fatigue - gastritis - glucosuria - hepatitis - laryngeal pain - maculopathy - oedema - pyrexia - renal tubulopathy - skin pigmentation - sleep disorder
  ▶ **Rare** Oesophagitis - optic neuritis
  ▶ **Frequency not known** Acute pancreatitis - acute renal failure - alopecia - anaphylaxis - angioedema - blood disorders - erythema multiforme - hepatic failure - hypersensitivity reactions - hypersensitivity vasculitis - metabolic acidosis - nephrolithiasis - Stevens-Johnson syndrome - toxic epidermal necrolysis - tubulointerstitial nephritis - urticaria

● **PREGNANCY** Manufacturer advises avoid unless essential - toxicity in animal studies.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

● **HEPATIC IMPAIRMENT** Use with caution in moderate impairment, reduce dose considerably then gradually increase to max. 50% of normal dose. Avoid in severe impairment.

● **RENAL IMPAIRMENT** Manufacturer advises reduce dose if creatinine clearance less than 90 mL/minute and serum creatinine increased by more than 33% of baseline measurement on 2 consecutive occasions—consult product literature. Manufacturer advises avoid if estimated creatinine clearance less than 60 mL/minute.

● **MONITORING REQUIREMENTS** Manufacturer advises monitoring of the following patient parameters: baseline serum creatinine twice and creatinine clearance once before initiation of treatment, weekly in the first month after treatment initiation or modification, then monthly thereafter; proteinuria before treatment initiation then monthly thereafter, and other markers of renal tubular function as needed; liver function before treatment initiation, every 2 weeks during the first month of treatment, then monthly thereafter; eye and ear examinations before treatment and annually during treatment; serum-ferritin concentration monthly.

● **DIRECTIONS FOR ADMINISTRATION** For dispersible tablets, manufacturer advises tablets should be dispersed in 100–200 mL of water, orange juice, or apple juice; if necessary any residue should be resuspended in a small volume of water or juice then administered; do not chew or swallow whole. For film-coated tablets, manufacturer advises tablets may be crushed and sprinkled on to soft food (yoghurt or apple sauce), then administered immediately.

● **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer deferasirox dispersible tablets.

● **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (January 2007) that deferasirox is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload associated with the treatment of rare acquired or inherited anaemias requiring recurrent blood transfusions. It is not recommended for patients with myelodysplastic syndromes.

The Scottish Medicines Consortium has advised (January 2017) that deferasirox (Exjade®) is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload due to blood transfusions when deferoxamine treatment is contra-indicated or inadequate, in adult and paediatric patients aged 2 years and older with rare acquired or inherited anaemias. This advice relates only for use in patients with myelodysplastic syndrome with an International Prognostic Scoring System score of low or intermediate -1 risk.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Dispersible tablet**

**CAUTIONARY AND ADVISORY LABELS 13, 22**

- [Exjade](Novartis Pharmaceuticals UK Ltd) ▼

**Deferiprone**

● **DRUG ACTION** Deferiprone is an oral iron chelator.

● **INDICATIONS AND DOSE**

Treatment of iron overload in patients with thalassaemia major in whom desferrioxamine is contra-indicated or is inadequate

- **BY MOUTH**
  - Adult: 25 mg/kg 3 times a day; maximum 100 mg/kg per day

● **CONTRA-INDICATIONS** History of agranulocytosis or recurrent neutropenia

● **INTERACTIONS** → Appendix 1: deferi proline

● **SIDE-EFFECTS** Agranulocytosis - arthropathy - blood dyscrasias - gastro-intestinal disturbances (reducing dose and increasing gradually may improve tolerance) - headache - increased appetite - neutropenia - red-brown urine discoloration - zinc deficiency

● **CONCEPTION AND CONCEPTION** Manufacturer advises avoid before intended conception—teratogenic and embryotoxic in animal studies. Contraception advised in females of child-bearing potential.

● **PREGNANCY** Manufacturer advises avoid during pregnancy—teratogenic and embryotoxic in animal studies.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function—inrupt treatment if persistent elevation in serum alanine aminotransferase.

● **RENAI IMPAIRMENT** Manufacturer advises caution—no information available.

● **MONITORING REQUIREMENTS**
  - Monitor neutrophil count weekly and discontinue treatment if neutropenia develops.
  - Monitor plasma-zinc concentration.

**Blood and nutrition**

**940 Iron overload**

**BNF 74**
### Desferrioxamine mesilate (Desferoxamine Mesilate)

#### INDICATIONS AND DOSE
**Iron poisoning**
- **Adult:** By continuous intravenous infusion
- **Adult:** Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service

**Aluminium overload in dialysis patients**
- **Adult:** By intravenous infusion
- **Adult:** Consult product literature or local protocols

**Chronic iron overload (low iron overload)**
- **Adult:** By subcutaneous infusion
- **Adult:** The dose should reflect the degree of iron overload

**Chronic iron overload (established overload)**
- **Adult:** By subcutaneous infusion
- **Adult:** 20–50 mg/kg daily

#### CAUTIONS
- Aluminium-related encephalopathy (may exacerbate neurological dysfunction)

#### INTERACTIONS
- Common or very common: Abdominal pain, arthralgia, bone disorders, growth retardation, headache, hearing disturbances, injection-site reactions, myalgia, nausea, peripheral neuropathy, thrombocytopenia, visual disturbances, Yersinia and mucormycosis infections
- Very rare: Acute respiratory distress, convulsions, dizziness, neurological disturbances, neuropathy, paraesthesia, renal impairment
- Frequency not known: Muscle spasms

#### PREGNANCY
- Teratogenic in animal studies. Manufacturer advises use only if potential benefit outweighs risk.

#### BREAST FEEDING
- Manufacturer advises use only if potential benefit outweighs risk—no information available.

#### RENAL IMPAIRMENT
- Use with caution.

### Neutropenia and stem cell mobilisation

#### 3 Neutropenia

### Neutropenia

#### Management

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival.

Filgrastim p. 942 (un glycosylated rhG-CSF) and lenograstim p. 943 (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Pegyl filgrastim p. 944 is a polyethylene glycol-conjugated (‘pegylated’) derivative of filgrastim; pegylation increases the duration of filgrastim activity. Lipegfilgrastim p. 943 is a polyethylene glycol-conjugated via a glycine linker derivative of filgrastim.

Granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

### IMMUNOSTIMULANTS

#### 3.1 Neutropenia

### Granulocyte-colony stimulating factors

#### DRUG ACTION
- Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils.

#### CAUTIONS
- Malignant myeloid conditions, pre-malignant myeloid conditions, risk of splenomegaly and rupture—spleen size should be monitored, sickle-cell disease

#### CAUTIONS, FURTHER INFORMATION
- Acute respiratory distress syndrome There have been reports of pulmonary infiltrates leading to acute respiratory
distress syndrome—patients with a recent history of pulmonary infiltrates or pneumonia may be at higher risk.

- **SIDE-EFFECTS**
  - Common or very common: Alopecia, anorexia, asthenia, bone pain, chest pain, fever, gastrointestinal disturbances, headache, injection-site reactions, leucocytosis, musculoskeletal pain, rash, thrombocytopenia
  - Rare: Acute febrile neutrophilic dermatosis, cutaneous vasculitis, pulmonary side-effects (particularly interstitial pneumonia)

**SIDE-EFFECTS, FURTHER INFORMATION**

- Pulmonary infiltration: Treatment should be withdrawn in patients who develop signs of pulmonary infiltration.
- **PREGNANCY**: There have been reports of toxicity in animal studies and manufacturers advise not to use granulocyte-colony stimulating factors during pregnancy unless the potential benefit outweighs the risk.
- **BREAST FEEDING**: There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding their use.

**MONITORING REQUIREMENTS**

- Full blood counts including differential white cell and platelet counts should be monitored.
- Spleen size should be monitored during treatment—risk of splenomegaly and rupture.

---

**Filgrastim**

*(Recombinant human granulocyte-colony stimulating factor; G-CSF)*

- **INDICATIONS AND DOSE**
  - *Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)*
  - **BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Adult: 5 micrograms/kg daily until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia), to be started at least 24 hours after cytotoxic chemotherapy. Preferably given by subcutaneous injection; if given by intravenous infusion, administer over 30 minutes.
  - *Reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone-marrow transplantation (specialist use only)*
    - **BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION**
    - Adult: 10 micrograms/kg daily, to be started at least 24 hours following cytotoxic chemotherapy and within 24 hours of bone-marrow infusion, then adjusted according to neutrophil count—consult product literature, doses administered over 30 minutes or 24 hours via intravenous route and over 24 hours via subcutaneous route.

**Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone (specialist use only)**

- **BY SUBCUTANEOUS INFUSION, OR BY SUBCUTANEOUS INJECTION**
  - Adult: 10 micrograms/kg daily for 5–7 days, to be administered over 24 hours if given by subcutaneous infusion.

**Mobilisation of peripheral blood progenitor cells for autologous infusion, used following adjunctive myelosuppressive chemotherapy—to improve yield (specialist use only)**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 5 micrograms/kg daily until neutrophil count in normal range, to be started the day after completing chemotherapy, for timing of leucopheresis, consult product literature.

**Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion (specialist use only)**

- **BY SUBCUTANEOUS INJECTION**
  - Adult 18-59 years: 10 micrograms/kg daily for 4–5 days, for timing of leucopheresis, consult product literature.

**Severe congenital neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 12 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol.

**Severe cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 5 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol.

**Persistent neutropenia in HIV infection (specialist use only)**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 1 microgram/kg daily, subsequent doses increased as necessary until neutrophil count in normal range, then adjusted to maintain neutrophil count in normal range—consult product literature; maximum 4 micrograms/kg per day.

---

**CONTRA-INDICATIONS**

- Severe congenital neutropenia (Kostmann’s syndrome) with abnormal cytogenetics.

**CAUTIONS**

- Osteoporotic bone disease (monitor bone density if given for more than 6 months) • secondary acute myeloid leukaemia.

**SIDE-EFFECTS**

- Common or very common: Anaemia, dysuria, epistaxis, exacerbation of rheumatoid arthritis, haematuria, hepatomegaly, mucositis, osteoporosis, proteinuria, pseudogout, raised uric acid, splenic enlargement, transient decrease in blood glucose, transient hypotension, urinary abnormalities.
- Uncommon: Capillary leak syndrome (including fatal cases).
- Rare: Splenic rupture.

**MONITORING REQUIREMENTS**

- Regular morphological and cytogenetic bone marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia).

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion (Neupogen®; Nivestim®; Ratiogranstim®; Zarzio®) give continuously or intermittently in Glucose 5%, for a filgrastim concentration of less than 1 500 000 units/mL (15 micrograms/mL albumin solution (human albumin solution) is added to produce a final albumin concentration of 2 mg/mL; should not be diluted to a filgrastim concentration of less than 200 000 units/mL (2 micrograms/mL) and should not be diluted with sodium chloride solution.

**PRESCRIBING AND DISPENSING INFORMATION**

- Filgrastim is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

1 million units of filgrastim solution for injection contains 10 micrograms filgrastim.
Mobilisation of peripheral blood progenitor cells, used following adjunctive myelosuppressive chemotherapy (to improve yield) (specialist use only)

- By subcutaneous injection
  - Adult: 150 micrograms/m² daily until neutrophil count stable in acceptable range, to be started 1–5 days after completion of chemotherapy, for timing of leukopheresis, consult product literature

### Side-effects
- Mucositis - splenic rupture - toxic epidermal necrolysis

### Directions for Administration
- With intravenous use
  - For intravenous infusion (Granocyte®), give intermittently in Sodium chloride 0.9%; initially reconstitute with 1 mL water for injection provided (do not shake vigorously) then dilute with up to 50 mL infusion fluid for each vial of Granocyte-13 or up to 100 mL infusion fluid for Granocyte-34; give over 30 minutes

### Prescribing and Dispensing Information
- Granocyte® solution for injection contains 105 micrograms of lenograstim per 13.4 mega unit vial and 263 micrograms lenograstim per 33.6 mega unit vial.

### Medicinal Forms
- There can be variation in the licensing of different medicines containing the same drug.

#### Powder and solvent for solution for injection

EXCIPIENTS: May contain Phenylalanine

- **Granocyte** (Chugai Pharma UK Ltd)
  - Lenograstim 13.4 mega u Granocyte-13 powder and solvent for solution for injection vials | 1 vial (POM) £40.11 | 5 vial (POM) £200.55
  - Lenograstim 33.6 mega u Granocyte-34 powder and solvent for solution for injection vials | 1 vial (POM) £62.54 | 5 vial (POM) £312.69

### Lenograstim

(Recombinant human granulocyte-colony stimulating factor; rHuG-CSF)

#### Indications and dose

Reduction in the duration of neutropenia and associated complications following bone-marrow transplantation for non-myeloid malignancy (specialist use only).

Reduction in the duration of neutropenia and associated complications following peripheral stem cell transplantation for non-myeloid malignancy (specialist use only)

- By intravenous infusion, or by subcutaneous injection
  - Adult: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started the day after transplantation. Intravenous infusion to be given over 30 minutes

Reduction in the duration of neutropenia and associated complications following treatment with cytotoxic chemotherapy associated with a significant incidence of febrile neutropenia (specialist use only)

- By subcutaneous injection
  - Adult: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started on the day after completion of chemotherapy

Mobilisation of peripheral blood progenitor cells for harvesting and subsequent infusion, used alone (specialist use only)

- By subcutaneous injection
  - Adult: 10 micrograms/kg daily for 4–6 days (5–6 days in healthy donors)

### Lipegfilgrastim

(Glycopegylated recombinant methionyl human granulocyte-colony stimulating factor)

#### Indications and dose

Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes)

- By subcutaneous injection
  - Adult (specialist use only): 6 mg, for each chemotherapy cycle, given approximately 24 hours after chemotherapy, dose expressed as filgrastim

#### Caution
- Myelosuppressive chemotherapy

#### Side-effects
- Hypokalaemia

### Medicinal Forms
- There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- Lonquex (Teva UK Ltd)
  - Lipegfilgrastim 10 mg per 1 ml Lonquex 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (POM) £652.06
Pegfilgrastim
(Pegylated recombinant methionyl human granulocyte-colony stimulating factor)

- **INDICATIONS AND DOSE**
  Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)
  - By subcutaneous injection
  - Adult: 6 mg for each chemotherapy cycle, to be given at least 24 hours after chemotherapy, dose is expressed as filgrastim

- **CAUTIONS**
  - Acute leukaemia - myelosuppressive chemotherapy

- **SIDE-EFFECTS**
  - Rare Capillary leak syndrome (including fatal cases)
  - Very rare Splenic rupture

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  - Neulasta (Amgen Ltd)
    Filgrastim (as Pegfilgrastim) 10 mg per 1 ml
    Neulasta 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection $686.38

3.2 Stem cell mobilisation

**IMMUNOSTIMULANTS**

- **CHEMOKINE RECEPTOR ANTAGONISTS**

Plerixafor

- **DRUG ACTION**
  Plerixafor is a chemokine receptor antagonist.

- **INDICATIONS AND DOSE**
  Mobilise haematopoietic stem cells to peripheral blood for collection and subsequent autologous transplantation in patients with lymphoma or multiple myeloma (specialist use only)
  - By subcutaneous injection
  - Adult: 240 micrograms/kg daily usually for 2–4 days (max 7 days), to be administered 6–11 hours before initiation of apheresis, dose to be given following 4 days treatment with a granulocyte-colony stimulating factor

- **SIDE-EFFECTS**
  - Common or very common Arthralgia - dizziness - dry mouth - erythema - fatigue - gastro-intestinal disturbances - headache - injection-site reactions - insomnia - musculoskeletal pain - oral hypoaesthesia - sweating
  - Uncommon Dyspnoea - hypersensitivity reactions - periorbital swelling

- **CONCEPTION AND CONCEPTION**
  Use effective contraception during treatment— teratogenic in animal studies.

- **PREGNANCY**
  Manufacturer advises avoid unless essential— teratogenic in animal studies.

- **BREAST FEEDING**
  Manufacturer advises avoid— no information available.

- **RENAL IMPAIRMENT**
  Reduce dose to 160 micrograms/kg daily if creatinine clearance 20–50 mL/minute. No information available if creatinine clearance less than 20 mL/minute.

4 Platelet disorders

**Platelet disorders**

**Idiopathic thrombocytopenic purpura**

Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. In adults, idiopathic thrombocytopenic purpura can be treated with a corticosteroid, e.g. prednisolone p. 639, gradually reducing the dose over several weeks. Splenectomy is considered if a satisfactory platelet count is not achieved or if there is a relapse on reducing the dose of corticosteroid or withdrawing it.

**Immunoglobulin** preparations, are also used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are also used for children often in preference to a corticosteroid. Anti-D (Rh) immunoglobulin p. 1185 is effective in raising the platelet count in about 80% of un splenectomised rhesus-positive individuals; its effects may last longer than normal immunoglobulin p. 1186 for intravenous use, but further doses are usually required.

Other therapy that has been tried in refractory idiopathic thrombocytopenic purpura includes azathioprine p. 787, cyclophosphamide p. 830, vincristine sulfate p. 858, cyclosporin p. 788, and danazol p. 699. Rituximab p. 820 may also be effective and in some cases induces prolonged remission. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid p. 107 may be given to reduce the severity of haemorrhage.

Eltrombopag p. 945 and romiplostim p. 947 are thrombopoietin receptor agonists licensed for the treatment of chronic idiopathic thrombocytopenic purpura in splenectomised patients refractory to other treatments, such as corticosteroids or immunoglobulins, or as a second-line treatment in non-splenectomised patients when surgery is contra-indicated (see also NICE guidance). Eltrombopag is an oral preparation and romiplostim is an injection which is made biosynthetically by recombinant DNA technology; they should both be used under the supervision of a specialist.

**Essential thrombocythaemia**

Anagrelide p. 945 inhibits platelet formation. It is licensed for essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs. An at risk patient is defined by one or more of the following features: over 60 years of age, or a platelet count greater than 1000 x 10^9/L or history of thrombo-haemorrhagic events. Anagrelide should be initiated under specialist supervision.
4.1 Essential thrombocythaemia

**ANTITHROMBOTIC DRUGS＞CYCLIC AMP PHOSPHODIESTERASE III INHIBITORS**

### Anagrelide

- **INDICATIONS AND DOSE**
  Essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs (initiated under specialist supervision)
  - **BY MOUTH**
    - Adult: Initially 500 micrograms twice daily, dose to be adjusted at weekly intervals according to response, increased in steps of 500 micrograms daily; usual dose 1–3 mg daily in divided doses (max. per dose 2.5 mg); maximum 10 mg per day

- **CAUTIONS** Cardiovascular disease—assess cardiac function before and regularly during treatment; comitant use of drugs that prolong QT-interval—assess cardiac function before and regularly during treatment; risk factors for QT-interval prolongation—assess cardiac function before and regularly during treatment

- **INTERACTIONS**＞Appendix 1: anagrelide

- **SIDE-EFFECTS**
  - Common or very common Anaemia, dizziness, fatigue, fluid retention, gastro-intestinal disturbances, headache, palpitation, rash, tachycardia
  - Uncommon: Alopecia, amnesia, anorexia, arrhythmias, arthralgia, back pain, blood disorders, chest pain, confusion, congestive heart failure, depression, dry mouth, dyspnoea, ecchymosis, epistaxis, fever, gastrointestinal haemorrhage, haemorrhage, hypertension, hypoaesthesia, impotence, malaise, myalgia, nervousness, oedema, pancreatitis, paraesthesia, pneumonia, pleural effusion, pruritus, skin discoloration, sleep disturbances, syncope, weight changes
  - Rare: Angina, asthenia, cardiomegaly, cardiomyopathy, colitis, dry skin, dysarthria, gastritis, gingival bleeding, impaired coordination, migraine, myocardial infarction, nocturia, pericardial effusion, postural hypotension, pulmonary hypertension, pulmonary infiltrates, renal failure, somnolence, tinnitus, vasodilatation, visual disturbances
  - Frequency not known Hepatitis, interstitial lung disease, Torresade de pointes, tubulointerstitial nephritis

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment

- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies).

- ** BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment. Avoid in moderate to severe impairment.

- **RENAL IMPAI RMENT** Manufacturer advises avoid if eGFR less than 50 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established).
  - Monitor liver function.
  - Monitor serum creatinine.
  - Monitor urea.
  - Monitor electrolytes (including potassium, magnesium and calcium) before and during treatment.

### Eltrombopag

- **INDICATIONS AND DOSE**
  Chronic immune (idiopathic) thrombocytopenic purpura in patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)
  - **BY MOUTH**
    - Adult: Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of 50x10⁹/litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day
    - Adult (patients of East Asian origin): Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of 50x10⁹/litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day

  Treatment of thrombocytopenia associated with chronic hepatitis C infection, where the degree of thrombocytopenia is the main factor preventing the initiation or limiting the ability to maintain optimal interferon-based therapy (under expert supervision)
  - **BY MOUTH**
    - Adult: Initially 25 mg once daily, dose to be adjusted to achieve a platelet count sufficient to initiate antiviral therapy then a platelet count of 50–75x10⁹/litre during antiviral therapy—consult product literature for dose adjustments, discontinue if inadequate response after 2 weeks treatment at maximum dose; maximum 100 mg per day

  Acquired severe aplastic anaemia in patients either refractory to or heavily pretreated with prior immunosuppressive therapy and are unsuitable for haematopoietic stem cell transplantation (under expert supervision)
  - **BY MOUTH**
    - Adult: Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of 50x10⁹/litre or more—consult product literature for dose adjustments, discontinue if no haematological response after 16 weeks treatment; maximum 150 mg per day
    - Adult (patients of East Asian origin): Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of 50x10⁹/litre or more—consult product literature for dose adjustments, discontinue if no haematological response after 16 weeks treatment; maximum 150 mg per day.

- **PATIENT AND CARER ADVICE**
  Driving and skilled tasks
  Dizziness may affect performance of skilled tasks (e.g. cycling, driving).

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**
  - **Xagrid** (Shire Pharmaceuticals Ltd) ▼
    - Anagrelide (as Anagrelide hydrochloride) 500 microgram x Xagrid 500microgram capsules | 100 capsule | £40.57

4.2 Idiopathic thrombocytopenic purpura

**ANTIHAEMORRHAGICS＞THROMBOPOIETIN RECEPTOR AGONISTS**

- **INDICATIONS AND DOSE**
  9

Blood and nutrition

09-Jun-2017
- **CAUTIONS** Patients of East Asian origin - risk factors for thromboembolism
- **INTERACTIONS** → Appendix 1: eltrombopag
- **SIDE-EFFECTS**
  - **Frequency not known** Increased bone marrow reticulocyte - discontinue
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment.
- **PREGNANCY** Avoid - toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** For *idiopathic thrombocytopenic purpura*, manufacturer advises avoid unless potential benefit outweighs risk - reduce initial dose to 25 mg once daily and wait at least 3 weeks before upwards titration of dose.
  For *severe aplastic anaemia*, manufacturer advises reduce initial dose to 25 mg once daily and wait at least 2 weeks before upwards titration of dose.
  For *thrombocytopenia associated with chronic hepatitis C infection*, manufacturer advises reduce initial dose to 25 mg once daily and wait at least 2 weeks before upwards titration of dose in moderate-to-severe impairment. For *thrombocytopenia associated with chronic hepatitis C infection*, manufacturer advises use only if potential benefit outweighs risk in severe impairment and monitor closely - increased risk of hepatic decompensation and thromboembolic events.
- **RENAL IMPAIRMENT** Use with caution.
- **PRE-TREATMENT SCREENING** For *severe aplastic anaemia*, manufacturer advises do not initiate if patients have existing cytogenetic abnormalities of chromosome 7.
- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor liver function before treatment, every two weeks when adjusting the dose, and monthly thereafter.
  - Manufacturer advises regular ophthalmological examinations for cataract formation.
  - Manufacturer advises peripheral blood smear prior to initiation to establish baseline level of cellular morphologic abnormalities; once stabilised, full blood count with white blood cell count differential should be performed monthly.
  - For *idiopathic thrombocytopenic purpura*, manufacturer advises monitor full blood count including platelet count and peripheral blood smears every week during treatment until a stable platelet count is reached (50x10⁹/litre or more for at least 4 weeks), then monthly thereafter; monitor platelet count weekly for 4 weeks following treatment discontinuation.
  - For *severe aplastic anaemia*, manufacturer advises bone marrow examination with aspirations for cytogenetics prior to initiation, at 3 months of treatment and 6 months thereafter.
  - For *thrombocytopenia associated with chronic hepatitis C infection*, manufacturer advises monitor platelet count every week before and during antiviral treatment until a stable platelet count is reached (50–75x10⁹/litre), then monitor full blood count including platelet count and peripheral blood smears monthly thereafter.
- **DIRECTIONS FOR ADMINISTRATION** Each dose should be taken at least 4 hours before or after any dairy products (or foods containing calcium), indigestion remedies, or medicines containing aluminium, calcium, iron, magnesium, zinc, or selenium to reduce possible interference with absorption.
- **PATIENT AND CARER ADVICE** Patient counselling is advised on how to administer eltrombopag tablets.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - **Eltrombopag for treating chronic immune (idiopathic) thrombocytopenic purpura** (*July 2013* NICE TA293)
      - Eltrombopag is recommended for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in splenectomised adults refractory to other treatments, or as a second-line treatment in non-splenectomised adults when surgery is contra-indicated, only if:
        - the manufacturer provides eltrombopag at the agreed discount as part of the patient access scheme *and*
        - their condition is refractory to standard active treatments and rescue therapies or
        - they have severe disease and a high risk of bleeding that needs frequent courses of rescue therapies.
      - Patients currently receiving eltrombopag whose disease does not meet these criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.
      - [www.nice.org.uk/TA293](http://www.nice.org.uk/TA293)
  - **Scottish Medicines Consortium (SMC) Decisions**
    - The Scottish Medicines Consortium has advised (*July 2010*) that eltrombopag (*Revolade®*) is accepted for restricted use within NHS Scotland for the treatment of both splenectomised and non-splenectomised patients with severe symptomatic immune (idiopathic) thrombocytopenic purpura or a high risk of bleeding.
- **MEDICINAL FORMS**
  - **Tablet**
    - *Revolade* (Novartis Pharmaceuticals UK Ltd)
      - Eltrombopag (as *Eltrombopag olamine*) 25 mg
        - Revolade 25mg tablets | 28 tablet pack | £770.00
        - Eltrombopag (as *Eltrombopag olamine*) 50 mg
          - Revolade 50mg tablets | 28 tablet pack | £1,540.00
Romiplostim

**INDICATIONS AND DOSE**

Treatment of chronic idiopathic thrombocytopenic purpura in splenectomised patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision) | Second-line treatment of chronic idiopathic thrombocytopenic purpura in non-splenectomised patients when surgery is contra-indicated (under expert supervision)

▶ **BY SUBCUTANEOUS INJECTION**

▶ Adult: Initially 1 microgram/kg once weekly, adjusted in steps of 1 microgram/kg once weekly (max. per dose 10 micrograms/kg once weekly) until a stable platelet count of 50x10⁹/litre or more is reached, discontinue treatment if inadequate response after 4 weeks at maximum dose, consult product literature for dose adjustments.

**SIDE-EFFECTS** Arthralgia · asthenia · bone pain · dizziness · ecchymosis · fatigue · flushing · gastro-intestinal disturbances · increased bone marrow reticulin · influenza-like symptoms · injection site reactions · insomnia · migraine · muscle spasm · myalgia · oedema · paraesthesia · rash

**PREGNANCY** Manufacturer advises use only if essential—toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Avoid in moderate or severe impairment unless potential benefit outweighs risk (e.g. of portal vein thrombosis).

**RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

**MONITORING REQUIREMENTS**

▶ Monitor full blood count and peripheral blood smears for morphological abnormalities before and during treatment.

▶ Monitor platelet count weekly until platelet count reaches 50x10⁹/litre or more for at least 4 weeks without dose adjustment, then monthly thereafter.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks

Dizziness may affect performance of skilled tasks (e.g. driving).

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (Tas)**

Romiplostim for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (April 2011) NICE TA221

Romiplostim is recommended for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in adults:

◊ if the manufacturer provides romiplostim at the agreed discount as part of the patient access scheme and

◊ whose condition is refractory to standard active treatments and rescue therapies or

◊ who have severe disease and a high risk of bleeding that needs frequent courses of rescue therapies.

www.nice.org.uk/TA221

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (September 2009) that romiplostim (Nplate®) is accepted for restricted use within NHS Scotland for patients with severe symptomatic idiopathic thrombocytopenic purpura or those at high risk of bleeding.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

Nplate (Amgen Ltd)

**Fluids and electrolytes**

**Electrolyte replacement therapy**

The electrolyte concentrations (intravenous fluid) table and the electrolyte content (gastro-intestinal secretions) table may be helpful in planning replacement electrolyte therapy; faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected.

**Oral preparations for fluid and electrolyte imbalance**

Sodium and potassium salts, may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree.

**Oral potassium**

Compensation for potassium loss is especially necessary:

◊ in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias;

◊ in patients in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, cirrhosis of the liver, the nephrotic syndrome, and severe heart failure;

◊ in patients with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse.

**Fluids and electrolytes**

Measures to compensate for potassium loss may also be required in the elderly since they frequently take inadequate amounts of potassium in the diet (but see **warning** on renal insufficiency). Measures may also be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are seldom required with the small doses of diuretics given to treat hypertension; potassium-sparing diuretics (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide p. 221 or the thiazides when these are given to eliminate oedema.

If potassium salts are used for the prevention of hypokalaemia, then doses of potassium chloride daily (in divided doses) by mouth are suitable in patients taking a normal diet. **Smaller doses must be used if there is renal insufficiency (common in the elderly) to reduce the risk of hyperkalaemia.**

Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness; when appropriate, potassium-sparing diuretics are preferable.

When there is established potassium depletion larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with
chloride depletion and with metabolic alkalosis, and these disorders require correction.

Management of hyperkalaemia
Acute severe hyperkalaemia (plasma-potassium concentration above 6.5 mmol/litre or in the presence of ECG changes) calls for urgent treatment with calcium gluconate 10% p. 959 by slow intravenous injection, titrated and adjusted to ECG improvement, to temporarily protect against myocardial excitability. An intravenous injection of soluble insulin (5–10 units) with 50 mL glucose 50% p. 959 given over 5–15 minutes, reduces serum-potassium concentration; this is repeated if necessary or a continuous infusion instituted. Salbutamol p. 244 [unlicensed indication], by nebulisation or slow intravenous injection may also reduce plasma-potassium concentration; it should be used with caution in patients with cardiovascular disease. The correction of causal or compounding acidosis with sodium bicarbonate infusion p. 950 should be considered (important: preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; occasionally haemodialysis is needed.

Ion-exchange resins may be used to remove excess potassium in mild hyperkalaemia or in moderate hyperkalaemia when there are no ECG changes.

Oral sodium and water
Sodium chloride p. 953 is indicated in states of sodium depletion and usually needs to be given intravenously. In chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride or sodium bicarbonate, according to the acid-base status of the patient, may be sufficient.

Oral rehydration therapy (ORT)
As a worldwide problem diarrhoea is by far the most important indication for fluid and electrolyte replacement. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through diarrhoea can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

Oral rehydration solutions should:
- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic diarrhoea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

The WHO oral rehydration salts formulation contains sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. It is dissolved in sufficient water to produce 1 litre (providing Na+ 75 mmol, K+ 20 mmol, Cl− 65 mmol, citrate 10 mmol, glucose 75 mmol/litre). This formulation is recommended by the WHO and the United Nations Children’s fund, but it is not commonly used in the UK.

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breast-feeding or formula feeds should be offered between oral rehydration drinks.

Oral bicarbonate
Sodium bicarbonate is given by mouth for chronic acidotic states such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed. For severe metabolic acidosis, sodium bicarbonate can be given intravenously.

Sodium bicarbonate may also be used to increase the pH of the urine; it is also used in dyspepsia.

Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Where hyperchloeraemic acidosis is associated with potassium deficiency, as in some renal tubular and gastrointestinal disorders it may be appropriate to give oral potassium bicarbonate, although acute or severe deficiency should be managed by intravenous therapy.

Parenteral preparations for fluid and electrolyte imbalance
Electrolytes and water
Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses, when the patient is nauseated or vomiting and is unable to take adequate amounts by mouth. When intravenous administration is not possible, fluid (as sodium chloride 0.9% p. 953 or glucose 5% p. 955) can also be given by subcutaneous infusion (hypodermoclysis).

The nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical investigations. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, e.g. 20% glucose, are best given through an indwelling catheter positioned in a large vein.

Intravenous sodium
Sodium chloride in isotonic solution provides the most important extracellular ions in near physiological concentrations and is indicated in sodium depletion, which can arise from such conditions as gastro-enteritis, diabetic ketoacidosis, ileus, and ascites. In a severe deficit of 4 to 8 litres, 2 to 3 litres of isotonic sodium chloride may be given over 2 to 3 hours; thereafter the infusion can usually be at a slower rate.

Chronic hyponatraemia arising from inappropriate secretion of antidiuretic hormone should ideally be corrected by fluid restriction. However, if sodium chloride is required for acute or chronic hyponatraemia, regardless of the cause, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome and the rise in plasma-sodium concentration should not exceed 10 mmol/litre in 24 hours. In severe hyponatraemia, sodium chloride 1.8% may be used cautiously.

Compound sodium lactate (Hartmann’s solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded; it may reduce the risk of hyperchloeraemic acidosis.

Sodium chloride with glucose p. 954 solutions are indicated when there is combined water and sodium depletion. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the

sodium salt with a volume of water determined by the normal plasma Na⁺ remains extracellular.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate.

**Intravenous glucose**

Glucose solutions (5%) are used mainly to replace water deficit. Average water requirements in a healthy adult are 1.5 to 2.5 litres daily and this is needed to balance unavoidable losses of water through the skin and lungs and to provide sufficient for urinary excretion. Water depletion (dehydration) tends to occur when these losses are not matched by a comparable intake, as may occur in coma or dysphagia or in the elderly or apathetic who may not drink enough water on their own initiative.

Excessive loss of water without loss of electrolytes is uncommon, occurring in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder, but usually lies within the range of 2 to 6 litres.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition.

Glucose solutions are given in regimens with calcium and insulin for the emergency management of hyperkalaemia. They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuing insulin infusion.

**Intravenous potassium**

Potassium chloride with sodium chloride intravenous infusion p. 953 is the initial treatment for the correction of severe hypokalaemia and when sufficient potassium cannot be taken by mouth.

Repeated measurement of plasma-potassium concentration is necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should not involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

**Bicarbonate and lactate**

Sodium bicarbonate p. 950 is used to control severe metabolic acidosis (pH<7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anoxia or hypovolaemia, sodium bicarbonate (1.26%) can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock, for example in cardiac arrest, metabolic acidosis can develop without sodium or volume depletion; in these circumstances sodium bicarbonate is best given as a small volume of hypertonic solution, such as 50 mL of 8.4% solution intravenously.

Sodium lactate intravenous infusion is no longer used in metabolic acidosis because of the risk of producing lactic acidosis.
acidity, particularly in seriously ill patients with poor tissue perfusion or impaired hepatic function.

For chronic acidotic states, sodium bicarbonate can be given by mouth.

**Plasma and plasma substitutes**

Plasma and plasma substitutes (‘colloids’) contain large molecules that do not readily leave the intravascular space where they exert osmotic pressure to maintain circulatory volume. Compared to fluids containing electrolytes such as sodium chloride and glucose (‘crystalloids’), a smaller volume of colloid is required to produce the same expansion of blood volume, thereby shifting salt and water from the extravascular space. If resuscitation requires a volume of fluid that exceeds the maximum dose of the colloid then crystalloids can be given; packed red cells may also be required.

Albumin solution p. 960, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient’s blood group.

Albumin is usually used after the acute phase of illness, to correct a plasma-volume deficit; hypoalbuminaemia itself is not an appropriate indication. The use of albumin solution in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solution (20%) can be used under specialist supervision in patients with an intravascular fluid deficit and oedema because of interstitial fluid overload, to restore intravascular plasma volume with less exacerbation of the salt and water overload than isotonic solutions. Concentrated albumin solution p. 960 may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in hepatic cirrhosis).

Recent evidence does not support the previous view that the use of albumin increases mortality.

**Plasma substitutes**

Dextran, gelatin p. 961, and the hydroxyethyl starch, tetrasaccharide, are macromolecular substances which are metabolised slowly. Dextran and gelatin may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicemia; they may also be used as an immediate short-term measure to treat haemorrhage until blood is available. Dextran and gelatin are rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion.

Hydroxyethyl starches should only be used for the treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient; they should be used at the lowest effective dose for the first 24 hours of fluid resuscitation.

Plasma substitutes should not be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of some plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

### BICARBONATE

**Sodium bicarbonate**

- **INDICATIONS AND DOSE**
  - **Alkalisation of urine** | **Relief of discomfort in mild urinary-tract infections**
    - **BY MOUTH**
    - **Adult:** 3 g every 2 hours until urinary pH exceeds 7, to be dissolved in water

Electrolyte imbalance

BY INTRAVENOUS INFUSION

Adult: Depending on the deficit or the daily maintenance requirements (consult product literature)

■ INTERACTIONS

Appendix 1: potassium chloride

■ PRESCRIBING AND DISPENSING INFORMATION

Potassium chloride 0.15% with sodium chloride 0.9% contains K+ 20 mmol, Na+ 150 mmol, and Cl– 170 mmol/litre or potassium chloride 0.3% with sodium chloride 0.9% contains K+ 40 mmol, Na+ 150 mmol, and Cl– 190 mmol/litre.

■ MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Infusion

Potassium chloride with sodium chloride (Non-proprietary) Potassium chloride 3 mg per 1 ml, Sodium chloride 9 mg per 1 ml Sterifelex No.15 potassium chloride 0.3% (potassium 20mmol/500ml)/sodium chloride 0.9% infusion 500ml bags | 1 bag (Pot) £1.67 | 15 bag (Pot) no price available Potassium chloride 0.3% (potassium 20mmol/500ml)/sodium chloride 0.9% infusion 500ml bags | 1 bag (Pot) no price available | 10 bag (Pot) no price available Potassium chloride 0.3% (potassium 20mmol/500ml)/sodium chloride 0.9% infusion 500ml bags | 1 bag (Pot) no price available | 20 bag (Pot) no price available Potassium chloride 0.3% (potassium 20mmol/500ml)/sodium chloride 0.9% infusion 500ml bags | 1 bag (Pot) no price available | 50 bag (Pot) no price available Potassium chloride 0.3% (potassium 20mmol/500ml)/sodium chloride 0.9% infusion 500ml bags | 1 bag (Pot) no price available | 100 bag (Pot) no price available

Potassium chloride 1.5 mg per 1 ml, Sodium chloride 9 mg per 1 ml Sterifelex No.12 potassium chloride 0.15% (potassium 20mmol/1litre)/sodium chloride 0.9% infusion 1litre bags | 1 bag (Pot) £2.20 | 10 bag (Pot) no price available Sterifelex No.12 potassium chloride 0.15% (potassium 10mmol/500ml)/sodium chloride 0.9% infusion 500ml bags | 1 bag (Pot) £1.67 Potassium chloride 0.15% (potassium 10mmol/500ml)/sodium chloride 0.9% infusion 500ml bags | 1 bag (Pot) no price available | 20 bag (Pot) no price available Potassium chloride 0.15% (potassium 10mmol/500ml)/sodium chloride 0.9% infusion 500ml bags | 1 bag (Pot) no price available | 50 bag (Pot) no price available Potassium chloride 0.15% (potassium 10mmol/500ml)/sodium chloride 0.9% infusion 500ml bags | 1 bag (Pot) no price available | 100 bag (Pot) no price available Potassium chloride 0.15% (potassium 20mmol/1litre)/sodium chloride 0.9% infusion 1litre bags | 1 bag (Pot) no price available | 10 bag (Pot) no price available Potassium chloride 0.15% (potassium 20mmol/1litre)/sodium chloride 0.9% infusion 1litre bags | 1 bag (Pot) no price available | 12 bag (Pot) no price available Potassium chloride 2 mg per 1 ml, Sodium chloride 9 mg per 1 ml Sterifelex No.28 potassium chloride 0.2% (potassium 13.3mmol/500ml)/sodium chloride 0.9% infusion 500ml bags | 1 bag (Pot) £1.67 | 15 bag (Pot) no price available Sterifelex No.28 potassium chloride 0.2% (potassium 27mmol/1litre)/sodium chloride 0.9% infusion 1litre bags | 1 bag (Pot) £2.20

Electrolyte imbalance

BY INTRAVENOUS INFUSION

Adult: 4–8 tablets daily, to be taken with water, up to maximum 20 tablets daily in severe depletion

Chronic renal salt wasting

BY MOUTH

Adult: Up to 2 tablets daily, to be taken with appropriate fluid intake

Management of diabetic ketoacidosis (to restore circulating volume if systolic blood pressure is below 90 mmHg and adjusted for age, sex, and medication as appropriate)

BY INTRAVENOUS INFUSION

Adult: 500 mL, sodium chloride 0.9% to be given over 10–15 minutes, repeat if blood pressure remains below 90 mmHg and seek senior medical advice, when blood pressure is over 90 mmHg, sodium chloride 0.9% should be given by intravenous infusion at a rate that replaces deficit and provides maintenance, management regimen also includes administration of potassium chloride, soluble insulin, long acting insulin analogues and glucose 10% solution

Diluent for instillation of drugs to the bladder

BY INTRAVESICAL INSTILLATION

Adult: (consult product literature)

■ CAUTIONS

With intravenous use Avoid excessive administration • cardiac failure • dilutional hyponatraemia especially in the elderly • hypertension • peripheral oedema • pulmonary oedema • restrict intake in impaired renal function • toxemia of pregnancy

■ SIDE-EFFECTS

With intravenous use Administration of large doses may give rise to sodium accumulation • hyperchloraeamic acidosis • oedema

■ MONITORING REQUIREMENTS

With intravenous use The jugular venous pressure should be assessed, the bases of the lungs should be examined for crepitations, and in elderly or seriously ill patients it is often helpful to monitor the right atrial (central) venous pressure.

■ PRESCRIBING AND DISPENSING INFORMATION

Sodium chloride 0.9% intravenous infusion contains Na+ and Cl– each 150 mmol/litre. The term ‘normal saline’ should not be used to describe sodium chloride intravenous infusion 0.9%; the term ‘physiological saline’ is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).

Each Slow Sodium® tablet contains approximately 10 mmol each of Na+ and Cl–; tablets can be crushed before administration.

■ MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, solution for injection, infusion, solution for infusion

Modified-release tablet

### Sodium chloride with glucose

The properties listed below are those particular to the combination only. For the properties of the components please consider, sodium chloride p. 953, glucose p. 955.

#### INDICATIONS AND DOSE

**Combined water and sodium depletion**

- **By intravenous infusion**
- **Adult:** (consult product literature)

#### INTERACTIONS

Appendix 1: glucose
MONITORING REQUIREMENTS  Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electrolyte imbalance.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

NUTRIENTS  SUGARS

Glucose (Dextrose Monohydrate)

INDICATIONS AND DOSE
- Establish presence of gestational diabetes
  - Adult: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 ml fluid

Oral glucose tolerance test
- Adult: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 ml fluid

Hypoglycaemia
- By intravenous infusion
  - Child: 500 mg/kg, to be administered as Glucose 10% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs
  - Adult: 10 g, to be administered as Glucose 20% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs

Energy source
- By intravenous infusion
  - Adult: 1–3 litres daily, solution concentration of 20–50% to be administered

Water replacement
- By intravenous infusion
  - Adult: The volume of glucose solution needed to replace deficits may vary (consult product literature)

Persistent cyanosis (in combination with propranolol)
- By intravenous infusion
  - Child: 200 mg/kg, to be administered as Glucose 10% intravenous infusion over 10 minutes

Management of diabetic ketoacidosis
- By intravenous infusion
  - Child: Glucose 5% or 10% should be added to replacement fluid once blood-glucose concentration falls below 14 mmol/litre
  - Adult: Glucose 10% should be given once blood-glucose concentration falls below 14 mmol/litre, to be administered into a large vein through a large-gauge needle at a rate of 125 ml/hour, in addition to the sodium chloride 0.9% infusion

DOSE EQUIVALENCE AND CONVERSION
- 75 g anhydrous glucose is equivalent to Glucose BP 82.5 g.

CAUTIONS
- Do not give alone except when there is no significant loss of electrolytes · prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances

INTERACTIONS
- Appendix 1: glucose

SIDE-EFFECTS
- Glucose injections especially if hypertonic may have a low pH and may cause venous irritation and thrombophlebitis

DIRECTIONS FOR ADMINISTRATION
- In children Injections containing more than 10% glucose can be irritant and should be given into a central venous line; however, solutions containing up to 12.5% can be administered for a short period into a peripheral line

PRESCRIBING AND DISPENSING INFORMATION
- Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose

EXCEPTIONS TO LEGAL CATEGORY
- With intravenous use Prescription only medicine restriction does not apply to 50% solution where administration is for saving life in emergency

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, solution for injection, solution for infusion

Solution for infusion
- Glucose (Non-proprietary)

ORAL REHYDRATION SALTS

Disodium hydrogen citrate with glucose, potassium chloride and sodium chloride
(Formulated as oral rehydration salts)

INDICATIONS AND DOSE
Fluid and electrolyte loss in diarrhoea

BY MOUTH
Child 1-11 months: 1-1.5 times usual feed volume to be given
Child 1-11 years: 200 mL, to be given after every loose motion
Child 12-17 years: 200-400 mL, to be given after every loose motion, dose according to fluid loss
Adult: 200-400 mL, to be given after every loose motion, dose according to fluid loss

DIRECTIONS FOR ADMINISTRATION
Reconstitute 1 sachet with 200mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na+ 60 mmol, K+ 20 mmol, Cl- 60 mmol, citrate 10 mmol, and glucose 90 mmol.

PRESCRIBING AND DISPENSING INFORMATION
Flavours of oral powder formulations may include black currant, citrus, or natural.

PATIENT AND CARER ADVICE
After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

Medicines for Children leaflet: Oral rehydration salts www.medicinesforchildren.org.uk/oral-rehydration-salts

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder
Dioralyte (Sanofi)
Potassium chloride 300 mg, Sodium chloride 470 mg, Disodium hydrogen citrate 530 mg, Glucose 3.56 gram
Dioralyte oral powder sachets citrus | 20 sachet (P) £6.72
Dioralyte oral powder sachets plain | 20 sachet (P) £6.72
Dioralyte oral powder sachets blackcurrant | 20 sachet (P) £6.72

Potassium chloride with rice powder, sodium chloride and sodium citrate
(Formulated as oral rehydration salts)

INDICATIONS AND DOSE
Fluid and electrolyte loss in diarrhoea

BY MOUTH
Adult: 200-400 mL, to be given after every loose motion, dose according to fluid loss

DIRECTIONS FOR ADMINISTRATION
Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water
1.1 Calcium imbalance

Calcium

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand, and in old age, due to impaired absorption. In osteoporosis, a calcium intake which is double the recommended amount reduces the rate of bone loss. If the actual dietary intake is less than the recommended amount, a supplement of as much as 40 mmol is appropriate.

In severe acute hypocalcaemia or hypocalcaemic tetany, an initial slow intravenous injection of calcium gluconate injection 10% p. 959 should be given, with plasma–calcium and ECG monitoring (risk of arrhythmias if given too rapidly), and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence. Calcium chloride injection p. 959 is also available, but is more irritant; care should be taken to prevent extravasation. Oral supplements of calcium and vitamin D may also be required in persistent hypocalcaemia. Concurrent hypomagnesaemia should be corrected with magnesium sulfate p. 963.

See the role of calcium gluconate in temporarily reducing the toxic effects of hyperkalaemia.

Severe hypercalcaemia

Severe hypercalcaemia, which leads to a decrease in serum calcium concentrations.

Cinacalcet

**DRUG ACTION** Cinacalcet reduces parathyroid hormone

**INDICATIONS AND DOSE** Secondary hyperparathyroidism in patients with end-stage renal disease on dialysis

- **BY MOUTH**
  - Adult: Initially 30 mg once daily, dose to be adjusted every 2–4 weeks; maximum 180 mg per day

**Primary hyperparathyroidism in patients where parathyroidectomy is inappropriate**

- **BY MOUTH**
  - Adult: Initially 30 mg twice daily (max. per dose 90 mg 4 times a day), dose to be adjusted every 2–4 weeks according to response

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose adjustment may be necessary if smoking started or stopped during treatment.

**CAUTIONS** Treatment should not be initiated in patients with hypocalcaemia

**INTERACTIONS** → Appendix 1: cinacalcet

**SIDE-EFFECTS**

- Common or very common: Anorexia, asthenia, dizziness, myalgia, nausea, paraesthesia, rash, reduced testosterone concentrations, vomiting
- Uncommon: Diarrhoea, dyspepsia, seizures
- Frequency not known: Allergic reactions, angioedema, heart failure, hypotension

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment. Monitor closely in hepatic impairment especially when increasing dose.

After treatment of severe hypercalcaemia the underlying cause must be established. Further treatment is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be useful.

**Hyperparathyroidism**

Paricalcitol p. 995 is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure. Parathyroidectomy may be indicated for hyperparathyroidism.

**Hypercalciuria**

Hypercalciuria should be investigated for an underlying cause, which should be treated. Where a cause is not identified (idiopathic hypercalciuria), the condition is managed by increasing fluid intake and giving bendroflumethiazide p. 161. Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.
Blood and nutrition

[NATURAL_TEXT]

Calcium carbonate

**INDICATIONS AND DOSE**

**Phosphate binding in renal failure and hyper-phosphataemia**

- **By mouth**
  - Adult: (consult product literature)

**Calcium deficiency**

- **By mouth**
  - Adult: (consult product literature)

**INTERACTIONS** → Appendix 1: calcium salts

**PRESCRIBING AND DISPENSING INFORMATION**

- Adcal® contains calcium carbonate 1.5 g (calcium 600 mg or Ca\(^{2+}\)
  - 15 mmol); Calcichew® contains calcium carbonate 1.25 g (calcium 500 mg or Ca\(^{2+}\)
  - 12.5 mmol); Calcichew Forte® contains calcium carbonate 2.5 g (calcium 1 g or Ca\(^{2+}\)
  - 25 mmol); Cacit® contains calcium carbonate 1.25 g, providing calcium citrate when dispersed in water (calcium 500 mg or Ca\(^{2+}\)
  - 12.5 mmol); consult product literature for details of other available products.

Flavours of soluble tablet formulations may include orange or fruit flavour.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS** 25
  - **Calcium carbonate (Non-proprietary)**
  - Calcium carbonate 1.25 gram Calcium carbonate 1.25g tablets 100 tablet no price available
  - **Effervescent tablet**
    - **CAUTIONARY AND ADVISORY LABELS** 13
    - Cacit (Warner Chilcott Ltd)
      - Calcium carbonate 1.25 gram Cacit 500mg effervescent tablets sugar-free 76 tablet £11.81 DT price = £11.81
  - **Chewable tablet**
    - **CAUTIONARY AND ADVISORY LABELS** 24
    - EXCIPIENTS: May contain Aspartame
    - Calcium carbonate (Non-proprietary)
      - Calcium carbonate 1.25 gram Calcium carbonate 1.25g chewable tablets sugar-free 100 tablet £12.50 DT price = £9.33
      - Adcal (Kyowa Kirin Ltd)
        - Calcium carbonate 1.5 gram Adcal 1500mg chewable tablets sugar-free 100 tablet £8.70 DT price = £8.70
        - Calcichew (Forum Health Products Ltd)
          - Calcium carbonate 2.5 gram Calcichew 500mg chewable tablets sugar-free 60 tablet £13.16 DT price = £13.16

1.1b Hypocalcaemia

**ELECTROLYTES AND MINERALS** → CALCIUM

Calcium salts

- **CONTRA-INDICATIONS** Conditions associated with hypercalcaemia (e.g. some forms of malignant disease) - conditions associated with hypercalciuria (e.g. some forms of malignant disease)
- **CAUTIONS** History of nephrolithiasis - sarcoidosis
- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
  - **Rare** Gastro-intestinal disturbances
  - **Frequency not known** Hypocalcaemia
- **SPECIFIC SIDE-EFFECTS**
  - With intravenous use: Arrhythmias - bradycardia - fall in blood pressure - injection-site reactions - peripheral vasodilatation - severe tissue damage with extravasation - sweating
- **RENA L IMPAIRMENT** Use with caution.

Calcium carbonate with calcium lactate gluconate

The properties listed below are those particular to the combination only. For the properties of the components please consider, calcium carbonate above.

**INDICATIONS AND DOSE**

**Calcium deficiency**

- **By mouth**
  - Adult: Dose according to requirements

**INTERACTIONS** → Appendix 1: calcium salts

**PRESCRIBING AND DISPENSING INFORMATION**

Each Sandocal® tablet contains 1 g calcium (Ca\(^{2+}\)
  - 25 mmol); flavours of soluble tablet formulations may include orange.
Calcium chloride

**INDICATIONS AND DOSE**

Severe acute hypocalcaemia or hypocalcaemic tetany

- **BY INTRAVENOUS INJECTION**
  - Adults: Dose according to requirements.

**CAUTIONS**

Avoid in respiratory acidosis - avoid in respiratory failure.

**INTERATIONS**

Appendix 1: calcium salts

**DIRECTIONS FOR ADMINISTRATION**

Care should be taken to avoid extravasation.

**PRESCRIBING AND DISPENSING INFORMATION**

Non-proprietary Calcium chloride dihydrate 7.35%(calcium 20 mg or Ca²⁺ 500 micromol/mL); Calcium chloride dihydrate 10%(calcium 27.3 mg or Ca²⁺ 680 micromol/mL); Calcium chloride dihydrate 14.7%(calcium 40.1 mg or Ca²⁺ 1000 micromol/mL).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

**Solution for injection**

- **Calcium chloride (Non-proprietary)**
  - Calcium chloride solution for injection 10ml ampoules | 10 ampoule
  - Calcium chloride dihydrate 73.5 mg per 1 ml | 10 ampoule
  - Solution for injection 10ml ampoules | 10 ampoule
  - Solution for injection 10ml prepared syringes | 1 pre-filled disposable injection
  - Calcium chloride dihydrate 100 mg per 1 ml | 10 ampoule
  - Calcium chloride dihydrate 147 mg per 1 ml | 10 ampoule
  - Solution for injection 10ml ampoules | 10 ampoule
  - Calcium chloride dihydrate 14.7% solution for injection 10ml ampoules | 10 ampoule

**Calcium gluconate**

**INDICATIONS AND DOSE**

Severe acute hypocalcaemia or hypocalcaemic tetany

- **BY INTRAVENOUS INJECTION**
  - Adults: Initially 10–20 mL, calcium gluconate injection 10% (providing approximately 2.25–4.5 mmol of calcium) should be administered with plasma-calcium and ECG monitoring, and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence, alternatively (by continuous intravenous infusion), initially 50 mL/hour, adjusted according to response, infusion to be administered using 100 mL of calcium gluconate 10% diluted in 1 litre of glucose 5% or sodium chloride 0.9%

Acute severe hyperkalaemia (plasma-potassium concentration above 6.5 mmol/litre or in the presence of ECG changes)

- **BY SLOW INTRAVENOUS INJECTION**
  - Adults: 10–20 mL, calcium gluconate 10% should be administered, dose titrated and adjusted to ECG improvement.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Calcium gluconate (Non-proprietary)**
  - Calcium gluconate 100 mg per 1 ml | 10 ampoule
  - Solution for injection 10ml ampoules | 10 ampoule
  - Calcium gluconate 100 mg per 1 ml | 10 ampoule
  - Solution for injection 10ml ampoules | 10 ampoule
  - Calcium gluconate 147 mg per 1 ml | 10 ampoule
  - Calcium gluconate 14.7% solution for injection 10ml ampoules | 10 ampoule
  - Calcium gluconate 14.7% solution for injection 10ml ampoules | 10 ampoule

**Effervescent tablet**

- **Calcium gluconate (Non-proprietary)**
  - Calcium gluconate 500 mg | 10 tablet
  - Calcium gluconate 500 mg | 10 tablet
  - Calcium gluconate 500 mg | 10 tablet

**Calcium lactate**

**INDICATIONS AND DOSE**

Calcium deficiency

- **BY MOUTH**
  - Adult: Dose according to requirements.

**INTERATIONS**

Appendix 1: calcium salts

**DIRECTIONS FOR ADMINISTRATION**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Calcium lactate (Non-proprietary)**
  - Calcium lactate 300 mg | 84 tablet
  - Calcium lactate 300 mg | 84 tablet

**Calcium phosphate**

**INDICATIONS AND DOSE**

Indications listed in combination monographs (available in the UK only in combination with other drugs)

- **BY MOUTH**
  - Adult: Doses listed in combination monographs.
1.2 Low blood volume

**BLOOD AND RELATED PRODUCTS  >  PLASMA PRODUCTS**

### Albumin solution

**Human Albumin Solution**

**INDICATIONS AND DOSE**

Acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery (with isotonic solutions) | Plasma exchange (with isotonic solutions) | Severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required (with concentrated solutions 20%) | Paracentesis of large volume ascites associated with portal hypertension (with concentrated solutions 20%)

- **BY INTRAVENOUS INFUSION**
- **Adult:** (consult product literature)

**CONTRA-INDICATIONS** Cardiac failure • severe anaemia

**CAUTIONS** Correct dehydration when administering concentrated solution • history of cardiac disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) • history of circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) • increased capillary permeability

**SIDE-EFFECTS** Anaphylaxis • chills • fever • hypersensitivity reactions • hypotension • increased salivation • nausea • tachycardia • vomiting

**MONITORING REQUIREMENTS** Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

**PRESCRIBING AND DISPENSING INFORMATION** A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Infusion**
  - **Flexbumin** (Baxalta UK Ltd)
    - Albumin solution human 200 gram per 1 litre | 1 vial | £34.00
  - **Biotest** (Biotest UK Ltd)
    - Albumin solution human 50 mg per 1 ml | 1 vial | £49.50
  - **Grifols** (Grifols UK Ltd)
    - Albumin solution human 50 mg per 1 ml | 1 bottle | £54.00

**PLASMA SUBSTITUTES**

### Dextran 70 with sodium chloride

**INDICATIONS AND DOSE**

Initial treatment of hypovolaemia with hypotension induced by traumatic injury

- **BY INTRAVENOUS INFUSION**
- **Adult:** 250 ml, to be given over 2–5 minutes using RescueFlow®, followed immediately by administration of isotonic fluids.

**CAUTIONS** Cardiac disease • hyperosmolality • severe hypoglycaemia • severe liver disease

**SIDE-EFFECTS**

- **Rare** Severe anaphylactic reactions
- **Frequency not known** Hypersensitivity reactions • transient increase in bleeding time

**PREGNANCY** Avoid—reports of anaphylaxis in mother causing fetal anoxia, neurological damage and death.

**HEPATIC IMPAIRMENT** Use with caution in severe impairment.

**RENAL IMPAIRMENT** Use with caution.

**MONITORING REQUIREMENTS**

Where possible, monitor central venous pressure.

- Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
- Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

**EFFECT ON LABORATORY TESTS** Can interfere with some laboratory tests—dextran may interfere with blood group cross-matching or biochemical measurements, and these should be carried out before infusion is begun.

**PRESCRIBING AND DISPENSING INFORMATION** Dextran 70 is dextran with an average molecular weight of about 70,000.
**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Infusion**

- **RescueFlow** (Pharmacosmos UK Ltd)
  - Gelatin 40 mg per 1 ml
  - Sodium chloride 75 mg per 1 ml
  - Rescuflow 6% infusion 250ml bags | 1 bag (POM) no price available (Hospital only)

**Gelatin**

**INDICATIONS AND DOSE**

**Low blood volume in hypovolaemic shock, burns and cardiopulmonary bypass**

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 500–1000 mL, use 3.5–4% solution

**Indications and Dose**

**VOLULYTE® INFUSION**

Treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 10–20 mL, then increased to up to 30 mL/kg per hour for a maximum duration of treatment of 24 hours, the initial dose must be given slowly and with careful monitoring of the patient to allow any anaphylactic reaction to be detected as early as possible

**VOLUVEN® INFUSION**

Treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient

**SIDE-EFFECTS**

- Rare: Severe anaphylactic reactions
- Frequency not known: Hypersensitivity reactions: transient increase in bleeding time

**PREGNANCY**

Manufacturer of Geloplasma® advises avoid at the end of pregnancy.

**HEPATIC IMPAIRMENT**

Use with caution in severe impairment.

**RENAL IMPAIRMENT**

Use with caution in renal impairment.

**MONITORING REQUIREMENTS**

- Urine output should be monitored. Care should be taken to avoid haematuric concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
- Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

**PRESCRIBING AND DISPENSING INFORMATION**

**Gelatin**

The gelatin is partially degraded.

**Gelavan®** contains succinylated gelatin (modified fluid gelatin, average molecular weight 26500) 40g, Na⁺ 151 mmol, K⁺ 4 mmol, Mg²⁺ 1 mmol, Cl⁻ 103 mmol, Ca²⁺ 1 mmol, acetate 24 mmol/litre; **Gelofusine®** contains succinylated gelatin (modified fluid gelatin, average molecular weight 30000) 40g (4%), Na⁺ 154 mmol, Cl⁻ 124 mmol/litre; **Gelofusine®** contains partially hydrolysed and succinylated gelatin (modified liquid gelatin) (as anhydrous gelatin) 30g (3%), Na⁺ 150 mmol, K⁺ 5 mmol, Mg²⁺ 1.5 mmol, Cl⁻ 100 mmol, lactate 30 mmol/litre; **Isoplex®** contains succinylated gelatin (modified fluid gelatin, average molecular weight 30000) 40g (4%), Na⁺ 145 mmol, K⁺ 4 mmol, Mg²⁺ 0.9 mmol, Cl⁻ 105 mmol, lactate 25 mmol/litre; **Volplex®** contains succinylated gelatin (modified fluid gelatin, average molecular weight 30000) 40g (4%), Na⁺ 154 mmol, Cl⁻ 125 mmol/litre.

**Tetrastarch**

**INDICATIONS AND DOSE**

**VOLULYTE® INFUSION**

Treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 10–20 mL, then increased to up to 30 mL/kg per hour for a maximum duration of treatment of 24 hours, the initial dose must be given slowly and with careful monitoring of the patient to allow any anaphylactic reaction to be detected as early as possible

**VOLUVEN® INFUSION**

Treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient

**SIDE-EFFECTS**

- Rare: Severe anaphylactic reactions
- Frequency not known: Hypersensitivity reactions: pruritus raised serum amylase: transient increase in bleeding time

**HEPATIC IMPAIRMENT**

Avoid in severe impairment.

**RENAL IMPAIRMENT**

Avoid.

**MONITORING REQUIREMENTS**

- Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times. Treatment with hydroxyethyl starches should be guided by continuous haemodynamic monitoring so that the infusion is stopped as soon as appropriate haemodynamic goals have been achieved.
- Monitor renal function.
- Monitor for hypersensitivity reactions.
- Urine output should be monitored.

**PRESCRIBING AND DISPENSING INFORMATION**

Hydroxyethyl starch is composed of more than 90% of amylopectin that has been etherified with hydroxyethyl groups; the term tetrastarch reflects the degree of etherification. Hydroxyethyl starches should only be used for the treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient; they should be used at the lowest effective dose for the first 24 hours of fluid resuscitation.

**Volubelt®** contains hydroxyethyl starch 6% (average molecular weight 130 000) in sodium chloride intravenous
Blood and nutrition

1.3 Magnesium imbalance

Magnesium

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate as an osmotic laxative.

Hypermagnesaemia

Since magnesium is secreted in large amounts in the gastrointestinal tract, excessive losses in diarrhoea, stoma or fistula are the most common causes of hypermagnesaemia; deficiency may also occur in alcoholism or as a result of treatment with certain drugs. Hypermagnesaemia often causes secondary hypocalcaemia, and also hypokalaemia and hyponatraemia.

Symptomatic hypermagnesaemia is associated with a deficit of 0.5–1 mmol/kg; up to 160 mmol Mg²⁺ over up to 5 days may be required to replace the deficit (allowing for urinary losses). Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent recurrence of the deficit, magnesium may be given by mouth, but there is limited evidence of benefit. Magnesium aspartate powder for oral solution below is available as a licensed preparation and, magnesium glycerophosphate tablets p. 963 and liquid [unlicensed] are available from ‘special-order’ manufacturers or specialist importing companies.

Arrhythmias

Magnesium sulfate injection has also been recommended for the emergency treatment of serious arrhythmias, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as torsade de pointes.

Myocardial infarction

Limited evidence that magnesium sulfate prevents arrhythmias and reperfusion injury in patients with suspected myocardial infarction has not been confirmed by large studies. Routine use of magnesium sulfate for this purpose is not recommended.

Magnesium aspartate

Eclampsia and pre-eclampsia

Magnesium sulfate injection is the drug of choice for the treatment of seizures and the prevention of recurrent seizures in women with eclampsia. Regimens may vary between hospitals. Calcium gluconate injection is used for the management of magnesium toxicity.

Magnesium sulfate injection is also of benefit in women with pre-eclampsia in whom there is concern about developing eclampsia. The patient should be monitored carefully.

1.3a Hypomagnesaemia

ELECTROLYTES AND MINERALS > MAGNESIUM

Magnesium aspartate

INDICATIONS AND DOSE

Treatment and prevention of magnesium deficiency

BY MOUTH

Adult: 10–20 mmol daily, taken as 1–2 sachets of Magnaspartate® powder.

CONTRA-INDICATIONS

Disorders of cardiac conduction

INTERACTIONS

Appendix 1: magnesium

SIDE-EFFECTS

Uncommon Diarrhoea

Rare Hypermagnesaemia

Frequency not known Dental caries (on long term use) • gastrointestinal irritation

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects generally occur at higher doses; if side-effects (such as diarrhoea) occur, consider interrupting treatment and restarting at a reduced dose.

Overdose

Symptoms of hypermagnesaemia may include nausea, vomiting, flushing of the skin, thirst, hypotension due to peripheral vasodilatation, drowsiness, confusion, loss of tendon reflexes and respiratory depression due to neuromuscular blockade, slurred speech, double vision, muscle weakness, bradycardia, cardiac arrhythmias, coma, and cardiac arrest.

RENAL IMPAIRMENT

Avoid in severe impairment (eGFR less than 30 mL/minute/1.7³).

DIRECTIONS FOR ADMINISTRATION

Dissolve sachet contents in 50–200 mL water, tea or orange juice and take immediately.

PRESCRIBING AND DISPENSING INFORMATION

Magnaspartate® contains magnesium aspartate 6.5 g (10 mmol Mg²⁺)/sachet.

PATIENT AND CARER ADVICE

Patients and carers should be given advice on how to administer magnesium aspartate powder.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder

EXCIPIENTS: May contain Sucrose

Magnaspartate (KoRa Healthcare)

Magnesium (as Magnesium aspartate) 243 mg Magnaspartate 243mg (magnesium 10mmol) oral powder sachets | 10 sachet PO £8.95

infusion 0.6%, containing Na⁺ 137 mmol, K⁺ 4 mmol, Mg²⁺ 1.5 mmol, Cl⁻ 110 mmol, acetate 34 mmol/litre.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Magnesium glycerophosphate 02-Jun-2016

- **INDICATIONS AND DOSE**
  - Prevent recurrence of magnesium deficit
    - **BY MOUTH**
    - Adult: 24 mmol daily in divided doses, dose expressed as Mg<sup>2+</sup>.

- **DOSE EQUIVALENCE AND CONVERSION**
  - Magnesium glycerophosphate 1 g is approximately equivalent to Mg<sup>2+</sup> 4 mmol or magnesium 97 mg.

- **UNLICENSED USE** Not licensed for use.
- **INTERACTIONS** → Appendix 1: magnesium
- **SIDE-EFFECTS** Arrhythmias · colic · coma · confusion · diarrhoea · drowsiness · flushing of skin · hypermagnesaemia associated side-effects · hypotension · loss of tendon reflexes · muscle weakness · nausea · respiratory depression · thirst · vomiting
- **RENAL IMPAIRMENT** Avoid or reduce dose. Increased risk of toxicity.
- **MONITORING REQUIREMENTS** Monitor blood pressure, respiratory rate, urinary output, and urine volume for signs of over dosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in water.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet, capsule, oral suspension, oral solution, powder.
  - **Tablet**
    - Magnesium glycerophosphate (Non-proprietary)
      - Magnesium (as Magnesium glycerophosphate) 97.2 mg Mag-4 (magnesium 97.2mg (4mmol)) tablets | 30 tablet £84.50
    - **Oral solution**
      - LiquaMag GP (Fontus Health Ltd)

        - MagnaPhos 48.6mg (2mmol) capsules | 50 capsule £35.87
        - Magnesium (as Magnesium glycerophosphate) 97.2 mg Mag-4 (magnesium 97.2mg (4mmol)) capsules | 30 capsule £89.30
        - MagnaPhos 97.2mg (4mmol) capsules | 50 capsule £37.87

---

Magnesium sulfate

- **INDICATIONS AND DOSE**
  - Severe acute asthma | Continuing respiratory deterioration in anaphylaxis
    - **BY INTRAVENOUS INFUSION**
    - Child 2-17 years: 40 mg/kg (max. per dose 2 g), to be given over 20 minutes
    - Adult: 1.2–2 g, to be given over 20 minutes
  - **Prevention of seizures in pre-eclampsia**
    - **INITIALLY BY INTRAVENOUS INJECTION**
    - Adult: Initially 4 g, to be given over 5–15 minutes, followed by (by intravenous infusion) 1 gram/hour for 24 hours, if seizure occurs, additional dose of 2 g by intravenous injection to be administered

---

Treatment of seizures and prevention of seizure recurrence in eclampsia

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 4 g, to be given over 5–15 minutes, followed by (by intravenous infusion) 1 gram/hour for 24 hours after seizure or delivery (whichever is later), if seizure recurs, increase the infusion rate to 1.5–2 g/hour or give an additional dose of 2 g by intravenous injection

**Hypomagnesaemia**

- **BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: Up to 40 g, given over a period of up to 5 days, dose given depends on the amount required to replace the deficit (allowing for urinary losses)

**Hypomagnesaemia maintenance (e.g. in intravenous nutrition)**

- **BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: 2.5–5 g daily, usual dose 3 g daily

**Emergency treatment of serious arrhythmias**

- **BY INTRAVENOUS INJECTION**
  - Adult: 2 g, to be given over 10–15 minutes, dose may be repeated once if necessary

**Rapid bowel evacuation (acts in 2–4 hours)**

- **BY MOUTH**
  - Adult: 5–10 g, dose to be mixed in a glass of water, taken preferably before breakfast

- **DOSE EQUIVALENCE AND CONVERSION**
  - Magnesium sulfate heptahydrate 1 g equivalent to Mg<sup>2+</sup> approx. 4 mmol.

- **UNLICENSED USE** Unlicensed indication in severe acute asthma. Continuing respiratory deterioration in anaphylaxis.
- **CONTRA-INDICATIONS**
  - With oral use in rapid bowel evacuation—acute gastrointestinal conditions (in adults)
- **CAUTIONS**
  - With oral use in rapid bowel evacuation—elderly and debilitated patients (in adults)
- **INTERACTIONS** → Appendix 1: magnesium
- **SIDE-EFFECTS**
  - Arrhythmias · colic · coma · confusion · drowsiness · flushing of skin · hypermagnesaemia associated side-effects · hypotension · loss of tendon reflexes · muscle weakness · nausea · respiratory depression · thirst · vomiting
  - **SPECIFIC SIDE-EFFECTS**
    - With oral use Colic · diarrhoea
  - **PREGNANCY**
    - When used for Hypomagnesaemia or Arrhythmias or Prevention of seizures in pre-eclampsia or Treatment of seizures and prevention of seizure recurrence in eclampsia or Severe acute asthma or Continuing respiratory deterioration in anaphylaxis. Not known to be harmful for short-term intravenous administration in eclampsia, but excessive doses in third trimester cause neonatal respiratory depression.
  - **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.
  - **RENAL IMPAIRMENT** Avoid or reduce dose. Increased risk of toxicity.
  - **MONITORING REQUIREMENTS** Monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).
  - **DIRECTIONS FOR ADMINISTRATION**
    - With intravenous use In severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump). For *intravenous injection*, in
Phosphorus

Phosphate supplements

Oral phosphate supplements are rarely used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate binding agents and can cause aluminium accumulation.

Sevelamer p. 966 is licensed for the treatment of hyperphosphataemia in patients on haemodialysis or peritoneal dialysis. Sevelamer carbonate is also licensed for the treatment of patients with chronic kidney disease not on dialysis who have a serum–phosphate concentration of 1.78 mmol/litre or more.

Lanthanum p. 965 is licensed for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD), and in patients with chronic kidney disease not on dialysis who have a serum–phosphate concentration of 1.78 mmol/litre or more that cannot be controlled by a low-phosphate diet.

Sucralfate oxyhydroxide p. 966 is licensed for the control of hyperphosphataemia in patients with chronic kidney disease on haemodialysis or peritoneal dialysis. It is used as part of a multiple therapeutic approach to control the development of renal bone disease; this could include the concomitant use of a calcium supplement, a vitamin D analogue or calcimimetics.

1.4a Hyperphosphataemia

ELECTROLYTES AND MINERALS ★ ALUMINIUM

Aluminium hydroxide

INDICATIONS AND DOSE

Hyperphosphataemia in renal failure

BY MOUTH USING CAPSULES

Adult: 4–20 capsules daily in divided doses, to be taken with meals

Antacid

BY MOUTH USING CAPSULES

Adult: 475 mg 5 times a day, last dose to be taken at bedtime

CONTRA-INDICATIONS

Hypophosphataemia

INTERACTIONS

Appendix 1: antacids

SIDE-EFFECTS

Constipation · hyperaluminaemia

HEPATIC IMPAIRMENT

Avoid; can cause constipation which may precipitate coma.

RENAI IMPAIRMENT

There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

Alu-Cap (Meda Pharmaceuticals Ltd)

Aluminium hydroxide 475 mg Alu-Cap 475mg capsules 120 capsules £13.71 DT price = £13.71

CALCIUM

Calcium acetate

INDICATIONS AND DOSE

PHOSEX ® TABLETS

Hyperphosphataemia

BY MOUTH

Adult: Initially 1 tablet 3 times a day, to be taken with meals, dose to be adjusted according to serum–phosphate concentration, usual dose 4–6 tablets
daily in divided doses, (1 or 2 tablets with each meal); maximum 12 tablets per day

**RENACET® TABLETS**

**Hyperphosphataemia**

> **BY MOUTH**
> Adult: 475–950 mg, to be taken with breakfast and with snacks, 0.95–2.85 g, to be taken with main meals and 0.95–1.9 g, to be taken with supper, dose to be adjusted according to serum-phosphate concentration; maximum 6.65 g per day

**INTERACTIONS**

> Appendix 1: calcium salts

**DIRECTIONS FOR ADMINISTRATION**

**PHOSEX® TABLETS**

Phosex® tablets are taken with meals. Tablets can be broken to aid swallowing, but not chewed (bitter taste).

**RENACET® TABLETS**

Manufacturer advises that other drugs should be taken 1 to 2 hours before or after Renacet® to reduce the possible interference with absorption of other drugs. Renacet® tablets are taken with meals.

**PRESCRIBING AND DISPENSING INFORMATION**

PhosLo® capsules contain calcium acetate (anhydrous) 667 mg (equivalent to calcium 169 mg or Ca2+ 4.2 mmol); Renacet® tablets contain calcium acetate 475 mg (equivalent to calcium 120.25 mg or Ca2+ 3 mmol); Phosex® tablets contain calcium acetate 1 g (equivalent to calcium 250 mg or Ca2+ 6.2 mmol).

**PATIENT AND CARER ADVICE**

Phosex® tablets Patients or carers should be given advice on how to administer Phosex® tablets.

Renacet® tablets Patients or carers should be given advice on how to administer Renacet® tablets.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

> Phosex (Pharmacosmos UK Ltd)
  > Calcium acetate 1 gram Phosex 1g tablets  |  180 tablet POM £19.79
  > DT price = £19.79
> Renacet (Stanningley Pharma Ltd)
  > Calcium acetate 475 mg Renacet 475mg tablets  |  200 tablet POM £9.71

  > DT price = £18.45

Combinations available: Calcium acetate with magnesium carbonate, below

**PHOSPHATE BINDERS**

**Calcium acetate with magnesium carbonate**

The properties listed below are those particular to the combination only. For the properties of the components please consider, calcium acetate p. 964, magnesium carbonate p. 69.

**INDICATIONS AND DOSE**

**Hyperphosphataemia**

> **BY MOUTH**
> Adult: Initially 1 tablet 3 times a day, adjusted according to serum-phosphate concentration, to be taken with food; usual dose 3–10 tablets daily; maximum 12 tablets per day

**CONTRA-INDICATIONS**

Hypercalcaemia - hypermagnesaemia - myasthenia gravis - third-degree AV block

**INTERACTIONS**

> Appendix 1: antacids, calcium salts

**DIRECTIONS FOR ADMINISTRATION**

Manufacturer advises that other drugs should be taken at least 2 hours before or 3 hours after calcium acetate with magnesium carbonate to reduce possible interference with absorption of other drugs.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer calcium acetate with magnesium carbonate tablets.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

> Rephoren (Vifor Fresenius Medical Care Renal Pharma UK Ltd)
  > Magnesium carbonate heavy 235 mg, Calcium acetate 435 mg Osaven 435mg/235mg tablets  |  180 tablet (POM) £24.00

**Lanthanum**

**INDICATIONS AND DOSE**

Hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD) Hyperphosphataemia in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more that cannot be controlled by a low-phosphate diet

> **BY MOUTH**
> Adult: 1.5–3 g daily in divided doses, dose to be adjusted according to serum-phosphate concentration every 2–3 weeks, to be taken with or immediately after meals

**CAUTIONS**

Acute peptic ulcer - bowel obstruction - Crohn’s disease - ulcerative colitis

**INTERACTIONS**

> Appendix 1: lanthanum

**SIDE-EFFECTS**

> Common or very common Gastro-intestinal disturbances - headache - hypocalcaemia
> Frequency not known Accumulation of lanthanum in bone - transient changes in QT interval

**PREGNANCY**

Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING**

Manufacturer advises caution—no information available.

**HEPATIC IMPAIRMENT**

Lanthanum excreted in bile—possible accumulation in obstructive jaundice.

**DIRECTIONS FOR ADMINISTRATION**

Tablets are to be chewed. Each sachet of powder to be mixed with soft food and consumed within 15 minutes.

**PATIENT AND CARER ADVICE**

Patient and carers should be given advice on how to administer lanthanum tablets and powder.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (March 2007) that lanthanum (Fosrenol®) is accepted for restricted use within NHS Scotland for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis, as a second-line agent, where a non-aluminium, non-calcium phosphate binder is required.

**INDICATIONS AND DOSE**

RENAGEL®

Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis

- **BY MOUTH**
  - Adult: Initially 2.4–4.8 g daily in 3 divided doses, dose to be given with meals and adjusted according to serum-phosphate concentration; usual dose 2.4–12 g daily in 3 divided doses

RENELA® 800MG TABLETS

Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis | Hyperphosphataemia in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more

- **BY MOUTH**
  - Adult: Initially 2.4–4.8 g daily in 3 divided doses, dose to be taken with meals and adjusted according to serum-phosphate concentration every 2–4 weeks; usual dose 6 g daily in 3 divided doses

RENELA® 2.4G ORAL POWDER SACHETS

Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis | Hyperphosphataemia in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more

- **BY MOUTH**
  - Adult: Initially 2.4–4.8 g daily in 3 divided doses, dose to be taken with meals and adjusted according to serum-phosphate concentration every 2–4 weeks; usual dose 6 g daily in 3 divided doses

**CONTRA-INDICATIONS**

Bowel obstruction

**CAUTIONS**

Gastro-intestinal disorders

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain | constipation | diarrhoea | dyspepsia | flatulence | nausea | vomiting

- **Frequency not known** Ileus | intestinal obstruction (higher incidence with sevelamer hydrochloride salt) | intestinal perforation | pruritus | rash

RENAGEL® Diverticulitis

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

RENELA® 2.4G ORAL POWDER SACHETS

Unlikely to be present in milk (however, manufacturer advises avoid).
### 1.5 Potassium imbalance

#### 1.5a Hyperkalaemia

**Other drugs used for Hyperkalaemia** Calcium gluconate, p. 959 · Insulin, p. 673

#### ANTIDOTES AND CHELATORS > CATION EXCHANGE RESINS

**Calcium polystyrene sulfonate**

- **INDICATIONS AND DOSE**
  - Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients
    - **BY MOUTH**
      - Adult: 15 g 3–4 times a day
    - **BY RECTUM**
      - Adult: 30 g, retained for 9 hours followed by irrigation to remove resin from colon

- **SORBISTERIT® POWDER**
  - Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients
    - **BY MOUTH**
      - Adult: 20 g 1–3 times a day
    - **BY RECTUM**
      - Adult: 40 g 1–3 times a day, retained for 6 hours followed by irrigation to remove resin from colon

- **CONTRA-INDICATIONS**
  - Hyperparathyroidism · metastatic carcinoma · multiple myeloma · obstructive bowel disease · sarcoidosis

- **INTERACTIONS** → Appendix 1: polystyrine sulfonate

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Anorexia · constipation (discontinue treatment—avoid magnesium-containing laxatives) · diarrhea · gastric irritation · gastro-intestinal obstruction · hypercalcaemia (including in dialysed patients and occasionally in those with renal impairment) · hypomagnesaemia · intestinal necrosis (reported with concomitant sorbitol) · ischaemic colitis · nausea · necrosis · ulceration · vomiting
  - **SPECIFIC SIDE-EFFECTS**
    - With oral use: Gastro-intestinal concretions
    - With rectal use: Faecal impaction

- **PREGNANCY**
  - Manufacturers advise use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING**
  - Manufacturers advise use only if potential benefit outweighs risk—no information available.

- **MONITORING REQUIREMENTS**
  - Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre). A wide range of patients, including dialysis patients, benefit from treatment with calcium polystyrene sulfonate.

## 1.4b Hypophosphataemia

**ELECTROLYTES AND MINERALS > PHOSPHATES**

### Phosphate

- **INDICATIONS AND DOSE**
  - Treatment of moderate to severe hypophosphataemia
    - **BY INTRAVENOUS INFUSION**
      - Adult: consult product literature
  - For established hypophosphataemia (with monobasic potassium phosphate)
    - **BY INTRAVENOUS INFUSION**
      - Adult: 9 mmol every 12 hours, increased if necessary up to 0.5 mmol/kg (max. per dose 50 mmol), dose only increased in critically ill patients; dose in critically ill patients is approximately equivalent to 30 mmol in adults, dose to be infused over 6–12 hours, according to severity

- **SIDE-EFFETS**
  - Common or very common
    - Diarrhoea
    - Frequency not known
      - Acute renal failure · hypocalcaemia · hypotension · metastatic calcification · nausea · oedema · phlebitis · tissue necrosis on extravasation
  - **SIDE-EFFETS, FURTHER INFORMATION**
    - Diarrhoea is a common side-effect and should prompt a reduction in dosage.

- **RENAI IMPAIRMENT**
  - Reduce dose. Monitor closely in renal impairment.

- **MONITORING REQUIREMENTS**
  - It is essential to monitor closely plasma concentrations of calcium, phosphate, potassium, and other electrolytes—excessive doses of phosphates may cause hypocalcaemia and metastatic calcification.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - **Phosphate Sandoz®** contains sodium dihydrogen phosphate anhydrous (anhydrous sodium acid phosphate) 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg (Na+ 20.4 mmol), potassium 123 mg (K+ 3.1 mmol); **Polyfusor NA®** contains Na+ 162 mmol/litre, K+ 19 mmol/litre, PO4 3— 100 mmol/litre; non-proprietary potassium dihydrogen phosphate injection (potassium acid phosphate) 13.6% may contain 1 mmol/mL phosphate, 1 mmol/mL potassium.

- **MEDICINA FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Effervescent tablet**
      - COMMONFULLY AND ADVISORY LABELS 13
        - **Phosphate Sandoz® (HK Pharma Ltd)**
          - Sodium dihydrogen phosphate anhydrous 1.936 gram
        - **Phosphate Sandoz effervescent tablets** 100 tablet (£16.43
    - **Solution for infusion**
      - **Phosphate (Non-proprietary)**
        - Potassium dihydrogen phosphate 136 mg per 1 ml (potassium dihydrogen phosphate 13.6% (potassium 10mmol/10ml) solution for infusion 10ml ampoules | 10 ampoule (£80.25–£85.00 DT price = £84.63

- **Infusion**
  - **Phosphate (Non-proprietary)**
    - Potassium dihydrogen phosphate 1.295 gram per 1 litre
    - **Diasodium hydrogen phosphate anhydrous 5.75 gram per 1 litre**
      - Polyfusor NA phosphates infusion 500mL bottles | 1 bottle (£5.15

Blood and nutrition

1.5b Hypokalaemia

**ELECTROLYTES AND MINERALS  >  POTASSIUM**

**Potassium bicarbonate with potassium acid tartrate**

- **INDICATIONS AND DOSE**
  - Hyperchloraemic acidosis associated with potassium deficiency (as in some renal tubular and gastrointestinal disorders)
    - **BY MOUTH**
    - Adult: consult product literature
  - **CONTRA-INDICATIONS**
    - Hypochloraemia · plasma-potassium concentration above 5 mmol/litre
  - **CAUTIONS**
    - Cardiac disease · elderly
  - **SIDE-EFFECTS**
    - Abdominal pain · diarrhoea · flatulence · nausea · vomiting
  - **RENAI IMPAIRMENT**
    - Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hypokalaemia.
  - **DIRECTIONS FOR ADMINISTRATION**
    - To be dissolved in water before administration.
  - **PRESCRIBING AND DISPENSING INFORMATION**
    - These tablets do not contain chloride.

**Potassium chloride**

- **INDICATIONS AND DOSE**
  - Prevention of hypokalaemia (patients with normal diet)
    - **BY MOUTH**
    - Adult: 2–4 g daily in divided doses
  - **Electrolyte imbalance**
    - **BY INTRAVENOUS INFUSION**
    - Adult: Dose dependent on deficit or the daily maintenance requirements

**IMPORTANT SAFETY INFORMATION**

**SAFE PRACTICE**

Potassium overdose can be fatal. Ready-mixed infusion solutions containing potassium should be used. Exceptionally, if potassium chloride concentrate is used for preparing an infusion, the infusion solution should be thoroughly mixed. Local policies on avoiding inadvertent use of potassium chloride concentrate should be followed.

- **CONTRA-INDICATIONS**
  - Plasma-potassium concentration above 5 mmol/litre
- **CAUTIONS**
  - With intravenous use seek specialist advice in very severe potassium depletion or difficult cases
  - With oral use Cardiac disease · elderly · hiatus hernia (with modified-release preparations) · history of peptic ulcer (with modified-release preparations) · intestinal stricture (with modified-release preparations)

---

**Sodium polystyrene sulfonate**

- **INDICATIONS AND DOSE**
  - Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients
    - **BY MOUTH**
    - Adult: 15 g 3–4 times a day
    - **BY RECTUM**
    - Adult: 30 g, retain for 9 hours followed by irrigation to remove resin from colon

- **CONTRA-INDICATIONS**
  - Obstructive bowel disease
- **CAUTIONS**
  - Congestive heart failure · hypertension · oedema
- **INTERACTIONS**
  - Appendix 1: polystyrene sulfonate
- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Anorexia · constipation (discontinue treatment—avoid magnesium-containing laxatives) · diarrhoea · gastric irritation · gastro-intestinal obstruction · hypocalcaemia · hypomagnesaemia · intestinal necrosis (reported with concomitant use of sorbitol) · ischaemic colitis · nausea · necrosis · sodium retention · ulceration · vomiting
  - **SPECIFIC SIDE-EFFECTS**
    - With oral use · Gastro-intestinal concretions
    - With rectal use · Faecal impaction
- **PREGNANCY**
  - Manufacturers advise use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING**
  - Manufacturers advise use only if potential benefit outweighs risk—no information available.
- **RENAI IMPAIRMENT**
  - Use with caution.
- **MONITORING REQUIREMENTS**
  - Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).
- **DIRECTIONS FOR ADMINISTRATION**
  - With rectal use · Mix each 30 g of resin with 150 mL of water or 10% glucose.
  - With oral use · Administer dose (powder) in a small amount of water or honey—do not give with fruit juice or squash, which have a high potassium content.
- **MEDICINAL FORMS**

---

**CONTRA-INDICATIONS**

- Hypochloraemia · plasma-potassium concentration above 5 mmol/litre
INTERACTIONS  
Appendix 1: potassium chloride

SIDE-EFFECTS

- Common or very common
  - With oral use: Abdominal pain, diarrhoea, flatulence, nausea, vomiting
  - With intravenous use: Heart toxicity (with rapid infusion)
  - Frequency not known
    - With oral use: Bleeding (with modified-release preparations), gastrointestinal obstruction (with modified-release preparations), ulceration (with modified-release preparations)

RENAL IMPAIRMENT  
Smaller doses may be used in patients with renal impairment to reduce the risk of hyperkalaemia. Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.

MONITORING REQUIREMENTS

- Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements.
- With intravenous use: ECG monitoring should be performed in difficult cases.

DIRECTIONS FOR ADMINISTRATION

- With oral use: Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to hyperchloracemic states).
- With intravenous use: Potassium chloride concentrate must be diluted with not less than 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and mixed well.
  
  Ready-mixed infusion solutions should be used where possible; alternatively, potassium chloride concentrate as ampoules containing 1.5 g (K² 20 mmol) in 10 ml, is thoroughly mixed with 500 ml of sodium chloride 0.9% intravenous infusion and given slowly over 2 to 3 hours with specialist advice and ECG monitoring in difficult cases. For peripheral intravenous infusion, the concentration of potassium should not usually exceed 40 mmol/L. Higher concentrations of potassium chloride may be given in very severe depletion, but require specialist advice.

PRESCRIBING AND DISPENSING INFORMATION

Kay-Cee-L® contains 1 mmol/mL each of K⁺ and Cl⁻. Potassium Tablets Do not confuse Effervescent Potassium Tablets BPC 1968 with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloracemic states.

PATIENT AND CARER ADVICE

- Patient or carers should be given advice on how to administer potassium chloride modified-release tablets.
- Salt substitutes: A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. LoSalt® and Ruthmol®). These should not be used by patients with renal failure as potassium intoxication may result.

LESS SUITABLE FOR PRESCRIBING

Modified-release tablets are less suitable for prescribing. Modified-release preparations should be avoided unless effervescent tablets or liquid preparations inappropriate.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, oral solution, solution for injection, infusion, solution for infusion

Solution for infusion

- Potassium chloride (Non-proprietary)
  - Potassium chloride 150 mg per 1 ml (potassium 20 mmol/10 ml) solution for infusion 10 ml ampoules 10 ampoules £6.50 / 20 ampoules £6.50
  - Potassium chloride 15% (potassium 20 mmol/10 ml) solution for infusion 10 ml Mini-Plasco ampoules 20 ampoule £10.70
  - Potassium chloride 200 mg per 1 ml (potassium 20% (potassium 13.3 mmol/5 ml) solution for infusion 5 ml ampoules 10 ampoule £3.84–£4.00
  - Potassium chloride 20% (potassium 27 mmol/10 ml) solution for infusion 10 ml ampoules 10 ampoule £121.25

Oral solution

CAUTIONARY AND ADVISORY LABELS 21

Kay-Cee-L® (Geistlich Sons Ltd)

Potassium chloride 75 mg per 1 ml Kay-Cee-L syrup sugar-free 500 ml £7.95

2  Metabolic disorders

2.1 Acute porphyrias

Acute porphyrias

Overview

The acute porphyrias (acute intermitent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphoric crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, treatment should be started and urinary porphobiligenin excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphyria occurs during pregnancy, contact an expert porphyria service for further advice.

Haem arginate p. 971 is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

In the United Kingdom the National Acute Porphyrja Service (NAPS) provides clinical support and treatment with haem arginate from three centres (University Hospital of Wales, Addenbrooke’s Hospital, and King’s College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyrja Service.

Drugs unsafe for use in acute porphyrias

The following list contains drugs on the UK market that have been classified as ‘unsafe’ in porphyria because they have been shown to be porphyrinogenic in animals or in vivo, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered safe in acute porphyrias is available at www.wmic.wales.nhs.uk/specialist-services/drugs-in-porphyria/. Further information may be obtained from: www.porphyria-europe.org and also from:
Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

**Unsafe Drug Groups (check first)**

- Alkylating drugs (contact Welsh Medicines Information Centre for further advice)
- Anabolic steroids
- Antidepressants (includes tricyclic (and related) antidepressants and MAOIs; fluoxetine, duloxetine, venlafaxine, and trazodone thought to be safe)
- Antihistamines (alimemazine, chlorphenamine, desloratadine, fexofenadine, ketotifen, loratadine, and promethazine thought to be safe)
- Barbiturates (includes primidone and thiopental)
- Calcium channel blockers (amlodipine, felodipine, and nifedipine thought to be safe)
- Contraceptives, hormonal (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should never be used in those at risk of acute porphyria.)
- Ergot derivatives (includes ergometrine (oxytocin probably safe) and pergolide)
- Hormone replacement therapy (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should never be used in those at risk of acute porphyria.)
- Imidazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)
- Non-nucleoside reverse transcriptase inhibitors (contact Welsh Medicines Information Centre for further advice)
- Progestogens (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should never be used in those at risk of acute porphyria.)
- Triazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)

**Unsafe Drugs (check groups above first)**

- Acriflavine
- Alcohol
- Amiodarone
- Aprepitant (contact Welsh Medicines Information Centre for further advice)
- Artemether with lumefantrine
- Bexarotene
- Bosentan
- Bromocriptine
- Buspirone
- Cabergoline
- Carbamazepine
- Chloral hydrate (although evidence of hazard is uncertain, manufacturer advises avoid)
- Chloramphenicol
- Chloroform (small amounts in medicines probably safe)
- Clindamycin
- Cocaine
- Colistimethate sodium
- Danazol
- Dapsone
- Dexfenfluramine
- Disopyramide
- Disulfiram
- Erythromycin
- Etamsylate
- Ethosuximide
- Etonidazole
- Fenfluramine
- Flupentixol
- Flutamide
- Fosaprepitant (contact Welsh Medicines Information Centre for further advice)
- Fosphenytoin
- Griseofulvin
- Hydralazine
- Indapamide
- Isometheptene mucate
- Isoniazid (safety uncertain, contact Welsh Medicines Information Centre for further advice)
- Ketamine
- Mefenamic acid (may be used with caution if safer alternative not available)
- Meprobamate
- Methyldopa
- Metolazone
- Metyrapone
- Mifepristone
- Minoxidil (may be used with caution if safer alternative not available)
- Mitotane
- Mitotane
- Metyrapone
- Nalidixic acid
- Nitrazepam
- Nitrofurantoin
- Orphenadrine
- Oxicarbazepine
- Oxycodone
- Pentazocine (buprenorphine, codeine, diamorphine, dihydrocodeine, fentanyl, methadone, morphine, oxycodeone, pethidine, and tramadol are thought to be safe)
- Pentoxyfilline
- Phenoxybenzamine
- Phenytoin
- Pimecrolimus
- Porfimer
- Raloxifene
- Triazolinediones (contact Welsh Medicines Information Centre for further advice)
Carnitine deficiency

2.2 Carnitine deficiency

AMINO ACIDS AND DERIVATIVES

Levocarnitine
(Carnitine)

- **INDICATIONS AND DOSE**
  - Primary carnitine deficiency due to inborn errors of metabolism
    - BY MOUTH
      - Adult: Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day
    - BY SLOW INTRAVENOUS INJECTION
      - Adult: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes
  - Secondary carnitine deficiency in haemodialysis patients
    - INITIALLY BY SLOW INTRAVENOUS INJECTION
      - Adult: 20 mg/kg, to be administered over 2–3 minutes, after each dialysis session, dosage adjusted according to plasma-carnitine concentration, then (by mouth) maintenance 1 g daily, administered if benefit is gained from first intravenous course

- **CAUTIONS**
  - Diabetes mellitus
  - **SIDE-EFFECTS** Abdominal pain, body odour, diarrhoea, nausea, vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Side-effects may be dose-related—monitor tolerance during first week and after any dose increase.

- **PREGNANCY** Appropriate to use; no evidence of teratogenicity in animal studies.
- **RENAL IMPAIRMENT** Accumulation of metabolites may occur with chronic oral administration in severe impairment.
- **MONITORING REQUIREMENTS**
  - Monitoring of free and acyl carnitine in blood and urine recommended.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include:
    - **Solution for injection**
    - Carnitor (Logixx Pharma Solutions Ltd)
    - L-Carnitine 200 mg per 1 ml Carnitor 1g/5ml solution for injection ampoules | 5 ampoule (PO) £59.50
    - **Oral solution**
      - Levocarnitine (Non-proprietary)
      - L-Carnitine 300 mg per 1 ml Levocarnitine 1.5g/5ml (30%) oral solution paediatric | 20 ml (PO) £71.40 DT price = £71.40
      - Carnitor (Logixx Pharma Solutions Ltd)
    - L-Carnitine 100 mg per 1 ml Carnitor oral single dose 1g solution sugar-free | 10 unit dose (PO) £35.00

Chewable tablet
- Carnitor (Logixx Pharma Solutions Ltd)
  - L-Carnitine 1 gram Carnitor 1g chewable tablets | 10 tablet (PO) £35.00

Capsule
- Levocarnitine (Non-proprietary)
  - L-Carnitine 250 mg Bio-Carnitine 250mg capsules | 125 capsule (PO) £11.06
  - L-Carnitine 500 mg Lamberts L-Carnitine 500mg capsules | 60 capsule (PO) £11.14
2.3 Fabry’s disease

**ENZYMES**

**Agalsidase alfa**

- **DRUG ACTION** Agalsidase alfa, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry’s disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

- **INDICATIONS AND DOSE**

  **Fabry’s disease (specialist use only)**
  - By intravenous infusion
  - Adult: 200 micrograms/kg every 2 weeks

- **INTERACTIONS** → Appendix 1: agalsidase

- **SIDE-EFFECTS**

  **Common or very common** Acne · angioedema · arthralgia · asthenia · bradycardia · chest pain · cough · dizziness · dyspnoea · eye irritation · fatigue · flushing · gastrointestinal disturbances · headache · hypersensitivity reactions · hypertension · hypotension · influenza · like symptoms · muscle spasms · myalgia · nasopharyngitis · neuropathic pain · oedema · palpitation · paraesthesia · pruritus · rash · rhinorrhea · sleep disturbances · syncope · tachycardia · taste disturbances · tinnitus · tremor · urticaria

  **Uncommon** Cold extremities · ear pain · ear swelling · injection-site reactions · parosmia · skin discoloration

- **SIDE-EFFECTS, FURTHER INFORMATION**

  Infusion-related reactions Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Use with caution—no information available.

- **DIRECTIONS FOR ADMINISTRATION** Administration for intravenous infusion, given intermittently in sodium chloride 0.9%; dilute requisite dose with 100 mL infusion fluid and give over 40 minutes using an in-line filter; use within 3 hours of dilution.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Solution for infusion**

  - Replagal (Shire Pharmaceuticals Ltd)
    - Agalsidase alfa 1 mg per 1 mL Replagal 3.5mg/3.5ml solution for infusion vials | 1 vial £1,068.64

- **Agalsidase beta**

  - **DRUG ACTION** Agalsidase beta, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry’s disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

  - **INDICATIONS AND DOSE**

    **Fabry’s disease (specialist use only)**
    - By intravenous infusion
    - Adult: 1 mg/kg every 2 weeks

  - **INTERACTIONS** → Appendix 1: agalsidase

  - **SIDE-EFFECTS**

    **Common or very common** Acne · angioedema · arthralgia · asthenia · bradycardia · chest pain · cough · dizziness · dyspnoea · eye irritation · fatigue · flushing · gastrointestinal disturbances · headache · hypersensitivity reactions · hypertension · hypotension · influenza · like symptoms · muscle spasms · myalgia · nasopharyngitis · neuropathic pain · oedema · palpitation · paraesthesia · pruritus · rash · rhinorrhea · sleep disturbances · syncope · tachycardia · taste disturbances · tinnitus · tremor · urticaria

- **SIDE-EFFECTS, FURTHER INFORMATION**

  Infusion-related reactions Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Use with caution—no information available.

- **DIRECTIONS FOR ADMINISTRATION** Administration for intravenous infusion, given intermittently in sodium chloride 0.9%; dilute requisite dose with 100 mL infusion fluid and give over 40 minutes using an in-line filter; use within 3 hours of dilution.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Powder for solution for infusion**

  - Fabrazyme (Genzyme Therapeutics Ltd)
    - Agalsidase beta 5 mg Fabrazyme 5mg powder for solution for infusion vials | 1 vial £315.08
    - Agalsidase beta 35 mg Fabrazyme 35mg powder for solution for infusion vials | 1 vial £2,196.59

2.4 Gaucher’s disease

**Other drugs used for Gaucher’s disease** Miglustat, p. 976

**ENZYMES**

**Imiglucerase**

- **DRUG ACTION** Imiglucerase is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for non-neurological manifestations of type I or type III Gaucher’s disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

- **INDICATIONS AND DOSE**

  Non-neurological manifestations of type I Gaucher’s disease (specialist use only) · Non-neurological manifestations of type III Gaucher’s disease (specialist use only)

  - By intravenous infusion
  - Adult: Initially 60 units/kg every 2 weeks; maintenance, adjusted according to response, doses as low as 15 units/kg once every 2 weeks may improve haematological parameters and organomegaly

downloaded from www.medicalbr.com
SIDE-EFFECTS
- Common or very common: Angioedema, backache, cyanosis, flushing, hypersensitivity reactions, hypotension, paraesthesia, tachycardia, urticaria
- Uncommon: Abdominal cramps, arthralgia, diarrhoea, dizziness, fatigue, fever, headache, injection-site reactions, nausea, vomiting
- PREGNANCY: Manufacturer advises use with caution—limited information available.
- BREAST FEEDING: No information available.
- MONITORING REQUIREMENTS: Monitor for immunoglobulin G (IgG) antibodies to imiglucerase.
- When stabilised, monitor all parameters and response to treatment at intervals of 6–12 months.

DIRECTIONS FOR ADMINISTRATION
- For intravenous infusion (Cerezyme®), give intermittently in sodium chloride 0.9%; initially reconstitute with water for injections (200 units in 5.1 mL, 400 units in 10.2 mL) to give 40 units/mL solution; dilute requisite dose with infusion fluid to a final volume of 100–200 mL and give initial dose at a rate not exceeding 0.5 units/kg/minute, subsequent doses to be given at a rate not exceeding 1 unit/kg/minute; administer within 3 hours after reconstitution.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.
- Powder for solution for infusion
  - ELECTROLYTES: May contain sodium
  - Cerezyme (Genzyme Therapeutics Ltd)
    - Imiglucerase 400 unit Cerezyme 400 unit powder for solution for infusion vials | 1 vial (PO) £1,071.29

Velaglucerase alfa
- DRUG ACTION: Velaglucerase alfa is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for the treatment of type 1 Gaucher’s disease.

INDICATIONS AND DOSE
- Type 1 Gaucher’s disease (specialist use only)
  - BY INTRAVENOUS INFUSION
    - Adult: Initially 60 units/kg every 2 weeks; adjusted according to response to 15–60 units/kg every 2 weeks

SIDE-EFFECTS
- Abdominal pain, arthralgia, back pain, bone pain, dizziness, flushing, headache, hypersensitivity reactions, hypertension, hypotension, malaise, nausea, pyrexia, rash, tachycardia, urticaria
- SIDE-EFFECTS, FURTHER INFORMATION
  - Infusion-related reactions
    - Infusion-related reactions very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.
- PREGNANCY: Manufacturer advises use with caution—limited information available.
- BREAST FEEDING: Manufacturer advises use with caution—no information available.
- MONITORING REQUIREMENTS: Monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack of loss of effect with velaglucerase alfa.
- DIRECTIONS FOR ADMINISTRATION
  - For intravenous infusion (VPRIV®), give intermittently in sodium chloride 0.9%; reconstitute each 400-unit vial with 4.3 mL water for injections to produce a 100 units/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 60 minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.
- Powder for solution for infusion
  - ELECTROLYTES: May contain sodium
  - VPRIV (Shire Pharmaceuticals Ltd)
    - Velaglucerase alfa 400 unit VPRIV 400 units powder for solution for infusion vials | 1 vial (PO) £1,410.20

2.5 Homocystinuria

METHYL DONORS

Betaine
- INDICATIONS AND DOSE
  - Adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism (specialist use only)
    - BY MOUTH
      - Adult: 3 g twice daily (max. per dose 10 g), adjusted according to response; maximum 20 g per day

SIDE-EFFECTS
- Uncommon: Agitation, alopecia, anorexia, depression, gastro-intestinal disorders, personality disorder, reversible cerebral oedema, sleep disturbances, urinary incontinence, urticaria
- PREGNANCY: Manufacturer advises avoid unless essential—limited information available.
- BREAST FEEDING: Manufacturer advises caution—no information available.
- MONITORING REQUIREMENTS: Monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur.
- DIRECTIONS FOR ADMINISTRATION: Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of Cystadane® powder.
- PRESCRIBING AND DISPENSING INFORMATION: Betaine should be used in conjunction with dietary restrictions and may be given with supplements of vitamin B₁₂, pyridoxine, and folate under specialist advice.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions
- The Scottish Medicines Consortium has advised (July 2010) that betaine anhydrous (Cystadane®) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral solution
- Powder
  - Cystadane (Orphan Europe (UK) Ltd)
    - Betaine 1 gram per 1 gram Cystadane oral powder | 180 gram (PO) £347.00

Downloaded from www.medicalbr.com
2.6 Mucopolysaccharidosis

ENZYMES

Elosulfase alfa

- **DRUG ACTION** Elosulfase alfa is an enzyme produced by recombinant DNA technology that provides replacement therapy in conditions caused by N-acetylgalactosamine-6-sulfatase (GALNS) deficiency.

- **INDICATIONS AND DOSE**
  - Mucopolysaccharidosis IVA (specialist use only)
    - **BY INTRAVENOUS INFUSION**
    - Adult: 2 mg/kg once weekly

- **CAUTIONS** Elderly—no information available · infusion-related reactions

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · chills · diarrhoea · dizziness · dyspnoea · headache · hypersensitivity · infusion-related reactions · myalgia · nausea · ophthalmological pain · pyrexia · vomiting
  - **Uncommon** Anaphylaxis
  - **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.
  - **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion (Vimizim®), give intermittently in Sodium chloride 0.9%; body-weight under 25 kg, dilute requisite dose to final volume of 100 mL infusion fluid and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 3 mL/hour, then increase to a rate of 6 mL/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 6 mL/hour to 36 mL/hour; body-weight 25 kg or over, dilute requisite dose to final volume of 250 mL and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 6 mL/hour, then increase to a rate of 12 mL/printed after 15 minutes, then increase gradually if tolerated every 15 minutes by 12 mL/hour to max. 72 mL/hour.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C. After dilution use immediately or, if necessary, store at 2–8°C for max. 24 hours, followed by up to 24 hours at 23–27°C.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
  - Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for infusion**
    - **Vimizim** (BioMarin Europe Ltd) ▼
    - Elosulfase alfa 1 mg per 1 ml
    - Vimizim 5mg/5ml concentrate for solution for infusion vials | 1 vial £750.00

Galsulfase

- **INDICATIONS AND DOSE**
  - Mucopolysaccharidosis VI (specialist use only)
    - **BY INTRAVENOUS INFUSION**
    - Adult: 1 mg/kg once weekly

- **CAUTIONS** Acute febrile illness (consider delaying treatment) · acute respiratory illness (consider delaying treatment) · infusion-related reactions can occur · respiratory disease

- **SIDE-EFFECTS** Abdominal pain · apnoea · arreflexia · chest pain · conjunctivitis · corneal opacity · dyspnoea · ear pain · facial oedema · gastroenteritis · hypertension · infusion-related reactions · malaise · nasal congestion · pharyngitis · rigors · umbilical hernia

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion (Naglazyme®), give intermittently in Sodium chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL infusion fluid and give over at least 4 hours.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for infusion**
    - **Naglazyme** (BioMarin Europe Ltd) ▼
    - Galsulfase 1 mg per 1 ml
    - Naglazyme 5mg/5ml solution for infusion vials | 1 vial £982.00

Idursulfase

- **DRUG ACTION** Idursulfase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

- **INDICATIONS AND DOSE**
  - Mucopolysaccharidosis II (specialist use only)
    - **BY INTRAVENOUS INFUSION**
    - Adult: 500 micrograms/kg once weekly

- **CAUTIONS** Acute febrile respiratory illness (consider delaying treatment) · infusion-related reactions can occur · severe respiratory disease

- **SIDE-EFFECTS**
  - **Common or very common** Arrhythmia · arthralgia · bronchospasm · chest pain · cough · cyanosis · dizziness · dyspnoea · erythema · facial oedema · flushing · gastrointestinal disturbances · headache · hypertension · hypotension · hypoxia · infusion-site swelling · peripheral oedema · pruritus · pyrexia · rash · swollen tongue · tachycardia · tachypnoea · tremor · urticaria · wheezing
DIRECTIONS FOR ADMINISTRATION  
For intravenous infusion (Aldurazyme®), give intermittently in Sodium chloride 0.9%; body-weight under 20 kg, use 100 mL infusion fluid; body-weight over 20 kg use 250 mL infusion fluid; withdraw volume of infusion fluid equivalent to volume of laronidase concentrate being added; give through in-line filter (0.22 micron) initially at a rate of 2 units/kg/hour then increase gradually every 15 minutes to max. 43 units/kg/hour.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
ELECTROLYTES: May contain Sodium Aldurazyme (Genzyme Therapeutics Ltd) Laronidase 100 unit per 1 ml Aldurazyme 500units/5ml solution for infusion vials | 1 vial £44.70

2.7 Nephropathic cystinosis

AMINO ACIDS AND DERIVATIVES

Mercaptamine
(Cysteamine)

INDICATIONS AND DOSE
Nephropathic cystinosis (specialist use only)

BY MOUTH
Adult (body-weight 50 kg and above): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 2 g daily in 4 divided doses

DOSE EQUIVALENCES AND CONVERSION
1.3 g/m² is approximately equivalent to 50 mg/kg.

IMPORTANT SAFETY INFORMATION
SAFE PRACTICE
Mercaptamine has been confused with mercaptopurine; care must be taken to ensure the correct drug is prescribed and dispensed.

CAUTIONS
Dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine

SIDE-EFFECTS
Common or very common Abdominal pain · anorexia · breath and body odour · diarrhea · dyspepsia · encephalopathy · fever · gastroenteritis · headache · malaise · nausea · rash · vomiting
Uncommon Drowsiness · gastro-intestinal ulcer · hallucinations · leucopenia · nephrotic syndrome · nervousness · seizures

ALLERGY AND CROSS-SENSITIVITY
Contra—indicated if history of hypersensitivity to penicillamine.

PREGNANCY
Avoid—teratogenic and toxic in animal studies.

BREAST FEEDING
Avoid.

MONITORING REQUIREMENTS
Leucocyte-cystine concentration and haematological monitoring required—consult product literature.

PRESCRIBING AND DISPENSING INFORMATION
Mercaptamine has a very unpleasant taste and smell, which can affect compliance.
2.8 Niemann-Pick type C disease

**ENZYME INHIBITORS**

**GLUCOSYLCERAMIDE SYNTHASE INHIBITORS**

### Miglustat

**DRUG ACTION** Miglustat is an inhibitor of glucosylceramide synthase.

**INDICATIONS AND DOSE**

Mild to moderate type I Gaucher’s disease for whom enzyme replacement therapy is unsuitable (under expert supervision)

- **By mouth**
  - Adult: 100 mg 3 times a day, reduced if not tolerated to 100 mg 1–2 times a day

*Treatment of progressive neurological manifestations of Niemann-Pick type C disease (under expert supervision)*

- **By mouth**
  - Adult: 200 mg 3 times a day

**SIDE-EFFECTS** Abdominal pain - anemia - anorexia - ataxia - chills - constipation - decreased libido - depression - diarrhoea - diziness - dyspepsia - flatulence - headache - hypoaesthesia - insomnia - malaise - muscle spasm - muscle weakness - nausea - paraesthesia - peripheral neuropathy - thrombocytopenia - tremor - vomiting - weight changes

**CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment. Men should avoid fathering a child during and for 3 months after treatment.

**PREGNANCY** Manufacturer advises avoid—no information available.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** No information available—manufacturer advises caution.

**RENAL IMPAIRMENT** For Gaucher’s disease initially 100 mg twice daily if eGFR 50–70 mL/minute/1.73 m². Initially 100 mg once daily if eGFR 30–50 mL/minute/1.73 m². For Niemann-Pick type C disease, initially 200 mg twice daily if eGFR 50–70 mL/minute/1.73 m². Initially 100 mg twice daily if eGFR 30–50 mL/minute/1.73 m² Avoid if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Monitor cognitive and neurological function.
- Monitor growth and platelet count in Niemann-Pick type C disease.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- Zavesca (Actelion Pharmaceuticals UK Ltd) Miglustat 100 mg Zavesca 100mg capsules | 84 capsule £3,934.17 (Hospital only)

### 2.9 Pompe disease

**ENZYMES**

### Alglucosidase alfa

**DRUG ACTION** Alglucosidase alfa is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

**INDICATIONS AND DOSE**

**Pompe disease (specialist use only)**

- **By intravenous infusion**
  - Adult: 20 mg/kg every 2 weeks

**CAUTIONS** Cardiac dysfunction - infusion-related reactions—consult product literature - respiratory dysfunction

**SIDE-EFFECTS**

**FREQUENCY NOT KNOWN** Infusion-related reactions - necrotising skin lesions - severe skin reactions - ulcerative skin lesions

**SIDE-EFFECTS, FURTHER INFORMATION**

Infusion-related reactions - Infusion-related reactions very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details.

**PREGNANCY** Toxicity in animal studies, but treatment should not be withheld.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**MONITORING REQUIREMENTS**

- Monitor closely if cardiac dysfunction.
- Monitor closely if respiratory dysfunction.
- Monitor immunoglobulin G (IgG) antibody concentration.

**DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Myozyme®), give intermittent in Sodium chloride 0.9%; reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with infusion fluid to give a final concentration of 0.5–4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- Myozyme (Genzyme Therapeutics Ltd) Alglucosidase alfa 50 mg Myozyme 50mg powder for concentrate for solution for infusion vials | 1 vial £356.06 (Hospital only)
2.10 Tyrosinaemia type I

**ENZYME INHIBITORS**

*4-HYDROXYPHENYLPYRUVATE DIOXYGENASE INHIBITORS*

### Nitisinone

**(NTBC)**

- **INDICATIONS AND DOSE**
  - Hereditary tyrosinaemia type I (in combination with dietary restriction of tyrosine and phenylalanine) (specialist use only)
    - **BY MOUTH**
    - Adult: Initially 500 micrograms/kg twice daily, adjusted according to response; maximum 2 mg/kg per day

- **INTERACTIONS** → Appendix 1: nitisinone
- **SIDE-EFFECTS**
  - Common or very common Conjunctivitis · conical opacity · eye pain · granulocytopenia · keratitis · leucopenia · photophobia · thrombocytopenia
  - Uncommon Blepharitis · erythematous rash · exfoliative dermatitis · leucocytosis · pruritus
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—毒性 in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—adverse effects in animal studies.
- **PRE-TREATMENT SCREENING** Slit-lamp examination of eyes recommended before treatment.
- **MONITORING REQUIREMENTS**
  - Monitor liver function regularly.
  - Monitor platelet and white blood cell count every 6 months.
- **DIRECTIONS FOR ADMINISTRATION** Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Oral suspension**
    - Nitisinone 4 mg per 1 ml Orfadin 4mg/1ml oral suspension sugar-free | 90 ml [Pom] £1.692.00
  - **Capsule**
    - Orfadin (Swedish Orphan Biovitrum Ltd)
      - Nitisinone 2 mg Orfadin 2mg capsules | 60 capsule [Pom] £564.00
      - Nitisinone 5 mg Orfadin 5mg capsules | 60 capsule [Pom] £1,127.00
      - Nitisinone 10 mg Orfadin 10mg capsules | 60 capsule [Pom] £2,062.00
      - Nitisinone 20 mg Orfadin 20mg capsules | 60 capsule [Pom] £4,512.00

2.11 Urea cycle disorders

**AMINO ACIDS AND DERIVATIVES**

### Carglumic acid

- **INDICATIONS AND DOSE**
  - Hyperammonaemia due to N-acetylglutamate synthase deficiency (under expert supervision)
    - **BY MOUTH**
    - Adult: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma–ammonia concentration; maintenance 5–50 mg/kg twice daily, the total daily dose may alternatively be given in 3–4 divided doses
  - **Hyperammonaemia due to organic acidemia (under expert supervision)**
    - **BY MOUTH**
    - Adult: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma–ammonia concentration, the total daily dose may alternatively be given in 3–4 divided doses

**IMPORTANT SAFETY INFORMATION**

**EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS**

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

- **SIDE-EFFECTS**
  - Common or very common Sweating
  - Uncommon Bradycardia · diarrhoea · pyrexia · vomiting
  - PREGNANCY Manufacturer advises avoid unless essential—no information available.
  - **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
  - **DIRECTIONS FOR ADMINISTRATION** Dispersible tablets must be dispersed in at least 5–10 mL of water and taken orally immediately, or administered via a nasogastric tube.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Dispersible tablet**
    - Cautionary and Advisory Labels 13
      - Carbaglu (Orphan Europe (UK) Ltd)
      - Carglumic acid 200 mg Carbaglu 200mg dispersible tablets sugar-free | 5 tablet [Pom] £299.00 sugar-free | 60 tablet [Pom] £3,499.00

**DRUGS FOR METABOLIC DISORDERS**

**AMMONIA LOWERING DRUGS**

### Sodium phenylbutyrate

- **INDICATIONS AND DOSE**
  - Long-term treatment of urea cycle disorders (as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy) (under expert supervision)
    - **BY MOUTH**
    - Adult: 9.9–13 g/m² daily in divided doses, with meals; maximum 20 g per day

**IMPORTANT SAFETY INFORMATION**

**EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS**

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

- **CAUTIONS** Congestive heart failure (preparations contain significant amounts of sodium)
- **SIDE-EFFECTS**
  - Common or very common Alkalosis · blood disorders · body odour · decreased appetite · depression · gastro-intestinal disturbances · headache · irritability · menstrual disorders · metabolic acidosis · oedema · rash · renal tubular acidosis · syncope · taste disturbance · weight gain
  - Uncommon Arrhythmias · pancreatitis · peptic ulcer · rectal bleeding
2.12 Wilson’s disease

Other drugs used for Wilson’s disease

Penicillamine, p. 1002

2.12.1 Zinc acetate

**INDICATIONS AND DOSE**

Wilson’s disease (initiated under specialist supervision)

- **BY MOUTH**
  - Adult: 50 mg 3 times a day (max. per dose 50 mg 5 times a day), adjusted according to response

**DOSE EQUIVALENCE AND CONVERSION**

- Doses expressed as elemental zinc.

**PHARMACOKINETICS**

Symptomatic Wilson’s disease patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

**CAUTIONS**

Portal hypertension (risk of hepatic decompensation when switching from chelating agent)

**INTERACTIONS** → Appendix 1: zinc

**SIDE-EFFECTS**

- Gastric irritation (usually transient)
- Leucopenia · sideroblastic anaemia

SIDE-EFFECTS, FURTHER INFORMATION

Transient gastric irritation may be reduced if first dose is taken mid-morning or with a little protein.

**PREGNANCY**

Reduce dose to 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion.

**BREAST FEEDING**

Manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant.

**MONITORING REQUIREMENTS**

Monitor full blood count and serum cholesterol.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - CAUTIONARY AND ADVISORY LABELS 23
  - Wilzin (Orphan Europe (UK) Ltd) 25 mg 50 mg

**ANTIDOTES AND CHELATORS**

**COPPER CHELATORS**

**Trientine dihydrochloride**

**INDICATIONS AND DOSE**

Wilson’s disease in patients intolerant of penicillamine

- **BY MOUTH**
  - Adult: 1.2–2.4 g daily in 2–4 divided doses, adjusted according to response, to be taken before food

**SIDE-EFFECTS**

- Nausea · rash
- Anaemia
- Colitis · duodenitis
- PREGNANCY Teratogenic in animal studies—use only if benefit outweighs risks. Monitor maternal and neonatal serum-copper concentrations.

**PRESCRIBING AND DISPENSING INFORMATION**

Trientine is not an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - CAUTIONARY AND ADVISORY LABELS 6, 22
  - Trientine dihydrochloride (Non-proprietary) 300 mg

**Manufacturers**

- **Trientine dihydrochloride (Non-proprietary)**
  - Trientine dihydrochloride 300 mg 100 capsule £3.090.00 DT price = £3.090.00

3 Mineral and trace elements deficiencies

3.1 Selenium deficiency

**Selenium**

Selenium deficiency can occur as a result of inadequate diet or prolonged parenteral nutrition. A selenium supplement should not be given unless there is good evidence of deficiency.
VITAMINS AND TRACE ELEMENTS

Selenium

- INDICATIONS AND DOSE
  - Selenium deficiency
    - BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAPERITONEAL INJECTION
    - Adult: 100–500 micrograms daily
  - INTERACTIONS  ➔ Appendix 1: selenium

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  - Tablet
    - SelenoPrecise (Pharma Nord (UK) Ltd)
      - Selenium (as L-Selenomethionine) 100 microgram SelenoPrecise 100 microgram tablets | 60 tablet £4.02
      - L-Selenomethionine 200 microgram SelenoPrecise 200 microgram tablets | 60 tablet £4.02 | 150 tablet £8.01
  - Solution for injection
    - Selenase (Baxter Healthcare Ltd)
      - Selenium (as Sodium selenite) 50 microgram per 1 ml Selenase 100 microgram/2ml solution for injection ampoules | 10 ampuole | no price available
      - Selenase 500 micrograms/10ml solution for injection vials | 10 vial | no price available
  - Oral solution
    - Selenase (Baxter Healthcare Ltd)
      - Selenium (as Sodium selenite) 50 microgram per 1 ml Selenase 100 microgram/2ml oral solution 2ml unit dose ampoules | 20 unit dose | no price available
      - Selenase 500 micrograms/10ml oral solution unit dose vials | 10 unit dose | no price available
  - Capsule
    - Selenium (Non-proprietary)
      - L-Selenomethionine 200 microgram Selenium 200 microgram capsules | 30 capsule £3.20 | 60 capsule £5.79

3.2 Zinc deficiency

Zinc

Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia spuriously lowers plasma-zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disorders, or in zinc-losing states.

Zinc is used in the treatment of Wilson’s disease and acrodernatitis enteropathica, a rare inherited abnormality of zinc absorption. Parenteral nutrition regimens usually include trace amounts of zinc. If necessary, further zinc can be added to intravenous feeding regimens.

ELECTROLYTES AND MINERALS ➔ ZINC

Zinc sulfate

- INDICATIONS AND DOSE
  - Zinc deficiency or supplementation in zinc-losing conditions
    - BY MOUTH USING EFFERVESCENT TABLETS
    - Child (body-weight up to 10 kg): 22.5 mg daily, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
  - INTERACTIONS  ➔ Appendix 1: zinc

4 Nutrition (intravenous)

Intravenous nutrition

Overview

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to ordinary oral or tube feeding—supplemental parenteral nutrition, or may be the sole source of nutrition—total parenteral nutrition (TPN). Indications for this method include preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; severe or prolonged disorders of the gastro-intestinal tract; major surgery, trauma, or burns; prolonged coma or refusal to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations available is given under Proprietary Infusion Fluids for Parenteral Feeding p. 980.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, fat, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of a 3-litre bag. A single dose of vitamin B₁₂, as hydroxocobalamin p. 938, is given by intramuscular injection; regular vitamin B₁₂ injections are not usually required unless total parenteral nutrition continues for many months. Folic acid p. 937 is given in a dose of 15 mg once or twice each week, usually in the

2 Excludes protein- or amino acid-derived energy
nutrition solution. Other vitamins are usually given daily; they are generally introduced in the parenteral nutrition solution. Alternatively, if the patient is able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition for periods of up to a month, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of feeds of low osmolality and neutral pH. Only nutritional fluids should be given by the dedicated intravenous line.

Before starting, the patient should be well oxygenated with a near normal circulating blood volume and attention should be given to renal function and acid–base status. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment.

Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and management of parenteral nutrition complications, specialist literature should be consulted.

Protein is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of nonessential ones to provide sufficient nitrogen together with electrolytes. Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose p. 955) and electrolytes.

Energy is provided in a ratio of 0.6 to 1.1 megajoules (150–250 kcal) per gram of protein nitrogen. Energy requirements must be met if amino acids are to be utilised for tissue maintenance. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

Glucose is the preferred source of carbohydrate, but if more than 180 g is given per day frequent monitoring of blood glucose is required, and insulin may be necessary. Glucose in various strengths from 10 to 50% must be infused through a central venous catheter to avoid thrombosis.

In parenteral nutrition regimens, it is necessary to provide adequate phosphate in order to allow phosphorylation of glucose and to prevent hypophosphataemia; between 20 and 30 mmol of phosphate is required daily.

Fructose and sorbitol have been used in an attempt to avoid the problem of hyperosmolar hyperglycaemic non-ketotic acidosis but other metabolic problems may occur, as with xylitol and ethanol which are now rarely used.

Fat emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolarity with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Daily checks are necessary to ensure complete clearance from the plasma in conditions where fat metabolism may be disturbed. Additives should not be mixed with fat emulsions unless compatibility is known.

Administration
Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases product literature and other specialist literature should be consulted.

## NUTRIENTS

### PARENTERAL NUTRITION

#### INDICATIONS AND DOSE

**Dipeptiven 20G/100ML Concentrate for Solution for Infusion Bottles**
Amino acid supplement for hypercatabolic or hypermetabolic states

- **By intravenous infusion**
- **Adult:** 300–400 mg/kg daily, dose not to exceed 20% of total amino acid intake

#### CAUTIONS

**Peditrace Solution for Infusion 10ML Vials** Reduced biliary excretion - reduced biliary excretion in cholestatic liver disease - reduced biliary excretion in markedly reduced urinary excretion (careful biochemical monitoring required) - total parenteral nutrition exceeding one month

**Cautions, Further Information**
- Total parenteral nutrition exceeding one month Measure serum manganese concentration and check liver function before commencing treatment and regularly during treatment—discontinue if manganese concentration raised or if cholestasis develops.

**Directions for Administration** Because of the complex requirements relating to parenteral nutrition, full details relating to administration have been omitted. In all cases specialist pharmacy advice, product literature, and other specialist literature should be consulted. Compatibility with the infusion solution must be ascertained before adding supplementary preparations. Additives should not be mixed with fat emulsions unless compatibility is known.

**Cernevit Solution for Infusion Vials and Diluent** Dissolve in 5 mL water for injections.

**Peditrace Solution for Infusion 10ML Vials** For addition to Vaminolact®, Vamin® 14 Electrolyte-Free solutions, and glucose intravenous infusions.

**Tracutil® Ampoules** For addition to infusion solutions.

**Decan Concentrate for Solution for Infusion 40ML Bottles** For addition to infusion solutions.

**Addiphos® Vials** For addition to Vamin® solutions and glucose intravenous infusions.

**Dipeptiven 20G/100ML Concentrate for Solution for Infusion Bottles** For addition to infusion solutions containing amino acids.

**Additrase Solution for Infusion 10ML Ampoules** For addition to Vamin® solutions and glucose intravenous infusions.

**Glycophos® Vials** For addition to Vamin® and Vaminolact® solutions, and glucose intravenous infusions.

**Solivito N Powder for Solution for Infusion Vials** Dissolve in water for injections or glucose intravenous infusion for adding to glucose intravenous infusion or Intralipid®; dissolve in Vitlipid N® or Intralipid® for adding to Intralipid® only.

**Vitlipid N Infant Emulsion for Injection 10ML Ampoules** For addition to Intralipid®

**Vitlipid N Adult Emulsion for Injection 10ML Ampoules** For addition to Intralipid®

#### PRESCRIBING AND DISPENSING INFORMATION

**Cernevit Solution for Infusion Vials and Diluent** Cernevit® solution contains dl-alpha tocopherol 11.2 units, ascorbic acid 125 mg, biotin 69 micrograms, colecacferol 220 units, cyanocobalamin 6 micrograms, folic acid 414 micrograms, glycine 250 mg, nicotinamide 46 mg, pantothenic acid (as dextaphenol) 17.25 mg, pyridoxine hydrochloride 5.5 mg, retinol (as palmitate)
3500 units, riboflavin (as dihydrated sodium phosphate) 4.14 mg, thiamine (as cocarboxylase tetrahydrate) 3.51 mg.

**PEDIATRIC SOLUTION FOR INFECTION 10ML VIALS** Peditrace® solution contains traces of Zn²⁺, Cu²⁺, Mn⁺⁺, Se⁴⁺, F⁻, I⁻.

**TRACUTIL® AMPOULES** Tracutil® solution contains trace elements Fe³⁺, Zn²⁺, Mn⁺⁺, Cu²⁺, Cr³⁺, Se⁴⁺, Mo⁶⁺, I⁻, F⁻.

**DECAN CONCENTRATE FOR SOLUTION FOR INFUSION 40ML BOTTLES** For patients over 40 kg, Decan® solution contains trace elements Fe³⁺, Zn²⁺, Cu²⁺, Cr³⁺, Se⁴⁺, Mo⁶⁺, Mo⁶⁺, I⁻, F⁻.

**ADDIPHOS® VIALS** Addiphos® sterile solution contains phosphate 40 mmol, K⁺ 30 mmol, Na⁺ 30 mmol/20 mL.

**Dipeptiven 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES** Dipeptiven® solution contains N(2)-L-alanyl-L-glutamine 200 mg/ml (providing L-alanine 82 mg, L-glutamine 134.6 mg).

**ADDITRACE FOR SOLUTION FOR INFUSION 10ML AMPOULES** For patients over 40 kg, Additrace® solution contains traces of Fe³⁺, Zn²⁺, Mn⁺⁺, Cu²⁺, Cr³⁺, Se⁴⁺, Mo⁶⁺, F⁻, I⁻.

**GLYCOPHOS® VIALS** Glycophos® Sterile Concentrate solution contains phosphate 20 mmol, Na⁺ 40 mmol/20 mL.

**Solivito N Powder for Solution for Infusion VIALS** Solivito N® powder for reconstitution contains biotin 60 micrograms, cyanocobalamin 5 micrograms, folic acid 400 micrograms, thiamine nitrate 3.1 micrograms, pyridoxine hydrochloride 4.9 micrograms, riboflavin sodium phosphate 4.9 micrograms, sodium ascorbate 113 micrograms, sodium pantothenate 16.5 micrograms, nicotinamide 40 micrograms, copper chloride 340 micrograms, zinc chloride 681.5 micrograms, sodium ascorbate 113 micrograms.

**SOLIVITO N POWDER FOR SOLUTION FOR INFUSION VIALS** Solivito N® powder for reconstitution contains biotin 60 micrograms, cyanocobalamin 5 micrograms, folic acid 400 micrograms, thiamine nitrate 3.1 micrograms, pyridoxine hydrochloride 4.9 micrograms, riboflavin sodium phosphate 4.9 micrograms, sodium pantothenate 16.5 micrograms, nicotinamide 40 micrograms, copper chloride 340 micrograms, zinc chloride 681.5 micrograms, sodium ascorbate 113 micrograms.

**VITLIPID N INFANT EMULSION FOR INJECTION 10ML AMPOULES** Vitlipur N® infant emulsion contains vitamin A 230 units, ergocalciferol 40 units, dl-alpha tocopherol 0.7 unit, phytomenadione 20 micrograms/mL.

**VITLIPID N ADULT EMULSION FOR INJECTION 10ML AMPOULES** Vitlipur N® adult emulsion contains vitamin A 330 units, ergocalciferol 20 units, dl-alpha tocopherol 1 unit, phytomenadione 15 micrograms/mL. For adults and children over 11 years.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

**Solution for injection**

- **Cernevit** (Baxter Healthcare Ltd)
  Cyanocobalamin 6 micrograms, Biotin 69 micrograms, Folic acid 414 micrograms, Thiamine 3.51 mg, Riboflavin (as Riboflavin sodium phosphate) 4.14 mg, Pyridoxine (as Pyridoxine hydrochloride) 4.53 mg, Panthenol 16.5 mg, Manganese 1 microgram, Iodine 96 micrograms, Vitamin D₃ 204.6 micrograms, Folic acid 400 micrograms, Thiamine nitrate 3.1 micrograms, Pyridoxine hydrochloride 4.9 micrograms, Riboflavin sodium phosphate 4.9 micrograms, Sodium pantothenate 16.5 micrograms, Nicotinamide 40 micrograms, Copper chloride 340 micrograms, Zinc chloride 681.5 micrograms, Sodium ascorbate 113 micrograms, Ergocalciferol 1 microgram per 1 ml, Retinol palmitate 99 microgram per 1 ml, Alpha tocopherol 910 microgram per 1 ml, Retinol palmitate 99 microgram per 1 ml, Ergocalciferol 1 microgram per 1 ml, Retinol palmitate 99 microgram per 1 ml, Alpha tocopherol 910 microgram per 1 ml, Ergocalciferol 1 microgram per 1 ml, Retinol palmitate 99 microgram per 1 ml, Alpha tocopherol 910 microgram per 1 ml, Ergocalciferol 1 microgram per 1 ml.

**Solution for infusion**

- **Parenteral nutrition supplements (Non-proprietary)**
  Sodium glycerophosphate 216 mg per 1 ml, Sodium glycerophosphate 4.32g/20ml concentrate for solution for infusion 1 vial (Pom) £5.07 | 10 vials (Pom) no price available

- **Additrace** (Fresenius Kabi Ltd)
  Sodium molybdate 4.85 microgram per 1 ml, Chromic chloride 5.33 microgram per 1 ml, Sodium chelate 10.5 microgram per 1 ml, Potassium iodide 16.6 microgram per 1 ml, Manganese chloride 99 microgram per 1 ml, Sodium fluoride 210 microgram per 1 ml, Copper chloride 340 microgram per 1 ml, Ferric chloride 544 microgram per 1 ml, Zinc chloride 1.36 mg per 1 ml, Additrace solution for infusion 10ml ampoules | 1 ampoule (Pom) £1.96 | 20 ampoules (Pom) no price available

- **Dipeptiven** (Fresenius Kabi Ltd)

Dipeptiven 10g/50ml concentrate for solution for infusion bottles | 1 bottle (Pom) £13.94 | 10 bottle (Pom) no price available

- **Peditrace** (Fresenius Kabi Ltd)
  Manganese (as Manganese chloride) 1 microgram per 1 ml, Iodine (as Potassium iodide) 1 microgram per 1 ml, Selenium (as Sodium selenite) 2 microgram per 1 ml, Copper (as Copper chloride) 20 microgram per 1 ml, Fluoride (as Sodium fluoride) 57 microgram per 1 ml, Zinc (as Zinc chloride) 250 microgram per 1 ml, Peditrace solution for infusion 10ml vials | 1 vial (Pom) £3.55 | 10 vials (Pom) no price available

- **Tracutil** (B.Braun Melsungen AG)
  Sodium molybdate dihydrate 2.42 microgram per 1 ml, Chronic chloride 5.3 microgram per 1 ml, Sodium selenite pentahydrate 7.89 microgram per 1 ml, Potassium iodide 16.6 microgram per 1 ml, Sodium fluoride 126 microgram per 1 ml, Manganese chloride 1979 microgram per 1 ml, Copper chloride 204.6 microgram per 1 ml, Zinc chloride 681.5 microgram per 1 ml, Feroxos chloride 695.8 microgram per 1 ml, Tracutil concentrate for solution for infusion 10ml ampoules | 5 ampoules (Pom) £7.96

**Powder for solution for infusion**

- **Solivito N** (Fresenius Kabi Ltd)
  Cyanocobalamin 5 micrograms, Biotin 60 micrograms, Folic acid 400 micrograms, Thiamine nitrate 3.1 micrograms, Pyridoxine hydrochloride 4.9 micrograms, Riboflavin sodium phosphate 4.9 micrograms, Sodium pantothenate 16.5 micrograms, Nicotinamide 40 micrograms, Copper chloride 340 micrograms, Zinc chloride 681.5 micrograms, Sodium ascorbate 113 micrograms.

**Emulsion for injection**

- **Vitlipur N Adult** (Fresenius Kabi Ltd)
  Ergocalciferol 500 nanogram per 1 ml, Phytomenadione 15 microgram per 1 ml, Retinol palmitate 99 microgram per 1 ml, Alpha tocopherol 910 microgram per 1 ml

- **Vitlipur N Infant** (Fresenius Kabi Ltd)
  Ergocalciferol 1 microgram per 1 ml, Phytomenadione 20 microgram per 1 ml, Retinol palmitate 69 microgram per 1 ml, Alpha tocopherol 640 microgram per 1 ml

**5 Nutrition (oral)**

**Enteral nutrition**

**Overview**

The body’s reserves of protein rapidly become exhausted in severely ill patients, especially during chronic illness or in those with severe burns, extensive trauma, pancreatitis, or intestinal fistula. Much can be achieved by frequent meals and by persuading the patient to take supplementary snacks of ordinary food between the meals.

However, extra calories, protein, other nutrients, and vitamins are often best given by supplementing ordinary meals with enteral sip or tube feeds.

When patients cannot feed normally, for example, patients with severe facial injury, oesophageal obstruction, or coma, a nutritionally complete diet of enteral feeds must be given. The advice of a dietitian should be sought to determine the protein and total energy requirement of the patient and the form and relative contribution of carbohydrate and fat to the energy requirements.

Most enteral feeds contain protein derived from cows’ milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for patients who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored. Haematological and biochemical parameters should also be monitored, particularly in clinically unstable patients. Extra minerals (e.g. magnesium and zinc) may be needed in

**BNF 74**

**Nutrition (oral) 985**
patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed.

**Enteral nutrition in children**

Children have special requirements and in most situations liquid feeds prepared for adults are totally unsuitable—the advice of a paediatric dietitian should be sought.

### 5.1 Special diets

#### Nutrition in special diets

**Overview**

These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for patients who either cannot tolerate or cannot metabolise certain common constituents of food. In certain clinical conditions, some food preparations are regarded as drugs and can be prescribed within the NHS if they have been approved by the Advisory Committee on Borderline Substances (ACBS).

**Coeliac disease**

Coeliac disease is caused by an abnormal immune response to gluten. For management and further information, see Coeliac disease p. 35.

**Phenylketonuria**

Phenylketonuria (hyperphenylalaninaemia, PKU), which results from the inability to metabolise phenylalanine, is managed by restricting dietary intake of phenylalanine to a small amount sufficient for tissue building and repair.

Sapropterin dihydrochloride below, a synthetic form of tetrahydrobiopterin, is licensed as an adjunct to dietary restriction of phenylalanine in the management of patients with phenylketonuria and tetrahydrobiopterin deficiency.

Aspartame (used as a sweetener in some foods and medicines) contributes to the phenylalanine intake and may affect control of phenylketonuria. Where the presence of aspartame is specified in the product literature this is indicated in the BNF against the preparation; the patient should be informed of this.

### 5.1a Phenylketonuria

**DRUGS FOR METABOLIC DISORDERS > TETRAHYDROBIOPTERIN AND DERIVATIVES**

#### Sapropterin dihydrochloride

- **INDICATIONS AND DOSE**
  - **Phenylketonuria (adjunct to dietary restriction of phenylalanine) (specialist use only)**
    - **BY MOUTH**
    - **Adult:** Initially 10 mg/kg once daily, adjusted according to response; usual dose 5–20 mg/kg once daily, dose to be taken preferably in the morning
  - **Tetrahydrobiopterin deficiency (adjunct to dietary restriction of phenylalanine) (specialist use only)**
    - **BY MOUTH**
    - **Adult:** Initially 2–5 mg/kg once daily, adjusted according to response, dose to be taken preferably in the morning, the total daily dose may alternatively be given in 2–3 divided doses; maximum 20 mg/kg per day

- **CAUTIONS** History of convulsions
- **INTERACTIONS** → Appendix 1: sapropterin

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · cough · diarrhoea · headache · nasal congestion · pharyngolaryngeal pain · vomiting
  - **Frequency not known** Hypersensitivity reactions
- **PREGNANCY** Manufacturer advises caution—consider only if strict dietary management inadequate.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS**
  - Monitor blood-phenylalanine concentration before and after first week of treatment—if unsatisfactory response increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month.
  - Monitor blood-phenylalanine and tyrosine concentrations 1–2 weeks after dose adjustment and during treatment.

#### DIRECTIONS FOR ADMINISTRATION

Tablets should be dissolved in water and taken within 20 minutes.

#### PRESCRIBING AND DISPENSING INFORMATION

Sapropterin dihydrochloride is a synthetic form of tetrahydrobiopterin.

**PATIENT AND CARER ADVICE**

Patient or carers should be given advice on how to administer sapropterin dihydrochloride dispersible tablets.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Soluble tablet**
    - **CAUTIONARY AND ADVISORY LABELS** 13, 21
    - **Kuvan (BioMarin Europe Ltd)**
    - Sapropterin dihydrochloride 100 mg Kuvan 100mg soluble tablets sugar-free | 30 tablet | £597.22

### 6 Vitamin deficiency

#### Vitamins

**Overview**

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements.

Their use as general ‘pick-me-ups’ is of unproven value and, in the case of preparations containing vitamin A or D, may actually be harmful if patients take more than the prescribed dose. The ‘fad’ for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid p. 991 and pyridoxine hydrochloride p. 988, is unscientific and can be harmful.

Dietary reference values for vitamins are available in the Department of Health publication:

**Dental patients**

It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment.

Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if
this is suspected the patient should be referred to a medical practitioner.

**Vitamin A**
Deficiency of vitamin A (retinol) p. 988 is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption).

**Vitamin B group**
Deficiency of the B vitamins, other than vitamin B<sub>12</sub>, is rare in the UK and is usually treated by preparations containing thiamine (B<sub>1</sub>) p. 989, riboflavin (B<sub>2</sub>), and nicotinamide p. 1168, which is used in preference to nicotinic acid p. 194, as it does not cause vasodilatation. Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol nicotinate p. 227, and pantothenic acid or panthenol may be included in vitamin B preparations but there is no evidence of their value.

The severe deficiency states Wernicke’s encephalopathy and Korsakoff’s psychosis, especially as seen in chronic alcoholism, are best treated initially by the parenteral administration of B vitamins (Pabrinex®), followed by oral administration of thiamine in the longer term. Anaphylaxis has been reported with parenteral B vitamins.

As with other vitamins of the B group, pyridoxine hydrochloride (B<sub>6</sub>) deficiency is rare, but it may occur during isoniazid p. 554 therapy or penicillamine p. 1002 treatment in Wilson’s disease and is characterised by peripheral neuritis. High doses of pyridoxine hydrochloride are given in some metabolic disorders, such as hyperoxaluria, and it is also used in sideroblastic anaemia. There is evidence to suggest that pyridoxine hydrochloride may provide some benefit in premenstrual syndrome. It has been tried for a wide variety of other disorders, but there is little sound evidence to support the claims of efficacy.

Nicotinic acid inhibits the synthesis of cholesterol and triglyceride. Folic acid p. 937 and vitamin B<sub>12</sub> are used in the treatment of megaloblastic anaemia. Polynic acid p. 869 (available as calcium folinate) is used in association with cytotoxic therapy.

**Vitamin C**
Vitamin C (ascorbic acid) therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency are commonly found, especially in the elderly.

Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a patient with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proven.

**Vitamin D**
The term Vitamin D is used for a range of compounds which possess the activity of preventing or curing rickets. They include ergocalciferol (calciferol, vitamin D<sub>2</sub>) p. 994, colecalciferol (vitamin D<sub>3</sub>) p. 992, dihydrotachysterol p. 994, alfalcacidol (1α-hydroxycholecalciferol) p. 991, and calcitriol (1,25-dihydroxycholecalciferol) p. 992.

Simple vitamin D deficiency can be prevented by taking an oral supplement of ergocalciferol (calciferol, vitamin D<sub>2</sub>) or colecalciferol (vitamin D<sub>3</sub>) daily. Vitamin D deficiency can occur in people whose exposure to sunlight is limited and in those whose diet is deficient in vitamin D. In these individuals, ergocalciferol or colecalciferol daily by mouth may be given to treat vitamin D deficiency; higher doses may be necessary for severe deficiency. Patients who do not respond should be referred to a specialist.

Preparations containing colecalciferol with calcium carbonate p. 993 are available for the management of combined calcium and vitamin D deficiency, or for those at high risk of deficiency.

Vitamin D deficiency caused by intestinal malabsorption or chronic liver disease usually requires vitamin D in pharmacological doses.

Vitamin D requires hydroxylation by the kidney to its active form, therefore the hydroxylated derivatives alfalcacidol or calcitriol should be prescribed if patients with severe renal impairment require vitamin D therapy. Calcitriol is also licensed for the management of postmenopausal osteoporosis.

Paricalcitol p. 995, a synthetic vitamin D analogue, is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure.

**Vitamin E**
The daily requirement of vitamin E (tocopherol) has not been well defined but is probably 3 to 15 mg daily. There is little evidence that oral supplements of vitamin E are essential in adults, even where there is fat malabsorption secondary to cholestasis. In young children with congenital cholestasis, abnormally low vitamin E concentrations may be found in association with neuromuscular abnormalities, which usually respond only to the parenteral administration of vitamin E.

Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

**Vitamin K**
Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, patients with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. Menadiol sodium phosphate p. 996 is a water-soluble synthetic vitamin K derivative that can be given orally to prevent vitamin K deficiency in malabsorption syndromes.

Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects can be antagonised by giving vitamin K.

**Other compounds**
Potassium aminobenzoate p. 988 has been used in the treatment of various disorders associated with excessive fibrosis such as sclerodema and Peyronie’s disease. In Peyronie’s disease there is some evidence to support efficacy in reducing progression when given early in the disease; however, there is no evidence for reversal of the condition. The therapeutic value of potassium aminobenzoate in sclerodema is doubtful.

**VITAMINS AND TRACE ELEMENTS**

**MULTIVITAMINS**

**Vitamins A and D**

**INDICATIONS AND DOSE**

**Prevention of vitamin A and D deficiency**

- **By mouth**
  - Child: 1 capsule daily, 1 capsule contains 4000 units vitamin A and 400 units (10 micrograms) vitamin D
  - Adult: (consult product literature)

**UNLICENSED USE** Not licensed in children under 6 months of age.

**SIDE-EFFECTS**

**Overdose**

Excessive ingestion Prolonged excessive ingestion of vitamins A and D can lead to hypervitaminosis.
Blood and nutrition

VITAMINS AND TRACE ELEMENTS

988 Vitamin deficiency

● INDICATIONS AND DOSE
Prevention of vitamin deficiency

» BY MOUTH

> Child 1 month-4 years: 5 drops daily, 5 drops contain vitamin A approx. 700 units, vitamin D approx. 300 units (7.5 micrograms), ascorbic acid approx. 20 mg

VITAMINS AND TRACE ELEMENTS

Potassium aminobenzoate

● INDICATIONS AND DOSE
Peyronie’s disease | Scleroderma

» BY MOUTH

> Adult: 12 g daily in divided doses, to be taken after food

VITAMINS AND TRACK ELEMENTS

Vitamin A

● INDICATIONS AND DOSE
Vitamin A deficiency

» BY MOUTH

> Child 1-11 months: 5000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency
> Child 1-17 years: 10 000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency

Pyridoxine hydrochloride

(Vitamin B₆)

● INDICATIONS AND DOSE
Deficiency states

» BY MOUTH

> Adult: 20–50 mg 1–3 times a day
> Isoniazid-induced neuropathy (prophylaxis)

» BY MOUTH

> Adult: 10–20 mg daily
> Isoniazid-induced neuropathy (treatment)

> Adult: 50 mg 3 times a day

● PRESCRIBING AND DISPENSING INFORMATION
This drug contains vitamin D; consult individual vitamin D monographs.

● MEDICINAL FORMS

Vitamins A and D (Non-proprietary)

Vitamin D 400 unit, Vitamin A 4000 unit

Capsule

Downloaded from www.medicalbr.com
Idiopathic sideroblastic anaemia
▶ BY MOUTH
▶ Adult: 100–400 mg daily in divided doses

Prevention of penicillamine-induced neuropathy in Wilson’s disease
▶ BY MOUTH
▶ Adult: 20 mg daily

Premenstrual syndrome
▶ BY MOUTH
▶ Adult: 50–100 mg daily

IMPORTANT SAFETY INFORMATION
Prolonged use of pyridoxine in a dose of 10 mg daily is considered safe but the long-term use of pyridoxine in a dose of 200 mg or more daily has been associated with neuropathy. The safety of long-term pyridoxine supplementation with doses above 10 mg daily has not been established.

SIDE-EFFECTS Sensory neuropathy (with high doses when given for extended periods)
Overdose
Overdosage induces toxic effects.

  • Adult: 1 capsule daily, one hour after a meal
KETOVITE® LIQUID
Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism | Adjunct in restricted, specialised, or synthetic diets
• BY MOUTH
  • Adult: 5 mL daily, use with Ketovite® Tablets for complete vitamin supplementation.
KETOVITE® TABLETS
Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism | Adjunct in restricted, specialised, or synthetic diets
• BY MOUTH
  • Adult: 1 tablet 3 times a day, use with Ketovite® Liquid for complete vitamin supplementation.

INTEGRATIVE AND DISPENSING INFORMATION
To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements.

PATIENT AND CARER ADVICE
KETOVITE® LIQUID Ketovite® liquid may be mixed with milk, cereal, or fruit juice.
KETOVITE® TABLETS Tablets may be crushed immediately before use.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Oral emulsion
• Vitamins with minerals and trace elements (Non-proprietary)
  Cyanocobalamin 2.5 microgram per 1 ml, Choline chloride 30 mg per 1 ml, Ergocalciferol 80 unit per 1 ml, Vitamin A 500 unit per 1 ml
  Ketovite liquid sugar-free | 150 ml [P] £19.10

Tablet
• Ketovite (Essential Pharmaceuticals Ltd)
  Cyanocobalamin 3 microgram, Selenium 50 microgram, Biotin 100 microgram, Iodine 140 microgram, Chromium 200 microgram, Molybdenum 250 microgram, Folic acid 400 microgram, Thiamine 1.2 mg, Riboflavin 1.6 mg, Copper 2 mg, Pyridoxine 2 mg, Manganese 3 mg, Pantothenic acid 4 mg, Potassium 4 mg, Tocopherol acetate 10 mg, Iron 12 mg,
VITAMINS AND TRACE ELEMENTS

Ascorbic acid
(Vitamin C)

• INDICATIONS AND DOSE
  Prevention of scurvy
    ▶ BY MOUTH
    ▶ Adult: 25–75 mg daily
  Treatment of scurvy
    ▶ BY MOUTH
    ▶ Adult: Not less than 250 mg daily in divided doses

• INTERACTIONS → Appendix 1: ascorbic acid

• PRESCRIBING AND DISPENSING INFORMATION
  It is rarely necessary to prescribe more than 100 mg daily except early in the treatment of scurvy.

• MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for infusion

  Tablet
  EXCIPIENTS: May contain Aspartame
    ▶ Ascorbic acid (Non-proprietary)
    Ascorbic acid 50 mg Ascorbic acid 50mg tablets | 28 tablet GSE
    Ascorbic acid 100 mg Ascorbic acid 100mg tablets | 28 tablet GSE
    Ascorbic acid 200 mg Ascorbic acid 200mg tablets | 28 tablet no price available DT price = £13.86 | 28 tablet GSE £19.86 DT price = £19.86 | 100 tablet GSE no price available
    Ascorbic acid 250 mg Ascorbic acid 250mg tablets | 1000 tablet DRT no price available
    Ascorbic acid 500 mg Ascorbic acid 500mg tablets | 28 tablet GSE £26.87 DT price = £26.87 | 100 tablet GSE no price available

  Chewable tablet
  CAUTIONARY AND ADVISORY LABELS 24
  EXCIPIENTS: May contain Aspartame
    ▶ Ascorbic acid (Non-proprietary)
    Ascorbic acid 60 mg Vitamin C 60mg chewable tablets | 60 tablet no price available | 180 tablet no price available
    Ascorbic acid 500 mg Numark Vitamin C 500mg chewable tablets | 25 tablet £0.90 | 60 tablet £3.90 | 100 tablet £5.58
    Ascorbic acid 1 gram Vitamin C 1000mg chewable tablets | 30 tablet £2.35 | 60 tablet £4.29

  ➤ Ascur (Ennogen Healthcare Ltd)
    Ascorbic acid 100 mg Ascur 100mg chewable tablets | 30 tablet £3.95
    Ascorbic acid (as Sodium ascorbate) 500 mg Ascur 500mg chewable tablets sugar-free | 30 tablet £2.99

  Capsule
    ▶ Ascorbic acid (Non-proprietary)
    Ascorbic acid 500 mg Vitamin C 500mg capsules | 100 capsule no price available
    Ascorbic acid 1 gram Vitamin C 1000mg capsules | 100 capsule no price available | 250 capsule no price available

  Combinations available: Vitamin B substances with ascorbic acid, p. 990. Vitamins A, C and D, p. 988

VITAMINS AND TRACE ELEMENTS → VITAMIN D AND ANALOGUES

Vitamin D and analogues (systemic)

• CONTRA-INDICATIONS
  Hypercalcaemia - metastatic calcification

• SIDE-EFFECTS
  Overdose Symptoms of overdosage include anorexia, lasitude, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine.
  Pregnancy High doses teratogenic in animals but therapeutic doses unlikely to be harmful.
  Breastfeeding Caution with high doses; may cause hypercalcaemia in infant – monitor serum-calcium concentration.

• MONITORING REQUIREMENTS
  Important: All patients receiving pharmacological doses of vitamin D should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occur.

Alfacalcidol
(1α-Hydroxycholecalciferol)

• INDICATIONS AND DOSE
  Patients with severe renal impairment requiring vitamin D therapy
    ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION
    ▶ Adult: Initially 1 microgram daily, dose to be adjusted to avoid hypercalcaemia; maintenance 0.25–1 microgram daily
    ▶ Elderly: Initially 500 nanograms daily, dose adjusted to avoid hypercalcaemia; maintenance 0.25–1 microgram daily

  Hypophosphataemic rickets | Persistent hypocalcaemia due to hypoparathyroidism or pseudohypoparathyroidism
    ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION
    ▶ Child 1–17 years: 1 microgram once daily, dose to be adjusted as necessary

  Prevention of vitamin D deficiency in renal or cholestatic liver disease
    ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION
    ▶ Child 1 month–11 years: 25–50 nanograms/kg once daily, dose to be adjusted as necessary, maximum 1 microgram per day
    ▶ Child 12–17 years: 1 microgram once daily, dose to be adjusted as necessary

• DOSE EQUIVALENCE AND CONVERSION
  One drop of alfacalcidol 2 microgram/mL oral drops contains approximately 100 nanograms alfacalcidol.

• CAUTIONS
  Nephrolithiasis - take care to ensure correct dose in infants
  INTERACTIONS → Appendix 1: vitamin D substances
  SIDE-EFFECTS
  Rare Nephrocalcinosis - pruritus - rash - urticaria
RENAL IMPAIRMENT Monitor plasma-calcium concentration in renal impairment.

MONITORING REQUIREMENTS Monitor plasma-calcium concentration in patients receiving high doses.

DIRECTIONS FOR ADMINISTRATION For injection, shake ampoule for at least 5 seconds before use, and give over 30 seconds.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

Calcitriol (Non-proprietary)
Calcitriol 250 nanogram Calcitriol 250nanogram capsules | 30 capsule (Posm) £18.04 | 100 capsule (Posm) no price available DT price = £18.04
Calcitriol 500 nanogram Calcitriol 500nanogram capsules | 30 capsule (Posm) £32.25 | 100 capsule (Posm) no price available DT price = £32.25

Rocaltrol (Roche Products Ltd)
Calcitriol 250 nanogram Rocaltrol 250nanogram capsules | 100 capsule (Posm) £18.04 DT price = £18.04
Calcitriol 500 nanogram Rocaltrol 500nanogram capsules | 100 capsule (Posm) £32.25 DT price = £32.25

Colecalciferol (Cholecalciferol; Vitamin D₃)

INDICATIONS AND DOSE

Prevention of vitamin D deficiency
 BY MOUTH
 Adult: 400 units daily

Treatment of vitamin D deficiency
 BY MOUTH
 Adult: 800 units daily, higher doses may be necessary for severe deficiency

INTERACTIONS → Appendix 1: vitamin D substances

RENAL IMPAIRMENT Monitor plasma-calcium concentration in renal impairment.

MONITORING REQUIREMENTS Monitor plasma-calcium concentration in patients receiving high doses.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, oral drops

Tablet

Colecalciferol (Non-proprietary)
Colecalciferol 400 unit Colecalciferol 400unit tablets | 30 tablet no price available | 60 tablet £15.50
Colecalciferol 800 unit Colecalciferol 800unit tablets | 30 tablet (Posm) £3.60–£4.32 DT price = £3.60

Colecalciferol 5000 unit Vitamin D3 5,000unit tablets | 100 tablet £3.90
Colecalciferol 10000 unit Colecalciferol 10,000unit tablets | 30 tablet £36.00
Colecalciferol 20000 unit Colecalciferol 20,000unit tablets | 20 tablet £36.00 | 30 tablet no price available
Colecalciferol 50000 unit Vitamin D3 50,000unit tablets | 30 tablet £16.74

Desunin (Meda Pharmaceuticals Ltd)
Colecalciferol 500 unit Desunin 500unit tablets | 30 tablet (Posm) £3.60 DT price = £3.60 | 90 tablet (Posm) £10.17
Colecalciferol 4000 unit Desunin 4,000unit tablets | 70 tablet (Posm) £15.90 DT price = £15.90

Stexerol-D3 (Kyowa Kirin Ltd)
Colecalciferol 1000 unit Stexerol-D3 1,000unit tablets | 28 tablet (Posm) £2.95 DT price = £2.95
Colecalciferol 25000 unit Stexerol-D3 25,000unit tablets | 12 tablet (Posm) £17.00 DT price = £17.00

Calcitriol (1,25-Dihydroxycholecalciferol)

INDICATIONS AND DOSE

Renal osteodystrophy
 BY MOUTH
 Adult: Initially 250 nanograms daily, adjusted in steps of 250 nanograms every 2–4 weeks if required; usual dose 0.5–1 microgram daily

Renal osteodystrophy (in patients with normal or only slightly reduced plasma-calcium concentration)
 BY MOUTH
 Adult: Initially 250 nanograms once daily on alternate days, adjusted in steps of 250 nanograms every 2–4 weeks if required; usual dose 0.5–1 microgram daily

Established postmenopausal osteoporosis
 BY MOUTH
 Adult: 250 nanograms twice daily, plasma-calcium concentration and creatinine to be monitored (consult product literature)

INTERACTIONS → Appendix 1: vitamin D substances

HEPATIC IMPAIRMENT Manufacturer advises avoid—no information available.

RENAL IMPAIRMENT Manufacturer advises avoid—no information available. Monitor plasma-calcium concentration in renal impairment.

MONITORING REQUIREMENTS
Monitor plasma calcium, phosphate, and creatinine during dosage titration.
Monitor plasma-calcium concentration in patients receiving high doses.
Oral drops

- **Colecalciferol (Non-proprietary)**
  - Colecalciferol 200 unit per 1 drop: Vitamin D 200 units/drop for infants and children oral drops sugar-free | 50 ml £3.86

### Colecalciferol with calcium carbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, colecalciferol p. 992, calcium carbonate p. 958.

- **INDICATIONS AND DOSE**
  - Prevention and treatment of vitamin D and calcium deficiency
    - **BY MOUTH**
    - **Adult:** Dosed according to the deficit or daily maintenance requirements (consult product literature)

- **INTERACTIONS**
  - Appendix 1: calcium salts, vitamin D substances

- **PRESCRIBING AND DISPENSING INFORMATION**
  - **Accrete D³** contains calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units); **Adcal-D³** tablets contain calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units); **Calcium D³** contains calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 11 micrograms (440 units)/sachet; **Calcexos** contains calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units); **Calcichew-D³** tablets contain calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 5 micrograms (200 units); **Calcichew-D³ Forte** tablets contain calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units); **Calcichew-D³** 500 mg 400 unit caplets contain calcium carbonate (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units); **Calcichew-D³** contains calcium carbonate (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (800 units); **Natecal D³** contains calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units); consult product literature for details of other available products.

  Flavours of chewable and soluble forms may include orange, lemon, aniseed, peppermint, molasses, or tutti-frutti.

### Ergocalciferol with calcium lactate and calcium phosphate

*(Calcium and vitamin D)*

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergocalciferol p. 994, calcium lactate p. 959.

**INDICATIONS AND DOSE**

- Prevention of calcium and vitamin D deficiency
- Treatment of calcium and vitamin D deficiency
  - BY MOUTH
  - Adult: (consult product literature)

**INTERACTIONS**  ➔ Appendix 1: calcium salts, vitamin D substances

**DIRECTIONS FOR ADMINISTRATION**  Tablets may be crushed before administration, or may be chewed.

**PRESCRIBING AND DISPENSING INFORMATION**  Each tablet contains calcium lactate 300 mg, calcium phosphate 150 mg (calcium 97 mg or Ca²⁺ 2.4 mmol), ergocalciferol 10 micrograms (400 units).

**PATIENT AND CARER ADVICE**  Patient or carers should be given advice on how to administer calcium and ergocalciferol tablets.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Ergocalciferol with calcium lactate and calcium phosphate (Non-proprietary)
  - Ergocalciferol 10 microgram, Calcium phosphate 150 mg, Calcium lactate 300 mg: Calcium and Ergocalciferol tablets | 28 tablet (£18.50 DT price = £18.26 | 28 tablet no price available DT price = £18.26 | 500 tablet DT no price available

---

**Paricalcitol**

**INDICATIONS AND DOSE**

For prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure

- BY MOUTH
- Adult: (consult product literature)

For prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure in patients on haemodialysis

- Adult: To be administered via haemodialysis access (consult product literature)

**INTERACTIONS**  ➔ Appendix 1: vitamin D substances

**SIDE-EFFECTS**  Acne · breast tenderness · dyspepsia · pruritus · rash · taste disturbance

**PREGNANCY**  Toxicity in animal studies—manufacturer advises avoid unless potential benefit outweighs risk.

**BREAST FEEDING**  Manufacturer advises caution—no information available.

**MONITORING REQUIREMENTS**

- Monitor plasma calcium and phosphate during dose titration and at least monthly when stabilised.
- Monitor parathyroid hormone concentration.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for Injection**

EXCIPIENTS: May contain Propylene glycol
- Zemplar (AbbVie Ltd)
  - Paricalcitol 5 microgram per 1 ml: Zemplar 5 microgram capsules/1ml solution for injection ampoules | 5 ampoule | £62.00 (Hospital only)

VITAMINS AND TRACE ELEMENTS Vitamin K

Menadiol sodium phosphate

INDICATIONS AND DOSE Prevention of Vitamin K deficiency in malabsorption syndromes

BY MOUTH

Adult: 10–40 mg daily, dose to be adjusted as necessary

CAUTIONS G6PD deficiency (risk of haemolysis) · vitamin E deficiency (risk of haemolysis)

PREGNANCY Avoid in late pregnancy and labour unless benefit outweighs risk of neonatal haemolytic anaemia, hyperbilirubinaemia, and kernicterus in neonate.
**Phytomenadione**

*(Vitamin K₁)*

**INDICATIONS AND DOSE**

- **Major bleeding in patients on warfarin (in combination with dried prothrombin complex or fresh frozen plasma)**
  - **By Slow Intravenous Injection**
  - Adult: 5 mg for 1 dose, stop warfarin treatment
  - INR > 8.0 with minor bleeding in patients on warfarin
    - **By Slow Intravenous Injection**
    - Adult: 1–3 mg, stop warfarin treatment, dose may be repeated if INR still too high after 24 hours, restart warfarin treatment when INR < 5
  - INR > 8.0 with no bleeding in patients on warfarin
    - **By Mouth**
    - Adult: 1–5 mg, intravenous preparation to be used orally, stop warfarin treatment, repeat dose if INR still too high after 24 hours, restart warfarin treatment when INR < 5
  - INR 5.0–8.0 with minor bleeding in patients on warfarin
    - **By Slow Intravenous Injection**
    - Adult: 1–3 mg, stop warfarin treatment, restart warfarin treatment when INR < 5
  - Reversal of anticoagulation prior to elective surgery (after warfarin stopped)
    - **By Mouth**
    - Adult: 1–5 mg, intravenous preparation to be used orally, dose to be given the day before surgery if INR ≥ 1.5
  - Reversal of anticoagulation prior to emergency surgery (when surgery can be delayed 6–12 hours)
    - **By Intravenous Injection**
    - Adult: 5 mg as a single dose, if surgery cannot be delayed, dried prothrombin complex can be given in addition to phytomenadione and the INR checked before surgery

**UNLICENSED USE** Oral use of intravenous preparations is unlicensed.

**CAUTIONS** Intravenous injections should be given very slowly—risk of vascular collapse

KONAKION® MM Reduce dose in elderly

**SIDE-EFFECTS**

KONAKION® MM Anaphylactoid reactions

**PREGNANCY** Use if potential benefit outweighs risk.

**BREAST FEEDING** Present in milk.

**HEPATIC IMPAIRMENT**

KONAKION® MM Caution—glycocholic acid may displace bilirubin.

**DIRECTIONS FOR ADMINISTRATION**

KONAKION® MM Paediatric Konakion® MM Paediatric may be administered by mouth or by intramuscular injection or by intravenous injection. For intravenous injection, may be diluted with Glucose 5%; may be injected into lower part of infusion apparatus.

**MEDICINAL FORMS**

- Konakion MM (Roche Products Ltd)
- Phytomenadione 10 mg per 1 ml Konakion MM Paediatric 2 mg/0.2 ml solution for injection ampoules 5 ampoule (Paediatric) £4.71
- Konakion MM 10 mg/1 ml solution for injection ampoules 10 ampoule (Paediatric) £3.78 DT price = £3.78

---

**6.1 Neural tube defects (prevention in pregnancy)**

**Neural tube defects (prevention in pregnancy)**

**Prevention in pregnancy**

Folic acid supplements p. 937 taken before and during pregnancy can reduce the occurrence of neural tube defects. The risk of a neural tube defect occurring in a child should be assessed and folic acid given as follows:

- Women at a low risk of conceiving a child with a neural tube defect should be advised to take folic acid as a medicinal or food supplement daily (at low-risk group dose) before conception and until week 12 of pregnancy. Women who have not been taking folic acid and who suspect they are pregnant should start at once and continue until week 12 of pregnancy.
- Couples are at a high risk of conceiving a child with a neural tube defect if either partner has a neural tube defect (or either partner has a family history of neural tube defects), if they have had a previous pregnancy affected by a neural tube defect, or if the woman has coeliac disease (or other malabsorption state), diabetes mellitus, sickle-cell anaemia, or is taking antiepileptic medicines.
- Women in the high-risk group who wish to become pregnant (or who are at risk of becoming pregnant) should be advised to take folic acid daily (at high-risk group dose) and continue until week 12 of pregnancy (women with sickle-cell disease should continue taking their normal dose of folic acid (or to increase the dose to high-risk group daily dose) and continue this throughout pregnancy).

There is no justification for prescribing multiple-ingredient vitamin preparations containing vitamin B₁₂ or folic acid.

1 Arthritis

Arthritis

Rheumatoid arthritis and other inflammatory disorders

A non-steroidal anti-inflammatory drug (NSAID) is indicated for pain and stiffness resulting from inflammatory rheumatic disease; analgesics such as paracetamol p. 422 or codeine phosphate p. 431 can also be used.

Drugs are also used to influence the rheumatic disease process itself. For *rheumatoid arthritis* these disease-modifying antirheumatic drugs (DMARDs) include methotrexate p. 844, cytokine modulators, azathioprine p. 787, ciclosporin p. 788, cyclophosphamide p. 830, leflunomide p. 1002, penicillamine p. 1002, gold, antimalarials (chloroquine p. 582 and hydroxychloroquine sulfate p. 1001), and sulfasalazine p. 42. Corticosteroids also have a significant role in the management of *rheumatoid arthritis*.

Drugs which may affect the disease process in *psoriatic arthritis* include sulfasalazine, gold, azathioprine, methotrexate, leflunomide, and cytokine modulators.

Osteoarthritis and soft-tissue disorders

For pain relief in osteoarthritis and soft-tissue disorders, paracetamol should be used first and may need to be taken regularly. A topical NSAID or topical capsaicin 0.025% p. 458 should also be considered, particularly in knee or hand osteoarthritis. An oral NSAID can be substituted for, or used in addition to, paracetamol. If further pain relief is required in osteoarthritis, then the addition of an opioid analgesic may be considered, but with a substantial risk of adverse effects; however, an opioid analgesic should also be considered before a NSAID in patients taking low-dose aspirin.

Intra-articular corticosteroid injections may produce temporary benefit in osteoarthritis, especially if associated with soft-tissue inflammation.

Non-drug measures, such as weight reduction and exercise, should also be encouraged.

Glucosamine p. 1000 and rabeprazole are not recommended for the treatment of osteoarthritis.

Hyaluronic acid and its derivatives are available for osteoarthritis of the knee, but are not recommended. Sodium hyaluronate p. 1068 (Duragel®, Euflexxa®, Fermathrom®), Orthovisc®, Ostenil®, Ostenil Plus®, RenehaVis®, SuplasyN®, Synocrom®, Synovis® or hylan G-F 20 (Synvisc®) is injected intra-articularly to supplement natural hyaluronic acid in the synovial fluid. These injections may reduce pain over 1–6 months, but are associated with a short-term increase in knee inflammation. Sodium hyaluronate (SportVis®) is also licensed for the relief of pain and optimisation of recovery following ankle sprain, and for the relief of chronic pain and disability associated with tennis elbow.

Rheumatic disease, suppressing drugs

Overview

Certain drugs such as those affecting the immune response can suppress the disease process in *rheumatoid arthritis* and *psoriatic arthritis*; gold, penicillamine p. 1002, hydroxychloroquine sulfate p. 1001, chloroquine p. 582, and sulfasalazine p. 42 can also suppress the disease process in *rheumatoid arthritis* while sulfasalazine and possibly gold can suppress the disease process in *psoriatic arthritis*. Unlike NSAIDs, which are used only for symptom control, disease-modifying anti-rheumatic drugs (DMARDs) can affect the progression of disease but may require 2–6 months of treatment for a full therapeutic response. Response to DMARDs may allow the NSAID dose to be reduced or withdrawn. All patients with suspected inflammatory joint disease should be referred to a specialist as soon as possible to confirm diagnosis and evaluate disease activity; early initiation of DMARDs is recommended to control the signs and symptoms, and to limit joint damage.

Choice

The choice of a disease-modifying antirheumatic drug should take into account co-morbidity and patient preference. Methotrexate p. 844, sulfasalazine, intramuscular gold, and penicillamine are similar in efficacy. However, methotrexate or sulfasalazine may be better tolerated.

A combination of DMARDs (including methotrexate and at least one other DMARD) and a short-term corticosteroid, should be given to patients with newly diagnosed active rheumatoid arthritis, ideally within 3 months of the onset of persistent symptoms. If the use of particular DMARDs is contra-indicated and combination therapy is not possible, monotherapy with a suitable DMARD should be given and the dose rapidly increased until clinically effective. In patients with established and stable rheumatoid arthritis, cautiously reduce drug doses to the lowest that are clinically effective. Response to drug treatment often produces a reduction in requirements of both corticosteroids and other drugs.
Gold and penicillamine are effective in **palindromic rheumatism**. **Systemic and discoid lupus erythematosus** are sometimes treated with chloroquine or hydroxychloroquine sulfate.

If a disease-modifying anti-rheumatic drug does not lead to an objective benefit within 6 months, it should be replaced by a different one.

**Gold**

**Gold** can be given as sodium aurothiomalate p. 1003 for active progressive rheumatoid arthritis; it must be given by deep intramuscular injection and the area gently massaged. A test dose must be given followed by doses at weekly intervals until there is definite evidence of remission. In patients who do respond, the interval between injections is then gradually increased to 4 weeks and treatment is continued for up to 5 years after complete remission. If relapse occurs the dosage frequency may be immediately increased and only once control has been obtained again should the dosage frequency be decreased; if no response is seen within 2 months, alternative treatment should be sought. It is important to avoid complete relapse since second courses of gold are not usually effective.

**Penicillamine**

Penicillamine has a similar action to gold. More patients are able to continue treatment than with gold but side-effects are common.

Patients should be warned not to expect improvement for at least 6 to 12 weeks after treatment is initiated. Penicillamine should be discontinued if there is no improvement within 1 year.

**Sulfasalazine**

Sulfasalazine has a beneficial effect in suppressing the inflammatory activity of rheumatoid arthritis. Sulfasalazine may also be used by specialists, in the management of psoriatic arthritis affecting peripheral joints [unlicensed indication]. Haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment.

**Antimalarials**

The antimalarial hydroxychloroquine sulfate is used to treat rheumatoid arthritis of moderate inflammatory activity; chloroquine is also licensed for treating inflammatory disorders but is used much less frequently and is generally reserved for use if other drugs have failed.

Chloroquine and hydroxychloroquine sulfate are effective for mild systemic lupus erythematosus, particularly involving the skin and joints. These drugs should not be used for psoriatic arthritis. Chloroquine and hydroxychloroquine sulfate are better tolerated than gold or penicillamine.

Retinopathy rarely occurs provided that the recommended doses are not exceeded; in the elderly it is difficult to distinguish drug-induced retinopathy from changes of ageing.

Mepacrine hydrochloride p. 479 is sometimes used in discoid lupus erythematosus [unlicensed].

**Drugs affecting the immune response**

Methotrexate is a disease-modifying antirheumatic drug suitable for moderate to severe rheumatoid arthritis. **Azathioprine** p. 787, **ciclosporin** p. 786, **cyclophosphamide** p. 830, **leflunomide** p. 1002, and the **cytokine modulators** are considered more toxic and they are used in cases that have not responded to other disease-modifying drugs.

Methotrexate is usually given by mouth once a week, adjusted according to response. In patients who experience mucosal or gastro-intestinal side-effects with methotrexate, folic acid p. 937 given every week [unlicensed indication], on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

Leflunomide acts on the immune system as a disease-modifying antirheumatic drug. Its therapeutic effect starts after 4–6 weeks and improvement may continue for a further 4–6 months. Leflunomide, which is similar in efficacy to sulfasalazine and methotrexate, may be chosen when these drugs cannot be used.

Ciclosporin is licensed for severe active rheumatoid arthritis when conventional second-line therapy is inappropriate or ineffective. There is some evidence that ciclosporin may retard the rate of erosive progression and improve symptom control in those who respond only partially to methotrexate.

Cyclophosphamide may be used for rheumatoid arthritis with severe systemic manifestations [unlicensed indication]; it is toxic and regular blood counts (including platelet counts) should be carried out. Cyclophosphamide can also be given for severe **systemic rheumatoid arthritis** and for other connective tissue disorders (especially with active vasculitis).

Drugs that affect the immune response are also used in the management of severe cases of **systemic lupus erythematosus** and other connective tissue disorders. They are often given in conjunction with corticosteroids for patients with severe or progressive renal disease. They may be used in cases of **polymyositis** that are resistant to corticosteroids. They are used for their corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive. Azathioprine is usually used.

In the specialist management of psoriatic arthritis affecting peripheral joints, leflunomide, methotrexate, or azathioprine [unlicensed indication] may be used.

**Juvenile idiopathic arthritis**

Many children with **juvenile idiopathic arthritis** (juvenile chronic arthritis) do not require disease-modifying antirheumatic drugs. Methotrexate is effective; sulfasalazine is an alternative [unlicensed indication] but it should be avoided in **systemic-onset juvenile idiopathic arthritis**. Gold and penicillamine are no longer used. Cytokine modulators have a role in **juvenile idiopathic arthritis**.

**Cytokine modulators**

Cytokine modulators should be used under specialist supervision.

Adalimumab is licensed for moderate to severe active **rheumatoid arthritis** when response to other disease-modifying antirheumatic drugs (including methotrexate p. 844) has been inadequate; it is also licensed for severe, active, and progressive disease in adults not previously treated with methotrexate. In the treatment of rheumatoid arthritis, adalimumab should be used in combination with methotrexate, but it can be given alone if methotrexate is inappropriate. Adalimumab is also licensed for the treatment of active and progressive **psoriatic arthritis** and severe active **ankylosing spondylitis** that have not responded adequately to other disease-modifying antirheumatic drugs. It is also licensed for the treatment of severe axial spondyloarthritis without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs. Adalimumab also has a role in inflammatory bowel disease and plaque psoriasis.

Certolizumab pegol is licensed for use in patients with moderate to severe active **rheumatoid arthritis** when response to disease-modifying antirheumatic drugs (including methotrexate) has been inadequate. Certolizumab pegol can be used in combination with methotrexate, or as a
monotherapy if methotrexate is not tolerated or is contra-indicated. Certolizumab pegol is also licensed for the treatment of severe active ankylosing spondylitis in patients who have had an inadequate response to, or are intolerant of, NSAIDs. It is also licensed for the treatment of severe active axial spondyloarthritis, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to or are intolerant of NSAIDs.

Etanercept is licensed for the treatment of moderate to severe active rheumatoid arthritis either alone or in combination with methotrexate when the response to other disease-modifying antirheumatic drugs is inadequate and in severe, active and progressive rheumatoid arthritis in patients not previously treated with methotrexate. It is also licensed for the treatment of active and progressive psoriatic arthritis inadequately responsive to other disease-modifying antirheumatic drugs, and for severe ankylosing spondylitis inadequately responsive to conventional therapy. Etanercept also has a role in plaque psoriasis.

Golimumab is licensed in combination with methotrexate for the treatment of moderate to severe active rheumatoid arthritis when response to disease-modifying antirheumatic drug (DMARD) therapy (including methotrexate) has been inadequate; it is also licensed in combination with methotrexate for patients with severe, active, and progressive rheumatoid arthritis not previously treated with methotrexate. Golimumab is also licensed for the treatment of active and progressive psoriatic arthritis, as monotherapy or in combination with methotrexate, when response to DMARD therapy has been inadequate; it is also licensed for the treatment of severe active ankylosing spondylitis when there is an inadequate response to conventional treatment.

Infliximab is licensed for the treatment of active rheumatoid arthritis in combination with methotrexate when the response to other disease-modifying antirheumatic drugs, including methotrexate, is inadequate; it is also licensed in combination with methotrexate for patients who have severe, active, and progressive rheumatoid arthritis. Infliximab is also licensed for the treatment of ankylosing spondylitis, in patients with severe axial symptoms who have not responded adequately to conventional therapy, and in combination with methotrexate (or alone if methotrexate is not tolerated or is contra-indicated) for the treatment of active and progressive psoriatic arthritis which has not responded adequately to disease-modifying antirheumatic drugs.

Rituximab p. 820 is licensed in combination with methotrexate for the treatment of severe active rheumatoid arthritis in patients whose condition has not responded adequately to other disease-modifying antirheumatic drugs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them. Rituximab has a role in malignant disease.

Abatacept p. 1007 prevents the full activation of T-lymphocytes. It is licensed for moderate to severe active rheumatoid arthritis in combination with methotrexate, in patients unresponsive to other disease-modifying antirheumatic drugs (including methotrexate or a tumour necrosis factor (TNF) inhibitor). Abatacept is not recommended for use in combination with TNF inhibitors.

Anakinra (in combination with methotrexate) is licensed for the treatment of rheumatoid arthritis which has not responded to methotrexate alone. Anakinra is not recommended for the treatment of rheumatoid arthritis except when used in a controlled long-term clinical study. Patients who are already receiving anakinra for rheumatoid arthritis should continue treatment until they and their specialist consider it appropriate to stop.

Belimumab p. 795 inhibits the activity of B-lymphocyte stimulator. Belimumab is licensed as adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy.

Secukinumab p. 1004 inhibits the activity of interleukin-17A. Secukinumab is licensed for the treatment of active psoriatic arthritis, in combination with methotrexate or alone, which has not responded adequately to disease-modifying antirheumatic drugs; it is also licensed for the treatment of ankylosing spondylitis, in patients who have not responded adequately to conventional therapy.

Secukinumab also has a role in plaque psoriasis.

Tocilizumab p. 1005 antagonises the actions of interleukin-6. Tocilizumab is licensed for use in patients with moderate to severe active rheumatoid arthritis when response to at least one disease-modifying antirheumatic drug or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated.

Ustekinumab p. 1006 inhibits the activity of interleukins 12 and 23. It is licensed for the treatment of active psoriatic arthritis (in combination with methotrexate or alone) in patients who have had an inadequate response to one or more disease-modifying antirheumatic drugs.

Other drugs used for Arthritis

Glucosamine

- **Drug Action** Glucosamine is a natural substance found in mucopolysaccharides, mucoproteins, and chitin.

- **Indications and Dose**

  **Alateris®**

  Symptomatic relief of mild to moderate osteoarthritis of the knee

  - By mouth
  - Adult: 1250 mg once daily, review treatment if no benefit after 2–3 months

  **Dolenio®**

  Symptomatic relief of mild to moderate osteoarthritis of the knee

  - By mouth
  - Adult: 1500 mg once daily, review treatment if no benefit after 2–3 months

  **Glucartel®**

  Symptomatic relief of mild to moderate osteoarthritis of the knee

  - By mouth
  - Adult: 1500 mg once daily, dose to be dissolved in at least 250 mL of water, review treatment if no benefit after 2–3 months

- **Caution** Asthma, impaired glucose tolerance, predisposition to cardiovascular disease

- **Interactions** → Appendix 1: glucosamine
Hydroxychloroquine sulfate

**INDICATIONS AND DOSE**

Active rheumatoid arthritis (administered on expert advice) | Systemic and discoid lupus erythematosus (administered on expert advice) | Dermatological conditions caused or aggravated by sunlight (administered on expert advice)

- **BY MOUTH**
  - Adult: 200–400 mg daily, maximum dose to be based on ideal body-weight; maximum 6.5 mg/kg per day

**CAUTIONS**

- Acute porphyrias p. 969 | diabetes (may lower blood glucose) | elderly | G6PD deficiency | may aggravate myasthenia gravis | may exacerbate psoriasis | neurological disorders (especially in those with a history of epilepsy) | severe gastro-intestinal disorders

**CAUTIONS, FURTHER INFORMATION**

- Screening for ocular toxicity | A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term treatment with chloroquine and hydroxychloroquine (Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening 2009). The following recommendations relate to hydroxychloroquine, which is only rarely associated with toxicity.

**Before treatment:**

- Assess renal and liver function (adjust dose if impaired)

- Ask patient about visual impairment (not corrected by glasses). If impairment or eye disease present, assessment by an ophthalmologist is advised and any abnormality should be immediately referred to an ophthalmologist.

- Record near visual acuity of each eye (with glasses where appropriate) using a standard reading chart.

- Initiate hydroxychloroquine treatment if no abnormality detected. (at a dose not exceeding hydroxychloroquine sulfate 6.5 mg/kg daily)

**During treatment:**

- Ask patient about visual symptoms and monitor visual acuity annually using the standard reading chart.

- Refer to ophthalmologist if visual acuity changes or if vision blurred and warn patient to seek prescribing doctor’s advice about stopping treatment.

- If long-term treatment is required (more than 5 years), individual arrangements should be agreed with the local ophthalmologist.

**INTERACTIONS**

- Appendix 1: hydroxychloroquine

**SIDE-EFFECTS**

- Common or very common | Gastro-intestinal disturbances | headache | pruritus | rashes | skin reactions

- Uncommon | Convulsions | discoloration of skin, nails, and mucous membranes | ECG changes | hair depigmentation | hair loss | keratopathy | ototoxicity | retinal damage | visual changes

- Rare | Acute generalised exanthematous pustulosis | agranulocytosis | angioedema | aplastic anaemia | blood disorders | cardiomyopathy | emotional disturbances | exfoliative dermatitis | hepatic damage | mental changes | myopathy | neuromyopathy | photosensitivity | psychosis | Stevens-Johnson syndrome | thrombocytopenia

**FREQUENCY NOT KNOWN**

- Bronchospasm | diffuse parenchymal lung disease | drug rash with eosinophilia | systemic symptoms

**OVERDOSE**

Hydroxychloroquine is toxic in overdose; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- **PREGNANCY**
  - It is not necessary to withdraw an antimalarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.

- **BREAST FEEDING**
  - Avoid—risk of toxicity in infant.

- **HEPATIC IMPAIRMENT**
  - Caution in moderate to severe hepatic impairment.

- **RENAL IMPAIRMENT**
  - Manufacturer advises caution. Monitor plasma-hydroxychloroquine concentration in severe renal impairment.

**MONITORING REQUIREMENTS**

- Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory (see advice of the Royal College of Ophthalmologists).

**PRESCRIBING AND DISPENSING INFORMATION**

- To avoid excessive dosage in obese patients, the dose of hydroxychloroquine should be calculated on the basis of ideal body-weight.

- **PATIENT AND CARER ADVICE**
  - Do not take antacids for at least 4 hours before or after hydroxychloroquine to reduce possible interference with hydroxychloroquine absorption.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (May 2008) that glucosamine (Alateris) and (July 2011) glucosamine (Glusartel) are not recommended for use within NHS Scotland for the symptomatic relief of mild to moderate cardiovascular disease.

- **LESS SUITABLE FOR PRESCRIBING**
  - Less suitable for prescribing—the mechanism of action is not understood and there is limited evidence to show it is effective.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- ELECTROLYTES: May contain Sodium

- **Alateris** (MW Healthcare Ltd)
  - Glucosamine (as Glucosamine hydrochloride) 625 mg
  - 625 mg tablets | 60 tablet (£18.40 DT price + £18.40)

- **Dolenio** (Alisa Healthcare Research Ltd)
  - Dolenio 1500mg tablets | 30 tablet (£18.20 DT price + £18.20)

**DISEASE-MODIFYING ANTI-RHEUMATIC DRUGS**
Leflunomide

**INDICATIONS AND DOSE**
Moderate to severe active rheumatoid arthritis (specialist use only)
- BY MOUTH
  - Adult: Initially 100 mg once daily for 3 days, then reduced to 10–20 mg once daily

Active psoriatic arthritis (specialist use only)
- BY MOUTH
  - Adult: Initially 100 mg once daily for 3 days, then reduced to 20 mg once daily

**CONTRA-INDICATIONS**
- Serious infection
- Severe hypoproteinemia
- Severe immunodeficiency

**CAUTIONS**
- Anaemia (avoid if significant and due to causes other than rheumatoid arthritis)
- History of tuberculosis
- Impaired bone-marrow function
- Due to causes other than rheumatoid arthritis
- Leucopenia
- Avoid if significant and due to causes other than rheumatoid arthritis
- Thrombocytopenia
- Avoid if significant and due to causes other than rheumatoid arthritis

**INTERACTIONS**

  - Anxiety
  - Hyperlipidaemia
  - Hypokalaemia
  - Hypophosphatemia
  - Taste disturbance
  - Tendon rupture
  - Thrombocytopenia

- Rare
  - Hepatitis
  - Eosinophilia
  - Intestinal lung disease
  - Jaundice
  - Pancytopenia
  - Severe infection

- Very rare
  - Hepatic failure
  - Pancreatitis
  - Peripheral neuropathy
  - Progressive multifocal leucoencephalopathy
  - Stevens–Johnson syndrome
  - Toxic epidermal necrolysis

- Frequency not known
  - Bone-marrow toxicity
  - Hypouricaemia
  - Malignancy
  - Reduced sperm count
  - Renal failure

**SIDE-EFFECTS, FURTHER INFORMATION**
- Discontinue treatment and institute washout procedure in case of serious side-effect (consult product literature).
- Hepatotoxicity
  - Potentially life-threatening hepatotoxicity reported usually in the first 6 months.
  - Discontinue treatment (and institute washout procedure—consult product literature) or reduce dose according to liver-function abnormality; if liver-function abnormality persists after dose reduction, discontinue treatment and institute washout procedure.

**CONCEPTION AND CONTRACEPTION**
- Effective contraception essential during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (plasma concentration monitoring required; waiting time before conception may be reduced with washout procedure—consult product literature).
- The concentration of the active metabolite after washout should be less than 20 micrograms/litre (measured on 2 occasions 14 days apart) in men or women before conception—consult product literature.

**PREGNANCY**
- Avoid—active metabolite teratogenic in animal studies.

**BREAST FEEDING**
- Present in milk in animal studies—manufacturer advises avoid.

**HEPATIC IMPAIRMENT**
- Avoid—active metabolite may accumulate.

**RENAL IMPAIRMENT**
- Manufacturer advises avoid in moderate or severe impairment—no information available.

**PRE-TREATMENT SCREENING**
- Exclude pregnancy before treatment.

**MONITORING REQUIREMENTS**
- Monitor full blood count (including differential white cell count and platelet count) before treatment and every 2 weeks for 6 months then every 8 weeks.
- Monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks.
- Monitor blood pressure.

**TREATMENT CESSATION**
- Washout Procedure
  - The active metabolite persists for a long period; to aid drug elimination in case of serious adverse effect, or before starting another disease-modifying antirheumatic drug, or before conception, stop treatment and give either colchicine or charcoal, activated p. 1256. Procedure may be repeated as necessary.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- CAUTIONARY AND ADVISORY LABELS 21
  - **Leflunomide (Non-proprietary)**
    - Leflunomide 10 mg tablet | 30 tablet POM £46.00 DT price = £4.69
    - Leflunomide 15 mg tablet | 30 tablet POM £46.00 DT price = £4.69
    - Leflunomide 20 mg tablet | 30 tablet POM £61.36 DT price = £4.62
    - **Arava** (Sanofi)
      - Leflunomide 10 mg tablet | 30 tablet POM £51.13 DT price = £4.69
      - Leflunomide 20 mg tablet | 30 tablet POM £61.36 DT price = £4.62
      - Leflunomide 100 mg tablet | 3 tablet POM £30.67

Penicillamine

**DRUG ACTION**
- Penicillamine aids the elimination of copper ions in Wilson’s disease (hepatolenticular degeneration).

**INDICATIONS AND DOSE**
- Severe active rheumatoid arthritis (administered on expert advice)
- BY MOUTH
  - Adult: Initially 125–250 mg daily for 1 month, then increased in steps of 125–250 mg, at intervals of not less than 4 weeks; maintenance 500–750 mg daily in divided doses, then reduced in steps of 125–250 mg every 12 weeks, dose reduction attempted only if remission sustained for 6 months; maximum 1.5 g per day
  - Elderly: Initially up to 125 mg daily for 1 month, then increased in steps of up to 125 mg, at intervals of at least 4 weeks; maximum 1 g per day
Wilson’s disease

- **BY MOUTH**
- **Adult:** 1.5–2 g daily in divided doses, adjusted according to response, to be taken before food; maintenance 0.75–1 g daily, a dose of 2 g daily should not be continued for more than one year; maximum 2 g per day
- **Elderly:** 20 mg/kg daily in divided doses, adjusted according to response

Autoimmune hepatitis (used rarely; after disease controlled with corticosteroids)

- **BY MOUTH**
- **Adult:** Initially 500 mg daily in divided doses, to be increased slowly over 3 months; maintenance 1.25 g daily

Cystinuria, therapeutic

- **BY MOUTH**
- **Adult:** 1–3 g daily in divided doses, to be adjusted to maintain urinary cystine below 200 mg/litre, to be taken before food
- **Elderly:** Minimum dose to maintain urinary cystine below 200 mg/litre is recommended

- **SIDE-EFFECTS**
  - Common or very common: Anorexia, fever, nausea, proteinuria, rash, thrombocytopenia
  - Rare: Alopecia, breast enlargement (male and female), elastosis perforans haematuria (withdraw immediately if cause unknown), mouth ulceration, pseudoxanthoma elasticum, skin laxity, stomatitis
  - Frequency not known: Agranulocytosis, aplastic anaemia, blood disorders, bronchiolitis, cholestatic jaundice, dermatomyositis, glomerulonephritis, Goodpasture’s syndrome, haemolytic anaemia, haemolytic leucopenia, late rashes (consider dose reduction), lupus erythematosus, myasthenia gravis, nephrotic syndrome, neuropathy (especially if neurological involvement in Wilson’s disease—prophylactic pyridoxine recommended), neutropenia, pancreatitis, pemphigus, pemphigoid, polymyositis, pulmonary haemorrhage, rheumatoid arthritis, septic arthritis (in patients with rheumatoid arthritis), Stevens-Johnson syndrome, taste lost (mineral supplements not recommended), urticaria, vomiting

- **CONTRA-INDICATIONS** Lupus erythematosus
- **CAUTIONS** Neurological involvement in Wilson’s disease
- **INTERACTIONS** → Appendix 1: penicillamine

**MEDICINAL FORMS**

- **Tablet**
  - Cautions and Advisory Labels 6, 22
  - Penicillamine (Non-proprietary)
    - Penicillamine 125 mg Penicillamine 125mg tablets | 56 tablet Pot £45.00
      - Penicillamine 250 mg Penicillamine 250mg tablets | 56 tablet Pot £88.75
    - Distamine (Alliance Pharmaceuticals Ltd)
      - Penicillamine 125 mg Distamine 125mg tablets | 100 tablet Pot £10.34
      - Penicillamine 250 mg Distamine 250mg tablets | 100 tablet Pot £17.78

**Sodium aurothiomalate**

- **INDICATIONS AND DOSE**
  - Active progressive rheumatoid arthritis (administered on expert advice)
    - **BY DEEP INTRAMUSCULAR INJECTION**
      - **Adult:** Test dose 10 mg, followed by 50 mg once weekly until there is definite evidence of remission, then reduced to 50 mg every 4 weeks continued for up to 5 years after complete remission, dose to be reduced gradually. Benefit is not expected until 300–500 mg has been given; it should be discontinued if there is no remission after 1 year has been given
  - Relapse in patients who have previously received sodium aurothiomalate therapy for active progressive rheumatoid arthritis (administered on expert advice)
    - **BY DEEP INTRAMUSCULAR INJECTION**
      - **Adult:** 50 mg once weekly until control has been obtained again, then reduced to 50 mg every 4 weeks continued for up to 5 years after complete continued →
remission, if no response is seen within 2 months, alternative treatment should be sought

- **CONTRA-INDICATIONS** Exfoliative dermatitis - history of blood disorders - history of bone marrow aplasia - necrotising enterocolitis - pulmonary fibrosis - systemic lupus erythematosus
- **CAUTIONS** Colitis - eczema - elderly - history of urticaria

**CAUTIONS, FURTHER INFORMATION**

Sodium aurothiomalate should be discontinued in the presence of blood disorders, gastro-intestinal bleeding (associated with ulcerative enterocolitis), or unexplained proteinuria (associated with immune complex nephritis) which is repeatedly above 300 mg/litre.

- **INTERACTIONS** → Appendix 1: sodium aurothiomalate
- **SIDE-EFFECTS** Alopecia - blood disorders (sometimes sudden and fatal) - colitis - gold deposits in eye - hepatoxicity with cholestatic jaundice - irreversible pigmentation in sun-exposed areas (on prolonged parenteral treatment) - mouth ulcers - nephrotic syndrome - peripheral neuropathy - proteinuria - pulmonary fibrosis - severe anaphylactic reactions - skin reactions - stomatitis - taste disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

Rashes with pruritus often occur after reactions.

There can be variation in the licensing of different medicines containing the same drug.

**IMMUNOSUPPRESSANTS** → INTERLEUKIN INHIBITORS

**Anakinra**

- **INDICATIONS AND DOSE** Treatment of rheumatoid arthritis (in combination with methotrexate) which has not responded to methotrexate alone
  - BY SUBCUTANEOUS INJECTION
  - Adult: 100 mg once daily

**CONTRA-INDICATIONS** Neutropenia
- **CAUTIONS** History of asthma (risk of serious infection) - predisposition to infection
- **INTERACTIONS** → Appendix 1: anakinra
- **SIDE-EFFECTS**
  - Common or very common Neutropenia
  - Frequency not known Antibody formation - headache - infections - injection-site reactions - malignancy

**SIDE-EFFECTS, FURTHER INFORMATION**

Blood disorders Neutropenia reported commonly—discontinue if neutropenia develops.

**CONCEPTION AND CONTRACTION** Effective contraception must be used during treatment.

**PREGNANCY** Manufacturer advises avoid.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**RENAL IMPAIRMENT** Caution if eGFR 30–50 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Monitor neutrophil count before treatment, then every month for 6 months, then every 3 months.

**PATIENT AND CARER ADVICE**

Blood disorders Patients should be instructed to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat, bruising or, bleeding) develop.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (July 2002) that anakinra is not recommended for the treatment of rheumatoid arthritis within NHS Scotland.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Kineret** (Swedish Orphan Biovitrum Ltd)
  - Anakinra 150 mg per 1 ml Kineret 100mg/0.67ml solution for injection pre-filled syringes | 28 pre-filled disposable injection
  - £734.44

**Secukinumab**

16-Mar-2016

**DRUG ACTION** Secukinumab is a recombinant human monoclonal antibody that selectively binds to cytokine interleukin-17A (IL-17A) and inhibits the release of proinflammatory cytokines and chemokines.

**INDICATIONS AND DOSE**

Psoriatic arthritis | Ankylosing spondylitis

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 150 mg every week for 5 doses, then maintenance 150 mg every month, review treatment if no response within 16 weeks of initial dose

Psoriatic arthritis with concomitant moderate to severe plaque psoriasis or if inadequate response to anti-TNFα treatment | Plaque psoriasis

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 300 mg every week for 5 doses, then maintenance 300 mg every month, review treatment if no response within 16 weeks of initial dose

**CONTRA-INDICATIONS** Severe active infection

**CAUTIONS** Chronic infection - Crohn’s disease (monitor for exacerbations) - history of recurrent infection - predisposition to infection (discontinue if new serious infection develops)
CAUTIONS, FURTHER INFORMATION

- Tuberculosis: Manufacturer advises that patients with latent tuberculosis should complete anti-tuberculosis therapy before starting secukinumab.

INTERACTIONS → Appendix 1: monoclonal antibodies

SIDE-EFFECTS

- Common or very common: Diarrhoea, oral herpes, rhinorrhoea, upper respiratory tract infections
- Uncommon: Conjunctivitis, neutropenia (usually mild and reversible), oral candidiasis, otitis externa, tinea pedis
- Rare: Anaphylactic reactions

CONCEPTION AND CONTRACEPTION

Manufacturer advises that women of childbearing potential should use effective contraception during treatment and for at least 20 weeks after stopping treatment.

PREGNANCY

Manufacturer advises avoid—no information available.

BREAST FEEDING

Manufacturer advises avoid during treatment and for up to 20 weeks after discontinuing treatment—no information available.

DIRECTIONS FOR ADMINISTRATION

Manufacturer advises to take the syringe or pen out of the refrigerator 20 minutes before administration and to avoid injecting into areas of the skin that show psoriasis. Patients may self-administer Cosentyx® pre-filled pen.

PATIENT AND CARER ADVICE

Self-administration: Patients and their carers should be given training in subcutaneous injection technique. Injection: Patients and their carers should be advised to seek immediate medical attention if symptoms of infection develop during treatment with secukinumab.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Secukinumab for treating moderate to severe plaque psoriasis (July 2015) NICE TA350
Secukinumab is recommended as an option for the treatment of moderate to severe plaque psoriasis in adults if:

- the disease has failed to respond to standard systemic treatments (including ciclosporin, methotrexate, and PUVA), or when standard treatments are contra-indicated or not tolerated; and
- the manufacturer provides secukinumab with the discount agreed in the patient access scheme.

Secukinumab should be withdrawn in patients whose psoriasis has not responded adequately within 12 weeks of initial dose; further treatment cycles are not recommended.

Patients whose treatment with secukinumab was started before this guidance was published, but does not meet these criteria, should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA350

- Secukinumab for active ankylosing spondylitis after treatment with non-steroidal anti-inflammatory drugs or TNF-alpha inhibitors (September 2016) NICE TA407
Secukinumab is recommended, within its marketing authorisation, as an option for treating active ankylosing spondylitis in adults who have responded inadequately to conventional therapy (non-steroidal anti-inflammatory drugs or TNF-alpha inhibitors) only if the manufacturer provides secukinumab with the discount agreed in the patient access scheme.

Assess response to secukinumab after 16 weeks of treatment and continue only if there is clear evidence of response, defined as a reduction in the Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) score to 50% of the pre-treatment value or by 2 or more units and a reduction in the spinal pain visual analogue scale (VAS) by 2 cm or more.

www.nice.org.uk/TA407

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (May 2015) that secukinumab (Cosentyx®) is accepted for restricted use within NHS Scotland for the treatment of moderate to severe plaque psoriasis in adults who have failed to respond to standard systemic therapies (including ciclosporin, methotrexate and phototherapy), or when standard treatments cannot be used because of intolerance or contra-indications.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Cosentyx (Novartis Pharmaceuticals UK Ltd)▼
  - Secukinumab 150 mg per 1 ml
  - Cosentyx 150mg/1ml solution for injection pre-filled pens | 2 pre-filled disposable injection PSM £1,218.78
  - Cosentyx 150mg/1ml solution for injection pre-filled syringes | 2 pre-filled disposable injection PSM £1,218.78

Tocilizumab

31-May-2016

INDICATIONS AND DOSE

Moderate to severe active rheumatoid arthritis (in combination with methotrexate or alone if methotrexate inappropriate) when response to at least one disease-modifying antirheumatic drug or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs

BY INTRAVENOUS INFUSION

- Adult: 8 mg/kg every 4 weeks (max. per dose 800 mg), for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count, consult product literature.

CONTRA-INDICATIONS

Do not initiate if absolute neutrophil count less than 2 × 10⁹/litre - severe active infection.

CAUTIONS

- History of diverticulitis - history of intestinal ulceration - history of recurrent or chronic infection (interrupt treatment if serious infection occurs) - low absolute neutrophil count - low platelet count - predisposition to infection (interrupt treatment if serious infection occurs).

CAUTIONS, FURTHER INFORMATION

- Tuberculosis: Patients with latent tuberculosis should be treated with standard therapy before starting tocilizumab.

INTERACTIONS → Appendix 1: monoclonal antibodies

SIDE-EFFECTS

- Common or very common: Abdominal pain, antibody formation, dizziness, gastritis, headache, hypercholesterolaemia, hypersensitivity, hypertension, infection, leucopenia, mouth ulceration, neutropenia, peripheral oedema, pruritus, raised hepatic transaminases, rash, upper respiratory tract infection.
- Uncommon: Anaphylaxis, gastric ulcer, gastro-intestinal perforation, hypertriglyceridaemia, hypothyroidism, infusion-related reactions, nephrolithiasis.
- Frequency not known: Thrombocytopenia.

SIDE-EFFECTS, FURTHER INFORMATION

- Neutrophil and platelet counts: Discontinue if absolute neutrophil count less than 0.5 × 10⁹/litre or platelet count less than 50 × 10⁹/microlitre.
● CONCEPTION AND CONTRACEPTION Effective contraception required during and for 3 months after treatment.
● PREGNANCY Manufacturer advises avoid unless essential—toxicity in animal studies.
● BREAST FEEDING Manufacturer advises use only if potential benefit outweighs risk—no information available.
● HEPATIC IMPAIRMENT Manufacturer advises caution—consult product literature.
● RENAL IMPAIRMENT Manufacturer advises monitor renal function closely in moderate or severe impairment.
● PRE-TREATMENT SCREENING Tuberculosis Patients should be evaluated for tuberculosis before treatment.

● MONITORING REQUIREMENTS
  ▶ Monitor lipid profile 4–8 weeks after starting treatment and then as indicated.
  ▶ Monitor for demyelinating disorders.
  ▶ Monitor hepatic transaminases every 4–8 weeks for first 6 months, then every 12 weeks.
  ▶ Monitor neutrophil and platelet counts 4–8 weeks after starting treatment and then as indicated.

● DIRECTIONS FOR ADMINISTRATION For intravenous infusion (RoActemra®), give intermittently in Sodium chloride 0.9%; dilute requisite dose to a volume of 100 mL with infusion fluid and give over 1 hour.

● PATIENT AND CARER ADVICE An alert card should be provided.

  Patients and their carers should be advised to seek immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur.

● NATIONAL FUNDING/ACCESS DECISIONS
  NICE technology appraisals (TAs)
    ▶ Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375
    ▶ Tocilizumab, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if all the following criteria are met:
      1. disease is severe, that is, a disease activity score (DAS28) greater than 5.1,
      2. disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs),
      3. the manufacturer provides tocilizumab as agreed in the patient access schemes.
      Tocilizumab can be used as monotherapy in patients who cannot take methotrexate because it is contra-indicated or because of intolerance, when the criteria above are met.
      Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.
      Patients currently receiving tocilizumab whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

  www.nice.org.uk/TA375

    ▶ Tocilizumab for the treatment of rheumatoid arthritis (February 2012–updated February 2016) NICE TA247
    Tocilizumab, in combination with methotrexate, is recommended as an option for the treatment of rheumatoid arthritis in adults if:
      1. the disease has responded inadequately to DMARDs and a TNF inhibitor and the patient cannot receive rituximab because of contra-indications or intolerance, and
tocilizumab is used as described for TNF inhibitor treatments (specifically the recommendations on disease activity) in the NICE guidance (August 2010)
Adalimumab, etanercept, infliximab, rituximab and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor, or
      2. the disease has responded inadequately to one or more TNF inhibitor treatments and to rituximab
      3. the manufacturer provides tocilizumab with the discount agreed as part of the patient access scheme.

  Patients currently receiving tocilizumab for the treatment of rheumatoid arthritis who do not meet these criteria should have the option to continue treatment until they and their clinicians consider it appropriate to stop.

  www.nice.org.uk/TA247

● MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Solution for infusion
  ▶ RoActemra (Roche Products Ltd)
    Tocilizumab 20 mg per 1 mL RoActemra 400 mg/20 mL concentrate for solution for infusion vials | 1 vial £512.00 (Hospital only)
    RoActemra 200 mg/10 mL concentrate for solution for infusion vials | 1 vial £256.00 (Hospital only)
    RoActemra 80 mg/4 mL concentrate for solution for infusion vials | 1 vial £102.40 (Hospital only)

Ustekinumab

● INDICATIONS AND DOSE
  Severe plaque psoriasis that has not responded to at least 2 standard systemic treatments and photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications
  ▶ BY SUBCUTANEOUS INJECTION
    Adult (body-weight up to 100 kg): Initially 45 mg, then 45 mg after 4 weeks, then 45 mg every 12 weeks, discontinue if no response within 16 weeks
    Adult (body-weight 100 kg and above): Initially 45–90 mg, then 45–90 mg after 4 weeks, then 45–90 mg every 12 weeks, discontinue if no response within 16 weeks
  Active psoriatic arthritis (in combination with methotrexate or alone) in patients who have had an inadequate response within the disease activity (in the NICE guidance (August 2010)
Abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor, or
the disease has responded inadequately to one or more TNF inhibitor treatments and to rituximab
the manufacturer provides tocilizumab with the discount agreed as part of the patient access scheme.

  Patients currently receiving tocilizumab for the treatment of rheumatoid arthritis who do not meet these criteria should have the option to continue treatment until they and their clinicians consider it appropriate to stop.

  www.nice.org.uk/TA247

● CONTRA-INDICATIONS Active infection
● CAUTIONS Development of malignancy • elderly • history of malignancy • predisposition to infection • start appropriate treatment if widespread erythema and skin exfoliation develop, and stop ustekinumab treatment if exfoliative dermatitis suspected

  CAUTIONS, FURTHER INFORMATION
  ▶ Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting ustekinumab. Patients who have previously received appropriate treatment for tuberculosis can start ustekinumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before...
starting ustekinumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis may be given concurrently with ustekinumab.

- **INTERACTIONS**  ➔ Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - **Common or very common**  Arthralgia, diarrhoea, dizziness, headache, infections (sometimes severe), injection-site reactions, malaise, myalgia, nausea, ophthalmological pain, pruritus
  - **Uncommon**  Depressions, facial palsy, hypersensitivity reactions (possibly delayed onset), nasal congestion, pustular psoriasis
  - **Rare**  Exfoliative dermatitis
- **CONCEPTION AND CONTRACEPTION**  Manufacturer advises effective contraception during treatment and for 15 weeks after stopping treatment.
- **PREGNANCY**  Avoid.
- **BREAST FEEDING**  Manufacturer advises avoid—present in milk in animal studies.
- **PRE-TREATMENT SCREENING**
  - Tuberculosis  Patients should be evaluated for tuberculosis before treatment.
- **MONITORING REQUIREMENTS**
  - Monitor for non-melanoma skin cancer, especially in patients with a history of PUVA treatment or prolonged immunosuppressant therapy, or those over 60 years of age.
  - Monitor for signs and symptoms of exfoliative dermatitis or erythrodermic psoriasis.
- **PATIENT AND CARER ADVICE**
  - Exfoliative dermatitis  Patients should be advised to seek prompt medical attention if symptoms suggestive of exfoliative dermatitis or erythrodermic psoriasis (such as increased redness and shedding of skin over a larger area of the body) develop.
  - Tuberculosis  Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Ustekinumab for plaque psoriasis in adults (September 2009) NICE TA180
      - Ustekinumab is recommended for the treatment of severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Ustekinumab should be withdrawn if the response is not adequate after 16 weeks.
      - For patients weighing over 100 kg, the manufacturer should provide the 90-mg dose of ustekinumab at the same price as the 45-mg dose.
      - www.nice.org.uk/TA180
    - Ustekinumab for treating active psoriatic arthritis (June 2015) NICE TA340
      - Ustekinumab is an option, alone or in combination with methotrexate, for the treatment of active psoriatic arthritis in adults only when:
        - Treatment with tumour necrosis factor (TNF) alpha inhibitors is contra-indicated but would otherwise be considered (as described in the NICE guidance on etanercept, infliximab and adalimumab for the treatment of psoriatic arthritis (August 2010) and golimumab for the treatment of psoriatic arthritis (April 2011)) or
        - The patient has had treatment with 1 or more TNF-alpha inhibitors.
      - Ustekinumab is recommended only if the manufacturer provides the 90 mg dose of ustekinumab for patients who weigh more than 100 kg at the same cost as the 45 mg dose, as agreed in the patient access scheme.
      - Ustekinumab treatment should be stopped if the patient’s psoriatic arthritis has not shown an adequate response using the Psoriatic Arthritis Response Criteria (PsARC) at 24 weeks.
      - Patients currently receiving ustekinumab whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.
      - www.nice.org.uk/TA340

**Scottish Medicines Consortium (SMC) Decisions**

The **Scottish Medicines Consortium** has advised (February 2014) that ustekinumab (Stelara®) is accepted for restricted use within NHS Scotland either alone or in combination with methotrexate, for the treatment of active psoriatic arthritis in adults who have responded inadequately to previous therapy with a non-biological disease-modifying anti-rheumatic drug, and failed on, or are unsuitable for, treatment with a TNF inhibitor.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - **CAUTIONARY AND ADVISORY LABELS**
      - **Stelara** (Janssen-Cilag Ltd)
        - Ustekinumab 90 mg per 1 ml
        - Stealra 90mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (£2,147.00)
        - Stealra 45mg/0.5ml solution for injection vials | 1 vial (£2,147.00)
        - Stealra 45mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (£2,147.00)

**IMMUNOSUPPRESSANTS**

> **T-CELL ACTIVATION INHIBITORS**

**Abatacept**

- **INDICATIONS AND DOSE**
  - Moderate to severe active rheumatoid arthritis (in combination with methotrexate) in patients unresponsive to other disease-modifying antirheumatic drugs (including methotrexate or a tumour necrosis factor (TNF) inhibitor)
    - **INITIALLY BY INTRAVENOUS INJECTION**
      - Adult (body-weight up to 60 kg): 500 mg every 2 weeks for 3 doses (loading dose), then (by intravenous infusion) 500 mg every 4 weeks, alternatively (by subcutaneous injection) 125 mg once weekly, first subcutaneous dose to be given within 1 day of the intravenous loading dose; patients who are unable to receive an infusion may initiate subcutaneous abatacept without receiving an intravenous loading dose
      - Adult (body-weight 60-100 kg): 750 mg every 2 weeks for 3 doses (loading dose), then (by intravenous infusion) 750 mg every 4 weeks, alternatively (by subcutaneous injection) 125 mg once weekly, first subcutaneous dose to be given within 1 day of the intravenous loading dose; patients who are unable to receive an infusion may initiate subcutaneous abatacept without receiving an intravenous loading dose
      - Adult (body-weight 101 kg and above): 1 g every 2 weeks for 3 doses (loading dose), then (by intravenous infusion) 1 g every 4 weeks, alternatively (by subcutaneous injection) 125 mg once weekly, first subcutaneous dose to be given within 1 day of the intravenous loading dose; patients who are unable to receive an infusion may initiate subcutaneous abatacept without receiving an intravenous loading dose

---

**Arthritis** 1007

Musculoskeletal system
Musculoskeletal system

PREGNANCY

CONTRA-INDICATIONS
Severe infection

CAUTIONS
Do not initiate until active infections are controlled • elderly (increased risk of side-effects) • predisposition to infection (screen for latent tuberculosis and viral hepatitis) • progressive multifocal leucoencephalopathy (discontinue treatment if neurological symptoms present)

INTERACTIONS → Appendix 1: abatacept

SIDE-EFFECTS

Common or very common Abdominal pain • conjunctivitis • cough • diarrhea • dizziness • dyspepsia • fatigue • flushing • headache • hypertension • infection • leucopenia • nausea • pain in extremities • paraesthesia • stomatitis • vomiting

Uncommon Psoriasis • alopecia • anxiety • arthralgia • basal and squamous cell carcinoma • bradycardia • bronchospasm • bruising • depression • dry eye • dry skin • dyspnoea • gastritis • hyperhidrosis • hypotension • menstrual disturbances • palpitation • skin papilloma • sleep disorder • tachycardia • thrombocytopenia • visual disturbance • weight gain

Frequency not known Lung cancer • lymphoma

CONCEPTION AND CONTRACEPTION Effective contraception required during treatment and for 14 weeks after last dose.

PREGNANCY
Manufacturer advises avoid unless essential.

BREAST FEEDING
Present in milk in animal studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose.

DIRECTIONS FOR ADMINISTRATION
For intravenous
infusion, given intermittently in Sodium chloride 0.9%; reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in Sodium Chloride 0.9% to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron).

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) NICE TA195

Abatacept, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other disease-modifying antirheumatic drugs (DMARDs) including at least 1 tumour necrosis factor (TNF) inhibitor, and who cannot use rituximab because of contra-indications or intolerance. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.

www.nice.org.uk/TA195

Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375

Abatacept, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if all the following criteria are met:

• disease is severe, that is, a disease activity score (DAS28) greater than 5.1,
• disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs),
• the manufacturers provides abatacept as agreed in the patient access schemes.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving abatacept whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA375

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

Orencia (Bristol-Myers Squibb Pharmaceuticals Ltd)
Abatacept 250 mg Orencia 250mg powder for concentrate for solution for infusion vials 1 vial £302.40 (Hospital only)

IMMUNOSUPPRESSANTS → TUMOR NECROSION FACTOR ALPHA (TNF-α) INHIBITORS

Adalimumab

INDICATIONS AND DOSE
Severe plaque psoriasis either refractory to at least 2 standard systemic treatments or photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications

BY SUBCUTANEOUS INJECTION

Adult: Initially 80 mg, then 40 mg every 2 weeks, to be started 1 week after initial dose, discontinue treatment if no response within 16 weeks

Moderate-to-severe active rheumatoid arthritis (in combination with methotrexate or alone if methotrexate inappropriate) when response to other disease-modifying drugs (including methotrexate) has been inadequate • Severe, active, and progressive rheumatoid arthritis (in combination with methotrexate or alone if methotrexate inappropriate) not previously treated with methotrexate

BY SUBCUTANEOUS INJECTION

Adult: 40 mg every 2 weeks, then increased if necessary to 40 mg once weekly, dose to be increased only in patients receiving adalimumab alone, review treatment if no response within 12 weeks

Active and progressive psoriatic arthritis that has not responded adequately to other disease-modifying antirheumatic drugs • Severe active ankylosing spondylitis that has not responded adequately to other disease-modifying antirheumatic drugs • Severe axial spondyloarthritis without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of, NSAIDs

BY SUBCUTANEOUS INJECTION

Adult: 40 mg every 2 weeks, discontinue treatment if no response within 12 weeks

Severe active Crohn’s disease

BY SUBCUTANEOUS INJECTION

Adult: Initially 80 mg, then 40 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose

Severe active Crohn’s disease (accelerated regimen)

BY SUBCUTANEOUS INJECTION

Adult: Initially 160 mg, dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose

27-Apr-2017
Severe active ulcerative colitis

▶ By subcutaneous injection

- Adult: Initially 160 mg, dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 8 weeks of initial dose.

Active moderate to severe hidradenitis suppurativa (acne inversa) in patients with an inadequate response to conventional systemic therapy

▶ By subcutaneous injection

- Adult: Initially 160 mg, given as either four 40 mg injections in one day or as two 40 mg injections per day for 2 consecutive days, followed by 80 mg after 2 weeks, given as two 40 mg injections in one day, then 40 mg after 2 weeks; maintenance 40 mg once weekly, review treatment if no response within 12 weeks; if treatment interrupted—consult product literature.

Uveitis (in combination with corticosteroids or alone if corticosteroids inappropriate), with or without other disease-modifying drugs (initiated under specialist supervision)

▶ By subcutaneous injection

- Adult: Initially 80 mg, given as two 40 mg injections in one day, then 40 mg after 1 week; maintenance 40 mg every 2 weeks.

Contraindications

- Moderate or severe heart failure
- Severe infection

Caution

- Demyelinating disorders (risk of exacerbation), development of malignancy. Do not initiate until active infections are controlled (discontinue if new serious infection develops), hepatitis B virus—monitor for active infection, history of malignancy, mild heart failure (discontinue if symptoms develop or worsen), predisposition to infection.

Caution, further information

- Tuberculosis: Active tuberculosis should be treated with standard treatment for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab.

Interactions

- Appendix 1: monoclonal antibodies.

Side-effects

- Common or very common: Anxiety, benign tumours, chest pain, cough, dehydration, dermatitis, dizziness, dyspepsia, dyspnoea, electrolyte disturbances, eye disorders, flushing, gastrointestinal haemorrhage, haematuria, hyperlipidaemia, hypertension, hyperuricaemia, impaired healing, mood changes, musculoskeletal pain, oedema, onycholysis, paraesthesia, rash, renal impairment, skin cancer, sleep disturbances, tachycardia, vomiting.

- Uncommon: Aortic aneurysm, arrhythmias, cholecystitis, cholelithiasis, dysphagia, erectile dysfunction, hearing loss, hepatic steatosis, interstitial lung disease, leukaemia, lymphoma, malignancy, neuropathy, nocturia, pancreatitis, pneumonitis, rhabdomyolysis, solid tumours, tinnitus, tremor, vascular occlusion.

- Rare: Autoimmune hepatitis, demyelinating disorders, myocardial infarction.

- Frequency not known: Abdominal pain, anaemia, antibody formation, aplastic anaemia, blood disorders, cutaneous vasculitis, depression, fever, headache, hypersensitivity reactions, injection-site reactions, leucopenia, lupus erythematosus-like syndrome, nausea, new onset psoriasis, pancytopenia, pleural effusion, pruritus, pulmonary embolism, sarcoidosis, Stevens-Johnson syndrome, thrombocytopenia, worsening heart failure, worsening of symptoms of dermatomyositis, worsening psoriasis.

Side-effects, further information

- Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

- Conception and contraception: Manufacturer advises effective contraception required during treatment and for at least 5 months after last dose.

- Pregnancy: Avoid.

- Breast feeding: Avoid; manufacturer advises avoid for at least 5 months after last dose.

- Pre-treatment screening:
  - Tuberculosis: Patients should be evaluated for tuberculosis before treatment.

- Monitoring requirements:
  - Manufacturer advises monitor for infection before, during, and for 4 months after treatment.
  - Manufacturer advises monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy.

- For uveitis, manufacturer advises patients should be assessed for pre-existing or developing central demyelinating disorders before and at regular intervals during treatment.

- Patient and carer advice: An alert card should be provided.

When used to treat hidradenitis suppurativa, patients and their carers should be advised to use a daily topical antiseptic wash on lesions during treatment with adalimumab.

Tuberculosis: Patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, or fever) develop.

Blood disorders: Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

National funding/access decisions

- NICE technology appraisals (TAs):
  - Adalimumab for plaque psoriasis in adults (June 2008)
  - NICE TA146
  - Adalimumab is recommended for the treatment of severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Adalimumab should be withdrawn if the response is not adequate after 16 weeks.

  - Infliximab and adalimumab for Crohn’s disease (May 2010)
  - NICE TA187
  - Adalimumab is recommended for the treatment of severe active Crohn’s disease that has not responded to conventional therapy (including corticosteroids and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contra-indications. Adalimumab should be used as a planned course of treatment for 12 months or until treatment failure, whichever is shorter. Treatment should be continued beyond 12 months only if there is evidence of active disease—in these cases the need for treatment should be...
reviewed at least annually. If the disease relapses after stopping treatment, adalimumab can be restarted.

www.nice.org.uk/TA187

▶ infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015) NICE TA329 Adalimumab is an option for treating moderately to severely active ulcerative colitis in adults whose disease has responded inadequately to conventional therapy including corticosteroids and mercaptopurine or azathioprine, or in adults who are intolerant to or have contra-indications for conventional therapies. The choice of treatment should be made on an individual basis and if more than one treatment is suitable, the least expensive should be chosen.

Adalimumab should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

www.nice.org.uk/TA329

▶ Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010) NICE TA199 Adalimumab is recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination). Adalimumab should be discontinued if there is an inadequate response at 12 weeks.

www.nice.org.uk/TA199

▶ Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) NICE TA195 Adalimumab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. In patients who cannot use methotrexate because of intolerance or contra-indications, adalimumab can be given as monotherapy. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.

www.nice.org.uk/TA195

▶ Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375 Adalimumab, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if the following criteria are met:
- disease is severe, that is, a disease activity score (DAS28) greater than 5.1, and,
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs).

Adalimumab can be used as another therapy in patients who cannot take methotrexate because it is contra-indicated or because of intolerance, when the criteria above are met.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving adalimumab whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA375

▶ TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016) NICE TA383 Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs).

Adalimumab, certolizumab pegol and etanercept are also recommended as options for treating severe non-radiographic axial spondyloarthritis in patients whose disease has responded inadequately to, or who are intolerant of, NSAIDs.

The response to treatment should be assessed 12 weeks after the start of treatment and should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF)-alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

www.nice.org.uk/TA383

▶ Adalimumab for treating moderate-to-severe hidradenitis suppurativa (June 2016) NICE TA392 Adalimumab is recommended, within its marketing authorisation, as an option for treating active moderate-to-severe hidradenitis suppurativa in adults whose disease has not responded to conventional systemic therapy. The drug is recommended only if the manufacturer provides it at the price agreed in the patient access scheme. Response should be assessed after 12 weeks of treatment, and the drug continued only if there is clear evidence of response, defined as a reduction of 25% or more in the total abscess and inflammatory nodule count and no increase in abscesses and draining fistulas.

www.nice.org.uk/TA392

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium issued similar advice for plaque psoriasis to NICE TA146 in May 2008.

Certolizumab pegol

**INDICATIONS AND DOSE**

Moderate to severe active rheumatoid arthritis when response to disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (as monotherapy or in combination with methotrexate)

Severe, active and progressive rheumatoid arthritis in patients not previously treated with methotrexate or other disease-modifying antirheumatic drugs (in combination with methotrexate)

Active psoriatic arthritis when response to disease-modifying antirheumatic drugs has been inadequate (as monotherapy or in combination with methotrexate)

**BY SUBCUTANEOUS INJECTION**

Adult: Loading dose 400 mg every 2 weeks for 3 doses, then maintenance 200 mg every 2 weeks, once clinical response is confirmed, an alternative maintenance dosing of 400 mg every 4 weeks can be considered, review treatment if no response within 12 weeks

**TREATMENT OF SEVERE ACTIVE ANKYLOSING SPONDYLITIS IN PATIENTS WHO HAVE HAD AN INADEQUATE RESPONSE TO, OR ARE INTOLERANT OF NSAIADS**

Tuberculosis

**CONTRA-INDICATIONS**

Moderate to severe heart failure - severe active infection

**CAUTIONS**

Demyelinating CNS disorders (risk of exacerbation) - do not initiate until active infections are controlled (discontinue if new serious infection develops and until infection controlled) - hepatitis B virus (monitor for active infection) - history or development of malignancy - mild heart failure (discontinue if symptoms develop or worsen) - predisposition to infection

**CAUTIONS, FURTHER INFORMATION**

Tuberculosis

Active tuberculosis should be treated with standard treatment for at least 2 months before starting certolizumab pegol. Patients who have previously received adequate treatment for tuberculosis can start certolizumab pegol but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting certolizumab pegol. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with certolizumab pegol.

Common or very common

Hypertension - rash - sensory abnormalities

Uncommon

Rare

Atioventricular block - cerebrovascular accident - cholelithiasis - impaired coordination - interstitial lung disease - nephropathy - Raynaud’s phenomenon - seizures - sexual dysfunction - splenomegaly - thyroid disorders - trigeminal neuralgia

Frequency not known

**SIDE-EFFECTS, FURTHER INFORMATION**

Infection

Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises adequate contraception during treatment and for at least 5 months after last dose.

**PREGNANCY**

Avoid.

**BREAST FEEDING**

Manufacturer advises use only if potential benefit outweighs risk — no information available.

**PRE-TREATMENT SCREENING**

Tuberculosis

Patients should be evaluated for tuberculosis before treatment.

**MONITORING REQUIREMENTS**

Monitor for infection before, during, and for 5 months after treatment.

**PATIENT AND CARER ADVICE**

An alert card should be provided.

Blood disorders

Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Tuberculosis

Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss and fever) develop.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375

Certolizumab pegol, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1,
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs),
- the manufacturers provide certolizumab pegol as agreed in the patient access schemes.

Certolizumab pegol can be used as monotherapy in patients who cannot take methotrexate because it is contra-indicated or because of intolerance, when the criteria above are met.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving certolizumab pegol within the NHS whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA375
TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016)

NICE TA383

Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in adult patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs.

Adalimumab, certolizumab pegol and etanercept are also recommended as options for treating severe non-radiographic axial spondyloarthritis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs).

The response to treatment should be assessed 12 weeks after the start of treatment. Treatment should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF) alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF alpha inhibitor, or in those whose disease has stopped responding after an initial response.

www.nice.org.uk/TA383

Certolizumab pegol for treating rheumatoid arthritis after inadequate response to a TNF-alpha inhibitor (October 2016)

NICE TA415

Certolizumab pegol, in combination with methotrexate, or as monotherapy, is recommended as an option for treating active rheumatoid arthritis in adults who have had an inadequate response to, or who cannot tolerate, other disease-modifying antirheumatic drugs (DMARDs) including at least 1 tumour necrosis factor-alpha (TNF-alpha) inhibitor, only if the following criteria are met:

- disease activity is severe and
- rituximab is contra-indicated or not tolerated, or if monotherapy, rituximab cannot be given because methotrexate is contra-indicated or not tolerated and
- the manufacturers provide certolizumab pegol as agreed in the patient access scheme.

Continue treatment only if there is at least a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if at least a moderate EULAR response is not maintained.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA415

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (July 2014) that certolizumab pegol is accepted for restricted use within NHS Scotland, in combination with methotrexate, for the treatment of active psoriatic arthritis in patients whose disease has not responded to adequate trials of at least two standard disease-modifying antirheumatic drugs (DMARDs), administered either individually or in combination.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

INDICATIONS AND DOSE

BENEPALE® SOLUTION FOR INJECTION

Moderate-to-severe active rheumatoid arthritis (alone or in combination with methotrexate) when the response to other disease-modifying antirheumatic drugs is inadequate | Severe, active and progressive rheumatoid arthritis not previously treated with methotrexate | Active and progressive psoriatic arthritis when the response to other disease-modifying antirheumatic drugs is inadequate | Severe active ankylosing spondylitis when the response to conventional therapy is inadequate | Severe, non-radiographic axial spondylarthropathy when the response to non-steroidal anti-inflammatory drugs is inadequate

- BY SUBCUTANEOUS INJECTION
- Adult: 50 mg once weekly, review treatment if no response within 12 weeks of initial dose

Moderate-to-severe plaque psoriasis when the response to other systemic therapies or psoralen and ultraviolet-A light (PUVA) is inadequate, or when these therapies cannot be used because of intolerance or contra-indications

- BY SUBCUTANEOUS INJECTION
- Adult: 50 mg once weekly, alternatively 50 mg twice weekly for up to 12 weeks, followed by 50 mg once weekly if required continue treatment for up to 24 weeks — continuous therapy beyond 24 weeks may be appropriate in some patients (consult product literature), discontinue if no response after 12 weeks

ENBREL® POWDER AND SOLVENT FOR SOLUTION FOR INJECTION

Moderate-to-severe active rheumatoid arthritis (alone or in combination with methotrexate) when the response to other disease-modifying antirheumatic drugs is inadequate | Severe, active and progressive rheumatoid arthritis not previously treated with methotrexate | Active and progressive psoriatic arthritis when the response to other disease-modifying antirheumatic drugs is inadequate | Severe active ankylosing spondylitis when the response to conventional therapy is inadequate | Severe, non-radiographic axial spondylarthropathy when the response to non-steroidal anti-inflammatory drugs is inadequate

- BY SUBCUTANEOUS INJECTION
- Adult: 25 mg twice weekly, alternatively 50 mg once weekly, review treatment if no response within 12 weeks of initial dose

Moderate-to-severe plaque psoriasis when the response to other systemic therapies or psoralen and ultraviolet-A light (PUVA) is inadequate, or when these therapies cannot be used because of intolerance or contra-indications

- BY SUBCUTANEOUS INJECTION
- Adult: 25 mg twice weekly, alternatively 50 mg once weekly, alternatively 50 mg twice weekly for up to 12 weeks, followed by 25 mg twice weekly, alternatively 50 mg once weekly if required continue treatment for up to 24 weeks — continuous therapy beyond 24 weeks may be appropriate in some patients (consult product literature), discontinue if no response after 12 weeks
■ CONTRA-INDICATIONS Active infection

■ CAUTIONS Development of malignancy · diabetes mellitus · heart failure (risk of exacerbation) · hepatitis B virus—monitor for active infection · hepatitis C infection (monitor for worsening infection) · history of blood disorders · history of malignancy · history or increased risk of demyelinating disorders · predisposition to infection (avoid if predisposition to septicemia) · significant exposure to herpes zoster virus—interrupt treatment and consider varicella—zoster immunoglobulin

CAUTIONS, FURTHER INFORMATION

■ Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting etanercept. Patients who have previously received adequate treatment for tuberculosis can start etanercept but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting etanercept. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with etanercept.

■ INTERACTIONS ➔ Appendix 1: etanercept

■ SIDE-EFFECTS

■ Uncommon Intestinal lung disease · new onset or worsening psoriasis · rash · skin cancer · uveitis

■ Rare Demyelinating disorders · lymphoma · seizures · Stevens-Johnson syndrome · vasculitis

■ Very rare Toxic epidermal necrolysis

■ Frequency not known Abdominal pain · anaemia · antibody formation · aplastic anaemia · appendicitis · blood disorders · cutaneous ulcer · depression · diabetes mellitus · fever · gastritis · headache · hypersensitivity reactions · inflammatory bowel disease · injection-site reactions · leucopenia · leukaemia · lupus erythematosus-like syndrome · macrophage activation syndrome · malignancy · nausea · oesophagitis · pancytopenia · pruritus · solid tumours · thrombocytopenia · vomiting · worsening heart failure

SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

■ CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception required during treatment and for 3 weeks after last dose.

■ PREGNANCY Avoid—limited information available.

■ BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

■ HEPATIC IMPAIRMENT Use with caution in moderate to severe alcoholic hepatitis.

■ PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

■ MONITORING REQUIREMENTS Monitor for skin cancer before and during treatment, particularly in those at risk (including patients with psoriasis or a history of PUVA treatment).

■ PRESCRIBING AND DISPENSING INFORMATION

Etanercept is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

■ PATIENT AND CARER ADVICE

An alert card should be provided.

Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Tuberculosis Patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

■ NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

■ Etanercept and efalizumab for plaque psoriasis (July 2006) NICE TA103

Etanercept is recommended for severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Etanercept should be withdrawn if the response is not adequate after 12 weeks.

www.nice.org.uk/TA103

■ Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) NICE TA195

Etanercept, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. In patients who cannot use methotrexate because of intolerance or contra-indications, etanercept can be given as monotherapy. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.

www.nice.org.uk/TA195

■ Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010) NICE TA199

Etanercept is recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination).
Enbrel etanercept should be discontinued if there is an inadequate response at 12 weeks. www.nice.org.uk/TA199

- Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375

Etanercept, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if the following criteria are met:
- disease is severe, that is, a disease activity score (DAS28) greater than 5.1, and
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs)

Etanercept can be used as monotherapy in patients who cannot take methotrexate because it is contra-indicated or because of intolerance, when the criteria above are met.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving etanercept whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA375

- TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016) NICE TA383

Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs).

Adalimumab, certolizumab pegol and etanercept are also recommended as options for treating severe non-radiographic axial spondyloarthritis in patients whose disease has responded inadequately to, or who are intolerant of, NSAIDs.

The response to treatment should be assessed 12 weeks after the start of treatment and should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF)-alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

www.nice.org.uk/TA383

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium issued similar advice to NICE TA103 on the use of etanercept for severe plaque psoriasis in adults (August 2009) and children over 6 years old (April 2012).

- INDICATIONS AND DOSE

Treatment of severe ulcerative colitis in patients whose condition has not responded adequately to conventional therapy, or who are intolerant of it

- BY SUBCUTANEOUS INJECTION

  - Adult (body-weight up to 80 kg): Initially 200 mg, then 100 mg after 2 weeks; maintenance 50 mg every 4 weeks, review treatment if no response after 4 doses

  - Adult (body-weight 80 kg and above): Initially 200 mg, then 100 mg after 2 weeks; maintenance 100 mg every 4 weeks, review treatment if no response after 4 doses

- Treatment of moderate to severe active rheumatoid arthritis (in combination with methotrexate) when response to disease-modifying antirheumatic drug (DMARD) therapy (including methotrexate) has been inadequate | Treatment of severe, active, and progressive rheumatoid arthritis (in combination with methotrexate) in patients not previously treated with methotrexate | Treatment of active and progressive psoriatic arthritis as monotherapy or in combination with methotrexate when response to DMARD therapy has been inadequate | Treatment of severe active ankylosing spondylitis when there is inadequate response to conventional treatment

- BY SUBCUTANEOUS INJECTION

  - Adult (body-weight up to 100 kg): 50 mg once a month, on the same date each month, review treatment if no response after 3–4 doses

  - Adult (body-weight 100 kg and above): Initially 50 mg once a month for 3–4 doses, on the same date each month, dose may be increased if inadequate response, increased to 100 mg once a month, review treatment if inadequate response to this higher dose after 3–4 doses

- CONTRA-INDICATIONS

  - Moderate or severe heart failure - severe active infection

- CAUTIONS

  - Active infection (do not initiate until active infections are controlled; discontinue if new serious infection develops until infection controlled) - demyelinating disorders (risk of exacerbation) - hepatitis B virus—monitor for active infection - history or development of malignancy - mild heart failure (discontinue if symptoms develop or worsen) - predisposition to infection - risk factors for dysplasia or carcinoma of the colon—screen for dysplasia regularly

- CAUTIONS, FURTHER INFORMATION

  - Tuberculosis: Active tuberculosis should be treated with standard treatment for at least 2 months before starting golimumab. Patients who have previously received adequate treatment for tuberculosis can start golimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting golimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with...
golimumab. Patients who have tested negative for latent tuberculosis, and those who are receiving or who have completed treatment for latent tuberculosis, should be monitored closely for symptoms of active infection.

**INTERACTIONS**  
Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**

- **Common or very common**  
  Asthenia, dizziness, dyspepsia, hypertension

- **Uncommon**  
  Alopecia, arthralgia, bone fractures, bronchospasm, cholelithiasis, colitis, constipation, demyelinating disorders, dermatitis, eye irritation, flushing, gastritis, gastro-oesophageal reflux disease, heart failure, hepatic disorders, hyperglycaemia, hyperlipidaemia, insomnia, interstitial lung disease, ischaemic coronary artery disorders, lymphoma, malignancy, melasma, menstrual disorders, new onset or worsening psoriasis, paraesthesia, Raynaud’s syndrome, stomatitis, taste disturbance, thrombosis, thyroid disorders, visual disturbance

- **Rare**  
  Impaired wound healing

- **Frequency not known**  
  Abdominal pain, anaemia, antibody formation, aplastic anaemia, blood disorders, depression, fever, headache, hypersensitivity reactions, injection-site reactions, leukopenia, lupus erythematosus-like syndrome, nausea, pancytopenia, pruritus, thrombocytopenia, worsening heart failure

**SIDE-EFFECTS, FURTHER INFORMATION**

Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises adequate contraception during treatment and for at least 6 months after last dose.

**PREGNANCY**

Use only if essential.

**BREAST FEEDING**

Manufacturer advises avoid during and for at least 6 months after treatment—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution—no information available.

**PRE-TREATMENT SCREENING**

Tuberculosis  
Patients should be evaluated for tuberculosis before treatment.

**MONITORING REQUIREMENTS**

Monitor for infection before, during, and for 5 months after treatment.

**DIRECTIONS FOR ADMINISTRATION**

For doses requiring multiple injections, each injection should be administered at a different site.  
Missed dose  
If dose administered more than 2 weeks late, subsequent doses should be administered on a new monthly due date.

**PATIENT AND CARER ADVICE**

An alert card should be provided.  
Tuberculosis  
All patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g., persistent cough, weight loss, and fever) develop.  
Blood disorders  
Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- **Golimumab for the treatment of psoriatic arthritis (April 2011)** NICE TA220  
  Golimumab is an option for the treatment of active and progressive psoriatic arthritis in adults only if:  
  - golimumab is used as described in the NICE guidance (August 2010) for other tumour necrosis factor (TNF) inhibitors, and  
  - the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose.  
  www.nice.org.uk/TA220

- **Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015)** NICE TA329  
  Golimumab is an option for treating moderately to severely active ulcerative colitis in adults whose disease has responded inadequately to conventional therapy including corticosteroids and mercaptopurine or azathioprine, or in adults who are intolerant to or have contra-indications for conventional therapies.

  Golimumab is recommended only if the manufacturer provides the 100 mg dose of golimumab at the same dose as the 50 mg dose, as agreed in the patient access scheme.

  The choice of treatment should be made on an individual basis and if more than one treatment is suitable, the least expensive should be chosen.

  Golimumab should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

  www.nice.org.uk/TA329

- **Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016)** NICE TA375  
  Golimumab, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if all the following criteria are met:
  - disease is severe, that is, a disease activity score (DAS28) greater than 5.1,
  - disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs),
  - the manufacturer provides golimumab as agreed in the patient access schemes.

  Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

  Patients currently receiving treatment with golimumab whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

  www.nice.org.uk/TA375

- **TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016)** NICE TA383  
  Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs).

  The response to treatment should be assessed 12 weeks after the start of treatment. Treatment should only be continued if there is clear evidence of response.

  Treatment with another tumour necrosis factor (TNF) alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

  www.nice.org.uk/TA383
Golimumab for the treatment of rheumatoid arthritis after the failure of previous disease-modifying antirheumatic drugs (June 2011—updated February 2016) NICE TA225

Golimumab, in combination with methotrexate, is an option for the treatment of rheumatoid arthritis in patients who have had an inadequate response to DMARDs, including a TNF inhibitor, if golimumab is used as described in the NICE technology appraisal guidance 195 (August 2010) for other TNF inhibitors, and the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose.

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2012) that golimumab (Simponi®) is accepted for restricted use within NHS Scotland at a dose of 50 mg, alone or in combination with methotrexate, for the treatment of active and progressive psoriatic arthritis in adults whose disease has not responded to adequate trials of at least two standard DMARDs, administered either individually or in combination.

All Wales Medicines Strategy Group (AWMSG) Decisions

The All Wales Medicines Strategy Group has advised (October 2016) that Golimumab (Simponi®) is recommended as an option for use within NHS Wales for the treatment of adults with severe, active non radiographic axial spondyloarthritis with objective signs of inflammation (indicated by elevated C reactive protein and/or magnetic resonance imaging evidence, who have had an inadequate response to, or are intolerant to non-steroidal anti-inflammatory drugs. The recommendation applies only if the approved Wales Patient Access Scheme (WPAS) is used or where the list/contract price is equivalent or lower.

MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

Simponi (Merk Sharp & Dohme Ltd)

Golimumab 100 mg per 1 ml Simponi 50mg/0.5ml solution for injection pre-filled disposable devices | 1 pre-filled disposable injection £762.97

Simponi 100mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection £1,525.94

Simponi 50mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £762.97

Infliximab

INDICATIONS AND DOSE

Severe active Crohn’s disease

BY INTRAVENOUS INFUSION

Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, then 5 mg/kg after 4 weeks, if condition has responded, then maintenance 5 mg/kg every 8 weeks

Fistulating Crohn’s disease

BY INTRAVENOUS INFUSION

Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, if condition has responded consult product literature for guidance on further doses

Severe active ulcerative colitis

BY INTRAVENOUS INFUSION

Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 8 weeks, discontinue if no response 14 weeks after initial dose

Rheumatoid arthritis (in combination with methotrexate)

BY INTRAVENOUS INFUSION

Adult: Initially 3 mg/kg, then 3 mg/kg after 2 weeks, followed by 3 mg/kg after 4 weeks, then 3 mg/kg every 8 weeks, dose to be increased only if response is inadequate after 12 weeks of initial treatment; increased in steps of 1.5 mg/kg every 8 weeks, increased if necessary up to 7.5 mg/kg every 8 weeks, alternatively increased if necessary to 3 mg/kg every 4 weeks, discontinue if no response by 12 weeks of initial infusion or after dose adjustment

Ankylosing spondylitis

BY INTRAVENOUS INFUSION

Adult: 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 6–8 weeks, discontinue if no response by 6 weeks of initial infusion

Psoriatic arthritis (in combination with methotrexate)

BY INTRAVENOUS INFUSION

Adult: 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, followed by 5 mg/kg every 8 weeks

Plaque psoriasis

BY INTRAVENOUS INFUSION

Adult: 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 8 weeks, discontinue if no response within 14 weeks of initial infusion

IMPORTANT SAFETY INFORMATION

Adequate resuscitation facilities must be available when infliximab is used.

CONTRA-INDICATIONS

Moderate or severe heart failure • severe infections

CAUTIONS

Demyelinating disorders (risk of exacerbation) • dermatomyositis • development of malignancy • hepatitis B virus—monitor for active infection • history of colon carcinoma (in inflammatory bowel disease) • history of dysplasia (in inflammatory bowel disease) • history of malignancy • history of prolonged immunosuppressant or PUVA treatment in patients with psoriasis • mild heart failure (discontinue if symptoms develop or worsen) • predisposition to infection (discontinue if new serious infection develops) • risk of delayed hypersensitivity reactions if drug-free interval exceeds 16 weeks (re-administration after interval exceeding 16 weeks not recommended)

CAUTIONS, FURTHER INFORMATION

Tuberculosis

Manufacturer advises to evaluate patients for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment for at least 2 months before starting infliximab. If latent tuberculosis is diagnosed, treatment should be started before commencing treatment with infliximab. Patients who have previously received adequate treatment for tuberculosis can start infliximab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting infliximab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with infliximab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis develop (e.g. persistent cough, weight loss and fever).

Hypersensitivity reactions

Hypersensitivity reactions (including fever, chest pain, hypotension, hypertension, dyspnoea, transient visual loss, pruritus, urticaria, serum sickness-like reactions, angioedema, anaphylaxis) reported during or within 1–2 hours after infusion (risk
greatest during first or second infusion or in patients who discontinue other immunosuppressants). Manufacturer advises prophylactic antipyretics, antihistamines, or hydrocortisone may be administered.

**INTERACTIONS** → Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**

- **Common or very common** Alopecia · arthralgia · constipation · diarrhoea · dizziness · dry skin · dyspepsia · ecchymosis · epistaxis · flushing · gastro-intestinal haemorrhage · gastro-oesophageal reflux · hyperhydrosis · hypertension · hypoaesthesia · hypotension · myalgia · new onset or worsening psoriasis · palpitation · paraesthesia · rash · sleep disturbances · tachycardia

- **Uncommon** Abnormal skin pigmentation · agitation · amnesia · arrhythmia · bradycardia · bullous eruption · cheilitis · cholecystitis · confusion · eye disorders · heart failure · hepatitis · hyperkeratosis · impaired healing · intestinal perforation · nervoussness · neuropathy · pancreatitis · peripheral ischaemia · pleurisy · pulmonary oedema · rosacea · seborrhoea · seizures · syncope · vaginitis

- **Rare** Demyelinating disorders · interstitial lung disease · leukaemia · lymphoma · melanoma · pericardial effusion · Stevens-Johnson syndrome · toxic epidermal necrolysis · vasospasm

- **Frequency not known** Abdominal pain · anaemia · antibody formation · aplastic anaemia · blood disorders · depression · fever · headache · hepatic failure · hepatosplenic T-cell lymphoma (more likely in inflammatory bowel disease) · hypersensitivity reactions · injection-site reactions · leucopenia · lupus erythematosus-like syndrome · Merkel cell carcinoma · nausea · pancytopenia · pruritus · thrombocytopenia · worsening heart failure · worsening symptoms of dermatomyositis

**SIDE-EFFECTS, FURTHER INFORMATION**

Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during and for at least 6 months after last dose.

**PREGNANCY** Use only if essential.

**BREAST FEEDING** Amount probably too small to be harmful.

**PRE-TREATMENT SCREENING** Tuberculosis Patients should be evaluated for tuberculosis before treatment.

**MONITORING REQUIREMENTS**

- Monitor for infection before, during, and for 6 months after treatment.
- All patients should be observed carefully for 1–2 hours after infusion and resuscitation equipment should be available for immediate use (risk of hypersensitivity reactions).
- Monitor for symptoms of delayed hypersensitivity if re-administered after a prolonged period.
- Manufacturer advises periodic skin examination for non-melanoma skin cancer, particularly in patients with risk factors.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Remicade®), give intermittently in Sodium chloride 0.9%; reconstitute each 100–mg vial with 10 mL water for injections using a 21-gauge or smaller needle; gently swirl vial without shaking to dissolve; allow to stand for 5 minutes; dilute requisite dose with infusion fluid to a final volume of 250 mL and give through a low protein-binding filter (1.2 micron or less) over at least 2 hours (adults over 18 years who have tolerated 3 initial 2-hour infusions may be given subsequent infusions of up to 6 mg/kg over at least 1 hour); start infusion within 3 hours of reconstitution.

**PRESCRIBING AND DISPENSING INFORMATION** Infliximab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

**PATIENT AND CARER ADVICE** An alert card should be provided. Tuberculosis Patients and carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop. Blood disorders Patients and carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop. Hypersensitivity reactions Patients and carers should be advised to keep Alert card with them at all times and seek medical advice if symptoms of delayed hypersensitivity develop.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- **Infliximab for plaque psoriasis in adults (January 2008)** NICE TA134
  - Infliximab is recommended for the treatment of very severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) or to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Infliximab should be withdrawn if the response is not adequate after 10 weeks.
  - www.nice.org.uk/TA134

- **Infliximab for acute exacerbations of ulcerative colitis** (December 2008) NICE TA163
  - Infliximab is recommended as an option for the treatment of acute exacerbations of severe ulcerative colitis when treatment with ciclosporin is contra-indicated or inappropriate.
  - www.nice.org.uk/TA163

- **Infliximab and adalimumab for Crohn's disease** (May 2010) NICE TA187
  - Infliximab is recommended for the treatment of severe active Crohn's disease that has not responded to conventional therapy (including corticosteroids and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contra-indications; infliximab can also be used in a similar way in children over 6 years of age. In adults over 18 years of age, infliximab is recommended for the treatment of fistulating Crohn's disease that has not responded to conventional therapy (including antibacterials, drainage, and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contra-indications.
  - Infliximab should be given as a planned course of treatment for 12 months or until treatment failure, whichever is shorter. Treatment should be continued beyond 12 months only if there is evidence of active disease—in these cases the need for treatment should be reviewed at least annually. If the disease relapses after stopping treatment, infliximab can be restarted.
  - www.nice.org.uk/TA187

- **Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor** (August 2010) NICE TA195
  - Infliximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.
  - www.nice.org.uk/TA195
Musculoskeletal system

▶ Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010) NICE TA199

Etanercept is recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination). Infliximab should be discontinued if there is an inadequate response at 12 weeks.

www.nice.org.uk/TA199

▶ Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015) NICE TA329

Infliximab is an option for treating moderately to severely active ulcerative colitis in adults whose disease has responded inadequately to conventional therapy including corticosteroids and mercaptapontine or azathioprine, or in adults who are intolerant to or have contra-indications for conventional therapies.

The choice of treatment should be made on an individual basis and if more than one treatment is suitable, the least expensive should be chosen.

Infliximab should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

www.nice.org.uk/TA329

▶ Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375

Infliximab, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1, and,
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs).

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving infliximab whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA375

▶ TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016) NICE TA383

Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs). Infliximab is recommended only if treatment is started with the least expensive infliximab product.

Patients currently receiving infliximab should continue treatment with the same infliximab product until they and their clinician considers it appropriate to stop.

The response to treatment should be assessed 12 weeks after the start of treatment and should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF)-alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

www.nice.org.uk/TA383

PHOSPHODIESTERASE TYPE-4 INHIBITORS

Apremilast

13-Apr-2017

▶ DRUG ACTION

Apremilast inhibits the activity of phosphodiesterase type-4 (PDE4) which results in suppression of pro-inflammatory mediator synthesis and promotes anti-inflammatory mediators.

▶ INDICATIONS AND DOSE

Active psoriatic arthritis (in combination with disease-modifying antirheumatic drugs or alone) in patients who have had an inadequate response or who have been intolerant to a prior disease-modifying antirheumatic drug therapy / Moderate to severe chronic plaque psoriasis that has not responded to standard systemic treatments or photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications

▶ BY MOUTH

Adult: Initially 10 mg daily on day 1, then 10 mg twice daily on day 2, then 10 mg in the morning and 20 mg in the evening on day 3, then 20 mg twice daily on day 4, then 20 mg in the morning and 30 mg in the evening on day 5, then maintenance 30 mg twice daily, doses should be taken approximately 12 hours apart; review treatment if no response within 24 weeks of initiation

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JANUARY 2017): APREMLAST (OTEZLA®): RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR

A review of evidence from clinical trials and postmarketing cases has suggested a causal association between apremilast and suicidal thoughts and behaviour.

▶ CAUTIONS

Concomitant use of drugs likely to cause psychiatric symptoms — history of psychiatric illness — body weight—consider discontinuation if weight loss is unexplained or clinically significant

▶ INTERACTIONS

Common or very common

Back pain • bronchitis • cough • decreased appetite • depression • diarrhoea • dyspepsia • fatigue • gastroesophageal reflux disease • headache • insomnia • migraine • nasopharyngitis • nausea • tension headache • upper abdominal pain • upper respiratory tract infections • vomiting
Uncommon Rash • suicidal ideation and behaviour • weight loss

CONCEPTION AND CONTRACEPTION Exclude pregnancy before treatment and ensure effective contraception during treatment.

PREGNANCY Avoid—teratogenic in animal studies.

BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

RENAL IMPAIRMENT Reduce dose if eGFR less than 30 mL/minute/1.73 m²; consult product literature for initial dose titration.

MONITORING REQUIREMENTS

Manufacturer advises monitor body-weight regularly in patients underweight at the start of treatment.

Manufacturer advises monitor for psychiatric symptoms (including depression, suicidal ideation and behaviour)—discontinue treatment if new or worsening psychiatric symptoms are identified.

PATIENT AND CARER ADVICE

Manufacturer advises patients and carers should be instructed to notify the prescriber of any changes in behaviour or mood, and of any suicidal ideation.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Apremilast for treating active psoriatic arthritis (February 2017) NICE TA433

Apremilast, alone or in combination with disease-modifying antirheumatic drugs (DMARDs), is recommended as an option for treating active psoriatic arthritis in adults only if:

• they have peripheral arthritis with 3 or more tender joints and 3 or more swollen joints and
• their disease has not responded to adequate trials of at least 2 standard DMARDs, given either alone or in combination and
• the manufacturer provides apremilast with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA433

Apremilast for treating moderate to severe plaque psoriasis (November 2016) NICE TA419

Apremilast is recommended as an option for treating chronic plaque psoriasis in patients whose disease has not responded to other systemic therapies, including ciclosporin, methotrexate and PUVA, or when these treatments are contra-indicated or not tolerated, only if:

• the disease is severe, as defined by a total Psoriasis Area Severity Index (PASI) of 10 or more and a Dermatology Life Quality Index (DLQI) of more than 10 and
• treatment is stopped if the psoriasis has not responded adequately at 16 weeks (defined as a 75% reduction in the PASI score (PASI 75) from when treatment started or a 50% reduction in the PASI score (PASI 50) and a 5-point reduction in DLQI from start of treatment), and
• the manufacturer provides apremilast with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA419

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2015) that apremilast (Otezla®) is accepted for restricted use within NHS Scotland for the treatment of active psoriatic arthritis in patients who have had an inadequate response with at least two prior Disease Modifying Antirheumatic Drug (DMARD) therapies or who are intolerant to such therapies.

MEDICINAL FORMS

2 Hyperuricaemia and gout

Gout

Overview

It is important to distinguish drugs used for the treatment of acute attacks of gout from those used in the long-term control of the disease. The latter exacerbate and prolong the acute manifestations if started during an attack. The management of gout in adolescents requires specialist supervision.

Acute attacks of gout

Acute attacks of gout are usually treated with high doses of NSAIDs such as diclofenac sodium p. 1034, diclofenac potassium p. 1033, etoricoxib p. 1038, indometacin p. 1043, ketoprofen p. 1044, naproxen p. 1048 or sulindac p. 1051. Colchicine p. 1020 is an alternative in patients in whom NSAIDs are contra-indicated. Aspirin p. 117 is not indicated in gout. Allopurinol p. 1021, febuxostat p. 1021, and uricosurics are not effective in treating an acute attack and may prolong it indefinitely if started during the acute episode.

The use of colchicine is limited by the development of toxicity at higher doses, but it is of value in patients with heart failure since, unlike NSAIDs, it does not induce fluid retention; moreover, it can be given to patients receiving anticoagulants.

Oral or parenteral corticosteroids are an effective alternative in those who cannot tolerate NSAIDs or who are resistant to other treatments. Intra-articular injection of a corticosteroid can be used in acute monoarticular gout [unlicensed indication]. A corticosteroid by intramuscular injection can be effective in podagra.

Canakinumab p. 794, a recombinant monoclonal antibody, can be used for the symptomatic treatment of frequent gouty arthritis attacks (at least 3 in the previous 12 months). It is licensed for use in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine, or who are intolerant of them.

Long-term control of gout

Frequent recurrence of acute attacks of gout, the presence of tophi, or signs of chronic gouty arthritis may call for the initiation of long-term (“interval”) treatment. For long-term control of gout the formation of uric acid from purines may be reduced with the xanthine-oxidase inhibitors allopurinol or febuxostat alternatively the uricosuric drug sulfinpyrazone p. 1020 may be used to increase the excretion of uric acid in the urine. Treatment should be continued indefinitely to prevent further attacks of gout by correcting the hyperuricaemia. These drugs should never be started during an acute attack; they are usually started 1–2 weeks...
after the attack has settled. The initiation of treatment may precipitate an acute attack, and therefore an anti-inflammatory analgesic or colchicine should be used as a prophylactic and continued for at least one month after the hyperuricaemia has been corrected. However, if an acute attack develops during treatment, then the treatment should continue at the same dosage and the acute attack treated in its own right.

Allopurinol is widely used and is especially useful in patients with renal impairment or urate stones when uricosuric drugs cannot be used; it is not indicated for the treatment of asymptomatic hyperuricaemia. It can cause rashes.

Febuxostat is licensed for the treatment of chronic hyperuricaemia where urate deposition has already occurred; it is not indicated for patients in whom the rate of urate formation is greatly increased, such as in malignant disease or in Lesch-Nyhan syndrome.

Sulfinpyrazone can be used instead of allopurinol or in conjunction with it in cases that are resistant to treatment.

Benzbromarone (available from ‘special-order’ manufacturers or specialist importing companies) is a uricosuric drug that can be used in patients with mild renal impairment.

Crystalisation of urate in the urine can occur with the uricosuric drugs and it is important to ensure an adequate urine output especially in the first few weeks of treatment. As an additional precaution the urine may be rendered alkaline.

Aspirin and other salicylates antagonise the uricosuric drugs; they do not antagonise allopurinol but are nevertheless not indicated in gout.

**ALKALOIDS † PLANT ALKALOIDS**

### Colchicine

**INDICATIONS AND DOSE**

- **Acute gout**
  - **BY MOUTH**
  - Adult: 500 micrograms 2–4 times a day until symptoms relieved, maximum 6 mg per course, do not repeat course within 3 days

- **Short-term prophylaxis during initial therapy with allopurinol and uricosuric drugs**
  - **BY MOUTH**
  - Adult: 500 micrograms twice daily

- **Prophylaxis of familial Mediterranean fever (recurrent polyserositis)**
  - **BY MOUTH**
  - Adult: 0.5–2 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises reduce dose by half with concurrent use of moderate inhibitors of CYP3A4. Manufacturer advises reduce dose by 75% (to one quarter of usual dose) with concurrent use of potent inhibitors of CYP3A4 or P-glycoprotein inhibitors; avoid concurrent use in patients with hepatic or renal impairment.

**UNLICENSED USE** BNF doses may differ from those in the product literature. Use of colchicine for prophylaxis of familial Mediterranean fever (recurrent polyserositis) is an unlicensed indication.

**CONTRA-INDICATIONS** Blood disorders

**CAUTIONS** Cardiac disease · elderly · gastro-intestinal disease

**INTERACTIONS** → Appendix 1: colchicine

**SIDE-EFFECTS**

- Common or very common Abdominal pain · nausea · vomiting
- Rare Alopecia · blood disorders with prolonged treatment · inhibition of spermatogenesis · myopathy · peripheral neuritis
- **Frequency not known** Excessive doses may cause profuse diarrhoea · gastrointestinal haemorrhage · hepatic damage · rash · renal damage

**PREGNANCY** Avoid—teratogenicity in animal studies.

**BREAST FEEDING** Present in milk but no adverse effects reported. Manufacturers advise caution.

**HEPATIC IMPAIRMENT** Use with caution.

**RENAL IMPAIRMENT** Reduce dose or increase dosage interval if eGFR 10–50 mL/minute/1.73 m². Avoid if eGFR less than 10 mL/minute/1.73 m².

**MEDICINAL FORMS**

- **Tablet**
  - Colchicine (Non-proprietary)
  - Colchicine 500 microgram Colchicine 500microgram tablets | 100 tablet £45.56 DT price = £14.28

### Sulfinpyrazone

(Sulphinpyrazone)

**INDICATIONS AND DOSE**

- **Gout prophylaxis | Hyperuricaemia**
  - **BY MOUTH**
  - Adult: Initially 100–200 mg daily, dose to be taken with food (or milk); increased to 600–800 mg daily over 2–3 weeks, 800 mg daily is rarely given; continue until serum uric acid concentration normal then reduce dose for maintenance (maintenance dose may be as low as 200 mg daily)

**CONTRA-INDICATIONS** Acute gout attack · acute polyphorias p. 969 · history of blood disorders · peptic ulceration

**CAUTIONS** Cardiac disease (may cause salt and water retention) · ensure adequate fluid intake (about 2–3 litres daily) and render urine alkaline during initial treatment

**INTERACTIONS** → Appendix 1: sulfinpyrazone

**SIDE-EFFECTS**

- Rare Acute renal failure · blood disorders · gastrointestinal bleeding · gastrointestinal ulceration · hepatitis · jaundice · raised liver enzymes
- **Frequency not known** Allergic skin reactions · gastrointestinal disturbances · salt retention · water retention

**ALLERGY AND CROSS-SENSITIVITY** Avoid in hypersensitivity to aspirin, salicylates, NSAIDs.

**PREGNANCY** Manufacturer advises caution—no information available.

**BREAST FEEDING** No information available.

**HEPATIC IMPAIRMENT** Avoid in severe impairment.

**RENAL IMPAIRMENT** Reduce dose. Avoid in severe impairment.

**MONITORING REQUIREMENTS** Regular blood counts before treatment and at regular intervals during treatment.

**MEDIINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.
- **No licensed medicines listed.**
Xanthine Oxidase Inhibitors

Allopurinol

■ INDICATIONS AND DOSE

Prophylaxis of gout and of uric acid and calcium oxalate renal stones | Prophylaxis of hyperuricaemia associated with cancer chemotherapy

▲ BY MOUTH
Adult: Initially 100 mg daily, for maintenance adjust dose according to plasma or urinary uric acid concentration, dose to be taken preferably after food

Prophylaxis of gout and of uric acid and calcium oxalate renal stones (usual maintenance in mild conditions) | Prophylaxis of hyperuricaemia associated with cancer chemotherapy (usual maintenance in mild conditions)

▲ BY MOUTH
Adult: 100–200 mg daily, dose to be taken preferably after food

Prophylaxis of gout and of uric acid and calcium oxalate renal stones (usual maintenance in moderately severe conditions) | Prophylaxis of hyperuricaemia associated with cancer chemotherapy (usual maintenance in moderately severe conditions)

▲ BY MOUTH
Adult: 300–600 mg daily in divided doses (max. per dose 300 mg), dose to be taken preferably after food

■ CONTRA-INDICATIONS Not a treatment for acute gout but continue if attack develops when already receiving allopurinol, and treat attack separately

■ CAUTIONS Ensure adequate fluid intake (2–3 litres/day) for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy

CAUTIONS, FURTHER INFORMATION
Administer prophylactic NSAID (not aspirin or salicylates) or colchicine until at least 1 month after hyperuricaemia corrected (usually for first 3 months) to avoid precipitating an acute attack.

■ INTERACTIONS ▲ Appendix 1: allopurinol

■ SIDE-EFFECTS

▲ Common or very common Gastro-intestinal disorders - rashes (withdraw therapy; if rash mild re-introduce cautiously but discontinue promptly if recurrence)

▲ Rare Alopecia · alopaeic anaemia · arthralgia · blood disorders · drowsiness · eosinophilia resembling Stevens-Johnson syndrome · eosinophilia resembling toxic epidermal necrolysis · exfoliation · fever · gyneraenastia · haemolytic anaemia · headache · hepatitis · hepatotoxicity · hypersensitivity reactions · hypertension · leucopenia · lymphadenopathy · malaise · neuropathy · paraesthesia · renal impairment · taste disturbances · thrombocytopenia · vasculitis · vertigo · visual disturbances

▲ Very rare Seizures

■ PREGNANCY Toxicity not reported. Manufacturer advises use only if no safer alternative and disease carries risk for mother or child.

■ BREAST FEEDING Present in milk—not known to be harmful.

■ HEPATIC IMPAIRMENT Reduce dose.

■ RENAL IMPAIRMENT Max. 100 mg daily, increased only if response inadequate; in severe impairment, reduce daily dose below 100 mg, or increase dose interval; if facilities available, adjust dose to maintain plasma-oxipurinol concentration below 100 micromol/litre.

■ MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, mouthwash

■ Tablet

CAUTIONARY AND ADVISORY LABELS 8, 21, 27

▲ Allopurinol (Non-proprietary)
Allopurinol 100 mg | 28 tablet DT price = £0.77
Allopurinol 300 mg | 28 tablet DT price = £0.85

▲ Uricto (Ennogen Pharma Ltd)
Allopurinol 100 mg | 28 tablet DT price = £1.25
Allopurinol 300 mg | 28 tablet DT price = £0.94

▲ Zyloric (Aspen Pharma Trading Ltd)
Allopurinol 100 mg | 100 tablet DT price = £10.19
Allopurinol 300 mg | 28 tablet DT price = £0.85

Febuxostat

■ INDICATIONS AND DOSE

Treatment of chronic hyperuricaemia in gout

▲ BY MOUTH
Adult: Initially 80 mg once daily, if after 2–4 weeks of initial dose, serum uric acid greater than 6 mg/100 mL then increase dose; increased if necessary to 120 mg once daily

Prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematologic malignancies

▲ BY MOUTH
Adult: 120 mg once daily, to be started 2 days before start of cytotoxic therapy and continued for 7–9 days, according to chemotherapy duration

■ IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS (JUNE 2012)

There have been rare but serious reports of hypersensitivity reactions, including Stevens-Johnson syndrome and acute anaphylactic shock with febuxostat.

Patients should be advised of the signs and symptoms of severe hypersensitivity; febuxostat must be stopped immediately if these occur (early withdrawal is associated with a better prognosis), and must not be restarted in patients who have ever developed a hypersensitivity reaction to febuxostat. Most cases occur during the first month of treatment; a prior history of hypersensitivity to allopurinol and/or renal disease may indicate potential hypersensitivity to febuxostat.

■ CONTRA-INDICATIONS Not a treatment for acute gout but continue if attack develops when already receiving febuxostat, and treat attack separately

■ CAUTIONS Congestive heart failure · ischaemic heart disease · thyroid disorders · transplant recipients

CAUTIONS, FURTHER INFORMATION

Administer prophylactic NSAID (not aspirin or salicylates) or colchicine for at least 1 month after hyperuricaemia associated with a better prognosis, and must not be continued if these occur (early withdrawal is associated with a better prognosis), and must not be restarted in patients who have ever developed a hypersensitivity reaction to febuxostat. Most cases occur during the first month of treatment; a prior history of hypersensitivity to allopurinol and/or renal disease may indicate potential hypersensitivity to febuxostat.

■ INTERACTIONS ▲ Appendix 1: febuxostat

■ SIDE-EFFECTS

▲ Common or very common Abnormal liver function tests · gastro-intestinal disturbances · headache · oedema · rash
Uncommon Renal failure • appetite change • arthralgia • arthritis • atrial fibrillation • bronchitis • bursitis • chest pain • cholelithiasis • cough • decreased libido • dermatitis • diabetes mellitus • dizziness • drowsiness • dyspnoea • ECG abnormalities • erectile dysfunction • flushing • haematuria • haemophilia • hyperlipidaemia • hypertension • hypoaesthesia • increased thyroid stimulating hormone • increased urinary frequency • insomnia • muscle spasm • muscle weakness • myalgia • nephrolithiasis • palpitation • paraesthesia • proteinuria • smell disturbances • taste disturbances • upper respiratory tract infection • weight change

Rare Asthenia • blurred vision • hepatitis • jaundice • mouth ulceration • nervousness • pancreatitis • pancytopenia • rhabdomyolysis • thirst • thrombocytopenia • tinnitus • tubulointerstitial nephritis

Pregnancy Manufacturer advises avoid—limited information available.

Breast Feeding Manufacturer advises avoid—present in milk in animal studies.

Hepatic Impairment Max. 80 mg daily in mild impairment. No dose information available in moderate or severe impairment.

Renal Impairment Use with caution if eGFR less than 30 mL/minute/1.73 m²—no information available.

Pre-treatment Screening Monitor liver function tests before treatment as indicated.

Monitoring Requirements Monitor liver function tests periodically during treatment as indicated.

National Funding/Access Decisions

NICE Technology Appraisals (TAs)

Febuxostat for the management of hyperuricaemia in patients with gout (December 2008) NICE TA164

Febuxostat is recommended as an option for the management of chronic hyperuricaemia in gout only for patients who are intolerant of allopurinol or for whom allopurinol is contra-indicated.

For the purposes of this guidance, intolerance of allopurinol is defined as adverse effects that are sufficiently severe to warrant discontinuation, or to prevent full dose escalation for optimal effectiveness. www.nice.org.uk/TA164

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium issued similar advice to NICE guidance: Febuxostat for the management of hyperuricaemia in patients with gout (December 2008), in August 2010.

The Scottish Medicines Consortium has advised (June 2016) that febuxostat (Adenuric®) is accepted for restricted use within NHS Scotland for the prevention and treatment of hyperuricaemia in patients undergoing chemotherapy for haematological malignancies at intermediate to high risk of tumour lysis syndrome, only when allopurinol is not tolerated or contra-indicated.

Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Febuxostat (Non-proprietary)
  - Febuxostat 80 mg Febuxostat 80mg tablets | 28 tablet no price available DT price = £24.36
  - Febuxostat 120 mg Febuxostat 120mg tablets | 28 tablet no price available DT price = £24.36
- Adenuric (A. Menarini Farmaceutica Internazionale SRL)
  - Febuxostat 80 mg Adenuric 80mg tablets | 28 tablet £24.36
  - Febuxostat 120 mg Adenuric 120mg tablets | 28 tablet £24.36

3 Neuromuscular disorders

Neuromuscular disorders

Drugs that enhance neuromuscular transmission

Anticholinesterases are used as first-line treatment in oculare myasthenia gravis and as an adjunct to immunosuppressant therapy for generalised myasthenia gravis.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine p. 787 is frequently used to reduce the dose of corticosteroid.

Plasmapheresis or infusion of intravenous immunoglobulin [unlicensed indication] may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thymectomy.

Anticholinesterases

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntory muscle in myasthenia gravis. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine sulfate p. 1224.

Neostigmine p. 1024 produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine sulfate or propantheline bromide p. 84 may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. The maximum that most patients can tolerate is 180 mg daily.

Pyridostigmine bromide p. 1025 is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastrointestinal effect but an antimuscarinic drug may still be required.

Neostigmine is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs.

Immunosuppressant therapy

Corticosteroids are established as treatment for myasthenia gravis; although they are commonly given on alternate days there is little evidence of benefit over daily administration. Corticosteroid treatment is usually initiated under in-patient supervision and all patients should receive osteoporosis prophylaxis.

In generalised myasthenia gravis prednisolone p. 639 is given. About 10% of patients experience a transient but very serious worsening of symptoms in the first 2–3 weeks, especially if the corticosteroid is started at a high dose.

Smaller doses of corticosteroid are usually required in oculare myasthenia. Once clinical remission has occurred (usually after 2–6 months), the dose of prednisolone should be reduced slowly to the minimum effective dose.

In generalised myasthenia gravis azathioprine is usually started at the same time as the corticosteroid and it allows a lower maintenance dose of the corticosteroid to be used.

Ciclosporin p. 788, methotrexate p. 844, or mycophenolate mofetil p. 796 can be used in patients unresponsive or intolerant to other treatments [unlicensed indications].
Acetylcholine-release enhancers

Amifampridine p. 1025 is licensed for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS), a rare disorder of neuromuscular transmission.

Fampridine p. 799 is licensed for the improvement of walking in patients with multiple sclerosis p. 797 who have a walking disability.

Skeletal muscle relaxants

The drugs described are used for the relief of chronic muscle spasm or spasticity associated with multiple sclerosis p. 797 or other neurological damage; they are not indicated for spasm associated with minor injuries. Baclofen, diazepam, and tizanidine act principally on the central nervous system. Dantrolene has a peripheral site of action; cannabis extract has both a central and a peripheral action. Skeletal muscle relaxants differ in action from the muscle relaxants used in anaesthesia, which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

Baclofen p. 1026 inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

A cannabis extract p. 1026 containing dronabinol (delta-9-tetrahydrocannabinol) and cannabidiol is licensed as an adjunct treatment for moderate to severe spasticity associated with multiple sclerosis in patients who have not responded adequately to other skeletal muscle relaxants. The dose should be titrated over 2 weeks; response to treatment should be reviewed after 4 weeks and treatment stopped if an adequate response is not achieved.

Dantrolene sodium p. 1236 acts directly on skeletal muscle and produces fewer central adverse effects making it a drug of choice. The dose should be increased slowly. Diazepam p. 327 can also be used. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties. Muscle-relaxant doses of benzodiazepines are similar to anxiolytic doses.

Tizanidine p. 1027 is an alpha2-adrenoceptor agonist indicated for spasticity associated with multiple sclerosis or spinal cord injury.

Other muscle relaxants

The clinical efficacy of methocarbamol p. 1027 and meprobamate p. 330 as muscle relaxants is not well established, although they have been included in compound analgesic preparations.

CAUTIONS, FURTHER INFORMATION

Interstial lung disease Perform chest radiography if symptoms such as dry cough or dyspnoea develop; discontinue if interstitial lung disease is diagnosed.

INTERACTIONS → Appendix 1: riluzole

SIDE-EFFECTS

Common or very common Abdominal pain · asthenia · diarrhoea · dizziness · drowsiness · headache · nausea · oral paraesthesia · tachycardia · vomiting

Uncommon Anaemia · angioedema · interstitial lung disease · pancreatitis

Rare Neutropenia

Very rare Hepatitis

SIDE-EFFECTS, FURTHER INFORMATION

Neutropenia White blood cell counts should be determined in febrile illness; neutropenia requires discontinuation of riluzole.

PREGNANCY Avoid—no information available.

BREAST FEEDING Avoid—no information available.

HEPATIC IMPAIRMENT Avoid.

RENAL IMPAIRMENT Avoid—no information available.

PATIENT AND CARER ADVICE

Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever occur.

Driving and skilled tasks Dizziness or vertigo may affect performance of skilled tasks (e.g. driving).

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Riluzole for motor neurone disease (January 2001) NICE TA20

Riluzole is recommended for treating the amyotrophic lateral sclerosis (ALS) form of motor neurone disease (MND). Treatment should be initiated by a specialist in MND but it can then be supervised under a shared-care arrangement involving the general practitioner. www.nice.org.uk/TA20

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder

Oral suspension

Teglutik (Martindale Pharmaceuticals Ltd)

Riluzole 5 mg per 1 ml Teglutik 5mg/1ml oral suspension sugar-free | 300 ml £100.00 DT price = £100.00

History of abnormal hepatic function (consult product literature for details) · interstitial lung disease
3.1 Muscular dystrophy

**DRUGS FOR NEUROMUSCULAR DISORDERS**

**Ataluren**  
- **DRUG ACTION** Ataluren restores the synthesis of dystrophin by allowing ribosomes to read through premature stop codons that cause incomplete dystrophin synthesis in nonsense mutation Duchenne muscular dystrophy.

- **INDICATIONS AND DOSE**  
  Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients (initiated by a specialist)  
  - **BY MOUTH**  
    - Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: ataluren

- **SIDE-EFFECTS**  
  - **Common or very common** Abdominal discomfort - constipation - cough - decreased appetite - diarrhoea - enuresis - epistaxis - flatulence - haematuria - headache - hypertension - hypertriglyceridaemia - musculoskeletal chest pain - nausea - pain in extremity - pyrexia - rash - upper abdominal pain - vomiting - weight loss
  - **Frequency not known** Changes in renal function tests - raised cholesterol

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises discontinue breastfeeding—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises close monitoring—safety and efficacy not established.

- **RENAL IMPAIRMENT** Manufacturer advises close monitoring—safety and efficacy not established.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor renal function at least every 6–12 months, and cholesterol and triglyceride concentrations at least annually.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises the contents of each sachet should be mixed with at least 30 mL of liquid (water, milk, fruit juice), or 3 tablespoons of semi-solid food (yoghurt or apple sauce).

- **PATIENT AND CARER ADVICE** Manufacturer advises patients should maintain adequate hydration during treatment.

  **Missed doses**  
  Manufacturer advises if a morning or midday dose is more than 3 hours late, or an evening dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) Decisions**  
  The Scottish Medicines Consortium has advised (April 2016) that ataluren (Translarna<sup>®</sup>) is not recommended for use within NHS Scotland for the treatment of Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients aged 5 years and older as the economic case was not demonstrated.

**Granules**  
- **Translarna** (PTC Therapeutics Ltd)  
  - Ataluren 125 mg Translarna 125 mg granules for oral suspension sachets | 30 sachet (PoM) no price available
  - Ataluren 250 mg Translarna 250 mg granules for oral suspension sachets | 30 sachet (PoM) no price available
  - Ataluren 1 gram Translarna 1,000 mg granules for oral suspension sachets | 30 sachet (PoM) no price available

---

3.2 Myasthenia gravis and Lambert-Eaton myasthenic syndrome

**ANTICHOLINESTERASES**

**Anticholinesterases**

- **DRUG ACTION** They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase.

- **CONTRA-INDICATIONS** Intestinal obstruction - urinary obstruction

- **CAUTIONS** Arrhythmias - asthma (extreme caution) - atropine or other antidote to muscarinic effects may be necessary (particularly when neostigmine is given by injection) but not given routinely because it may mask signs of overdosage - bradycardia - epilepsy - hyperthyroidism - hypotension - parkinsonism - peptic ulceration - recent myocardial infarction - vagotonia

- **SIDE-EFFECTS** Abdominal cramps (more marked with higher doses) - diarrhoea - increased salivation - nausea - vomiting

**Overdose**

Signs of overdosage include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation, involuntary micturition, miosis, nyctagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness eventually leading to fasciculation and paralysis.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Amount probably too small to be harmful.

**Neostigmine**

*(Neostigmine methylsulfate)*

- **INDICATIONS AND DOSE**  
  Treatment of myasthenia gravis  
  - **BY MOUTH**  
    - Adult: Initially 15–30 mg, dose repeated at suitable intervals throughout the day, total daily dose 75–300 mg, the maximum that most patients can tolerate is 180 mg daily
  - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**  
    - Adult: 1–2.5 mg, dose repeated at suitable intervals throughout the day (usual total daily dose 5–20 mg)

**Reversal of non-depolarising (competitive) neuromuscular blockade**

- **BY INTRAVENOUS INJECTION**  
  - Adult: 2.5 mg (max. per dose 5 mg), repeated if necessary after or with glycopyrronium or atropine, to be given over 1 minute
Nocturnal leg cramps 1025

**CAUTIONS** Glycopyrronium or atropine should also be given when reversing neuromuscular blockade

**INTERACTIONS** → Appendix 1: neostigmine

**RENAI IMPAIRMENT** May need dose reduction.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Solution for injection**
- **Neostigmine (Non-proprietary)**
  - Neostigmine metilsulfate 2.5 mg per 1 ml
  - Neostigmine 2.5mg/1ml solution for injection ampoules | 10 ampoule £5.06-£5.45

**Tablet**
  - **Neostigmine (Non-proprietary)**
  - Neostigmine bromide 15 mg | Neostigmine 15mg tablets | 140 tablet £95.60 DT price = £95.60

**Pyridostigmine bromide**

**DRUG ACTION** Pyridostigmine bromide has weaker muscarinic action than neostigmine.

**INDICATIONS AND DOSE**

**Myasthenia gravis**
- Initially by mouth
- Adult: 30–120 mg, doses to be given at suitable intervals throughout day; (by mouth) usual dose 0.3–1.2 g daily in divided doses, it is inadvisable to exceed a total daily dose of 450 mg in order to avoid acetylcholine receptor down-regulation; patients requiring doses exceeding 450 mg daily will usually require input from a specialised neuromuscular service. Immunosuppressant therapy is usually considered if the dose of pyridostigmine exceeds 360 mg daily

**INTERACTIONS** → Appendix 1: pyridostigmine

**RENAI IMPAIRMENT** Reduce dose; excreted by kidney.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
- **Pyridostigmine bromide (Non-proprietary)**
  - Pyridostigmine bromide 60 mg | Pyridostigmine bromide 60mg tablets | 200 tablet £45.54 DT price = £45.54
  - **Mestinon** (Meda Pharmaceuticals Ltd)
  - Pyridostigmine bromide 60 mg | Mestinon 60mg tablets | 200 tablet £45.57 DT price = £45.54

**CHOLINERGIC RECEPTOR STIMULATING DRUGS**

**Amifampridine**

**INDICATIONS AND DOSE**

**Symptomatic treatment of Lambert-Eaton myasthenic syndrome (specialist use only)**
- **BY MOUTH**
- Adult: Initially 15 mg daily in 3 divided doses, then increased in steps of 5 mg every 4–5 days, increased to up to 60 mg daily in 3–4 divided doses (max. per dose 20 mg); maximum 60 mg per day

**CONTRA-INDICATIONS** Congenital QT syndromes • epilepsy • uncontrolled asthma

**CAUTIONS** Non-paraneoplastic form of Lambert- Eaton myasthenic syndrome

**INTERACTIONS** → Appendix 1: amifampridine

**SIDE-EFFECTS** Anxiety • arrhythmias • blurred vision • bronchial hypersecretion • chorea • convulsions • cough • dizziness • drowsiness • exacerbation or precipitation of asthma • gastro-intestinal disorders • headache • myoclonia • palpitations • paraesthesia • Raynaud’s syndrome • sleep disturbances • weakness

**CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.

**PREGNANCY** Manufacturer advises avoid.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** In mild impairment reduce initial dose to 10 mg daily in divided doses, increased in steps of 5 mg every 7 days. In moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days. Use with caution.

**RENAI IMPAIRMENT** In mild impairment reduce initial dose to 10 mg daily in divided doses, increased in steps of 5 mg every 7 days. In moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days. Use with caution.

**MONITORING REQUIREMENTS** Clinical and ECG monitoring required at treatment initiation and yearly thereafter.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium (SMC) has advised (July 2012) that amifampridine phosphate (Firdapse®) is not recommended for use within NHS Scotland for the symptomatic treatment of Lambert–Eaton myasthenic syndrome (LEMS).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Tablet**
- **CAUTIONARY AND ADVISORY LABELS** 3, 21
- **Firdapse** (BioMarin Europe Ltd)
- Amifampridine (as Amifampridine phosphate) 10 mg | Firdapse 10mg tablets | 100 tablet £1,815.00

3.3 Nocturnal leg cramps

**Quinine salts**
Quinine salts p. 586, such as quinine sulfate are effective in reducing the frequency of nocturnal leg cramps by about 25% in ambulatory patients; however, because of potential toxicity, quinine is not recommended for routine treatment and should not be used unless cramps cause regular disruption to sleep. Quinine should only be considered when cramps are very painful or frequent; when other treatable causes of cramp have been excluded; and when non-pharmacological treatments have not worked (e.g. passive stretching exercises). It may take up to 4 weeks for improvement to become apparent; if there is benefit, quinine treatment can be continued. Treatment should be interrupted at intervals of approximately 3 months to assess the need for further quinine treatment. In patients taking quinine long term, a trial discontinuation may be considered. Quinine is toxic in overdosage and accidental fatalities have occurred.
3.4 Spasticity

Other drugs used for Spasticity Dantrolene sodium, p. 1236
• Diazepam, p. 327

CANNABINOIDS

Cannabis extract

● INDICATIONS AND DOSE
Adjuvant in moderate to severe spasticity in multiple sclerosis (specialist use only)
  • BY Buccal administration
  • Adult: (consult product literature)

● CONTRA-INDICATIONS Family history of psychosis • history of other severe psychiatric disorder • personal history of psychosis

● CAUTIONS History of epilepsy • significant cardiovascular disease

● INTERACTIONS → Appendix 1: cannabis extract

● SIDE-EFFECTS
  • Common or very common Amnesia • blurred vision • constipation • depression • diarrhoea • disorientation • dissociation • dizziness • drowsiness • dry mouth • dysarthria • impaired attention • increased or decreased appetite • malaise • mood disturbance • mouth ulcers • nausea • oral pain • taste disturbance • vertigo • vomiting
  • Uncommon Abdominal pain • delusions • hallucinations • hypertension • ophthalmological disorders • palpitation • paranoia • pharyngitis • stomatitis • suicidal thoughts • syncope • tachycardia • tooth discoloration
  • Frequency not known Anxiety • seizures

● CONCEPTION AND CONTRACEPTION Manufacturer recommends effective contraception during and for 3 months after treatment in men and women.

● PREGNANCY Manufacturer advises use only if potential benefit outweighs risks.

● BREAST FEEDING Avoid—present in milk.

● HEPATIC IMPAIRMENT Manufacturer advises more frequent monitoring in significant hepatic impairment—possible risk of prolonged or enhanced effect.

● RENAL IMPAIRMENT Manufacturer advises more frequent monitoring in significant renal impairment—possible risk of prolonged or enhanced effect.

● MONITORING REQUIREMENTS Monitor oral mucosa—interrupt treatment if lesions or persistent soreness.

● PATIENT AND CARER ADVICE
Driving and skilled tasks
For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including cannabis, see Drugs and driving under Guidance on prescribing p. 1.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Spray
EXCIPIENTS: May contain Propylene glycol
• Sativex (Bayer Plc)
  Cannabidiol 2.5 mg per 1 dose, Dronabinol 2.7 mg per 1 dose Sativex oromucosal spray | 270 dose [Pst] £375.00 (P4-1)

MUSCLE RELAXANTS → CENTRALEY ACTING

Baclofen

21-Nov-2016

● INDICATIONS AND DOSE
Pain of muscle spasm in palliative care
  • BY MOUTH
  • Adult: 5—10 mg 3 times a day

Hiccups due to gastric distension (in palliative care)
  • BY MOUTH
  • Adult: 5 mg twice daily

Chronic severe spasticity resulting from disorders such as multiple sclerosis or traumatic partial section of spinal cord
  • BY MOUTH
  • Adult: Initially 5 mg 3 times a day, gradually increased; maintenance up to 60 mg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 100 mg per day

Severe chronic spasticity unresponsive to oral antispastic drugs (or where side-effects of oral therapy unacceptable) or as an alternative to ablative neurosurgical procedures (specialist use only)
  • BY INTRATHECAL INJECTION
  • Adult: Test dose 25—50 micrograms, to be given over at least 1 minute via catheter or lumbar puncture, then increased in steps of 25 micrograms (max. per dose 100 micrograms), not given more often than every 24 hours to determine appropriate dose, then dose titration phase, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose (ranging from 12 micrograms to 2 mg daily for spasticity of spinal origin or 22 micrograms to 1.4 mg daily for spasticity of cerebral origin) retaining some spasticity to avoid sensation of paralysis

IMPORTANT SAFETY INFORMATION
Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use. Treatment with continuous pump-administered intrathecal baclofen should be initiated within 3 months of a satisfactory response to intrathecal baclofen testing.

● CONTRA-INDICATIONS
• With intrathecal use Local infection • systemic infection
• With oral use Avoid oral route in active peptic ulceration

● CAUTIONS

GENERAL CAUTIONS
Cerebrovascular disease • diabetes • elderly • epilepsy • history of peptic ulcer • hypertonic bladder sphincter • Parkinson’s disease • psychiatric illness • respiratory impairment

SPECIFIC CAUTIONS
• With intrathecal use Coagulation disorders • malnutrition (increased risk of post-surgical complications) • previous spinal fusion procedure

● INTERACTIONS → Appendix 1: baclofen

● SIDE-EFFECTS
  • Common or very common Agitation • anxiety • ataxia • cardiovascular depression • confusion • depression • dizziness • drowsiness • dry mouth • euphoria • gastro-intestinal disturbances • hallucinations • headache • hyperhidrosis • hypotension • insomnia • myalgia • nightmares • rash • respiratory depression • sedation • seizure • tremor • urinary disturbances • visual disorders
Rare Abdominal pain · changes in hepatic function · dysarthria · erectile dysfunction · paraesthesia · taste disturbances

Very rare Hypothermia

Pregnancy Manufacturer advises use only if potential benefit outweighs risk (toxicity in animal studies).

Breast feeding Present in milk—amount probably too small to be harmful.

Hepatic impairment With oral use Manufacturer advises use with caution.

Renal impairment With oral use Risk of toxicity—use smaller doses (e.g. 5 mg daily by mouth) and if necessary increase dosage interval; if eGFR less than 15 mL/minute/1.73 m² manufacturer advises use by mouth only if potential benefit outweighs risk. Excreted by the kidney.

Treatment cessation Avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychotropic reactions and convulsions; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur)).

Prescribing and dispensing information Flavours of oral liquid formulations may include raspberry.

Palliative care For further information on the use of baclofen in palliative care, see www.palliativedrugs.com/formulary/en/baclofen.html.

Patient and carer advice Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

Medicinal forms There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Side-effects Common or very common Altered liver enzymes (discontinue if persistently raised—consult product

Downloaded from www.medicalbr.com
4 Pain and inflammation in musculoskeletal disorders

Low back pain and sciatica

Description of condition
Low back pain is pain in the lumbosacral area of the back. It can be described as non-specific, mechanical, musculoskeletal or simple (if it is not associated with serious or potentially serious causes). Episodes of back pain do not usually last long, with rapid improvements in pain and disability seen within a few weeks to months.

Sciatica (radicular pain or radiculopathy) is neuropathic leg pain secondary to compressive lumbosacral nerve root pathology.

Non-drug treatment

Exercise programmes, manual therapy, and psychological therapies should be considered for managing low back pain with or without sciatica.

Spinal decompression may be considered in patients with sciatica when pain and function has not improved with non-surgical treatment (including drug treatment).

Drug treatment

An oral NSAID (see Non-steroidal anti-inflammatory drugs, below) should be considered for managing acute low back pain, taking into consideration the gastro-intestinal, cardio-renal and hepatic risks associated with NSAIDs; as well as the need for continued monitoring, and the possible need for gastroprotective treatment (see NSAID-associated ulcers under Peptic ulceration p. 70).

A weak opioid, either alone or with paracetamol p. 422, can be used to manage acute low back pain only if an NSAID is contra-indicated, not tolerated or ineffective (see Opioid analgesics under Analgesics p. 420). Paracetamol alone is ineffective for managing low back pain.

Benzodiazepines are sometimes used to manage acute low back pain (particularly in loss of lordosis); however evidence to support their use is very weak.

In patients with chronic low back pain who have had an inadequate response to non-drug treatment, NSAIDs should be considered as first-line therapy. Opioids should be the last treatment option considered and should be considered only in patients for whom other therapies have failed and only if the potential benefits outweigh the risks for individual patients. If indicated, opioids should only be prescribed for a limited period of time. Long term opioid therapy should be avoided.

Selective serotonin re-uptake inhibitors (SSRIs), serotonin and noradrenaline re-uptake inhibitors (SNRIs), tricyclic antidepressants, and antiepileptic drugs should not be offered for managing low back pain.

When non-surgical treatment is ineffective in patients with moderate and severe localised back pain arising from structures supplied by the medial branch nerve, radiofrequency denervation can be considered.

Sciatica

Patients with sciatica may require specific treatment for Neuropathic pain p. 457.

Patients with acute and severe sciatica may benefit from treatment with epidural injections of local anaesthetic and/or corticosteroid.

Useful Resources

Non-steroidal anti-inflammatory drugs

Therapeutic effects

In single doses non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol p. 422, but paracetamol is preferred, particularly in the elderly.

In regular full dosage NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation. Therefore, although paracetamol often gives adequate pain control in osteoarthritis, NSAIDs are more appropriate than paracetamol or the opioid analgesics in the inflammatory arthritides (e.g. rheumatoid arthritis) and in some cases of advanced osteoarthritis. NSAIDs can also be of benefit in the less well defined conditions of back pain and soft-tissue disorders.

Choice

Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance to these drugs. About 60% of patients will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. If appropriate responses are not obtained within these times, another NSAID should be tried.
NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. Several other factors also influence susceptibility to gastrointestinal effects, and a NSAID should be chosen on the basis of the incidence of gastro-intestinal and other side-effects.

Ibuprofen p. 1041 is a propionic acid derivative with anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other non-selective NSAIDs but its anti-inflammatory properties are weaker. It is unsuitable for conditions where inflammation is prominent, such as acute gout. Diclofenac p. 1032 is the active enantiomer of ibuprofen. It has similar properties to ibuprofen and is licensed for the relief of mild to moderate pain and inflammation.

Other propionic acid derivatives:
- Naproxen p. 1048 is one of the first choices because it combines good efficacy with a low incidence of side-effects (but more than ibuprofen).
- Diclofenac sodium p. 1034 and aceclofenac p. 1030 are similar in efficacy to naproxen.
- Etodolac p. 1037 is comparable in effect to naproxen; it is licensed for the short-term relief of pain in osteoarthritis and rheumatoid arthritis.
- Indomethacin p. 1043 has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances.
- Mefenamic acid p. 1046 has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.
- Meloxicam p. 1046 is licensed for the short-term relief of pain in osteoarthritis and for long-term treatment of rheumatoid arthritis and ankylosing spondylitis.
- Nonsteroidal anti-inflammatory drugs (NSAIDs) are associated with a low risk of gastrointestinal side-effects than non-selective NSAIDs such as naproxen. Although selective inhibitors can cause serious gastrointestinal events, available evidence appears to indicate that the risk of serious upper gastrointestinal events is lower with selective inhibitors compared to non-selective NSAIDs; this advantage may be lost in patients who require concomitant low-dose aspirin.

Celecoxib and etoricoxib are licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; etoricoxib is also licensed for the relief of pain from acute gout.

Aspirin p. 117 has been used in high doses to treat rheumatoid arthritis, but other NSAIDs are now preferred.

Dental and orofacial pain
Most mild to moderate dental pain and inflammation is effectively relieved by NSAIDs. Those used for dental pain include ibuprofen, diclofenac sodium, and diclofenac potassium p. 1033.

Asthma
Any degree of worsening of asthma may be related to the ingestion of NSAIDs, either prescribed or (in the case of ibuprofen and others) purchased over the counter.

NSAIDs and cardiovascular events
All NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those receiving high doses long term.

Cyclo-oxygenase-2 selective inhibitors, diclofenac (150 mg daily) and ibuprofen (2.4 g daily) are associated with an increased risk of thrombotic events. Although there are limited data regarding the thrombotic effects of acetylsalicylic acid, treatment advice has been updated in line with diclofenac, based on acetylsalicylic acid's structural similarity to diclofenac and its metabolism to diclofenac. The increased risk for diclofenac is similar to that of licensed doses of etoricoxib.

Naproxen (1 g daily) is associated with a lower thrombotic risk, and low doses of ibuprofen (1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms and the need for long-term treatment should be reviewed periodically.

NSAIDs and gastro-intestinal events
All NSAIDs are associated with serious gastro-intestinal toxicity; the risk is higher in the elderly. Evidence on the relative safety of non-selective NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—pirprofen p. 1049, ketoprofen p. 1044, and ketorolac trometamol p. 1077 are associated with the highest risk; indomethacin p. 1043, diclofenac, and naproxen p. 1048 are associated with intermediate risk, and ibuprofen p. 1041 with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). Selective inhibitors of cyclo-oxygenase-2 are associated with a lower risk of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Recommendations are that NSAIDs associated with a low risk e.g. ibuprofen are generally preferred, to start at the lowest recommended dose and not to use more than one oral NSAID at a time.

The combination of a NSAID and low-dose aspirin can increase the risk of gastro-intestinal side-effects; this combination should be used only if absolutely necessary and the patient should be monitored closely.
While it is preferable to avoid NSAIDs in patients with active or previous gastro-intestinal ulceration or bleeding, and to withdraw them if gastro-intestinal lesions develop, nevertheless patients with serious rheumatic diseases (e.g. rheumatoid arthritis) are usually dependent on NSAIDs for effective relief of pain and stiffness. Patients at risk of gastro-intestinal ulceration (including the elderly), who need NSAID treatment should receive gastroprotective treatment.

Systemic as well as local effects of NSAIDs contribute to gastro-intestinal damage; taking oral formulations with milk or food, or using enteric-coated formulations, or changing the route of administration may only partially reduce symptoms such as dyspepsia.

**NSAIDs and alcohol**

Alcohol increases the risk of gastro-intestinal haemorrhage associated with NSAIDs. Specialist sources recommend that concurrent use need not be avoided with moderate alcohol intake, but greater caution is warranted in those who drink more than the recommended daily limits.

Some cases of acute kidney injury have been attributed to use of NSAIDs and acute excessive alcohol consumption.

| SIDE-EFFECTS, FURTHER INFORMATION  |
| Serious side-effects  |
| For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028. |

| ALLERGY AND CROSS-SENSITIVITY  |
| Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID. |

| CONCEPTION AND CONTRACEPTION  |
| Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment. |

| PREGNANCY  |
| Most manufacturers advise avoiding the use of NSAIDs during pregnancy or avoiding them unless the potential benefit outweighs the risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of labour may be delayed and its duration may be increased. |

| BREAST FEEDING  |
| Use with caution during breast-feeding. Manufacturer advises avoid. |

| HEPATIC IMPAIRMENT  |
| Initially 100 mg daily. Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease. |

| RENAL IMPAIRMENT  |
| Avoid if possible or use with caution; avoid in moderate to severe impairment. The lowest effective dose should be used for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure. |

| MEDICINAL FORMS  |
| There can be variation in the licensing of different medicines containing the same drug. |

| history of recurrent gastro-intestinal ulceration (two or more distinct episodes)  |
| severe heart failure |
CAUTIONS
Allergic disorders • cardiac impairment (NSAIDs may impaire renal function) • cerebrovascular disease • coagulation defects • connective-tissue disorders • Cronh’s disease (may be exacerbated) • elderly (risk of serious side-effects and fatalities) • epilepsy • heart failure • ischaemic heart disease • parkinsonism • peripheral arterial disease • psychiatric disturbances • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated) • uncontrolled hypertension

INTERACTIONS ▶ Appendix 1: NSAIDs

SIDE-EFFECTS
▶ Rare Alveolitis • asceptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • blood disorders • confusion • convulsions • hepatic damage • hyperglycaemia • interstitial fibrosis associated with NSAIDs can lead to renal failure • intestinal strictures • pancreatitis • papillary necrosis associated with NSAIDs can lead to renal failure • peripheral neuropathy • psychiatric disturbances • pulmonary eosinophilia • Stevens-Johnson syndrome • syncope • thrombocytopenia • toxic epidermal necrolysis • visual disturbances

Frequency not known Angioedema • blood disorders • bronchospasm • colitis (induction of or exacerbation of) • Cronh’s disease (induction of or exacerbation of) • depression • diarrhoea • dizziness • drowsiness • fluid retention (rarely precipitating congestive heart failure) • gastro-intestinal bleeding • gastro-intestinal discomfort • gastro-intestinal ulceration • haematuria • headache • hearing disturbances • hyperkalaemia • hypersensitivity reactions • insomnia • nausea • nervousness • photosensitivity • raised blood pressure • rashes • renal failure (especially in patients with pre-existing renal impairment) • tinnitus • vertigo

SIDE-EFFECTS, FURTHER INFORMATION
Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028.

ALLERGY AND CROSS-SENSITIVITY Contra–indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY Most manufacturers advise avoiding the use of NSAIDs during pregnancy or avoiding them unless the potential benefit outweighs the risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of labour may be delayed and its duration may be increased.

BREAST FEEDING Use with caution during breast-feeding. Manufacturer advises avoid.

HEPATIC IMPAIRMENT Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

RENAL IMPAIRMENT Avoid if possible or use with caution. The lowest effective dose should be used for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

MONITORING REQUIREMENTS During prolonged therapy ophthalmic and blood examinations particularly advisable.

PATIENT AND CARER ADVICE
Driving and skilled tasks Driving Dizziness may affect performance of skilled tasks (e.g. driving).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Capsule
CAUTIONARY AND ADVISORY LABELS 21
▶ Emflex (Merck Serono Ltd)
Acentacin 60 mg Emflex 60mg capsules | 90 capsule POM £28.20 DT price = £28.20

Celecoxib

INDICATIONS AND DOSE
Pain and inflammation in osteoarthritis
▶ BY MOUTH
Adult: 200 mg daily in 1–2 divided doses, then increased if necessary up to 200 mg twice daily, discontinue if no improvement after 2 weeks on maximum dose

Pain and inflammation in rheumatoid arthritis
▶ BY MOUTH
Adult: 100 mg twice daily, then increased if necessary to 200 mg twice daily, discontinue if no improvement after 2 weeks on maximum dose

Ankylosing spondylitis
▶ BY MOUTH
Adult: 200 mg daily in 1–2 divided doses, then increased if necessary up to 400 mg daily in 1–2 divided doses, discontinue if no improvement after 2 weeks on maximum dose

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Manufacturer advises reduce dose by half with concurrent use of fluconazole.

CONTRA-INDICATIONS Active gastro-intestinal bleeding • active gastro-intestinal ulceration • cerebrovascular disease • inflammatory bowel disease • ischaemic heart disease • mild to severe heart failure • peripheral arterial disease

CAUTIONS Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • coagulation defects • connective-tissue disorders • Cronh’s disease (may be exacerbated) • elderly (risk of serious side-effects and fatalities) • history of cardiac failure • hypertension • left ventricular dysfunction • oedema • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated)

INTERACTIONS ▶ Appendix 1: NSAIDs

SIDE-EFFECTS
▶ Common or very common Dyspnoea • influenza-like symptoms
▶ Uncommon Cerebral infarction • fatigue • muscle cramps • palpitation • paraesthesia • stomatitis
▶ Rare Alopecia • alveolitis • asceptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • hepatic damage • interstitial fibrosis associated with NSAIDs can lead to renal failure • pancreatitis • papillary necrosis associated with NSAIDs can lead to renal failure • pulmonary eosinophilia • Stevens-Johnson syndrome • taste disturbance • toxic epidermal necrolysis • visual disturbances

Very rare Seizures

Frequency not known Angioedema • blood disorders • bronchospasm • chest pain • colitis (induction of or exacerbation of) • Cronh’s disease (induction of or exacerbation of) • depression • diarrhoea • dizziness.

Serious side-effects

BY MOUTH

▶ Mild to moderate pain and inflammation in containing the

There can be variation in the licensing of different medicines

Pain and inflammation associated with osteoarthritis and other musculoskeletal disorders | Mild to moderate pain and inflammation including dental pain

▶ BY MOUTH

Adult: 600–900 mg daily in up to 3 divided doses; increased if necessary up to 1.2 g daily (max. per dose 400 mg)

Mild to moderate pain and inflammation in dysmenorrhoea

▶ BY MOUTH

Adult: 600–900 mg daily in up to 3 divided doses (max. per dose 300 mg); maximum 900 mg per day

CONTRA-INDICATIONS Active gastro-intestinal bleeding - active gastro-intestinal ulceration | history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

CAUTIONS Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn's disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

CAUTIONS, FURTHER INFORMATION

High-dose dexibuprofen A small increase in cardiovascular risk, similar to the risk associated with cyclo-oxygenase-2 inhibitors and diclofenac, has been reported with high-dose dexibuprofen (≥ 1.2 g daily); use should be avoided in patients with established ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, congestive heart failure (New York Heart Association classification II–III), and uncontrolled hypertension.

INTERACTIONS → Appendix 1: NSAIDs

SIDE-EFFECTS

Rare Alveolitis - asceptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances

Frequency not known Angioedema - blood disorders - bronchospasm - colitis (induction of or exacerbation of) - Crohn's disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - drowsiness - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal disturbances - gastro-intestinal ulceration - haematuria - headache - hearing disturbances - hypersensitivity reactions - insomnia - nausea - nervousness - photosensitivity - raised blood pressure - rashes - renal failure (especially in patients with pre-existing renal impairment) - tinnitus - vertigo

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028.

ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

Contra-indicated in patients with sulphonamide sensitivity.

CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY Avoid (teratogenic in animal studies).

BREAST FEEDING Avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT Halve initial dose in moderate impairment. Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

RENAL IMPAIRMENT Avoid if possible or use with caution. Avoid if eGFR less than 30 mL/minute/1.73 m². The lowest effective dose should be used for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

MONITORING REQUIREMENTS Monitor blood pressure before and during treatment.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

▶ Seractil (Thornton & Ross Ltd)
Dexibuprofen 400 mg Seractil 400mg tablets | 60 tablet £8.47 DT price = £8.47

Dexketoprofen

INDICATIONS AND DOSE
Short-term treatment of mild to moderate pain including dysmenorrhoea

BY MOUTH

▶ Adult: 12.5 mg every 4–6 hours, alternatively 25 mg every 8 hours; maximum 75 mg per day
▶ Elderly: 12.5 mg every 4–6 hours, alternatively 25 mg every 8 hours, initial max. 50 mg; maximum 75 mg daily

CONTRA-INDICATIONS
Active gastro-intestinal bleeding • active gastro-intestinal ulceration • history of gastrointestinal bleeding related to previous NSAID therapy • history of gastro-intestinal perforation related to previous NSAID therapy • history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) • history of recurrent gastro-intestinal ulceration (two or more distinct episodes) • severe heart failure

CAUTIONS
Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • cerebrovascular disease • coagulation defects • connective-tissue disorders • Crohn’s disease (may be exacerbated) • elderly (risk of serious side-effects and fatalities) • heart failure • ischaemic heart disease • peripheral arterial disease • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated) • uncontrolled hypertension

INTERACTIONS → Appendix 1: NSAIDs

SIDE-EFFECTS

▶ Rare
Alveolitis • aspetic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • hepatic damage • interstitial fibrosis associated with NSAIDs can lead to renal failure • pancreatitis • papillary necrosis associated with NSAIDs can lead to renal failure • pulmonary eosinophilia • Stevens-Johnson syndrome • toxic epidermal necrolysis • visual disturbances

FREQUENCY NOT KNOWN
Angioedema • blood disorders • bronchospasm • colitis (induction of or exacerbation of) • Crohn’s disease (induction of or exacerbation of) • depression • diarrhoea • dizziness • drowsiness • fluid retention (rarely precipitating congestive heart failure) • gastro-intestinal bleeding • gastro-intestinal discomfort • gastro-intestinal ulceration • haematuria • headache • hearing disturbances • hypersensitivity reactions • insomnia • nausea • nervousness • photosensitivity • raised blood pressure • rashes • renal failure (especially in patients with pre-existing renal impairment) • tinnitus • vertigo

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028.

ALLERGY AND CROSS-SENSITIVITY
Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCEPTION AND CONTRACEPTION
Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY
Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

BREAST FEEDING
Use with caution during breast-feeding. Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT
Reduce initial dose to max. 50 mg daily in mild to moderate impairment. Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

RENAL IMPAIRMENT
Avoid if possible or use with caution. Avoid in moderate to severe impairment. Reduce initial dose to 50 mg daily. The lowest effective dose should be used for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

CONTRA-INDICATIONS

With systemic use

- History of cardiac failure
- Hypertension
- Left ventricular dysfunction
- Oedema
- Risk factors for cardiovascular events
- Ulcerative colitis (may be exacerbated)

With topical use

- Avoid contact with eyes
- Avoid contact with inflamed or broken skin
- Avoid contact with mucous membranes
- Not for use with occlusive dressings

Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

INTERACTIONS

Appendix 1: NSAIDs

SIDE-EFFECTS

Rare

With systemic use

- Alveolitis
- Aseptic meningitis

With connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible

- Hepatic damage
- Interstitial fibrosis associated with NSAIDs can lead to renal failure
- Pancreatitis
- Papillary necrosis associated with NSAIDs can lead to renal failure
- Pulmonary eosinophilia
- Stevens-Johnson syndrome
- Toxic epidermal necrolysis
- Visual disturbances

Frequency not known

With intramuscular use or intravenous use

Injection site reactions

With rectal use

- Suppositories may cause rectal irritation

With systemic use

- Angioedema
- Blood disorders
- Bronchospasm
- Colitis (induction of or exacerbation of)
- Crohn’s disease (induction of or exacerbation of)
- Depression
- Diarrhoea
- Dizziness
- Drowsiness
- Fluid retention (rarely precipitating congestive heart failure)
- Gastro-intestinal bleeding
- Gastro-intestinal discomfort
- Gastro-intestinal disturbances
- Gastro-intestinal ulceration
- Haematuria
- Headache
- Hearing disturbances
- Hypersensitivity reactions
- Insomnia
- Nausea
- Nervousness
- Photosensitivity
- Raised blood pressure
- Rash
- Renal failure (especially in patients with pre-existing renal impairment)
- Tinnitus
- Vertigo

With topical use

- Paraesthesia
- Photosensitivity
- Rash (discontinue use if develops)

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects

For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028.

With topical use

- Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

ALLERGY AND CROSS-SENSITIVITY

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCEPTION AND CONTRACEPTION

With systemic use

- Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY

With systemic use

- Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in uterus and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

With topical use

- Patient packs for topical preparations carry a warning to avoid during pregnancy.

BREAST FEEDING

With systemic use

- Use with caution during breast-feeding.
- Amount in milk too small to be harmful.

With topical use

- Patient packs for topical preparations carry a warning to avoid during breast-feeding.

### Etdolac

**INDICATIONS AND DOSE**
Pain and inflammation in rheumatoid arthritis and osteoarthritis
▶ By mouth using immediate-release medicines
▶ Adult: 300–600 mg daily in 1–2 divided doses
▶ By mouth using modified-release medicines
▶ Adult: 600 mg daily

**CONTRA-INDICATIONS** Active gastro-intestinal bleeding • active gastro-intestinal ulceration • history of gastro-intestinal bleeding related to previous NSAID therapy • history of gastro-intestinal haemorrhage (two or more distinct episodes) • history of recurrent gastro-intestinal ulceration (two or more distinct episodes) • severe heart failure

**CAUTIONS** Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • cerebrovascular disease • coagulation defects • connective-tissue disorders • Crohn’s disease (may be exacerbated) • elderly (risk of serious side-effects and fatalities) • heart failure • ischaemic heart disease • peripheral arterial disease • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated) • uncontrolled hypertension

**INTERACTIONS** → Appendix 1: NSAIDs

**SIDE-EFFECTS**
▶ Rare: Alveolitis • aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • hepatic damage • interstitial fibrosis associated with NSAIDs can lead to renal failure • pancreatitis • papillary necrosis associated with NSAIDs can lead to renal failure •

- **Pulmonary eosinophilia • Stevens-Johnson syndrome • toxic epidermal necrolysis • visual disturbances**
  ▶ **Frequency not known** Angioedema • blood disorders • bronchospasm • colitis (induction of or exacerbation of) • confusion • Crohn’s disease (induction of or exacerbation of) • depression • diarrhoea • dizziness • drowsiness • dysphagia • dysuria • fatigue • fluid retention (rarely precipitating congestive heart failure) • gastro-intestinal bleeding • gastro-intestinal discomfort • gastro-intestinal disturbances • gastro-intestinal ulceration • haematuria • headache • hearing disturbances • hypersensitivity reactions • insomnia • nausea • nervousness • palpitation • paraesthesia • photosensitivity • pruritus • pyrexia • raised blood pressure • rashes • renal failure (especially in patients with pre-existing renal impairment) • stomatitis • tinnitus • tremor • urinary frequency • vasculitis • vertigo

### SIDE-EFFECTS, FURTHER INFORMATION

- **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS** 25

- Etdolac (Non-proprietary)
  Etdolac 600 mg Etdolac 600mg modified-release tablets | 30 tablet (PDM) £21.40 DT price = £15.50
- Etolyn (Mylan Ltd)
  Etdolac 600 mg Etdolac 600mg modified-release tablets | 30 tablet (PDM) £22.40 DT price = £15.50
- Etopan XL (Ranbaxy (UK) Ltd)
  Etdolac 600 mg Etopan XL 600mg tablets | 30 tablet (PDM) £14.60 DT price = £15.50
- Lodine SR (Almirall Ltd)
  Etdolac 600 mg Etdolac 600 mg modified-release tablets | 30 tablet (PDM) £15.50 DT price = £15.50

**Capsule**

- Eccoxolac (Meda Pharmaceuticals Ltd)
  Etdolac 300 mg Eccoxolac 300mg capsules | 60 capsule (PDM) £8.14 DT price = £8.14
Etoricoxib 23-Nov-2016

**INDICATIONS AND DOSE**

**Pain and inflammation in osteoarthritis**

- **BY MOUTH**
  - Child 16-17 years: 30 mg once daily, increased if necessary to 60 mg once daily
  - Adult: 30 mg once daily, increased if necessary to 60 mg once daily

**Relief of pain in musculoskeletal conditions**

- **BY MOUTH**
  - Adult: 120 mg once daily for maximum 8 days

**CONTRA-INDICATIONS** Active gastro-intestinal bleeding - active gastro-intestinal ulceration - cerebrovascular disease - inflammatory bowel disease - ischaemic heart disease - mild to severe heart failure - peripheral arterial disease - uncontrolled hypertension (persistently above 140/90 mmHg)

**CAUTIONS** Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - coagulation defects - connective-tissue disorders - Crohn's disease (may be exacerbated) - dehydration - elderly (risk of serious side-effects and fatalities) - history of cardiac failure - hypertension - left ventricular dysfunction - oedema - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated)

**INTERACTIONS** → Appendix 1: NSAIDs

**SIDE-EFFECTS**

- **Common or very common** Ecchymosis - fatigue - influenza-like symptoms - palpitation
- **Uncommon** Anxiety - appetite change - arthralgia - atrial fibrillation - chest pain - cough - dry mouth - dysphagia - electrolyte disturbance - epistaxis - flushing - mental acuity impaired - mouth ulcer - myalgia - paraesthesia - taste disturbance - transient ischaemic attack - weight change
- **Rare** Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances
- **Very rare** Confusion - hallucinations

- **Frequency not known** Angioedema - blood disorders - bronchospasm - colitis (induction of or exacerbation of) - Crohn's disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - drowsiness - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal ulceration - haematuria - headache - hearing disturbances - hypersensitivity reactions - insomnia - nausea - nervousness - photosensitivity - raised blood pressure - rashes - renal failure (especially in patients with pre-existing renal impairment) - tinnitus - vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**

- Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Max. 60 mg daily in mild impairment. Max. 60 mg on alternate days or 30 mg once daily in moderate impairment. Use with caution; there is an increased risk of gastrointestinal bleeding and fluid retention. Avoid in severe liver disease.

**RENAL IMPAIRMENT** Avoid if possible or use with caution. The lowest effective dose should be used for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- In adults Avoid if eGFR less than 30 mL/minute/1.73 m².
- In children Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Monitor blood pressure before treatment, 2 weeks after initiation and periodically during treatment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Arcoxia (Grunenthal Ltd)
  - **Etoricoxib 30 mg** Etoricoxib 30 mg tablets | 28 tablet [POT] £13.99 DT price = £13.99
  - **Etoricoxib 60 mg** Arcoxia 60 mg tablets | 28 tablet [POT] £20.11 DT price = £20.11
  - **Etoricoxib 90 mg** Arcoxia 90 mg tablets | 5 tablet [POT] £4.10 | 28 tablet [POT] £22.96 DT price = £22.96
  - **Etoricoxib 120 mg** Arcoxia 120 mg tablets | 7 tablet [POT] £6.03 | 28 tablet [POT] £24.11 DT price = £24.11

Felbinac

**DRUG ACTION** Felbinac is an active metabolite of the NSAID fenbufen.

**INDICATIONS AND DOSE**

**Relief of pain in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)**

- **TO THE SKIN**
  - Adult: Apply 2–4 times a day, therapy should be reviewed after 14 days; maximum 25 g per day

**CONTRA-INDICATIONS** Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastrointestinal bleeding related to previous NSAID therapy - history of gastro-intestinal haemorrhage (two or more distinct episodes) - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

**CAUTIONS** Allergic disorders - avoid contact with eyes - avoid contact with inflamed or broken skin - avoid contact with mucous membranes - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn's...
Pain and inflammation in musculoskeletal disorders

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Foam

CAUTIONARY AND ADVISORY LABELS

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol)

Traxam (AMCo)

Felbinac 31.7 mg per 1 gram Traxam 3.17% foam | 100 gram Posm £8.41 DT price = £8.41

Gel

AMCo

Felbinac 30 mg per 1 gram Traxam 3% gel | 100 gram Posm £8.03 DT price = £8.03

Traxam Pain Relief 3% gel | 7.5 gram | £1.24 | 30 gram | £2.26 DT price = £2.26

Fenoprofen

Indications and dose

Pain and inflammation in rheumatic disease and other musculoskeletal disease | Mild to moderate pain

By mouth

Adult: 300–600 mg 3–4 times a day; maximum 3 g per day

Contra-indications

Active gastro-intestinal bleeding, active gastro-intestinal ulceration, history of gastro-intestinal bleeding related to previous NSAID therapy, history of gastro-intestinal perforation related to previous NSAID therapy, history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes), history of recurrent gastro-intestinal ulceration (two or more distinct episodes), severe heart failure

Caution

Allergic disorders - cardiac impairment (NSAIDs may impair renal function), cerebrovascular disease, coagulation defects, connective-tissue disorders, Crohn’s disease (may be exacerbated), elderly (risk of serious side-effects and fatalities), heart failure, ischaemic heart disease, peripheral arterial disease, risk factors for cardiovascular events, ulcerative colitis (may be exacerbated), uncontrolled hypertension

Interactions

Appendix 1: NSAIDs

Side-effects

Rare: Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances

Frequency not known

Angioedema - blood disorders - bronchospasm - colitis (induction of or exacerbation of) - Crohn’s disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - drowsiness - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal disturbances - gastro-intestinal ulceration - haematuria - headache - hearing disturbances - hypersensitivity reactions - insomnia - nausea - nervousness - Photosensitivity - raised blood pressure - rash (discontinue use if develops) - renal failure (especially in patients with pre-existing renal impairment) - tinnitus - vertigo

Side-effects, further information

Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028.

Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

Allergy and cross-sensitivity

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

Conception and contraception

Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

Pregnancy

Patient packs for topical preparations carry a warning to avoid during pregnancy.

Breast feeding

Patient packs for topical preparations carry a warning to avoid during breast-feeding.

Hepatic impairment

Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

Renal impairment

Deterioration in renal function has been reported after topical use.

Directions for administration

For topical preparations, apply with gentle massage only.

Patient and carer advice

For topical preparations and carer advice should be advised to wash hands immediately after use.

Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension
Flurbiprofen

**INDICATIONS AND DOSE**

Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Migraine | Postoperative analgesia | Mild to moderate pain

- **BY MOUTH**
  - Child 12-17 years: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions
  - Adult: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions

**Dysmenorrhoea**

- **BY MOUTH**
  - Child 12-17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day
  - Adult: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day

**CONTRA-INDICATIONS**

Active gastro-intestinal bleeding | active gastro-intestinal ulceration | history of gastro-intestinal bleeding related to previous NSAID therapy | history of gastro-intestinal perforation related to previous NSAID therapy | history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) | history of recurrent gastro-intestinal ulceration (two or more distinct episodes) | severe heart failure

**CAUTIONS**

Allergic disorders | cardiac impairment (NSAIDs may impair renal function) | cerebrovascular disease | coagulation defects | connective-tissue disorders | Crohn’s disease (may be exacerbated) | elderly (risk of serious side-effects and fatalities) | heart failure | ischaemic heart disease | peripheral arterial disease | risk factors for cardiovascular events | ulcerative colitis (may be exacerbated) | uncontrolled hypertension

**INTERACTIONS**

Appendix 1: NSAIDs

**SIDE-EFFECTS**

- Common or very common: Stomatitis
- Uncommon: Confusion, fatigue, hallucinations, paranoia
- Rare: Alveolitis, aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) | hepatic damage | interstitial fibrosis associated with NSAIDs can lead to renal failure | pancreatitis | papillitis | possible leading to renal failure

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### INDICATIONS AND DOSE

**Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Mild to moderate pain including dysmenorrhea | Postoperative analgesia | Migraine | Dental pain**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - **Adult:** Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate
  - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
    - **Adult:** 1.6 g once daily; dose to be taken in the early evening, increased if necessary to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

**Mild to moderate pain | Pain and inflammation of soft-tissue injuries | Pyrexia with discomfort**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - **Child 3–5 months:** 50 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
  - **Child 6–11 months:** 50 mg 3–4 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
  - **Child 1–3 years:** 100 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
  - **Child 4–6 years:** 150 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
  - **Child 7–9 years:** 200 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
  - **Child 10–11 years:** 300 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
  - **Child 12–17 years:** Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate

**Pain and inflammation**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - **Child 12–17 years:** 1.6 g once daily, dose preferably taken in the early evening, increased to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

**Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - **Child 3 months–17 years:** 30–40 mg/kg daily in 3–4 divided doses; maximum 2.4 g per day

**Pain and inflammation in systemic juvenile idiopathic arthritis**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - **Child 3 months–17 years:** Up to 60 mg/kg daily in 4–6 divided doses; maximum 2.4 g per day

**Post-immunisation pyrexia in infants (on doctor’s advice only)**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - **Child 2–3 months:** 50 mg for 1 dose, followed by 50 mg after 6 hours if required

**Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)**

- **TO THE SKIN**
  - **Adult:** Apply up to 3 times a day, ibuprofen gel 5% gel to be administered

---

### CAUTIONS, FURTHER INFORMATION

**SIDE-EFFECTS**

- **Rare**
  - With systemic use: Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances

**FREQUENCY not known**

---

**FENBID® FORTE**

**Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)**

- **TO THE SKIN**
  - **Adult:** Apply up to 4 times a day, therapy should be reviewed after 14 days

**IBUGEL® FORTE**

**Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)**

- **TO THE SKIN**
  - **Adult:** Apply up to 3 times a day

**UNLICENSED USE**

Not licensed for use in children under 3 months or body-weight under 5 kg. Maximum dose for systemic juvenile idiopathic arthritis is unlicensed.

**CONTRA-INDICATIONS**

- With systemic use: Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

---

**UNLICENSED USE**

Not licensed for use in children under 3 months or body-weight under 5 kg. Maximum dose for systemic juvenile idiopathic arthritis is unlicensed.

**CONTRA-INDICATIONS**

- With systemic use: Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

**CAUTIONS**

- With systemic use: Allergic disorders (in adults) - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

- With topical use: Avoid contact with eyes - avoid contact with inflamed or broken skin - avoid contact with mucous membranes - not for use with occlusive dressings - topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

**CONTRA-INDICATIONS**  
Active gastro-intestinal bleeding: active gastro-intestinal ulceration, history of gastro-intestinal bleeding related to previous NSAID therapy, history of gastro-intestinal perforation related to previous NSAID therapy; history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes); history of recurrent gastro-intestinal ulceration (two or more distinct episodes): severe heart failure

**CAUTIONS**  

**INTERACTIONS**  
Appendix 1: NSAIDs

**SIDE-EFFECTS**  
Rare: Alveolitis: aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible): blood disorders: confusion: convulsions: hepatic damage: hyperglycaemia: interstitial fibrosis associated with NSAIDs can lead to renal failure: intestinal strictures: pancreatitis: papillary necrosis associated with NSAIDs can lead to renal failure: peripheral neuropathy: psychiatric disturbances: pulmonary eosinophilia: Stevens–Johnson syndrome: syncope: thrombocytopenia: toxic epidermal necrolysis: visual disturbances

**Frequency not known**  

With rectal use: Suppositories may cause occasional bleeding: suppositories may cause rectal irritation

**SIDE-EFFECTS, FURTHER INFORMATION**  
Serious side-effects: For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028

**ALLERGY AND CROSS-SENSITIVITY**  
Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of
asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING** Amount probably too small to be harmful—manufacturers advise avoid. Use with caution during breast-feeding.

**HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in more severe liver disease.

**RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**MONITORING REQUIREMENTS** During prolonged therapy ophthalmic and blood examinations particularly advisable.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Suppository**

- Indometacin (Non-proprietary)
  - Indometacin 100 mg Indometacin 100mg suppositories | 10 suppository (PoM) £17.61 DT price = £17.61
  - Indocid (Aspen Pharma Trading Ltd)
  - Indometacin 100 mg Indocid 100mg suppositories | 10 suppository (PoM) £17.61 DT price = £17.61

**Modified-release capsule**

CAUTIONARY AND ADVISORY LABELS 21, 25

- Indometacin (Non-proprietary)
  - Indometacin 75 mg Indometacin 75mg modified-release capsules | 100 capsule (PoM) no price available DT price = £8.65
  - Berlind Retard (Tillomed Laboratories Ltd)
  - Indometacin 75 mg Berlind 75 Retard capsules | 100 capsule (PoM) £8.65 DT price = £8.65

**Capsule**

CAUTIONARY AND ADVISORY LABELS 21

- Indometacin (Non-proprietary)
  - Indometacin 25 mg Indometacin 25mg capsules | 28 capsule (PoM) £5.00 DT price = £1.22
  - Indometacin 50 mg Indometacin 50mg capsules | 28 capsule (PoM) £7.50 DT price = £1.36

**Ketoprofen**

**INDICATIONS AND DOSE**

**Pain and mild inflammation in rheumatic disease**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 100–200 mg daily in 2–4 divided doses
  - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 100–200 mg once daily, dose to be taken with food
  - **BY RECTUM**
  - Adult: 100 mg once daily, to be administered at bedtime, combined oral and rectal treatment, maximum total daily dose 200 mg

**Pain in musculoskeletal disorders | Pain after orthopaedic surgery | Dysmenorrhoea | Acute gout**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 50 mg up to 3 times a day
  - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 100–200 mg once daily, dose to be taken with food

**Relief of pain in musculoskeletal disorders | Treatment in knee or hand osteoarthritis**

- **TO THE SKIN**
  - Adult: Apply 2–4 times a day for up to 7 days, ketoprofen 2.5% gel to be administered; maximum 15 g per day

**POWERGEL ®**

**Relief of pain in musculoskeletal conditions | Adjunctive treatment in knee or hand osteoarthritis**

- **TO THE SKIN**
  - Adult: Apply 2–3 times a day for up to max. 10 days

**CONTRA-INDICATIONS**

- With systemic use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding · history of gastro-intestinal perforation · history of gastro-intestinal ulceration · severe heart failure

**CAUTIONS**

- With systemic use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn’s disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

**INTERACTIONS** (Appendix 1: NSAIDs)

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

Photosensitivity

**SPECIFIC SIDE-EFFECTS**

- **Rare**
  - With systemic use Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances

- **Frequency not known**
  - With systemic use Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn’s disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

- With rectal use Suppositories may cause rectal irritation

- With topical use Rash (discontinue use if develops)
SIDE-EFFECTS, FURTHER INFORMATION

- Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028.
- With topical use Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

- ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- CONCEPTION AND CONTRACEPTION
- With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- PREGNANCY
- With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

- BREAST FEEDING
- With systemic use Use with caution during breast-feeding. Amount probably too small to be harmful but manufacturers advise avoid.
- With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

- HEPATIC IMPAIRMENT
- With systemic use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Should be avoided in severe liver disease.

- RENAL IMPAIRMENT
- With systemic use Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration.
- With topical use Deterioration in renal function has also been reported after topical use.

- DIRECTIONS FOR ADMINISTRATION For topical preparations apply with gentle massage only.

- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include strawberry.

- PATIENT AND CARER ADVICE
- With topical use For topical preparations, patients and their carers should be advised to wash hands immediately after use. Photosensitivity
- With topical use Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity. Patients should be advised not to expose area treated to sunbeds or sunlight (even on a bright but cloudy day) during, and for two weeks after stopping treatment; treated areas should be protected with clothing.

- EXCEPTIONS TO LEGAL CATEGORY Smaller pack sizes of gel preparations may be available on sale to the public.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release capsule**

**CAUTIONARY AND ADVISORY LABELS** 21, 25

---

**Ketoprofen with omeprazole**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ketoprofen p. 1044, omeprazole p. 78.

**INDICATIONS AND DOSE**

Patients requiring ketoprofen for osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis, who are at risk of NSAID associated duodenal or gastric ulcer or gastroduodenal erosions

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: Initially 100/20 mg daily, increased if necessary to 200/20 mg daily, depending on severity of symptoms, dose expressed as x/y mg ketoprofen/omeprazole

**INTERACTIONS** → Appendix 1: NSAIDs, proton pump inhibitors

**PRESCRIBING AND DISPENSING INFORMATION** Capsules enclose microgranules containing modified-release ketoprofen and gastro-resistant omeprazole.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.
Mefenamic acid

- **INDICATIONS AND DOSE**

  **Pain and inflammation in rheumatoid arthritis and osteoarthritis | Postoperative pain | Mild to moderate pain**
  - BY MOUTH
    - Adult: 500 mg 3 times a day

  **Acute pain including dysmenorrhoea | Menorrhagia**
  - BY MOUTH
    - Child 12-17 years: 500 mg 3 times a day
    - Adult: 500 mg 3 times a day

- **CONTRA-INDICATIONS**

  Active gastro-intestinal bleeding; active gastro-intestinal ulceration; history of gastro-intestinal bleeding related to previous NSAID therapy; history of gastro-intestinal perforation related to previous NSAID therapy; history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes); history of recurrent gastro-intestinal ulceration (two or more distinct episodes); inflammatory bowel disease; severe heart failure

- **CAUTIONS**

  Acute porphyrias p. 969; allergic disorders; cardiac impairment (NSAIDs may impair renal function); cerebrovascular disease; coagulation defects; connective-tissue disorders; Crohn’s disease (may be exacerbated); elderly (risk of serious side-effects and fatalities); epilepsy; heart failure; ischaemic heart disease; peripheral arterial disease; risk factors for cardiovascular events; ulcerative colitis (may be exacerbated); uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

- **SIDE-EFFECTS**

  - Common or very common: Diarrhoea (withdraw treatment); rash (withdraw treatment); stomatitis
  - Uncommon: Fatigue; paraesthesia
  - Rare: Alveolitis; aplastic anaemia; aseptic meningitis (in patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible); glucose intolerance; haemolytic anaemia (positive Coombs’ test); hepatic damage; hypotension; interstitial fibrosis associated with NSAIDs can lead to renal failure; palpitation; pancreatitis; papillary necrosis associated with NSAIDs can lead to renal failure; pulmonary eosinophilia; Stevens-Johnson syndrome; thrombocytopenia; toxic epidermal necrolysis; visual disturbances
  - Frequency not known: Angioedema; blood disorders; bronchospasm; colitis (induction of or exacerbation of); Crohn’s disease (induction of or exacerbation of); depression; diziness; drowsiness; fluid retention (rarely precipitating congestive heart failure); gastro-intestinal bleeding; gastro-intestinal discomfort; gastro-intestinal disturbances; gastro-intestinal ulceration; haematuria; headache; hearing disturbances; hypersensitivity reactions; insomnia; nausea; nervousness; photosensitivity; raised blood pressure; renal failure (especially in patients with pre-existing renal impairment); tinnitus; vertigo

  **SIDE-EFFECTS, FURTHER INFORMATION**

  - Serious side-effects: For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028.
  - Overdose
    - Mefenamic acid has important consequences in overdosage because it can cause convulsions, which if prolonged or recurrent, require treatment.
    - For details on the management of poisoning, see Emergency treatment of poisoning p. 1249, in particular, Convulsions.

- **ALLERGY AND CROSS-SENSITIVITY**

  Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION**

  Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY**

  Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING**

  Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.

- **HEPATIC IMPAIRMENT**

  Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT**

  Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  **Oral suspension**

  CAUTIONARY AND ADVISORY LABELS 21

  EXCIPIENTS: May contain ethanol

  - Mefenamic acid (Non-proprietary)
    - Mefenamic acid 10 mg per 1 ml: Mefenamic acid 50mg/5ml oral suspension | 125 ml (Spm) £17.90 DT price = £17.90

  **Tablet**

  CAUTIONARY AND ADVISORY LABELS 21

  - Mefenamic acid (Non-proprietary)
    - Mefenamic acid 500 mg: Mefenamic acid 500mg tablets | 28 tablet (Spm) £50.20 DT price = £6.15 | 84 tablet (Spm) £44.99

      - Mefenamic acid 250 mg: Ponstan 250mg capsules | 100 capsule (Spm) £6.17 DT price = £5.94

Meloxicam

- **INDICATIONS AND DOSE**

  **Exacerbation of osteoarthritis (short-term)**

  - BY MOUTH
    - Child 16–17 years: 7.5 mg once daily, then increased if necessary up to 15 mg once daily
    - Adult: 7.5 mg once daily, then increased if necessary up to 15 mg once daily

  **Pain and inflammation in rheumatic disease | Ankylosing spondylitis**

  - BY MOUTH
    - Child 16–17 years: 15 mg once daily, then reduced to 7.5 mg once daily if required
    - Adult: 15 mg once daily, then reduced to 7.5 mg once daily if required
    - Elderly: 7.5 mg once daily

Meloxicam
Relief of pain and inflammation in juvenile idiopathic arthritis and other musculoskeletal disorders in children intolerant to other NSAIDs

> BY MOUTH
  - Child 12-17 years (body-weight up to 50 kg): 7.5 mg once daily
  - Child 12-17 years (body-weight 50 kg and above): 15 mg once daily

### CONTRA-INDICATIONS
Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

### CAUTIONS
Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn's disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

### INTERACTIONS
» Appendix 1: NSAIDs

### SIDE-EFFECTS
- Rare
  - Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances
- Frequency not known
  - Angioedema - blood disorders - bronchospasm - colitis (induction of or exacerbation of) - Crohn's disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - drowsiness - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal disturbances - gastro-intestinal ulceration - haematuria - headache - hearing disturbances - hypersensitivity reactions - insomnia - nausea - nervousness - photosensitivity - raised blood pressure - rashes - renal failure (especially in patients with pre-existing renal impairment) - tinnitus - vertigo

### SIDE-EFFECTS, FURTHER INFORMATION
- Serious side-effects
  - For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028.
- ALLERGY AND CROSS-SENSITIVITY
  - Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- CONCEPTION AND CONTRACEPTION
  - Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- PREGNANCY
  - Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- BREAST FEEDING
  - Use with caution during breast-feeding. Present in milk in animal studies—manufacturer advises avoid.

### HEPATIC IMPAIRMENT
Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

### RENAL IMPAIRMENT
Avoid if possible or use with caution. The lowest effective dose should be used for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- In adults
  - Avoid if eGFR less than 25 mL/minute/1.73 m².
- In children
  - Avoid if estimated glomerular filtration rate less than 25 mL/minute/1.73 m².

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Naproxen

INDICATIONS AND DOSE

Pain and inflammation in musculoskeletal disorders

BY MOUTH

Adult: 0.5–1 g daily in 1–2 divided doses

Pain and inflammation in musculoskeletal disorders

BY MOUTH

Adult: Initially 500 mg, then 250 mg every 6–8 hours as required, maximum dose after the first day 1.25 g daily

Acute gout

BY MOUTH

Adult: Initially 750 mg, then 250 mg every 8 hours until attack has passed

CONTRA-INDICATIONS

Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

CAUTIONS

Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn’s disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

INTERACTIONS  Appendix 1: NSAIDs

SIDE-EFFECTS

Rare  Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances

FREQUENCY NOT KNOWN  Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn’s disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rash · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

FREQUENCY NOT KNOWN  Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn’s disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rash · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects  For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028.

ALLERGY AND CROSS-SENSITIVITY  Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCEPTION AND CONTRACEPTION  Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY  Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

BREAST FEEDING  Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.

HEPATIC IMPAIRMENT  Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

RENAL IMPAIRMENT  Avoid if possible or use with caution. Avoid if potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
women aged 15–50 years subject to max. single dose of 500 mg, max. daily dose of 750 mg for max. 3 days, and a max. pack size of 9 × 250 mg tablets.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Oral suspension**
- Naproxen (Non-proprietary)
  - Naproxen 25 mg per 1 ml Naproxen 25mg/ml oral suspension sugar free-sugar-free | 100 ml [pos] £110.00 DT price = £110.00
  - Naproxen 125mg/5ml oral suspension sugar free-sugar-free | 100 ml [pos] £110.00–£128.00 DT price = £110.00
- Naproxen 50 mg per 1 ml Naproxen 50mg/ml oral suspension | 100 ml [pos] £75.00

**Gastro-resistant tablet**

CAUTIONARY AND ADVISORY LABELS 5, 25
- Naproxen (Non-proprietary)
  - Naproxen 250 mg Naproxen 250mg gastro-resistant tablets | 56 tablet [pos] £7.00 DT price = £2.97
  - Naproxen 375 mg Naproxen 375mg gastro-resistant tablets | 56 tablet [pos] £26.62 DT price = £26.62
- Naproxen 500 mg Naproxen 500mg gastro-resistant tablets | 56 tablet [pos] £17.03 DT price = £7.01
- Naprosyn EC (Atnahn Pharma UK Ltd)
  - Naproxen 250 mg Naprosyn EC 250mg tablets | 56 tablet [pos] £4.29 DT price = £2.97
  - Naproxen 375 mg Naprosyn EC 375mg tablets | 56 tablet [pos] £6.42 DT price = £26.82
- Naproxen 500 mg Naproxen EC 500mg tablets | 56 tablet [pos] £8.56 DT price = £7.01

**Effervescent tablet**
- Stirlescent (Stirling Anglian Pharmaceuticals Ltd)
  - Naproxen 250 mg Stirlescent 250mg effervescent tablets sugar-free | 20 tablet [pos] £7.90 DT price = £7.90

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21
- Naproxen (Non-proprietary)
  - Naproxen 250 mg Naproxen 250mg tablets | 28 tablet [pos] £2.10 DT price = £0.93
  - Naproxen 500 mg Naproxen 500mg tablets | 28 tablet [pos] £4.27 DT price = £1.42
- Naprosyn (Atnahn Pharma UK Ltd)
  - Naproxen 250 mg Naproxen 250mg tablets | 56 tablet [pos] £4.29
  - Naproxen 500 mg Naproxen 500mg tablets | 56 tablet [pos] £8.56

**Naproxen with misoprostol**
The properties listed below are those particular to the combination only. For the properties of the components please consider, naproxen p. 1048, misoprostol p. 75.

**INDICATIONS AND DOSE**
Patients requiring naproxen for rheumatoid arthritis, osteoarthritis, or ankylosing spondylitis, with prophylaxis against NSAID-induced gastroduodenal ulceration
- BY MOUTH
  - Adult: 500 mg twice daily, naproxen and 200 micrograms twice daily, misoprostol, taken together with food

**INTERACTIONS**
- Appendix 1: NSAIDs

**PRESCRIBING AND DISPENSING INFORMATION**
The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by the misoprostol with naproxen combination pack.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

CAUTIONARY AND ADVISORY LABELS 22, 25
- Naproxen with misoprostol (Non-proprietary)
  - Esomeprazole (as Esomeprazole magnesium trihydrate) 20 mg, Naproxen 500 mg Naproxen 500mg / Esomeprazole 20mg modified-release tablets | 60 tablet [pos] no price available DT price = £14.95
  - Vimovo (AstraZeneca UK Ltd)
    - Esomeprazole (as Esomeprazole magnesium trihydrate) 20 mg, Naproxen 500 mg Vimovo 500mg/20mg modified-release tablets | 60 tablet [pos] £14.95 DT price = £14.95

**Piroxicam**

**INDICATIONS AND DOSE**
Rheumatoid arthritis (initiated by a specialist) | Osteoarthritis (initiated by a specialist) | Ankylosing spondylitis (initiated by a specialist)
- BY MOUTH
  - Adult: Up to 20 mg once daily

**PAIN RELIEF IN MUSCULOSKELETAL CONDITIONS**
Treatment in knee or hand osteoarthritis (adjunct)
- TO THE SKIN
  - Adult: Apply 3–4 times a day, 0.5% gel to be applied; review treatment after 4 weeks

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**CHMP ADVICE—PIROXICAM (JUNE 2007)**
The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastrointestinal side effects and serious skin reactions. The CHMP has advised that:
- piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
- piroxicam should not be used as first-line treatment
- in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
- piroxicam dose should not exceed 20 mg daily
- piroxicam should no longer be used for the treatment

**IMPORTANT SAFETY INFORMATION**

The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastrointestinal side effects and serious skin reactions. The CHMP has advised that:
- piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
- piroxicam should not be used as first-line treatment
- in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
- piroxicam dose should not exceed 20 mg daily
- piroxicam should no longer be used for the treatment
of acute painful and inflammatory conditions
- treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
- concomitant administration of a gastro-protective agent should be considered. Topical preparations containing piroxicam are not affected by these restrictions.

**CONTRA-INDICATIONS**
- With systemic use Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding - history of gastro-intestinal perforation - history of gastro-intestinal ulceration - inflammatory bowel disease - severe heart failure
- CAUTIONS
- With systemic use Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn's disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension
- With topical use Avoid contact with eyes - avoid contact with inflamed or broken skin - avoid contact with mucous membranes - not for use with occlusive dressings - topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

**INTERACTIONS**
- Appendix 1: NSAIDs
- SIDE-EFFECTS
- Rare
- With systemic use Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances
- Frequency not known
- With topical use Photosensitivity - rash (discontinue use if develops)

**SIDE-EFFECTS, FURTHER INFORMATION**
- Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028.
- With topical use Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).
- ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**CONCEPTION AND CONTRACEPTION**
- With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**PREGNANCY**
- With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

**BREAST FEEDING**
- With systemic use Use with caution during breast-feeding. Amount too small to be harmful.
- With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

**HEPATIC IMPAIRMENT**
- With systemic use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

**RENAL IMPAIRMENT**
- With systemic use Avoid if possible or use with caution. The lowest effective dose should be used for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- With topical use Deterioration in renal function has also been reported after topical use.

**DIRECTIONS FOR ADMINISTRATION**
- For topical preparations apply with gentle massage only.

**MEDICINAL FORMS**
- Piroxicam orodispersible tablets can be taken by placing on the tongue and allowing to dissolve or by swallowing.

**PREGNANCY AND CONtraception**
- With systemic use May contain Asparagine

**MEDICATIONS**
- There can be variation in the licensing of different medicines containing the same drug.

**Orodispersible tablet**

**CAUTIONARY AND ADVISORY LABELS**

### Sulindac

**INDICATIONS AND DOSE**

**Pain and inflammation in musculoskeletal disorders**

- **Acute gout**
  - **BY MOUTH**
  - Adult: 200 mg twice daily for maximum duration 7–10 days in peri-articular disorders, dose may be reduced according to response; acute gout should respond within 7 days; maximum 400 mg per day

**CONTRA-INDICATIONS**

- Active gastro-intestinal bleeding
- active gastro-intestinal ulceration
- history of gastro-intestinal bleeding related to previous NSAID therapy
- history of gastro-intestinal perforation related to previous NSAID therapy
- history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes)
- history of recurrent gastro-intestinal ulceration (two or more distinct episodes)
- severe heart failure

**CAUTIONS**

- Allergic disorders
- cardiac impairment (NSAIDs may impair renal function)
- cerebrovascular disease
- coagulation defects
- connective-tissue disorders
- Crohn’s disease (may be exacerbated)
- elderly (risk of serious side-effects and fatalities)
- ensure adequate hydration
- heart failure
- history of renal stones
- ischaemic heart disease
- peripheral arterial disease
- risk factors for cardiovascular events
- ulcerative colitis (may be exacerbated)
- uncontrolled hypertension

**INTERACTIONS**

- Rare
  - Alveolitis
  - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible)
  - hepatic damage
  - interstitial fibrosis associated with NSAIDs can lead to renal failure
  - pancreatitis
  - papillary necrosis associated with NSAIDs can lead to renal failure
  - pulmonary eosinophilia
  - Stevens-Johnson syndrome
  - toxic epidermal necrolysis
  - visual disturbances

**SIDE-EFFECTS**

- Serious side-effects
  - For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION**
  - Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY**
  - Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**INDICATIONS AND DOSE**

**Pain and inflammation in acute musculoskeletal disorders**

- **BY MOUTH**
- Adult: 20 mg once daily as initial treatment for 1–2 days if oral administration not possible

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS**
- 21
- Sulindac (Non-proprietary)
  - Sulindac 100 mg Sulindac 100mg tablets | 56 tablet | £48.00
  - Sulindac 200 mg Sulindac 200mg tablets | 56 tablet | £96.00
- DT price = £8.29

### Tenoxicam

**INDICATIONS AND DOSE**

**Pain and inflammation in rheumatic disease**

- **BY MOUTH**
- Adult: 20 mg once daily
- **BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
- Adult: 20 mg once daily as initial treatment for 1–2 days if oral administration not possible

**Pain and inflammation in acute musculoskeletal disorders**

- **BY MOUTH**
- Adult: 20 mg once daily for 7 days; maximum duration of treatment 14 days (including treatment by intravenous or intramuscular injection)
- **BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
- Adult: 20 mg once daily as initial treatment for 1–2 days if oral administration not possible

**CONTRA-INDICATIONS**

- Active gastro-intestinal bleeding
- active gastro-intestinal ulceration
- history of gastro-intestinal bleeding related to previous NSAID therapy
- history of gastro-intestinal perforation related to previous NSAID therapy
- history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes)
- history of recurrent gastro-intestinal ulceration (two or more distinct episodes)
- severe heart failure

**CAUTIONS**

- Allergic disorders
- cardiac impairment (NSAIDs may impair renal function)
- cerebrovascular disease
- coagulation defects

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS**
- 21
depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal ulceration · haematura· · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SIDE-EFFECTS, FURTHER INFORMATION
▶ Serious side-effects. For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028.

● ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

● CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

● PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

● BREAST FEEDING Use with caution during breast-feeding. Present in milk in animal studies.

● HEPATIC IMPAIRMENT Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

● RENAL IMPAIRMENT Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection
▶ Tenoxicam (Non-proprietary)
Tenoxicam 20 mg Tenoxicam 20mg powder and solvent for solution for injection vials | 1 vial [POM] £3.98

Tablet
CAUTIONARY AND ADVISORY LABELS 21
▶ Tenoxicam (Non-proprietary)
Tenoxicam 20 mg Tenoxicam 20mg tablets | 28 tablet [POM] £16.16
DT price = £16.16

Mobiflex (Meda Pharmaceuticals Ltd)
Tenoxicam 20 mg Mobiflex 20mg tablets | 30 tablet [POM] £13.42

Tiaprofenic acid

● INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders
▶ BY MOUTH
▶ Adult: 300 mg twice daily

IMPORTANT SAFETY INFORMATION

CSM ADVICE

Following reports of severe cystitis the CSM has recommended that tiaprofenic acid should not be given to patients with urinary-tract disorders and should be stopped if urinary symptoms develop.

Patients should be advised to stop taking tiaprofenic acid and to report to their doctor promptly if they develop urinary-tract symptoms (such as increased frequency, nocturia, urgency, pain on urinating, or blood in urine).

CONTRA-INDICATIONS Active bladder disease (or symptoms) · active gastro-intestinal bleeding · active gastro-intestinal ulceration · active prostate disease (or symptoms) · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · history of recurrent urinary-tract disorders (if urinary symptoms develop discontinue immediately and perform urine tests and culture) · severe heart failure

CAUTIONS Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn’s disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

INTERACTIONS → Appendix 1: NSAIDs

SIDE-EFFECTS
▶ Rare Alveolitis · aspetic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances

Frequency not known Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn’s disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematura · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SIDE-EFFECTS, FURTHER INFORMATION
▶ Serious side-effects. For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1028.

ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

BREAST FEEDING Use with caution during breast-feeding. Amount too small to be harmful.

HEPATIC IMPAIRMENT Reduce dose in mild or moderate impairment. Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

5 Soft tissue and joint disorders

5.1 Local inflammation of joints and soft tissue

Other drugs used for local inflammation of joints and soft tissue Betamethasone p. 635

CORTICOSTEROIDS

Corticosteroids, inflammatory disorders

Systemic corticosteroids

Short-term treatment with corticosteroids can help to rapidly improve symptoms of rheumatoid arthritis. Long-term treatment in rheumatoid arthritis should be considered only after evaluating the risks and all other treatment options have been considered. Corticosteroids can induce osteoporosis, and prophylaxis should be considered on long-term treatment.

In severe, possibly life-threatening, situations a high initial dose of corticosteroid is given to induce remission and the dose is then reduced gradually and discontinued altogether. Relapse may occur as the dose of corticosteroid is reduced, particularly if the reduction is too rapid. The tendency is therefore to increase the maintenance dose and consequently the patient becomes dependent on corticosteroids. For this reason pulse doses of corticosteroids (e.g. methylprednisolone p. 1054 up to 1 g intravenously on 3 consecutive days) are used to suppress highly active inflammatory disease while longer-term treatment with a disease-modifying drug is commenced.

Prednisolone p. 1054 may reduce the rate of joint destruction in moderate to severe rheumatoid arthritis of less than 2 years’ duration. The reduction in joint destruction must be distinguished from mere symptomatic improvement (which lasts only 6 to 12 months at this dose) and care should be taken to avoid increasing the dose above 7.5 mg daily. Evidence supports maintenance of this anti-erosive dose for 2–4 years only after which treatment should be tapered off to reduce long-term adverse effects.

A modified-release preparation of prednisone p. 641 is also available for the treatment of moderate to severe rheumatoid arthritis.

Polymyalgia rheumatica and giant cell (temporal) arteritis are always treated with corticosteroids. Relapse is common if therapy is stopped prematurely. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long-term low-dose corticosteroid treatment.

Polyarteritis nodosa and polymyositis are usually treated with corticosteroids.

Systemic lupus erythematosus is treated with corticosteroids when necessary using a similar dosage regimen to that for polyarteritis nodosa and polymyositis. Patients with pleurisy, pericarditis, or other systemic manifestations will respond to corticosteroids. It may then be possible to reduce the dosage; alternate-day treatment is sometimes adequate, and the drug may be gradually withdrawn. In some mild cases corticosteroid treatment may be stopped after a few months. Many mild cases of systemic lupus erythematosus do not require corticosteroid treatment. Alternative treatment with anti-inflammatory analgesics, and possibly chloroquine p. 582 or hydroxychloroquine sulfate p. 1001, should be considered.

Ankylosing spondylitis should not be treated with long-term corticosteroids; rarely, pulse doses may be needed and may be useful in extremely active disease that does not respond to conventional treatment.

Local corticosteroid injections

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, particularly in rheumatoid arthritis, they are given by intra-articular injection to relieve pain, increase mobility, and reduce deformity in one or a few joints; they can also provide symptomatic relief while waiting for DMARDs to take effect. Full aseptic precautions are essential; infected areas should be avoided. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Smaller amounts of corticosteroids may also be injected directly into soft tissues for the relief of inflammation in conditions such as tennis or golfer’s elbow or compression neuropathies. In tendinitis, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Hydrocortisone acetate p. 1054 or one of the synthetic analogues is generally used for local injection. Intra-articular corticosteroid injections can cause flushing and may affect the hyaline cartilage. Each joint should not usually be treated more than 4 times in one year.

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions.

Dexamethasone

- INDICATIONS AND DOSE
  - Local inflammation of joints
    - By intra-articular injection
      - Adult: 0.3–3.3 mg, where appropriate, dose may be repeated at intervals of 3–21 days according to response, dose given according to size—consult product literature
  - Local inflammation of soft tissues
    - By local infiltration
      - Adult: 1.7–5 mg, dose given according to size—consult product literature, where appropriate may be repeated at intervals of 3–21 days, use the 3.3 mg/mL injection preparation for this dose

- INTERACTIONS Appendix 1: corticosteroids
- PREGNANCY Dexamethasone readily crosses the placenta.
- PRESCRIBING AND DISPENSING INFORMATION Dexamethasone 3.8 mg/mL Injection has replaced Dexamethasone 4 mg/mL Injection. All dosage
recommendations for intravenous, intramuscular, intrarticular use or local infiltration; are given in units of dexamethasone base.

**MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**  
**CAUTIONARY AND ADVISORY LABELS**

- **Dexamethasone (Non-proprietary)**
  - Dexamethasone (as Dexamethasone sodium phosphate) 3.3 mg per 1 ml Dexamethasone 6.6mg/2ml solution for injection vials | 5 vial [Pom] £20.00 DT price = £24.00  
  - Dexamethasone 6.6mg/2ml solution for injection vials | 5 ampoule [Pom] £11.00 DT price = £11.00  
  - 10 ampoule [Pom] £22.00  
  - Dexamethasone 3.3mg/1ml solution for injection vials | 5 ampoule [Pom] £12.00  
  - 10 ampoule [Pom] £12.00 DT price = £12.00  

- **Dexamethasone (as Dexamethasone sodium phosphate) 3.8 mg per 1 ml** Dexamethasone 3.8mg/1ml solution for injection vials | 10 vial [Pom] £19.99 DT price = £19.99

**Hydrocortisone**

**INDICATIONS AND DOSE**

- **HYDROCORTISTAB**

  **Local inflammation of joints and soft-tissues**
  - **BY INTRA-ARTICULAR INJECTION**
  - Adult: 5–50 mg, select dose according to size of patient and joint; where appropriate dose may be repeated at intervals of 21 days. Not more than 3 joints should be treated on any one day, for details consult product literature

- **Methylprednisolone with lidocaine**

  **Local inflammation of joints**
  - **BY INTRA-ARTICULAR INJECTION**
  - Adult: 4–80 mg, dose adjusted according to size; where appropriate may be repeated at intervals of 7–35 days, for details consult product literature

**INTERACTIONS** → Appendix 1: antiarrhythmics, corticosteroids

**Prednisolone**

**INDICATIONS AND DOSE**

- **DELTASTAB**

  **Local inflammation of joints**
  - **BY INTRA-ARTICULAR INJECTION**
  - Adult: 5–25 mg, dose according to size; not more than 3 joints should be treated on any one day; where appropriate may be repeated when relapse occurs, for details consult product literature

**INTERACTIONS** → Appendix 1: corticosteroids

**PREGNANCY** As it crosses the placenta 88% of prednisolone is inactivated.

**BREAST FEEDING** Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Deltastab (AMCo)**
  - Prednisolone acetate 25 mg per 1 ml Deltastab 25mg/1ml suspension for injection ampoules | 10 ampoule [Pom] £68.72

**Triamcinolone acetonide**

**INDICATIONS AND DOSE**

- **ADCORTYL INTRA-ARTICULAR/INTRADERMAL**

  **Local inflammation of joints and soft tissues**
  - **BY INTRA-ARTICULAR INJECTION**
  - Adult: 2.5–15 mg, adjusted according to size (for larger doses use Kenalog®). Where appropriate dose may be repeated when relapse occurs, for details consult product literature.

  **BY INTRADERMAL INJECTION**
  - Adult: 2–3 mg, max. 5 mg at any one site (total max. 30 mg). Where appropriate may be repeated at intervals of 1–2 weeks, for details consult product literature
administration into the subcutaneous or subdermal tissue. It must be dealt with promptly to prevent tissue necrosis. Acidic or alkaline preparations and those with an osmolarity greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. In addition, certain patients such as the very young and the elderly are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

Prevention of extravasation
Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and patients receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers’ recommendations for administration. Placing a glyceryl trinitrate patch p. 212 distal to the cannula may improve the patency of the vessel in patients with small veins or in those whose veins are prone to collapse.

Patients should be asked to report any pain or burning at the site of injection immediately.

Management of extravasation
If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy.

Corticosteroids are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone p. 1054 or dexamethasone p. 1053 can be given either locally by subcutaneous injection or intravenously at a site distant from the injury. Antihistamines and analgesics may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it. The first method may be appropriate following extravasation of vesicant drugs and involves administration of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase p. 1056. A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should not be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique). Dextrazoxane p. 868 is licensed for the treatment of anthracycline-induced extravasation.

Enzymes
Collagenase
Collagenase p. 1056 are proteolytic enzymes that are derived from the fermentation of Clostridium histolyticum and have the ability to break down collagen. A preparation containing a mixture of two collagenases is licensed for the treatment of Dupuytren’s contracture; the preparation should be injected into a palpable cord with a contracture of a metacarpophalangeal joint or proximal interphalangeal joint.
**Hyaluronidase**

Hyaluronidase is used to render the tissues more readily permeable to injected fluids, e.g. for introduction of fluids by subcutaneous infusion (termed hypodermoclysis).

**Rubefacients, topical NSAIDs, capsaicin, and poultries**

**Rubefacients** act by counter-irritation. Pain, whether superficial or deep-seated, is relieved by any method that itself produces irritation of the skin. Topical rubefacient preparations may contain nicotinate and salicylate compounds, essential oils, capsicum, and camphor. The evidence available does not support the use of topical rubefacients in acute or chronic musculoskeletal pain.

**Topical NSAIDs**

The use of a NSAID by mouth is effective for relieving musculoskeletal pain. Topical NSAIDs (e.g. felbinac p. 1038, ibuprofen p. 1041, ketoprofen p. 1044, and piroxicam p. 1049) may provide some relief of pain in musculoskeletal conditions; they can be considered as an adjunctive treatment in knee or hand osteoarthritis.

**Capsaicin**

A preparation containing capsaicin 0.025% p. 458 can be considered as an adjunct in hand or knee osteoarthritis. It may need to be used for 1–2 weeks before pain is relieved.

A capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia after lesions have healed, and for the relief of painful diabetic neuropathy.

A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients.

**ENZYMES**

**Collagenase**

**INDICATIONS AND DOSE**

**Dupuytren’s contracture in patients with a palpable cord**

- **BY INTRALESIONAL INJECTION**
  - Adult: 580 micrograms, then 580 micrograms every 4 weeks if required, inject into palpable cord, maximum 3 injections per cord, maximum 8 injections in total and only one cord may be treated at a time

- **CONTRA-INDICATIONS** Avoid injecting into other structures containing collagen (e.g. tendons, nerves, and blood vessels)—risk of tendon rupture or ligament damage

- **CAUTIONS** Coagulation disorders • use of anticoagulants

- **SIDE-EFFECTS**
  - Common or very common Arthralgia • burning sensation • ecchymosis • hyperhidrosis • hypoesthesia • injection site reactions • joint swelling • lymphadenopathy • myalgia • paraesthesia
  - Uncommon Complex regional pain syndrome • crepitus • ligament injury • monoplegia • muscle spasm • muscle weakness • tendon rupture • tremor • wound dehiscence

- **PREGNANCY** Manufacturer advises avoid.

- **BREAST FEEDING** Systemic absorption by mother negligible.

- **DIRECTIONS FOR ADMINISTRATION** Reconstitution and injected volumes vary with site of injection—consult product literature.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) Decisions**
  
  The Scottish Medicines Consortium has advised (April 2012) that collagenase Clostridium histolyticum (Xiapex®) is accepted for restricted use within NHS Scotland as an alternative to limited fasciectomy, for the treatment of Dupuytren’s contracture of moderate severity (as defined by the British Society for Surgery of the Hand) in patients with a palpable cord and up to two affected joints per hand, who are suitable for limited fasciectomy, but for whom percutaneous needle fasciectomy is not considered a suitable treatment option.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Powder and solvent for solution for injection**

  - Xiapex (Swedish Orphan Biovitrum Ltd)
    - Collagenase clostridium histolyticum 900 microgram Xiapex 0.5mg powder and solvent for solution for injection ampoules | 1 vial £50.00

**Hyaluronidase**

**INDICATIONS AND DOSE**

Enhance permeation of subcutaneous or intramuscular injections

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: 1500 units, to be dissolved directly into the solution to be injected (ensure compatibility)

Enhance permeation of local anaesthetics

- **BY LOCAL INFILTRATION**
  - Adult: 1500 units, to be mixed with the local anaesthetic solution

Enhance permeation of ophthalmic local anaesthetic

- **TO THE EYE**
  - Adult: 15 units/mL, to be mixed with the local anaesthetic solution

**Hypodermoclysis**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride and infiltrated into affected area as soon as possible after extravasation

**Extravasation**

- **BY LOCAL INFILTRATION**
  - Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride and infiltrated into affected area

**Haematoma**

- **BY LOCAL INFILTRATION**
  - Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride and infiltrated into affected area

- **CONTRA-INDICATIONS** Avoid sites where infection is present • avoid sites where malignancy is present • do not apply direct to cornea • not for anaesthesia in unexplained premature labour • not for intravenous administration • not to be used to enhance the absorption and dispersion of dopamine and/or alpha-adrenoceptor agonists • not to be used to reduce swelling of bites • not to be used to reduce swelling of stings

- **CAUTIONS** Elderly (control speed and total volume and avoid overhydration especially in renal impairment)

- **SIDE-EFFECTS**
  - Common or very common Oedema
  - Rare Bleeding • bruising • infection • local irritation
  - Frequency not known Anaphylaxis • severe allergy

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Powder for solution for injection**

  - Hyaluronidase (Non-proprietary)
    - Hyaluronidase 1500 unit Hyaluronidase 1,500unit powder for solution for injection ampoules | 10 ampoule £36.55
**Chapter 11**

**Eye**

**Administration of drugs to the eye**

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents). Product-specific devices may be supplied by manufacturers—consult individual manufacturers for information. They are particularly useful for the elderly, visually impaired, arthritic, or otherwise physically limited patients.

**Eye drops and eye ointments**

Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; one drop is all that is needed. Instillation of more than one drop should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow may occur when one immediately follows the other. The patient should therefore leave an interval of at least 5 minutes between the two; the interval should be extended when eye drops with a prolonged contact time, such as gels and suspensions, are used. Eye ointment should be applied after drops.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

After using eye drops or eye ointments, patients should be warned not to drive or perform other skilled tasks until vision is clear.

Also see warnings relating to eye drops and contact lenses.

**Eye lotions**

These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% p. 1068 solution is usually used. Clean water will suffice in an emergency.

**Other preparations administered to the eye**

Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy; intracameral and intravitreal routes can also be used to administer certain drugs, for example antibacterials. These injections should only be used under specialist supervision.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat susceptible eye conditions.

**Ophthalmic Specials**

Certain eye drops, e.g. amphotericin p. 561, ceftazidime p. 500, cefuroxime p. 1070, colistimethate sodium p. 525, desferrioxamine mesilate p. 941, dexamethasone p. 1061, gentamicin p. 1070, and vancomycin p. 505 can be prepared aseptically from material supplied for injection.

The Royal College of Ophthalmologists and the UK Ophthalmic Specials Guidance can be accessed on the Royal College of Ophthalmologists website (www.rcophth.ac.uk). The guidance will be reviewed every six months to ensure the most accurate and up-to-date information is available.

**Preservatives and sensitisers**

Information on preservatives and substances identified as skin sensitisers is provided under Excipients statements in preparation entries. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

**Control of microbial contamination**

Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for domiciliary use should not be used for more than 4 weeks after first opening (unless otherwise stated by the manufacturer).

Multiple application eye drops for use in hospital wards are
normally discarded 1 week after first opening—local practice may vary. Individual containers should be provided for each patient. A separate container should be supplied for each eye only if there are special concerns about contamination. Containers used before an eye operation should be discarded at the time of the operation and fresh containers supplied postoperatively. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue containers that have been dispensed to the patient on the day of discharge.

In out-patient departments single-application containers should be used; if multiple-application containers are used, they should be discarded after single patient use within one clinical session.

In eye surgery single-application containers should be used if possible; if a multiple-application container is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intraocular surgery; intravenous infusion preparations are not usually suitable for this purpose (Hartmann’s solution may be used in some ocular surgery). For all surgical procedures, a previously unopened container is used for each patient.

Contact lenses

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid (‘hard’ or gas permeable) lenses or soft (hydrogel or silicone hydrogel—in adults only) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious keratitis is increased by extended continuous contact lens wear, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

Acanthamoeba keratitis, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

Contact lenses and drug treatment

Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic and adverse reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephedrine hydrochloride p. 261 and hyaluronic acid hydrochloride p. 175). Other drugs that may affect contact lens wear are isotretinoin p. 1166 (can cause conjunctival inflammation), aspirin p. 117 (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin p. 549 and sulfasalazine p. 42 (can discolor lenses).

1 Allergic and inflammatory eye conditions

Eye, allergy and inflammation

Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery.

Topical corticosteroids are applied frequently for the first 24–48 hours; once inflammation is controlled, the frequency of application is reduced. They should normally only be used under expert supervision; three main dangers are associated with their use:

- a ‘red eye’, when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye. Bacterial, fungal, and amoebic infections pose a similar hazard;
- ‘steroid glaucoma’ can follow the use of corticosteroid eye preparations in susceptible individuals;
- a ‘steroid cataract’ can follow prolonged use.

Combination products containing a corticosteroid with an anti-infective drug are sometimes used after ocular surgery to reduce inflammation and prevent infection; use of combination products is otherwise rarely justified.

Systemic corticosteroids may be useful for ocular conditions. The risk of producing a ‘steroid cataract’ increases with the dose and duration of corticosteroid use.

Intravitreal corticosteroids

An intravitreal implant containing dexamethasone p. 1061 (Ozurdex®) is licensed for the treatment of adults with macular oedema following either branch retinal vein occlusion or central retinal vein occlusion; it is also licensed for the treatment of adult patients with inflammation of the posterior segment of the eye presenting as non-infectious uveitis.

An intravitreal implant containing flucinolone acetonide p. 1091 (Fluoven®) is licensed for the treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies. It should be administered by specialists experienced in the use of intravitreal injections.

Other anti-inflammatory preparations

Other preparations used for the topical treatment of inflammation and allergic conjunctivitis include antihistamines, lodoxamide p. 1060, and sodium cromoglicate p. 1060.

Eye drops containing antihistamines, such as antazoline (with xylometazoline hydrochloride p. 1100 as Otrivine-Antistin®), azelastine hydrochloride p. 1059, epinastine hydrochloride p. 1059, ketotifen p. 1059, and olopatadine p. 1060, can be used for allergic conjunctivitis.

Sodium cromoglicate (sodium cromoglycate) and nedocromil sodium eye drops p. 1060 can be useful for vernal keratoconjunctivitis and other allergic forms of conjunctivitis.
Lodoxamide eye drops are used for allergic conjunctival conditions including seasonal allergic conjunctivitis. Diclofenac sodium eye drops, p. 1077 and emedastine eye drops, below, are also licensed for seasonal allergic conjunctivitis.

Non-steroidal anti-inflammatory eye drops are used for the prophylaxis and treatment of inflammation of the eye following surgery or laser treatment.

Ciclosporin p. 1064 is licensed for severe keratitis in patients with dry eye disease, which has not improved despite treatment with tear substitutes.

1.1 Allergic conjunctivitis

### Antihistamines

#### Azelastine with xylometazoline

**INDICATIONS AND DOSE**

- **Allergic conjunctivitis**
  - **TO THE EYE**
  - Child 12-17 years: Apply 2–3 times a day for maximum 7 days
  - Adult: Apply 2–3 times a day for maximum 7 days

**CAUTIONS**

- Angle-closure glaucoma
- Cardiovascular disease
- Diabetes mellitus
- Hypertension
- Hyperthyroidism
- Phaeochromocytoma
- Urinary retention

**INTERACTIONS**

- Antihistamines (non-sedating)
- Mydriatics
- Non-steroidal anti-inflammatory agents

**SIDE-EFFECTS**

- Common or very common: Transient stinging
- Frequency not known: Blurred vision, eye irritation, mydriasis

**MEDICINAL FORMS**

- **Eye drops**
  - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
  - **Antazoline with Xylometazoline**
    - Xylometazoline hydrochloride 500 microgram per 1 ml, Antazoline sulphate 5 mg per 1 ml
    - Otrivine Antistin (Thea Pharmaceuticals Ltd)
    - Optidrops (Hoffmann-La Roche Ltd)
      - Optidrops 0.05% eye drops | 8 ml ($\text{P}$$\text{X}) £6.40 DT price = £6.40

**SIDE-EFFECTS, FURTHER INFORMATION**

Absorption of antazoline and xylometazoline may result in systemic side-effects.

#### Azelastine hydrochloride

**INDICATIONS AND DOSE**

- **Seasonal allergic conjunctivitis**
  - **TO THE EYE**
  - Child 12–17 years: Apply twice daily for maximum 7 days
  - Adult: Apply twice daily for maximum 8 weeks

**INTERACTIONS**

- Appendices 1 and 2: antihistamines (sedating)

**SIDE-EFFECTS**

- Common or very common: Photophobia, rhinitis, transient burning, transient stinging

**MEDICINAL FORMS**

- **Eye drops**
  - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
  - **Azelastine**
    - Azelastine hydrochloride 500 microgram per 1 ml
      - Optidrops 0.05% eye drops | 8 ml ($\text{P}$$\text{X}) £6.40 DT price = £6.40

**SIDE-EFFECTS**

- Common or very common: Photophobia, rhinitis, transient burning, transient stinging

**MEDICINAL FORMS**

- **Eye drops**
  - **EXCIPIENTS:** May contain Benzalkonium chloride
  - **Emedastine**
    - Emedastine (as Emedastine difumarate) 500 microgram per 1 ml
      - Emadine 0.5mg/ml eye drops | 5 ml ($\text{P}$$\text{X}) £7.31 DT price = £7.31

#### Epinastine hydrochloride

**INDICATIONS AND DOSE**

- **Seasonal allergic conjunctivitis**
  - **TO THE EYE**
  - Child 12–17 years: Apply twice daily for maximum 7 days
  - Adult: Apply twice daily for maximum 8 weeks

**INTERACTIONS**

- Appendices 1 and 2: antihistamines (sedating)

**SIDE-EFFECTS**

- Common or very common: Photophobia, rhinitis, transient burning, transient stinging

**MEDICINAL FORMS**

- **Eye drops**
  - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
  - **Epinastine**
    - Epinastine hydrochloride 500 microgram per 1 ml
      - Relestat (Allergan Ltd)
        - Relestat 500micrograms/ml eye drops | 5 ml ($\text{P}$$\text{X}) £9.90 DT price = £9.90

#### Ketotifen

**INDICATIONS AND DOSE**

- **Seasonal allergic conjunctivitis**
  - **TO THE EYE**
  - Child 3–17 years: Apply twice daily
  - Adult: Apply twice daily

**INTERACTIONS**

- Appendices 1 and 2: antihistamines (sedating)

**SIDE-EFFECTS**

- Common or very common: Punctate corneal epithelial erosion, transient burning, transient stinging
- Uncommon: Dry eye, photophobia, subconjunctival haemorrhage
- Frequency not known: Drowsiness, dry mouth, headache, skin reactions
**1060 Allergic and inflammatory eye conditions**

**Mast-cell stabilisers**

**Lodoxamide**

- **indications and dose**
  - **seasonal allergic conjunctivitis**
    - TO THE EYE
    - Child 4–17 years: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks
    - Adult: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks

- **side-effects**
  - **common or very common**
    - Blurred vision
    - Burning
    - Itching
    - Ocular discomfort
    - Stinging
    - Tear production disturbance
  - **uncommon**
    - Blepharitis
    - Dizziness
    - Drowsiness
    - Flushing
    - Headache
    - Keratitis
    - Nasal dryness

- **exceptions to legal category**
  - **loadoxamide 0.1%**

- **medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug.

  **eye drops**
  - **excipients:** May contain benzalkonium chloride
  - **zaditen** (thea pharmaceuticals ltd)
    - Loadoxime (as loadoxime trometamol) 1 mg per 1 ml
  - **alomide** (alcon laboratories (uk) ltd)
    - Alomide 0.1% eye drops | 10 ml | £5.21
    - Alomide Allergy 0.1% eye drops | 5 ml | £3.12

**Nedocromil sodium**

- **indications and dose**
  - **seasonal and perennial conjunctivitis**
    - TO THE EYE
    - Child 6–17 years: Apply twice daily, increased if necessary to 4 times a day, max. 12 weeks duration of treatment for seasonal allergic conjunctivitis
    - Adult: Apply twice daily, increased if necessary to 4 times a day, max. 12 weeks duration of treatment for seasonal allergic conjunctivitis

- **medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug.

  **eye drops**
  - **excipients:** May contain benzalkonium chloride, disodium edetate
  - **rapitil** (sanofi)
    - Nedocromil sodium 20 mg per 1 ml
    - Rapitil 2% eye drops | 5 ml | £2.86

**sodium cromoglicate**

- **indications and dose**
  - **allergic conjunctivitis**
    - TO THE EYE
    - Child: Apply 4 times a day
    - Adult: Apply 4 times a day

- **side-effects**
  - Transient burning • transient stinging

- **exceptions to legal category**
  - Sodium cromoglicate 2% eye drops can be sold to the public (in max. pack size of 10 mL) for treatment of acute seasonal and perennial allergic conjunctivitis

- **medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

  **eye drops**
  - **sodium cromoglicate (non-proprietary)**
    - Sodium cromoglicate 20 mg per 1 ml
    - Sodium cromoglicate 2% eye drops | 13.5 ml | £8.03
  - **cromolux** (tubilux pharma ltd)
    - Sodium cromoglicate 20 mg per 1 ml
    - Cromolux 2% eye drops | 13.5 ml | £3.20
  - **opticrom** (sanofi)
    - Sodium cromoglicate 20 mg per 1 ml
    - Opticrom aqueous 2% eye drops | 13.5 ml | £8.03
  - **vividrin** (bausch & lomb uk ltd)
    - Sodium cromoglicate 20 mg per 1 ml
    - Vividrin 2% eye drops | 13.5 ml | £10.95

Other drugs used for Inflammatory eye conditions
Adalimumab, p. 1008

ANALGESICS ▶ NON-STERoidal ANTI-INFLAMMATORY DRUGS

Nepafenac

● INDICATIONS AND DOSE
Prophylaxis and treatment of postoperative pain and inflammation associated with cataract surgery
Reduction in the risk of postoperative macular oedema associated with cataract surgery in diabetic patients
▶ TO THE EYE
▶ Child:
▶ Adult:

● CAUTIONS
Avoid sunlight, corneal epithelial breakdown (if evidence of, then discontinue immediately)

● INTERACTIONS
▶ Appendix 1: NSAIDs

● SIDE-EFFECTS
▶ Common or very common
Punctate keratitis
▶ Uncommon
Allergic conjunctivitis, blurred vision, choroidal effusion, conjunctival hyperaemia, corneal deposits, corneal epithelial defect, dry eye, eye pruritus, headache, increased lacrimation, iris, keratitis, nausea, ocular discomfort, photophobia
▶ Frequency not known
Corneal opacity, dermatochalasis, dizziness, eye swelling, impaired corneal healing, reduced visual acuity

● NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (May 2017) that nepafenac (Nevanac®) 3 mg/mL eye drops are accepted for use within NHS Scotland for the reduction in risk of postoperative macular oedema associated with cataract surgery in diabetic patients.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Eye drops
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
▶ Nevanac (Acon Laboratories (UK) Ltd)
Nepafenac 1 mg per 1 ml Nevanac 1mg/ml eye drops | 5 ml £14.92

CORTICOSTEROIDS

Betamethasone

● INDICATIONS AND DOSE
Local treatment of inflammation (short-term)
▶ TO THE EYE USING EYE DROP
▶ Child:
▶ Adult:

▶ TO THE EYE USING EYE OINTMENT
▶ Child:
▶ Adult:

● INTERACTIONS
▶ Appendix 1: corticosteroids

● SIDE-EFFECTS
Corneal thinning, scleral thinning

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
▶ Betamethasone (Non-proprietary)
Betamethasone sodium phosphate 1 mg per 1 ml Betamethasone 0.1% eye/nose drops | 5 ml £0.87
▶ Betnesol (Focus Pharmaceuticals Ltd)
Betamethasone sodium phosphate 1 mg per 1 ml Betnesol 0.1% eye/nose drops | 10 ml £2.32
▶ Vistamethasone (Martindale Pharmaceuticals Ltd)
Betamethasone sodium phosphate 1 mg per 1 ml Vistamethasone 0.1% eye/ear/nose drops | 5 ml £0.99

Eye ointment
▶ Betnesol (Focus Pharmaceuticals Ltd)
Betamethasone sodium phosphate 1 mg per 1 gram Betnesol 0.1% eye ointment | 3 gram £1.41

Combinations available: Betamethasone with neomycin, p. 1063

Dexamethasone

● INDICATIONS AND DOSE
Local treatment of inflammation (short-term)
▶ TO THE EYE USING EYE DROP
▶ Child:
▶ Adult:

▶ TO THE EYE USING EYE OINTMENT
▶ Child:
▶ Adult:

● UNLICENSED USE

● CONTRA-INDICATIONS
▶ With intravitreal use
Active ocular herpes simplex - active or suspected ocular infection - active or suspected periorcular infection - rupture of the posterior lens capsule in patients with aphakia, iris or transscleral fixated intra-ocular lens or anterior chamber intra-ocular lens - uncontrolled advanced glaucoma

● CAUTIONS
▶ With intravitreal use
History of ocular viral infection (including herpes simplex) - posterior capsule tear or iris defect (risk of implant migration into the anterior chamber which may cause corneal oedema and, in persistent severe cases, the need for corneal transplantation) - retinal vein occlusion with significant retinal ischaemia

● INTERACTIONS
▶ Appendix 1: corticosteroids

Downloaded from www.medicalbr.com
**SIDE-EFFECTS**

- **Uncommon**
  - With intravitreal use: Eyelid pruritus · glaucoma · migraine · necrotising retinitis
- **Frequency not known**
  - When used by eye: Corneal thinning · scleral thinning
  - With intravitreal use: Bacterial endophthalmitis · endophthalmitis · intravitreal haemorrhage · necrotising retinitis

**PREGNANCY**

Dexamethasone readily crosses the placenta.

- With intravitreal use: Manufacturer advises avoid unless potential benefit outweighs risk — no information available.

**BREAST FEEDING**

- With intravitreal use: Manufacturer advises avoid unless potential benefit outweighs risk — no information available.

**MONITORING REQUIREMENTS**

- With intravitreal use: Monitor intra-ocular pressure and for signs of ocular infection. In patients with posterior capsule tear or iris defect monitor for implant migration to allow for; early diagnosis and management.

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose Dexamethasone eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (TAs)**

  Dexamethasone intravitreal implant for the treatment of macular oedema secondary to retinal vein occlusion (July 2011) NICE TA229

  Dexamethasone intravitreal implant is recommended as an option for the treatment of macular oedema following central retinal vein occlusion. Dexamethasone intravitreal implant is also recommended as an option for the treatment of macular oedema following branch retinal vein occlusion when:
  - treatment with laser photocoagulation has not been beneficial, or
  - treatment with laser photocoagulation is not considered suitable because of the extent of macular haemorrhage.

  [www.nice.org.uk/TA229](http://www.nice.org.uk/TA229)

  Dexamethasone intravitreal implant for treating diabetic macular oedema (July 2015) NICE TA349

  Dexamethasone intravitreal implant is recommended as an option for treating diabetic macular oedema only if:
  - the implant is to be used in an eye with an intraocular (pseudophakic) lens and
  - the diabetic macular oedema does not respond to non-corticosteroid treatment, or such treatment is unsuitable.

  [www.nice.org.uk/TA349](http://www.nice.org.uk/TA349)

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (May 2012) that dexamethasone intravitreal implant (Ozurdex®) is accepted for restricted use within NHS Scotland for the treatment of adults with macular oedema (i) following central retinal vein occlusion, and (ii) with branch retinal vein occlusion who are not clinically suitable for laser treatment, including patients with dense macular haemorrhage, or patients who have received and failed on previous laser treatment.

INHIBITORS AND RELATED DRUGS

LESS SUITABLE FOR PRESCRIBING  Dexamethasone with tobramycin eye-drops are less suitable for prescribing.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, eye ointment

Eye drops
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- Maxitrol (Alcon Laboratories (UK) Ltd)
  Dexamethasone 1 mg per ml, Hyponemulose 5 mg per 1 ml, Neomycin (as Neomycin sulfate) 3500 unit per 1 ml, Polymyxin B sulfate 6000 unit per 1 ml Maxitrol eye drops | 5 ml | £1.68

IMMUNOSUPPRESSANTS ★ CALCINEURIN INHIBITORS AND RELATED DRUGS

Ciclosporin (Cyclosporin)

DRUG ACTION  Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

INDICATIONS AND DOSE
Severe keratitis in dry eye disease that has not responded to treatment with tear substitutes (initiated by a specialist)
- TO THE EYE
- Adult: Apply 1 drop at bedtime, review treatment at least every 6 months

CONTRA-INDICATIONS  Active or suspected ocular or periocular infection

CAUTIONS  Glaucome—limited information available · history of ocular herpes—no information available

INTERACTIONS  → Appendix 1: ciclosporin

SIDE-EFFECTS
- Common or very common  Blurred vision · instillation site pain · local erythema · local irritation · local oedema · local pain · ocular hyperaemia
- Uncommon  Bacterial keratitis · blepharitis · chalazion · conjunctivitis · corneal decompensation · corneal infiltrates · corneal scar · eye discharge · herpes zoster (ophthalmic) · iridocyclitis · keratitis · local pruritus

CONCEPTION AND CONTRACEPTION  Manufacturer recommends effective contraception during treatment in women of child-bearing potential.

PREGNANCY  Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

BREAST FEEDING  Manufacturer advises avoid—limited information.

DIRECTIONS FOR ADMINISTRATION  Keep eyes closed for 2 minutes after using Ikervis® eye drops, to increase local drug action and reduce systemic absorption.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
- Ciclosporin for treating dry eye disease that has not improved despite treatment with artificial tears (December 2015) NICE TA369
  Ciclosporin (Ikervis®) is recommended as an option for treating dry eye disease that has not improved despite treatment with tear substitutes.
  www.nice.org.uk/TA369

1.2a Anterior uveitis

ANTIMUSCARINICS

Antimuscarinics (eye)

CAUTIONS  Children under 3 months owing to the possible association between cycloplegia and the development of amblyopia · darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage · mydriasis can precipitate acute angle-closure glaucoma (usually in those aged over 60 years and hypermetropic (long-sighted), who are predisposed to the condition because of a shallow anterior chamber)

SIDE-EFFECTS  Conjunctivitis (on prolonged administration) · contact dermatitis · eye oedema (on prolonged administration) · hyperaemia (on prolonged administration) · local irritation (on prolonged administration) · raised intraocular pressure · transient stinging

PATIENT AND CARER ADVICE  Patients may not be able to undertake skilled tasks until vision clears after mydriasis.

Atropine sulfate

INDICATIONS AND DOSE
Cycloplegia
- TO THE EYE USING EYE DROP
- Adult: (consult product literature)

Anterior uveitis
- TO THE EYE USING EYE DROP
- Adult: (consult product literature)

INTERACTIONS  → Appendix 1: atropine

SIDE-EFFECTS  Systemic side-effects can occur, particularly in children and the elderly.

PRESCRIBING AND DISPENSING INFORMATION
Although multi-dose atropine sulphate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
Dry eye conditions

Dry eye

Tear deficiency, ocular lubricants, and astringents

Chronic soreness of the eyes associated with reduced or abnormal tear secretion (e.g. in Sjögren’s syndrome) often responds to tear replacement therapy or pilocarpine p. 1105 given by mouth in adults. The severity of the condition and patient preference will often guide the choice of preparation. Hypromellose p. 1067 is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hypromellose with a mucolytic such as acetylcysteine below can be helpful.

The ability of carbomers to cling to the eye surface may help reduce frequency of application to 4 times daily. Polyvinyl alcohol p. 1068 increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

Sodium hyaluronate eye drops p. 1068 are also used in the management of tear deficiency. Sodium chloride 0.9% drops p. 1068 are sometimes useful in tear deficiency, and can be used as ‘comfort drops’ by contact lens wearers, and to facilitate lens removal. They are also used to irrigate the eye. Special presentations of sodium chloride 0.9% and other irrigation solutions are used routinely for intra-ocular surgery. Sodium chloride 5% eye drops are used for the short-term treatment of corneal oedema in adults.

Eye ointments containing a paraffin can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application before sleep. Ointments should not be used during contact lens wear.

Ocular lubricants

Acetylcysteine

07-Feb-2017

INDICATIONS AND DOSE

Tear deficiency | Impaired or abnormal mucus production

TO THE EYE

Adult: Apply 3–4 times a day

    - Hypermellose 3 mg per 1 ml Ocu-Lube 0.3% eye drops preservative free | 10 ml £5.75
  - **SoftDrops** (Farmigea S.p.A.)
    - Hypermellose 3 mg per 1 ml SoftDrops 0.3% eye drops | 10 ml £1.67 DT price = £1.42

### Hypermellose with dextran 70

The properties listed below are those particular to the combination only. For the properties of the components please consider, hypermellose above.

#### INDICATIONS AND DOSE

**Tear deficiency**
- **TO THE EYE**
- Adult: Apply as required

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **EXCIPIENTS**: May contain Benzalkonium chloride, disodium edetate
  - **Tears Naturale** (Alcon Laboratories (UK) Ltd)
    - Dextran 70 1 mg per 1 ml, Hypermellose 3 mg per 1 ml Tears Naturale eye drops | 15 ml £1.89
    - Tears Naturale eye drops 0.4ml unit dose | 28 unit dose £13.26

### Liquid paraffin with white soft paraffin and wool alcohols

#### INDICATIONS AND DOSE

**Dry eye conditions**
- **TO THE EYE**
- Child: Apply as required, best suited for application before sleep
- Adult: Apply as required, best suited for application before sleep

**PATIENT AND CARER ADVICE**

May cause temporary visual disturbance. Should not be used during contact lens wear.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Eye ointment**

- **Lacrif-Lube** (Allergan Ltd)
  - Wool alcohols 2 mg per 1 gram, Liquid paraffin 425 mg per 1 gram, White soft paraffin 573 mg per 1 gram | Lacri-lube eye ointment | 3.5 gram £2.94 | 5 gram £3.88

### Paraffin, yellow, soft

#### INDICATIONS AND DOSE

**Eye surface lubrication**
- **TO THE EYE**
- Child: Apply every 2 hours as required
- Adult: Apply every 2 hours as required

**PATIENT AND CARER ADVICE**

Ophthalmic preparations may cause temporary visual disturbance. Should not be used during contact lens wear.
Retinol palmitate with white soft paraffin and light liquid paraffin and liquid paraffin and wool fat (Formulated as an ocular lubricant)

**INDICATIONS AND DOSE**
- **Dry eye conditions**
  - **TO THE EYE**
  - Adult: (consult product literature)

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Eye ointment**
- **VITA-POS** (Scope Ophthalmics Ltd)
- VITA-POS eye ointment preservative free | 5 gram £2.75

Sodium hyaluronate

**INDICATIONS AND DOSE**
- **Dry eye conditions**
  - **TO THE EYE**
  - Adult: Apply as required

**PRESCRIBING AND DISPENSING INFORMATION**
- Some preparations are contained in units which are resealable and may be used for up to 12 hours.
- Although multi-dose sodium hyaluronate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, eye ointment, eye washes and suspensions.

**Eye drops**
- **Sodium hyaluronate (proprietary)**
  - *Artelac Rebalance* (Bausch & Lomb UK Ltd)
    - Artelac Rebalance 0.15% eye drops | 10 ml £4.00
  - *Artelac Splash* (Bausch & Lomb UK Ltd)
    - Artelac Splash 0.2% eye drops 0.5ml unit dose | 30 unit dose £7.00 | 60 unit dose £11.20
  - *Blink Intensive* (AMO UK Ltd)
    - Blink Intensive Tears 0.2% eye drops 0.4ml unit dose | 20 unit dose £2.97
  - *Clinitas* (Alcon Ltd)
    - Clinitas Multi 0.4% eye drops preservative free | 10 ml £6.99
    - Clinitas 0.4% eye drops 0.5ml unit dose | 30 unit dose £5.70
  - *Evolve HA* (Medicom Healthcare Ltd)
    - Evolve HA 0.2% eye drops preservative free | 10 ml £5.99
  - *Hy-Opti* (Alissia Healthcare Research Ltd)
    - Hy-Opti 0.1% eye drops preservative free | 10 ml £8.50
    - Hy-Opti 0.2% eye drops preservative free | 10 ml £9.50
  - *Hyabak* (Thea Pharmaceuticals Ltd)
    - Hyabak 0.15% eye drops preservative free | 10 ml £7.99
    - Hyabak UD 0.15% eye drops 0.4ml unit dose preservative free | 30 unit dose £4.99

**Eye ointment**
- **VITA-POS** (Scope Ophthalmics Ltd)
- VITA-POS eye ointment preservative free | 5 gram £2.75

**Sodium chloride**

**INDICATIONS AND DOSE**
- **Tear deficiency | Ocular lubricants and astringents | Irrigation, including first-aid removal of harmful substances | Intra-ocular or topical irrigation during surgical procedures**
  - **TO THE EYE**
  - Adult: Use 0.9% eye preparations

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, eye ointment, eye washes and suspensions.

**Eye ointment**
- **Sodium chloride (proprietary)**
  - *Sodium chloride 50 mg per 1 ml* Sodium chloride 5% eye ointment preservative free | 5 gram £22.50
Most acute superficial eye infections can be treated topically. Blepharitis and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal.

Bacterial blepharitis is treated by application of an antibacterial eye ointment to the conjunctival sac or to the lid margins. Systemic treatment may occasionally be required and is usually undertaken after culturing organisms from the lid margin and determining their antimicrobial sensitivity; antibiotics such as the tetracyclines given for 3 months or longer may be appropriate.

Most cases of acute bacterial conjunctivitis are self-limiting; where treatment is appropriate, antibacterial eye drops or an eye ointment are used. A poor response might indicate viral or allergic conjunctivitis.

Corneal ulcer and keratitis require specialist treatment and may call for hospital admission for intensive therapy. Endophthalmitis is a medical emergency which also calls for specialist management and requires intravitreal administration of antimicrobials; concomitant systemic treatment is required in some cases. Surgical intervention, such as vitrectomy, is sometimes indicated.

### Antibacterials

Bacterial eye infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis.

Chloramphenicol p. 1072 has a broad spectrum of activity and is the drug of choice for superficial eye infections. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, ciprofloxacin p. 1071, levofloxacin p. 1071, moxifloxacin p. 1071, and ofloxacin p. 1072; the aminoglycosides, gentamicin p. 1070 and tobramycin p. 1070 are also active against a wide variety of bacteria. Gentamicin, tobramycin, quinolones (except moxifloxacin), and polymyxin B are effective for infections caused by Pseudomonas aeruginosa.

Ciprofloxacin eye drops are licensed for corneal ulcers; intensive application (especially in the first 2 days) is required throughout the day and night.

Azithromycin eye drops p. 1070 are licensed for trachomatous conjunctivitis caused by Chlamydia trachomatis and for purulent bacterial conjunctivitis. Trachoma which results from chronic infection with Chlamydia trachomatis can be treated with azithromycin by mouth (unlicensed indication).

Fusidic acid is useful for staphylococcal infections. Propamidine isethionate p. 1073 is of little value in bacterial infections but is used by specialists to treat the rare, but potentially sight-threatening, condition of acanthamoeba keratitis [unlicensed indication].

Cefuroxime p. 1070 can be administered by intracameral injection for the prophylaxis of endophthalmitis following cataract surgery.

### With corticosteroids

Many antibacterial preparations also incorporate a corticosteroid but such mixtures should not be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed ‘red eye’ which is sometimes caused by the herpes simplex virus and may be difficult to diagnose.

### Administration

Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows:

- **Eye drops**, apply 1 drop at least every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing.
- **Eye ointment**, apply either at night (if eye drops used during the day) or 3–4 times daily (if eye ointment used alone).

### Antifungals

Fungal infections of the cornea are rare but can occur after agricultural injuries, especially in hot and humid climates. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Increasing age, debility, or immunosuppression can encourage fungal proliferation. The spread of infection...

Many antibacterial preparations also incorporate a corticosteroid but such mixtures should not be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed ‘red eye’ which is sometimes caused by the herpes simplex virus and may be difficult to diagnose.

### Administration

Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows:

- **Eye drops**, apply 1 drop at least every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing.
- **Eye ointment**, apply either at night (if eye drops used during the day) or 3–4 times daily (if eye ointment used alone).

### Antifungals

Fungal infections of the cornea are rare but can occur after agricultural injuries, especially in hot and humid climates. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Increasing age, debility, or immunosuppression can encourage fungal proliferation. The spread of infection...
through blood occasionally produces metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411) or www.moorfields.nhs.uk.

Antivirals

Herpes simplex infections producing, for example, dendritic corneal ulcers can be treated with aciclovir p. 1073 or ganciclovir p. 1073. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster.

Slow-release ocular implants containing ganciclovir (available on a named-patient basis from specialist importing companies) may be inserted surgically to treat immediate sight-threatening CMV retinitis. Local treatments do not protect against systemic infection or infection in the other eye. See systemic treatment of CMV retinitis.

3.1 Bacterial eye infection

**ANTIBACTERIALS ➔ AMINOGLYCODIDES**

### Gentamicin

**INDICATIONS AND DOSE**

**Bacterial eye infections**

- **TO THE EYE**
  - **Child**: Apply 1 drop at least every 2 hours in severe infection, reduce frequency as infection is controlled and continue for 48 hours after healing. Frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient.
  - **Adult**: Apply 1 drop at least every 2 hours, reduce frequency as infection is controlled and continue for 48 hours after healing. Frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient.

- **INTERACTIONS** ➔ Appendix 1: aminoglycosides

- **PRESCRIBING AND DISPENSING INFORMATION**

  Eye drops may be sourced as a manufactured special or from specialist importing companies.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

  **Ear/eye drops solution**

  EXCIPIENTS: May contain Benzalkonium chloride

  - **Gentamicin (Non-proprietary)**

  - **Gentamicin (as Gentamicin sulphate) 3 mg per 1 ml**

  - **0.3% ear/eye drops**

  - **10 ml [POD] £2.14 DT price = £2.15**

### Tobramycin

**INDICATIONS AND DOSE**

**Local treatment of infections**

- **TO THE EYE**
  - **Child 1-17 years**: Apply twice daily for 6–8 days
  - **Adult**: Apply twice daily for 6–8 days

- **INTERACTIONS** ➔ Appendix 1: macrolides

- **SIDE-EFFECTS**

  - **Common or very common** Blurred vision • ocular burning • ocular discomfort • ocular pruritus
  - **Uncommon** Conjunctival hyperaemia • eyelid eczema • eyelid erythema • eyelid oedema • keratitis

- **ANTIBACTERIALS ➔ MACROLIDES**

### Cefuroxime

**INDICATIONS AND DOSE**

**APROKAM® INTRACAMERAL INJECTION**

**Prophylaxis of endophthalmitis after cataract surgery**

- **BY INTRACAMERAL INJECTION**

  - **Adult**: 1 mg, dose to be injected into the anterior chamber of the eye at the end of cataract surgery

- **INTERACTIONS** ➔ Appendix 1: cephhalosporins

- **PREGNANCY**

  Not known to be harmful.

- **BREAST FEEDING**

  Present in milk in low concentration, but appropriate to use.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) Decisions**

  The Scottish Medicines Consortium has advised (December 2016) that cefuroxime (Aprokam®) is accepted for use within NHS Scotland for antibiotic prophylaxis of postoperative endophthalmitis after cataract surgery.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injections**

- **Aprokam** (Thea Pharmaceuticals Ltd)

  Cefuroxime sodium 50 mg Aprokam powder for solution for injection | 10 vial [POD] £49.95

**Uncommon MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **Azter** (Thea Pharmaceuticals Ltd)
  - Azithromycin dihydrate 15 mg per 1 gram Azter 15mg/g eye drops 0.25g unit dose | 6 unit dose £6.99 DT price + £6.99

**SIDE-EFFECTS**
- Common or very common
  - lid exfoliation
  - conjunctival hyperaemia
  - increased lacrimation
  - pruritus
  - sensitivity to light
  - photophobia
  - ear pain
  - headache
- Uncommon
  - abdominal pain
  - taste disturbances
  - corneal deposits (reversible after completion of treatment)
  - corneal epithelial defect
  - keratitis
  - keratopathy
- Rare
  - maculopapular rash
  - corneal deposits (reversible after completion of treatment)

**TO THE EYE USING EYE DROP**

**INDICATIONS AND DOSE**

**Superficial bacterial eye infection**
- **TO THE EYE USING EYE DROP**
  - Adult: Apply 4 times a day for maximum duration of treatment 21 days
  - Child: Apply 4 times a day for maximum duration of treatment 21 days

**Superficial bacterial eye infection (severe infection)**
- **TO THE EYE USING EYE DROP**
  - Adult: Apply every 2 hours during waking hours for 2 days, then apply 4 times a day for maximum duration of treatment 21 days
  - Child: Apply every 2 hours during waking hours for 2 days, then apply 4 times a day for maximum duration of treatment 21 days

**Corneal ulcer**
- **TO THE EYE USING EYE DROP**
  - Adult: Apply every 15 minutes for 6 hours, then apply every 30 minutes for the remainder of day 1, then apply every 1 hour on day 2, then apply every 4 hours on days 3–14, maximum duration of treatment 21 days, to be administered throughout the day and night
  - Child: Apply every 15 minutes for 6 hours, then apply every 30 minutes for the remainder of day 1, then apply every 1 hour on day 2, then apply every 4 hours on days 3–14, maximum duration of treatment 21 days, to be administered throughout the day and night

**CONTRAINDICATIONS**
- Glaucoma
- Angle-closure glaucoma
- Hypersensitivity to any quinolone

**INTERACTIONS**
- Can discolour tears
- May cause visual disturbances

**PR EGNANCY**
- Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**
- Manufacturer advises caution.

Medicines for Children leaflet: Aciclovir eye ointment for herpes simplex infections www.medicinesforchildren.org.uk/aciclovir-eye-ointment-for-herpes-simplex-infection

**Mydriatics and cycloplegics**

**Overview**

Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action. Short-acting, relatively weak mydriatics, such as tropicamide 0.5% p. 1074 (action lasts for 4–6 hours), facilitate the examination of the fundus of the eye. Longer-acting options include cyclopentolate hydrochloride 1% p. 1065 (action up to 24 hours) or atropine sulfate p. 1064 (action up to 7 days).

Phenylephrine hydrochloride p. 1075 is used for mydriasis in diagnostic or therapeutic procedures; mydriasises occurs within 60–90 minutes and lasts up to 5–7 hours.

Mydriatics and cycloplegics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids. Atropine sulfate is used in anterior uveitis mainly to prevent posterior synechiae and to relieve ciliary spasm; cyclopentolate hydrochloride or homatropine hydrobromide p. 1065 (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.

**Other drugs used for Eye procedures**

- Apraclonidine, p. 1086 · Lidocaine hydrochloride, p. 1242
ANTIMUSCARINICS

Tropicamide

- **INDICATIONS AND DOSE**
  - **Funduscopy**
    - Adult: Apply, leave for 2 minutes, then irrigate thoroughly with sodium chloride 0.9%

      - **Fluorescein sodium 10 mg per 1 ml** Minims fluorescein sodium 1% eye drops 0.5ml unit dose | 20 unit dose [P] £8.89
      - **Fluorescein sodium 20 mg per 1 ml** Minims fluorescein sodium 2% eye drops 0.5ml unit dose | 20 unit dose [P] £8.89

  - **Fluorescein with lidocaine**

- **INDICATIONS AND DOSE**
  - **Local anaesthesia**
    - **TO THE EYE**
      - Adult: Apply as required

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Although multi-dose lidocaine and fluorescein eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Eye drops**
    - *Lidocaine and Fluorescein* (Bausch & Lomb UK Ltd)
      - **Fluorescein sodium 2.5 mg per 1 ml, Lidocaine hydrochloride 40 mg per 1 ml** Minims lidocaine and fluorescein eye drops 0.5ml unit dose | 20 unit dose [POM] £11.24

MIOTICS › PARASYMPATHOMIMETICS

Acetylcholine chloride

- **INDICATIONS AND DOSE**
  - **Cataract surgery | Penetrating keratoplasty | Iridectomy | Anterior segment surgery requiring rapid complete miosis**
    - **TO THE EYE**
    - Adult: (consult product literature)

- **CAUTIONS**
  - Asthma · gastro-intestinal spasm · heart failure · hyperthyroidism · parkinsonism · peptic ulcer · urinary-tract obstruction

- **INTERACTIONS** → Appendix 1: acetylcholine

- **SIDE-EFFECTS**
  - Rare Bradycardia · breathing difficulty · flushing · hypotension · sweating

- **PREGNANCY**
  - Avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING**
  - Avoid unless potential benefit outweighs risk—no information available.
**Phenylephrine with tropicamide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, phenylephrine hydrochloride above, tropicamide p. 1074.

**INDICATIONS AND DOSE**

**Pre-operative mydriasis**

- **To the eye**
- **Adult:** One insert to be applied into the lower conjunctival sac up to max. 2 hours before procedure; remove insert within 30 minutes of satisfactory mydriasis, and within 2 hours of application

**DIRECTIONS FOR ADMINISTRATION**

- **Patients with severe dry eyes may require a drop of saline to improve insert tolerance.**

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

- **Eye drops**
  - **Excipients:** May contain Disodium edetate, sodium metabisulfite
  - **Phenylephrine hydrochloride** (Bausch & Lomb UK Ltd)
    - Phenylephrine hydrochloride 25 mg per 1 ml Minims phenylephrine hydrochloride 2.5% eye drops 0.5ml unit dose | 20 unit dose £11.41

**OPHTHALMIC INSERT**

- **Mydriasant** (Thea Pharmaceuticals Ltd)
  - Tropicamide 28 mg, Phenylephrine hydrochloride 5.4 mg / 0.28mg ophthalmic inserts | 20 insert £64.00

---

**4.1 Post-operative pain and inflammation**

**Eye, surgical and peri-operative drug use**

**Ocular peri-operative drugs**

Drugs used to prepare the eye for surgery, drugs that are injected into the anterior chamber at the time of surgery, and those used after eye surgery, are included here.

- **Cefuroxime** p. 498, administered by intravenous injection into the anterior chamber of the eye (intracameral use), is used for the prophylaxis of endophthalmitis after cataract surgery.

- **Diclofenac sodium and flurbiprofen** are used for the prophylaxis of endophthalmitis after cataract surgery.

- **Naproxen sodium and ketorolac** are used for the prophylaxis and treatment of inflammation, pain, and other symptoms associated with ocular surgery or laser treatment of the eye. Cefuroxime p. 496 is used for the treatment of postoperative inflammation following cataract surgery.

- **Diclofenac sodium and flurbiprofen** are also used to prevent miosis during ocular surgery.

- **Apraclonidine, p. 1086, an alpha₁-adrenoceptor agonist, reduces intra-ocular pressure possibly by reducing the dilatation of the sphincter muscle of the iris and the blood flow in the iris.**

---

**Post-operative pain and inflammation**

- **1075**
production of aqueous humour. It is used to control increases in intra-ocular pressure associated with ocular surgery and as short-term treatment to reduce intraocular pressure prior to surgery.

Acetylcholine chloride p. 1074, administered into the anterior chamber of the eye during surgery, rapidly produces miosis which lasts approximately 20 minutes. If prolonged miosis is required, it can be applied again. Intra-ocular sodium hyaluronate p. 1068 and balanced salt solution are used during surgical procedures on the eye.

Povidone-iodine p. 1074 is used for peri-ocular and conjunctival antisepsis before ocular surgery to support postoperative infection control.

**Local anaesthetics**

Oxybuprocaine hydrochloride below and tetracaine below are widely used topical local anaesthetics. Proxymetacaine hydrochloride below causes less initial stinging and is useful for children. Oxybuprocaine hydrochloride or a combined preparation of lidocaine hydrochloride and fluorescein sodium p. 1074 is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine hydrochloride, with or without adrenaline/epinephrine p. 216, is injected into the eyelids for minor surgery. Local anaesthetics should never be used for the management of ocular symptoms.

**ANAESTHETICS, LOCAL**

*Oxybuprocaine hydrochloride* (Benoxinate hydrochloride)

- **INDICATIONS AND DOSE**
  - Local anaesthetic
    - Adult: Apply as required

  Diclofenac sodium 1 mg per 1 ml Voltarol Ophtha 0.1% eye drops 0.3ml unit dose | 5 unit dose [Pincl] £4.00 | 40 unit dose [Pincl] £32.00
  ▶ Voltarol Ophtha Multidose (Thea Pharmaceuticals Ltd)
  Diclofenac sodium 1 mg per 1 ml Voltarol Ophtha Multidose 0.1% eye drops | 5 ml [Pincl] £6.68

Flurbiprofen

- **INDICATIONS AND DOSE**
  Inhibition of intra-operative miosis (but does not possess intrinsic mydriatic properties) | Control of anterior segment inflammation following postoperative and post-laser trabecuoplasty when corticosteroids contra-indicated
  
  ▶ **TO THE EYE**
  ▶ Adult: (consult product literature)

- **INTERACTIONS**  ➔ Appendix 1: NSAIDs

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Eye drops**
  EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
  ▶ Acular (Allergan Ltd)
  Ketorolac trometamol 5 mg per 1 ml Acular 0.5% eye drops | 5 ml [Pincl] £3.00 DT price + £3.00

Corticosteroids

- **INDICATIONS AND DOSE**
  Treatment of post-operative inflammation following ocular surgery
  
  ▶ **TO THE EYE**
  ▶ Adult: Apply 4 times a day for maximum duration of treatment of 14 days, to be started 24 hours after surgery

- **SIDE-EFFECTS** Corneal thinning - scleral thinning

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Eye drops**
  EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
  ▶ Lotemax (Bausch & Lomb UK Ltd)
  Loteprednol etabonate 5 mg per 1 ml Lotemax 0.5% eye drops | 5 ml [Pincl] £5.50 DT price + £5.50

Ketorolac trometamol

- **INDICATIONS AND DOSE**
  Prophylaxis and reduction of inflammation and associated symptoms following ocular surgery
  
  ▶ **TO THE EYE**
  ▶ Adult: (consult product literature)

- **INTERACTIONS**  ➔ Appendix 1: NSAIDs

Glucoma and ocular hypertension

Glucoma

**Overview**

Glucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage. While glucoma is generally associated with raised intra-ocular pressure, it can occur when the intra-ocular pressure is within the normal range.

The most common form of glucoma is primary open-angle glucoma (chronic open-angle glucoma), where drainage of the aqueous humour through the trabecular meshwork is restricted. The condition is often asymptomatic, but the patient may present with significant loss of visual-field. Patients with ocular hypertension are at high risk of developing primary open-angle glucoma.

Drugs that reduce intra-ocular pressure by different mechanisms are available for managing ocular hypertension and glucoma. A topical beta-blocker or a prostaglandin analogue is usually the drug of first choice for the treatment of ocular hypertension. A prostaglandin analogue should be used to manage patients with early or moderate primary open-angle glucoma. After checking compliance and eye drop instillation technique, it may be necessary to combine these drugs or add others, such as sympathomimetics, carbonic anhydrase inhibitors, or miotics to control intra-ocular pressure.
Acute angle-closure glaucoma

Acute angle-closure glaucoma occurs when the outflow of aqueous humour from the eye is obstructed by bowing of the iris against the trabecular meshwork; it is a medical emergency that requires urgent reduction of intra-ocular pressure to prevent loss of vision. Patients with acute angle-closure glaucoma should be referred immediately for specialist ophthalmology assessment and treatment.

Standard antiglaucoma therapy is used if supplementary treatment is required after iridotomy, iridectomy, laser treatment, or drainage surgery in either primary open-angle or acute angle-closure glaucoma.

Beta-blockers

Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in primary open-angle glaucoma, probably by reducing the rate of production of aqueous humour. Administration by mouth also reduces intra-ocular pressure but this route is not used since side-effects may be troublesome.

Beta-blockers used as eye drops include betaxolol p. 1079, carteolol hydrochloride below, levobunolol hydrochloride below, and timolol maleate p. 1079.

Prostaglandin analogues and prostamides

The prostaglandin analogues latanoprost p. 1083, tafluprost p. 1084 and travoprost p. 1085, and the synthetic prostamide, bimatoprost p. 1082, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure in ocular hypertension or open-angle glaucoma.

Sympathomimetics

Brimonidine tartrate, a selective alpha2-adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow. It is licensed for the reduction of intra-ocular pressure in open-angle glaucoma or ocular hypertension in patients for whom beta-blockers are inappropriate; it may also be used as adjunctive therapy when intra-ocular pressure is inadequately controlled by other anti-glucoma therapy.

Apraclonidine p. 1086 is another alpha2-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. Eye drops containing apraclonidine 0.5% are used short-term to delay laser treatment or surgery in patients with glaucoma not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery. Apraclonidine may not provide additional benefit in patients already using two drugs that suppress the production of aqueous humour.

Carbonic anhydrase inhibitors and systemic drugs

The carbonic anhydrase inhibitors, acetazolamide p. 1080, brinzolamide p. 1080, and dorzolamide p. 1081, reduce intra-ocular pressure by reducing aqueous humour production. Systemic use of acetazolamide also produces weak diuresis.

Acetazolamide is given by mouth or by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is not generally recommended for long-term use.

Dorzolamide and brinzolamide are topical carbonic anhydrase inhibitors. They are licensed for use in patients resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Brinzolamide can also be used as an adjunct to a prostaglandin analogue or the alpha2-adrenoceptor agonist, brimonidine tartrate p. 1086. Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

The osmotic diuretics, intravenous hypertonic mannitol p. 222 or glycerol p. 61 by mouth are useful short-term ocular hypotensive drugs.

Miotics

Miotics act by opening the inefficient drainage channels in the trabecular meshwork.

Pilocarpine p. 1082, a miotic, is not commonly used for the treatment of primary open-angle glaucoma because side-effects are poorly tolerated. It is used mainly in the treatment of primary angle-closure glaucoma and in some secondary glaucomas.

BETA-ADRENOCEPTOR BLOCKERS ❯ NON-SELECTIVE

Carteolol hydrochloride

● INDICATIONS AND DOSE

Primary open-angle glaucoma

➢ TO THE EYE

Adult: Apply twice daily

➢ CONTRA-INDICATIONS

Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block

➢ CAUTIONS

Patients with corneal disease

CAUTIONS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.

➢ INTERACTIONS ➢ Appendix 1: beta blockers (non-selective)

➢ SIDE-EFFECTS

Anaphylaxis, blepharoconjunctivitis, burning, corneal disorders, dry eyes, erythema, itching, ocular stinging, pain

SIDE-EFFECTS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

➢ MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

➢ Teoptic (Thea Pharmaceuticals Ltd)

Carteolol hydrochloride 10 mg per 1 ml ➢ Teoptic 1% eye drops | 5 ml £7.60 DT price = £7.60

Carteolol hydrochloride 20 mg per 1 ml ➢ Teoptic 2% eye drops | 5 ml £8.40 DT price = £8.40

Levobunolol hydrochloride

● INDICATIONS AND DOSE

Primary open-angle glaucoma

➢ TO THE EYE

Adult: Apply 1–2 times a day

➢ CONTRA-INDICATIONS

Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block

➢ CAUTIONS

Patients with corneal disease

CAUTIONS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.

➢ INTERACTIONS ➢ Appendix 1: beta blockers (non-selective)
CONTRA-INDICATIONS

Interaction with timolol

SIDE-EFFECTS

Anaphylaxis - anterior uveitis - blepharoconjunctivitis - burning - corneal disorders - dry eyes - erythema - itching - ocular stinging - pain

SIDE-EFFECTS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

PRESCRIBING AND DISPENSING INFORMATION

Although multi-dose (Levbunolol) eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

PRESCRIBING AND DISPENSING INFORMATION

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2014) that timolol gel eye drops (Timoptic®) are accepted for restricted use within NHS Scotland for the reduction of elevated intraocular pressure in patients with ocular hypertension or chronic open angle glaucoma who have proven sensitivity to preservatives.

MEDICATION FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, sodium metabisulphite

Betagan (Allergan Ltd)

Levbunolol hydrochloride 5 mg per 1 ml Betagan 0.5% eye drops

5 ml (Pom) £1.85 DT price + £1.85

Betagan Unit Dose 0.5% eye drops 0.4ml unit dose 30 unit dose (Pom) £9.98

TIMOPTOL-LA ®

Reduction of intra-ocular pressure in primary open-angle glaucoma

TO THE EYE

Adult: Apply twice daily

TIMOPTOL-LA ®

Reduction of intra-ocular pressure in primary open-angle glaucoma

TO THE EYE

Adult: Apply once daily

TIOPLEX ®

Reduction of intra-ocular pressure in primary open-angle glaucoma

TO THE EYE

Adult: Apply once daily, to be applied in the morning

CONTRA-INDICATIONS Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block

CAUTIONS Consider also cautions listed for systemically administered beta blockers - patients with corneal disease

INTERACTIONS → Appendix 1: beta blockers (non-selective)

SIDE-EFFECTS Anaphylaxis - blepharoconjunctivitis - burning - corneal disorders - dry eyes - erythema - itching - ocular stinging - pain

SIDE-EFFECTS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

BREAST FEEDING Manufacturer advises avoidance.

PRESCRIBING AND DISPENSING INFORMATION

**CARBONIC ANHYDRASE INHIBITORS**

### Acetazolamide

**INDICATIONS AND DOSE**

Reduction of intra-ocular pressure in open-angle glaucoma | Reduction of intra-pressure in secondary glaucoma | Reduction of intra-ocular pressure perioperatively in angle-closure glaucoma

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: 0.25 – 1 g daily in divided doses, intramuscular injection preferably avoided because of alkalinity

Glaucoma

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 250 – 500 mg daily

Epilepsy

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: 0.25 – 1 g daily in divided doses, intramuscular injection preferably avoided because of alkalinity

**CONTRA-INDICATIONS**

Adrenocortical insufficiency · hyperchloreaemic acidosis · hypokalaemia · hypernatraemia · long-term administration in chronic angle-closure glaucoma

**CAUTIONS**

Avoid extravasation at injection site (risk of necrosis) · diabetes mellitus · elderly · impaired alveolar ventilation (risk of acidosis) · not generally recommended for long-term use · pulmonary obstruction (risk of acidosis) · renal calculi

**INTERACTIONS** → Appendix 1: acetazolamide

**SIDE-EFFECTS**

- **Common or very common** Ataxia · depression · diarrhoea · dizziness · excitement · fatigue · flushing · headache · irritability · loss of appetite · nausea · paraesthesia · polyuria · reduced libido · taste disturbance · thirst · vomiting
- **Uncommon** Blood disorders · bone marrow suppression · confusion · crystalluria · drowsiness · electrolyte disturbances on long-term therapy · fever · glycosuria · haematuria · hearing disturbances · melaena · metabolic acidosis · rash · renal calculi · renal colic · renal failure · renal lesions · Stevens-Johnson syndrome · toxic epidermal necrosis · urederic colic
- **Rare** Cholestatic jaundice · convulsions · flaccid paralysis · fulminant hepatic necrosis · hepatitis · photosensitivity
- **Frequency not known** Transient myopia

SIDE-EFFECTS, FURTHER INFORMATION

Acetazolamide is a sulfonamide derivative; blood disorders, rashes, and other sulfonamide-related side-effects occur occasionally—patients should be told to report any unusual skin rash.

If electrolyte disturbances and metabolic acidosis occur, these can be corrected by administering potassium bicarbonate (as effervescent potassium tablets).

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated if history of sulfonamide hypersensitivity.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 3

- **Acetazolamide (Non-proprietary)**
  - Acetazolamide 250 mg Acetazolamide 250mg tablets | 112 tablet | £75.36 DT price = £28.20

Powder for solution for injection

- **Diamox (AMCo)**
  - Acetazolamide 500 mg Diamox Sodium Parenteral 500mg powder for solution for injection vials | 1 vial | £14.76

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 3, 25

- **Diamox SR (AMCo)**
  - Acetazolamide 250 mg Diamox SR 250mg capsules | 30 capsule | £16.66 DT price = £16.66
  - **Eytaox (Teva UK Ltd)**
    - Acetazolamide 250 mg Eytaox 250mg modified-release capsules | 30 capsule | £16.60 DT price = £16.66

**Brinzolamide**

**INDICATIONS AND DOSE**

Reduction of intra-ocular pressure in ocular hypertension and open-angle glaucoma either as adjunct to beta-blockers or prostaglandin analogues or used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated

- TO THE EYE
  - Adult: Apply twice daily, then increased if necessary up to 3 times a day

**CONTRA-INDICATIONS**

Hyperchloreaemic acidosis

**CAUTIONS**

Renal tubular immaturity or abnormality · systemic absorption follows topical application

**INTERACTIONS** → Appendix 1: brinzolamide

**SIDE-EFFECTS**

- **Common or very common** Corneal erosion · corneal oedema · dry mouth · headache · ocular disturbances · photophobia · reduced visual acuity · taste disturbances
- **Uncommon** Alopecia · amnesia · bradycardia · chest pain · cough · decreased libido · depression · diarrhoea · dizziness · drowsiness · dyspepsia · dysphonia · epistaxis · erectile dysfunction · flattulence · malaise · nasal dryness · nausea · nervousness · oesophagitis · oral hypoesthesia and paraesthesia · palpititation · paraesthesia · pharyngitis · renal pain · sinusitis · sleep disturbances · throat irritation · tinnitus · upper respiratory tract congestion · vomiting
- **Frequency not known** Arrhythmia · asthma · dermatitis · erythema · hypertension · peripheral oedema · rhinitis · tachycardia · tremor · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated if history of sulfonamide hypersensitivity.
BRINZOLAMIDE WITH BRIMONIDINE

27-Sep-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, brinzolamide p. 1080, brimonidine tartrate p. 1086.

**INDICATIONS AND DOSE**

- **Raised intra-ocular pressure in open-angle glaucoma and in ocular hypertension when monotherapy is inadequate**
  - **TO THE EYE**
  - **Adult:** Apply 1 drop twice daily

**SIDE-EFFECTS**

- **Common or very common** Somnolence
- **Uncommon** Dermatitis - dry throat - hypotension - vertigo

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
- **Simbrinza** (Alcon Laboratories (UK) Ltd)
  - Brimonidine tartrate 2 mg per 1 ml, Brinzolamide 10 mg per 1 ml
  - Simbrinidine 10 mg/ml / 2mg/ml eye drops | 5 ml £9.23 DT price = £9.23

**Brinzolamide with timolol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, brinzolamide p. 1080, timolol maleate p. 1079.

**INDICATIONS AND DOSE**

- **Raised intra-ocular pressure in open-angle glaucoma or ocular hypertension when beta-blocker alone not adequate**
  - **TO THE EYE**
  - **Adult:** Apply twice daily

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **MIOTICS → PARASYMPATHOMIMETICS**

Pilocarpine

- **DRUG ACTION**
  - Pilocarpine acts by opening the inefficient drainage channels in the trabecular meshwork.

- **INDICATIONS AND DOSE**
  - **INDICATIONS**
    - Primary angle-closure glaucoma | Some secondary glaucomas
  - **DOSE**
    - TO THE EYE
    - Adult: Apply up to 4 times a day

- **CONTRA-INDICATIONS**
  - Acute inflammatory disease of the anterior segment - acute iritis - anterior uveitis - conditions where pupillary constriction is undesirable - some forms of secondary glaucoma (where pupillary constriction is undesirable)

- **CAUTIONS**
  - Darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid overdosage - asthma - cardiac disease - care in conjunctival damage - care in corneal damage - epilepsy - gastro-intestinal spasm - hypertension - hyperthyroidism - hypotension - marked vasomotor instability - Parkinson’s disease - peptic ulceration - retinal detachment has occurred in susceptible individuals and those with retinal disease - urinary-tract obstruction

- **INTERACTIONS**
  - Appendix 1: pilocarpine

- **SIDE-EFFECTS**
  - Rare Parasympathomimetics systemic side effects
  - Frequency not known Blurred vision - ciliary spasm (leads to headache and browache which may be more severe in the initial 2–4 weeks of treatment—a particular disadvantage in patients under 40 years of age) - conjunctival vascular congestion - lens changes (with chronic use) - myopia - ocular burning - ocular itching - pupillary block - smarting - vitreous haemorrhage

- **PREGNANCY**
  - Avoid unless the potential benefit outweighs risk—limited information available.

- **BREAST FEEDING**
  - Avoid unless the potential benefit outweighs risk—no information available.

- **PRE-TREATMENT SCREENING**
  - Fundus examination is advised before starting treatment with a miotic (retinal detachment has occurred).

- **MONITORING REQUIREMENTS**
  - Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

- **Eye drops**
  - **Excipients**: May contain Benzalkonium chloride

  - **Pilocarpine nitrate** (Bausch & Lomb UK Ltd)
    - Pilocarpine nitrate 20 mg per 1 ml
      - Minims pilocarpine nitrate 2% eye drops 0.5ml unit dose | 20 unit dose [POM] | £11.99

- **PROSTAGLANDIN ANALOGUES AND PROSTAMIDES**

Bimatoprost

- **INDICATIONS AND DOSE**
  - Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension
  - TO THE EYE
  - Adult: Apply once daily, to be administered preferably in the evening

- **CAUTIONS**
  - Angle-closure glaucoma (no experience of use) - aphakia - asthma - chronic obstructive pulmonary disease - compromised respiratory function - congenital glaucoma (no experience of use) - contact lens wearers - history of significant ocular viral infections - inflammatory ocular conditions (no experience of use) - narrow-angle glaucoma (no experience of use) - neovascular glaucoma (no experience of use) - predisposition to hypotension - pseudophakia with torn posterior lens capsule or anterior chamber lenses - risk factors for cystoid macular oedema - risk factors for iritis - risk factors for uveitis
**SIDE-EFFECTS**

- **Common or very common** Blepharitis • blood pressure changes • brown pigmentation particularly in those with mixed–colour irides • conjunctival disorders • corneal erosion • darkening, thickening and lengthening of eye lashes • eyelash and vellus hair changes • headache • ocular discomfort • photophobia • pigmentation of periorcular skin • punctate keratitis • reduced visual acuity • transient punctate epithelial erosion
- **Uncommon** Asthenopia • dizziness • skin rash
- **Rare** Arthralgia • darkening of palpebral skin • facial oedema • iritis • macular oedema • myalgia • uveitis
- **Very rare** Chest pain • exacerbation of angina • palpitation • periorbital changes resulting in deepening of the eyelid sulcus

**Frequency not known** Asthma • blepharospasm • bradycardia • dyspnoea • exacerbation of COPD • eyelid retraction • malaise • nausea • ocular infection • reactivation of previous corneal infiltrates • retinal haemorrhage

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment—no information available.

**RENAL IMPAIRMENT** Use with caution—no information available.

**PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose bimatoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**PATIENT AND CARER ADVICE**

Changes to eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

**INDICATIONS AND DOSE**

- **Raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate**
  - TO THE EYE
  - Adult: Apply once daily

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (October 2013) that Ganfort® unit dose eye drops are accepted for restricted use within NHS Scotland for the reduction of intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension insufficiently responsive to topical beta-blockers or prostaglandin analogues who have proven sensitivity to preservatives.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **EXCIPIENTS:** May contain Benzalkonium chloride
- **Lumigan®** (Allergan Ltd)
- **Bimatoprost 100 microgram per 1 ml**
  - Lumigan 100micrograms/ml eye drops 3 ml (PST) £11.71 DT price = £11.71
  - 9 ml (PST) £35.13
- **Bimatoprost 300 microgram per 1 ml**
  - Lumigan 300micrograms/ml eye drops 0.4ml unit dose 30 unit dose (PST) £13.75 DT price = £13.75

**CONTRA-INDICATIONS** Active herpes simplex keratitis • history of recurrent herpetic keratitis associated with prostaglandin analogues

**CAUTIONS** Angle-closure glaucoma (no experience of use) • aphaikia • asthma • chronic obstructive pulmonary disease • compromised respiratory function • congenital glaucoma (no experience of use) • contact lens wearers • do not use within 5 minutes of thiomersal-containing preparations • history of significant ocular viral infections • inflammatory ocular conditions (no experience of use) • narrow-angle glaucoma (no experience of use) • neovascular glaucoma (no experience of use) • peri-operative period of cataract surgery • pseudophakia with torn posterior lens capsule or...
anterior chamber lenses - risk factors for cystoid macular oedema - risk factors for iritis - risk factors for uveitis

- **SIDE-EFFECTS**
  - Common or very common: Blepharitis - blood pressure changes - brown pigmentation particularly in those with mixed-colour irides - conjunctival disorders - corneal erosion - darkening, thickening and lengthening of eye lashes - eyelash and vellus hair changes - headache - ocular discomfort - photophobia - pigmentation of periocular skin - punctate keratitis - reduced visual acuity - transient punctate epithelial erosion

**Travoprost**

**INDICATIONS AND DOSE**

**Raised intra-ocular pressure in open-angle glaucoma**

**Ocular hypertension**

- **TO THE EYE**
- **Adult:** Apply once daily, to be administered preferably in the evening.

**CAUTIONS**

- History of significant ocular viral infections: angle-closure glaucoma (no experience of use).
- Asthma: chronic obstructive pulmonary disease.
- Compromised respiratory function: congenital glaucoma (no experience of use).
- Contact lens wearers: inflammatory ocular conditions (no experience of use).
- Narrow-angle glaucoma (no experience of use).
- Neovascular glaucoma (no experience of use).
- Pseudophakia with torn posterior lens capsule or anterior chamber lenses.
- Risk factors for cystoid macular oedema: risk factors for iritis.
- Risk factors for uveitis.

**SIDE-EFFECTS**

- Common or very common: Blepharitis, blood pressure changes.
- Rare: Arthralgia, darkening of palpebral skin.
- Very rare: Chest pain, exacerbation of angina.

**MEDICINAL FORMS**

- **Eye drops:** Travoprost 40 microgram per 1 ml (Santen UK Ltd).
- **EXCIPIENTS:** May contain Disodium edetate.

---

**Tafloproust with timolol**

30-Mar-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, tafluprost p. 1084, timolol maleate p. 1079.

**INDICATIONS AND DOSE**

**Raised intra-ocular pressure in open-angle glaucoma and ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate**

- **Adult:** Apply 1 drop once daily.

**SIDE-EFFECTS**

- Common or very common: Blurred vision, ocular hyperaemia.
- Uncommon: Anterior chamber inflammation, conjunctivitis.

**PATIENT AND CARER ADVICE**

- **Driving and skilled tasks:** Blurred vision may affect performance of skilled tasks (e.g. driving or operating machinery).

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2015) that Travatan® (tafluprost with timolol) is accepted for restricted use within NHS Scotland, within the licensed indications, in patients who have proven sensitivity to preservatives.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Eye drops:** Travoprost 40 microgram per 1 ml (Travatan 40micrograms/ml eye drops) 2.5 ml (£10.95 DT price + £10.95).
Travoprost with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, travoprost p. 1085, timolol maleate p. 1079.

**INDICATIONS AND DOSE**

**Raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate**

- **TO THE EYE**
  - **Adult:** Apply once daily

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

**EXCIPIENTS:** May contain Propylene glycol

- **DuoTrav** (Alcon Laboratories (UK) Ltd)
  - Travoprost 40 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml DuoTrav 40micrograms/ml / 5mg/ml eye drops | 2.5 ml [POD] £13.95 DT price + £3.95 | 7.5 ml [POD] £39.68

**SYMPATHOMIMETICS**

> **ALPHA₂-ADRENOCEPTOR AGONISTS**

**Apraclonidine**

**DRUG ACTION**

Apraclonidine is an alpha₂-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. It is a derivative of clonidine.

**INDICATIONS AND DOSE**

Control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery

- **TO THE EYE**
  - **Adult:** Apply 1 drop, 1 hour before laser procedure, then 1 drop, immediately after completion of procedure, 1% eye drops to be administered

Short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug

- **TO THE EYE**
  - **Adult:** Apply 1 drop 3 times a day usually for maximum 1 month, 0.5% eye drops to be administered, may not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

**CONTRA-INDICATIONS**

History of severe or unstable and uncontrolled cardiovascular disease

**CAUTIONS**

Cerebrovascular disease - depression - heart failure - history of angina - hypertension - loss of effect may occur over time - Parkinson’s syndrome - Raynaud’s syndrome - recent myocardial infarction - reduction in vision in end-stage glaucoma (suspend treatment) - severe coronary insufficiency - thromboangiitis obliterans - vasovagal attack

**INTERACTIONS**

- **Appendix 1: apraclonidine**

**SIDE-EFFECTS**

- **Common or very common** Conjunctivitis - dry eye - ocular intolerance - rhinitis - taste disturbance

- **Uncommon** Asthma - blepharitis - blepharospasm - chest pain - conjunctival vascular disorders - corneal erosion and infiltrates - dyspnoea - eyelid ptosis or retraction - impaired co-ordination - irritability - keratitis - keratopathy - myalgia - mydriasis - nervousness - parosmia - photophobia - rhinorrhoea - throat irritation - visual impairment

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Ocular intolerance** Withdraw if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur.

- **Systemic effects** Since absorption may follow topical application, see clonidine hydrochloride p. 139.

**PREGNANCY**

Manufacturer advises avoid—no information available.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution.

**RENAL IMPAIRMENT**

Use with caution in chronic renal failure.

**MONITORING REQUIREMENTS**

- Monitor intra-ocular pressure and visual fields.
- Monitor for excessive reduction in intra-ocular pressure following peri-operative use.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

**EXCIPIENTS:** May contain Benzoalkonium chloride

- **Iopidine** (Alcon Laboratories (UK) Ltd)
  - Apraclonidine (as Apraclonidine hydrochloride) 5 mg per 1 ml Iopidine 5mg/ml eye drops | 5 ml [POD] £10.88 DT price = £10.88
  - Apraclonidine (as Apraclonidine hydrochloride) 10 mg per 1 ml Iopidine 1% eye drops 0.25ml unit dose | 24 unit dose [POD] £77.85 DT price = £77.85

**Brimonidine tartrate**

**DRUG ACTION**

Brimonidine, an alpha₂-adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow.

**INDICATIONS AND DOSE**

Raised intra-ocular pressure in open-angle glaucoma in patients for whom beta-blockers are inappropriate

Ocular hypertension in patients for whom beta-blockers are inappropriate

- **Adjunctive therapy when intra-ocular pressure is inadequately controlled by other antiglaucoma therapy**

- **TO THE EYE**
  - **Adult:** Apply twice daily

**CAUTIONS**

Cerebral insufficiency - coronary insufficiency - depression - postural hypotension - Raynaud’s syndrome - severe cardiovascular disease - thromboangiitis obliterans

**INTERACTIONS**

- **Appendix 1: brimonidine**

**SIDE-EFFECTS**

- **Common or very common** Burning sensation at application site - conjunctival blanching - conjunctival disturbances - conjunctival follicles - conjunctival infection - corneal erosion - corneal staining - dizziness - dryness - dry mouth - eyelid inflammation - gastro-intestinal disturbances - headache - malaise - ocular disturbances - ocular dryness - ocular hyperaemia - ocular pain - ocular pruritus - photophobia - stinging at application site - taste disturbances - upper respiratory symptoms - visual disturbances

- **Uncommon** Arrhythmia - bradycardia - depression - nasal dryness - palpitation - tachycardia

- **Rare**

- **Very rare** Hypertension - hypotension - insomnia - iritis - miosis - syncope

**PREGNANCY**

Manufacturer advises use only if benefit outweighs risk—limited information available.
6 Retinal disorders

6.1 Macular degeneration

Subfoveal choroidal neovascularisation

Treatment

Aflibercept below, pegaptanib sodium p. 1088 and ranibizumab p. 1089 are vascular endothelial growth factor inhibitors licensed for the treatment of neovascular (wet) age-related macular degeneration. Aflibercept is also licensed for the treatment of macular oedema secondary to central retinal vein occlusion, and diabetic macular oedema; ranibizumab is also licensed for the treatment of visual impairment due to diabetic macular oedema, macular oedema secondary to branch or central retinal vein occlusion, and choroidal neovascularisation secondary to pathologic myopia. Ranibizumab can be administered concomitantly with laser photocoagulation for the treatment of diabetic macular oedema and for macular oedema secondary to branch retinal vein occlusion.

ANTINEOVOCA RISATION DRUGS

VASCULAR ENDOTHELIAL GROWTH FACTOR INHIBITORS

Aflibercept

- **DRUG ACTION** Aflibercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placent al growth factor (PIGF). Aflibercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels that supply tumours with oxygen and nutrients.

- **INDICATIONS AND DOSE**

  Neovascular (wet) age-related macular degeneration (specialist use only)

  - **BY INTRAVITREAL INJECTION**
    - Adult: Initially 2 mg once a month for 3 months, then 2 mg every 2 months, review treatment frequency after 12 months

  Macular oedema secondary to retinal vein occlusion (specialist use only)

  - **BY INTRAVITREAL INJECTION**
    - Adult: Initially 2 mg once a month until maximum visual acuity is achieved or there are no signs of disease activity (discontinue treatment if no improvement in visual and anatomic outcomes)

  Diabetic macular oedema (specialist use only)

  - **BY INTRAVITREAL INJECTION**
    - Adult: Initially 2 mg once a month for 5 months, then maintenance 2 mg every 2 months, review treatment frequency after 12 months (discontinue treatment if no improvement in visual and anatomic outcomes)

  Myopic choroidal neovascularisation (specialist use only)

  - **BY INTRAVITREAL INJECTION**
    - Adult: 2 mg for 1 dose, if visual or anatomic outcomes indicate that disease persists, additional doses may be administered; the interval between 2 doses should be greater than 1 month

- **CONTRA-INDICATIONS** Clinical signs of irreversible ischaemic visual function loss · ocular or periorbital infection · severe intra-ocular inflammation

- **CAUTIONS** Active systemic infection · diabetic patients with uncontrolled hypertension · discontinue treatment if stage 3 or 4 macular holes develop—consult product literature for full details · discontinue treatment in the event of a retinal break—consult product literature for full details · discontinue treatment in the event of rhegmatogenous retinal detachment—consult product literature for full details · patients at risk of retinal pigment epithelial tear · poorly controlled glaucoma · recent history of myocardial infarction · recent history of stroke · recent history of transient ischaemic attack

CAUTIONS, FURTHER INFORMATION

Aflibercept is given by intravitreal injection by specialists experienced in the management of this condition. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.

- **INTERACTIONS** • Appendix 1: aflibercept
Aflibercept for pregnancy

- **Common or very common** Treating visual impairment caused by diabetic macular oedema (July 2016) NICE TA305

Aflibercept solution for injection is recommended as an option for use within NHS Wales for the treatment of adult patients with visual impairment due to myopic choroidal neovascularisation. This recommendation applies only if the approved Wales Patient Access Scheme (PAS) is used or where the list/contract price is equivalent or lower.

### Pegaptanib sodium

#### INDICATIONS AND DOSE

Treatment of neovascular (wet) age-related macular degeneration (specialist use only)

- **By intravitreal injection**
- **Adults:** 300 micrograms every 6 weeks, to be administered into the affected eye, review treatment if no benefit after 2 consecutive injections

#### CONTRA-INDICATIONS

Ocular or periocular infection

#### CAUTIONS

**CAUTIONS, FURTHER INFORMATION**

Pegaptanib is given by intravitreal injection by specialists. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.

#### SIDE-EFFECTS

- **Common or very common** Anterior chamber inflammation - cataract - conjunctival haemorrhage - conjunctivitis - corneal dystrophy - dry eye - eye discharge - eye irritation - eye pain - flashing lights - headache - local oedema - macular degeneration - mydriasis - periorbital haematoma - photophobia - punctate keratitis - raised intra-ocular pressure - retinal haemorrhage - rhinorrhoea - retinal disorders - vitreous disorders - vitreous floaters

#### PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk.

#### BREAST FEEDING

Manufacturer advises avoid—no information available.
MONITORING REQUIREMENTS
- Monitor intra-ocular pressure (transient increase may occur following injection, and small, sustained increases reported after repeated dosing).
- Monitor for vitreous haemorrhage and for signs of ocular infection for 2 weeks following injection.

DIRECTIONS FOR ADMINISTRATION
For further information on administration, consult product literature.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Ranibizumab and pegaptanib for the treatment of age-related macular degeneration (updated May 2012) NICE TA155
- Pegaptanib is not recommended for the treatment of wet age-related macular degeneration; patients currently receiving pegaptanib for any lesion type can continue therapy until they and their specialist consider it appropriate to stop. www.nice.org.uk/TA155

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

Ranibizumab

INDICATIONS AND DOSE
Neovascular (wet) age-related macular degeneration (specialist use only)
- BY INTRAVITREAL INJECTION
  - Adult: 500 micrograms once a month, to be administered into the affected eye, monitor visual acuity monthly, continue treatment until visual acuity is stable for 3 consecutive months, thereafter monitor visual acuity monthly, if necessary subsequent doses may be given at least 1 month apart

Diabetic macular oedema / Macular oedema secondary to retinal vein occlusion (specialist use only)
- BY INTRAVITREAL INJECTION
  - Adult: Initially 500 micrograms once a month, to be administered into the affected eye, monitor visual acuity monthly, continue treatment until visual acuity is stable for 3 consecutive months (discontinue treatment if no improvement in visual acuity after initial 3 injections), thereafter monitor visual acuity monthly, if necessary subsequent doses may be given at least 1 month apart

Choroidal neovascularisation secondary to pathologic myopia (specialist use only)
- BY INTRAVITREAL INJECTION
  - Adult: Initially 500 micrograms, to be administered as a single injection into the affected eye, monitor for disease activity monthly for first 2 months, then at least every 3 months thereafter during the first year, then as required, if necessary subsequent doses may be given at least 1 month apart

Concomitant treatment of diabetic macular oedema, or macular oedema secondary to branch retinal vein occlusion, with laser photocoagulation (specialist use only)
- BY INTRAVITREAL INJECTION
  - Adult: 500 micrograms, to be administered at least 30 minutes after laser photocoagulation

CONTRA-INDICATIONS
- Ocular or periocular infection • severe intra-ocular inflammation • signs of irreversible ischaemic visual function loss in patients with retinal vein occlusion

CAUTIONS
- Active systemic infection • diabetic macular oedema due to type 1 diabetes (limited information available) • diabetic patients with HbA1c over 12% • history of stroke • history of transient ischaemic attack • patients at risk of retinal pigment epithelial tear • previous intravitreal injections • proliferative diabetic retinopathy • retinal detachment or macular hole (discontinue treatment if rhegmatogenous retinal detachment or stage 3 or 4 macular holes develop) • uncontrolled hypertension

CAUTIONS, FURTHER INFORMATION
Ranibizumab is given by intravitreal injection by specialists. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.

INTERACTIONS
- Appendix 1: ranibizumab

SIDE-EFFECTS
- Common or very common Allergic skin reactions • anaemia • anterior chamber flare • anxiety • arthralgia • blepharitis • cataract • conjunctival disorders • conjunctivitis • cough • eye haemorrhage • eyelid oedema • headache • iridocyclitis • iritis • nasopharyngitis • nausea • ocular discomfort • photophobia • photopsia • posterior capsule opacification • punctuate keratitis • raised intra-ocular pressure • retinal disorders • urinary tract infection • uveitis • visual disturbance • vitreous disorders
- Uncommon Blindness • corneal disorders • hyphaema • hypopyon • iris adhesion • keratopathy

CONCEPTION AND CONTRACEPTION
Manufacturer recommends women use effective contraception during and for at least 3 months after treatment.

PREGNANCY
Manufacturer advises avoid unless potential benefit outweighs risk.

BREAST FEEDING
Manufacturer advises avoid—no information available.

MONITORING REQUIREMENTS
- Monitor intra-ocular pressure, perfusion of the optic nerve head, and for signs of ocular infection following injection.
- Monitor visual acuity, see individual indications and dose for frequency.

DIRECTIONS FOR ADMINISTRATION
For further information on administration, consult product literature.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Ranibizumab for treating choroidal neovascularisation associated with pathological myopia (November 2013) NICE TA298
Ranibizumab is recommended as an option for treating visual impairment due to choroidal neovascularisation secondary to pathological myopia when the manufacturer provides ranibizumab with the discount agreed in the patient access scheme. www.nice.org.uk/TA298

Ranibizumab for the treatment of visual impairment caused by macular oedema secondary to retinal vein occlusion (May 2013) NICE TA283
Ranibizumab is recommended as an option for treating visual impairment caused by macular oedema:
- following central retinal vein occlusion
- following branch retinal vein occlusion only if treatment with laser photocoagulation has not been beneficial, or when laser photocoagulation is not suitable because of the extent of macular haemorrhage and
- only if the manufacturer provides ranibizumab with the discount agreed in the patient access scheme revised in the context of NICE technology appraisal guidance 274. www.nice.org.uk/TA283

Ranibizumab for the treatment of diabetic macular oedema (February 2011) NICE TA274
Ranibizumab is recommended as an option for the
treatment of visual impairment due to diabetic macular oedema only if:

- the eye has a central retinal thickness of 400 micrometres or more at the start of treatment and
- the manufacturer provides ranibizumab with the discount agreed in the patient access scheme (as revised in 2012).

Patients currently receiving ranibizumab for treating visual impairment due to diabetic macular oedema whose disease does not meet the criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA274

- Ranibizumab and pegaptanib for the treatment of age-related macular degeneration (updated May 2012) NICE TA155

Ranibizumab is recommended for the treatment of wet age-related macular degeneration if all of the following apply:

- the best corrected visual acuity is between 6/12 and 6/96;
- there is no permanent structural damage to the central fovea;
- the lesion size is less than or equal to 12 disc areas in greatest linear dimension;
- there is evidence of recent disease progression;
- the manufacturer provides ranibizumab with the discount agreed in the patient access scheme (as revised in 2012).

Ranibizumab should only be continued in patients who maintain adequate response to therapy.

www.nice.org.uk/TA155

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (May 2007) that ranibizumab (Lucentis®) is accepted for use within NHS Scotland for the treatment of neovascular (wet) age-related macular degeneration.

The Scottish Medicines Consortium has advised (October 2011 and April 2013) that ranibizumab (Lucentis®) is accepted for use within NHS Scotland for the treatment of macular oedema secondary to branch or central retinal vein occlusion, and (November 2012) for restricted use for the treatment of visual impairment due to diabetic macular oedema in adults with best corrected visual acuity 75 Early Treatment Diabetic Retinopathy Study letters or less at baseline, and (October 2013) for the treatment of visual impairment due to choroidal neovascularisation secondary to pathologic myopia in adults; SMC advice is contingent upon the continuing availability of ranibizumab at the price agreed in the patient access scheme.

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Lucentis (Novartis Pharmaceuticals UK Ltd)

  Ranibizumab 10 mg per 1 ml: Lucentis 2.3mg/0.23ml solution for injection vials | 1 vial (£55.00 (Hospital only))
  Lucentis 1.65mg/0.165ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (POM) £55.00

**PHOTOSENSITISERS**

**Verteporfin**

- **DRUG ACTION** Following intravenous infusion, verteporfin is activated by local irradiation using non-thermal red light to produce cytotoxic derivatives.

- **INDICATIONS AND DOSE**

  Photodynamic treatment of age-related macular degeneration associated with predominantly classic subfoveal choroidal neovascularisation or with pathological myopia (specialist use only)

  - **BY INTRAVENOUS INFUSION**
  - **Adult:** 6 mg/m², dose to be given over 10 minutes

- **CONTRA-INDICATIONS**
  - Acute porphyria

- **CAUTIONS**
  - Avoid extravasation - biliary obstruction - photosensitivity

- **INTERACTIONS**
  - Frequency not known

- **SIDE-EFFECTS**

  - Common or very common
    - Back pain - flashing lights - hypercholesterolaemia - malaise - nausea - photosensitivity - reduced visual acuity - visual disturbances - visual-field defects

  - Uncommon
    - Hyperaesthesia - hypertension - pyrexia - retinal detachment - subretinal, retinal or vitreous haemorrhage

  - Rare
    - Retinal or choroidal vessel non-perfusion

  - Frequency not known
    - Chest pain - macular oedema - myocardial infarction - retinal oedema - vasovagal reactions

- **PREGNANCY**
  - Manufacturer advises use only if potential benefit outweighs risk (teratogenic in animal studies).

- **BREAST FEEDING**
  - No information available—manufacturer advises avoid breast-feeding for 48 hours after administration.

- **HEPATIC IMPAIRMENT**
  - Use with caution in moderate hepatic impairment. Avoid in severe hepatic impairment.

- **DIRECTIONS FOR ADMINISTRATION**
  - For information on administration and light activation, consult product literature.

  - For intravenous infusion (Visudyne®), give intermittently in Glucose 5%; reconstitute each 15 mg with 7 ml water for injections to produce a 2 mg/ml solution then dilute requisite dose with infusion fluid to a final volume of 30 ml and give over 10 minutes; protect infusion from light and administer within 4 hours of reconstitution. Incompatible with sodium chloride infusion.

- **PATIENT AND CARER ADVICE**
  - Photosensitivity—avoid exposure of unprotected skin and eyes to bright light during infusion and for 48 hours afterwards.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - NICE technology appraisals (TAs)

  - Verteporfin photodynamic therapy for wet age-related macular degeneration (September 2003) NICE TA68

  Photodynamic therapy is recommended for wet age-related macular degeneration with a confirmed diagnosis of classic (no occult) subfoveal choroidal neovascularisation and best-corrected visual acuity of 6/60 or better.

  Photodynamic therapy is **not** recommended for wet age-related macular degeneration with predominantly classic but partly occult subfoveal choroidal neovascularisation except in clinical studies.

6.2 Macular oedema

Other drugs used for Macular oedema
Aflibercept, p. 921 · Dexamethasone, p. 1061 · Ranibizumab, p. 1089

CORTICOSTEROIDS

Fluocinolone acetonide

- **INDICATIONS AND DOSE**
  - Treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies (specialist use only)
  - **BY INTRAVITREAL INJECTION**
  - **Adult:** 190 micrograms, to be administered into the affected eye

- **CONTRA-INDICATIONS**
  - Active or suspected ocular infection
  - Pre-existing glaucoma

- **CAUTIONS**
  - Raised baseline intra-ocular pressure

- **SIDE-EFFECTS**
  - **Common or very common**
    - Blurred vision
cat
    - Cataract
    - Conjunctival haemorrhage
glaucoma
    - Ocular discomfort
    - Raised intra-ocular pressure
    - Reduced visual acuity
    - Vitreous floaters
    - Vitreous haemorrhage
  - **Uncommon**
    - Conjunctival ulcer
    - Endophthalmitis
    - Eye discharge
    - Eye pruritus
    - Headache
    - Iris adhesions
    - Iris neovascularisation
    - Maculopathy
    - Ocular haeryema
    - Optic atrophy
    - Optic nerve disorder
    - Posterior capsule opacification
    - Retinal exudates
    - Retinal vascular occlusion
    - Scleral thinning
    - Vitreous degeneration
    - Vitreous detachment

- **PREGNANCY**
  - Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING**
  - Manufacturer advises avoid unless essential.

- **MONITORING REQUIREMENTS**
  - Monitor for raised intra-ocular pressure (particularly if raised at baseline), retinal detachment, endophthalmitis, vitreous haemorrhage or detachment within 2–7 days following the procedure.
  - Monitor intra-ocular pressure at least every 2 months thereafter (for approximately 36 months).

- **DIRECTIONS FOR ADMINISTRATION**
  - Concurrent administration to both eyes not recommended. For further information on administration and repeat dosing, consult product literature.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Gel is useful for application to the scalp and other hairy areas.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - NICE technology appraisals (TAs)
    - Fluocinolone acetonide intravitreal implant for treating chronic diabetic macular oedema after an inadequate response to prior therapy (November 2013) NICE TA301
    - Fluocinolone acetonide intravitreal implant is recommended as an option for treating chronic diabetic macular oedema that is insufficiently responsive to available therapies only if:
    - the implant is to be used in an eye with an intra-ocular (pseudophakic lens) and
    - the manufacturer provides fluocinolone acetonide intravitreal implant with the discount agreed in the patient access scheme.

  - [www.nice.org.uk/TA301](http://www.nice.org.uk/TA301)

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (February 2014) that fluocinolone acetonide intravitreal implant ([Iluvien](http://www.nice.org.uk/TA301)) is recommended for restricted use within NHS Scotland for the treatment of vision impairment associated with chronic diabetic macular oedema, considered insufficiently responsive to available therapies, only in patients in whom the affected eye is pseudophakic (has an artificial lens after cataract surgery), and retreatment would take place only if the patient had previously responded to treatment with fluocinolone acetonide and subsequently best corrected visual acuity had deteriorated to less than 20/32.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Implant**
    - [Iluvien](http://www.nice.org.uk/TA301) (Alimera Sciences Ltd)
    - Fluocinolone acetonide 190 microgram Iluvien 190 mcg intravitreal implant in applicator 1 device £5,500.00

6.3 Optic neuropathy

DRUGS FOR METABOLIC DISORDERS > ANTIOXIDANTS

Idebenone

- **DRUG ACTION**
  - Idebenone is a nootropic and antioxidant that is thought to act by restoring cellular ATP generation, thereby reactivating retinal ganglion cells.

- **INDICATIONS AND DOSE**
  - [Leber’s Hereditary Optic Neuropathy (initiated by a specialist)](http://www.nice.org.uk/TA301)
  - **BY MOUTH**
  - **Adult:** 300 mg 3 times a day

- **SIDE-EFFECTS**
  - **Common or very common**
    - Back pain
    - Cough
    - Diarrhoea
    - Nasopharyngitis
  - **Frequency not known**
    - Anorexia
    - Azotaemia
    - Blood disorders
    - Bronchitis
    - Chromatia
    - Dyspepsia
    - Hepatitis
    - Malaise
    - Nausea
    - Nervous system disorders
    - Pain in extremity
    - Pruritus
    - Raised lipids
    - Raised liver enzymes
    - Rash
    - Vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Chromatia
  - The metabolites of idebenone may cause red-brown discolouration of the urine. This effect is harmless, but the manufacturer advises caution as this may mask colour changes due to other causes (e.g. renal or blood disorders).

- **PREGNANCY**
  - Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING**
  - Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises use with caution—no information available.

- **RENAL IMPAIRMENT**
  - Manufacturer advises use with caution—no information available.
6.4 Vitreomacular traction

RECOMBINANT PROTEOLYTIC ENZYMES

Ocriplasmin

**INDICATIONS AND DOSE**
Treatment of vitreomacular traction, including when associated with a macular hole of diameter less than or equal to 400 microns (specialist use only)

- **BY INTRAVITREAL INJECTION**
- Adult: 125 micrograms for 1 dose, to be administered into the affected eye, concurrent administration to both eyes is not recommended

**CONTRA-INDICATIONS**
Active or suspected ocular or periocular infection • aphakia • exudative age-related macular degeneration • high myopia • history of rhegmatogenous retinal detachment • ischaemic retinopathies • large diameter macular hole (> 400 microns) • lens zonule instability • proliferative diabetic retinopathy • recent intra-ocular injection (including laser therapy) • recent ocular surgery • retinal vein occlusions • vitreous haemorrhage

**CAUTIONS**
History of uveitis (including severe active inflammation) • non-proliferative diabetic retinopathy • significant eye trauma

**SIDE-EFFECTS**
- **Common or very common** Abnormal retinograph • anterior chamber cell or flare • chromatosia • conjunctival disorders • eyelid oedema • iritis • macular degeneration • macular hole • macular oedema • metamorphopsia • ocular discomfort • ocular hyperaemia • photophobia • photopsia • raised intra-ocular pressure • reduced visual acuity • retinal disorders • retinal pigment epitheliopathy • vitreous disorders
- **Uncommon** Anterior chamber inflammation • corneal abrasion • diplopia • eye inflammation • hyphaema • lens subluxation • miosis • scotoma • transient blindness • unequal pupils • visual field defect

**PREGNANCY**
Manufacturer advises use only if potential benefit outweighs risk — no information available.

**BREAST FEEDING**
Manufacturer advises use only if potential benefit outweighs risk — no information available.

**MONITORING REQUIREMENTS**
Monitor intra-ocular pressure, visual acuity, and for signs of intra-ocular inflammation or infection following injection.

Ear

Otitis externa

Otitis externa is an inflammatory reaction of the meatal skin. It is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping. A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution p. 1097. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

If infection is present, a topical anti-infective which is not used systemically (such as neomycin sulfate p. 1095 or clioquinol) may be used, but for only about a week as excessive use may result in fungal infections; these may be difficult to treat and require expert advice. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. Aluminium acetate ear drops are also effective against bacterial infection and inflammation of the ear. Chloramphenicol p. 1095 may be used but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroid are used for treating cases where infection is present with inflammation and eczema.

In view of reports of ototoxicity, manufacturers contra-indicate treatment with topical aminoglycosides or polymyxins in patients with a perforated tympanic membrane (eardrum) or patent grommet. However, some specialists do use these drops cautiously in the presence of a perforation or patent grommet in patients with chronic suppurative otitis media and when other measures have failed for otitis externa; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

A solution of acetic acid 2% acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an anti-inflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (EarCalm® spray) is on sale to the public.

For severe pain associated with otitis externa, a simple analgesic, such as paracetamol p. 422 or ibuprofen p. 1041, can be used. A systemic antibacterial can be used if there is spreading cellulitis or if the patient is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory meatus, flucloxacillin p. 523 is the drug of choice; ciprofloxacin p. 527 (or an aminoglycoside) may be needed in pseudomonal infections which may occur if the patient has diabetes or is immunocompromised.

The skin of the pinna adjacent to the ear canal is often affected by eczema. A topical corticosteroid cream or ointment is then required, but prolonged use should be avoided.

Otitis media

Acute otitis media

Acute otitis media is the commonest cause of severe aural pain in small children. Many infections, especially those accompanying coryza, are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment and a simple analgesic, such as paracetamol, may be sufficient. In children without systemic features, a systemic antibacterial may be started after 72 hours if there is no improvement, or earlier if there is deterioration, if the patient is systemically unwell, if the patient is at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis is present, or in children under 2 years of age with bilateral otitis media. Perforation of the tympanic membrane in patients with acute otitis media usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, a systemic antibacterial can be given. Topical treatment of acute otitis media is ineffective and there is no place for drops containing a local anaesthetic.
Otitis media with effusion
Otitis media with effusion (glue ear) occurs in about 10% of children and in 90% of children with cleft palates. Systemic antibiotics are not usually required. If glue ear persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of chronic otitis media.

Chronic otitis media
Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in patients with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction which may completely resolve long-standing infection. Local cleansing of the meatal and middle ear may be followed by treatment with a sponge wick or ribbon gauze dressing soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution; this is particularly beneficial for discharging ears or infections of the mastoid cavity. An antibacterial ear ointment may also be used. Acute exacerbations of chronic infection may also require systemic treatment with amoxicillin p. 518 (or erythromycin p. 510 if penicillin-allergic); treatment is adjusted according to the results of sensitivity testing.

In view of reports of ototoxicity, manufacturers contraindicate topical treatment with ototoxic antibiotics in the presence of a tympanic perforation or patent grommet. Ciprofloxacin or ofloxacin eye drops p. 530 used in the ear [unlicensed use] or ear drops [both unlicensed; available from ‘special-order’ manufacturers or specialist importing companies] are an effective alternative to such ototoxic ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

However, some specialists do use ear drops containing aminoglycosides or polymyxins [unlicensed indications] cautiously in patients with chronic suppurrative otitis media and a perforation of the tympanic membrane, if the otitis media has failed to settle with systemic antibacterials; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances. It is considered that the pus in the middle ear associated with otitis media also carries a risk of ototoxicity.

Removal of ear wax
Ear wax (cerumen) is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Ear wax can be softened using simple remedies such as olive oil ear drops or almond oil ear drops; sodium bicarbonate ear drops p. 1097 are also effective, but may cause dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Some proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium p. 1098 or urea hydrogen peroxide p. 1098 are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in patients unable to cooperate with the procedure, in those with otitis media in the last six weeks, in otitis externa, in patients with cleft palate, a history of ear drum perforation, or previous ear surgery. A person who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

**Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml**

 Betnesol-N ear/eye/nose drops | 10 ml [Pos] £2.39 DT price = £2.39

**Dexamethasone with ciprofloxacin**

09-Mar-2017

**INDICATIONS AND DOSE**

Acute otitis media in patients with tympanostomy tubes

**TO THE EAR**

- Adult: Apply 4 drops twice daily for 7 days

Acute otitis externa

**TO THE EAR**

- Adult: Apply 4 drops twice daily for 7 days

**CONTRA-INDICATIONS**

- Fungal ear infections • viral ear infections
- Avoid prolonged use

**SIDE-EFFECTS**

- Common or very common Ear pain
- Uncommon Ear congestion • flushing • fungal ear infections • irritability • malaise • otorrhoea • paraesthesia of the ear • skin exfoliation • taste disturbances • vomiting
- Rare Dizziness • erythematous rash • headache • hearing loss • tinnitus

**SIDE-EFFECTS, FURTHER INFORMATION**

- Otorrhoea Manufacturer advises further evaluation of underlying conditions if otorrhoea persists after a full course, or if at least two episodes of otorrhoea occur within 6 months.
- Pregnancy Manufacturer advises use only if potential benefit outweighs risk—no information available.
- Breastfeeding Manufacturer advises caution—no information available.

**PATIENT AND CARER ADVICE**

Manufacturer advises counselling on administration.
CONTRA-INDICATIONS

MEDICINAL FORMS

The properties listed below are those particular to the same drug.

Ear drops
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- Cilodex (Alcon Laboratories (UK) Ltd)
  - Dexamethasone 1 mg per 1 ml, Ciprofloxacine (as Ciprofloxacine hydrochloride) 3 mg per 1 ml
  - Cilodex ear drops | 5 ml £0.62
  - DT price = £6.12

Dexamethasone with framycetin sulfate and gramicidin

INDICATIONS AND DOSE

Eczematous inflammation in otitis externa

- TO THE EAR
- Child: 2–3 drops 3–4 times a day
- Adult: 2–3 drops 3–4 times a day

INDICATIONS AND DOSE

Removal of earwax

- TO THE EAR
- Child: Allow drops to warm to room temperature before use (consult product literature)
- Adult: Allow drops to warm to room temperature before use (consult product literature)

DIRECTIONS FOR ADMINISTRATION  The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Liquid

- Almond oil (Non-proprietary)
  - Almond oil liquid | 50 ml £0.91
  - 50 ml £0.73–£0.82
  - 200 ml £2.54
  - 500 ml £11.90

Parents of the Ear: Otitis Externa and the Softening Drugs

INSTRUCTIONS FOR ADMINISTRATION

DIRECTIONS FOR ADMINISTRATION

Topical

- Almond oil is a softening drug and can be used alone without any medication.
- May contain Hydroxybenzoates (parabens)

- Almond oil 1 ml per 1 ml
- Almond oil 2%
- Almond oil 5%
- Almond oil 10%
- Almond oil 20%
- Almond oil 50%

Other drugs

- Dexamethasone 1 mg per 1 ml
- Dexamethasone with framycetin sulfate
- Dexamethasone with glacial acetic acid and neomycin sulfate
- Sodium bicarbonate 50 mg per 1 ml
- Sodium bicarbonate 5% ear drops

INDICATIONS AND DOSE

Eczematous inflammation in otitis externa

- TO THE EAR
- Child: 2–3 drops 3–4 times a day
- Adult: 2–3 drops 3–4 times a day

DIRECTIONS FOR ADMINISTRATION

- Almond oil is a softening drug and can be used alone without any medication.
- May contain Hydroxybenzoates (parabens)

- Almond oil 1 ml per 1 ml
- Almond oil 2%
- Almond oil 5%
- Almond oil 10%
- Almond oil 20%
- Almond oil 50%
Arachis oil with chlorobutanol

**INDICATIONS AND DOSE**
- Removal of ear wax
  - TO THE EAR
  - Adult: (consult product literature)

**LESS SUITABLE FOR PRESCRIBING** Arachis (peanut) oil with chlorobutanol ear drops are less suitable for prescribing.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
- **Ear drops**
  - Cerumol (Thornton & Ross Ltd)
    - Chlorobutanol 50 mg per 1 ml, Arachis oil 573 mg per 1 ml Cerumol ear drops | 11 ml | £2.05
  - Oleax (Arjun Products Ltd)
    - Arjun ear drops | 10 ml | £1.26
  - Cerumol (olive oil) (Thornton & Ross Ltd)
    - Cerumol olive oil ear drops | 10 ml no price available
  - Oteax (JR Biomedical Ltd)
    - Oteax ear drops | 15 ml | £1.40
  - Ceramic (Cerumol Ltd)
    - Ceramic olive oil ear drops | 10 ml | £1.42

Olive oil

**INDICATIONS AND DOSE**
- Removal of ear wax
  - TO THE EAR
  - Child: Apply twice daily for several days (if wax is hard and impacted)
  - Adult: Apply twice daily for several days (if wax is hard and impacted)

**DIRECTIONS FOR ADMINISTRATION** The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Allow ear drops to warm to room temperature before use.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
- **Ear drops**
  - Olive oil
    - Olive oil ear drops | 10 ml | £1.35–£1.42 | 15 ml | £0.92 | 20 ml | £2.70
  - Arjun (Arjun Products Ltd)
    - Arjun ear drops | 10 ml | £1.26
  - Cerumol (olive oil) (Thornton & Ross Ltd)
    - Cerumol olive oil ear drops | 10 ml no price available
  - Oteax (JR Biomedical Ltd)
    - Oteax ear drops | 15 ml | £1.40
  - Ceramic (Cerumol Ltd)
    - Ceramic olive oil ear drops | 10 ml | £1.42

Urea hydrogen peroxide

**INDICATIONS AND DOSE**
- Softening and removal of ear wax
  - TO THE EAR
  - Adult: (consult product literature)

**PATIENT AND CARER ADVICE** The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear.

**LESS SUITABLE FOR PRESCRIBING** Urea-hydrogen peroxide ear drops are less suitable for prescribing.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
- **Ear drops**
  - Exterol (Dermal Laboratories Ltd)
    - Urea hydrogen peroxide 50 mg per 1 gram Exterol 5% ear drops | 8 ml | £1.75 DT price = £2.89
  - Oteax (Dendron Ltd)
    - Urea hydrogen peroxide 50 mg per 1 gram Oteax 5% ear drops | 8 ml | £2.89

Nose

**Rhinitis and bacterial sinusitis**
Rhinitis is often self-limiting but bacterial sinusitis may require treatment with antibacterials. There are few indications for nasal sprays and drops except in allergic rhinitis and perennial rhinitis. Many nasal preparations contain sympathomimetic drugs which may damage the nasal cilia. Sodium chloride 0.9% p. 953 solution may be used as a douche or ‘sniff’ following endonasal surgery.

**Drugs used in nasal allergy**
Mild allergic rhinitis is controlled by **antihistamines** (see Antihistamines, allergen immunotherapy and allergic emergencies p. 265) or topical **nasal corticosteroids**; systemic nasal decongestants are of doubtful value. Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms and nasal congestion can be relieved by topical nasal corticosteroids; sodium cromoglicate p. 1105 is an alternative, but may be less effective. The topical antihistamine azelastine hydrochloride p. 1059 is useful for controlling breakthrough symptoms in allergic rhinitis. Topical antihistamines are considered less effective than topical corticosteroids but probably more effective than cromoglicate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous treatment may be required for years in perennial rhinitis.

Montelukast p. 258 is less effective than topical nasal corticosteroids; montelukast can be used in patients with seasonal allergic rhinitis and concomitant asthma.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide can reduce watery rhinorrhea.

Very disabling symptoms occasionally justify the use of **systemic corticosteroids** for short periods, for example, in...
students taking important examinations. They may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal cavity.

**Corticosteroids**
Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, after nasal surgery (until healing has occurred), and in pulmonary tuberculosis. Patients transferred from systemic corticosteroids may experience exacerbation of some symptoms. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

**Nasal polyps**
Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the patient in the ‘head down’ position. A short course of a systemic corticosteroid may be required initially to shrink large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

**Pregnancy**
If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclometasone dipropionate p. 1102, budesonide p. 1103, fluticasone p. 1103, or sodium cromoglicate may be considered.

**Topical nasal decongestants**
The nasal mucosa is sensitive to changes in atmospheric temperature and humidity and these alone may cause slight nasal congestion. The nose and nasal sinuses produce a litre of mucus in 24 hours and much of this finds its way silently into the stomach via the nasopharynx. Slight changes in the nasal airway, accompanied by an awareness of mucus passing along the nasopharynx causes some patients to be inaccurately diagnosed as suffering from chronic sinusitis. These symptoms are particularly noticeable in the later stages of the common cold. Sodium chloride 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions.

Inhalation of warm moist air is useful in the treatment of symptoms of acute infective conditions. The addition of volatile substances such as menthol and eucalyptus may encourage the use of warm moist air (see under Aromatic inhalations, cough preparations and systemic nasal decongestants p. 282).

Symptoms of nasal congestion associated with vasomotor rhinitis and the common cold can be relieved by the short-term use (usually not longer than 7 days) of decongestant nasal drops and sprays. These all contain sympathomimetic drugs which exert their effect by vasoconstriction of the mucosal blood vessels which in turn reduces oedema of the nasal mucosa. They are of limited value because they can give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events. Ephedrine hydrochloride nasal drops, below, are the safest sympathomimetic preparation and can give relief for several hours. The more potent sympathomimetic drugs oxymetazoline and xylometazoline hydrochloride p. 1100 are more likely to cause a rebound effect.

Non-allergic watery rhinorrhea often responds well to treatment with the antimuscarinic ipratropium bromide p. 1102.

**Sinusitis and oral pain**
Sinusitis affecting the maxillary antrum can cause pain in the upper jaw. Where this is associated with blockage of the opening from the sinus into the nasal cavity, it may be helpful to relieve the congestion with inhalation of warm moist air or with ephedrine hydrochloride nasal drops.

Systemic antibacterials may sometimes be required for sinusitis (see under Nose infections, bacterial p. 467).

**Nasal preparations for infection**
There is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis; see elimination of nasal staphylococci.

**Nasal staphylococci**
Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing chlorhexidine and neomycin (Naseptin®), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population.

A nasal ointment containing mupirocin p. 1101 is also available; it should probably be held in reserve for resistant infections. In hospitals or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of meticillin-resistant *Staphylococcus aureus* (MRSA). A sample should be taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.

# 1 Nasal congestion

**SYMPATHOMIMETICS **

**Ephedrine hydrochloride**

- **INDICATIONS AND DOSE**
  - Nasal congestion | Sinusitis affecting the maxillary antrum
  - **BY INTRanasAL ADMINISTRATION**
  - Child 12-17 years: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril, administer ephedrine 0.5% nasal drops
  - Adult: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril

**IMPORTANT SAFETY INFORMATION**

**CHM/MHRA ADVICE**
The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine can be considered for up to 5 days’ treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

- **CAUTIONS** Avoid excessive or prolonged use • cardiovascular disease (in children) • diabetes mellitus • elderly • hypertension • hyperthyroidism • ischaemic heart disease • prostatic hypertrophy (risk of acute urinary retention) (in adults)
Pseudoephedrine hydrochloride

INDICATIONS AND DOSE
Congestion of mucous membranes of upper respiratory tract
  - BY MOUTH
    - Child 6–11 years: 30 mg 3–4 times a day
    - Child 12–17 years: 60 mg 3–4 times a day
    - Adult: 60 mg 3–4 times a day

IMPORTANT SAFETY INFORMATION
Children under 6 years should not be given over-the-counter cough and cold medicines containing pseudoephedrine.

CAUTIONS
- Diabetes
- Heart disease
- Hypertension
- Hyperthyroidism
- Ischaemic heart disease
- Prostatic hypertrophy
- Raised intra-ocular pressure (in children)
- Susceptibility to angle-closure glaucoma

INTERACTIONS
  - Appendix 1: sympathomimetics, vasoconstrictor

SIDE-EFFECTS
  - Common or very common
    - Anxiety
    - Headache
    - Hypertension
    - Insomnia
    - Nausea
    - Restlessness
    - Tachycardia
    - Vomiting
  - Rare
    - Hallucinations
    - Rash
  - Very rare
    - Angle-closure glaucoma
  - Frequency not known
    - Urinary retention

PREGNANCY
Defective closure of the abdominal wall (gastrochisis) reported very rarely in newborns after first trimester exposure.

BREAST FEEDING
May suppress lactation; avoid if lactation not well established or if milk production insufficient.

Hepatic Impairment
Manufacturer advises use with caution in severe impairment.

Renal Impairment
Use with caution in mild to moderate renal impairment. Manufacturer advises avoid in severe renal impairment.

Less Suitable for Prescribing
Pseudoephedrine hydrochloride is less suitable for prescribing.

EXCEPTIONS TO LEGAL CATEGORY
Galpseud® and Sudafed® can be sold to the public provided no more than 720 mg of pseudoephedrine salts are supplied, and ephedrine base (or salts) are not supplied at the same time; for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Oral solution
EXCIPIENTS: May contain Alcohol
- Galpseud (Thornton & Ross Ltd)
  Pseudoephedrine hydrochloride 6 mg per 1 ml
  30 mg/5 ml: £0.14
- Galpseud (Thornton & Ross Ltd)
  Pseudoephedrine hydrochloride 60 mg
  60 mg tablets: £0.25

Tablet
- Galpseud (Thornton & Ross Ltd)
  Pseudoephedrine hydrochloride 60 mg
  60 mg tablets: £0.52

Xylometazoline hydrochloride

DRUG ACTION
Xylometazoline is a sympathomimetic.

INDICATIONS AND DOSE
Nasal congestion
  - BY INTRanasal administration using nasal drops
    - Child 6–11 years: 1–2 drops 1–2 times a day as required for maximum duration of 5 days, 0.05% solution to be administered into each nostril
    - Child 12–17 years: 2–3 drops 2–3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril
    - Adult: 2–3 drops 2–3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril
  - BY INTRanasal administration using nasal spray
    - Child 12–17 years: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril
    - Adult: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril

IMPORTANT SAFETY INFORMATION
The CHM/MHRA has stated that non-prescription cough and cold medicines containing oxymetazoline or xylometazoline can be considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

CAUTIONS
- Angle-closure glaucoma
- Avoid excessive or prolonged use
- Cardiovascular disease (in children)
- Diabetes mellitus
- Elderly
- Hypertension
- Hyperthyroidism
- Ischaemic heart disease
- Prostatic hypertrophy (risk of acute retention)
- Rebound congestion

CAUTIONS, FURTHER INFORMATION
- Rebound congestion
  - Sympathomimetic drugs are of limited value in the treatment of nasal congestion because they can, following prolonged use (more than 7 days), give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This

in turn tempts the further use of the decongestant, leading to a vicious cycle of events.

**INTERACTIONS**  
Appendix 1: sympathomimetics, vasoconstrictors

**SIDE-EFFECTS**  
Cardiovascular effects • hallucinations in small children • headache • local irritation • nausea • rebound congestion • restlessness in small children • sleep disturbances in small children • tolerance with diminished effect (after excessive use) • transient visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**  
Hallucinations in small children. Discontinue treatment if hallucinations occur.

**PREGNANCY**  
Manufacturer advises caution — no information available.

**MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.

**Spray**
- Otrivine (GlaxoSmithKline Consumer Healthcare)
  - Xylometazoline hydrochloride 1 mg per 1 ml Otrivine Congestion Relief 0.1% nasal spray | 10 ml [GSL] £0.05 DT price = £2.18
  - Otrivine Adult Measured Dose Sinusitis spray | 10 ml [GSL] £2.62 DT price = £2.18
  - Otrivine Allergy Relief 0.1% nasal spray | 10 ml [GSL] £2.62 DT price = £2.18
  - Otrivine Adult nasal spray | 10 ml [GSL] £2.18 DT price = £2.18
  - Otrivine Adult Metered Dose 0.1% nasal spray | 10 ml [GSL] £2.62 DT price = £2.18
- Sudafed Congestion Relief (McNeil Products Ltd)
  - Xylometazoline hydrochloride 1 mg per 1 ml Sudafed Congestion Relief 0.1% nasal spray | 10 ml [GSL] £0.25 DT price = £2.18
- Sudafed Mucus Relief (McNeil Products Ltd)
  - Xylometazoline hydrochloride 1 mg per 1 ml Sudafed Mucus Relief 0.1% nasal spray | 10 ml [GSL] £2.57
  - Sudafed Non-Drowsy Decongestant (xylometazoline) (McNeil Products Ltd)
  - Xylometazoline hydrochloride 1 mg per 1 ml Sudafed Blocked Nose 0.1% spray | 10 ml [GSL] £2.38

**Nasal drops**
- Otrivine (GlaxoSmithKline Consumer Healthcare)
  - Xylometazoline hydrochloride 500 microgram per 1 ml Otrivine Child nasal drops | 10 ml [P] £1.91 DT price = £1.91
  - Xylometazoline hydrochloride 1 mg per 1 ml Otrivine Adult 0.1% nasal drops | 10 ml [GSL] £2.18 DT price = £2.18

## 2 Nasal infection

### ANTIBACTERIALS

#### Chlorhexidine with neomycin

**INDICATIONS AND DOSE**

**Eradication of nasal carriage of staphylococci**
- **BY INTRANASAL ADMINISTRATION**
  - Child: Apply 4 times a day for 10 days
  - Adult: Apply 4 times a day for 10 days

**Preventing nasal carriage of staphylococci**
- **BY INTRANASAL ADMINISTRATION**
  - Child: Apply twice daily
  - Adult: Apply twice daily

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cream**
- **EXCIPIENTS:** May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol)

**ANTIBACTERIALS**

#### Mupirocin

**INDICATIONS AND DOSE**

**BACTROBAN NASAL**
For eradication of nasal carriage of staphylococci, including meticillin-resistant *Staphylococcus aureus* (MRSA)
- **BY INTRANASAL ADMINISTRATION**
  - Child: Apply 2–3 times a day for 5 days; a sample should be taken 2 days after treatment to confirm eradication. Course may be repeated once if sample positive (and throat not colonised), dose to be applied to the inner surface of each nostril
  - Adult: Apply 2–3 times a day for 5 days; a sample should be taken 2 days after treatment to confirm eradication. Course may be repeated once if sample positive (and throat not colonised), dose to be applied to the inner surface of each nostril

**PREGNANCY**
Manufacturer advises avoid unless potential benefit outweighs risk — no information available.

**BREAST FEEDING**
No information available.

**RENAL IMPAIRMENT**
Manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Nasal ointment**
- Bactroban (GlaxoSmithKline UK Ltd)
  - Mupirocin (as Mupirocin calcium) 20 mg per 1 gram Bactroban 2% nasal ointment | 3 gram [POM] £4.24 DT price = £4.24

### CORTICOSTEROIDS

#### CORTICOSTEROID COMBINATIONS WITH ANTI-INFECCIVES

**Betamethasone with neomycin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1095, neomycin sulfate p. 492.

**INDICATIONS AND DOSE**

**Nasal infection**
- **BY INTRANASAL ADMINISTRATION USING NASAL DROPS**
  - Child: Apply 2–3 drops 2–3 times a day, to be applied into each nostril
  - Adult: Apply 2–3 drops 2–3 times a day, to be applied into each nostril

**LESS SUITABLE FOR PRESCRIBING**
Betamethasone with neomycin nasal-drops are less suitable for prescribing; there is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis.
Nasal inflammation, nasal polyps and rhinitis

Other drugs used for Nasal inflammation, nasal polyps and rhinitis Desloratadine, p. 269 · Fexofenadine hydrochloride, p. 269 · Ketotifen, p. 275

ANTIMUSCARINICS

Ipratropium bromide 24-Feb-2016

- INDICATIONS AND DOSE Rhinorrhoea associated with allergic and non-allergic rhinitis
  → BY INTRANASAL ADMINISTRATION
  - Child 12-17 years: 2 sprays 2–3 times a day, dose to be sprayed into each nostril
  - Adult: 2 sprays 2–3 times a day, dose to be sprayed into each nostril
- SIDE-EFFECTS
  - Common or very common Epistaxis · nasal dryness · nasal irritation
  - Uncommon Headache · nausea
  - Very rare Gastro-intestinal motility disturbances · palpitations · urinary retention

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Spray
    - EXCipients: May contain Benzalkonium chloride, disodium edetate
      → Beconase (GlaxoSmithKline UK Ltd, Omega Pharma Ltd)
        Ipratropium bromide 21 microgram per 1 dose Beconase
  - Dose equivalence and conversion
    - 1 metered spray of nasal spray = 21 micrograms.

- MONITORING REQUIREMENTS
  - The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

Beclometasone dipropionate (Beclometasone dipropionate)

- INDICATIONS AND DOSE
  Prophylaxis and treatment of allergic and vasomotor rhinitis
  → BY INTRANASAL ADMINISTRATION
  - Child 6-17 years: 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day
  - Adult: 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Spray
    - EXCipients: May contain Benzalkonium chloride, polysorbates
      → Beclometasone dipropionate (Non-proprietary)
        Beclometasone dipropionate 50 microgram per 1 dose Beclometasone dipropionate 50 microgram per 1 dose
  - Price
    - Beclometasone dipropionate 50 microgram per 1 dose Beclometasone dipropionate 50 microgram per 1 dose
      - no price available DT price = £2.10
      - Beconase Aqueous 50microgram/dose nasal spray | 200 micrograms per nostril for 18 years subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 20 mg.

Corticosteroids (intranasal)

- CAUTIONS
  - Avoid after nasal surgery (until healing has occurred); avoid in pulmonary tuberculosis; avoid in the presence of untreated nasal infections; patients transferred from systemic corticosteroids may experience exacerbation of some symptoms

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Spray
    - EXCipients: May contain Benzalkonium chloride, disodium edetate
      → Beconase (GlaxoSmithKline UK Ltd, Omega Pharma Ltd)
        Beclometasone dipropionate 50 microgram per 1 dose Beclometasone dipropionate 50 microgram per 1 dose
      → Beconase Aqueous 50 microgram/dose nasal spray | 200 micrograms per nostril for 18 years subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 20 mg.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
**Betamethasone**

### INDICATIONS AND DOSE

**BETNESOL**

Non-infected inflammatory conditions of nose

- **BY INTRANASAL ADMINISTRATION**
  - Adult: Apply 2–3 drops 2–3 times a day, dose to be applied into each nostril

**VISTAMETHASONE**

Non-infected inflammatory conditions of nose

- **BY INTRANASAL ADMINISTRATION**
  - Adult: Apply 2–3 drops twice daily, dose to be applied into each nostril

### INTERACTIONS

Appendix 1: corticosteroids

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye/nose drops solution**

**EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate

- **Betnesol** (Focus Pharmaceuticals Ltd)
  - Betnesol sodium phosphate 1 mg per 1 ml Betnesol 0.1% eye/ear/nose drops | 10 ml [POM] £2.32 DT price = £2.32
- **Vistamethasone** (Martindale Pharmaceuticals Ltd)
  - Vistamethasone sodium phosphate 1 mg per 1 ml Vistamethasone 0.1% eye/ear/nose drops | 5 ml [POM] £0.87 | 10 ml [POM] £0.99 DT price = £2.32

---

**Budesonide**

### INDICATIONS AND DOSE

Prophylaxis and treatment of allergic rhinitis and perennial rhinitis

- **BY INTRANASAL ADMINISTRATION USING NASAL SPRAY**
  - Child 4–11 years: 50 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 50 micrograms twice daily
  - Child 12–16 years: 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved
  - Adult: 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, dose to be reduced when control achieved

**Nasal polyps**

- **BY INTRANASAL ADMINISTRATION**
  - Child 12–17 years: 100 micrograms twice daily for up to 3 months, dose to be administered into each nostril
  - Adult: 100 micrograms twice daily for up to 3 months, dose to be administered into each nostril

**Rhinitis**

- **BY INTRANASAL ADMINISTRATION**
  - Adult: 128 micrograms once daily, dose to be administered into each nostril in the morning, alternatively 64 micrograms twice daily, dose to be administered into each nostril; reduced to 64 micrograms once daily when control achieved. Use for maximum 3 months, doses to be administered into each nostril

**Nasal polyps**

- **BY INTRANASAL ADMINISTRATION**
  - Adult: 64 micrograms twice daily for up to 3 months, dose to be administered into each nostril

---

---

**Fluticasone**

### INDICATIONS AND DOSE

Prophylaxis and treatment of allergic rhinitis and perennial rhinitis

- **BY INTRANASAL ADMINISTRATION USING NASAL SPRAY**
  - Child 4–11 years: 50 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 50 micrograms twice daily
  - Child 12–16 years: 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved
  - Adult: 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, dose to be reduced when control achieved

**Nasal polyps**

- **BY INTRANASAL ADMINISTRATION USING NASAL DROPS**
  - Child 16–17 years: 200 micrograms 1–2 times a day, to be administered into each nostril, alternative treatment should be considered if no improvement after 4–6 weeks, (200 micrograms is equivalent to approximately 6 drops)
  - Adult: 200 micrograms 1–2 times a day, to be administered into each nostril, alternative treatment should be considered if no improvement after 4–6 weeks, (200 micrograms is equivalent to approximately 6 drops)

**AVAMYS® SPRAY**

Prophylaxis and treatment of allergic rhinitis

- **BY INTRANASAL ADMINISTRATION**
  - Child 4–11 years: 27.5 micrograms once daily, dose to be sprayed into each nostril, then increased if necessary to 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose
  - Child 12–17 years: 55 micrograms once daily, dose to be sprayed into each nostril, continued →
 reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose

- Adult: 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose

**DOSE EQUIVALENCE AND CONVERSION**
- For Avamys® spray: 1 spray equivalent to 27.5 micrograms.

**INTERACTIONS** → Appendix 1: corticosteroids

**SIDE-EFFECTS** Nasal ulceration occurs commonly with nasal preparations containing fluticasone furoate.

**EXCEPTIONS TO LEGAL CATEGORY**
Preparations of fluticasone propionate can be sold to the public for nasal administration (other than by pressurised nasal spray) if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years, subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 3 mg.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- **EXCIPENTS**: May contain Benzalkonium chloride, disodium edetate, polysorbates
- Fluticasone (Non-proprietary)
  - Fluticasone propionate 50 microgram per 1 dose (GlaxoSmithKline UK Ltd) Fluticasone propionate 50micrograms/dose nasal spray | 60 dose (Pos) no price available | 150 dose (Pos) no price available DT price = £11.01
- Avamys® (GlaxoSmithKline UK Ltd)
  - Fluticasone furoate 27.5 microgram per 1 dose Avamys 27.5micrograms/dose nasal spray | 120 dose (Pos) £6.44 DT price = £6.44
- Flixonase® (GlaxoSmithKline UK Ltd)
  - Fluticasone propionate 50 microgram per 1 dose Flixonase 50micrograms/dose aqueous nasal spray | 150 dose (Pos) £11.01 DT price = £11.01
- Nasofan® (Teva UK Ltd)
  - Fluticasone propionate 50 microgram per 1 dose Nasofan 50micrograms/dose aqueous nasal spray | 150 dose (Pos) £8.04 DT price = £11.01

**Nasal drops**

- **EXCIPENTS**: May contain Polysorbates
- Flixonase® (GlaxoSmithKline UK Ltd)
  - Fluticasone propionate 400 microgram Flixonase Nasule 400microgram/unit dose nasal drops | 28 unit dose (Pos) £12.99 DT price = £12.99

### Fluticasone with azelastine

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluticasone p. 1103, azelastine hydrochloride p. 1059.

**INDICATIONS AND DOSE**
Moderate to severe seasonal and perennial allergic rhinitis, if monotherapy with antihistamine or corticosteroid is inadequate

- **BY INTRanasal ADMINISTRATION**
- Child 12-17 years: 1 spray twice daily, dose to be administered into each nostril
- Adult: 1 spray twice daily, dose to be administered into each nostril

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- **EXCIPENTS**: May contain Benzalkonium chloride, polysorbates
- Fluticasone with azelastine (Non-proprietary)
  - Fluticasone propionate 50 microgram per 1 actuation, Azelastine hydrochloride 137 microgram per 1 actuation Fluticasone propionate 50micrograms/dose / Azelastine 137micrograms/dose nasal spray | 120 dose (Pos) no price available DT price = £14.80
- Dymista® (Meda Pharmaceuticals Ltd)
  - Fluticasone propionate 50 microgram per 1 actuation, Azelastine hydrochloride 137 microgram per 1 actuation Dymista 137micrograms/dose / 50micrograms/dose nasal spray | 120 dose (Pos) £14.80 DT price = £14.80

### Mometasone furoate

**INDICATIONS AND DOSE**
Prophylaxis and treatment of allergic rhinitis

- **BY INTRanasal ADMINISTRATION**
- Child 6-11 years: 50 micrograms daily, dose to be sprayed into each nostril
- Child 12-17 years: 100 micrograms daily, increased if necessary up to 200 micrograms daily, dose to be sprayed into each nostril; reduced to 50 micrograms daily, dose to be reduced when control achieved, dose to be sprayed into each nostril
- Adult: 100 micrograms daily, increased if necessary up to 200 micrograms daily, dose to be sprayed into each nostril; reduced to 50 micrograms daily, dose to be reduced when control achieved, dose to be sprayed into each nostril

**Nasal polyps**

- **BY INTRanasal ADMINISTRATION**
- Adult: Initially 100 micrograms daily for 5–6 weeks, dose to be sprayed into each nostril, then increased if necessary to 100 micrograms twice daily, dose to be sprayed into each nostril; consider alternative treatment if no improvement after further 5–6 weeks, reduce to the lowest effective dose when control achieved

**INTERACTIONS** → Appendix 1: corticosteroids

**SIDE-EFFECTS** Nasal ulceration occurs commonly with preparations containing mometasone furoate.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- **EXCIPENTS**: May contain Benzalkonium chloride, polysorbates
- Mometasone furoate (Non-proprietary)
  - Mometasone furoate 50 microgram per 1 dose Mometasone 50micrograms/dose nasal spray | 120 dose (Pos) £7.30 DT price = £2.12
- Nasonex® (Merck Sharp & Dohme Ltd)
  - Mometasone furoate 50 microgram per 1 dose Nasonex 50micrograms/dose nasal spray | 140 dose (Pos) £7.68 DT price = £2.12

### Triamcinolone acetonide

**INDICATIONS AND DOSE**
Prophylaxis and treatment of allergic rhinitis

- **BY INTRanasal ADMINISTRATION**
- Child 6-11 years: 55 micrograms once daily, dose to be sprayed into each nostril, increased if necessary to 110 micrograms once daily, dose to be sprayed into each nostril; reduced to 55 micrograms once daily, dose to be sprayed into each nostril, reduce dose when
control achieved; maximum duration of treatment 3 months

- Child 12-17 years: 110 micrograms once daily, dose to be sprayed into each nostril, reduced to 55 micrograms once daily, dose to be sprayed into each nostril, reduce dose when control achieved
- Adult: 110 micrograms once daily, dose to be sprayed into each nostril, reduced to 55 micrograms once daily, dose to be sprayed into each nostril, reduce dose when control achieved

- **UNLICENSED USE**
  Not licensed for use in children under 6 years.

- **INTERACTIONS** → Appendix 1: corticosteroids

- **EXCEPTIONS TO LEGAL CATEGORY**
  Preparations of triamcinolone acetonide can be sold to the public for nasal administration as a non-pressurised nasal spray if supplied for the symptomatic treatment of seasonal allergic rhinitis in adults over 18 years, subject to maximum daily dose of 110 micrograms per nostril for maximum 3 months, and a pack size of 3.575 mg.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Spray**

  **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate, polysorbates

  **Nasacort (Sanofi)**

  **Triamcinolone acetonide 55 microgram per 1 dose**

  Nasacort
  Allergy 55 micrograms/dose nasal spray | 30 dose [P] £3.01
  Nasacort 55 micrograms/dose nasal spray | 120 dose [POM] £7.39 DT price = £7.39

  **MUST-CELL STABILISERS**

  **Sodium cromoglicate**

  *(Sodium cromoglycate)*

  - **INDICATIONS AND DOSE**
    - **Prophylaxis of allergic rhinitis**
      - **BY INTRanasAL ADMINISTRATION**
      - Child: 1 spray 2–4 times a day, to be administered into each nostril
      - Adult: 1 spray 2–4 times a day, to be administered into each nostril

  - **UNLICENSED USE**
    Licensed for use in children (age range not specified by manufacturers).

  - **SIDE-EFFECTS**
    - Rare Transient bronchospasm
    - Frequency not known Local irritation

  - **MEDICINAL FORMS**
    There can be variation in the licensing of different medicines containing the same drug.
    No licensed medicines listed.

### Oropharynx

#### 1 Dry mouth

**Treatment of dry mouth**

**Overview**

Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. antispasmodics, tricyclic antidepressants, and some antipsychotics), by diuretics, by irradiation of the head and neck region or by damage to or disease of the salivary glands. Patients with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop increased dental caries, periodontal disease, intolerance of dentures, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

**Artificial saliva** can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate. Of the proprietary preparations, Aquoral® & Biotène Oralbalance® gel or Xerolin® can be used for any condition giving rise to a dry mouth. BioXtra®, Glandosane®, Saline Orithna®, and Saliveze®, have ACBS approval for dry mouth associated with radiotherapy or sicca syndrome. Salix® pastilles, which act locally as salivary stimulants, are also available for any condition leading to a dry mouth and SST tablets may be prescribed for dry mouth in patients with salivary gland impairment (and patent salivary ducts).

Pilocarpine pastilles are licensed for the treatment of xerostomia following irradiation for head and neck cancer and for dry mouth and dry eyes (xerophthalmia) in Sjögren’s syndrome. They are effective only in patients who have some residual salivary gland function, and therefore should be withdrawn if there is no response.

**PARASYMPATHOMIMETICS**

**Pilocarpine**

- **INDICATIONS AND DOSE**
  - **Xerostomia following irradiation for head and neck cancer**
    - **BY MOUTH**
    - Adult: 5 mg 3 times a day for 4 weeks, then increased if tolerated to up to 30 mg daily in divided doses if required, dose to be taken with or immediately after meals (last dose always with evening meal), maximum therapeutic effect normally within 4–8 weeks; discontinue if no improvement after 2–3 months
  - **Dry mouth and dry eyes in Sjögren’s syndrome**
    - **BY MOUTH**
    - Adult: 5 mg 4 times a day; increased if tolerated to up to 30 mg daily in divided doses if required, dose to be taken with meals and at bedtime, discontinue if no improvement after 2–3 months

- **CONTRA-INDICATIONS** Acute iritis - chronic obstructive pulmonary disease (increased bronchial secretions and increased airways resistance) - uncontrolled asthma (increased bronchial secretions and increased airways resistance) - uncontrolled cardiorenal disease

- **CAUTIONS** Asthma (avoid if uncontrolled) - biliary-tract disease - cardiovascular disease (avoid if uncontrolled) - cholelithiasis - chronic obstructive pulmonary disease (avoid if uncontrolled) - cognitive disturbances - maintain adequate fluid intake to avoid dehydration associated with excessive sweating - peptic ulceration - psychiatric disturbances - risk of increased renal colic - risk of increased urethral smooth muscle tone - susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1: pilocarpine

- **SIDE-EFFECTS**
  - Common or very common Influenza-like symptoms - abdominal pain - asthenia - conjunctivitis - constipation - diarrhea - dizziness - dyspepsia - flushing - headache -
hypertension, increased urinary frequency, lacrimation, nausea, ocular pain, palpitation, pruritus, rash, rhinitis, sweating, visual disturbances, vomiting

- **Uncommon** Flatulence, urinary urgency
- **Pregnancy** Avoid—smooth muscle stimulant; toxicity in animal studies.
- **Breastfeeding** Manufacturer advises avoid—present in milk in animal studies.
- **Hepatic Impairment** Reduce initial oral dose in moderate or severe cirrhosis.
- **Renal Impairment** Manufacturer advises caution with tablets.
- **Patient and Carer Advice**
  Driving and skilled tasks
  Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

- **Medicinal Forms**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

  **Tablet**
  CAUTIONARY AND ADVISORY LABELS 21, 27
  - Salagen (Merus Labs Luxco S.A R.L.)

  - Pilocarpine hydrochloride 5 mg Salagen 5mg tablets | 84 tablet (£4.14 OT price = £4.14

  **Capsule**
  Biotene Oralbalance dry mouth saliva replacement gel
  (GlaxoSmithKline Consumer Healthcare) Glucose oxidase 12000 unit, Lactoferrin 12 mg, Lactoperoxidase 12000 unit, Muramidase 12 mg 50 gram • NHS indicative price = £4.46 • Drug Tariff (Part IXa)

- **Pregnancy**
  Uncommon

- **Glandosane**
  Carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75.

- **Indications and Dose**
  Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)
  ▶ BY MOUTH
  ▶ Adult: Apply as required, spray onto oral and pharyngeal mucosa

- **Prescribing and Dispensing Information**
  AS Saliva Orthana® lozenges do not contain fluoride.

  **AS Saliva Orthana® lozenges**
  A S Pharma Ltd
  30lozenge(ACBS) • NHS indicative price = £3.50

- **AS Saliva Orthana® spray**
  Gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral.

- **Indications and Dose**
  Symptomatic treatment of dry mouth
  ▶ BY MOUTH
  ▶ Adult: Apply 2–3 sprays as required, spray onto oral and pharyngeal mucosa

- **Prescribing and Dispensing Information**
  Contains traces of milk protein and egg white protein.

  **Oralieve Moisturising Mouth Gel**
  (Inspiration Pharma Ltd)
  50ml • NHS indicative price = £2.96 • Drug Tariff (Part IXa)

- **Indications and Dose**
  Symptomatic treatment of dry mouth
  ▶ BY MOUTH
  ▶ Adult: Apply as required, particularly at night, to oral mucosa

- **Prescribing and Dispensing Information**
  Lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis.

- **Indications and Dose**
  Symptomatic treatment of dry mouth
  ▶ BY MOUTH
  ▶ Adult: Apply as required, apply to gums and tongue

- **Prescribing and Dispensing Information**
  Lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis.

- **Prescribing and Dispensing Information**
  Contains traces of milk protein and egg white protein.
2 Oral hygiene

Mouthwashes and other preparations for oropharyngeal use

Lozenges and sprays

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

Mouthwashes, gargles, and dentifrices

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chloride mouthwash p. 1109 with an equal volume of warm water.

Mouthwashes containing an oxidising agent, such as hydrogen peroxide p. 1109, may be useful in the treatment of acute ulcerative gingivitis (Vincent’s infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris.

Chlorhexidine p. 1108 is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed.

Chlorhexidine mouthwash is used in the treatment of denture stomatitis. It is also used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis (Vincent’s infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has a haemorrhagic disorder, or is disabled.

Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis. With prolonged use, chlorhexidine causes reversible brown staining of teeth and tongue. Chlorhexidine may be incompatible with some ingredients in toothpaste, causing an unpleasant taste in the mouth; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing products.

There is no convincing evidence that gargles are effective in adults.
ANTISEPTICS AND DISINFECTANTS

Chlorhexidine

- **INDICATIONS AND DOSE**
  - Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of apthous ulcers
    - BY MOUTH USING MOUTHWASH
      - Child: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)
      - Adult: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)
  - Denture stomatitis
    - MOUTHWASH
    - Adult: Cleanse and soak dentures in mouthwash solution for 15 minutes twice daily
  - Oral hygiene and plaque inhibition and gingivitis
    - BY MOUTH USING DENTAL GEL
      - Child: Apply 1–2 times a day, to be brushed on the teeth
      - Adult: Apply 1–2 times a day, to be brushed on the teeth
  - Oral candidiasis | Management of apthous ulcers
    - BY MOUTH USING OROMUCOSAL SPRAY
      - Child: Apply up to 12 sprays twice daily as required, to be applied tooth, gingival, or ulcer surfaces
      - Adult: Apply up to 12 sprays twice daily as required, to be applied tooth, gingival, or ulcer surfaces
  - Bladder irrigation and catheter patency solutions
    - BY INTRAVESICAL INSTILLATION
    - Adult: (consult product literature)

- **UNLICENSED USE** Corsodyl® not licensed for use in children under 12 years (unless on the advice of a healthcare professional).

- **SIDE-EFFECTS** Anaphylaxis | Hypersensitivity | Mucosal irritation | Parotid gland swelling | Reversible brown staining of composite restorations | Reversible brown staining of silicate compositions | Reversible brown staining of teeth | Taste disturbance | Tongue discolouration

  **SIDE-EFFECTS, FURTHER INFORMATION** If desquamation occurs with mucosal irritation, discontinue treatment or dilute mouthwash with an equal volume of water.

- **PATIENT AND CARER ADVICE** Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing product.

- **PROFESSION SPECIFIC INFORMATION**

  **Dental practitioners’ formulary**
  Corsodyl® dental gel may be prescribed as Chlorhexidine Gluconate Gel; Corsodyl® mouthwash may be prescribed as Chlorhexidine Mouthwash; Corsodyl® oral spray may be prescribed as Chlorhexidine Oral Spray.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid, irrigation solution

  **Dental gel**
  - Corsodyl® (GlaxoSmithKline Consumer Healthcare)
    Chlorhexidine gluconate 10 mg per 1 gram | 50 gram [G] £1.26 DT price = £1.26
  - Spray
    - Corsodyl® (GlaxoSmithKline Consumer Healthcare)
      Chlorhexidine gluconate 2 mg per 1 ml | 60 mL [G] £4.28 DT price = £1.26

  **Oral hygiene and plaque inhibition and gingivitis**
  - Adult: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)

  **Denture stomatitis**
  - MOUTHWASH
  - Adult: Cleanse and soak dentures in mouthwash solution for 15 minutes twice daily

  **Oral hygiene and plaque inhibition and gingivitis**
  - MOUTHWASH
  - Adult: Apply 1–2 times a day, to be brushed on the teeth

  **Oral candidiasis | Management of apthous ulcers**
  - MOUTHWASH
  - Adult: Apply 1–2 times a day, to affect areas

  **Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of apthous ulcers**
  - MOUTH WASHING
  - Adult: Apply up to 12 sprays twice daily as required, to be applied tooth, gingival, or ulcer surfaces

  **Bladder irrigation and catheter patency solutions**
  - BY INTRAVESICAL INSTILLATION
  - Adult: (consult product literature)

  **Chlorhexidine with chlorobutanol**

  The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine above.

- **INDICATIONS AND DOSE**
  - Oral hygiene and plaque inhibition
    - BY MOUTH USING MOUTHWASH
      - Child 6-17 years: Rinse or gargle 10–15 mL 2–3 times a day, to be diluted with lukewarm water in measuring cup provided
      - Adult: Rinse or gargle 10–15 mL 2–3 times a day, to be diluted with lukewarm water in measuring cup provided
  - Denture disinfection
    - Adult: Soak previously cleansed dentures in mouthwash (diluted with 2 volumes of water) for 60 minutes

  **PRESCRIBING AND DISPENSING INFORMATION**
  Flavours of mouthwash may include mint.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

**Hexetidine**

- **INDICATIONS AND DOSE**
  - Oral hygiene
    - BY MOUTH USING MOUTHWASH
      - Child 6-17 years: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted
      - Adult: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted

下载自 www.medicalbr.com
**SIDE-EFFECTS**
- Very rare: Taste disturbance, transient anaesthesia
- Frequency not known: Local irritation

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

---

**Hydrogen peroxide**

**INDICATIONS AND DOSE**

**Oral hygiene (with hydrogen peroxide 6%)**
- **By mouth using mouthwash**
- Child: Rinse or gargle 15 mL 2–3 times a day for 2–3 minutes, to be diluted in half a tumblerful of warm water
- Adult: Rinse or gargle 15 mL 2–3 times a day for 2–3 minutes, to be diluted in half a tumblerful of warm water

**Peroxyl®**

**Oral hygiene**
- **By mouth using mouthwash**
- Child 6–17 years: Rinse or gargle 10 mL 3 times a day for about 1 minute, for maximum 7 days, to be used after meals and at bedtime
- Adult: Rinse or gargle 10 mL up to 4 times a day for about 1 minute, to be used after meals and at bedtime

**SIDE-EFFECTS**
Hypertrophy of papillae of tongue on prolonged use.

**PRESCRIBING AND DISPENSING INFORMATION**
When prepared extemporaneously, the BP states Hydrogen Peroxide Mouthwash, BP consists of hydrogen peroxide 6% solution (= approx. 20 volume) BP.

**HANDLING AND STORAGE**
Hydrogen peroxide bleaches fabric.

**PROFESSION SPECIFIC INFORMATION**
Dental practitioners’ formulary
Hydrogen Peroxide Mouthwash may be prescribed.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

---

**Sodium chloride**

**INDICATIONS AND DOSE**

**Oral hygiene**
- **By mouth using mouthwash**
- Child: Rinse or gargle as required
- Adult: Rinse or gargle as required

**DIRECTIONS FOR ADMINISTRATION**
Extemporaneous mouthwash preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water.

**PRESCRIBING AND DISPENSING INFORMATION**
No mouthwash preparations available—when prepared extemporaneously, the BP states Sodium Chloride Mouthwash, Compound, BP consists of sodium bicarbonate 1%, sodium chloride 1.5% in a suitable vehicle with peppermint flavour.

**PROFESSION SPECIFIC INFORMATION**
Dental practitioners’ formulary
Compound Sodium Chloride Mouthwash may be prescribed.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

---

2.1 Dental caries

**Fluoride**

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops provides suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months.

Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is necessary to prevent children from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.
VITAMINS AND TRACE ELEMENTS

Sodium fluoride

- **INDICATIONS AND DOSE**
  - Prophylaxis of dental caries for water content less than 300 micrograms/litre (0.3 parts per million) of fluoride ion
    - **BY MOUTH USING TABLETS**
    - Child 6 months–2 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
    - Child 3–5 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)
    - Child 6–17 years: 1 mg daily, doses expressed as fluoride ion (F⁻)
    - Adult: 1 mg daily, doses expressed as fluoride ion (F⁻)
  - Prophylaxis of dental caries for water content between 300 and 700 micrograms/litre (0.3–0.7 parts per million) of fluoride ion
    - **BY MOUTH USING TABLETS**
    - Child 6 months–17 years: Supplements not advised
    - Adult: Supplements not advised
  - Prophylaxis of dental caries for individuals who are caries prone or medically compromised
    - **BY MOUTH USING TABLETS**
    - Child 10–17 years: Apply 1 centimetre twice daily, to be applied using a toothbrush
    - Adult: Apply 1 centimetre twice daily, to be applied using a toothbrush

- **DIRECTIONS FOR ADMINISTRATION**
  - **COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE** Brush teeth for 1 minute before spitting out.
  - **COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE** Brush teeth for 3 minutes before spitting out.
  - **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral tablet formulations may include orange.

- **PATIENT AND CARER ADVICE**
  - Mouthwash Avoid eating, drinking, or rinsing mouth for 15 minutes after use.
  - **COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE** Patients or carers should be given advice on how to administer sodium fluoride toothpaste. Avoid drinking or rinsing mouth for 30 minutes after use.
  - **COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE** Patients or carers should be given advice on how to administer Sodium fluoride toothpaste.

- **PROFESSIONAL INFORMATION**
  - Dental practitioners’ formulary
  - Tablets may be prescribed as Sodium Fluoride Tablets. Oral drops may be prescribed as Sodium Fluoride Oral Drops. Mouthwashes may be prescribed as Sodium Fluoride Mouthwash 0.05% or Sodium Fluoride Mouthwash 2%
  - **COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE** May be prescribed as Sodium Fluoride Toothpaste 0.619%.
  - **COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE** May be prescribed as Sodium Fluoride Toothpaste 1.1%

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution

- **Tablet**
  - **Endekay** (Manx Healthcare Ltd)
    - Sodium fluoride 1.1 mg

Oral ulceration and inflammation

3 Oral ulceration and inflammation

Oral ulceration and inflammation

Ulcration and inflammation

Ulcration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy (see also Chemotherapy induced mucositis and myelosuppression under Cytotoxic drugs p. 825). It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Patients with an unexplained mouth ulcer of more than 3 weeks' duration require urgent referral to hospital to exclude oral cancer.

Simple mouthwashes

A saline mouthwash may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

Antiseptic mouthwashes

Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of a chlorhexidine mouthwash p. 1108 is often beneficial and may accelerate healing of recurrent aphthae.

Corticosteroids

Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the ‘prodromal’ phase. Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

Hydrocortisone oromucosal tablets p. 1113 are allowed to dissolve next to an ulcer and are useful in recurrent aphthae and erosive lichenoid lesions.

Beclometasone dipropionate inhaler p. 1113 sprayed on the oral mucosa is used to manage oral ulceration [unlicensed indication]. Alternatively, betamethasone soluble tablets p. 1113 dissolved in water can be used as a mouthwash to treat oral ulceration [unlicensed indication]. Systemic corticosteroid therapy (see under Corticosteroids, inflammatory disorders p. 1053), is reserved for severe conditions such as pemphigus vulgaris.

Local analgesics

Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that analgesia cannot be maintained continuously throughout the day. The main indication for a topical local analgesic is to relieve the pain of otherwise intractable oral ulceration particularly when it is due to major aphthae. For this purpose lidocaine hydrochloride 5% ointment below or lozenges containing a local anaesthetic are applied to the ulcer. Lidocaine hydrochloride 10% solution as spray can be applied thinly to the ulcer [unlicensed indication] using a cotton bud. When local anaesthetics are used in the mouth care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

Preparations on sale to the public: many mouth ulcer preparations, throat lozenges, and throat sprays on sale to the public contain a local anaesthetic. To identify the active ingredients in such preparations, consult the product literature of the manufacturer—the correct proprietary name should be ascertained as many products have very similar names but different active ingredients.

Benzydamine hydrochloride p. 1112 and flurbiprofen p. 1113 are non-steroidal anti-inflammatory drugs (NSAIDs). Benzydamine hydrochloride mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of tonsillitis and post-irradiation mucositis. Some patients find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water. Flurbiprofen lozenges are licensed for the relief of sore throat.

Choline salicylate p. 1113 is a derivative of salicylic acid and has some analgesic action. The dental gel may provide relief for recurrent aphthae, but excessive application or confinement under a denture irritates the mucosa and can itself cause ulceration.

Other preparations

Doxycycline p. 1114 rinsed in the mouth may be of value for recurrent aphthous ulceration.

Periodontitis

Low-dose doxycycline (Periostat®) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis.

For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see under Oropharyngeal bacterial infections p. 1114. See also Mouthwashes and other preparations for oropharyngeal use p. 1107 for mouthwashes used for oral hygiene and plaque inhibition.

</table>
| Adult: Rub gently into dry gum           | continued ➔
Relief of pain in oral lesions
- TO THE LESION USING OINTMENT
- Adult: Apply as required, rub sparingly and gently on affected areas

**LARYNGOJECT**

Anesthesia of mucous membranes of oropharynx, trachea, or respiratory tract
- TO MUCOUS MEMBRANES
- Adult: 40–200 mg, to be given as a single dose sprayed, instilled (if a cavity), or applied with a swab (reduce dose according to size, age and condition of patient); usual dose 160 mg

XYLOCAINE

**Bronchoscopy | Laryngoscopy | Oesophagoscopy | Endotracheal intubation**
- TO MUCOUS MEMBRANES
- Adult: Up to 20 doses

**Dental practice**
- TO MUCOUS MEMBRANES
- Adult: 1–5 doses

**Maxillary sinus puncture**
- TO MUCOUS MEMBRANES
- Adult: 3 doses

Relief of pain in oral lesions
- TO THE LESION
- Adult: Apply thinly to the ulcer using a cotton bud

**UNLICENSED USE**  Spray not licensed for the relief of pain in oral lesions.

**CAUTIONS**  Avoid anaesthesia of the pharynx before meals—risk of choking · can damage plastic cuffs of endotracheal tubes

**INTERACTIONS** → Appendix 1: antiarrhythmics

**SIDE-EFFECTS**  Affects a topical lidocaine preparation does not generally cause systemic side-effects.

**ALLERGY AND CROSS-SENSITIVITY**
- Hypersensitivity and cross-sensitivity  Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

**PREGNANCY**  Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.

**BREAST FEEDING**  Present in milk but amount too small to be harmful.

**HEPATIC IMPAIRMENT**  Caution—increased risk of side-effects.

**RENAL IMPAIRMENT**  Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

**PROFESSION SPECIFIC INFORMATION**

**Dental practitioners’ formulary**
Lidocaine ointment 5% may be prescribed. Spray may be prescribed as Lidocaine Spray 10%.

XYLOCAINE  May be prescribed as lidocaine spray 10%.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid, ointment

**Spray**
- **XYLOCAINE** (Aspen Pharma Trading Ltd)
  - Lidocaine 10 mg per 1 actuation  Xylocaine 10mg/dose spray sugar-free  | 50 ml  £6.29

**Ointment**
- **Lidocaine hydrochloride (Non-proprietary)**
  - Lidocaine hydrochloride 50 mg per 1 gram  Lidocaine 5% ointment  | 15 gram  £6.50 DT price = £6.18

**Liquid**
- **Laryngo Jet** (UCB Pharma Ltd)
  - Lidocaine hydrochloride 40 mg per 1 mL  Lidocaine 4% oromucosal solution Laryngojet pre-filled syringes  | 1 pre-filled disposable injection  £5.10

**ANALGESICS | Non-steroidal anti-inflammatory drugs**

**Benzydamine hydrochloride**

**INDICATIONS AND DOSE**

**Painful inflammatory conditions of oropharynx**
- TO THE LESION USING MOUTHWASH
  - Child 1–5 years: Rinse or gargle 15 mL every 1.5–3 hours as required usually for not more than 7 days, dilute with an equal volume of water if stinging occurs
  - Adult: Rinse or gargle 15 mL every 1.5–3 hours as required usually for not more than 7 days, dilute with an equal volume of water if stinging occurs
  - TO THE LESION USING OROMUCOSAL SPRAY
    - Child 1 month–5 years (body-weight 4–7 kg): 1 spray every 1.5–3 hours, to be administered onto the affected area
    - Child 1 month–5 years (body-weight 8–11 kg): 2 sprays every 1.5–3 hours, to be administered onto the affected area
    - Child 1 month–5 years (body-weight 12–15 kg): 3 sprays every 1.5–3 hours, to be administered onto the affected area
    - Child 1 month–5 years (body-weight 16 kg and above): 4 sprays every 1.5–3 hours, to be administered onto the affected area
    - Child 6–11 years: 4 sprays every 1.5–3 hours, to be administered onto affected area
    - Child 12–17 years: 4–8 sprays every 1.5–3 hours, to be administered onto affected area
  - Adult: 4–8 sprays every 1.5–3 hours, to be administered onto affected area

**INTERACTIONS** → Appendix 1: NSAIDs

**SIDE-EFFECTS**
- Rare  Hypersensitivity reactions
- Frequency not known  Occasional numbness or stinging

**PROFESSION SPECIFIC INFORMATION**

**Dental practitioners’ formulary**
Benzydamine Oromucosal Spray 0.15% may be prescribed. Benzydamine mouthwash may be prescribed as Benzydamine Mouthwash 0.15%.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Spray**
- **Benzydamine hydrochloride (Non-proprietary)**
  - Benzydamine hydrochloride 1.5 mg per 1 ml  Benzydamine 0.15% oromucosal spray sugar-free  | 30 ml  £4.53 DT price = £4.10
  - **Difflam** (Meda Pharmaceuticals Ltd)
  - Benzydamine hydrochloride 1.5 mg per 1 ml  Difflam 0.15% spray sugar-free  | 30 ml  £4.24 DT price = £4.10
Mouthwash

- **Betamethasone dipropionate**
- **Hydrocortisone**

### CORTICOSTEROIDS

#### Beclometasone dipropionate (Beclomethasone dipropionate)

- **INDICATIONS AND DOSE**
  - **Management of oral ulceration**
  - **BY BUCCAL ADMINISTRATION**
  - **Adult:** 50–100 micrograms twice daily, use inhaler device to spray dose on to the oral mucosa

- **UNLICENSED USE** Use of inhaler unlicensed in oral ulceration.

- **INTERACTIONS** → Appendix 1: corticosteroids

- **MEDICINAL FORMS**
  - For preparations, see inhaled beclometasone, p. 249.

#### Betamethasone

- **INDICATIONS AND DOSE**
  - **Oral ulceration**
  - **TO THE LESION USING SOLUBLE TABLETS**
  - **Child 12-17 years:** 500 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed
  - **Adult:** 500 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed

- **UNLICENSED USE**
  - In children Betamethasone soluble tablets not licensed for use as mouthwash or in oral ulceration.

---

**Flurbiprofen**

- **INDICATIONS AND DOSE**
  - **Relief of sore throat**
    - **BY MOUTH USING LOZENGES**
    - **Child 12-17 years:** 1 lozenge every 3–6 hours for maximum 3 days, allow lozenge to dissolve slowly in the mouth; maximum 5 lozenges per day
    - **Adult:** 1 lozenge every 3–6 hours for maximum 3 days, allow lozenge to dissolve slowly in the mouth; maximum 5 lozenges per day

- **INTERACTIONS** → Appendix 1: NSAIDs

- **SIDE-EFFECTS**
  - Mouth ulcers (move lozenge around mouth)
  - Taste disturbance

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Lozenge**
  - **Strefen** (Reckitt Benckiser Healthcare (UK) Ltd)
  - **Flurbiprofen 8.75 mg** Strefen 8.75mg lozenges | 16 lozenges [P] £2.58
  - DT price = £4.42

- **UNLICENSED USE**
  - Use of inhaler unlicensed in oral ulceration.

- **INTERACTIONS** → Appendix 1: corticosteroids

- **MEDICINAL FORMS**
  - For preparations, see inhaled beclometasone, p. 249.

#### Hydrocortisone

- **INDICATIONS AND DOSE**
  - **Oral and perioral lesions**
  - **TO THE LESION USING BUCCAL TABLET**
  - **Child 1-11 years:** Only on medical advice
  - **Child 12-17 years:** 1 lozenge 4 times a day, allowed to dissolve slowly in the mouth in contact with the ulcer
  - **Adult:** 1 lozenge 4 times a day, allowed to dissolve slowly in the mouth in contact with the ulcer

- **UNLICENSED USE**
  - **Hydrocortisone mucoadhesive buccal tablets** licensed for use in children (under 12 years—on medical advice only).

- **CONTRA-INDICATIONS** Untreated local infection

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS** Candidal infection · exacerbation of local infection

- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
  - Mucosal tablets may be prescribed as Hydrocortisone Oromucosal Tablets.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Muco-adhesive buccal tablet**
  - **Hydrocortisone (Non-proprietary)**
  - Hydrocortisone (as Hydrocortisone sodium succinate)
  - 2.5 mg Hydrocortisone 2.5mg muco-adhesive buccal tablets sugar free sugar-free | 20 tablet [P] £6.30
  - DT price = £7.20

#### Sалиclic acid and derivatives

#### Choline salicylate

- **INDICATIONS AND DOSE**
  - **Mild oral and perioral lesions**
  - **TO THE LESION**
  - **Child 16-17 years:** Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours
  - **Adult:** Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours

- **CONTRA-INDICATIONS** Children under 16 years

- **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - Reye’s syndrome The CHM has advised that topical oral pain relief products containing salicylate salts should not be prescribed.
used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye’s syndrome.

- **CAUTIONS** Frequent application, especially in children, may give rise to salicylate poisoning - not to be applied to dentures—leave at least 30 minutes before re-insertion of dentures (in adults)

- **INTERACTIONS**  → Appendix 1: choline salicylate

- **SIDE-EFFECTS** Transient local burning sensation

- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Choline Salicylate Dental Gel, BP consists of choline salicylate 8.7% in a flavoured gel basis.

- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
    - Choline Salicylate Dental Gel may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - **Oromucosal gel**
    - **Bonjela** (Reckitt Benckiser Healthcare (UK) Ltd)
      - Choline salicylate 87 mg per 1 gram Bonjela Cool Mint gel sugar-free 15 gram [GSL] £3.55 DT price = £2.58
      - Bonjela Original gel sugar-free 15 gram [GSL] £2.58 DT price = £2.58

**Salicylic acid with rhubarb extract**

- **INDICATIONS AND DOSE**
  - Mild oral and perioral lesions
    - **TO THE LESION**
      - Child 16-17 years: Apply 3–4 times a day maximum duration 7 days
      - Adult: Apply 3–4 times a day maximum duration 7 days

- **CONTRA-INDICATIONS** Children under 16 years

- **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - Reye's syndrome The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye’s syndrome.

- **CAUTIONS** Frequent application, especially in children, may give rise to salicylate poisoning - not to be applied to dentures—leave at least 30 minutes before re-insertion of dentures (in adults)

- **SIDE-EFFECTS** Temporary discolouration of oral mucosa - temporary discoloration of teeth - transient local burning sensation

- **PATIENT AND CARER ADVICE**  May cause temporary discolouration of teeth and oral mucosa.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - **Paint**
    - **EXCIPIENTS:** May contain Ethanol
      - **Pyralvex** (Meda Pharmaceuticals Ltd)
        - Salicylic acid 10 mg per 1 ml, Rhubarb extract 50 mg per 1 ml Pyralvex solution 10 ml [GSL] £3.25

4 **Oropharyngeal bacterial infections**

**Oropharyngeal bacterial infections**

**Antibacterial therapy for periconititis**

Antibacterial required only in presence of systemic features of infection, or of trismus, or persistent swelling despite local treatment.

- Metronidazole p. 512, or alternatively, amoxicillin p. 518
  - **Suggested duration of treatment** 3 days or until symptoms resolve.

**Antibacterial therapy for gingivitis: acute necrotising ulcerative**

Antibacterial required only if systemic features of infection.

- Metronidazole, or alternatively, amoxicillin
  - **Suggested duration of treatment** 3 days or until symptoms resolve.

**Antibacterial therapy for periapical or periodontal abscess**

Antibacterial required only in severe disease with cellulitis or if systemic features of infection.

- Amoxicillin, or alternatively, metronidazole
  - **Suggested duration of treatment** 5 days.

**Antibacterial therapy for periodontitis**

Antibacterial used as an adjunct to debridement in severe disease or disease unresponsive to local treatment alone.

- Metronidazole, or alternatively in adults and children over 12 years, doxycycline below

**Antibacterial therapy for throat infections**

Most throat infections are caused by viruses and many do not require antibacterial therapy. Consider antibacterial, if history of valvular heart disease, if marked systemic upset, if peritonsillar cellulitis or abscess, or if at increased risk from acute infection (e.g. in immunosuppression, cystic fibrosis); prescribe antibacterial for beta-haemolytic streptococcal pharyngitis.

- Phenoxymethylpenicillin p. 518
  - In severe infection, initial parenteral therapy with benzylpenicillin sodium p. 517, then oral therapy with phenoxymethylpenicillin or amoxicillin (or ampicillin p. 520). **Avoid** amoxicillin if possibility of glandular fever.
  - **Suggested duration of treatment** 10 days.

- **If penicillin-allergic**, clarithromycin p. 508 (or azithromycin p. 507 or erythromycin p. 510)
  - **Suggested duration of treatment** 10 days

**ANTIBACTERIALS ▶ TETRACYCLINES AND RELATED DRUGS**

**Doxycycline**

- **INDICATIONS AND DOSE**
  - Treatment of recurrent aphthous ulceration
    - **BY MOUTH USING SOLUBLE TABLETS**
      - Child 12-17 years: 100 mg 4 times a day usually for 3 days, dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2–3 minutes, it should preferably not be swallowed
      - Adult: 100 mg 4 times a day usually for 3 days, dispersible tablet can be stirred into a small amount of
water then rinsed around the mouth for 2–3 minutes, it should preferably not be swallowed

- **UNLICENSED USE** Not licensed for use in children under 12 years.
- **CAUTIONS** Alcohol dependence
- **INTERACTIONS** → Appendix 1: tetracyclines
- **SIDE-EFFECTS** Anorexia · anxiety · dry mouth · flushing · tinnitus
- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).
- **PATIENT AND CARER ADVICE** Counselling on administration advised (posture). Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.
- **PROFESSION SPECIFIC INFORMATION**

  **Dental practitioners’ formulary**

  Doxycycline Capsules 100 mg may be prescribed. Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets. Tablets may be prescribed as Doxycycline Tablets 20 mg.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Dispersible tablet**

  CAUTIONARY AND ADVISORY LABELS 6, 9, 11, 13

  → Vibramycin-D (Pfizer Ltd)

  Doxycycline (as Doxycycline monohydrate) 100 mg Vibramycin-D 100mg dispersible tablets sugar-free | 8 tablet [Pack] £4.91 DT price = £4.91

### 5 Oropharyngeal fungal infections

**Oropharyngeal fungal infections**

**Overview**

Fungal infections of the mouth are usually caused by Candida spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

- **Thrush**

  Acute pseudomembranous candidiasis (thrush), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child’s teeth) immediately after using the inhaler may avoid the problem. Treatment with nystatin p. 1116 or miconazole p. 1116 may be needed. Fluconazole p. 562 is effective for unresponsive infections or if a topical antifungal drug cannot be used or if the patient has dry mouth. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

- **Acute erythematous candidiasis**

  Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with fluconazole.

- **Denture stomatitis**

  Patients with denture stomatitis (chronic atrophic candidiasis), should cleanse their dentures thoroughly and leave them out as often as possible during the treatment period. To prevent recurrence of the problem, dentures should not normally be worn at night. New dentures may be required if these measures fail despite good compliance.

  Miconazole oral gel can be applied to the fitting surface of the denture before insertion (for short periods only). Denture stomatitis is not always associated with candidiasis and other factors such as mechanical or chemical irritation, bacterial infection, or rarely allergy to the dental base material, may be the cause.

- **Chronic hyperplastic candidiasis**

  Chronic hyperplastic candidiasis (candidal leucoplakia) carries an increased risk of malignancy; biopsy is essential—this type of candidiasis may be associated with varying degrees of dysplasia, with oral cancer present in a high proportion of cases. Chronic hyperplastic candidiasis is treated with a systemic antifungal such as fluconazole to eliminate candidal overlay. Patients should avoid the use of tobacco.

- **Angular cheilitis**

  Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It is commonly associated with denture stomatitis but may represent a nutritional deficiency or it may be related to orofacial granulomatosis or HIV infection. Both yeasts (Candida spp.) and bacteria (Staphylococcus aureus and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. A reduction in facial height related to ageing and tooth loss with maceration in the deep occlusive folds that may subsequently arise, predisposes to such infection. While the underlying cause is being identified and treated, it is often helpful to apply miconazole cream or fusidic acid ointment p. 539; if the angular cheilitis is unresponsive to treatment, hydrocortisone with miconazole cream or ointment p. 1150 can be used.

**Immunocompromised patients**

See advice on prevention of fungal infections in Immunocompromised patients under Antifungals, systemic use p. 558.

**Drugs used in oropharyngeal candidiasis**

Nystatin is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole is applied locally (as an oral gel) in the mouth but it is absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. Fluconazole is given by mouth for infections that do not respond to topical therapy or when topical therapy cannot be used. It is reliably absorbed and effective. Itraconazole p. 564 can be used for fluconazole-resistant infections.

If candidal infection fails to respond to 1 to 2 weeks of treatment with antifungal drugs the patient should be sent for investigation to eliminate the possibility of underlying disease. Persistent infection may also be caused by reinfection from the genito-urinary or gastro-intestinal tract. Infection can be eliminated from these sources by appropriate anticalendial therapy; the patient’s partner may also require treatment to prevent reinfection.

Antiseptic mouthwashes are used in the prevention of oral candidiasis in immunocompromised patients and in the treatment of denture stomatitis.
**Oropharyngeal viral infections**

**Miconazole**

**INDICATIONS AND DOSE**

Prevention and treatment of oral candidiasis
- **BY MOUTH USING ORAL GEL**
  - Child 2-17 years: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)
  - Adult: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)

Prevention and treatment of intestinal candidiasis
- **BY MOUTH USING ORAL GEL**
  - Child 4 months-17 years: 5 mg/kg 4 times a day (max. per dose 250 mg 4 times a day) treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared
  - Adult: 5 mg/kg 4 times a day (max. per dose 250 mg 4 times a day) treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared

**SIDE-EFFECTS**
- Common or very common: Nausea, rash, vomiting
- Rare: Diarrhoea (usually on long term treatment), hepatitis (rash in children), Stevens-Johnson syndrome, toxic epidermal necrolysis
- Pregnancy: Manufacturer advises avoid if possible—no information available.
- Breast feeding: Manufacturer advises caution—no information available.
- Hepatic impairment: Avoid.
- DIRECTIONS FOR ADMINISTRATION: Oral gel should be held in mouth, after food.
- PRESCRIBING AND DISPENSING INFORMATION: Flavours of oral gel may include orange.
- PATIENT AND CARER ADVICE: Patients or carers should be given advice on how to administer miconazole oromucosal gel.
- PROFESSION SPECIFIC INFORMATION:
  - Dental practitioners’ formulary: Miconazole Oromucosal Gel may be prescribed.
  - EXCEPTIONS TO LEGAL CATEGORY: 15-g tube of oral gel can be sold to the public.

**INUNICATED USE**
- Not licensed for use in children under 4 months of age or during first 5–6 months of life of an infant born pre-term.

**CONTRA-INDICATIONS**
- Infants with impaired swallowing reflex

**INTERACTIONS**
- → Appendix 1: antifungals, azoles

**CAUTIONS**
- Avoid in acute porphyrias p. 969

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Oral suspension**
- **CAUTIONARY AND ADVISORY LABELS**
  - 9
- **EXCIPIENTS:** May contain Ethanol
- **Nystatin (Non-proprietary)**
  - Nystatin 100,000 unit per 1 ml
  - Nystatin 100,000 units/ml oral suspension | 30 ml (Psd) £2.33 DT price = £2.09
  - Nystatin (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Nystatin 100,000 unit per 1 ml
  - Nystatin 100,000 units/ml oral suspension (ready mixed) | 30 ml (Psd) £1.80 DT price = £2.09

**SIDE-EFFECTS**
- Local irritation, local sensitisation, nausea

**Nystatin**

**INDICATIONS AND DOSE**

Oral candidiasis
- **BY MOUTH**
  - Child: 100,000 units 4 times a day usually for 7 days, and continued for 48 hours after lesions have resolved
  - Adult: 100,000 units 4 times a day usually for 7 days, and continued for 48 hours after lesions have resolved

**PROFESSION SPECIFIC INFORMATION**
- Dental practitioners’ formulary: Nystatin Oral Suspension may be prescribed.

**ANTIFUNGALS › POLYENE ANTIFUNGALS**

**Oropharyngeal viral infections**

**Management**

Viral infections are the most common cause of a sore throat. They do not benefit from anti-infective treatment. The management of primary herpetic gingivostomatitis is a soft diet, adequate fluid intake, and analgesics as required, including local use of benzylamine hydrochloride p. 1112. The use of chlorhexidine mouthwash p. 1108 will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general. In the case of severe herpetic stomatitis, a systemic antiviral such as aciclovir p. 599 is required. Valaciclovir p. 602 and famciclovir p. 601 are suitable alternatives for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used for the prevention of frequently recurring herpes simplex lesions of the mouth, particularly when implicated in the initiation of erythema multiforme.

Skin conditions, management

Vehicles
The British Association of Dermatologists list of preferred unlicensed dermatological preparations (specials) is available at www.bad.org.uk/specials.

Both vehicle and active ingredients are important in the treatment of skin conditions; the vehicle alone may have more than a mere placebo effect. The vehicle affects the degree of hydration of the skin, has a mild anti-inflammatory effect, and aids the penetration of active drug.

Applications are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

Collodions are painted on the skin and allowed to dry to leave a flexible film over the site of application.

Creams are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.

Gels consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

Lotions have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. Shake lotions (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

Ointments are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid, and hard paraffin. Some ointment bases have both hydrophilic and lipophilic properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. Water-soluble ointments contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

Pastes are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

Dusting powders are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

Dilution
The BP directs that creams and ointments should not normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

Suitable quantities for prescribing

</table>

These amounts are usually suitable for an adult for twice daily application for 1 week. The recommendations do not apply to corticosteroid preparations. For suitable quantities of corticosteroid preparations, see relevant table.
**Excipients and sensitisation**

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided. The following excipients in topical preparations are associated, rarely, with sensitisation; the presence of these excipients is indicated in the entries for topical products.

- Beeswax
- Benzyl alcohol
- Butylated hydroxyanisole
- Butylated hydroxytoluene
- Cetostearyl alcohol (including cetyl and stearyl alcohol)
- Chlororesol
- Edetic acid (EDTA)
- Ethylhexylamine
- Fragrances
- Hydroxybenzoates (parabens)
- Imidurea
- Isopropyl palmitate
- N-(3-Chloroallyl)hexaminium chloride (quaternium 15)
- Polysorbates
- Propylene glycol
- Sodium metabisulphite
- Sorbic acid
- Wool fat and related substances including lanolin (purified versions of wool fat have reduced the problem)

**1 Dry and scaling skin disorders**

**Emollient and barrier preparations**

**Borderline substances**

The preparations marked ‘ACBS’ are regarded as drugs when prescribed in accordance with the advice of the Advisory Committee on Borderline Substances for the clinical conditions listed. Prescriptions issued in accordance with this advice and endorsed ‘ACBS’ will normally not be investigated.

**Emollients**

Emollients soothe, smooth and hydrate the skin and are indicated for all dry or scaling disorders. Their effects are short lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis. The choice of an appropriate emollient will depend on the severity of the condition, patient preference, and the site of application. Some ingredients rarely cause sensitisation and this should be suspected if an eczematous reaction occurs. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

Preparations such as aqueous cream and emulsifying ointment can be used as soap substitutes for hand washing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil may also be helpful.

Urea is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

**Emollient bath and shower preparations**

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. In dry skin conditions soap should be avoided.

The quantities of bath additives recommended for adults are suitable for an adult-size bath. Proportionately less should be used for a child-size bath or a washbasin; recommended bath additive quantities for children reflect this.

**Barriers**

Barrier preparations often contain water-repellent substances such as dimeticone p. 1134 or other silicones. They are used on the skin around stomas, bedsores, and pressure areas in the elderly where the skin is intact. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations are not a substitute for adequate nursing care.

**Nappy rash**

The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone 0.5% or 1% p. 1145 can be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and waterproof pants may increase absorption of corticosteroids. If the rash is associated with candidal infection, a topical antifungal such as clotrimazole cream p. 1130 can be used. Topical antibacterial preparations can be used if bacterial infection is present; treatment with an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.

**Barrier creams and ointments**

**INDICATIONS AND DOSE**

For use as a barrier preparation

- To the skin
- Child: (consult product literature)
- Adult: (consult product literature)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

**EXCIPIENTS:** May contain Wool fat and related substances including lanolin.

- **Barrier creams and ointments (Non-proprietary)**
  - Cetostearyl alcohol 20 mg per 1 gram, Zinc oxide 75 mg per 1 gram, Beeswax white 100 mg per 1 gram, Arachis oil 305 mg per 1 gram, Castor oil 500 mg per 1 gram
  - Zinc and Castor oil cream | 100 gram [GSL] £1.45
  - Brands may include Metanium
DERMATOLOGICAL DRUGS

**EMOLLIENTS**

**Dermol**® **200 SHOWER EMOLLIENT**

**Dry and pruritic skin conditions including eczema and dermatitis**

- **TO THE SKIN**
- **Child:** To be applied to the skin or used as a soap substitute
- **Adult:** To be applied to the skin or used as a soap substitute

**Dermol**® **600®** **BATH EMOLLIENT**

**Dry and pruritic skin conditions including eczema and dermatitis**

- **TO THE SKIN**
- **Child 1–23 months:** 5–15 mL/bath, not to be used undiluted
- **Child 2–17 years:** 15–30 mL/bath, not to be used undiluted
- **Adult:** Up to 30 mL/bath, not to be used undiluted

**Dermol**® **WASH EMULSION**

**Dry and pruritic skin conditions including eczema and dermatitis**

- **TO THE SKIN**
- **Child:** To be applied to the skin or used as a soap substitute
- **Adult:** To be applied to the skin or used as a soap substitute

**Emulsiderm**®

**Dry skin conditions including eczema and ichthyosis**

- **TO THE SKIN**
- **Child 1–23 months:** 5–10 mL/bath, alternatively, to be rubbed into dry skin until absorbed
- **Child 2–17 years:** 7–30 mL/bath, alternatively, to be rubbed into dry skin until absorbed
- **Adult:** 7–30 mL/bath, alternatively, to be rubbed into dry skin until absorbed

**OILATUM® PLUS**

**Topical treatment of eczema, including eczema at risk from infection**

- **TO THE SKIN**
- **Child 6–11 months:** 1 mL/bath, not to be used undiluted
- **Child 1–17 years:** 1–2 capfuls/bath, not to be used undiluted
- **Adult:** 1–2 capfuls/bath, not to be used undiluted

**IMPORTANT SAFETY INFORMATION**

These preparations make skin and surfaces slippery—particular care is needed when bathing.

**MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING**

See Emollient and barrier preparations p. 1118.

**DIRECTIONS FOR ADMINISTRATION**

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

**PRESCRIBING AND DISPENSING INFORMATION**

Preparations containing an antibacterial should be avoided unless infection is present or is a frequent complication.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Bath additive**

**CAUTIONARY AND ADVISORY LABELS 15**

**EXCIPIENTS:** May contain Acetylated lanolin alcohols, isopropyl palmitate, poloxamers

- **Dermol 600®** (Dermal Laboratories Ltd)
  - Benzalkonium chloride 5 mg per 1 gram, Isopropyl myristate 250 mg per 1 gram, Liquid paraffin 250 mg per 1 gram Dermol 600 bath emollient | 600 mL | £7.55
- **Emulsiderm** (Dermal Laboratories Ltd)
  - Benzalkonium chloride 5 mg per 1 gram, Isopropyl myristate 250 mg per 1 gram, Liquid paraffin 250 mg per 1 gram Emulsiderm emollient | 300 mL | £3.85 | 1000 mL | £12.00
- **Oilatum Plus** (GlaxoSmithKline Consumer Healthcare)
  - Triclosan 20 mg per 1 gram, Benzalkonium chloride 60 mg per 1 gram, Liquid paraffin light 525 mg per 1 gram Oilatum Plus bath additive | 500 mL | £7.22

**Liquids**

**CAUTIONARY AND ADVISORY LABELS 15**

**EXCIPIENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol)

- **Dermol 200®** (Dermal Laboratories Ltd)
  - Benzalkonium chloride 1 mg per 1 gram, Chlorhexidine hydrochloride 1 mg per 1 gram, Isopropyl myristate 25 mg per 1 gram, Liquid paraffin 25 mg per 1 gram Dermol 200 shower emollient | 200 mL | £3.55
- **Dermol Wash** (Dermal Laboratories Ltd)
  - Benzalkonium chloride 1 mg per 1 gram, Chlorhexidine hydrochloride 1 mg per 1 gram, Isopropyl myristate 25 mg per 1 gram, Liquid paraffin 25 mg per 1 gram Dermol Wash cutaneous emulsion | 200 mL | £3.55

**Spray**

**CAUTIONARY AND ADVISORY LABELS 15**

**EXCIPIENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), wool fat and related substances including lanolin,

- Sprilon (J M Loveridge Ltd)
  - Dimeticone 10.4 mg per 1 gram, Zinc oxide 125 mg per 1 gram Sprilon aerosol spray | 115 g | GSL | £8.90 DT price = £8.90

**Cream**

**EXCIPIENTS:** May contain Beeswax, butylated hydroxyanisole, butylated hydroxytoluene, cetylstearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, fragrances, hydroxybenzoates (parabens), propylene glycol, wool fat and related substances including lanolin

- Conotran® (LEO Pharma)
  - Benzalkonium chloride 1 mg per 1 gram, Dimeticone 220 mg per 1 gram Conotran cream | 100 g | GSL | £0.88 DT price = £0.88 | 500 g | GSL | £3.51
- Drapolene® (Omega Pharma Ltd)
  - Benzalkonium chloride 100 microgram per 1 gram, Cetrimide 2 mg per 1 gram Drapolene cream | 100 g | GSL | £1.76 | 200 g | GSL | £2.86 | 350 g | GSL | £4.28
- Siopel® (Derma UK Ltd)
  - Cetrimide 3 mg per 1 gram, Dimeticone 1000 100 mg per 1 gram Siopel cream | 50 g | GSL | £4.65
- Sudocrem® (Teva UK Ltd)
  - Benzyl cinnamate 1.5 mg per 1 gram, Benzyl alcohol 3.9 mg per 1 gram, Benzyl benzoate 10.1 mg per 1 gram, Wool fat hydrolysate 40 mg per 1 gram, Zinc oxide 125.5 mg per 1 gram Sudocrem antiseptic healing cream | 60 g | GSL | £1.45 | 125 g | GSL | £2.15 | 250 g | GSL | £3.67 | 400 g | GSL | £5.25

**DERMOL® SHOWERS**
**Emollient bath and shower products, colloidal oatmeal-containing**

**INDICATIONS AND DOSE**

Endogenous and exogenous eczema | Xeroderma | Ichthyosis

- TO THE SKIN
  - Child 2-17 years: 20–30 mL/bath, alternatively apply to wet skin and rinse
  - Adult: 20–30 mL/bath, alternatively apply to wet skin and rinse

Pruritus of the elderly associated with dry skin

- TO THE SKIN
  - Elderly: 20–30 mL/bath, alternatively apply to wet skin and rinse

**IMPORTANT SAFETY INFORMATION**

These preparations make skin and surfaces slippery—particular care is needed when bathing.

**DIRECTIONS FOR ADMINISTRATION**

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

**Emollient bath and shower products, paraffin-containing**

**INDICATIONS AND DOSE**

AQUAMAX® WASH

Dry skin conditions

- TO THE SKIN
  - Child: To be applied to wet or dry skin and rinse
  - Adult: To be applied to wet or dry skin and rinse

CETRABEN® BATH

Dry skin conditions, including eczema

- TO THE SKIN
  - Child 1 month-11 years: 0.5–1 capful/bath, alternatively, to be applied to wet skin and rinse
  - Child 12-17 years: 1–2 capfuls/bath, alternatively, to be applied to wet skin and rinse
  - Adult: 1–2 capfuls/bath, alternatively, to be applied to wet skin and rinse

DERMALO®

Dermatitis | Dry skin conditions, including ichthyosis

- TO THE SKIN
  - Child 1 month-11 years: 5–10 mL/bath, alternatively, to be applied to wet skin and rinse
  - Child 12-17 years: 15–20 mL/bath, alternatively, to be applied to wet skin and rinse
  - Adult: 15–20 mL/bath, alternatively, to be applied to wet skin and rinse

Pruritus of the elderly

- TO THE SKIN
  - Elderly: 15–20 mL/bath, alternatively, to be applied to wet skin and rinse

**DOUBLEBASE® EMBOLIEN BATH ADDITIVE**

Dry skin conditions including dermatitis and ichthyosis

- TO THE SKIN
  - Child 1 month-11 years: 5–10 mL/bath
  - Child 12-17 years: 15–20 mL/bath
  - Adult: 15–20 mL/bath

Pruritus of the elderly

- TO THE SKIN
  - Elderly: 15–20 mL/bath

**DOUBLEBASE® EMBOLIEN SHOWER GEL**

Dry, chapped, or itchy skin conditions

- TO THE SKIN
  - Child: To be applied to wet or dry skin and rinse, or apply to dry skin after showering
  - Adult: To be applied to wet or dry skin and rinse, or apply to dry skin after showering

**E45® BATH OIL**

Endogenous and exogenous eczema, xeroderma, and ichthyosis

- TO THE SKIN
  - Child 1 month-11 years: 5–10 mL/bath, alternatively, to be applied to wet skin and rinse
  - Child 12-17 years: 15 mL/bath, alternatively, to be applied to wet skin and rinse
  - Adult: 15 mL/bath, alternatively, to be applied to wet skin and rinse

Pruritus of the elderly associated with dry skin

- TO THE SKIN
  - Elderly: 15 mL/bath, alternatively, to be applied to wet skin and rinse

**E45® WASH CREAM**

Endogenous and exogenous eczema, xeroderma, and ichthyosis

- TO THE SKIN
  - Child: To be used as a soap substitute
  - Adult: To be used as a soap substitute

Pruritus of the elderly associated with dry skin

- TO THE SKIN
  - Elderly: To be used as a soap substitute

**HYDROMOL® BATH AND SHOWER EMOLLIENT**

Dry skin conditions | Eczema | Ichthyosis

- TO THE SKIN
  - Child 1 month-11 years: 0.5–2 capfuls/bath, alternatively apply to wet skin and rinse
  - Child 12-17 years: 1–3 capfuls/bath, alternatively apply to wet skin and rinse
  - Adult: 1–3 capfuls/bath, alternatively apply to wet skin and rinse

Pruritus of the elderly

- TO THE SKIN
  - Elderly: 1–3 capfuls/bath, alternatively apply to wet skin and rinse

**LPL 63.4®**

Dry skin conditions

- TO THE SKIN
  - Child 1 month-11 years: 0.5–2 capfuls/bath, alternatively, to be applied to wet skin and rinse
  - Child 12-17 years: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse
  - Adult: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse
OILATUM® EMOLLIENT BATH ADDITIVE

Dry skin conditions including dermatitis and ichthyosis

▷ TO THE SKIN
▷ Child 1 month-11 years: Apply 0.5–2 capfuls/bath, alternatively, to be applied to wet skin and rinse
▷ Child 12-17 years: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse
▷ Adult: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse

Pruritus of the elderly

▷ TO THE SKIN
▷ Elderly: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse

OILATUM® JUNIOR BATH ADDITIVE

Dry skin conditions including dermatitis and ichthyosis

▷ TO THE SKIN
▷ Child 1 month-11 years: 0.5–2 capfuls/bath, alternatively, apply to wet skin and rinse
▷ Child 12-17 years: 1–3 capfuls/bath, alternatively, apply to wet skin and rinse
▷ Adult: 1–3 capfuls/bath, alternatively, apply to wet skin and rinse

Pruritus of the elderly

▷ TO THE SKIN
▷ Elderly: 1–3 capfuls/bath, alternatively, apply to wet skin and rinse

QV® BATH OIL

Dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus

▷ TO THE SKIN
▷ Child: 1-11 months: 5 mL/bath, alternatively, to be applied to wet skin and rinse
▷ Child 1-7 years: 10 mL/bath, alternatively, to be applied to wet skin and rinse
▷ Adult: 10 mL/bath, alternatively, to be applied to wet skin and rinse

QV® GENTLE WASH

Dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus

▷ TO THE SKIN
▷ Child: To be used as a soap substitute
▷ Adult: To be used as a soap substitute

ZEROLATUM®

Dry skin conditions | Dermatitis | Ichthyosis

▷ TO THE SKIN
▷ Child 1 month-11 years: 5–10 mL/bath
▷ Child 12-17 years: 15–20 mL/bath
▷ Adult: 15–20 mL/bath

Pruritus of the elderly

▷ TO THE SKIN
▷ Elderly: 15–20 mL/bath

IMPORANT SAFETY INFORMATION

These preparations make the skin and surfaces slippery—particular care is needed when bathing.

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING

See Emollient and barrier preparations p. 1118.

**IMPORTANT SAFETY INFORMATION**
These preparations make skin and surfaces slippery—particular care is needed when bathing.

- **DIRECTIONS FOR ADMINISTRATION** Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Bath additive**
    - **EXCIPIENTS:** May contain Butylated hydroxytoluene, fragrances, propylene glycol
    - **Lauramicrogols 150 mg per 1 gram, Soya oil 829.5 mg per 1 gram**
    - Balneum Plus bath oil | 500 ml [GSL] £6.66
    - Soya oil 847.5 mg per 1 gram
    - Balneum 84.75% bath oil | 200 ml [GSL] £2.48 | 500 ml [GSL] £3.58 | 1000 ml [GSL] £10.39
    - Zeroneum (Thornton & Ross Ltd)
    - Soya oil 833.5 mg per 1 gram
      - Zeroneum 83.35% bath additive | 500 ml £4.48

**Emollient creams and ointments, antimicrobial-containing**

- **INDICATIONS AND DOSE**
  - **Psoriderm® EMULSION**
    - **Psoriasis**
      - **TO THE SKIN**
        - Adult: Up to 30 mL/bath, use 30 mL in adult-size bath, soak for 5 minutes

**IMPORTANT SAFETY INFORMATION**

    - **EXCIPIENTS:** May contain Isopropyl palmitate, polysorbates
    - **Coal tar distilled 400 mg per 1 ml**
    - **Psoriderm® Emulsion 40% bath additive** | 200 ml [GSL] £2.74

**Emollient bath and shower products, tar-containing**

- **INDICATIONS AND DOSE**
  - **POLYTAR EMOLLIENT®**
    - **Psoriasis, eczema, atopic and pruritic dermatoses**
      - **TO THE SKIN**
        - Adult: 2–4 capfuls/bath, add 15–30 mL to an adult-size bath; soak for 20 minutes

**IMPORTANT SAFETY INFORMATION**
See Emollient and barrier preparations p. 1118.

**DIRECTIONS FOR ADMINISTRATION** Emollients should be applied immediately after washing or bathing to maximise the effect of skin hydration. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

**PRESCRIBING AND DISPENSING INFORMATION**
Preparations containing an antibacterial should be avoided unless infection is present or is a frequent complication.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cream**

- **CAUTIONARY AND ADVISORY LABELS**
- **EXCIPIENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol)
- **Dermol** (Dermal Laboratories Ltd)
  - Benzalcohol chloride 1 mg per 1 gram, Chlorhexidine hydrochloride 1 mg per 1 gram, Isopropyl myristate 100 mg per
Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- **Cautionary and Advisory Labels 15**
- **Dermamist (Alliance Pharmaceuticals Ltd)**
- White soft paraffin 100 mg per 1 gram
- Dermamist 10% spray
- 250 ml £0.97

### Cream

- **Cautionary and Advisory Labels 15**
- **Dermol 100 mg per 1 gram**
- White soft paraffin 100 mg per 1 gram
- Dermol 10% spray
- 250 ml £0.97

**Emollients should be applied immediately after washing or bathing to maximise the effect of skin hydration. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient.**

### Directions for Administration

Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

### Directions for Application

Emollients should be applied immediately after washing or bathing to maximise the effect of skin hydration. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient.
3 Emollients, urea-containing

- **DRUG ACTION** Urea is a keratin softener and hydrating agent used in the treatment of dry, scaling conditions (including ichthyosis) and may be useful in elderly patients.

### INDICATIONS AND DOSE

#### AQUADRATE ®

- **Dry, scaling, and itching skin**
  - **TO THE SKIN**
  - Child: Apply twice daily, to be applied thinly
  - Adult: Apply twice daily, to be applied thinly

#### BALNEUM ® CREAM

- **Dry skin conditions**
  - **TO THE SKIN**
  - Child: Apply twice daily
  - Adult: Apply twice daily

#### BALNEUM ® PLUS CREAM

- **Dry, scaling, and itching skin**
  - **TO THE SKIN**
  - Child: Apply twice daily
  - Adult: Apply twice daily

#### CALMURID ®

- **Dry, scaling, and itching skin**
  - **TO THE SKIN**
  - Child: Apply twice daily, apply a thick layer for 3–5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs.
  - Adult: Apply twice daily, apply a thick layer for 3–5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs.

#### DERMATONICS ONCE HEEL BALM ®

- **Dry skin on soles of feet**
  - **TO THE SKIN**
  - Child 12–17 years: Apply once daily
  - Adult: Apply once daily

#### E45 ® ITCH RELIEF CREAM

- **Dry, scaling, and itching skin**
  - **TO THE SKIN**
  - Child: Apply twice daily
  - Adult: Apply twice daily

#### EUCERIN ® INTENSIVE CREAM

- **Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis**
  - **TO THE SKIN**
  - Child: Apply twice daily, to be applied thinly and rubbed into area
  - Adult: Apply twice daily, to be applied thinly and rubbed into area

#### EUCERIN ® INTENSIVE LOTION

- **Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis**
  - **TO THE SKIN**
  - Child: Apply twice daily, to be applied sparingly and rubbed into area
  - Adult: Apply twice daily, to be applied sparingly and rubbed into area

#### FLEXITOL ®

- **Dry skin on soles of feet and heels**
  - **TO THE SKIN**
  - Child 12–17 years: Apply 1–2 times a day
  - Adult: Apply 1–2 times a day

**2 Infections of the skin**

### Skin infections

#### Antibacterial preparations

**Cellulitis**, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment. Lower leg infections or infections spreading around wounds are almost always cellulitis. *Erysipelas*, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial.

In the community, acute *impetigo* on small areas of the skin may be treated by short-term topical application of fusidic acid p. 539; mupirocin p. 1129 should be used only to treat meticillin-resistant *Staphylococcus aureus*. If the impetigo is extensive or longstanding, an oral antibacterial such as flucloxacillin p. 523 (or clarithromycin p. 508 in penicillin allergy) should be used. Mild antiseptics can be used to soften crusts.

Although many antibacterial drugs are available in topical preparations, some are potentially hazardous and frequently their use is not necessary if adequate hygienic measures can be taken. Moreover, not all skin conditions that are oozing, crusts, or characterised by pustules are actually infected.

Topical antibacterials should be *avoided* on leg ulcers unless used in short courses for defined infections; treatment of bacterial colonisation is generally inappropriate.

To minimise the development of resistant organisms it is advisable to limit the choice of antibacterials applied topically to those not used systemically. Unfortunately some of these, for example neomycin sulfate p. 1127, may cause sensitisation, and there is cross-sensitivity with other aminoglycoside antibiotics, such as gentamicin p. 491. If *large areas of skin* are being treated, ototoxicity may also be a hazard with aminoglycoside antibiotics (and also with polymyxins p. 1128), particularly in children, in the elderly, and those with renal impairment. *Resistant organisms* are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

Mupirocin is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low–level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic such as povidone–iodine p. 1172, chlorhexidine p. 1173, or alcohol can be used; their use should be discussed with the local microbiologist.

Retapamulin p. 1129 can be used for impetigo and other superficial bacterial skin infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes* that are resistant to first-line topical antibacterials. However, it is not effective against MRSA.

*Tedizolid* p. 541 is licensed for the treatment of acute bacterial skin and skin structure infections. Silver sulfadiazine p. 1128 is used in the treatment of infected burns.

**Antibacterial preparations also used systemically**

Fusidic acid is a narrow-spectrum antibacterial used for *staphylococcal* infections. Fusidic acid has a role in the treatment of impetigo.
An ointment containing fusidic acid is used in the fissures of angular cheilitis when associated with staphylococcal infection. See Oropharyngeal fungal infections p. 1115 for further information on angular cheilitis.

Metronidazole p. 1127 is used topically for rosacea and to reduce the odour associated with anaerobic infections; oral metronidazole is used to treat wounds infected with anaerobic bacteria.

**Antifungal preparations**

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy is necessary for scalp infection or if the skin infection is widespread, disseminated, or intractable; although topical therapy may be used to treat some nail infections, systemic therapy is more effective. Skin scrapings should be examined if systemic therapy is being considered or where there is doubt about the diagnosis.

**Dermatophytoes**

Ringworm infection can affect the scalp (tinea capitis), body (tinea corporis), groin (tinea cruris), hand (tinea manuum), foot (tinea pedis, athlete’s foot), or nail (tinea unguium). Scalp infection requires systemic treatment; additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm. Most other local ringworm infections can be treated adequately with topical antifungal preparations (including shampoos). The imidazole antifungals clotrimazole p. 1130, econazole nitrate p. 1130, ketoconazole p. 1130, and miconazole p. 1131 are all effective. Terbinafine cream p. 1132 is also effective but it is more expensive. Other topical antifungals include griseofulvin p. 1132 and the **undecenoates. Compound benzoic acid ointment** (Whitfield’s ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Topical preparations for athlete’s foot containing **tolnaftate** are on sale to the public.

Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. However, topical application of amorolfine p. 1131 or toconazole p. 1131 may be useful for treating early onychomycosis when involvement is limited to mild distal disease, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy.

**Pityriasis versicolor**

Pityriasis (tinea) versicolor can be treated with ketoconazole shampoo. Alternatively, **selenium sulphide** shampoo [unlicensed indication] can be used as a lotion (diluting with a small amount of water can reduce irritation) and left on the affected area for 10 minutes before rinsing off; it should be applied once daily for 7 days, and the course repeated if necessary.

Topical imidazole antifungals such as clotrimazole, econazole nitrate, ketoconazole, and miconazole, or topical terbinafine are alternatives, but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with a triazole antifungal. Relapse is common, especially in the immunocompromised.

**Candidiasis**

Candidal skin infections can be treated with a topical imidazole antifungal, such as clotrimazole, econazole nitrate, ketoconazole, or miconazole; topical terbinafine is an alternative. Topical application of nystatin is also effective for candidiasis but it is ineffective against dermatophytosis. Refractory candidiasis requires systemic treatment generally with a triazole such as fluconazole p. 562; systemic treatment with terbinafine is not appropriate for refractory candidiasis.

**Angular cheilitis**

Miconazole cream is used in the fissures of angular cheilitis when associated with Candida.

**Compound topical preparations**

Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1% p. 1145) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm.

Combination of a mild corticosteroid with either an imidazole or nystatin may be of use in the treatment of intertrigo associated with candida.

**Antiviral preparations**

Aciclovir p. 1135 cream is licensed for the treatment of initial and recurrent labial and genital herpes simplex infections; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections and for herpes zoster (shingles).

**Herpes labialis**

Aciclovir cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

Penciclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream.

Systemic treatment is necessary if cold sores recur frequently or for infections in the mouth.

**Parasiticidal preparations**

<table>
<thead>
<tr>
<th>Suitable quantities of parasiticidal preparations</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Area of body</strong></td>
</tr>
<tr>
<td>Scalp (head lice)</td>
</tr>
<tr>
<td>Body (scabies)</td>
</tr>
<tr>
<td>Body (crab lice)</td>
</tr>
</tbody>
</table>

These amounts are usually suitable for an adult for single application.

**Scabies**

Permethrin p. 1135 is used for the treatment of scabies (Sarcoptes scabiei); malathion p. 1135 can be used if permethrin is inappropriate.

Benzyl benzoate p. 1134 is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

Ivermectin p. 571 (available on a named patient basis from ‘special-order’ manufacturers or specialist importing companies) by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or ‘Norwegian’) scabies that does not respond to topical treatment alone; further doses may be required.

**Application**

Although acaricides have traditionally been applied after a hot bath, this is not necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.
All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate in adults, up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

Itching
The itch and eczema of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema may be required. Application of crotamiton p. 1161 can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest that scabies eradication was not successful. Oral administration of a sedating antihistamine at night may also be useful.

Head lice
Dimeticone p. 1134 is effective against head lice (Pediculus humanus capitis). It coats head lice and interferes with water balance in lice by preventing the excretion of water; it is less active against eggs and treatment should be repeated after 7 days. Malathion, an organophosphorus insecticide, is an alternative, but resistance has been reported. Benzyl benzoate is licensed for the treatment of head lice but it is less effective than other drugs and not recommended for use in children. Permethrin is active against head lice but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present. Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected household members should be treated simultaneously.

Wet combing methods
Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks, and continued until no lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process.

Several devices for the removal of head lice such as combs and topical solutions, are available and some are prescribable on the NHS. The Drug Tariffs can be accessed online at:
- National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
- Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm
- Scottish Drug Tariff: www.isdscotland.org/Health-topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

Crab lice
Permethrin and malathion are used to eliminate crab lice (Pthirus pubis). An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

2.1 Bacterial skin infections

ANTIBACTERIALS > AMINOGLYCOSIDES

Neomycin sulfate

- INDICATIONS AND DOSE
  - Bacterial skin infections
    - TO THE SKIN
      - Child: Apply up to 3 times a day, for short-term use only
      - Adult: Apply up to 3 times a day, for short-term use only

- UNLICENSED USE
  - In children Neomycin Cream BPC—no information available.

- CONTRA-INDICATIONS
  - Neonates

- CAUTIONS
  - If large areas of skin are being treated ototoxicity may be a hazard, particularly in children, the elderly, and in those with renal impairment.

- INTERACTIONS
  - Appendix 1: neomycin

- SIDE-EFFECTS
  - Sensitisation (cross sensitivity with other aminoglycosides may occur)

- RENAL IMPAIRMENT
  - Ototoxicity may be a hazard if large areas of skin are treated.

- LESS SUITABLE FOR PRESCRIBING
  - Neomycin sulfate cream is less suitable for prescribing.

ANTIBACTERIALS > NITROIMIDAZOLE DERIVATIVES

Metronidazole

- DRUG ACTION
  - Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

- INDICATIONS AND DOSE
  - ACEA ®
    - Acute inflammatory exacerbation of rosacea
      - TO THE SKIN
        - Adult: Apply twice daily for 8 weeks, to be applied thinly
  - ANABACT ®
    - Malodorous fungating tumours and malodorous gravitational and decubitus ulcers
      - TO THE SKIN
        - Adult: Apply 1–2 times a day, to be applied clean wound and covered with non-adherent dressing
  - METROGEL ®
    - Acute inflammatory exacerbation of rosacea
      - TO THE SKIN
        - Adult: Apply twice daily for 8–9 weeks, to be applied thinly

- Malodorous fungating tumours
  - TO THE SKIN
  - Adult: Apply 1–2 times a day, to be applied clean wound and covered with non-adherent dressing
  - continued →
Skin

**ANTIBACTERIALS**

**ROZEX®**

Inflammatory papules and pustules of rosacea

- **TO THE SKIN**
- **Adult:** Apply twice daily for 3–4 months

**ROZEX® CREAM**

Inflammatory papules, pustules and erythema of rosacea

- **TO THE SKIN**
- **Adult:** Apply twice daily for 3–4 months

**GEL**

Inflammatory papules, pustules and erythema of rosacea

- **TO THE SKIN**
- **Adult:** Apply twice daily for very exudative sites and extensive abrasions

**CAUTIONS** Avoid exposure to strong sunlight or UV light

**INTERACTIONS** → Appendix 1: metronidazole

**SIDE-EFFECTS** Skin irritation

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Gel**

**EXCIPIENTS:** May contain Benzyl alcohol, disodium edetate, hydroxybenzoates (parabens), propylene glycol

- **Aceca** (Pierre Fabre Dermo-Cosmetique)
  - **Metronidazole 75 mg per 1 gram** Aceca 0.75% gel | 40 gram **PoS** £9.95 DT price = £22.63
- **Anabact** (Cambridge Healthcare Supplies Ltd)
  - **Metronidazole 75 mg per 1 gram** Anabact 0.75% gel | 15 gram **PoS** £4.47 DT price = £4.47 | 30 gram **PoS** £7.89
- **Metrogel** (Galderma (UK) Ltd)
  - **Metronidazole 75 mg per 1 gram** Metrogel 0.75% gel | 40 gram **PoS** £22.63 DT price = £22.63
- **Metrosa** (M & A Pharmachem Ltd)
  - **Metronidazole 75 mg per 1 gram** Metrosa 0.75% gel | 30 gram **PoS** £12.00 | 40 gram **PoS** £19.90 DT price = £22.63
- **Rozex** (Galderma (UK) Ltd)
  - **Metronidazole 75 mg per 1 gram** Rozex 0.75% gel | 30 gram **PoS** £6.60 | 40 gram **PoS** £9.88 DT price = £22.63
- **Zyomet (AMCo)**
  - **Metronidazole 75 mg per 1 gram** Zyomet 0.75% gel | 30 gram **PoS** £12.00

**Cream**

**EXCIPIENTS:** May contain Benzyl alcohol, isopropyl palmitate, propylene glycol

- **Rosiced** (Pierre Fabre Dermo-Cosmetique)
  - **Metronidazole 75 mg per 1 gram** Rosiced 0.75% cream | 30 gram **PoS** £7.50 DT price = £6.60
- **Rozex** (Galderma (UK) Ltd)
  - **Metronidazole 75 mg per 1 gram** Rozex 0.75% cream | 30 gram **PoS** £6.60 DT price = £6.60 | 40 gram **PoS** £9.88 DT price = £9.88

**ANTIBACTERIALS** → **SULFONAMIDES**

**Silver sulfadiazine**

**INDICATIONS AND DOSE**

Prophylaxis and treatment of infection in burn wounds

- **TO THE SKIN**
  - **Child:** Apply daily, may be applied more frequently if very exudative
  - **Adult:** Apply daily, may be applied more frequently if very exudative

For conservative management of finger-tip injuries

- **TO THE SKIN**
  - **Child:** Apply every 2–3 days, consult product literature for details
  - **Adult:** Apply every 2–3 days, consult product literature for details

As an adjunct to short-term treatment of infection in leg ulcers

- **TO THE SKIN**
  - **Adult:** Apply once daily or on alternate days

**SIDE-EFFECTS**

- Allergic reactions
- **FOR THERAPEUTIC LEVELS WITH METRONIDAZOLE**
- **Nephrotoxicity and neurotoxicity may be a hazard,** particularly in children, in the elderly, and in those with renal impairment.

**INTERACTIONS** → Appendix 1: silver sulfadiazine

**SIDE-EFFECTS**

- **Sensitisation**

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

No licensed medicines listed.

Combinations available: *Bacitracin with polymyxin B*, p. 1129

**UNLICENSED USE**

- In children No age range specified by manufacturer.
- **CONTRA-INDICATIONS** Not recommended for neonates (in children)

**CAUTIONS** G6PD deficiency

**CAUTIONS, FURTHER INFORMATION**

- Large areas Plasma-sulfadiazine concentrations may approach therapeutic levels with *side-effects* and *interactions* as for sulfonamides if large areas of skin are treated.

**INTERACTIONS** → Appendix 1: silver sulfadiazine

**SIDE-EFFECTS** Allergic reactions • argyria (following treatment of large areas of skin or prolonged use) • burning • itching • leucopenia • rashes

**SIDE-EFFECTS, FURTHER INFORMATION**

- Severe blood and skin disorders Owing to the association of sulfonamides with severe blood and skin disorders, treatment should be stopped immediately if blood disorders or rashes develop.

Leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to normality within a few days.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with sensitivity to sulfonamides.
**PRENANCY** Risk of neonatal haemolysis and methaemoglobinemia in third trimester.

**BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.

**HEPATIC IMPAIRMENT** Manufacturer advises caution if significant impairment.

**RENAL IMPAIRMENT** Manufacturer advises caution if significant impairment.

**MONITORING REQUIREMENTS** Monitor for leucopenia.

**DIRECTIONS FOR ADMINISTRATION** Apply with sterile applicator.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cream**
EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

- **Flamazine** (Smith & Nephew Healthcare Ltd)
  - Sulfadiazine silver 10 mg per 1 gram Flamazine 1% cream | 20 gram £2.91 | 50 gram £3.85 DT price = £3.85 | 250 gram £10.32 DT price = £10.32 | 500 gram £18.27 DT price = £18.27

**ANTIBACTERIALS**

### Bacitracin with polymyxin B

#### INDICATIONS AND DOSE

**Bacterial skin infections**

- **TO THE SKIN**
  - Child: Apply twice daily, can be applied more frequently if required
  - Adult: Apply twice daily, can be applied more frequently if required

#### UNLICENSED USE
Licensed for use in children (age range not specified by manufacturer).

#### CAUTIONS
Nephrotoxicity · neurotoxicity

#### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Ointment**
- **Polyfax** (Teva UK Ltd)
  - Bacitracin zinc 500 unit per 1 gram, Polymyxin B sulfate 10000 unit per 1 gram Polyfax ointment | 4 gram £3.26 | 20 gram £4.62 DT price = £4.62

### Mupirocin

#### INDICATIONS AND DOSE

**Bacterial skin infections, particularly those caused by Gram-positive organisms (except pseudomonal infection)**

- **TO THE SKIN**
  - Child: Apply up to 3 times a day for up to 10 days
  - Adult: Apply up to 3 times a day for up to 10 days

#### UNLICENSED USE

**SIDE-EFFECTS**
- Burning sensation · local reactions · pruritus · rash · urticaria

**PREGNANCY**
Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

**BREAST FEEDING**
No information available.

**RENAL IMPAIRMENT**
Manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Ointment**
- **Mupirocin (Non-proprietary)**
  - Mupirocin 20 mg per 1 gram Mupirocin 2% ointment | 15 gram £12.50 DT price = £5.26
  - **Bactroban** (GlaxoSmithKline UK Ltd)
    - Mupirocin 20 mg per 1 gram Bactroban 2% ointment | 15 gram £5.26 DT price = £5.26

**Cream**
EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol)

- **Bactroban** (GlaxoSmithKline UK Ltd)
  - Mupirocin (as Mupirocin calcium) 20 mg per 1 gram Bactroban 2% cream | 15 gram £5.26 DT price = £5.26

### Retapamulin

#### INDICATIONS AND DOSE

Superficial bacterial skin infection caused by *Staphylococcus aureus* and *Streptococcus pyogenes* (if resistant to first line topical antibacterials)

- **TO THE SKIN**
  - Child 9 months-17 years: Apply twice daily for 5 days, to be applied thinly, maximum area of skin treated 2% of body surface area, review treatment if no response within 2–3 days
  - Adult: Apply twice daily for 5 days, to be applied thinly, maximum area of skin treated 100 cm² or lesion length 10 cm, review treatment if no response within 2–3 days

#### CONTRA-INDICATIONS
Contact with eyes · contact with mucous membranes

#### SIDE-EFFECTS
Contact dermatitis · localised erythema · localised irritation · localised pain · pruritus

#### NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (March 2008) that retapamulin (Altargo®) is not recommended for use within NHS Scotland for the treatment of superficial skin infections.

#### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

CAUTIONARY AND ADVISORY LABELS 28
EXCIPIENTS: May contain Butylated hydroxytoluene

- **Altargo** (GlaxoSmithKline UK Ltd)
  - Retapamulin 10 mg per 1 gram Altargo 10mg/g ointment | 5 gram £7.89

2.2 Fungal skin infections

ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

Clotrimazole

- **INDICATIONS AND DOSE**
  - **Fungal skin infections**
    - **TO THE SKIN**
      - Child: Apply 2–3 times a day
      - Adult: Apply 2–3 times a day
  - **Fungal nail infections**
    - **BY TRANSUNGUAL APPLICATION**
      - Child: Apply once daily, applied under occlusive dressing
      - Adult: Apply once daily, applied under occlusive dressing
  - **Cautions** Contact with eyes and mucous membranes should be avoided
  - **INTERACTIONS** → Appendix 1: antifungals, azoles
  - **SIDE-EFFECTS** Local irritation · erythema · hypersensitivity reactions · itching · mild burning sensation

SIDE-EFFECTS, FURTHER INFORMATION

Treatment should be discontinued if side-effects are severe.

- **PREGNANCY** Minimal absorption from skin; not known to be harmful.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

- **EXCIPIENTS:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

  - **Clotrimazole (Non-proprietary)**
    - Clotrimazole 10 mg per 1 gram Clotrimazole 1% cream | 20 gram £2.06 DT price = £1.12 | 50 gram £5.45 DT price = £2.80
    - Canesten (clotrimazole) (Bayer Plc)
      - Clotrimazole 10 mg per 1 gram Canesten 1% cream | 20 gram £2.14 DT price = £1.12 | 50 gram £3.50 DT price = £2.80
      - Canesten Antifungal 1% cream | 20 gram £1.85 DT price = £1.12
      - Canesten Dual Action 1% cream
    - Clotrimazole 20 mg per 1 gram Canesten 2% thrush cream | 10 gram £ no price available | 20 gram £4.46 DT price = £4.46
    - Clotrimazole 100 mg per 1 gram Canesten 10% VC cream | 5 gram £4.50 DT price = £6.23

- **Liquids**
  - Canesten (clotrimazole) (Bayer Plc)
    - Clotrimazole 10 mg per 1 ml Canesten 1% solution | 20 ml £2.30 DT price = £2.30

Combinations available: **Hydrocortisone with clotrimazole**, p. 1150

Econazole nitrate

- **INDICATIONS AND DOSE**
  - **Fungal skin infections**
    - **TO THE SKIN**
      - Child: Apply twice daily
      - Adult: Apply twice daily
  - **Fungal nail infections**
    - **BY TRANSUNGUAL APPLICATION**
      - Child: Apply once daily, applied under occlusive dressing
      - Adult: Apply once daily, applied under occlusive dressing
  - **Cautions** Avoid contact with eyes and mucous membranes
  - **SIDE-EFFECTS** Burning sensation · erythema · hypersensitivity reactions · itching · occasional local irritation

- **PREGNANCY** Minimal absorption from skin; not known to be harmful.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

- **EXCIPIENTS:** May contain Butylated hydroxyanisole, fragrances

  - Pevaryl (Janssen-Cilag Ltd)
    - Econazole nitrate 10 mg per 1 gram Pevaryl 1% cream | 30 gram £3.71

Ketoconazole

- **INDICATIONS AND DOSE**
  - **Tinea pedis**
    - **TO THE SKIN USING CREAM**
      - Adult: Apply twice daily
  - **Fungal skin infection (not Tinea pedis)**
    - **TO THE SKIN USING CREAM**
      - Adult: Apply 1–2 times a day
  - **Treatment of seborrhoeic dermatitis and dandruff**
    - **TO THE SKIN USING SHAMPOO**
      - Child 12–17 years: Apply twice weekly for 2–4 weeks, leave preparation on for 3–5 minutes before rinsing
      - Adult: Apply twice weekly for 2–4 weeks, leave preparation on for 3–5 minutes before rinsing
  - **Prophylaxis of seborrhoeic dermatitis and dandruff**
    - **TO THE SKIN USING SHAMPOO**
      - Child 12–17 years: Apply every 1–2 weeks, leave preparation on for 3–5 minutes before rinsing
      - Adult: Apply every 1–2 weeks, leave preparation on for 3–5 minutes before rinsing
  - **Treatment of pityriasis versicolor**
    - **TO THE SKIN USING SHAMPOO**
      - Child 12–17 years: Apply once daily for maximum 5 days, leave preparation on for 3–5 minutes before rinsing
      - Adult: Apply once daily for maximum 5 days, leave preparation on for 3–5 minutes before rinsing
  - **Prophylaxis of pityriasis versicolor**
    - **TO THE SKIN USING SHAMPOO**
      - Child 12–17 years: Apply once daily for up to 3 days before sun exposure, leave preparation on for 3–5 minutes before rinsing
      - Adult: Apply once daily for up to 3 days before sun exposure, leave preparation on for 3–5 minutes before rinsing

- **CAUTIONS** Avoid contact with eyes · avoid contact with mucous membranes
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS** Erythema · hypersensitivity reactions · itching · mild burning sensation · occasional local irritation

SIDE-EFFECTS, FURTHER INFORMATION

Treatment should be discontinued if side-effects are severe.

- **CONCEPTION AND CONTRACEPTION** Effect on latex condoms and diaphragms not yet known.
- **NATIONAL FUNDING/ACCESS DECISIONS** Ketoconazole cream is not prescribable on the NHS except for seborrhoeic dermatitis and pityriasis versicolor and endorsed ‘SLS’.
- **EXCEPTIONS TO LEGAL CATEGORY**
  A 15-g tube is available for sale to the public for the treatment of tinea pedis, tinea cruris, and candidal intertrigo.
Miconazole

**INDICATIONS AND DOSE**

**Fungal skin infections**
- **TO THE SKIN**
  - Child: Apply twice daily continuing for 10 days after lesions have healed
  - Adult: Apply twice daily continuing for 10 days after lesions have healed

**Fungal nail infections**
- **TO THE SKIN**
  - Child: Apply 1–2 times a day
  - Adult: Apply 1–2 times a day

**SIDE-EFFECTS**
- Common or very common: Nausea, rash, vomiting
- Frequency not known: Burning sensation, erythema, hypersensitivity reactions, itching, occasional local irritation

**SIDE-EFFECTS, FURTHER INFORMATION**
Treatment should be discontinued if side effects are severe.

**PREGNANCY**
Manufacturer advises avoid.

**MEDICAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cream**
- **EXCIPIENTS:** May contain Butylated hydroxyanisole
  - Daktarin (McNeil Products Ltd)
    - Miconazole nitrate 20 mg per 1 gram | Daktarin 2% cream | 15 gram £2.14 | 30 gram £1.82 DT price = £1.82
  - Daktarin (McNeil Products Ltd)
    - Miconazole nitrate 20 mg per 1 gram | Daktarin 2% powder | 20 gram £2.58 DT price = £2.58

**Shampoo**
- **EXCIPIENTS:** May contain Imidurea
  - Ketoconazole (Non-proprietary)
    - Ketoconazole 20 mg per 1 gram | 283 mg per 1 ml shampoo | 120 ml £2.77 DT price = £2.77
  - Dandraxol (Transdermal Ltd)
    - Ketoconazole 20 mg per 1 gram | Dandraxol 2% shampoo | 120 ml £5.20 DT price = £5.20
  - Nizoral (Janssen-Cilag Ltd, McNeil Products Ltd)
    - Ketoconazole 20 mg per 1 gram | Nizoral 2% shampoo | 120 ml £3.59 DT price = £3.77

**Antifungals > Other**

Amorolfin

**INDICATIONS AND DOSE**

**Fungal nail infections**
- **BY TRANSGUNGAL APPLICATION**
  - Child 12–17 years: Apply 1–2 times a week for 6 months to treat finger nails and for toe nails 9–12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes
  - Adult: Apply 1–2 times a week for 6 months to treat finger nails and for toe nails 9–12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes

**UNLICENSED USE**
Not licensed for use in children under 12 years.
**Infections of the skin**

**Side Effects**

- **Side Effects, Further Information**
  Treatment should be discontinued if side-effects are severe.

**Patient and Carer Advice**

- **Avoid nail varnish or artificial nails during treatment.**

**Exceptions to Legal Category**

- **In adults** Amorolfine nail lacquer can be sold to the public if supplied for the treatment of mild cases of distal and lateral subungual onychomycoses caused by dermatophytes, yeasts and moulds; subject to treatment of max. 2 nails, max. strength of nail lacquer amorolfine 5% and a pack size of 3 mL.

**Medicinal Forms**

- **There can be variation in the licensing of different medicines containing the same drug.**

**Medicated nail lacquer**

**INDICATIONS AND ADVISORY LABELS**

**Amorolfine (Non-proprietary)**

- Amorolfine (as Amorolfine hydrochloride) 50 mg per 1 ml
  - Medicated nail lacquer
  - **Amorolfine (as Amorolfine hydrochloride) 50 mg per 1 ml**
  - **Loceryl** (Galderma (UK) Ltd)
  - 5% medicated nail lacquer | 2.5 ml [POM] £7.26 | 5 ml [POM] £9.08 DT price = £6.99
  - **Omicur** (Morningside Healthcare Ltd)
  - 5% medicated nail lacquer | 2.5 ml [POM] £3.09 | 5 ml [POM] £9.09 DT price = £6.99

**TERBINAFINE**

**Indications and Dose**

**Tinea pedis**

- **TO THE SKIN USING CREAM**
  - Adult: Apply 1–2 times a day for up to 1 week, to be applied thinly
  - **BY MOUTH USING TABLETS**
  - Adult: 250 mg once daily for 2–6 weeks

**Tinea corporis**

- **TO THE SKIN USING CREAM**
  - Adult: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks
  - **BY MOUTH USING TABLETS**
  - Adult: 250 mg once daily for 4 weeks

**Tinea cruris**

- **TO THE SKIN USING CREAM**
  - Adult: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks
  - **BY MOUTH USING TABLETS**
  - Adult: 250 mg once daily for 2–4 weeks

**Dermatophyte infections of the nails**

- **BY MOUTH USING TABLETS**
  - Adult: 250 mg once daily for 6 weeks-3 months (occasionally longer in toenail infections)

**Cutaneous candidiasis / Pityriasis versicolor**

- **TO THE SKIN USING CREAM**
  - Adult: Apply 1–2 times a day for 2 weeks, to be applied thinly, review treatment after 2 weeks

**Caution**

- With oral use autoimmune disease (risk of lupus-erythematosus-like effect) • psoriasis (risk of exacerbation)

**Interactions**

- **Appendix 1: terbinafine**

**Side Effects**

- **Common or very common**
  - With oral use Abdominal discomfort • anorexia • arthralgia • diarrhoea • dyspepsia • headache • myalgia • nausea • rash • urticaria

- **Rare**
  - With oral use Taste disturbance

- **Very rare**
  - With oral use Alopecia • blood disorders • lupus erythematosus-like effect • neutropenia • photosensitivity • serious skin reactions • Stevens-Johnson syndrome • thrombocytopenia • toxic epidermal necrolysis

- **Frequency not known**
  - With oral use Disturbances in smell • exacerbation of psoriasis • hearing disturbances • influenza-like symptoms • pancreatitis • rhabdomyolysis • vasculitis

- **With topical use**
  - Erythema • hypersensitivity reactions • itching • mild burning sensation • occasional local irritation

**Medicinal Forms**

- **There can be variation in the licensing of different medicines containing the same drug.**

**Spray**

**INDICATIONS AND ADVISORY LABELS**

**EXCIPIENTS:** May contain Benzyl alcohol

- **Grisol AF** (Transdermal Ltd)
  - Griseofulvin 10 mg per 1 gram
  - **Grisol AF 1% spray** | 20 ml [P] £3.35

**Griseofulvin**

**Indications and Dose**

**Tinea pedis**

- **TO THE SKIN USING CREAM**
  - Adult: Apply 400 micrograms once daily, apply to an area approximately 13 cm²; increased if necessary to 1.2 mg once daily for maximum treatment duration of 4 weeks, allow each spray to dry between application

**Caution**

- Avoid contact with eyes and mucous membranes

**Interactions**

- **Appendix 1: griseofulvin**

**Side Effects**

- **Common or very common**
  - With oral use Application at margins of lesions • burning sensation systemically • erythema • flushing

- **Uncommon**
  - With oral use Alopecia • anaglyphia • auditory distractibility • dizziness • epistaxis • extrapyramidal disorders • gallbladder disorder • gingival hyperplasia • glaucoma • hair loss • headache • hypoglycaemia • hypokalaemia • hyporeflexia • hypothermia • hyperuricaemia • insomnia • hypothyroidism • impotence • itching • irritative effects • leucopenia • liver function disturbance • mouth ulcers • myalgia • myasthenia • nasal septum deviation on the affected side • tinnitus • urticaria • vasculitis

- **Very rare**
  - With oral use Alopecia • blood disorders • lupus erythematosus-like effect • neutropenia • photosensitivity • serious skin reactions • Stevens-Johnson syndrome • thrombocytopenia • toxic epidermal necrolysis

- **Frequency not known**
  - With oral use Disturbances in smell • exacerbation of psoriasis • hearing disturbances • influenza-like symptoms • pancreatitis • rhabdomyolysis • vasculitis

- **With topical use**
  - Erythema • hypersensitivity reactions • itching • mild burning sensation • occasional local irritation

**Medicinal Forms**

- **There can be variation in the licensing of different medicines containing the same drug.**

**Spray**

**INDICATIONS AND ADVISORY LABELS**

**EXCIPIENTS:** May contain Benzyl alcohol

- **Grisol AF** (Transdermal Ltd)
  - **Grisol AF 1% spray** | 20 ml [P] £3.35

**Terbinafine**

- **Indications and Dose**
  - **Tinea pedis**
    - Adult: Apply 1–2 times a day for up to 1 week, to be applied thinly
  - **By mouth using tablets**
    - Adult: 250 mg once daily for 2–6 weeks

**Tinea corporis**

- **To the skin using cream**
  - Adult: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks
  - **By mouth using tablets**
    - Adult: 250 mg once daily for 4 weeks

**Tinea cruris**

- **To the skin using cream**
  - Adult: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks
  - **By mouth using tablets**
    - Adult: 250 mg once daily for 2–4 weeks

**Dermatophyte infections of the nails**

- **By mouth using tablets**
  - Adult: 250 mg once daily for 6 weeks-3 months (occasionally longer in toenail infections)

**Cutaneous candidiasis / Pityriasis versicolor**

- **To the skin using cream**
  - Adult: Apply 1–2 times a day for 2 weeks, to be applied thinly, review treatment after 2 weeks
BENEFITS AND POTENTIAL HARM OF DEVICES

- **PREGNANCY**
  - With oral use: Manufacturer advises use only if potential benefit outweighs risk—animal studies suggest no adverse effects.
  - With topical use: Manufacturer advises use only if potential benefit outweighs risk—no information available.
  - With oral use: Manufacturer advises avoid—elimination reduced.

- **BREAST FEEDING**
  - With topical use: Manufacturer advises avoid—present in milk.
  - With oral use: Manufacturer advises avoid—present in milk.

- **HEPATIC IMPAIRMENT**
  - With oral use: Manufacturer advises avoid—elimination reduced.

- **RENAL IMPAIRMENT**
  - With oral use: Use half normal dose if eGFR less than 30 mL/minute/1.73 m² and no suitable alternative available.

- **MONITORING REQUIREMENTS**
  - With oral use: Monitor hepatic function before treatment and then every 4–6 weeks during treatment—discontinue if abnormalities in liver function tests.

- **EXCEPTIONS TO LEGAL CATEGORY**
  - With topical use: Preparations of terbinfine hydrochloride (maximum 1%) can be sold to the public for use in those over 16 years for external use for the treatment of tinea pedis as a cream in a pack containing maximum 15 g, or for the treatment of tinea pedis and cruris as a cream in a pack containing maximum 15 g, or for the treatment of tinea pedis, cruris, and corporis as a spray in a pack containing 30 mL spray or as a gel in a pack containing maximum 30 g gel.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - **Terbinafine (Non-proprietary)**
    - Terbinafine hydrochloride 250 mg: 28 tablet [Dos] £34.93
    - Lamisil (Novartis Pharmaceuticals UK Ltd)
      - Terbinafine (as Terbinafine hydrochloride) 250 mg: 28 tablet [Dos] £41.09
  - **Cream**
    - EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), fragrances
    - Terbinafine hydrochloride 10 mg per 1 gram: 28 tablet [Dos] £1.29

- **ANTISEPTICS AND DISINFECTANTS**

  **UNDECENOATES**

  **Terbinafine (Non-proprietary)**
  - Terbinafine hydrochloride 10 mg per 1 gram: 28 tablet [Dos] £1.29

  **Mycota (zinc undecenoate / undecenoic acid)** (Thornton & Ross Ltd)
  - Undecenoic acid 50 mg per 1 gram: Mycota cream | 25 gram [Dos] £2.01
  -UNDENINDOZOCRZNDAO
  - **Terbinafine (as Terbinafine hydrochloride)** (Novartis Pharmaceuticals UK Ltd)
    - Terbinafine hydrochloride 250 mg: 28 tablet [Dos] £41.09

  **Chlorhexidine with nystatin**

  **Skin infections due to Candida spp.**
