Access the BNF your way

The *British National Formulary* (BNF) and *BNF for Children* are updated monthly online via MedicinesComplete, ensuring healthcare professionals always have the latest prescribing advice.

**ONLINE**

**BNF on MedicinesComplete**
Access BNF and *BNF for Children* on MedicinesComplete and receive the very latest drug information through monthly online updates.

**FormularyComplete** Create, edit and manage your own local formulary content built upon the trusted prescribing advice of the BNF and *BNF for Children*.

**BNF on Evidence Search**
Search the BNF and *BNF for Children* alongside other authoritative clinical and non-clinical evidence and best practice at www.evidence.nhs.uk from NICE.

**PRINT**

Eligible health professionals will now receive one print copy a year – the September issue – to supplement online access. If you are entitled to an NHS copy please refer to page ii for full details on distribution, call 01268 495 609 or email bnf@binleys.com.

*Turn the page for more details...*
How to purchase

**Buy direct from Pharmaceutical Press** by visiting
www.pharmpress.com/bnf

Preface

The BNF is a joint publication of the British Medical Association and the Royal Pharmaceutical Society. It is published under the authority of a Joint Formulary Committee which comprises representatives of the two professional bodies, the UK Health Departments, the Medicines and Healthcare products Regulatory Agency, and a national guideline producer. The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the Group includes representatives of the British Dental Association and a representative from the UK Health Departments. The Nurse Prescribers’ Advisory Group advises on the content relevant to nurses and includes representatives from different parts of the nursing community and from the UK Health Departments.

The BNF aims to provide prescribers, pharmacists, and other healthcare professionals with sound up-to-date information about the use of medicines.

The BNF includes key information on the selection, prescribing, dispensing and administration of medicines. Medicines generally prescribed in the UK are covered and those considered less suitable for prescribing are clearly identified. Little or no information is included on medicines promoted for purchase by the public.

Information on drugs is drawn from the manufacturers’ product literature, medical and pharmaceutical literature, UK health departments, regulatory authorities, and professional bodies. Advice is constructed from clinical literature and reflects, as far as possible, an evaluation of the evidence from diverse sources. The BNF also takes account of authoritative national guidelines and emerging safety concerns. In addition, the editorial team receives advice on all therapeutic areas from expert clinicians; this ensures that the BNF’s recommendations are relevant to practice.

The BNF is designed as a digest for rapid reference and it may not always include all the information necessary for prescribing and dispensing. Also, less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. BNF for Children should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services, see Medicines Information Services (see inside front cover).

It is important to use the most recent BNF information for making clinical decisions. The print edition of the BNF is updated in March and September each year. Monthly updates are provided online via Medicines Complete and the NHS Evidence portal. The more important changes are listed under Changes; changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies.

The BNF Publications website (www.bnf.org) includes additional information of relevance to healthcare professionals. Other digital formats of the BNF—including versions for mobile devices and integration into local formularies—are also available.

BNF Publications welcomes comments from healthcare professionals. Comments and constructive criticism should be sent to:

Acknowledgements

The Joint Formulary Committee is grateful to individuals and organisations that have provided advice and information to the BNF.

The principal contributors for this update were:

Expert advice on the management of oral and dental conditions was kindly provided by M. Addy, P. Coulthard, A. Crighton, M.A.O. Lewis, J.G. Meechan, N.D. Robb, C. Scully, R.A. Seymour, R. Welbury, and J.M. Zakrzewska.

S. Kaur provided valuable advice on dental prescribing policy.

Members of the Advisory Committee on Malaria Prevention, R.H. Behrens, D. Bell, P.L. Chiodini, V. Field, F. Genasi, L. Goodyer, A. Green, J. Jones, G. Kassianos, D.G. Lalloo, D. Patel, H. Patel, M. Powell, D.V. Shingadia, N.O. Subair, C.J.M. Whitty, M. Blaze (Secretariat), and V. Smith (Secretariat) have provided valuable advice.

The UK Ophthalmic Pharmacy Group have also provided valuable advice.

The MHRA have provided valuable assistance.

Correspondents in the pharmaceutical industry have provided information on new products and commented on products in the BNF.

Numerous doctors, pharmacists, nurses, and others have sent comments and suggestions.

BNF interactions are provided by C.L. Preston, S.L. Jones, H.K. Sandhu, and S. Sutton.

The BNF has valuable access to the Martindale data banks by courtesy of A. Brayfield and staff.

How BNF Publications are constructed

Overview
The BNF is an independent professional publication that addresses the day-to-day prescribing information needs of healthcare professionals. Use of this resource throughout the health service helps to ensure that medicines are used safely, effectively, and appropriately.

Hundreds of changes are made between print editions, and are published monthly in a number of digital formats. The most clinically significant updates are listed under Changes p. xix.

The BNF is unique in bringing together authoritative, independent guidance on best practice with clinically validated drug information. Validation of information follows a standardised process, reviewing emerging evidence, best-practice guidelines, and advice from a network of clinical experts. Where the evidence base is weak, further validation is undertaken through a process of peer review. The process and its governance are outlined in greater detail in the sections that follow.

Joint Formulary Committee
The Joint Formulary Committee (JFC) is responsible for the content of the BNF. The JFC includes pharmacy, medical, nursing, and lay representatives; there are also representatives from the Medicines and Healthcare products Regulatory Agency (MHRA), the UK Health Departments, and a national guideline producer. The JFC decides on matters of policy and reviews amendments to the BNF in the light of new evidence and expert advice.

Dental Advisory Group
The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the group includes representatives from the British Dental Association and a representative from the UK Health Departments.

Nurse Prescribers’ Advisory Group
The Nurse Prescribers’ Advisory Group oversees the list of drugs approved for inclusion in the Nurse Prescribers’ Formulary; the group includes representatives from a range of nursing disciplines and stakeholder organisations.

Expert advisers
The BNF uses about 60 expert clinical advisers (including doctors, pharmacists, nurses, and dentists) throughout the UK to help with clinical content. The role of these expert advisers is to review existing text and to comment on amendments drafted by the clinical writers. These clinical experts help to ensure that the BNF remains reliable by:
- commenting on the relevance of the text in the context of best clinical practice in the UK;
- checking draft amendments for appropriate interpretation of any new evidence;
- providing expert opinion in areas of controversy or when reliable evidence is lacking;
- providing independent advice on drug interactions, prescribing in hepatic impairment, renal impairment, pregnancy, breast-feeding, children, the elderly, palliative care, and the emergency treatment of poisoning.

In addition to consulting with regular advisers, the BNF calls on other clinical specialists for specific developments when particular expertise is required.

The BNF works closely with a number of expert bodies that produce clinical guidelines. Drafts or pre-publication copies of guidelines are often received for comment and assimilation into the BNF.

Editorial team
BNF clinical writers have all worked as pharmacists or possess a pharmacy degree and a further, relevant postgraduate qualification, and have a sound understanding of how drugs are used in clinical practice. As a team, the clinical writers are responsible for editing, maintaining, and updating BNF content. They follow a systematic prioritisation process in response to updates to the evidence base in order to ensure the most clinically important topics are reviewed as quickly as possible. In parallel the team of clinical writers undertakes a process of rolling revalidation, aiming to review all of the content in the BNF over a 3- to 4-year period.

Amendments to the text are drafted when the clinical writers are satisfied that any new information is reliable and relevant. A set of standard criteria define when content is referred to expert advisers, the Joint Formulary Committee or other advisory groups, or submitted for peer review.

Clinical writers prepare the text for publication and undertake a number of validation checks on the knowledge at various stages of the production process.

Sources of BNF information
The BNF uses a variety of sources for its information; the main ones are shown below.

Summaries of product characteristics
The BNF reviews summaries of product characteristics (SPCs) of all new products as well as revised SPCs for existing products. The SPCs are the principal source of product information and are carefully processed. Such processing involves:
- verifying the approved names of all relevant ingredients including ‘non-active’ ingredients (the BNF is committed to using approved names and descriptions as laid down by the Human Medicine Regulations 2012);
- comparing the indications, cautions, contra-indications, and side-effects with similar existing drugs. Where these are different from the expected pattern, justification is sought for their inclusion or exclusion;
- seeking independent data on the use of drugs in pregnancy and breast-feeding;
- incorporating the information into the BNF using established criteria for the presentation and inclusion of the data;
- checking interpretation of the information by a second clinical writer before submitting to a content manager; changes relating to doses receive a further check;
- identifying potential clinical problems or omissions and seeking further information from manufacturers or from expert advisers;
- constructing, with the help of expert advisers, a comment on the role of the drug in the context of similar drugs.

Much of this processing is applicable to the following sources as well.

Literature
Clinical writers monitor core medical and pharmaceutical journals. Research papers and reviews relating to drug therapy are carefully processed. When a difference between the advice in the BNF and the paper is noted, the new information is assessed for reliability (using tools based on SIGN methodology) and relevance to UK clinical practice. If necessary, new text is drafted and discussed with expert advisers and the Joint Formulary Committee. The BNF enjoys a close working relationship with a number of national information providers.

In addition to the routine process, which is used to identify ‘triggers’ for changing the content, systematic literature searches are used to identify the best quality evidence available to inform an update. Clinical writers receive training in critical appraisal, literature evaluation, and search strategies.
Consensus guidelines
The advice in the BNF is checked against consensus guidelines produced by expert bodies. The quality of the guidelines is assessed using adapted versions of the AGREE II tool. A number of bodies make drafts or pre-publication copies of the guidelines available to the BNF; it is therefore possible to ensure that a consistent message is disseminated. The BNF routinely processes guidelines from the National Institute for Health and Care Excellence (NICE), the All Wales Medicines Strategy Group (AWMSG), the Scottish Medicines Consortium (SMC), and the Scottish Intercollegiate Guidelines Network (SIGN).

Reference sources
Textbooks and reference sources are used to provide background information for the review of existing text or for the construction of new text. The BNF team works closely with the editorial team that produces Martindale: The Complete Drug Reference. The BNF has access to Martindale information resources and each team keeps the other informed of significant developments and shifts in the trends of drug usage.

Peer review
Although every effort is made to identify the most robust data available, inevitably there are areas where the evidence base is weak or contradictory. While the BNF has the valuable support of expert advisers and the Joint Formulary Committee, the recommendations made may be subject to a further level of scrutiny through peer review to ensure they reflect best practice.

Content for peer review is posted on bnf.org and interested parties are notified via a number of channels, including the BNF e-newsletter.

Statutory information
The BNF routinely processes relevant information from various Government bodies including Statutory Instruments and regulations affecting the Prescriptions only Medicines Order. Official compendia such as the British Pharmacopoeia and its addenda are processed routinely to ensure that the BNF complies with the relevant sections of the Human Medicines Regulations 2012.

The BNF maintains close links with the Home Office (in relation to controlled drug regulations) and the Medicines and Healthcare products Regulatory Agency (including the British Pharmacopoeia Commission). Safety warnings issued by the Commission on Human Medicines (CHM) and guidelines on drug are issued by the UK health departments are processed as a matter of routine.

Relevant professional statements issued by the Royal Pharmaceutical Society are included in the BNF as are guidelines from bodies such as the Royal College of General Practitioners.

Medicines and devices
NHS Prescription Services (from the NHS Business Services Authority) provides non-clinical, categorial information (including prices) on the medicines and devices included in the BNF.

Comments from readers
Readers of the BNF are invited to send in comments. Numerous letters and emails are received by the BNF team. Such feedback helps to ensure that the BNF provides practical and clinically relevant information. Many changes in the presentation and scope of the BNF have resulted from comments sent in by users.

Comments from industry
Close scrutiny of BNF by the manufacturers provides an additional check and allows them an opportunity to raise issues about BNF’s presentation of the role of various drugs; this is yet another check on the balance of BNF’s advice. All comments are looked at with care and, where necessary, additional information and expert advice are sought.

Market research
Market research is conducted at regular intervals to gather feedback on specific areas of development.

Assessing the evidence
From January 2016, recommendations made in BNF publications have been evidence graded to reflect the strength of the recommendation. The addition of evidence grading is to support clinical decision making based on the best available evidence.

Evidence used to make a recommendation is assessed for validity using standardised methodology tools based on AGREE II and assigned a level of evidence. The recommendation is then given a grade that is extrapolated from the level of evidence, and an assessment of the body of evidence and its applicability.

Evidence assigned a level 1- or 2- score has an unacceptable level of bias or confounding and is not used to form recommendations.

Levels of evidence
- **Level 1++**: High quality meta-analyses, systematic reviews of randomised controlled trials (RCTs), or RCTs with a very low risk of bias.
- **Level 1+**: Well-conducted meta-analyses, systematic reviews, or RCTs with a low risk of bias.
- **Level 1-**: Meta-analyses, systematic reviews, or RCTs with a high risk of bias.
- **Level 2++**: High quality systematic reviews of case control or cohort studies; or high quality case control or cohort studies with a very low risk of confounding or bias and a high probability that the relationship is causal.
- **Level 2+**: Well-conducted case control or cohort studies with a low risk of confounding or bias and a moderate probability that the relationship is causal.
- **Level 2-**: Case control or cohort studies with a high risk of confounding or bias and a significant risk that the relationship is not causal.
- **Level 3**: Non-analytic studies, e.g. case reports, case series.
- **Level 4**: Expert advice or clinical experience from respected authorities.

Grades of recommendation
- **Grade A: High strength**: NICE-accredited guidelines; or guidelines that pass AGREE II assessment; or at least one meta-analysis, systematic review, or RCT rated as 1++, and directly applicable to the target population; or a body of evidence consisting principally of studies rated as 1+, directly applicable to the target population, and demonstrating overall consistency of results.
● **Grade B: Moderate strength**
A body of evidence including studies rated as 2++, directly applicable to the target population, and demonstrating overall consistency of results; or extrapolated evidence from studies rated as 1++ or 1+.

● **Grade C: Low strength**
A body of evidence including studies rated as 2+, directly applicable to the target population and demonstrating overall consistency of results; or extrapolated evidence from studies rated as 2++.

● **Grade D: Very low strength**
Evidence level 3; or extrapolated evidence from studies rated as 2+; or tertiary reference source created by a transparent, defined methodology, where the basis for recommendation is clear.

● **Grade E: Practice point**
Evidence level 4.
How to use BNF Publications in print

How to use the BNF

This edition of the BNF continues to display the fundamental change to the structure of the content that was first shown in BNF 70. The changes were made to bring consistency and clarity to BNF content, and to the way that the content is arranged within print and digital products, increasing the ease with which information can be found.

For reference, the most notable changes to the structure of the content include:

- Drug monographs – where possible, all information that relates to a single drug is contained within its drug monograph, moving information previously contained in the prescribing notes. Drug monographs have also changed structurally: additional sections have been added, ensuring greater regularity around where information is located within the publication.
- Drug class monographs – where substantial amounts of information are common to all drugs within a drug class (e.g. macrolides p. 507), a drug class monograph has been created to contain the common information.
- Medicinal forms – categorical information about marketed medicines, such as price and pack size, continues to be sourced directly from the Dictionary of Medicines and Devices provided by the NHS Business Services Authority. However, clinical information curated by the BNF team has been clearly separated from the categorical pricing and pack size information and is included in the relevant section of the drug monograph.
- Section numbering – the BNF section numbering has been removed. This section numbering tied the content to a rigid structure and enforced the retention of defunct classifications, such as mercurial diuretics, and hindered the relocation of drugs where therapeutic use had altered. It also caused constraints between the BNF and BNF for Children, where drugs had different therapeutic uses in children.
- Appendix 4 – the content has been moved to individual drug monographs. The introductory notes have been replaced with a new guidance section, Guidance on intravenous infusions p. 16.

Introduction

In order to achieve the safe, effective, and appropriate use of medicines, healthcare professionals must be able to use the BNF effectively, and keep up to date with significant changes in the BNF that are relevant to their clinical practice. This How to Use the BNF is key in reinforcing the details of the new structure of the BNF to all healthcare professionals involved with prescribing, monitoring, supplying, and administering medicines, as well as supporting the learning of students training to join these professions.

Structure of the BNF

This BNF edition continues to broadly follows the high-level structure of earlier editions of the BNF (i.e. those published before BNF 70):

- Front matter, comprising information on how to use the BNF, the significant content changes in each edition, and guidance on various prescribing matters (e.g. prescription writing, the use of intravenous drugs, particular considerations for special patient populations).
- Chapters, containing drug monographs describing the uses, doses, safety issues and other considerations involved in the use of drugs; drug class monographs; and treatment summaries, covering guidance on the selection of drugs. Monographs and treatment summaries are divided into chapters based on specific aspects of medical care, such as Chapter 5, Infections, or Chapter 16, Emergency treatment of poisoning; or drug use related to a particular system of the body, such as Chapter 2, Cardiovascular.

Within each chapter, content is organised alphabetically by therapeutic use (e.g. Airways disease, obstructive), with the treatment summaries first, (e.g. asthma), followed by the monographs of the drugs used to manage the conditions discussed in the treatment summary. Within each therapeutic use, the drugs are organised alphabetically by classification (e.g. Antimuscarinics, Beta 2-agonist bronchodilators) and then alphabetically within each classification (e.g. Aclidinium bromide, Glycopyrronium bromide, Ipratropium bromide).

Appendices, covering interactions, borderline substances, cautionary and advisory labels, and woundcare.

Back matter, covering the lists of medicines approved by the NHS for Dental and Nurse Practitioner prescribing, proprietary and specials manufacturers’ contact details, and the index. Yellow cards are also included, to facilitate the reporting of adverse events, as well as quick reference guides for life support and key drug doses in medical emergencies, for ease of access.

Navigating the BNF

The contents page provides the high-level layout of information within the BNF; and in addition, each chapter begins with a small contents section, describing the therapeutic uses covered within that chapter. Once in a chapter, location is guided by the side of the page showing the chapter number (the thumbnail), alongside the chapter title. The top of the page includes the therapeutic use (the running head) alongside the page number.

Once on a page, visual cues aid navigation: treatment summary information is in black type, with therapeutic use titles similarly styled in black, whereas the use of colour indicates drug-related information, including drug classification titles, drug class monographs, and drug monographs.

Although navigation is possible by browsing, primarily access to the information is via the index, which covers the titles of drug class monographs, drug monographs, and treatment summaries. The index also includes the names of branded medicines and other topics of relevance, such as abbreviations, guidance sections, tables, and images.

Content types

Treatment summaries

Treatment summaries are of three main types:

- an overview of delivering a drug to a particular body system (e.g. Skin conditions, management p. 1117)
- a comparison between a group or groups of drugs (e.g. beta-adrenoceptor blockers (systemic) p. 142)
- an overview of the drug management or prophylaxis of common conditions intended to facilitate rapid appraisal of options (e.g. Hypertension p. 135, or Malaria, prophylaxis p. 574).

In order to select safe and effective medicines for individual patients, information in the treatment summaries must be used in conjunction with other prescribing details about the drugs and knowledge of the patient’s medical and drug history.

Monographs

Overview

In earlier editions (i.e. before BNF 70), a systemically administered drug with indications for use in different body systems was split across the chapters relating to those body systems. So, for example, codeine phosphate p. 431 was found in chapter 1, for its antimotility effects and chapter 4 for its analgesic effects. However, the monograph in chapter
1 contained only the dose and some selected safety precautions.

Now, all of the information for the systemic use of a drug is contained within one monograph, so codeine phosphate is now included in chapter 4. This carries the advantage of providing all of the information in one place, so the user does not need to flick back and forth across several pages to find all of the relevant information for that drug. Cross references are included in chapter 1, where the management of diarrhoea is discussed, to the drug monograph to assist navigation.

Where drugs have systemic and local uses, for example, chloramphenicol p. 537, 1072, 1095 and the considerations around drug use are markedly different according to the route of administration, the monograph is split, as with earlier editions, into the relevant chapters.

This means that the majority of drugs are still placed in the same chapters and sections as earlier editions, and although there may be some variation in order, all of the relevant information will be easier to locate.

One of the most significant changes to the monograph structure is the increased granularity, with a move from around 9 sections to over 20 sections; sections are only included when relevant information has been identified. The following information describes these sections and their uses in more detail.

Nomenclature
Monograph titles follow the convention of recommended international non-proprietary names (rINNs), or, in the absence of a rINN, British Approved Names. Relevant synonyms are included below the title and, in some instances a brief description of the drug action is included. Over future editions these drug action statements will be rolled out for all drugs.

In some monographs, immediately below the nomenclature or drug action, there are a number of cross references or flags used to signpost the user to any additional information they need to consider about a drug.

This is most common for drugs formulated in combinations, where users will be signposted to the monographs for the individual ingredients (e.g. senna with ispaghula husk p. 62) or for drugs that are related to a drug class monograph (see Drug class monographs, below).

Indication and dose
User feedback has highlighted that one of the main uses of the BNF is identifying indications and doses of drugs. Therefore, indication and dose information has been promoted to the top of the monograph and highlighted by a coloured panel to aid quick reference.

The indication and dose section is more highly structured than in earlier editions, giving greater clarity around which doses should be used for which indications and by which route. In addition, if the dose varies with a specific preparation or formulation, that dosing information has been moved out of the preparations section and in to the indication and dose panel, under a heading of the preparation name.

Doses are either expressed in terms of a definite frequency (e.g. 1 g 4 times daily) or in the total daily dose format (e.g. 6 g daily in 3 divided doses); the total daily dose should be divided into individual doses (in the second example, the patient should receive 2 g 3 times daily).

Doses for specific patient groups (e.g. the elderly) may be included if they are different to the standard dose. Doses for children can be identified by the relevant age range and may vary according to their age or body-weight.

In earlier editions of the BNF, age ranges and weight ranges overlapped. For clarity and to aid selection of the correct dose, wherever possible these age and weight ranges now do not overlap. When interpreting age ranges it is important to understand that a patient is considered to be 64 up until the point of their 65th birthday, meaning that an age range of adult 18 to 64 is applicable to a patient from the day of their 18th birthday until the day before their 65th birthday. All age ranges should be interpreted in this way. Similarly, when interpreting weight ranges, it should be understood that a weight of up to 30 kg is applicable to a patient up to, but not including, the point that they tip the scales at 30 kg and a weight range of 35 to 59 kg is applicable to a patient as soon as they tip the scales at 35 kg right up until, but not including, the point that they tip the scales at 60 kg. All weight ranges should be interpreted in this way.

In all circumstances, it is important to consider the patient in question and their physical condition, and select the dose most appropriate for the individual.

Other information relevant to Indication and dose
The dose panel also contains, where known, an indication of pharmacokinetic considerations that may affect the choice of dose, and dose equivalence information, which may aid the selection of dose when switching between drugs or preparations.

The BNF includes unlicensed use of medicines when the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience. When the BNF recommends an unlicensed medicine or the ‘off-label’ use of a licensed medicine, this is shown below the indication and dose panel in the unlicensed use section.

Minimising harm and drug safety
The drug chosen to treat a particular condition should minimise the patient’s susceptibility to adverse effects and, where co-morbidities exist, have minimal detrimental effects on the patient’s other diseases. To achieve this, the Contra-indications, Cautions and Side-effects of the relevant drug should be reviewed.

The information under Cautions can be used to assess the risks of using a drug in a patient who has co-morbidities that are also included in the Cautions for that drug—if a safer alternative cannot be found, the drug may be prescribed while monitoring the patient for adverse-effects or deterioration in the co-morbidity. Contra-indications are far more restrictive than Cautions and mean that the drug should be avoided in a patient with a condition that is contra-indicated.

The impact that potential side-effects may have on a patient’s quality of life should also be assessed. For instance, in a patient who has difficulty sleeping, it may be preferable to avoid a drug that frequently causes insomnia.

Clinically relevant side-effects for drugs are included in the monographs or class monographs. Side-effects are listed in order of frequency, where known, and arranged alphabetically. The frequency of side-effects follows the regulatory standard:

- Very common — occurs more frequently than 1 in 10 administrations of a drug
- Common — occurs between 1 in 10 and 1 in 100 administrations of a drug
- Uncommon — between 1 in 100 and 1 in 1,000 administrations of a drug
- Rare — between 1 in 1,000 and 1 in 10,000 administrations of a drug
- Very rare — occurs less than 1 in 10,000 administrations of a drug
- Frequency not known

An exhaustive list of side-effects is not included, particularly for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). The BNF also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes).

Recognising that hypersensitivity reactions can occur with virtually all medicines, this effect is generally not listed, unless the drug carries an increased risk of such reactions,
Typical layout of a monograph and associated medicinal forms

1 Class Monographs and drug monographs
In most cases, all information that relates to an individual drug is contained in its drug monograph and there is no symbol. Class monographs have been created where substantial amounts of information are common to all drugs within a drug class, these are indicated by a flag symbol in a circle:

Drug monographs with a corresponding class monograph are indicated by a tab with a flag symbol:

The page number of the corresponding class monograph is indicated within the tab. For further information, see How to use BNF Publications

2 Drug classifications
Used to inform users of the class of a drug and to assist in finding other drugs of the same class. May be based on pharmacological class (e.g. opioids) but can also be associated with the use of the drug (e.g. cough suppressants)

3 Review date
The date of last review of the content

4 Specific preparation name
If the dose varies with a specific preparation or formulation it appears under a heading of the preparation name

5 Evidence grading
Evidence grading to reflect the strengths of recommendations will be applied as content goes through the revalidation process. A five level evidence grading system based on the former SIGN grading system has been adopted. The grades A, B, C, D, E are displayed next to the recommendations within the text, and are preceded by the symbol:

For further information, see How BNF Publications are constructed

Class monograph

CLASSIFICATION

Drug monograph

(Synonym) another name by which a drug may be known

DRUG ACTION how a drug exerts its effect in the body

INDICATIONS AND DOSE
Indications are the clinical reasons a drug is used. The dose of a drug will often depend on the indications

Indication
- ROUTE
- Age groups: [Child/Adult/Elderly]
  Dose and frequency of administration (max. dose)

SPECIFIC PREPARATION NAME

Indication
- ROUTE
- Age groups: [Child/Adult/Elderly]
  Dose and frequency of administration (max. dose)

DOSE EQUIVALENCE AND CONVERSION information around the bioequivalence between formulations of the same drug, or equivalent doses of drugs that are members of the same class

PHARMACOKINETICS how the body affects a drug (absorption, distribution, metabolism, and excretion)

POTENCY a measure of drug activity expressed in terms of the concentration required to produce an effect of given intensity

DOSES AT EXTREMES OF BODY-WEIGHT dosing information for patients who are overweight or underweight

UNLICENSED USE describes the use of medicines outside the terms of their UK licence (off-label use), or of medicines that have no licence for use in the UK

IMPORTANT SAFETY INFORMATION
Information produced and disseminated by drug regulators often highlights serious risks associated with the use of a drug, and may include advice that is mandatory

CONTRA-INDICATIONS circumstances when a drug should be avoided

CAUTIONS details of precautions required

INTERACTIONS when one drug changes the effects of another drug; the mechanisms underlying drug interactions are explained in Appendix 1

SIDE-EFFECTS listed in order of frequency, where known, and arranged alphabetically

ALLERGY AND CROSS-SENSITIVITY for drugs that carry an increased risk of hypersensitivity reactions

CONCEPTION AND CONTRACEPTION potential for a drug to have harmful effects on an unborn child when prescribing for a woman of childbearing age or for a man trying to father a child; information on the effect of drugs on the efficacy of latex condoms or diaphragms

PREGNANCY advice on the use of a drug during pregnancy

BREAST FEEDING advice on the use of a drug during breast feeding
- **HEPATIC IMPAIRMENT** advice on the use of a drug in hepatic impairment
- **RENAL IMPAIRMENT** advice on the use of a drug in renal impairment
- **PRE-TREATMENT SCREENING** covers one off tests required to assess the suitability of a patient for a particular drug
- **MONITORING REQUIREMENTS** specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index
- **EFFECTS ON LABORATORY TESTS** for drugs that can interfere with the accuracy of seemingly unrelated laboratory tests
- **TREATMENT CESSATION** specifies whether further monitoring or precautions are advised when the drug is withdrawn
- **DIRECTIONS FOR ADMINISTRATION** practical information on the preparation of intravenous drug infusions; general advice relevant to other routes of administration
- **PRESCRIBING AND DISPENSING INFORMATION** practical information around how a drug can be prescribed and dispensed including details of when brand prescribing is necessary
- **HANDLING AND STORAGE** includes information on drugs that can cause adverse effects to those who handle them before they are taken by, or administered to, a patient; advice on storage conditions
- **PARENT AND CARER ADVICE** for drugs with a special need for counselling
- **PROFESSION SPECIFIC INFORMATION** provides details of the restrictions certain professions such as dental practitioners or nurse prescribers need to be aware of when prescribing on the NHS
- **NATIONAL FUNDING/ACCESS DECISIONS** details of NICE Technology Appraisals and SMC advice
- **LESS SUITABLE FOR PRESCRIBING** preparations that are considered by the Joint Formulary Committee to be less suitable for prescribing
- **EXCEPTION TO LEGAL CATEGORY** advice and information on drugs which may be sold without a prescription under specific conditions

### Legal categories

[P] This symbol has been placed against those preparations that are available only on a prescription issued by an appropriate practitioner. For more detailed information see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition)

[CD1 CD2 CD3 CD4-1 CD4-2 CD5] These symbols indicate that the preparations are subject to the prescription requirements of the Misuse of Drugs Act

For regulations governing prescriptions for such preparations, see Controlled Drugs and Drug Dependence

Not all monographs include all possible sections; sections are only included when relevant information has been identified

### MEDICINAL FORMS

**Form**

- **CAUTIONARY AND ADVISORY LABELS** if applicable
- **EXCIPIENTS** clinically important but not comprehensive [consult manufacturer information for full details]
- **ELECTROLYTES** if clinically significant quantities occur

#### Preparation name (Manufacturer/Non-proprietary)

- Drug name and strength pack sizes

#### Combinations available

This indicates a combination preparation is available and a cross reference page number is provided to locate this preparation
when the information is included under Allergy and cross sensitivity.

The Important safety advice section in the BNF, delineated by a coloured outline box, highlights important safety concerns, often those raised by regulatory authorities or guideline producers. Safety warnings issued by the Commission on Human Medicines (CHM) or Medicines and Healthcare products Regulatory Agency (MHRA) are found here.

Drug selection should aim to minimise drug interactions. If it is necessary to prescribe a potentially serious combination of drugs, patients should be monitored appropriately. The mechanisms underlying drug interactions are explained in Appendix 1, followed by details of drug interactions.

**Use of drugs in specific patient populations**

Drug selection should aim to minimise the potential for drug accumulation, adverse drug reactions, and exacerbation of pre-existing hepatic or renal disease. If it is necessary to prescribe drugs whose effect is altered by hepatic or renal disease, appropriate drug dose adjustments should be made, and patients should be monitored adequately. The general principles for prescribing are outlined under Prescribing in hepatic impairment p. 19, and Prescribing in renal impairment p. 19. Information about drugs that should be avoided or used with caution in hepatic disease or renal impairment can be found in drug monographs under Hepatic impairment and Renal impairment (e.g. fluconazole p. 562).

Similarly, drug selection should aim to minimise harm to the fetus, nursing infant, and mother. The infant should be monitored for potential side-effects of drugs used by the mother during pregnancy or breast-feeding. The general principles for prescribing are outlined under Prescribing in pregnancy p. 22 and Prescribing in breast-feeding p. 22. The Treatment Summaries provide guidance on the drug treatment of common conditions that can occur during pregnancy and breast-feeding (e.g. Asthma p. 230). Information about the use of specific drugs during pregnancy and breast-feeding can be found in their drug monographs under Pregnancy, and Breast-feeding (e.g. fluconazole p. 562).

A section, Conception and contraception, containing information around considerations for females of childbearing potential or men who might father a child (e.g. isotretinoin p. 1166) has been included.

**Administration and monitoring**

When selecting the most appropriate drug, it may be necessary to screen the patient for certain genetic markers or metabolic states. This information is included within a section called Pre-treatment screening (e.g. abacavir p. 610). This section covers one-off tests required to assess the suitability of a patient for a particular drug.

Once the drug has been selected, it needs to be given in the most appropriate manner. A Directions for administration section contains the information about intravenous administration previously located in Appendix 4. This provides practical information on the preparation of intravenous drug infusions, including compatibility of drugs with standard intravenous infusion fluids, method of dilution or reconstitution, and administration rates. In addition, general advice relevant to other routes of administration is provided within this section (e.g. fentanyl p. 434).

After selecting and administering the most appropriate drug by the most appropriate route, patients should be monitored to ensure they are achieving the expected benefits from drug treatment without any unwanted side-effects. The Monitoring section specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index (e.g. theophylline p. 263). Monitoring may, in certain cases, be affected by the impact of a drug on laboratory tests (e.g. hydroxocobalamin p. 938), and this information is included in Effects on laboratory tests.

In some cases, when a drug is withdrawn, further monitoring or precautions may be advised (e.g. clonidine hydrochloride p. 139); these are covered under Treatment cessation.

**Choice and supply**

The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them (see Taking Medicines to Best Effect). Taking the time to explain to the patient (and carers) the rationale and the potential adverse effects of treatment may improve adherence. For some medicines there is a special need for counselling (e.g. appropriate posture during administration of doxycycline p. 534); this is shown in Patient and carer advice.

Other information contained in the latter half of the monograph also helps prescribers and those dispensing medicines choose medicinal forms (by indicating information such as flavour or when branded products may not be interchangeable (e.g. diltiliazem hydrochloride p. 152), assess the suitability of a drug for prescribing, understand the NHS funding status for a drug (e.g. sildenafil p. 766), or assess when a patient may be able to purchase a drug without prescription (e.g. loperamide hydrochloride p. 65).

**Medicinal forms**

In the BNF, preparations follow immediately after the monograph for the drug that is their main ingredient.

In earlier editions, when a particular preparation had safety information, dose advice or other clinical information specific to the product, it was contained within the preparations section. This information has been moved to the relevant section in the main body of the monograph under a heading of the name of the specific medicinal form (e.g. peppermint oil p. 46).

The medicinal forms (formerly preparations) section provides information on the type of formulation (e.g. tablet), the amount of active drug in a solid dosage form, and the concentration of active drug in a liquid dosage form. The legal status is shown for prescription-only medicines and controlled drugs, as well as pharmacy medicines and medicines on the general sales list. Practitioners are reminded, by a statement under the heading of "Medicinal Forms" that not all products containing a specific drug ingredient may be similarly licensed. To be clear on the precise licensing status of specific medicinal forms, practitioners should check the product literature for the particular product being prescribed or dispensed.

Details of all medicinal forms available on the dm+d for each drug in BNF Publications appears online on MedicinesComplete. In print editions, due to space constraints, only certain branded products are included in detail. Where medicinal forms are listed they should not be inferred as equivalent to the other brands listed under the same form heading. For example, all the products listed under a heading of "Modified release capsule" will be available as modified release capsules, however, the brands listed under that form heading may have different release profiles, the available strengths may vary and/or the products may have different licensing information. As with earlier editions of the BNF, practitioners must ensure that the particular product being prescribed or dispensed is appropriate.

As medicinal forms are derived from dm+d data, some drugs may appear under names derived from that data; this may vary slightly from those in previous BNF versions, e.g. sodium acid phosphate, is now sodium dihydrogen phosphate anhydrous.

Patients should be prescribed a preparation that complements their daily routine, and that provides the right dose of drug for the right indication and route of administration. When dispensing liquid preparations, a
sugar-free preparation should always be used in preference to one containing sugar. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries.

In earlier editions, the BNF only included excipients and electrolyte information for proprietary medicines. This information is now covered at the level of the dose form (e.g. tablet). It is not possible to keep abreast of all of the generic products available on the UK market, and so this information serves as a reminder to the healthcare professional that, if the presence of a particular excipient is of concern, they should check the product literature for the particular product being prescribed or dispensed.

Cautionary and advisory labels that pharmacists are recommended to add when dispensing are included in the medicinal forms section. Details of these labels can be found in Appendix 3, Guidance for cautionary and advisory labels p. 1454. As these labels have now been applied at the level of the dose form, a full list of medicinal products with their relevant labels would be extensive. This list has therefore been removed, but the information is retained within the monograph.

In the case of compound preparations, the prescribing information for all constituents should be taken into account.

**Prices in the BNF**

Basic NHS net prices are given in the BNF to provide an indication of relative cost. Where there is a choice of suitable preparations for a particular disease or condition the relative cost may be used in making a selection. Cost-effective prescribing must, however, take into account other factors (such as dose frequency and duration of treatment) that affect the total cost. The use of more expensive drugs is justified if it will result in better treatment of the patient, or a reduction of the length of an illness, or the time spent in hospital.

Prices are regularly updated using the Drug Tariff and proprietary price information published by the NHS dictionary of medicines and devices (dm+d, www.dmd.nhs.uk). The weekly updated dm+d data (including prices) can be accessed using the dm+d browser of the NHS Business Services Authority (apps.nhsbsa.nhs.uk/DMDBrowser). Prices have been calculated from the net cost used in pricing NHS prescriptions and generally reflect whole dispensing packs. Prices for extemporaneously prepared preparations are not provided in the BNF as prices vary between different manufacturers. In Appendix 4, prices stated are per dressing or bandage.

BNF prices are not suitable for quoting to patients seeking net prices (e.g. metropolan tartrate p. 149). Within this flag, the page number of the drug class monograph is provided (e.g. 1234), to help navigate the user to this information. This is particularly useful where occasionally, due to differences in therapeutic use, the drug monograph may not directly follow the drug class monograph (e.g. sotalol hydrochloride p. 105).

**Evidence grading**

The BNF has adopted a five level evidence grading system (see How BNF Publications are constructed p. ix). Recommendations that are evidence graded can be identified by a symbol appearing immediately before the recommendation. The evidence grade is displayed at the end of the recommendation.

**Other content**

**Nutrition**

Appendix 2, Borderline substances p. 1420, includes tables of ACBS-approved enteral feeds and nutritional supplements based on their energy and protein content. There are separate tables for specialised formulae for specific clinical conditions. Classified sections on foods for special diets and nutritional supplements for metabolic diseases are also included.

**Wound dressings**

A table on wound dressings in Appendix 4, Wound management products and elasticated garments p. 1457, allows an appropriate dressing to be selected based on the appearance and condition of the wound. Further information about the dressing can be found by following the cross-reference to the relevant classified section in the Appendix. Advanced wound contact dressings have been classified in order of increasing absorbency.

**Other useful information**

**Finding significant changes in the BNF**

- **Changes**, provides a list of significant changes, dose changes, classification changes, new names, and new preparations that have been incorporated into the BNF, as well as a list of preparations that have been discontinued and removed from the BNF. Changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoir for those using print copies. So many changes are made for each update of the BNF, that not all of them can be accommodated in the Changes section. We encourage healthcare professionals to regularly review the prescribing information on drugs that they encounter frequently;

- **Changes to the Dental Practitioners’ Formulary**, are located at the end of the Dental List;

- **E-newsletter**, the BNF & BNFC e-newsletter service is available free of charge. It alerts healthcare professionals to details of significant changes in the clinical content of these publications and to the way that this information is delivered. Newsletters also review clinical case studies, provide tips on using these publications effectively, and highlight forthcoming changes to the publications. To sign up for e-newsletters go to www.bnf.org.

- An e-learning programme developed in collaboration with the Centre for Pharmacy Postgraduate Education (CPPE), enables pharmacists to identify and assess how significant changes in the BNF affect their clinical practice. The module can be found at www.cppe.ac.uk.

**Using other sources for medicines information**

The BNF is designed as a digest for rapid reference. Less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to
specialist literature. *BNF for Children* should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services.
Changes

Monthly updates are provided online via MedicinesComplete and the NHS Evidence portal. The changes listed below are cumulative (from one print edition to the next).

**Significant changes**

Significant changes that appear in the print edition of BNF 74 (September 2017–March 2018):

- Acetylcysteine p. 1065 for paracetamol overdose [MHRA advice].
- Adalimumab p. 1008 for treating moderate-to-severe hidradenitis suppurativa [NICE guidance].
- Affibirecept p. 921 for treating visual impairment caused by macular oedema after branch retinal vein occlusion [NICE guidance].
- Antibacterials, principles of therapy p. 479: new guidance on early management of sepsis.
- Apremilast p. 1018 for treating moderate to severe plaque psoriasis [NICE guidance].
- Apremilast p. 1018 for treating active psoriatic arthritis [NICE guidance].
- Brimonidine tartrate p. 1086 gel (Mirvaso®): risk of exacerbation of rosacea [MHRA/CHM advice].
- Canagliflozin p. 661: increased risk of lower-limb amputation (mainly toes) [MHRA/CHM advice].
- Canagliflozin p. 661, dapagliflozin p. 662 or empagliflozin p. 664: risk of diabetic ketoacidosis [MHRA/CHM advice].
- Certolizumab pegol p. 1011 for treating rheumatoid arthritis after inadequate response to a TNF-alpha inhibitor [NICE guidance].
- Cholestasis p. 85: updated guidance on management.
- Cobimetinib p. 895 in combination with vemurafenib p. 917 for treating unresectable or metastatic BRAF V600 mutation-positive melanoma [NICE guidance].
- Constipation p. 51: updated guidance on management.
- Contraceptive, interactions p. 747: updated guidance.
- Crizotinib p. 896 for previously treated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer [NICE guidance update].
- Crizotinib p. 896 for untreated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer [NICE guidance].
- Crohn’s disease p. 36: updated guidance on management.

- Epilepsy p. 292: updated guidance on epilepsy and driving.
- Erectile dysfunction p. 765: updated guidance on management.
- Eribulin p. 862 for treating locally advanced or metastatic breast cancer after 2 or more chemotherapy regimens [NICE guidance].
- Everolimus p. 900 with exemestane p. 880 for treating advanced breast cancer after endocrine therapy [NICE guidance].
- Everolimus p. 900 for advanced renal cell carcinoma after previous treatment [NICE guidance].
- Evolocumab p. 200 for treating primary hypercholesterolaemia and mixed dyslipidaemia [NICE guidance].
- Fingolimod p. 802: signal of rebound effect after stopping or switching therapy [MHRA/CHM advice].
- Finasteride p. 742: rare reports of depression and suicidal thoughts [MHRA/CHM advice].
- Food allergy p. 82: updated guidance on management.
- Gallstones p. 85: updated guidance on management.
- Haemorrhoids p. 89: new guidance on management.
- Hyoscine butylbromide p. 83 (Buscopan®) injection: risk of serious adverse effects in patients with underlying cardiac disease [MHRA/CHM advice].
- Ibrutinib p. 902 for previously treated chronic lymphocytic leukaemia and untreated chronic lymphocytic leukaemia with 17p deletion or TP53 mutation [NICE guidance].
- Imatinib p. 904 for chronic myeloid leukaemia [updated NICE guidance].
- Low back pain and sciatica p. 1028: new guidance on management.
- Pegylated liposomal irinotecan hydrochloride p. 856 for treating pancreatic cancer after gemcitabine [NICE guidance].
- Inborn errors of primary bile acid synthesis p. 85: updated guidance on management.
- Mepolizumab p. 256 for treating severe refractory eosinophilic asthma [NICE guidance].
- Motor neurone disease p. 385: new guidance on management.
- Multiple sclerosis p. 797: new guidance on management.
- Necitumumab p. 812 for untreated advanced or metastatic squamous non-small-cell lung cancer [NICE guidance].
- Nivolumab p. 813 for previously treated advanced renal cell carcinoma [NICE guidance].
- Osimertinib p. 908 for treating locally advanced or metastatic EGFR T790M mutation-positive non-small-cell lung cancer [NICE guidance].
- Pegaspargase p. 865 for treating acute lymphoblastic leukaemia [NICE guidance].
- Pembrolizumab p. 816 for treating PD-L1-positive non-small-cell lung cancer after chemotherapy [NICE guidance].
- Pertuzumab p. 817 for the neoadjuvant treatment of HER2-positive breast cancer [NICE guidance].
- Pomalidomide p. 886 for multiple myeloma previously treated with lenalidomide and bortezomib [NICE guidance].
- Ponatinib p. 911: risk of vascular occlusive events—updated advice on possible dose reduction [MHRA/CHM advice].
- Primary biliary cholangitis p. 86: updated guidance on management.
- Secukinumab p. 1004 for active ankylosing spondylitis after treatment with non-steroidal anti-inflammatory drugs or TNF-alpha inhibitors [NICE guidance].
- Sodium valproate p. 312: resources to support the safety of girls and women who are being treated with valproate [NHS improvement patient safety alert].
● Direct-acting antiviral interferon-free regimens to treat chronic hepatitis C: risk of hepatitis B reactivation [MHRA/CHM advice], see sofosbuvir p. 595.
● Sofosbuvir with velpatavir p. 596 for treating chronic hepatitis C [NICE guidance].
● Talimogene laherparepvec p. 881 for treating unresectable metastatic melanoma [NICE guidance].
● Ticagrelor p. 208 for preventing atherothrombotic events after myocardial infarction [NICE guidance].
● Trametinib p. 915 in combination with dabrafenib p. 897 for treating unresectable or metastatic melanoma [NICE guidance].
● Trametinib p. 915: risk of gastrointestinal perforation and colitis [MHRA/CHM advice].
● Direct-acting antivirals to treat chronic hepatitis C: risk of interaction with vitamin K antagonists and changes in INR [MHRA/CHM advice], see sofosbuvir p. 595.
● Tuberculosis p. 546: updated guidance on management.
● Ulcerative colitis p. 37: updated guidance on management.
● Urinary retention p. 736: updated guidance on management.
● Valproic acid p. 337: resources to support the safety of girls and women who are being treated with valproate [NHS improvement patient safety alert].

Dose changes
Changes in dose statements that appear in the print edition of BNF 74 (September 2017–March 2018):
● Atorvastatin p. 196 fluvastatin p. 196 simvastatin p. 198 [with concomitant elbasvir with grazoprevir]; rosuvastatin p. 197 [with concomitant elbasvir with grazoprevir or with concomitant sofosbuvir with velpatavir].
● Bicalutamide p. 874: prostate cancer (metastatic) with the aim of retaining sexual function [unlicensed use].
● Fenofibrate p. 193 [dose in renal impairment].
● Lansoprazole p. 77: severe oesophagitis, refractory to initial treatment [unlicensed use].
● Lithium citrate p. 341 [Li-Liquid®].
● Medroxyprogesterone acetate p. 763: hot flushes caused by long-term androgen suppression in men with prostate cancer [unlicensed use].
● Nystatin p. 1116
● Pantoprazole p. 79: severe oesophagitis, refractory to initial treatment [unlicensed use].
● Phytoxy p. 308 [rate of intravenous administration in adults].
● Rabeprazole sodium p. 80: severe oesophagitis, refractory to initial treatment [unlicensed use].
● Tranexamic acid p. 107: prevention and treatment of significant haemorrhage following trauma [unlicensed use].

Classification changes
Classification changes that appear in the print edition of BNF 74 (September 2017–March 2018):

New names
Name changes that appear in the print edition of BNF 74 (September 2017–March 2018):

Deleted preparations
Preparations discontinued in the print edition of BNF 74 (September 2017–March 2018):
● Incivo® [telaprevir].
● Vikrius® [boceprevir].
● Trobalt® [retigabin].
● Prempak-C® [conjugated oestrogens with norgestrel].

New preparations
New preparations that appear in the print edition of BNF 74 (September 2017–March 2018):
● Adasuve® [loxapine p. 370].
● AirFluSal Forspiro® [fluticasone with salmeterol p. 255].
● Amsidine® [amsacrine p. 860].
● Benepali® [etanercept p. 1012].
● Blincyto® [blinatumomab p. 809].
● Bupepe® [buprenorphine p. 425].
● Buplast® [buprenorphine p. 425].
● Butec® [buprenorphine p. 425].
● Catephyn® [camellia sinensis p. 1179].
● Cilodex® [dexamethasone with ciprofloxacin p. 1096].
● Cingaero® [resizumab p. 257].
● Cleveryrex® [clevidipine p. 151].
● Coteflo® [cobimetinib p. 895].
● Cortint® [budesonide p. 43].
● Dazaralex® [daratumumab p. 811].
● Delmosart® [modified release tablet [methylphenidate hydrochloride p. 331]]
● Descovy® [emricitabine with tenofovir alafenamide p. 615].
● Duavive® [conjugated oestrogens with bazedoxifene acetate p. 711].
● Emlipirci® [elotuzumab p. 811].
● Ensitil® [calcioprotet with benzamethasone p. 1141].
● Eplusa® [sofosbuvir with velpatavir p. 596].
● Evotax® [etatanaivir with cobicistat p. 618].
● Exjade® [film-coated tablets [deferasirox p. 939].
● Feracaura® [ferric maltol p. 933].
● Fiasp® [insulin aspart p. 673].
● Fluomizin® [dexamethasone chloride p. 780].
● Genvoya® [elvetigavir with cobicistat, emricitabine and tenofovir alafenamide p. 613].
● Ibrance® [palbociclib p. 909].
● Imlyctic® [talimogene laherparepvec p. 881].
● Invicorp® [aviparatid with phenolamine mesilate p. 772].
● Kyrotil® [carfilzomib p. 890].
● Kyplyx® [lenalidomib p. 906].
● Lenvima® [lenvatinib p. 906].
● Lonsaur® [trifluridine with tipiracil p. 848].
● Lutjes® [progesterone p. 721].
● Mekinisi® [trameitinib p. 915].
● Nucala® [mepolizumab p. 256].
● Ninlaro® [ixazomicin p. 891].
● Noqdir® [desmopressin p. 628].
● Odfev® [emricitabine with rilpivirine and tenofovir alafenamide p. 614].
● Oncaspar® [pegaspargase p. 865].
● Ongents® [opicapone p. 393].
● Onixysde® [irinotecan hydrochloride p. 856].
● Panitax® [buprenorphine p. 425].
● Portrazza® [necitumumab p. 812].
● Praxbind® [idarucizumab p. 116].
● Prenotrix® [buprenorphine p. 425].
● Raxone® [idebenone p. 1091].
● Reletrans® [buprenorphine p. 425].
● Relevtec® [buprenorphine p. 425].
● Repathia® [evolocumab p. 200].
● Reolosta® [darunavir with cobicistat p. 619].
● Sevodone® [buprenorphine p. 425].
● Sereflo® [fluticasone with salmeterol p. 255].
● Soolantra® [ivermectin p. 571].
● Spectral® [asparaginase p. 861].
● Taltz® [ixekizumab p. 1155].
● Tagrisso® [osimertinib p. 908].
● Translarra® [ataluren p. 1024].
● Uptravi® [slexiopag p. 178].
● Venclyxo® [venetoclax p. 919].
● Votubia® [dispersible tablets [everolimus p. 900].
● Wakix® [pitolisant p. 467].
● Xadago® [safinamide p. 407].
● Zalviso® [sufentanil p. 446].
● Zepatier® [elbasvir with grazoprevir p. 591].
● Zerbaxa® [ceftolozane with tazobactam p. 502].
● Zinbryta® [dalcizumab p. 803].
Guidance on prescribing

General guidance
Medicines should be prescribed only when they are necessary, and in all cases the benefit of administering the medicine should be considered in relation to the risk involved. This is particularly important during pregnancy, when the risk to both mother and fetus must be considered. It is important to discuss treatment options carefully with the patient to ensure that the patient is content to take the medicine as prescribed. In particular, the patient should be helped to distinguish the adverse effects of prescribed drugs from the effects of the medical disorder. When the beneficial effects of the medicine are likely to be delayed, the patient should be advised of this.

Prescribing competency framework
The Royal Pharmaceutical Society has published a Prescribing Competency Framework that includes a common set of competencies that form the basis for prescribing, regardless of professional background. The competencies have been developed to help healthcare professionals to be safe and effective prescribers, with the aim of supporting patients to get the best outcomes from their medicines. It is available at www.rpharms.com/resources/frameworks/prescribers-competency-framework.

Multimorbidity
The presence of two or more long-term health conditions in a patient (multimorbidity) is associated with reduced quality of life, higher mortality, higher rates of adverse drug reactions, greater use of the health service, and a higher treatment burden (due to polypharmacy or multiple appointments). Treatment decisions in these patients should involve consideration of the patient’s needs, preferences for treatment, health priorities, and lifestyle with the aim of improving quality of life by reducing treatment burden, adverse events, and unplanned or uncoordinated care.

Prescribing in patients with multimorbidity
Prescribers should consider the risks and benefits of treatments recommended for patients with multimorbidity from guidance for single health conditions; evidence for these recommendations is commonly drawn from patients without multimorbidity or who are taking fewer prescribed regular medicines.

Treatments intended to relieve symptoms should be reviewed for effectiveness, including reducing or stopping the treatment and monitoring the effects. Alternatively, non-pharmacological treatments may be offered or treatments of limited benefit can be considered for discontinuation. Risks factors for future disease can be a major treatment burden for patients with multimorbidity and is not always appropriate.

Deprescribing
Deprescribing is the process of discontinuing or reducing the dose of medicines, supervised by a healthcare professional, with the aim of managing polypharmacy and improving outcomes. Deprescribing requires careful counselling and shared decision-making with patients, and is considered part of routine clinical care.

Taking medicines to best effect
Difficulties in adherence to drug treatment occur regardless of age. Factors contributing to poor compliance with prescribed medicines include:

- perceived lack of efficacy;
- real or perceived adverse effects;
- patients’ perception of the risk and severity of side-effects may differ from that of the prescriber;
- instructions for administration not clear;
- physical difficulty in taking medicines (e.g. swallowing the medicine, handling small tablets, or opening medicine containers);
- unattractive formulation (e.g. unpleasant taste);
- complicated regimen.

The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them (’concordance’). The prescriber should be sensitive to religious, cultural, and personal beliefs that can affect a patient’s acceptance of medicines.

Taking the time to explain to the patient (and relatives) the rationale and the potential adverse effects of treatment may improve adherence. Reinforcement and elaboration of the physician’s instructions by the pharmacist and other members of the healthcare team also helps. Advising the patient of the possibility of alternative treatments may encourage the patient to seek advice rather than merely abandon unacceptable treatment.

Simplifying the drug regimen may help; the need for frequent administration may reduce adherence, although there appears to be little difference in adherence between once-daily and twice-daily administration. Combination products reduce the number of drugs taken but at the expense of the ability to titrate individual doses.

Biological medicines
Biological medicines are medicines that are made by or derived from a biological source using biotechnology processes, such as recombinant DNA technology. The size and complexity of biological medicines, as well as the way they are produced, may result in a degree of natural variability in molecules of the same active substance, particularly in different batches of the medicine. This variation is maintained within strict acceptable limits. Examples of biological medicines include insulins and monoclonal antibodies. Biological medicines must be prescribed by brand name and the brand name specified on the prescription should be dispensed in order to avoid inadvertent switching. Automatic substitution of brands at the point of dispensing is not appropriate for biological medicines.

Biosimilar medicines
A biosimilar medicine is a biological medicine that is highly similar and clinically equivalent (in terms of quality, safety, and efficacy) to an existing biological medicine that has already been authorised in the European Union (known as the reference biological medicine or originator medicine). The active substance of a biosimilar medicine is similar, but not identical, to the originator biological medicine. Once the patent for a biological medicine has expired, a biosimilar medicine may be authorised by the European Medicines Agency (EMA). A biosimilar medicine is not the same as a generic medicine, which contains a simpler molecular structure that is identical to the originator medicine.

Therapeutic equivalence
Biosimilar medicines should be considered to be therapeutically equivalent to the originator biological medicine within their authorised indications. Biosimilar medicines are usually licensed for all the indications of the originator biological medicine, but this depends on the evidence submitted to the EMA for...
**Guidance on prescribing**

**Prescribing and dispensing** The choice of whether to prescribe a biosimilar medicine or the originator biological medicine rests with the clinician in consultation with the patient. Biological medicines (including biosimilar medicines) must be prescribed by brand name and the brand name specified on the prescription should be dispensed in order to avoid inadvertent switching. Automatic substitution of brands at the point of dispensing is not appropriate for biological medicines.

**Safety monitoring** Biosimilar medicines are subject to a black triangle status at the time of initial authorisation. It is important to report suspected adverse reactions using the Yellow Card Scheme (see Adverse reactions to drugs p. 12). For all biological medicines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine. UK Medicines Information centres have developed a validated tool to determine potential safety issues associated with all new medicines. These ‘in-use product safety assessment reports’ will be published for new biosimilar medicines as they become available, see www.ukmhi.nhs.uk/activities/patientSafety/default.asp?pageRef=20.

**National funding/access decisions** The Department of Health has confirmed that, in England, NICE can decide to apply the same remit, and the resulting technology appraisal guidance, to relevant biosimilar medicines which appear on the market subsequent to their originator biological medicine. In other circumstances, where a review of the evidence for a particular biosimilar medicine is necessary, NICE will consider producing an evidence summary: 

**Marketing authorisation and BNF advice** In general the *doses, indications, cautions, contra-indications, and side-effects* in the BNF reflect those in the manufacturers’ data sheets or Summaries of Product Characteristics (SPCs) which, in turn, reflect those in the corresponding marketing authorisations (formerly known as Product Licences). The BNF does not generally include proprietary medicines that are not supported by a valid Summary of Product Characteristics or when the marketing authorisation holder has not been able to supply essential information. When a preparation is available from more than one manufacturer, the BNF reflects advice that is the most clinically relevant regardless of any variation in the marketing authorisations. Unlicensed products can be obtained from ‘special-order’ manufacturers or specialist importing companies.

**Non-proprietary titles** Where non-proprietary (‘generic’) titles are given, they should be used in prescribing. This will enable any suitable product to be dispensed, thereby saving delay to the patient and sometimes expense to the health service. The only exception is where there is a demonstrable difference in clinical effect between each manufacturer’s version of the formulation, making it important that the patient should always receive the same brand; in such cases, the brand name or the manufacturer should be stated. Non-proprietary titles should not be invented for the purposes of prescribing generically since this can lead to confusion, particularly in the case of compound and modified-release preparations.

**Proprietary titles** Names followed by the symbol® are or have been used as proprietary names in the United Kingdom. These names may in general be applied only to products supplied by the owners of the trade marks.

**Availability** The following drugs are available as a biosimilar medicine:

- Epoetin alfa p. 925
- Epoetin zeta p. 928
- Etanercept p. 1012
- Filgrastim p. 942
- Filgrastim alfa p. 702
- Infliximab p. 1016
- Insulin glargine p. 672
- Somatropin p. 705

**Complementary and alternative medicine** An increasing amount of information on complementary and alternative medicine is becoming available. The scope of the BNF is restricted to the discussion of conventional medicines but reference is made to complementary treatments if they affect conventional therapy (e.g. interactions with St John’s wort). Further information on herbal medicines is available at www.mhra.gov.uk.

**Abbreviation of titles** In general, titles of drugs and preparations should be written in full. Unofficial abbreviations should not be used as they may be misinterpreted.
may also be available). It is provided with an adaptor and an instruction leaflet. The 5–mL spoon is used for doses of 5 mL (or multiples thereof).

**Important** To avoid inadvertent intravenous administration of oral liquid medicines, only an appropriate oral or enteral syringe should be used to measure an oral liquid medicine (if a medicine spoon or graduated measure cannot be used); these syringes should not be compatible with intravenous or other parenteral devices. Oral or enteral syringes should be clearly labelled ‘Oral’ or ‘Enteral’ in a large font size; it is the healthcare practitioner’s responsibility to label the syringe with this information if the manufacturer has not done so.

**Excipients**

Branded oral liquid preparations that do not contain fructose, glucose, or sucrose are described as ‘sugar-free’ in the BNF. Preparations containing hydrogenated glucose syrup, mannitol, maltitol, sorbitol, or xylitol are also marked ‘sugar-free’ since there is evidence that they do not cause dental caries. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries. Sugar-free preparations should be used whenever possible.

Where information on the presence of aspartame, gluten, sulfites, tartrazine, arachis (peanut) oil or sesame oil is available, this is indicated in the BNF against the relevant preparation.

Information is provided on selected excipients in skin preparations, in vaccines, and on selected preservatives and excipients in eye drops and injections. The presence of benzyl alcohol and polyoxyl castor oil (polyethoxylated castor oil) in injections is indicated in the BNF. Benzyl alcohol has been associated with a fatal toxic syndrome in preterm neonates, and therefore, parenteral preparations containing the preservative should not be used in neonates. Polyoxyl castor oils, used as vehicles in intravenous injections, have been associated with severe anaphylactoid reactions.

The presence of propylene glycol in oral or parenteral medicines is indicated in the BNF; it can cause adverse effects if its elimination is impaired, e.g. in renal failure, in neonates and young children, and in slow metabolisers of the substance. It may interact with disulfiram p. 471 and metronidazole p. 512. The lactose content in most medicines is too small to cause problems in most lactose-intolerant patients. However in severe lactose intolerance, the lactose content should be determined before prescribing. The amount of lactose varies according to manufacturer, product, formulation, and strength.

**Important** In the absence of information on excipients in the BNF and in the product literature (available at www.medicines.org.uk/emc), contact the manufacturer (see Index of Proprietary Manufacturers) if it is essential to check details.

**Extemporaneous preparation**

A product should be dispensed extemporaneously only when no product with a marketing authorisation is available. The BP direction that a preparation must be freshly prepared indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be recently prepared indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15–25°C.

The term water used without qualification means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled purified water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation (Water for injections).

**Drugs and driving**

Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

A new offence of driving, attempting to drive, or being in charge of a vehicle, with certain specified controlled drugs in excess of specified limits, came into force on 2nd March 2015. This offence is in addition to the existing rules on drug impaired driving and fitness to drive, and applies to two groups of drugs—commonly abused drugs, including amfetamines, cannabis, cocaine, and ketamine p. 1234, and drugs used mainly for medical reasons, such as opioids and benzodiazepines. Anyone found to have any of the drugs (including related drugs, for example, apomorphine hydrochloride p. 398) above specified limits in their blood will be guilty of an offence, whether their driving was impaired or not. This also includes prescribed drugs which metabolise to those included in the offence, for example, selegiline hydrochloride p. 407. However, the legislation provides a statutory “medical defence” for patients taking drugs for medical reasons in accordance with instructions, if their driving was not impaired—it continues to be an offence to drive if actually impaired. Patients should therefore be advised to continue taking their medicines as prescribed, and when driving, to carry suitable evidence that the drug was prescribed, or sold, to treat a medical or dental problem, and that it was taken according to the instructions given by the prescriber, or information provided with the medicine (e.g. a repeat prescription form or the medicine’s patient information leaflet). Further information is available from the Department for Transport at www.gov.uk/government/collections/drug-driving.

**Patents**

In the BNF, certain drugs have been included notwithstanding the existence of actual or potential patent rights. In so far as such substances are protected by Letters Patent, their inclusion in this Formulary neither conveys, nor implies, licence to manufacture.

**Health and safety**

When handling chemical or biological materials particular attention should be given to the possibility of allergy, fire, explosion, radiation, or poisoning. Substances such as corticosteroids, some antimicrobials, phenothiazines, and many cytotoxics, are irritant or very potent and should be handled with caution. Contact with the skin and inhalation of dust should be avoided.

**Safety in the home**

Patients must be warned to keep all medicines out of the reach of children. All solid dose and all oral and external liquid preparations must be dispensed in a reclosable child-resistant container unless:

- the medicine is in an original pack or patient pack such as to make this inadvisable;
- the patient will have difficulty in opening a child-resistant container;
- a specific request is made that the product shall not be dispensed in a child-resistant container;
- no suitable child-resistant container exists for a particular liquid preparation.

All patients should be advised to dispose of unwanted medicines by returning them to a supplier for destruction.
Labelling of prescribed medicines
There is a legal requirement for the following to appear on the label of any prescribed medicine:
- name of the patient;
- name and address of the supplying pharmacy;
- date of dispensing;
- name of the medicine;
- directions for use of the medicine;
- precautions relating to the use of the medicine.

The Royal Pharmaceutical Society recommends that the following also appears on the label:
- the words ‘Keep out of the sight and reach of children’;
- where applicable, the words ‘Use this medicine only on your skin’.

A pharmacist can exercise professional skill and judgement to amend or include more appropriate wording for the name of the medicine, the directions for use, or the precautions relating to the use of the medicine.

Non-proprietary names of compound preparations
Non-proprietary names of compound preparations which appear in the BNF are those that have been compiled by the British Pharmacopoeia Commission or another recognised body; whenever possible they reflect the names of the active ingredients.

Prescribers should avoid creating their own compound names for the purposes of generic prescribing; such names do not have an approved definition and can be misinterpreted.

Special care should be taken to avoid errors when prescribing compound preparations; in particular the hyphen ‘co-’ should be retained.

Special care should also be taken to avoid creating generic names for modified-release preparations where the use of these names could lead to confusion between formulations with different lengths of action.

EEA and Swiss prescriptions
Pharmacists can dispense prescriptions issued by doctors and dentists from the European Economic Area (EEA) or Switzerland (except prescriptions for controlled drugs in Schedules 1, 2, or 3, or for drugs without a UK marketing authorisation). Prescriptions should be written in ink or otherwise so as to be indelible, should be dated, should state the name of the patient, should state the address of the prescriber, should contain particulars indicating whether the prescriber is a doctor or dentist, and should be signed by the prescriber.

Security and validity of prescriptions
The Councils of the British Medical Association and the Royal Pharmaceutical Society have issued a joint statement on the security and validity of prescriptions.

In particular, prescription forms should:
- not be left unattended at reception desks;
- not be left in a car where they may be visible; and
- when not in use, be kept in a locked drawer within the surgery and at home.

Where there is any doubt about the authenticity of a prescription, the pharmacist should contact the prescriber. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

Patient group direction (PGD)
In most cases, the most appropriate clinical care will be provided on an individual basis by a prescriber to a specific individual patient. However, a Patient Group Direction for supply and administration of medicines by other healthcare professionals can be used where it would benefit patient care without compromising safety.

A Patient Group Direction is a written direction relating to the supply and administration (or administration only) of a licensed prescription-only medicine (including some Controlled Drugs in specific circumstances) by certain classes of healthcare professionals; the Direction is signed by a doctor (or dentist) and by a pharmacist. Further information on Patient Group Directions is available in Health Service Circular HSC 2000/026 (England), HDL (2001) 7 (Scotland), and WHC (2000) 116 (Wales); see also the Human Medicines Regulations 2012.

NICE, Scottish Medicines Consortium and All Wales Medicines Strategy Group
Advice issued by the National Institute for Health and Care Excellence (NICE), the Scottish Medicines Consortium (SMC) and the All Wales Medicines Strategy Group (AWMSG) is included in the BNF when relevant. Details of the advice together with updates can be obtained from: www.nice.org.uk, www.scottishmedicines.org.uk and www.awmsg.org.
Shared care

In its guidelines on responsibility for prescribing (circular EL (91) 127) between hospitals and general practitioners, the Department of Health has advised that legal responsibility for prescribing lies with the doctor who signs the prescription.

Requirements

Prescriptions should be written legibly in ink or otherwise so as to be indelible (it is permissible to issue carbon copies of NHS prescriptions as long as they are signed in ink), should be dated, should state the name and address of the patient, the address of the prescriber, an indication of the type of prescriber, and should be signed in ink by the prescriber (computer-generated facsimile signatures do not meet the legal requirement). The age and the date of birth of the patient should preferably be stated, and it is a legal requirement. The age and the date of birth of the patient should preferably be stated, and it is a legal requirement in the case of prescription-only medicines to state the age for children under 12 years. These recommendations are acceptable for prescription-only medicines. Prescriptions for controlled drugs have additional legal requirements.

Wherever appropriate the prescriber should state the current weight of the child to enable the dose prescribed to be checked. Consideration should also be given to including the dose per unit mass e.g. mg/kg or the dose per m² body-surface area e.g. mg /m² where this would reduce error. The following should be noted:

- The strength or quantity to be contained in capsules, lozenges, tablets etc. should be stated by the prescriber. In particular, strength of liquid preparations should be clearly stated (e.g. 125 mg/5 mL).
- The unnecessary use of decimal points should be avoided, e.g. 3 mg, not 3.0 mg. Quantities of 1 gram or more should be written as 1 g etc. Quantities less than 1 gram should be written in milligrams, e.g. 500 mg, not 0.5 g. Quantities less than 1 mg should be written in micrograms, e.g. 100 micrograms, not 0.1 mg. When decimals are unavoidable a zero should be written in front of the decimal point where there is no other figure, e.g. 0.5 mL, not 5 mL. Use of the decimal point is acceptable to express a range, e.g. 0.5 to 1 g.
- ‘Micrograms’ and ‘nanograms’ should not be abbreviated. Similarly ‘units’ should not be abbreviated.
- The term ‘millilitre’ (mL or mL) is used in medicine and pharmacy, and cubic centimetre, c.c., or cm³ should not be used. (The use of capital ‘L’ in mL is a printing convention throughout the BNF; both ‘mL’ and ‘ml’ are recognised SI abbreviations).
- Dose and dose frequency should be stated; in the case of preparations to be taken ‘as required’ a minimum dose interval should be specified. Care should be taken to ensure children receive the correct dose of the active drug. Therefore, the dose should normally be stated in terms of the mass of the active drug (e.g. ‘125 mg 3 times daily’); terms such as ‘5 mL’ or ‘1 tablet’ should be avoided except for compound preparations. When doses other than multiples of 5 mL are prescribed for oral liquid preparations the dose-volume will be provided by means of an oral syringe, (except for preparations intended to be measured with a pipette). Suitable quantities:
  - Elixirs, Linctuses, and Paediatric Mixtures (5-mL dose), 50, 100, or 150 mL
  - Adult Mixtures (10-mL dose), 200 or 300 mL
  - Ear Drops, Eye drops, and Nasal Drops, 10 mL (or the manufacturer’s pack)
  - Eye Lotions, Gargles, and Mouthwashes, 200 mL
- The names of drugs and preparations should be written clearly and not abbreviated, using approved titles only; avoid creating generic titles for modified-release preparations.
- The quantity to be supplied may be stated by indicating the number of days of treatment required in the box provided on NHS forms. In most cases the exact amount will be supplied. This does not apply to items directed to be used as required—if the dose and frequency are not given then the quantity to be supplied needs to be stated. When several items are ordered on one form the box can be marked with the number of days of treatment provided the quantity is added for any item for which the amount cannot be calculated.
- Although directions should preferably be in English without abbreviation, it is recognised that some Latin abbreviations are used.

Sample prescription

Prescribing by dentists

Until new prescribing arrangements are in place for NHS prescriptions, dentists should use form FP10D (GP14 in Scotland, WP10D in Wales) to prescribe only those items listed in the Dental Practitioners’ Formulary. The Human Medicines Regulations 2012 does not set any limitations upon the number and variety of substances which the dentist may administer to patients in the surgery or may order by private prescription—provided the relevant legal requirements are observed the dentist may use or order whatever is required for the clinical situation. There is no statutory requirement for the dentist to communicate with a patient’s medical practitioner when prescribing for dental use. There are, however, occasions when this would be in the patient’s interest and such communication is to be encouraged. For legal requirements relating to prescriptions
of Controlled Drugs, see Controlled drugs and drug dependence p. 8.

Computer-issued prescriptions

For computer-issued prescriptions the following advice, based on the recommendations of the Joint GP Information Technology Committee, should also be noted:

1. The computer must print out the date, the patient’s surname, one forename, other initials, and address, and may also print out the patient’s title and date of birth. The age of children under 12 years and of adults over 60 years must be printed in the box available; the age of children under 5 years should be printed in years and months. A facility may also exist to print out the age of patients between 12 and 60 years.

2. The doctor’s name must be printed at the bottom of the prescription form; this will be the name of the doctor responsible for the prescription (who will normally sign it). The doctor’s surgery address, reference number, and Primary Care Trust (PCT, Health Board in Scotland, Local Health Board in Wales) are also necessary. In addition, the surgery telephone number should be printed.

3. When prescriptions are to be signed by general practitioner registrars, assistants, locums, or deputising doctors, the name of the doctor printed at the bottom of the form must still be that of the responsible principal.

4. Names of medicines must come from a dictionary held in the computer memory, to provide a check on the spelling and to ensure that the name is written in full. The computer can be programmed to recognise both the non-proprietary and the proprietary name of a particular drug and to print out the preferred choice, but must not print out both names. For medicines not in the dictionary, separate checks are required—the user must be warned that no check was possible and the entire prescription must be entered in the lexicon.

5. The dictionary may contain information on the usual doses, formulations, and pack sizes to produce standard predetermined prescriptions for common preparations, and to provide a check on the validity of an individual prescription on entry.

6. The prescription must be printed in English without abbreviation; information may be entered or stored in abbreviated form. The dose must be in numbers, the frequency in words, and the quantity in numbers in brackets, thus: 40 mg four times daily (112). It must also be possible to prescribe by indicating the length of treatment required.

7. The BNF recommendations should be followed as listed above.

8. Checks may be incorporated to ensure that all the information required for dispensing a particular drug has been filled in. For instructions such as ‘as directed’ and ‘when required’, the maximum daily dose should normally be specified.

9. Numbers and codes used in the system for organising and retrieving data must never appear on the form.

10. Supplementary warnings or advice should be written in full, should not interfere with the clarity of the prescription itself, and should be in line with any warnings or advice in the BNF; numerical codes should not be used.

11. A mechanism (such as printing a series of nonspecific characters) should be incorporated to cancel out unused space, or wording such as ‘no more items on this prescription’ may be added after the last item. Otherwise the doctor should delete the space manually.

12. To avoid forgery the computer may print on the form the number of items to be dispensed (somewhere separate from the box for the pharmacist). The number

13. Handwritten alterations should only be made in exceptional circumstances—it is preferable to print out a new prescription. Any alterations must be made in the doctor’s own handwriting and countersigned; computer records should be updated to fully reflect any alteration. Prescriptions for drugs used for contraceptive purposes (but which are not promoted as contraceptives) may need to be marked in handwriting with the symbol ‘C’ (or endorsed in another way to indicate that the item is prescribed for contraceptive purposes).

14. Prescriptions for controlled drugs can be printed from the computer, but the prescriber’s signature must be handwritten (See Controlled Drugs and Drug Dependence; the prescriber may use a date stamp).

15. The strip of paper on the side of the FP10SS (GP10SS in Scotland, WP10SS in Wales) may be used for various purposes but care should be taken to avoid including confidential information. It may be advisable for the patient’s name to appear at the top, but this should be preceded by ‘confidential’.

16. In rural dispensing practices prescription requests (or details of medicines dispensed) will normally be entered in one surgery. The prescriptions (or dispensed medicines) may then need to be delivered to another surgery or location; if possible the computer should hold up to 10 alternatives.

17. Prescription forms that are reprinted or issued as a duplicate should be labelled clearly as such.
Emergency supply of medicines

Emergency supply requested by member of the public
Pharmacists are sometimes called upon by members of the public to make an emergency supply of medicines. The Human Medicines Regulations 2012 allows exemptions from the Prescription Only requirements for emergency supply to be made by a person lawfully conducting a retail pharmacy business provided:

a) that the pharmacist has interviewed the person requesting the prescription-only medicine and is satisfied:
   i) that there is immediate need for the prescription-only medicine and that it is impracticable in the circumstances to obtain a prescription without undue delay;
   ii) that treatment with the prescription-only medicine has on a previous occasion been prescribed for the person requesting it;
   iii) as to the dose that it would be appropriate for the person to take;

b) that no greater quantity shall be supplied than will provide 5 days' treatment of phenobarbital p. 318, phenobarbital sodium, or Controlled Drugs in Schedules 4 or 5 (doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation) or 30 days' treatment for other prescription-only medicines, except when the prescription-only medicine is:
   i) insulin, an ointment or cream, or a preparation for the relief of asthma in an aerosol dispenser when the smallest pack can be supplied;
   ii) an oral contraceptive when a full cycle may be supplied;
   iii) an antibiotic in liquid form for oral administration when the smallest quantity that will provide a full course of treatment can be supplied;

c) that an entry shall be made by the pharmacist in the prescription book stating:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name and address of the patient;
   iv) the nature of the emergency;

d) that the container or package must be labelled to show:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name of the patient;
   iv) the name and address of the pharmacy;
   v) the words 'Emergency supply';
   vi) the words 'Keep out of the reach of children' (or similar warning);

e) that the prescription-only medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 318 or phenobarbital sodium for the treatment of epilepsy: for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition); (Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).

Emergency supply requested by prescriber
Emergency supply of a prescription-only medicine may also be made at the request of a doctor, a dentist, a supplementary prescriber, a community practitioner nurse prescriber, a nurse, pharmacist, or optometrist independent prescriber, or a doctor or dentist from the European Economic Area or Switzerland, provided:

a) that the pharmacist is satisfied that the prescriber by reason of some emergency is unable to furnish a prescription immediately;

b) that the prescriber has undertaken to furnish a prescription within 72 hours;

c) that the medicine is supplied in accordance with the directions of the prescriber requesting it;

d) that the medicine is not a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 318 or phenobarbital sodium for the treatment of epilepsy: for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition); (Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).

e) that an entry shall be made in the prescription book stating:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name and address of the practitioner requesting the emergency supply;
   iv) the name and address of the patient;
   v) the date on the prescription;
   vi) when the prescription is received the entry should be amended to include the date on which it is received.

Royal Pharmaceutical Society’s guidelines
1. The pharmacist should consider the medical consequences of not supplying a medicine in an emergency.
2. If the pharmacist is unable to make an emergency supply of a medicine the pharmacist should advise the patient how to obtain essential medical care.

For conditions that apply to supplies made at the request of a patient see Medicines, Ethics and Practice, London Pharmaceutical Press, (always consult latest edition).
Controlled drugs and drug dependence

Regulations and classification

The Misuse of Drugs Act, 1971 prohibits certain activities in relation to 'Controlled Drugs', in particular their manufacture, supply, and possession. The penalties applicable to offences involving the different drugs are graded broadly according to the harmlessness attributable to a drug when it is misused and for this purpose the drugs are defined in the following three classes:

- **Class C** includes: certain drugs related to the amfetamines such as benzphetamine and chlorphenetermine, buparephrine p. 425, mazindol, meprobamate p. 330, pempoline, pipradrol, most benzodiazepines, tramadol hydrochloride p. 447, zaleplon p. 465, zolpidem tartrate p. 465, zopiclone p. 466, androgenic and anabolic steroids, clenbuterol, choric gonadotrophin (HCG), non-human choric gonadotrophin, somatropin, somatrem, and somatropin p. 705.

The Misuse of Drugs Regulations 2001 (and subsequent amendments) define the classes of person who are authorised to supply and possess controlled drugs while acting in their professional capacities and lay down the conditions under which these activities may be carried out. In the regulations drugs are divided into five schedules each specifying the requirements governing such activities as import, export, production, supply, possession, prescribing, and record keeping which apply to them.

- **Schedule 1** includes drugs such as lysierge which is not used medicinally. Possession and supply are prohibited except in accordance with Home Office authority.

- **Schedule 2** includes drugs such as diamorphine hydrochloride (heroin) p. 433, morphine p. 439, nabilone p. 410, remifentanil p. 1233, pethidine hydrochloride p. 445, secoecobarbital, glutethimide, the amfetamines, sodium oxybate and cocaine and are subject to the full controlled drug requirements relating to prescriptions, safe custody (except for secoecobarbital), the need to keep registers, etc. (unless exempted in Schedule 5).

- **Schedule 3** includes the barbiturates (except secoecobarbital, now Schedule 2), buparephrine p. 425, mazindol, meprobamate p. 330, midazolam p. 323, pentazocine p. 445, phentermine, temazepam p. 463, and tramadol hydrochloride p. 447. They are subject to the special prescription requirements. Safe custody requirements do apply, except for any 5,5 disubstituted barbituric acid (e.g. phenobarbital), mazindol, meprobamate, midazolam, pentazocine, phentermine, tramadol hydrochloride, or any stereoisomeric form or salts of the above. Records in registers do not need to be kept (although there are requirements for the retention of invoices for 2 years).

- **Schedule 4** includes in Part I benzodiazepines (except temazepam p. 463 and midazolam p. 323, which are in Schedule 3), zaleplon p. 465, zolpidem tartrate p. 465, and zopiclone p. 466 which are subject to minimal control. Part II includes androgenic and anabolic steroids, clenbuterol, choric gonadotrophin (HCG), non-human choric gonadotrophin, somatotropin, somatrem, and somatropin p. 705. Controlled drug prescription requirements do not apply and Schedule 4 Controlled Drugs are not subject to safe custody requirements.

- **Schedule 5** includes those preparations which, because of their strength, are exempt from virtually all Controlled Drug requirements other than retention of invoices for two years.

Prescriptions

Preparations in Schedules 1, 2, 3, and 4 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are identified throughout the BNF and BNF for children using the following symbols:

- **CD1** for preparations in Schedule 1
- **CD2** for preparations in Schedule 2
- **CD3** for preparations in Schedule 3
- **CD4-1** for preparations in Schedule 4 (Part I)
- **CD4-2** for preparations in Schedule 4 (Part II)
- **CD5** for preparations in Schedule 5

The principal legal requirements relating to medical prescriptions are listed below (see also Department of Health Guidance).

**Prescription requirements** Prescriptions for Controlled Drugs that are subject to prescription requirements (all preparations in Schedules 2 and 3) must be indelible and must be signed by the prescriber, be dated, and specify the prescriber’s address. A machine-written prescription is acceptable, but the prescriber’s signature must be handwritten. Advanced electronic signatures can be accepted for Schedule 2 and 3 Controlled Drugs where the Electronic Prescribing Service (EPS) is used. All prescriptions for Controlled Drugs that are subject to the prescription requirements must always state:

- the name and address of the patient;
- in the case of a preparation, the form, (the dosage form e.g. tablets must be included on a Controlled Drugs prescription irrespective of whether it is implicit in the proprietary name e.g. MST Continus or whether only one form is available), and where appropriate the strength of the preparation (when more than one strength of a preparation exists the strength required must be specified);
- for liquids, the total volume in millilitres (in both words and figures) of the Controlled Drug to be supplied; for dosage units, the number (in both words and figures) of dosage units to be supplied; in any other case, the total quantity (in both words and figures) of the Controlled Drug to be supplied;
- the dose (the instruction ‘one as directed’ constitutes a dose but ‘as directed’ does not);
- the words ‘for dental treatment only’ if issued by a dentist.

A pharmacist is not allowed to dispense a Controlled Drug unless all the information required by law is given on the prescription. In the case of a prescription for a Controlled Drug in Schedule 2 or 3, a pharmacist can amend the prescription if it specifies the total quantity only in words or in figures if it contains minor typographical errors, provided that such amendments are indelible and clearly attributable to the pharmacist (implementation date for N. Ireland not confirmed). Failure to comply with the
regulations concerning the writing of prescriptions will result in inconvenience to patients and carers and delay in supplying the necessary medicine. A prescription for a Controlled Drug in Schedules 2, 3, or 4 is valid for 28 days from the date stated thereon (the prescriber may forward-date the prescription; the start date may also be specified in the body of the prescription).

**Instalments and ‘repeats’**
A prescription may order a Controlled Drug to be dispensed by instalments; the amount of instalments and the intervals to be observed must be specified. A total of 14 days’ treatment by instalment of any drug listed in Schedule 2 of the Misuse of Drugs Regulations, buprenorphine p. 425, and diazepam p. 327 may be prescribed in England. In England, forms FP10 (MDA) (blue) and FP10H (MDA) (blue) should be used. In Scotland, forms GP10 (peach), HBP (blue), or HBPA (pink) should be used. In Wales a total of 14 days’ treatment by instalment of any drug listed in Schedules 2–5 of the Misuse of Drugs Regulations may be prescribed. In Wales, form WP10 (MDA) or form WP10HP (AD) should be used. Instalment prescriptions must be dispensed in accordance with the directions in the prescription. However, the Home Office has approved specific wording which may be included in an instalment prescription to cover certain situations; for example, if a pharmacy is closed on the day when an instalment is due. For details, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition) or see Home Office approved wording for instalment prescribing (Circular 027/2015), available at www.gov.uk/.

Prescriptions ordering ‘repeats’ on the same form are not permitted for Controlled Drugs in Schedules 2 or 3.

**Private prescriptions**
Private prescriptions for Controlled Drugs in Schedules 2 and 3 must be written on specially designated forms provided by Primary Care Trusts in England, Health Boards in Scotland, Local Health Boards in Wales, or the Northern Ireland Central Services Agency; in addition, prescriptions must specify the prescriber’s identification number. Prescriptions to be supplied by a pharmacist in hospital are exempt from the requirements for private prescriptions.

**Department of Health guidance**
Guidance (June 2006) issued by the Department of Health in England on prescribing and dispensing of Controlled Drugs requires:

- in general, prescriptions for Controlled Drugs in Schedules 2, 3, and 4 to be limited to a supply of up to 30 days’ treatment; exceptionally, to cover a justifiable clinical need and after consideration of any risk, a prescription can be issued for a longer period, but the reasons for the decision should be recorded on the patient’s notes;
- the patient’s identifier to be shown on NHS and private prescriptions for Controlled Drugs in Schedules 2 and 3.

Further information is available at www.gov.uk/dh.

**Dependence and misuse**
The most serious drugs of addiction are **cocaine**, **diamorphine hydrochloride** (heroin) p. 433, **morphine** p. 439, and the **synthetic opioids**. For arrangements for prescribing of diamorphine, dipipanone, or cocaine for addicts, see Prescribing of diamorphine, dipipanone, or cocaine for addicts, Available at www.gov.uk/dh

**Benzo Diazepines** are commonly misused. However, the misuse of **barbiturates** is now uncommon, in line with declining medicinal use and consequent availability. **Cannabis** (Indian hemp) has no approved medicinal use and cannot be prescribed by doctors. Its use is illegal but widespread. Cannabis is a mild hallucinogen seldom accompanied by a desire to increase the dose; withdrawal symptoms are unusual. However, cannabis extract is licensed as a medicinal product. **Lysergide** (lysergic acid diethylamide, LSD) is a much more potent hallucinogen; its use can lead to severe psychotic states which can be life-threatening. There are concerns over increases in the availability and misuse of other drugs with variously combined hallucinogenic, anaesthetic, or sedative properties. These include ketamine p. 1234 and gamma-hydroxybutyrate (sodium oxybate, GHB).

**Supervised consumption**
Individuals prescribed opioid substitution therapy can take their daily dose under the supervision of a doctor, nurse, or pharmacist during the dose stabilisation phase (usually the first 3 months of treatment), after a relapse or period of...
instability, or if there is a significant increase in the dose of methadone. Supervised consumption should continue (in accordance with local protocols) until the prescriber is confident that the patient is compliant with their treatment.

**Prescribing drugs likely to cause dependence or misuse**

The prescriber has three main responsibilities:

- To avoid creating dependence by introducing drugs to patients without sufficient reason. In this context, the proper use of the morphine-like drugs is well understood. The dangers of other Controlled Drugs are less clear because recognition of dependence is not easy and its effects, and those of withdrawal, are less obvious.
- To see that the patient does not gradually increase the dose of a drug, given for good medical reasons, to the point where dependence becomes more likely. This tendency is seen especially with hypnotics and anxiolytics. The prescriber should keep a close eye on the amount prescribed to prevent patients from accumulating stocks. A minimal amount should be prescribed in the first instance, or when seeing a new patient for the first time.
- To avoid being used as an unwitting source of supply for addicts and being vigilant to methods for obtaining medicines. Methods include visiting more than one doctor, fabricating stories, and forging prescriptions.

Patients under temporary care should be given only small supplies of drugs unless they present an unequivocal letter from their own doctor. Doctors should also remember that their own patients may be attempting to collect prescriptions from other prescribers, especially in hospitals. It is sensible to reduce dosages steadily or to issue weekly or even daily prescriptions for small amounts if it is apparent that dependence is occurring. The stealing and misuse of prescription forms could be minimised by the following precautions:

- do not leave unattended if called away from the consulting room or at reception desks; do not leave in a car where they may be visible; when not in use, keep in a locked drawer within the surgery and at home;
- draw a diagonal line across the blank part of the form under the prescription;
- write the quantity in words and figures when prescribing drugs prone to abuse; this is obligatory for controlled drugs;
- alterations are best avoided but if any are made they should be clear and unambiguous; add initials against altered items;
- if prescriptions are left for collection they should be left in a safe place in a sealed envelope.

**Travelling abroad**

Prescribed drugs listed in Schedule 4 Part II (CD Anab) and Schedule 5 of the Misuse of Drugs Regulations 2001 are not subject to export or import licensing. However, patients intending to travel abroad for more than 3 months carrying any amount of drugs listed in Schedules 2, 3, or 4 Part I (CD Benz) will require a personal export/import licence. Further details can be obtained at www.gov.uk/guidance/controlled-drugs-licences-fees-and-returns or from the Home Office by contacting DFLU.ie@homeoffice.gsi.gov.uk. In cases of emergency, telephone (020) 7035 6330. Applications must be supported by a covering letter from the prescriber and should give details of:

- the patient’s name and address;
- the quantities of drugs to be carried;
- the strength and form in which the drugs will be dispensed;
- the country or countries of destination;
- the dates of travel to and from the United Kingdom.

Applications for licences should be sent to the Home Office, Drugs Licensing & Compliance Unit, Fry Building, 2 Marsham Street, London, SW1P 4DF. Alternatively, completed application forms can be emailed to dlcucommsofficer@homeoffice.gsi.gov.uk with a copy of the covering letter from the prescriber as a pdf. A minimum of two weeks should be allowed for processing the application. Patients travelling for less than 3 months do not require a personal export/import licence for carrying Controlled Drugs, but are advised to carry a letter from the prescribing doctor. Those travelling for more than 3 months are advised to make arrangements to have their medication prescribed by a practitioner in the country they are visiting.

Doctors who want to take Controlled Drugs abroad while accompanying patients may similarly be issued with licences. Licences are not normally issued to doctors who want to take Controlled Drugs abroad solely in case a family emergency should arise.

Personal export/import licences do not have any legal status outside the UK and are issued only to comply with the Misuse of Drugs Act and to facilitate passage through UK Customs and Excise control. For clearance in the country to be visited it is necessary to approach that country’s consulate in the UK.

**Notification of patients receiving structured drug treatment for substance dependence**

In England, doctors should report cases where they are providing structured drug treatment for substance dependence to their local National Drug Treatment Monitoring System (NDTMS) Team. General information about NDTMS can be found at www.nta.nhs.uk/ndtms.aspx. Enquiries about NDTMS, and how to submit data, should initially be directed to:

- EvidenceApplicationTeam@phe.gov.uk

In Scotland, doctors should report cases to the Substance Misuse Programme (SMP).

Tel: (0131) 275 6348

In Northern Ireland, the Misuse of Drugs (Notification of and Supply to Addicts) (Northern Ireland) Regulations 1973 require doctors to send particulars of persons whom they consider to be addicted to certain controlled drugs to the Chief Medical Officer of the Department of Health and Social Services. The Northern Ireland contacts are:

Medical contact:
Dr Ian McMaster, C3 Castle Buildings, Belfast, BT4 3FQ
Tel: (028) 9052 2421, Fax: (028) 9052 0718
ian.mcmaster@dhsspni.gov.uk

Administrative contact:
Public Health Information & Research Branch, Department of Health, Annexe 2, Castle Building, Stormont, Belfast BT4 3SQ
Tel: (028) 9052 2504

Public Health Information & Research Branch also maintains the Northern Ireland Drug Misuse Database (NIDMD) which collects detailed information on those presenting for treatment, on drugs misused and injecting behaviour; participation is not a statutory requirement.

In Wales, doctors should report cases where they are providing structured drug treatment for substance dependence on the Welsh National Database for Substance Misuse; enquiries should be directed to: substance.misuse-queries@wales.nhs.uk.
Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts

The Misuse of Drugs (Supply to Addicts) Regulations 1997 require that only medical practitioners who hold a special licence issued by the Home Secretary may prescribe, administer, or supply diamorphine hydrochloride p. 433, dipipanone (Diconal®), or cocaine in the treatment of drug addiction; other practitioners must refer any addict who requires these drugs to a treatment centre. Whenever possible the addict will be introduced by a member of staff from the treatment centre to a pharmacist whose agreement has been obtained and whose pharmacy is conveniently sited for the patient. Prescriptions for weekly supplies will be sent to the pharmacy by post and will be dispensed on a daily basis as indicated by the doctor. If any alterations of the arrangements are requested by the addict, the portion of the prescription affected must be represcribed and not merely altered.

General practitioners and other doctors do not require a special licence for prescribing diamorphine hydrochloride p. 433, dipipanone, and cocaine for patients (including addicts) for relieving pain from organic disease or injury.
Adverse reactions to drugs

Yellow card scheme
Any drug may produce unwanted or unexpected adverse reactions. Rapid detection and recording of adverse drug reactions is of vital importance so that unrecognised hazards are identified promptly and appropriate regulatory action is taken to ensure that medicines are used safely. Healthcare professionals and coroners are asked to report suspected adverse drug reactions directly to the Medicines and Healthcare products Regulatory Agency (MHRA) through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard. Alternatively, prepaid Yellow Cards for reporting are available from the address below and are also bound in the inside back cover of the BNF.

Send Yellow Cards to:
FREEPOST YELLOW CARD
(No other address details required).
Tel: 0800 731 6789

Suspected adverse drug reactions to any therapeutic agent should be reported, including drugs (self-medication as well as those prescribed), blood products, vaccines, radiographic contrast media, complementary and herbal products. For biosimilar medicines and vaccines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine or vaccine.

Suspected adverse drug reactions should be reported through the Yellow Card Scheme at www.mhra.gov.uk/yellowcard. Yellow Cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal or complementary products, whether self-medicated or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

A freephone service is available to all parts of the UK for advice and information on suspected adverse drug reactions; contact the National Yellow Card Information Service at the MHRA on 0800 731 6789. Outside office hours a telephone-answering machine will take messages.

The following Yellow Card Centres can be contacted for further information:

Yellow Card Centre Northwest
2nd Floor, 70 Pembroke Place, Liverpool, L69 3GF

The MHRA’s database facilitates the monitoring of adverse drug reactions. More detailed information on reporting and a list of products currently under additional monitoring can be found on the MHRA website: www.mhra.gov.uk.

MHRA Drug Safety Update
Drug Safety Update is a monthly newsletter from the MHRA and the Commission on Human Medicines (CHM); it is available at www.gov.uk/drug-safety-update.

Self-reporting
Patients and their carers can also report suspected adverse drug reactions to the MHRA. Reports can be submitted directly to the MHRA through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard, by telephone on 0808 100 3352, or by downloading the Yellow Card form from www.mhra.gov.uk. Alternatively, patients can use Yellow Cards available form pharmacies and GP surgeries. Information for patients about the Yellow Card Scheme is available in other languages at www.mhra.gov.uk/yellowcard.

Prescription-event monitoring
In addition to the MHRA’s Yellow Card Scheme, an independent scheme monitors the safety of new medicines using a different approach. The Drug Safety Research Unit identifies patients who have been prescribed selected new medicines and collects data on clinical events in these patients. The data are submitted on a voluntary basis by general practitioners on green forms. More information about the scheme and the Unit’s educational material is available from www.dsru.org.

Newer drugs and vaccines
Only limited information is available from clinical trials on the safety of new medicines. Further understanding about the safety of medicines depends on the availability of information from routine clinical practice. The black triangle symbol identifies newly licensed medicines that require additional monitoring by the European Medicines Agency. Such medicines include new active substances, biosimilar medicines, and medicines that the European Medicines Agency consider require additional monitoring. The black triangle symbol also appears in the Patient Information Leaflets for relevant medicines, with a brief explanation of what it means. Products usually retain a black triangle for 5 years, but this can be extended if required.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. For medicines showing the black triangle symbol, the MHRA asks that all suspected reactions (including those considered not to be serious) are reported through the Yellow Card Scheme. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time.

Established drugs and vaccines
Healthcare professionals and coroners are asked to report all suspected reactions to established drugs (including over-the-counter, herbal, and unlicensed medicines and medicines used off-label) and vaccines that are serious, medically significant, or result in harm. Serious reactions include those that are fatal, life-threatening, disabling,
incapacitating, or which result in or prolong hospitalisation, or a congenital abnormality; they should be reported even if the effect is well recognised. Examples include anaphylaxis, blood disorders, endocrine disturbances, effects on fertility, haemorrhage from any site, renal impairment, jaundice, ophthalmic disorders, severe CNS effects, severe skin reactions, reactions in pregnant women, and any drug interactions. Reports of serious adverse reactions are required to enable comparison with other drugs of a similar class. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

For established drugs there is no need to report well-known, relatively minor side-effects, such as dry mouth with tricyclic antidepressants or constipation with opioids.

**Medication errors**

Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National Reporting and Learning System (NRLS). If reported to the NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

**Adverse reactions to medical devices**

Suspected adverse reactions to medical devices including dental or surgical materials, intra-uterine devices, and contact lens fluids should be reported. Information on reporting these can be found at: [www.mhra.gov.uk](http://www.mhra.gov.uk).

**Side-effects in the BNF**

The BNF includes clinically relevant side-effects for most drugs; an exhaustive list is not included for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). Where causality has not been established, side-effects in the manufacturers’ literature may be omitted from the BNF.

Recognising that hypersensitivity reactions can occur with virtually all medicines, this effect is not generally listed, unless the drug carries an increased risk of such reactions. The BNF also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes).

Side-effects are generally listed in order of frequency and arranged broadly by body systems. Occasionally a rare side-effect might be listed first if it is considered to be particularly important because of its seriousness. In the product literature the frequency of side-effects is generally described as follows:

<table>
<thead>
<tr>
<th>Description of the frequency of side-effects</th>
<th>Very common</th>
<th>greater than 1 in 10</th>
</tr>
</thead>
<tbody>
<tr>
<td>Common</td>
<td>1 in 100 to 1 in 10</td>
<td></td>
</tr>
<tr>
<td>Uncommon [formerly ‘less commonly’ in BNF publications]</td>
<td>1 in 1000 to 1 in 100</td>
<td></td>
</tr>
<tr>
<td>Rare</td>
<td>1 in 10 000 to 1 in 1000</td>
<td></td>
</tr>
<tr>
<td>Very rare</td>
<td>less than 1 in 10 000</td>
<td></td>
</tr>
</tbody>
</table>

**Special problems**

**Delayed drug effects** Some reactions (e.g. cancers, chloroquine retinopathy, and retroperitoneal fibrosis) may become manifest months or years after exposure. Any suspicion of such an association should be reported directly to the MHRA through the Yellow Card Scheme.

**The elderly** Particular vigilance is required to identify adverse reactions in the elderly.

**Congenital abnormalities** When an infant is born with a congenital abnormality or there is a malformed aborted fetus doctors are asked to consider whether this might be an adverse reaction to a drug and to report all drugs (including self-medication) taken during pregnancy.

**Children** Particular vigilance is required to identify and report adverse reactions in children, including those resulting from the unlicensed use of medicines; all suspected reactions should be reported directly to the MHRA through the Yellow Card Scheme (see also Adverse Drug Reactions in Children).

**Prevention of adverse reactions**

Adverse reactions may be prevented as follows:

- never use any drug unless there is a good indication. If the patient is pregnant do not use a drug unless the need for it is imperative;
- allergy and idiosyncrasy are important causes of adverse drug reactions. Ask if the patient had previous reactions to the drug or formulation;
- ask if the patient is already taking other drugs including self-medication drugs, health supplements, complementary and alternative therapies; interactions may occur;
- age and hepatic or renal disease may alter the metabolism or excretion of drugs, so that much smaller doses may be needed. Genetic factors may also be responsible for variations in metabolism, and therefore for the adverse effect of the drug; notably of isoniazid p. 554 and the tricyclic antidepressants;
- prescribe as few drugs as possible and give very clear instructions to the elderly or any patient likely to misunderstand complicated instructions;
- whenever possible use a familiar drug; with a new drug, be particularly alert for adverse reactions or unexpected events;
- consider if excipients (e.g. colouring agents) may be contributing to the adverse reaction. If the reaction is minor, a trial of an alternative formulation of the same drug may be considered before abandoning the drug;
- warn the patient if serious adverse reactions are liable to occur.

**Drug allergy (suspected or confirmed)**

Suspected drug allergy is any reaction caused by a drug with clinical features compatible with an immunological mechanism. All drugs have the potential to cause adverse drug reactions, but not all of these are allergic in nature. A reaction is more likely to be caused by drug allergy if:

- The reaction occurred while the patient was being treated with the drug, or
- The drug is known to cause this pattern of reaction, or
- The patient has had a similar reaction to the same drug or drug-class previously.

A suspected reaction is less likely to be caused by a drug allergy if there is a possible non-drug cause or if there are only gastro-intestinal symptoms present.

The following signs, allergic patterns and timing of onset can be used to help decide whether to suspect drug allergy: **Immediate, rapidly-evolving reactions** (onset usually less than 1 hour after drug exposure)

- Anaphylaxis, with erythema, urticaria or angioedema, and hypotension and/or bronchospasm. See also Antihistamines, allergen immunotherapy and allergic emergencies p. 265
- Urticaria or angioedema without systemic features
- Exacerbation of asthma e.g. with non-steroidal anti-inflammatory drugs (NSAIDs)

**Non-immediate reactions, without systemic involvement** (onset usually 6–10 days after first drug exposure or 3 days after second exposure)

- Cutaneous reactions, e.g. widespread red macules and/or papules, or, fixed drug eruption (localised inflamed skin)
Adverse reactions to drugs

Non-immediate reactions, with systemic involvement (onset may be variable, usually 3 days to 6 weeks after first drug exposure, depending on features, or 3 days after second exposure)

- Cutaneous reactions with systemic features, e.g. drug reaction with eosinophilia and systemic signs (DRESS) or drug hypersensitivity syndrome (DHS), characterised by widespread red macules, papules or erythrodema, fever, lymphadenopathy, liver dysfunction or eosinophilia
- Toxic epidermal necrolysis or Stevens–Johnson syndrome
- Acute generalised exanthesmatous pustulosis (AGEP)

Suspicious drug allergy information should be clearly and accurately documented in clinical notes and prescriptions, and shared among all healthcare professionals. Patients should be given information about which drugs and drug-classes to avoid and encouraged to share their drug allergy status.

If a drug allergy is suspected, consider stopping the suspected drug and advising the patient or carer to avoid this drug in future. Symptoms of the acute reaction should be treated, in hospital if severe. Patients presenting with a suspected anaphylactic reaction, or a severe or non-immediate cutaneous reaction, should be referred to a specialist drug allergy service. Patients presenting with a suspected drug allergic reaction or anaphylaxis to NSAIDs, and local and general anaesthetics may also need to be referred to a specialist drug allergy service, e.g. in cases of anaphylactic reactions or to determine future treatment options. Patients presenting with a suspected drug allergic reaction or anaphylaxis associated with beta-lactam antibiotics should be referred to a specialist drug allergy service if their disease or condition can only be treated by a beta-lactam antibiotic or they are likely to need beta-lactam antibiotics frequently in the future (e.g. immunodeficient patients). For further information see Drug allergy: diagnosis and management. NICE Clinical Guideline 183 (September 2014) www.nice.org.uk/guidance/cg183.

Oral side-effects of drugs

Drug-induced disorders of the mouth may be due to a local reaction on the mouth or to a systemic effect manifested by oral changes. In the latter case urgent referral to the patient’s medical practitioner may be necessary.

Oral mucosa

Medicaments left in contact with or applied directly to the oral mucosa can lead to inflammation or ulceration; the possibility of allergy should also be borne in mind. Aspirin tablets p. 117 allowed to dissolve in the sulcus for the treatment of toothache can lead to a white patch followed by ulceration.

Flavouring agents, particularly essential oils, may sensitise the skin, but mucosal swelling is not usually prominent. The oral mucosa is particularly vulnerable to ulceration in patients treated with cytotoxic drugs, e.g. methotrexate p. 844. Other drugs capable of causing oral ulceration include ACE inhibitors, gold, nicorandil p. 206, NSAIDs, pancreatin p. 93, penicillamine p. 1002, proguanil hydrochloride p. 585, and protease inhibitors.

Erythema multiforme or Stevens–Johnson syndrome may follow the use of a wide range of drugs including antibacterials, antiretrovirals, sulfonamide derivatives, and anticonvulsants; the oral mucosa may be extensively ulcerated, with characteristic target lesions on the skin. Oral lesions of toxic epidermal necrolysis have been reported with a similar range of drugs.

Lichenoid eruptions are associated with ACE inhibitors, NSAIDs, methyldopa p. 140, chloroquine p. 582, oral antidiabetics, thiazide diuretics, and gold. Candidiasis can complicate treatment with antibacterials and immunosuppressants and is an occasional side-effect of corticosteroid inhalers.

Teeth and jaw

Brown staining of the teeth frequently follows the use of chlorhexidine mouthwash, spray or gel p. 1108, but can readily be removed by polishing. Iron salts in liquid form can stain the enamel black. Superficial staining has been reported rarely with co-amoxiclav suspension p. 521. Intrinsic staining of the teeth is most commonly caused by tetracyclines. They will affect the teeth if given at any time from about the fourth month in utero until the age of twelve years; they are contra-indicated during pregnancy, in breast-feeding women, and in children under 12 years. All tetracyclines can cause permanent, unsightly staining in children, the colour varying from yellow to grey. Excessive ingestion of fluoride leads to dental fluorosis with mottling of the enamel and areas of hypoplasia or pitting; fluoride supplements occasionally cause mild mottling (white patches) if the dose is too large for the child’s age (taking into account the fluoride content of the local drinking water and of toothpaste).

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget’s disease. All patients receiving bisphosphonates should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients with cancer receiving bevacizumab p. 807 or sunitinib p. 914 may also be at risk of osteonecrosis of the jaw.

Periodontium

Gingival overgrowth (gingival hyperplasia) is a side-effect of phenytoin p. 308 and sometimes of cyclosporin p. 788 or of nifedipine p. 157 (and some other calcium-channel blockers).

Thrombocytopenia may be drug related and may cause bleeding at the gingival margins, which may be spontaneous or may follow mild trauma (such as toothbrushing).

Salivary glands

The most common effect that drugs have on the salivary glands is to reduce flow (xerostomia). Patients with a persistently dry mouth may have poor oral hygiene; they are at an increased risk of dental caries and oral infections (particularly candidiasis). Many drugs have been implicated in xerostomia, particularly antimuscarinics (anticholinergics), antidepressants (including tricyclic antidepressants, and selective serotonin re-uptake inhibitors), alpha-blockers, antihistamines, antipsychotics, bacoferen p. 1026, bupropion hydrochloride p. 473, clonidine hydrochloride p. 139, SHT, agonists, opioids and tizanidine p. 1027. Excessive use of diuretics can also result in xerostomia.

Some drugs (e.g. clozapine p. 377, neostigmine p. 1024) can increase saliva production but this is rarely a problem unless the patient has associated difficulty in swallowing. Pain in the salivary glands has been reported with some antihypertensives (e.g. clonidine hydrochloride p. 139, methyldopa p. 140) and with vinca alkaloids.

Swelling of the salivary glands can occur with iodides, antithyroid drugs, phenothiazines, and sulfonamides.

Taste

There can be decreased taste acuity or alteration in taste sensation. Many drugs are implicated, including amiodarone hydrochloride p. 102, calcitonin, ACE inhibitors, carbamazepine p. 727, clarithromycin p. 508, gold, griseofulvin p. 568, lithium salts, metformin hydrochloride p. 652, metronidazole p. 512, penicillamine p. 1002, phenindione p. 101, propafenone hydrochloride p. 101, protease inhibitors, terbinafine p. 1132, and zopiclone p. 466.

Defective medicines

During the manufacture or distribution of a medicine an error or accident may occur whereby the finished product does not conform to its specification. While such a defect may impair the therapeutic effect of the product and could
adversely affect the health of a patient, it should **not** be confused with an Adverse Drug Reaction where the product conforms to its specification.
The Defective Medicines Report Centre assists with the investigation of problems arising from licensed medicinal products thought to be defective and co-ordinates any necessary protective action. Reports on suspect defective medicinal products should include the brand or the non-proprietary name, the name of the manufacturer or supplier, the strength and dosage form of the product, the product licence number, the batch number or numbers of the product, the nature of the defect, and an account of any action already taken in consequence. The Centre can be contacted at:
The Defective Medicines Report Centre
Medicines and Healthcare products Regulatory Agency,
151 Buckingham Palace Road, London, SW1W 9SZ
Tel: (020) 3080 6574
dmrc@mhra.gsi.gov.uk
Intravenous additives policies
A local policy on the addition of drugs to intravenous fluids should be drawn up by a multi-disciplinary team and issued as a document to the members of staff concerned. Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards. The information that follows should be read in conjunction with local policy documents.

Guidelines
- Drugs should only be added to infusion containers when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
- In general, only one drug should be added to any infusion container and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate. Only specially formulated additives should be used with fat emulsions or amino-acid solutions.
- Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
- Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
- The infusion container should be labelled with the patient’s name, the name and quantity of additives, and the date and time of addition (and the new expiry date or time). Such additional labelling should not interfere with information on the manufacturer’s label that is still valid. When possible, containers should be retained for a period after use in case they are needed for investigation.
- It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

Problems
Microbial contamination The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of *Candida*, *Enterobacter*, and *Klebsiella*. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

Incompatibility Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitation may occur, but in many instances there is no visual indication of incompatibility. Interaction may take place at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

Common incompatibilities Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, ‘salting-out’ effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in either thrombophlebitis (e.g. diazepam) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and certain cytotoxic drugs). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin). It is considered undesirable to mix β-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed. A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates. The breakdown products of dacarbazine have been implicated in adverse effects.

Blood Because of the large number of incompatibilities, drugs should not normally be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextran (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated). If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

Intravenous fat emulsions These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as *Vitlipid N*® may be added to appropriate intravenous fat emulsions.

Other infusions Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

Bactericides Bactericides such as chlororesol 0.1% or phenylmercuric nitrate 0.001% are present in some injection solutions. The total volume of such solutions added to a container for infusion on one occasion should not exceed 15 mL.

Method
Ready-prepared infusions should be used whenever available. *Potassium chloride* is usually available in concentrations of 20, 27, and 40 mmol/litre in sodium chloride intravenous infusion (0.9%), glucose intravenous infusion (5%) or sodium chloride and glucose intravenous infusion. *Lidocaine hydrochloride* is usually available in concentrations of 0.1 or 0.2% in glucose intravenous infusion (5%). When addition is required to be made extemporaneously, any product reconstitution instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, addition to the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions. It is also important in certain instances that an infusion fluid of specific pH be used (e.g. *furosemide* injection requires dilution in infusions of pH greater than 5.5).

When drug additions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing is hampered. If the solutions are not thoroughly mixed a concentrated layer of the additive may form owing to
differences in density. **Potassium chloride** is particularly prone to this 'layering' effect when added without adequate mixing to infusions packed in non-rigid infusion containers; if such a mixture is administered it may have a serious effect on the heart.

A time limit between addition and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the formation of toxic substances, an acceptable limit is the time taken for 10% decomposition of the drug. When toxic substances are produced stricter limits may be imposed. Because of the risk of microbial contamination a maximum time limit of 24 hours may be appropriate for additions made elsewhere than in hospital pharmacies offering central additive service.

Certain injections must be protected from light during continuous infusion to minimise oxidation, e.g. dacarbazine and sodium nitroprusside.

Dilution with a small volume of an appropriate vehicle and administration using a motorised infusion pump is advocated for preparations such as unfractionated heparin where strict control over administration is required. In this case the appropriate dose may be dissolved in a convenient volume (e.g. 24–48 mL) of sodium chloride intravenous infusion (0.9%).

### Information provided in the BNF

The BNF gives information about preparations given by three methods:

- continuous infusion;
- intermittent infusion;
- addition via the drip tubing.

**Drugs given by continuous infusion** The BNF includes information on addition to **Glucose intravenous infusion 5 and 10%**, and **Sodium chloride intravenous infusion 0.9%**. Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with **Sodium chloride and glucose intravenous infusion**. Infusion of a large volume of hypotonic solution should be avoided therefore care should be taken if water for injections is used. The information relates to the proprietary preparations indicated; for other preparations suitability should be checked with the manufacturer.

Drugs for **continuous infusion** must be diluted in a large volume infusion. Penicillins and cephalosporins are not usually given by continuous infusion because of stability problems and because adequate plasma and tissue concentrations are best obtained by intermittent infusion. Where it is necessary to administer them by continuous infusion, detailed literature should be consulted.

Drugs that are both compatible and clinically suitable may be given by **intermittent infusion** in a relatively small volume of infusion over a short period of time, e.g. 100 mL in 30 minutes. The method is used if the product is incompatible or unstable over the period necessary for continuous infusion; the limited stability of ampicillin or amoxicillin in large volume glucose or lactate infusions may be overcome in this way.

Intermittent infusion is also used if adequate plasma and tissue concentrations are not produced by continuous infusion as in the case of drugs such as dacarbazine, gentamicin, and ticarcillin.

An in-line burette may be used for intermittent infusion techniques in order to achieve strict control over the time and rate of administration, especially for infants and children and in intensive care units. Intermittent infusion may also make use of the 'piggy-back' technique provided that no additions are made to the primary infusion. In this method the drug is added to a small secondary container connected to a Y-type injection site on the primary infusion giving set; the secondary solution is usually infused within 30 minutes.

**Addition via the drip tubing** is indicated for a number of cytotoxic drugs in order to minimise extravasation. The preparation is added aseptically via the rubber septum of the injection site of a fast-running infusion. In general, drug preparations intended for a bolus effect should be given directly into a separate vein where possible. Failing this, administration may be made via the drip tubing provided that the preparation is compatible with the infusion fluid when given in this manner.
Prescribing in children

Overview
For detailed advice on medicines used for children, consult BNF for Children.
Children, and particularly neonates, differ from adults in their response to drugs. Special care is needed in the neonatal period (first 28 days of life) and doses should always be calculated with care. At this age, the risk of toxicity is increased by reduced drug clearance and differing target organ sensitivity.
Whenever possible, intramuscular injections should be avoided in children because they are painful.
Where possible, medicines for children should be prescribed within the terms of the marketing authorisation (product licence). However, many children may require medicines not specifically licensed for paediatric use.
Although medicines cannot be promoted outside the limits of the licence, the Human Medicines Regulations 2012 does not prohibit the use of unlicensed medicines. It is recognised that the informed use of unlicensed medicines or of licensed medicines for unlicensed applications (‘off-label’ use) is often necessary in paediatric practice.

Adverse drug reactions in children
Suspected adverse drug reactions in children and young adults under 18 years should be reported through the Yellow Card Scheme. Yellow cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal or complementary products, whether self-medicated or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

Report all suspected adverse drug reactions that are:
- serious, medically significant or result in harm.
- associated with newer drugs and vaccines; the most up to date list of black triangle medicines is available at: www.mhra.gov.uk/blacktriangle

If in doubt whether to report a suspected adverse drug reaction, please complete a Yellow Card. The identification and reporting of adverse reactions to drugs in children and neonates is particularly important because:
- the action of the drug and its pharmacokinetics in children (especially in the very young) may be different from that in adults;
- drugs may not have been extensively tested in children;
- many drugs are not specifically licensed for use in children and are used either ‘off-label’ or as unlicensed products;
- drugs may affect the way a child grows and develops or may cause delayed adverse reactions which do not occur in adults;
- suitable formulations may not be available to allow precise dosing in children or they may contain excipients that should be used with caution in children;
- the nature and course of illnesses and adverse drug reactions may differ between adults and children.

Even if reported through the British Paediatric Surveillance Unit’s Orange Card Scheme, any identified suspected adverse drug reactions should also be submitted to the Yellow Card Scheme.

Prescription writing
Prescriptions should be written according to the guidelines in Prescription Writing. Inclusion of age is a legal requirement in the case of prescription-only medicines for children under 12 years of age, but it is preferable to state the age for all prescriptions for children.
It is particularly important to state the strengths of capsules or tablets. Although liquid preparations are particularly suitable for children, they may contain sugar which encourages dental decay. Sugar-free medicines are preferred for long-term treatment.
Many children are able to swallow tablets or capsules and may prefer a solid dose form; involving the child and parents in choosing the formulation is helpful.

Dosage in children
Children’s doses in the BNF are stated in the individual drug entries.
Doses are generally based on body-weight (in kilograms) or specific age ranges. In the BNF and BNF for Children, the term neonate is used to describe a newborn infant aged 0–28 days. The terms child or children are used generically to describe the entire range from infant to adolescent (1 month–17 years). An age range is specified when the dose information applies to a narrower age range than a child from 1 month–17 years.

Dose calculation
Many children’s doses are standardised by weight (and therefore require multiplying by the body-weight in kilograms to determine the child’s dose); occasionally, the doses have been standardised by body surface area (in m²). These methods should be used rather than attempting to calculate a child’s dose on the basis of doses used in adults.
For most drugs the adult maximum dose should not be exceeded. For example if the dose is stated as 8 mg/kg (max. 300 mg), a child weighing 10 kg should receive 80 mg but a child weighing 40 kg should receive 300 mg (rather than 320 mg).
Young children may require a higher dose per kilogram than adults because of their higher metabolic rates. Other problems need to be considered. For example, calculation by body-weight in the overweight child may result in much higher doses being administered than necessary; in such
cases, dose should be calculated from an ideal weight, related to height and age. **Body surface area (BSA) estimates** are sometimes preferable to body-weight for calculation of paediatric doses since many physiological phenomena correlate better with body surface area. Body surface area can be estimated from weight. For more information, refer to *BNF for Children*. Where the dose for children is not stated, prescribers should consult *BNF for Children* or seek advice from a medicines information centre.

**Dose frequency**
Antibacterials are generally given at regular intervals throughout the day. Some flexibility should be allowed in children to avoid waking them during the night. For example, the night-time dose may be given at the child’s bedtime. Where new or potentially toxic drugs are used, the manufacturers’ recommended doses should be carefully followed.

**Prescribing in hepatic impairment**

**Overview**
Liver disease may alter the response to drugs in several ways as indicated below, and drug prescribing should be kept to a minimum in all patients with severe liver disease. The main problems occur in patients with jaundice, ascites, or evidence of encephalopathy.

**Impaired drug metabolism**
Metabolism by the liver is the main route of elimination for many drugs, but hepatic reserve is large and liver disease has to be severe before important changes in drug metabolism occur. Routine liver-function tests are a poor guide to the capacity of the liver to metabolise drugs, and in the individual patient it is not possible to predict the extent to which the metabolism of a particular drug may be impaired. A few drugs, e.g. rifampicin p. 549 and fusidic acid p. 539, are excreted in the bile unchanged and can accumulate in patients with intrahepatic or extrahepatic obstructive jaundice.

**Hypoproteinaemia**
The hypoalbuminaemia in severe liver disease is associated with reduced protein binding and increased toxicity of some highly protein-bound drugs such as phenytoin p. 308 and prednisolone p. 639.

**Reduced clotting**
Reduced hepatic synthesis of blood-clotting factors, indicated by a prolonged prothrombin time, increases the sensitivity to oral anticoagulants such as warfarin sodium p. 135 and phenindione p. 134.

**Hepatic encephalopathy**
In severe liver disease many drugs can further impair cerebral function and may precipitate hepatic encephalopathy. These include all sedative drugs, opioid analgesics, those diuretics that produce hypokalaemia, and drugs that cause constipation.

**Fluid overload**
Oedema and ascites in chronic liver disease can be exacerbated by drugs that give rise to fluid retention e.g. NSAIDs and corticosteroids.

**Hepatotoxic drugs**
Hepatotoxicity is either dose-related or unpredictable (idiosyncratic). Drugs that cause dose-related toxicity may do so at lower doses in the presence of hepatic impairment than in individuals with normal liver function, and some drugs that produce reactions of the idiosyncratic kind do so more frequently in patients with liver disease. These drugs should be avoided or used very carefully in patients with liver disease. Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

**Prescribing in renal impairment**

**Issues encountered in renal impairment**
The use of drugs in patients with reduced renal function can give rise to problems for several reasons:
- reduced renal excretion of a drug or its metabolites may cause toxicity;
- sensitivity to some drugs is increased even if elimination is unimpaired;
- many side-effects are tolerated poorly by patients with renal impairment;
- some drugs are not effective when renal function is reduced.

Many of these problems can be avoided by reducing the dose or by using alternative drugs.

If even mild renal impairment is considered likely on clinical grounds, renal function should be checked before prescribing any drug which requires dose modification.

**General guidance**
Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug monograph in the BNF. When both efficacy and toxicity are closely related to plasma-drug concentration, recommended regimens should be regarded only as a guide to initial treatment; subsequent doses must be adjusted according to clinical response and plasma-drug concentration. Dose recommendations are based on the severity of renal impairment. The total daily maintenance dose of a drug can
be reduced either by reducing the size of the individual doses or by increasing the interval between doses. For some drugs, although the size of the maintenance dose is reduced it is important to give a loading dose if an immediate effect is required. This is because it takes about five times the half-life of the drug to achieve steady-state plasma concentrations. Because the plasma half-life of drugs excreted by the kidney is prolonged in renal impairment it can take many doses for the reduced dosage to achieve a therapeutic plasma concentration.

**Important: dosage adjustment advice in the BNF** Clinical laboratories routinely report renal function in adults based on *estimated glomerular filtration rate* (eGFR) normalised to a body surface area of 1.73 m² — this is derived from either the Chronic Kidney Disease Epidemiology Collaboration (CKD-EPI) formula or the Modification of Diet in Renal disease (MDRD) formula. However, in product literature, the effects of renal impairment on drug elimination is usually stated in terms of *creatinine clearance* as a surrogate for GFR. The information on dosage adjustment in the BNF is usually expressed in terms of eGFR. Exceptions to the use of eGFR include toxic drugs, in elderly patients and in patients at extremes of muscle mass (see *Estimating renal function in patients at extremes of muscle mass* and *Estimating renal function in elderly patients*, below) where calculation of CrCl is recommended. Although these two measures of renal function are not interchangeable, for most drugs and for most adult patients of average build and height, eGFR (rather than CrCl) can be used to determine dosage adjustments.

**Nephrotoxic drugs** Nephrotoxic drugs should, if possible, be avoided in patients with renal disease because the consequences of nephrotoxicity are likely to be more serious when renal reserve is already reduced. During intercurrent illness the risk of acute kidney injury is increased in patients with an eGFR of less than 60 mL/min/1.73 m²; potentially nephrotoxic or renally excreted drugs may require dose reduction or temporary discontinuation.

**Renal replacement therapy and transplantation** For prescribing in patients who have received a renal transplant or who are on renal replacement therapy (peritoneal dialysis or haemodialysis), consult specialist literature.

### Estimating renal function

Direct measure of Glomerular filtration rate (GFR) using plasma or urinary clearance is considered the best overall index of renal function. However, this is difficult to do in practice. As an alternative, the *estimated* Glomerular filtration rate (eGFR) based on serum creatinine is used to assess renal function. Creatinine clearance (CrCl) is also used as an estimate of GFR. Various equations for estimating glomerular filtration rate exist, however there is no compelling evidence to support the superiority of any given method for drug dosing in all patient populations or clinical situations. There is also insufficient evidence to provide definitive guidance about dosage adjustment of all drugs in patients with reduced renal function. Therefore, an understanding of drug pharmacokinetics is necessary in order to make appropriate dosing decisions.

Using serum creatinine to derive eGFR has a number of limitations; serum creatinine levels are dependent on muscle mass and diet, therefore estimates should be interpreted with caution in certain individuals (such as the elderly, body builders, amputees, in muscle-wasting disorders and vegans)—estimates will be higher or lower than the true value. Creatinine-derived measurements are also not useful in periods of rapidly changing renal function or in patients with AKI.

**Estimated glomerular filtration rate**

**Chronic Kidney Disease Epidemiology Collaboration (CKD-EPI) formula** The CKD-EPI formula is the recommended method for estimating GFR and calculating drug doses in most patients with renal impairment. CKD-EPI is adjusted for body surface area (BSA) and utilises serum creatinine, age, sex and race as variables. Clinical laboratories should use the CKD-EPI formula to routinely report eGFR.

**CKD-EPI equation**

\[
eGFR \text{ (ml/min/1.73 m}^2\text{)} = 141 \times \min(S_{Cr}/K, \ 1)^{1.209} \times 0.993^{\text{age}} \times \text{max}(S_{Cr}/K, \ 1) \times 1.159 \text{ if female} \times 0.85 \text{ if black}
\]

Where:
- \(S_{Cr}\) = serum creatinine in mg/dL;
- \(K = 0.7\) for females and 0.9 for males;
- \(\text{age} = -0.329\) for females and \(-0.411\) for males;
- \(\min(S_{Cr}/K, \ 1)\) indicates the minimum of \(S_{Cr}/K\) or 1;
- \(\max(S_{Cr}/K, \ 1)\) indicates the maximum of \(S_{Cr}/K\) or 1.

**Modification of Diet in Renal disease (MDRD)** The MDRD formula, like CKD-EPI, is expressed in terms of body surface area. It is less accurate than the CKD-EPI formula when eGFR is greater than 60 mL/min/1.73 m². It also overestimates GFR in elderly patients.

**Estimated creatinine clearance**

**Cockcroft and Gault** The Cockcroft and Gault formula is the preferred method for estimating renal function or calculating drug doses in patients with renal impairment who are elderly or at extremes of muscle mass (see below); it provides an estimate of CrCl (which is not equivalent to eGFR).

\[
\text{Estimated Creatinine Clearance} = \frac{186 \times \text{Age} \times \text{Weight}}{\text{Serum creatinine} \times \text{Ideal body weight (kilograms)}}
\]

- \(\text{Age in years}\)
- \(\text{Weight in kilograms (use ideal body weight where fat is likely to be the major contributor to body mass)}\)
- \(\text{Serum creatinine in micromol/litre}\)
- \(\text{Ideal body weight} = \text{Constant + 0.018 \times \text{Height in centimetres}}\)

Where:
- \(\text{Constant} = 50\) for men; 45.5 for women
- \(\text{Height in centimetres}\)

**Estimated renal function in patients at extremes of muscle mass** In patients at both extremes of muscle mass, eGFR should be interpreted with caution. Reduced muscle mass will lead to overestimation of GFR and increased muscle mass will lead to underestimation of the GFR.

**Creatinine clearance or absolute glomerular filtration rate** should be used to adjust drug doses in patients with a BMI less than 18 kg/m² or greater than 40 kg/m². Ideal body weight should be used to calculate the CrCl. Where the patient’s actual body weight is less than their ideal body weight, actual body weight should be used instead.

The absolute glomerular filtration rate is determined by removing the normalisation for BSA from the eGFR using the following formula:

\[
\text{GFR (Absolute)} = \text{eGFR} \times (\text{individual’s body surface area} / 1.73)
\]

The ideal body weight is calculated as follows:

**Ideal body weight (kilograms) = Constant + 0.91 \times (Height - 152.4)**

Where:
- \(\text{Constant} = 50\) for men; 45.5 for women
- \(\text{Height in centimetres}\)

**Estimated renal function in elderly patients** The Cockcroft and Gault formula is the preferred method for estimating renal function in elderly patients aged 75 years and over.
**Chronic kidney disease**  
**Classification of chronic kidney disease using GFR and ACR**  
Chronic kidney disease is classified using a combination of GFR and albumin:creatinine ratio (ACR). A decreased GFR and an increased ACR is associated with an increased risk of adverse outcomes. For example, a person with an eGFR of 25 ml/min/1.73 m² and an ACR of 15 mg/mmol has a CKD classification of G4A2.

Prescribing in pregnancy

Overview
Drugs can have harmful effects on the embryo or fetus at any time during pregnancy. It is important to bear this in mind when prescribing for a woman of childbearing age or for men trying to father a child. During the first trimester drugs can produce congenital malformations (teratogenesis), and the period of greatest risk is from the third to the eleventh week of pregnancy. During the second and third trimesters drugs can affect the growth or functional development of the fetus, or they can have toxic effects on fetal tissues. Drugs given shortly before term or during labour can have adverse effects on labour or on the neonate after delivery. Not all the damaging effects of intra-uterine exposure to drugs are obvious at birth, some may only manifest later in life. Such late-onset effects include malignancy, e.g. adenocarcinoma of the vagina after puberty in females exposed to diethylstilbestrol in the womb, and adverse effects on intellectual, social, and functional development. The BNF and BNF for Children identifies drugs which:

- may have harmful effects in pregnancy and indicates the trimester of risk
- are not known to be harmful in pregnancy

The information is based on human data, but information from animal studies has been included for some drugs when its omission might be misleading. Maternal drug doses may require adjustment during pregnancy due to changes in maternal physiology but this is beyond the scope of the BNF and BNF for Children.

Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF and BNF for Children.

Important
Drugs should be prescribed in pregnancy only if the expected benefit to the mother is thought to be greater than the risk to the fetus, and all drugs should be avoided if possible during the first trimester. Drugs which have been extensively used in pregnancy and appear to be usually safe should be prescribed in preference to new or untried drugs; and the smallest effective dose should be used. Few drugs have been shown conclusively to be teratogenic in humans, but no drug is safe beyond all doubt in early pregnancy. Screening procedures are available when there is a known risk of certain defects.

Absence of information does not imply safety. It should be noted that the BNF and BNF for Children provide independent advice and may not always agree with the product literature.

Information on drugs and pregnancy is also available from the UK Teratology Information Service. www.uktis.org. Tel: 0344 892 0909 (09.00–17:00 Monday to Friday; urgent enquiries only outside these hours).

Prescribing in breast-feeding

Overview
Breast-feeding is beneficial; the immunological and nutritional value of breast milk to the infant is greater than that of formula feeds. Although there is concern that drugs taken by the mother might affect the infant, there is very little information on this. In the absence of evidence of an effect, the potential for harm to the infant can be inferred from:

- the amount of drug or active metabolite of the drug delivered to the infant (dependent on the pharmacokinetic characteristics of the drug in the mother);
- the efficiency of absorption, distribution, and elimination of the drug by the infant (infant pharmacokinetics);
- the nature of the effect of the drug on the infant (pharmacodynamic properties of the drug in the infant).

The amount of drug transferred in breast milk is rarely sufficient to produce a discernible effect on the infant. This applies particularly to drugs that are poorly absorbed and need to be given parenterally. However, there is a theoretical possibility that a small amount of drug present in breast milk can induce a hypersensitivity reaction. A clinical effect can occur in the infant if a pharmacologically significant quantity of the drug is present in milk. For some drugs (e.g. fluvastatin p. 196), the ratio between the concentration in milk and that in maternal plasma may be high enough to expose the infant to adverse effects. Some infants, such as those born prematurely or who have jaundice, are at a slightly higher risk of toxicity.

Some drugs inhibit the infant’s sucking reflex (e.g. phenobarbital p. 318) while others can affect lactation (e.g. bromocriptine p. 399).

The BNF identifies drugs:

- that should be used with caution or are contra-indicated in breast-feeding;
- that can be given to the mother during breastfeeding because they are present in milk in amounts which are too small to be harmful to the infant;
- that might be present in milk in significant amount but are not known to be harmful.

Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF.

Important
For many drugs insufficient evidence is available to provide guidance and it is advisable to administer only essential drugs to a mother during breast-feeding. Because of the inadequacy of information on drugs in breast-feeding, absence of information does not imply safety.
Prescribing in palliative care

Overview
Palliative care is an approach that improves the quality of life of patients and their families facing life-threatening illness, through the prevention and relief of suffering by means of early identification and impeccable assessment and treatment of pain and other problems, physical, psychological, and spiritual. Careful assessment of symptoms and needs of the patient should be undertaken by a multidisciplinary team.

Specialist palliative care is available in most areas as day hospice care, home-care teams (often known as Macmillan teams), in-patient hospice care, and hospital teams. Many acute hospitals and teaching centres now have consultative, hospital-based teams.

Hospice care of terminally ill patients has shown the importance of symptom control and psychosocial support of the patient and family. Families should be included in the care of the patient if they wish.

Many patients wish to remain at home with their families. Although some families may at first be afraid of caring for the patient at home, support can be provided by community nursing services, social services, voluntary agencies and hospices together with the general practitioner. The family may be reassured by the knowledge that the patient will be admitted to a hospital or hospice if the family cannot cope.

Drug treatment
The number of drugs should be as few as possible, for even the taking of medicine may be an effort. Oral medication is usually satisfactory unless there is severe nausea and vomiting, dysphagia, weakness, or coma, when parenteral medication may be necessary.

Pain
Pain management in palliative care is focused on achieving control of pain by administering the right drug in the right dose at the right time. Analgesics can be divided into three broad classes: non-opioid (paracetamol p. 422, NSAID), opioid (e.g. codeine phosphate ‘weak’ p. 431, morphine ‘strong’ p. 439) and adjuvant (e.g. antidepressants, antiepileptics). Drugs from the different classes are used alone or in combination according to the type of pain and response to treatment. Analgesics are more effective in preventing pain than in the relief of established pain; it is important that they are given regularly.

Paracetamol p. 422 or a NSAID given regularly will often be sufficient to manage mild pain. If non-opioid analgesics alone are not sufficient, then an opioid analgesic alone or in combination with a non-opioid analgesic at an adequate dosage, may be helpful in the control of moderate pain. Codeine phosphate p. 431 or tramadol hydrochloride p. 447 can be considered for moderate pain. If these preparations do not control the pain then morphine p. 439 is the most useful opioid analgesic. Alternatives to morphine including transdermal buprenorphine p. 425, transdermal fentanyl p. 434, hydrocode (crude) hydrochloride p. 439, methadone hydrochloride p. 476, or oxycodone hydrochloride p. 442, should be initiated by those with experience in palliative care. Initiation of an opioid analgesic should not be delayed by concern over a theoretical likelihood of psychological dependence (addiction).

Bone metastases
In addition to the above approach, radiotherapy, bisphosphonates, and radioactive isotopes of strontium ranelate p. 690 (Metastron® available from GE Healthcare) may be useful for pain due to bone metastases.

Neuropathic pain
Patients with neuropathic pain may benefit from a trial of a tricyclic antidepressant. An antiepileptic may be added or substituted if pain persists; gabapentin p. 301 and pregabalin p. 310 are licensed for neuropathic pain. Ketamine p. 1234 is sometimes used under specialist supervision for neuropathic pain that responds poorly to opioid analgesics. Pain due to nerve compression may be reduced by a corticosteroid such as dexamethasone p. 635, which reduces oedema around the tumour, thus reducing compression. Nerve blocks or regional anaesthesia techniques (including the use of epidural and intrathecal catheters) can be considered when pain is localised to a specific area.

Pain management with opioids

Oral route
Treatment with morphine p. 439 is given by mouth as immediate-release or modified-release preparations. During the titration phase the initial dose is based on the previous medication used, the severity of the pain, and other factors such as presence of renal impairment, increasing age, or frailty. The dose is given either as an immediate-release preparation 4-hourly or as a modified-release preparation 12-hourly, in addition to rescue doses.

If pain occurs between regular doses of morphine (‘breakthrough pain’), an additional dose (‘rescue dose’) of immediate-release morphine should be given. An additional dose should also be given 30 minutes before an activity that causes pain, such as wound dressing. The standard dose of a strong opioid for breakthrough pain is usually one-tenth to one-sixth of the regular 24-hour dose, repeated every 2–4 hours as required (up to hourly may be needed if pain is severe or in the last days of life). Review pain management if rescue analgesic is required frequently (twice daily or more). Each patient should be assessed on an individual basis.

Formulations of fentanyl p. 434 that are administered nasally, buccally or sublingually are also licensed for breakthrough pain.

When adjusting the dose of morphine, the number of rescue doses required and the response to them should be taken into account; increments of morphine should not exceed one-third to one-half of the total daily dose every 24 hours. Thereafter, the dose should be adjusted with careful assessment of the pain, and the use of adjuvant analgesics should also be considered. Upward titration of the dose of morphine stops when either the pain is relieved or unacceptable adverse effects occur, after which it is necessary to consider alternative measures.

Morphine immediate-release 30mg 4-hourly (or modified-release 100mg 12-hourly) is usually adequate for most patients; some patients require morphine immediate-release up to 200mg 4-hourly (or modified-release 600mg 12-hourly), occasionally more is needed.

Once their pain is controlled, patients started on 4-hourly immediate-release morphine can be transferred to the same total 24-hour dose of morphine given as the modified-release preparation for 12-hourly or 24-hourly administration. The first dose of the modified-release preparation is given with, or within 4 hours of, the last dose of the immediate-release preparation. For preparations suitable for 12-hourly or 24-hourly administration see modified-release preparations under morphine p. 439. Increments should be made to the dose, not to the frequency of administration. The patient must be monitored closely for efficacy and side-effects, particularly constipation, and nausea and vomiting. A suitable laxative should be prescribed routinely.

Oxycodone hydrochloride p. 442 can be used in patients who require an opioid but cannot tolerate morphine. If the patient is already receiving an opioid, oxycodone hydrochloride should be started at a dose equivalent to the current analgesic (see below). Oxycodone hydrochloride immediate-release preparations can be given for breakthrough pain.

Neuropathic pain
Patients with neuropathic pain may benefit from a trial of a tricyclic antidepressant. An antiepileptic may be added or substituted if pain persists; gabapentin p. 301 and pregabalin p. 310 are licensed for neuropathic pain. Ketamine p. 1234 is sometimes used under specialist supervision for neuropathic pain that responds poorly to opioid analgesics. Pain due to nerve compression may be reduced by a corticosteroid such as dexamethasone p. 635, which reduces oedema around the tumour, thus reducing compression. Nerve blocks or regional anaesthesia techniques (including the use of epidural and intrathecal catheters) can be considered when pain is localised to a specific area.

</tbody>
</table>
| PO = by mouth; IM = intramuscular; IV = intravenous; SC = subcutaneous

**Parenteral route** The equivalent parenteral dose of morphine p. 439 (subcutaneous, intramuscular, or intravenous) is about half of the oral dose. If the patient becomes unable to swallow, generally morphine is administered as a continuous subcutaneous infusion (for details, see Continuous Subcutaneous Infusions below). Diamorphine hydrochloride p. 433 is sometimes preferred, because being more soluble, it can be given in a smaller volume. The equivalent subcutaneous dose of diamorphine hydrochloride is about one-third of the oral dose of morphine.

If the patient can resume taking medicines by mouth, then oral morphine may be substituted for subcutaneous infusion of morphine or diamorphine hydrochloride, see table above of approximate equivalent doses of morphine and diamorphine hydrochloride. The infusion is discontinued when the first oral dose of morphine is given.

**Rectal route** Morphine is also available for rectal administration as suppositories; alternatively oxycodone hydrochloride suppositories p. 442 can be obtained on special order.

**Transdermal route** Transdermal preparations of fentanyl p. 434 and buprenorphine p. 425 are available, they are not suitable for acute pain or in patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Prescribers should ensure that they are familiar with the correct use of transdermal preparations, see under buprenorphine p. 425 and fentanyl p. 434 (inappropriate use has caused fatalities). Immediate-release morphine p. 439 can be given for breakthrough pain. The following 24-hour oral doses of morphine are considered to be approximately equivalent to the buprenorphine and fentanyl patches shown, however when switching due to possible opioid-induced hyperalgesia, reduce the calculated equivalent dose of the new opioid by one-quarter to one-half.

### Buprenorphine patches are approximately equivalent to the following 24-hour doses of oral morphine

- morphine salt 12 mg daily = buprenorphine ’5’ patch
- morphine salt 24 mg daily = buprenorphine ’10’ patch
- morphine salt 36 mg daily = buprenorphine ’15’ patch
- morphine salt 48 mg daily = buprenorphine ’20’ patch
- morphine salt 84 mg daily = buprenorphine ’35’ patch
- morphine salt 126 mg daily = buprenorphine ’52.5’ patch
- morphine salt 168 mg daily = buprenorphine ’70’ patch

Formulations of transdermal patches are available as 72-hourly, 96-hourly and 7-day patches, for further information see buprenorphine p. 425. Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.

### 72-hour Fentanyl patches are approximately equivalent to the following 24-hour doses of oral morphine

- morphine salt 30 mg daily = fentanyl ’12’ patch
- morphine salt 60 mg daily = fentanyl ’25’ patch
- morphine salt 120 mg daily = fentanyl ’50’ patch
- morphine salt 180 mg daily = fentanyl ’75’ patch
- morphine salt 240 mg daily = fentanyl ’100’ patch

Fentanyl equivalences in this table are for patients on well-tolerated opioid therapy for long periods; for patients who are opioid naive or who have been stable on oral morphine or other immediate release opioid for only several weeks, see Transdermal Route. Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.

### Symptom control

Several recommendations in this section involve unlicensed indications or routes.

**Anorexia** Anorexia may be helped by prednisolone p. 639 or dexamethasone p. 635.

**Bowel colic and excessive respiratory secretions** Bowel colic and excessive respiratory secretions may be reduced by a subcutaneous injection of hyoscine hydrobromide p. 417, hyoscine butylbromide p. 83, or glycopyrronium bromide p. 238. These antimuscarinics are generally given every 4 hours when required, but hourly use is occasionally necessary, particularly in excessive respiratory secretions. If symptoms persist, they can be given regularly via a continuous infusion device. Care is required to avoid the discomfort of dry mouth.

**Capillary bleeding** Capillary bleeding can be treated with tranexamic acid p. 107 by mouth; treatment is usually discontinued one week after the bleeding has stopped, or, if necessary, it can be continued at a reduced dose. Alternatively, gauze soaked in tranexamic acid 100 mg/mL p. 107 or adrenaline/epinephrine solution 1 mg/mL (1 in 1000) p. 216 can be applied to the affected area.

Vitamin K may be useful for the treatment and prevention of bleeding associated with prolonged clotting in liver disease. In severe chronic cholestasis, absorption of vitamin K may be impaired; either parenteral or water-soluble oral vitamin K (see phytomenadione p. 997 and menadion sodium phosphate p. 996) should be considered.

**Constipation** Constipation is a common cause of distress and is almost invariably after administration of an opioid.
analgesic. It should be prevented if possible by the regular administration of laxatives; a faecal softener with a peristaltic stimulant (e.g. co-danthramer p. 60) or lactulose solution p. 55 with a senna preparation p. 61 should be used. Methylprednisolone p. 62 is licensed for the treatment of opioid-induced constipation.

Convolutions Patients with cerebral tumours or uraemia may be susceptible to convulsions. Prophylactic treatment with phenytoin p. 308 or carbamazepine p. 297 should be considered. When oral medication is no longer possible, diazepam p. 327 given rectally, or phenobarbital p. 318 by injection is continued as prophylaxis. For the use of midazolam p. 323 by subcutaneous infusion using a continuous infusion device see below.

Dry mouth Dry mouth may be relieved by good mouth care and measures such as chewing sugar-free gum, sucking ice or pineapple chunks, or the use of artificial saliva, dry mouth associated with candidiasis can be treated by oral preparations of nystatin p. 1116 or miconazole p. 782, alternatively, fluconazole p. 562 can be given by mouth. Dry mouth may be caused by certain medications including opioids, antimuscarinic drugs (e.g. hyoscine), antidepressants and some antiepileptics; if possible, an alternative preparation should be considered.

Dysphagia A corticosteroid such as dexamethasone p. 635 may help, temporarily, if there is an obstruction due to tumour. See also Dry mouth, above.

Dyspnoea Breathlessness at rest may be relieved by regular oral morphine p. 439 in carefully titrated doses. Diazepam p. 327 may be helpful for dyspnoea associated with anxiety. A corticosteroid, such as dexamethasone p. 635, may also be helpful if there is bronchospasm or partial obstruction.

Fungating tumours Fungating tumours can be treated by regular dressing and antibacterial drugs; systemic treatment with metronidazole p. 512 is often required to reduce malodour but topical metronidazole p. 512 is also used.

Gastro-intestinal pain The pain of bowel colic may be reduced by loperamide hydrochloride p. 65. Hyoscine butylbromide p. 83, hyoscine hydrobromide p. 417, and glycopyrronium bromide p. 238 can also be used to treat bowel colic. Gastric distension pain due to pressure on the stomach may be caused by certain medications including opioids, antimuscarinic drugs (e.g. hyoscine), antidepressants and some antiepileptics; if possible, an alternative preparation should be considered.

Hiccups Hiccups may be relieved by moist inhalations or by regular administration of oral morphine p. 439. Methadone hydrochloride linctus p. 476 should be avoided because it has a long duration of action and tends to accumulate.

Muscle spasm The pain of muscle spasm can be helped by a muscle relaxant such as diazepam p. 327 or baclofen p. 1026.

Nausea and vomiting Nausea and vomiting are common in patients with advanced cancer. Ideally, the cause should be determined before treatment with an antiemetic is started. A prokinetic antiemetic may be a preferred choice for first-line therapy. Nausea and vomiting may occur with opioid therapy particularly in the initial stages but can be prevented by giving an antiemetic such as haloperidol p. 368 or metoclopramide hydrochloride p. 411. An antiemetic is usually necessary only for the first 4 or 5 days and therefore combined preparations containing an opioid with an antiemetic are not recommended because they lead to unnecessary antiemetic therapy (and associated side-effects when used long-term). Metoclopramide hydrochloride p. 411 has a prokinetic action and is used by mouth for nausea and vomiting associated with gastritis, gastric stasis, and functional bowel obstruction. Drugs with antimuscarinic effects antagonise prokinetic drugs and, if possible, should not be used concurrently.

Metoclopramide hydrochloride p. 411 has a prokinetic action and is used by mouth for nausea and vomiting associated with gastritis, gastric stasis, and functional bowel obstruction. Drugs with antimuscarinic effects antagonise prokinetic drugs and, if possible, should not be used concurrently.

Haloperidol p. 368 is used by mouth for most metabolic causes of vomiting (e.g. hypercalcaemia, renal failure). Cyclizine p. 409 is given by mouth. It is used for nausea and vomiting due to mechanical bowel obstruction, raised intracranial pressure, and motion sickness. Levomepromazine p. 419 is used as an antiemetic; it is given by mouth or by subcutaneous injection at bedtime. For the dose by subcutaneous infusion see below. Dexamethasone p. 635 by mouth can be used as an adjunct. Antiemetic therapy should be reviewed every 24 hours; it may be necessary to substitute the antiemetic or to add another one.

For the administration of antiemetics by subcutaneous infusion using a continuous infusion device, see below. For the treatment of nausea and vomiting associated with cancer chemotherapy see Cytotoxic drugs p. 824.

Pruritus Pruritus, even when associated with obstructive jaundice, often responds to simple measures such as application of emollients. In the case of obstructive jaundice, further measures include administration of colestyramine p. 191.

Raised intracranial pressure Headache due to raised intracranial pressure often responds to a high dose of a corticosteroid, such as dexamethasone p. 635 and should be given before 6 p.m. to reduce the risk of insomnia.

Restlessness and confusion Restlessness and confusion may require treatment with an antipsychotic, e.g. haloperidol p. 368 or levomepromazine p. 419, by mouth or by subcutaneous injection, both repeated every 2 hours if required. The dose and frequency is adjusted according to the level of patient distress and the response. A regular maintenance dose should also be considered, given twice daily either by mouth or by subcutaneous injection; alternatively use a continuous infusion device.

Levomepromazine is licensed to treat pain in palliative care—this use is reserved for distressed patients with severe pain unresponsive to other measures (seek specialist advice).

Continuous subcutaneous infusions Although drugs can usually be administered by mouth to control the symptoms of advanced cancer, the parenteral route may sometimes be necessary. Repeated administration of intramuscular injections can be difficult in a cachectic patient. This has led to the use of portable continuous infusion devices, such as syringe drivers, to give a continuous subcutaneous infusion, which can provide good control of symptoms with little discomfort or inconvenience to the patient.

Indications for the parenteral route are:

- the patient is unable to take medicines by mouth owing to nausea and vomiting, dysphagia, severe weakness, or coma
- there is malignant bowel obstruction in patients for whom further surgery is inappropriate (avoiding the need for
an intravenous infusion or for insertion of a nasogastric tube.

- occasionally when the patient does not wish to take regular medication by mouth.

**Syringe driver rate settings** Staff using syringe drivers should be adequately trained and different rate settings should be clearly identified and differentiated; incorrect use of syringe drivers is a common cause of medication errors.

**Bowel colic and excessive respiratory secretions** Hyoscine hydrobromide p. 417 effectively reduces respiratory secretions and bowel colic and is sedative (but occasionally causes paradoxical agitation).

Hyoscine butylbromide p. 83 is used for bowel colic and for excessive respiratory secretions, and is less sedative than hyoscine hydrobromide.

Glycopyrronium bromide p. 238 may also be used to treat bowel colic or excessive respiratory secretions.

**Confusion and restlessness** Haloperidol p. 368 has little sedative effect.

Levomepromazine p. 419 has a sedative effect.

Midazolam p. 323 is a sedative and an antiepileptic that may be used in addition to an antipsychotic drug in a very restless patient. Midazolam is also used for myoclonus.

**Convulsions** If a patient has previously been receiving an antiepileptic drug or has a primary or secondary cerebral tumour or is at risk of convulsion (e.g. owing to uraemia) antiepileptic medication should not be stopped. Midazolam p. 323 is the benzodiazepine antiepileptic of choice for continuous subcutaneous infusion.

**Nausea and vomiting** Haloperidol p. 368 and levomepromazine p. 419 can both be given as a subcutaneous infusion but sedation can limit the dose of levomepromazine.

Cyclizine is particularly likely to precipitate if mixed with diamorphine or other drugs (see under Mixing and Compatibility, below)

Metoclopramide hydrochloride p. 411 can cause skin reactions.

Octreotide p. 877, which stimulates water and electrolyte absorption and inhibits water secretion in the small bowel, can be used by subcutaneous infusion to reduce intestinal secretions and to reduce vomiting due to bowel obstruction.

**Pain control** Diamorphine hydrochloride p. 433 is the preferred opioid since its high solubility permits a large dose to be given in a small volume (see under Mixing and Compatibility, below). The table shows approximate equivalent doses of morphine and diamorphine hydrochloride.

**Mixing and compatibility** The general principle that injections should be given into separate sites (and should not be mixed) does not apply to the use of syringe drivers in palliative care. Provided that there is evidence of compatibility, selected injections can be mixed in syringe drivers. Not all types of medication can be used in a subcutaneous infusion. In particular, chlorpromazine hydrochloride p. 367, prochlorperazine p. 371, and diazepam p. 327 are contra-indicated as they cause skin reactions at the injection site; to a lesser extent cyclizine p. 409 and levomepromazine p. 419 also sometimes cause local irritation.

In theory injections dissolved in water for injections are more likely to be associated with pain (possibly owing to their hypotonicity). The use of physiological saline (sodium chloride 0.9% p. 953) however increases the likelihood of precipitation when more than one drug is used; moreover subcutaneous infusion rates are so slow (0.1–0.3 mL/hour) that pain is not usually a problem when water is used as a diluent.

**Compatibility with diamorphine** Diamorphine can be given by subcutaneous infusion in a strength of up to 250 mg/mL; up to a strength of 40 mg/mL either water for injections or physiological saline (sodium chloride 0.9%) is a suitable diluent—above that strength only water for injections is used (to avoid precipitation).

The following can be mixed with diamorphine:

- **Cyclizine**, may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.

- **Dexamethasone**, special care is needed to avoid precipitation of dexamethasone when preparing it.

- **Haloperidol**, mixtures of haloperidol and diamorphine are likely to precipitate after 24 hours if haloperidol concentration is above 2 mg/mL.

- **Hyoscine butylbromide**

- **Hyoscine hydrobromide**

- **Levomepromazine**

- **Metoclopramide**, under some conditions infusions containing metoclopramide become discoloured; such solutions should be discarded.

**Midazolam**

Subcutaneous infusion solution should be monitored regularly both to check for precipitation (and discolouration) and to ensure that the infusion is running at the correct rate.

**Problems encountered with syringe drivers** The following are problems that may be encountered with syringe drivers and the action that should be taken:

- if the subcutaneous infusion runs too quickly check the rate setting and the calculation;

- if the subcutaneous infusion runs too slowly check the start button, the battery, the syringe driver, the cannula, and make sure that the injection site is not inflamed;

- if there is an injection site reaction make sure that the site does not need to be changed—firmness or swelling at the site of injection is not in itself an indication for change, but pain or obvious inflammation is.
Equivalent doses of morphine sulfate and diamorphine hydrochloride given over 24 hours

These equivalences are *approximate only* and should be adjusted according to response

If breakthrough pain occurs give a subcutaneous (preferable) or intramuscular injection equivalent to one-tenth to one-sixth of the total 24-hour subcutaneous infusion dose. It is kinder to give an intermittent bolus injection subcutaneously—absorption is smoother so that the risk of adverse effects at peak absorption is avoided (an even better method is to use a subcutaneous butterfly needle). To minimise the risk of infection no individual subcutaneous infusion solution should be used for longer than 24 hours.
Prescribing in the elderly

Overview
Old people, especially the very old, require special care and consideration from prescribers. Medicines for Older People, a component document of the National Service Framework for Older People (Department of Health. National Service Framework for Older People. London: Department of Health, March 2001), describes how to maximise the benefits of medicines and how to avoid excessive, inappropriate, or inadequate consumption of medicines by older people.

Appropriate prescribing
Elderly patients often receive multiple drugs for their multiple diseases. This greatly increases the risk of drug interactions as well as adverse reactions, and may affect compliance. The balance of benefit and harm of some medicines may be altered in the elderly. Therefore, elderly patients’ medicines should be reviewed regularly and medicines which are not of benefit should be stopped. Non-pharmacological measures may be more appropriate for symptoms such as headache, sleeplessness, and light-headedness when associated with social stress as in widowhood, loneliness, and family dispersal.

In some cases prophylactic drugs are inappropriate if they are likely to complicate existing treatment or introduce unnecessary side-effects, especially in elderly patients with poor prognosis or with poor overall health. However, elderly patients should not be denied medicines which may help them, such as anticoagulants or antiplatelet drugs for atrial fibrillation, antihypertensives, statins, and drugs for osteoporosis.

Form of medicine
Frail elderly patients may have difficulty swallowing tablets; if left in the mouth, ulceration may develop. They should always be encouraged to take their tablets or capsules with enough fluid, and whilst in an upright position to avoid the possibility of oesophageal ulceration. It can be helpful to discuss with the patient the possibility of taking the drug as a liquid if available.

Manifestations of ageing
In the very old, manifestations of normal ageing may be mistaken for disease and lead to inappropriate prescribing. In addition, age-related muscle weakness and difficulty in maintaining balance should not be confused with neurological disease. Disorders such as light-headedness not associated with postural or postprandial hypotension are unlikely to be helped by drugs.

Sensitivity
The nervous system of elderly patients is more sensitive to many commonly used drugs, such as opioid analgesics, benzodiazepines, antipsychotics, and antiparkinsonian drugs, all of which must be used with caution. Similarly, other organs may also be more susceptible to the effects of drugs such as anti-hypertensives and NSAIDs.

Pharmacokinetics
Pharmacokinetic changes can markedly increase the tissue concentration of a drug in the elderly, especially in debilitated patients. The most important effect of age is reduced renal clearance. Many aged patients thus excrete drugs slowly, and are highly susceptible to nephrotoxic drugs. Acute illness can lead to rapid reduction in renal clearance, especially if accompanied by dehydration. Hence, a patient stabilised on a drug with a narrow margin between the therapeutic and the toxic dose (e.g. digoxin p. 106) can rapidly develop adverse effects in the aftermath of a myocardial infarction or a respiratory-tract infection. The hepatic metabolism of lipid soluble drugs is reduced in elderly patients because there is a reduction in liver volume. This is important for drugs with a narrow therapeutic window.

Adverse reactions
Adverse reactions often present in the elderly in a vague and non-specific fashion. Confusion is often the presenting symptom (caused by almost any of the commonly used drugs). Other common manifestations are constipation (with antimuscarinics and many tranquillisers) and postural hypotension and falls (with diuretics and many psychotropics).

Hypnotics
Many hypnotics with long half-lives have serious hangover effects, including drowsiness, unsteady gait, slurred speech, and confusion. Hypnotics with short half-lives should be used but they too can present problems. Short courses of hypnotics are occasionally useful for helping a patient through an acute illness or some other crisis but every effort must be made to avoid dependence. Benzodiazepines impair balance, which can result in falls.

Diuretics
Diuretics are overprescribed in old age and should not be used on a long-term basis to treat simple gravitational oedema which will usually respond to increased movement, raising the legs, and support stockings. A few days of diuretic treatment may speed the clearing of the oedema but it should rarely need continued drug therapy.

NSAIDs
Bleeding associated with aspirin and other NSAIDs is more common in the elderly who are more likely to have a fatal or serious outcome. NSAIDs are also a special hazard in patients with cardiac disease or renal impairment which may again place older patients at particular risk. Owing to the increased susceptibility of the elderly to the side-effects of NSAIDs the following recommendations are made:
- for osteoarthritis, soft-tissue lesions, and back pain, first try measures such as weight reduction (if obese), warmth, exercise, and use of a walking stick;
- for osteoarthritis, soft-tissue lesions, back pain, and pain in rheumatoid arthritis, paracetamol p. 422 should be used first and can often provide adequate pain relief;
- alternatively, a low-dose NSAID (e.g. ibuprofen p. 1041 up to 1.2 g daily) may be given;
- for pain relief when either drug is inadequate, paracetamol in a full dose plus a low-dose NSAID may be given;
- if necessary, the NSAID dose can be increased or an opioid analgesic given with paracetamol;
- do not give two NSAIDs at the same time.

Prophylaxis of NSAID-induced peptic ulcers may be required if continued NSAID treatment is necessary. NSAID-associated ulcers under Peptic ulceration p. 70.

Other drugs
Other drugs which commonly cause adverse reactions are antiparkinsonian drugs, antihypertensives, psychotropics, and digoxin p. 106. The usual maintenance dose of digoxin in very old patients is 125 micrograms daily (62.5 micrograms in those with renal disease); lower doses are often inadequate but toxicity is common in those given 250 micrograms daily. Drug-induced blood disorders are much more common in the elderly. Therefore drugs with a tendency to cause bone marrow depression (e.g. co-trimoxazole p. 531, mianserin...
hydrochloride p. 353) should be avoided unless there is no acceptable alternative.
The elderly generally require a lower maintenance dose of warfarin sodium p. 135 than younger adults; once again, the outcome of bleeding tends to be more serious.

**Guidelines**
Always consider whether a drug is indicated at all.

**Limit range**  It is a sensible policy to prescribe from a limited range of drugs and to be thoroughly familiar with their effects in the elderly.

**Reduce dose**  Dosage should generally be substantially lower than for younger patients and it is common to start with about 50% of the adult dose. Some drugs (e.g. long-acting antidiabetic drugs such as glibenclamide p. 665) should be avoided altogether.

**Review regularly**  Review repeat prescriptions regularly. In many patients it may be possible to stop some drugs, provided that clinical progress is monitored. It may be necessary to reduce the dose of some drugs as renal function declines.

**Simplify regimens**  Elderly patients benefit from simple treatment regimens. Only drugs with a clear indication should be prescribed and whenever possible given once or twice daily. In particular, regimens which call for a confusing array of dosage intervals should be avoided.

**Explain clearly**  Write full instructions on every prescription (including repeat prescriptions) so that containers can be properly labelled with full directions. Avoid imprecisions like ‘as directed’. Child-resistant containers may be unsuitable.

**Repeats and disposal**  Instruct patients what to do when drugs run out, and also how to dispose of any that are no longer necessary. Try to prescribe matching quantities. If these guidelines are followed most elderly people will cope adequately with their own medicines. If not then it is essential to enrol the help of a third party, usually a relative or a friend.

---

**Drugs and sport**

**Anti-doping**
UK Anti-Doping, the national body responsible for the UK’s anti-doping policy, advises that athletes are personally responsible should a prohibited substance be detected in their body. Information regarding the use of medicines in sport is available from:

UK Anti-doping
Fleetbank House
2-6 Salisbury Square
London
EC4Y 8AE
(020) 7842 3450
ukad@ukad.org.uk
www.ukad.org.uk

Information about the prohibited status of specific medications based on the current World Anti-Doping Agency Prohibited List is available from Global Drug Reference Online: www.globaldro.com/UK/search

**General Medical Council’s advice**
Doctors who prescribe or collude in the provision of drugs or treatment with the intention of improperly enhancing an individual’s performance in sport contravene the GMC’s guidance, and such actions would usually raise a question of a doctor’s continued registration. This does not preclude the provision of any care or treatment where the doctor’s intention is to protect or improve the patient’s health.
Prescribing in dental practice

General guidance
Advice on the drug management of dental and oral conditions has been integrated into the main text. For ease of access, guidance on such conditions is usually identified by means of a relevant heading (e.g. Dental and Orofacial Pain) in the appropriate sections of the BNF. The following is a list of topics of particular relevance to dentists:
- Prescribing by dentists, see Prescription writing p. 5
- Oral side-effects of drugs, see Adverse reactions to drugs p. 12
- Medical emergencies in dental practice, see below
- Medical problems in dental practice, see below

Drug management of dental and oral conditions

Dental and orofacial pain
- Neuropathic pain p. 457
- Non-opioid analgesics and compound analgesic preparations, see Analgesics p. 420
- Opioid analgesics, see Analgesics p. 420
- Non-steroidal anti-inflammatory drugs p. 1028

Oral infections
- Bacterial infections, see Antibacterials, principles of therapy p. 479
  - Phenoxymethylpenicillin p. 518
  - Broad-spectrum penicillins (amoxicillin p. 518 and ampicillin p. 520)
  - Cephalexins (cefelexin p. 497 and cefradine p. 497)
  - Tetracyclines p. 533
  - Macrolides (clarithromycin p. 508, erythromycin p. 510 and azithromycin p. 507)
  - Clindamycin p. 506
  - Metronidazole p. 512
  - Fusidic acid p. 539

Fungal infections
- Local treatment, see Oropharyngeal fungal infections p. 1115
- Systemic treatment, see Antifungals, systemic use p. 558

Viral infections
- Herpetic gingivostomatitis, local treatment, see Oropharyngeal viral infections p. 1116
- Herpetic gingivostomatitis, systemic treatment, see Oropharyngeal viral infections p. 1116 and Herpesvirus infections p. 598
- Herpes labialis, see Skin infections p. 1125

Anaesthetics, anxiolytics and hypnotics
- Sedation, anaesthesia, and resuscitation in dental practice p. 1219
- Hypnotics, see Hypnotics and anxiolytics p. 459
- Sedation for dental procedures, see Hypnotics and anxiolytics p. 459
- Local anaesthesia p. 1236

Minerals
- Fluorides

Oral ulceration and inflammation p. 1111
- Mouthwashes, gargles and dentifrices, see Mouthwashes and other preparations for ooropharyngeal use p. 1107
- Dry mouth, see Treatment of dry mouth p. 1105
- Aromatic inhalations, see Aromatic inhalations, cough preparations and systemic nasal decongestants p. 282
- Nasal decongestants, see Aromatic inhalations, cough preparations and systemic nasal decongestants p. 282
- Dental Practitioners’ Formulary p. 1482

Medical emergencies in dental practice
This section provides guidelines on the management of the more common medical emergencies which may arise in dental practice. Dentists and their staff should be familiar with standard resuscitation procedures, but in all circumstances it is advisable to summon medical assistance as soon as possible. See also algorithm of the procedure for Cardiopulmonary resuscitation p. 1533.

The drugs referred to in this section include:
- Adrenaline/epinephrine Injection p. 216, adrenaline 1 in 1000, (adrenaline 1 mg/mL as acid tartrate), 1 mL amps
- Aspirin Dispersible Tablets 300 mg p. 117
- Glucagon Injection p. 681, glucagon (as hydrochloride), 1–unit vial (with solvent) p. 681
- Oxygen
- Midazolam Oromucosal Solution p. 323, midazolam 5 mg/mL p. 323
- Salbutamol Aerosol Inhalation p. 244, salbutamol 100 micrograms/metered inhalation p. 244

Adrenal insufficiency
Adrenal insufficiency may follow prolonged therapy with corticosteroids and can persist for years after stopping. A patient with adrenal insufficiency may become hypotensive under the stress of a dental visit (important: see individual monographs for details of corticosteroid cover before dental surgical procedures under general anaesthesia).

Management
- Lay the patient flat
- Give oxygen
- Transfer patient urgently to hospital

Anaphylaxis
A severe allergic reaction may follow oral or parenteral administration of a drug. Anaphylactic reactions in dentistry may follow the administration of a drug or contact with substances such as latex in surgical gloves. In general, the more rapid the onset of the reaction the more profound it tends to be. Symptoms may develop within minutes and rapid treatment is essential. Anaphylactic reactions may also be associated with additives and excipients in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens (including those for topical application, particularly if they are intended for use in the mouth or for application to the nasal mucosa).

Symptoms and signs
- Paraesthesia, flushing, and swelling of face
- Generalised itching, especially of hands and feet
- Bronchospasm and laryngospasm (with wheezing and difficulty in breathing)
- Rapid weak pulse together with fall in blood pressure and pallor; finally cardiac arrest

Management
First-line treatment includes securing the airway, restoration of blood pressure (laying the patient flat and raising the feet, or in the recovery position if unconscious or nauseous and at risk of vomiting), and administration of adrenaline/epinephrine injection p. 216. This is given intramuscularly in a dose of 500 micrograms (0.5 mL adrenaline injection 1 in 1000); a dose of 300 micrograms (0.3 mL adrenaline injection 1 in 1000) may be appropriate for immediate self-administration. The dose is repeated if...
necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function. Oxygen administration is also of primary importance. Arrangements should be made to transfer the patient to hospital urgently.

**Asthma**

Patients with asthma may have an attack while at the dental surgery. Most attacks will respond to 2 puffs of the patient’s short-acting beta agonist inhaler such as salbutamol 100 micrograms/puff p. 244; further puffs are required if the patient does not respond rapidly. If the patient is unable to use the inhaler effectively, further puffs should be given through a large-volume spacer device (or, if not available, through a plastic or paper cup with a hole in the bottom for the inhaler mouthpiece). If the response remains unsatisfactory, or if further deterioration occurs, then the patient should be transferred urgently to hospital. Whilst awaiting transfer, oxygen should be given with salbutamol 5 mg or terbutaline sulfate 100 micrograms/puff p. 246 by nebuliser; if a nebuliser is unavailable, then 2–10 puffs of salbutamol 100 micrograms/metered inhalation should be given (preferably by a large-volume spacer), and repeated every 5 mg or terbutaline sulfate

Reassure the patient as much as possible to relieve further anxiety. If available, aspirin p. 117 in a single dose of 300 mg should be given. A note (to say that aspirin has been given) should be sent with the patient to the hospital. For further details on the initial management of myocardial infarction, see Management of ST-Segment Elevation Myocardial Infarction.

If the patient collapses and loses consciousness attempt standard resuscitation measures. See also algorithm of the procedure for Cardiopulmonary resuscitation p. 1533.

**Epileptic seizures**

Patients with epilepsy must continue with their normal dosage of anticonvulsant drugs when attending for dental treatment. It is not uncommon for epileptic patients not to volunteer the information that they are epileptic but there should be little difficulty in recognising a tonic-clonic (grand mal) seizure.

**Symptoms and signs**

- There may be a brief warning (but variable)
- Sudden loss of consciousness, the patient becomes rigid, falls, may give a cry, and becomes cyanotic (tonic phase)
- After 30 seconds, there are jerking movements of the limbs; the tongue may be bitten (clonic phase)
- There may be frothing from mouth and urinary incontinence
- The seizure typically lasts a few minutes; the patient may then become flaccid but remain unconscious. After a variable time the patient regains consciousness but may remain confused for a while

**Management**

During a convulsion try to ensure that the patient is not at risk from injury but make no attempt to put anything in the mouth or between the teeth (in mistaken belief that this will protect the tongue). Give oxygen to support respiration if necessary. Do not attempt to restrain convulsive movements. After convulsive movements have subsided place the patient in the coma (recovery) position and check the airway. After convulsive movements have subsided place the patient in the coma (recovery) position and check the airway. Again, the patient should be little dif volunteer the information that they are epileptic but there may not have such prominent changes but may appear unduly lethargic.

**Cardiac emergencies**

If there is a history of angina the patient will probably carry glyceryl trinitrate spray or tablets p. 212 (or isosorbide dinitrate tablets p. 214) and should be allowed to use them. Hospital admission is not necessary if symptoms are mild and resolve rapidly with the patient’s own medication. See also Coronary Artery Disease below.

Arrhythmias may lead to a sudden reduction in cardiac output with loss of consciousness. Medical assistance should be summoned. For advice on pacemaker interference, see also Pacemakers below.

The pain of myocardial infarction is similar to that of angina but generally more severe and more prolonged. For general advice see also Coronary Artery Disease below.

**Symptoms and signs of myocardial infarction:**

- Progressive onset of severe, crushing pain across front of chest; pain may radiate towards the shoulder and down arm, or into neck and jaw
- Skin becomes pale and clammy
- Nausea and vomiting are common
- Pulse may be weak and blood pressure may fall
- Breathlessness

**Initial management of myocardial infarction:**

Call immediately for medical assistance and an ambulance, as appropriate.

Allow the patient to rest in the position that feels most comfortable; in the presence of breathlessness this is likely to be sitting position, whereas the syncopal patient should be laid flat; often an intermediate position (dictated by the patient) will be most appropriate. Oxygen may be administered.

Sublingual glyceryl trinitrate p. 212 may relieve pain. Intramuscular injection of drugs should be avoided because absorption may be too slow (particularly when cardiac output is reduced) and pain relief is inadequate. Intramuscular injection also increases the risk of local bleeding into the muscle if the patient is given a thrombolytic drug.

Dental procedure. This should be discussed with the patient as appropriate.

Hospital admission is not necessary if symptoms are mild and resolve rapidly with the patient’s own medication. See also Coronary Artery Disease below.

**Hypoglycaemia**

Insulin-treated diabetic patients attending for dental treatment under local anaesthesia should inject insulin and eat meals as normal. If food is omitted the blood glucose will fall to an abnormally low level (hypoglycaemia). Patients can often recognise the symptoms themselves and this state responds to sugar in water or a few lumps of sugar. Children may not have such prominent changes but may appear unduly lethargic.
Symptoms and signs
- Shaking and trembling
- Sweating
- 'Pins and needles' in lips and tongue
- Hunger
- Palpitation
- Headache (occasionally)
- Double vision
- Difficulty in concentration
- Slurring of speech
- Confusion
- Change of behaviour; truculence
- Convulsions
- Unconsciousness

Management
Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from non-diet versions of Lucozade® Energy Original 55 mL, Coca-Cola® 100 mL, Ribena® Blackcurrent 19 mL (to be diluted), 2 teaspoons sugar, and also from 3 sugar lumps. (Proprietary products of quick-acting carbohydrate (e.g. GlucoGel®, Dextrogel®, GSF-Syrup®, Rapilose® gel) are available on prescription for the patient to keep to hand in case of hypoglycaemia). If necessary this may be repeated in 10–15 minutes. If glucose cannot be given by mouth, if it is ineffective, or if the hypoglycaemia causes unconsciousness, glucagon 1 mg (1 unit) should be given by intramuscular (or subcutaneous) injection; a child under 8 years or of body-weight under 25 kg should be given 500 micrograms. Once the patient regains consciousness oral glucose should be administered as above. If glucagon is ineffective or contra-indicated, the patient should be transferred urgently to hospital. The patient must also be admitted to hospital if hypoglycaemia is caused by an oral antidiabetic drug.

Syncope
Insufficient blood supply to the brain results in loss of consciousness. The commonest cause is a vasovagal attack or simple faint (syncope) due to emotional stress.

Symptoms and signs
- Patient feels faint
- Low blood pressure
- Pallor and sweating
- Yawning and slow pulse
- Nausea and vomiting
- Dilated pupils
- Muscular twitching

Management
- Lay the patient as flat as is reasonably comfortable and, in the absence of associated breathlessness, raise the legs to improve cerebral circulation
- Loosen any tight clothing around the neck
- Once consciousness is regained, give sugar in water or a cup of sweet tea

Other possible causes
Postural hypotension can be a consequence of rising abruptly or of standing upright for too long; antihypertensive drugs predispose to this. When rising, susceptible patients should take their time. Management is as for a vasovagal attack. Under stressful circumstances, some patients hyperventilate. This gives rise to feelings of faintness but does not usually result in syncope. In most cases reassurance is all that is necessary; rebreathing from cupped hands or a bag may be helpful but calls for careful supervision. Adrenal insufficiency or arrhythmias are other possible causes of syncope.

Medical problems in dental practice
Individuals presenting at the dental surgery may also suffer from an unrelated medical condition; this may require modification to the management of their dental condition. If the patient has systemic disease or is taking other medication, the matter may need to be discussed with the patient’s general practitioner or hospital consultant.

Allergy
Patients should be asked about any history of allergy; those with a history of atopic allergy (asthma, eczema, hay fever, etc.) are at special risk. Those with a history of a severe allergy or of anaphylactic reactions are at high risk—it is essential to confirm that they are not allergic to any medication, or to any dental materials or equipment (including latex gloves). See also Anaphylaxis above.

Arrhythmias
Patients, especially those who suffer from heart failure or who have sustained a myocardial infarction, may have irregular cardiac rhythm. Atrial fibrillation is a common arrhythmia even in patients with normal hearts and is of little concern except that dentists should be aware that such patients may be receiving anticoagulant therapy. The patient’s medical practitioner should be asked whether any special precautions are necessary. Premedication (e.g. with temazepam p. 463) may be useful in some instances for very anxious patients. See also Cardiac emergencies above, and Dental Anaesthesia (Local anaesthesia p. 1236).

Cardiac prostheses
For an account of the risk of infective endocarditis in patients with prosthetic heart valves, see Infective Endocarditis below. For advice on patients receiving anticoagulants, see Thromboembolic disease below.

Coronary artery disease
Patients are vulnerable for at least 4 weeks following a myocardial infarction or following any sudden increase in the symptoms of angina. It would be advisable to check with the patient’s medical practitioner before commencing treatment. See also Cardiac Emergencies above. Treatment with low-dose aspirin (75 mg daily), clopidogrel p. 119, or dipyridamole p. 120 should not be stopped routinely nor should the dose be altered before dental procedures.
A Working Party of the British Society for Antimicrobial Chemotherapy has not recommended antibiotic prophylaxis for patients following coronary artery bypass surgery.

Cyanotic heart disease
Patients with cyanotic heart disease are at risk in the dental chair, particularly if they have pulmonary hypertension. In such patients a syncopal reaction increases the shunt away from the lungs, causing more hypoxia which worsens the syncopal reaction—a vicious circle that may prove fatal. The advice of the cardiologist should be sought on any patient with congenital cyanotic heart disease. Treatment in hospital is more appropriate for some patients with this condition.

Hypertension
Patients with hypertension are likely to be receiving antihypertensive drugs. Their blood pressure may fall dangerously low under general anaesthesia, see also under Dental Anaesthesia (Local anaesthesia p. 1236).

Immunosuppression and indwelling intraperitoneal catheters
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are
immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis. The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

**Infective endocarditis**
While almost any dental procedure can cause bacteraemia, there is no clear association with the development of infective endocarditis. Routine daily activities such as tooth brushing also produce a bacteraemia and may present a risk for infective endocarditis. While almost any dental procedure can cause bacteraemia, there is no clear association with the development of infective endocarditis. Routine daily activities such as tooth brushing also produce a bacteraemia and may present a risk for infective endocarditis.

Antibacterial prophylaxis and chlorhexidine p. 1108 mouthwash are not recommended for the prevention of endocarditis in patients undergoing dental procedures. Such prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

**Reduction of oral bacteraemia**
Patients at risk of endocarditis including those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis, should be advised to maintain the highest possible standards of oral hygiene in order to reduce the:

- need for dental extractions or other surgery;
- chances of severe bacteraemia if dental surgery is needed;
- possibility of ‘spontaneous’ bacteraemia.

**Postoperative care**
Patients at risk of endocarditis including those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis, should be advised to maintain the highest possible standards of oral hygiene in order to reduce the:

- need for dental extractions or other surgery;
- chances of severe bacteraemia if dental surgery is needed;
- possibility of ‘spontaneous’ bacteraemia.

**Patients on anticoagulant therapy**
For general advice on dental surgery in patients receiving oral anticoagulant therapy see Thromboembolic Disease below.

**Joint prostheses**
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive. The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

**Pacemakers**
Pacemakers prevent asystole or severe bradycardia. Some ultrasonic scalers, electronic apex locators, electro-analgesic devices, and electrocautery devices interfere with the normal function of pacemakers (including shielded pacemakers) and should not be used. The manufacturer’s literature should be consulted whenever possible. If severe bradycardia occurs in a patient fitted with a pacemaker, electrical equipment should be switched off and the patient placed supine with the legs elevated. If the patient loses consciousness and the pulse remains slow or is absent, cardiopulmonary resuscitation may be needed. Call immediately for medical assistance and an ambulance, as appropriate.

**Thromboembolic disease**
Patients receiving a heparin or an oral anticoagulant such as warfarin sodium p. 135, acenocoumarol (nicoumalone) p. 134, phenindione p. 134, apixaban p. 121, dabigatran etexilate p. 131 or rivaroxaban p. 123 may be liable to excessive bleeding after extraction of teeth or other dental surgery. Often dental surgery can be delayed until the anticoagulant therapy has been completed. For a patient requiring long-term therapy with warfarin sodium, the patient’s medical practitioner should be consulted and the International Normalised Ratio (INR) should be assessed 72 hours before the dental procedure. This allows sufficient time for dose modification if necessary. In those with an unstable INR (including those who require weekly monitoring of their INR, or those who have had some INR measurements greater than 4.0 in the last 2 months), the INR should be assessed within 24 hours of the dental procedure. Patients requiring minor dental procedures (including extractions) who have an INR below 4.0 may continue warfarin sodium without dose adjustment. There is no need to check the INR for a patient requiring a non-invasive dental procedure. If it is necessary to remove several teeth, a single extraction should be done first; if this goes well further teeth may be extracted at subsequent visits (two or three at a time). Measures should be taken to minimise bleeding during and after the procedure. This includes the use of sutures and a haemostatic such as oxidised cellulose, collagen sponge or resorbable gelatin sponge. Scaling and root planing should initially be restricted to a limited area to assess the potential for bleeding.

For a patient on long-term warfarin sodium, the advice of the clinician responsible for the patient’s anticoagulation should be sought if:

- the INR is unstable, or if the INR is greater than 4.0;
- the patient has thrombocytopenia, haemophilia, or other disorders of haemostasis, or suffers from liver impairment, alcoholism, or renal failure;
- the patient is receiving antiplatelet drugs, cytotoxic drugs or radiotherapy.

Intramuscular injections are contra-indicated in patients taking anticoagulants with an INR above the therapeutic range, and in those with any disorder of haemostasis. In patients taking anticoagulants who have a stable INR within the therapeutic range, intramuscular injections should be avoided if possible; if an intramuscular injection is necessary, the patient should be informed of the increased risk of localised bleeding and monitored carefully.
A local anaesthetic containing a vasoconstrictor should be given by infiltration, or by intraligamentary or mental nerve injection if possible. If regional nerve blocks cannot be avoided the local anaesthetic should be given cautiously using an aspirating syringe.

Drugs which have potentially serious interactions with anticoagulants include aspirin and other NSAIDs, carbamazepine p. 297, imidazole and triazole antifungals (including miconazole p. 782), erythromycin p. 510, clarithromycin p. 508, and metronidazole p. 512; for details of these and other interactions with anticoagulants, see Appendix 1 (dabigatran etexilate, heparins, phenindione, rivaroxaban, and coumarins).

Although studies have failed to demonstrate an interaction, common experience in anticoagulant clinics is that the INR can be altered following a course of an oral broad-spectrum antibiotic, such as ampicillin p. 520 or amoxicillin p. 518. Information on the treatment of patients who take anticoagulants is available at www.npsa.nhs.uk/patientsafety/alerts-and-directives/alerts/anticoagulant.

Liver disease
Liver disease may alter the response to drugs and drug prescribing should be kept to a minimum in patients with severe liver disease. Problems are likely mainly in patients with jaundice, ascites, or evidence of encephalopathy. For guidance on prescribing for patients with hepatic impairment, see Prescribing in hepatic impairment p. 19. Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

Renal impairment
The use of drugs in patients with reduced renal function can give rise to many problems. Many of these problems can be avoided by reducing the dose or by using alternative drugs. Special care is required in renal transplantation and immunosuppressed patients; if necessary such patients should be referred to specialists. For guidance on prescribing in patients with renal impairment, see Prescribing in renal impairment p. 19. Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in the BNF.

Pregnancy
Drugs taken during pregnancy can be harmful to the fetus and should be prescribed only if the expected benefit to the mother is thought to be greater than the risk to the fetus; all drugs should be avoided if possible during the first trimester. For guidance on prescribing in pregnancy, see Prescribing in pregnancy p. 22. Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF.

Breast-feeding
Some drugs taken by the mother whilst breast-feeding can be transferred to the breast milk, and may affect the infant. For guidance on prescribing in breast-feeding, see Prescribing in breast-feeding p. 22. Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF.

1 Chronic bowel disorders

Chronic bowel disorders

Overview

Once tumours are ruled out individual symptoms of chronic bowel disorders need specific treatment including dietary manipulation as well as drug treatment and the maintenance of a liberal fluid intake.

Clostridium difficile infection

Clostridium difficile infection is caused by colonisation of the colon with Clostridium difficile and production of toxin. It often follows antibiotic therapy and is usually of acute onset, but may become chronic. It is a particular hazard of ampicillin p. 520, amoxicillin p. 518, co-amoxiclav p. 521, second- and third-generation cephalosporins, clindamycin p. 506, and quinolones, but few antibiotics are free of this side-effect. Treatment options include metronidazole p. 512, vancomycin p. 505, and fidaxomicin p. 538.

1.1 Coeliac disease

Coeliac disease

Description of condition

Coeliac disease is an autoimmune condition which is associated with chronic inflammation of the small intestine. Dietary proteins known as gluten, which are present in wheat, barley and rye, activate an abnormal immune response in the intestinal mucosa, which can lead to malabsorption of nutrients.

Aims of treatment

The management of coeliac disease is aimed at eliminating symptoms (such as diarrhoea, bloating and abdominal pain) and reducing the risk of complications, including those resulting from malabsorption.

Non-drug treatment

The only effective treatment for coeliac disease is a strict, life-long, gluten-free diet. A range of gluten-free products is available for prescription (see Borderline substances).

Drug treatment

Patients who have coeliac disease are at an increased risk of malabsorption of key nutrients (such as calcium and vitamin D). Their risk of osteoporosis and the need for active treatment of bone disease should form part of the ongoing management of coeliac disease. Supplementation of key nutrients may be required if dietary intake is insufficient.

Patients who have coeliac disease should be advised not to self-medicate with over-the-counter vitamins or mineral supplements. Initiation of supplementation should involve a discussion with a member of the patient’s healthcare team in order to identify the individual needs of the patient and to allow for appropriate ongoing monitoring.

Confirmed cases of refractory coeliac disease should be referred to a specialist centre. Treatment with prednisolone p. 639 can be considered for initial management while awaiting specialist advice.

Useful Resources

1.2 Diverticular disease and diverticulitis

Diverticular disease and diverticulitis

Description of condition

Diverticular disease is a condition where diverticula (sac-like protrusions of mucosa through the muscular colonic...
wall) cause intermittent lower abdominal pain in the absence of inflammation or infection. The prevalence of diverticula increases with age, with the majority of patients older than 50 years.

**Diverticulitis** occurs when the diverticula become inflamed and infected, causing marked lower abdominal pain usually accompanied by fever and general malaise, and occasionally, with large rectal bleeds. Complicated diverticulitis includes episodes associated with an abscess, free perforation, fistula, obstruction, or stricture.

To ensure that an accurate diagnosis of diverticulitis and diverticular disease is made, consider and exclude all other causes of lower abdominal pain prior to treatment.

### Aims of treatment

The aim of treatment is to relieve symptoms of diverticular disease, cure episodes of diverticulitis, and reduce the risk of recurrences and complications.

### Drug treatment

A high-fibre diet is recommended for the treatment of symptomatic diverticular disease, although evidence supporting this is inconsistent and of low quality. Bulk-forming drugs have also been used, but evidence of their effectiveness is lacking.

Treatment of uncomplicated diverticulitis includes a low residue diet and bowel rest. Antibacterials are recommended only when the patient presents with signs of infection or is immunocompromised, as there is no evidence to support routine administration.

Patients with complicated diverticulitis or with severe presentation, require hospital admission, treatment with intravenous antibacterials (covering Gram-negative organisms and anaerobes), and bowel rest.

There is insufficient evidence to justify the role of fibre, rifaximin p. 543, antispasmodics, mesalazine p. 39, and probiotics in the prevention or treatment of diverticulitis. Elective surgery to provide symptomatic relief or prevent recurrence, should be considered for patients following recovery from an episode of complicated diverticulitis. This includes episodes associated with free perforation, abscess, fistula, obstruction, or stricture. Urgent sigmoid colectomy is required for patients with diffuse peritonitis or for those in whom non-operative management of acute diverticulitis fails.

### 1.3 Inflammatory bowel disease

#### Inflammatory bowel disease

Chronic inflammatory bowel diseases include Crohn’s disease below and Ulcerative colitis p. 37.

#### Drugs used in chronic bowel disorders

**Aminosalicylates**

Sulfasalazine p. 42 is a combination of 5-aminosalicylic acid (‘5-ASA’) and sulfapyridine; sulfapyridine acts only as a carrier to the colonic site of action but still causes side-effects. In the newer aminosalicylates, mesalazine p. 39 (5-aminosalicylic acid), balsalazine sodium p. 39 (a pro-drug of 5-aminosalicylic acid) and olsalazine sodium p. 42 (a dimer of 5-aminosalicylic acid which cleaves in the lower bowel), the sulfonamide-related side-effects of sulfasalazine are avoided, but 5-aminosalicylic acid alone can still cause side-effects including blood disorders and lupus-like syndrome also seen with sulfasalazine.

**Drugs affecting the immune response**

Folic acid p. 937 should be given to reduce the possibility of methotrexate p. 844 toxicity [unlicensed indication]. Folic acid is usually given once weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

**Cytokine modulators**

Infliximab p. 1016, adalimumab p. 1008, and golimumab p. 1014 are monoclonal antibodies which inhibit the pro-inflammatory cytokine, tumour necrosis factor alpha. They should be used under specialist supervision.

### Crohn’s disease

#### Description of condition

Crohn’s disease is a chronic, inflammatory bowel disease that mainly affects the gastro-intestinal tract. It is characterised by thickened areas of the gastro-intestinal wall with inflammation extending through all layers, deep ulceration and fissuring of the mucosa, and the presence of granulomas; affected areas may occur in any part of the gastro-intestinal tract, interspersed with areas of relatively normal tissue. Crohn’s disease may present as recurrent attacks, with acute exacerbations combined with periods of remission or less active disease. Symptoms depend on the site of disease but may include abdominal pain, diarrhoea, fever, weight loss and rectal bleeding.

Complications of Crohn’s disease include intestinal strictures, abscesses in the wall of the intestine or adjacent structures, fistulae, anaemia, malnutrition, colorectal and small bowel cancers, and growth failure and delayed puberty in children. Crohn’s disease may also be associated with extra-intestinal manifestation: the most common are arthritis and abnormalities of the joints, eyes, liver and skin. Crohn’s disease is also a cause of secondary osteoporosis and those at greatest risk should be monitored for osteopenia and assessed for the risk of fractures.

**Fistulating Crohn’s disease**

Fistulating Crohn’s disease is a complication that involves the formation of a fistula between the intestine and adjacent structures, such as perianal skin, bladder, and vagina. It occurs in about one quarter of patients, mostly when the disease involves the ileocolonic area.

#### Aims of treatment

Treatment is largely directed at the induction and maintenance of remission and the relief of symptoms. Active treatment of acute Crohn’s disease should be distinguished from preventing relapse. The aims of drug treatment are to reduce symptoms and maintain or improve quality of life, while minimising toxicity related to drugs over both the short and long term.

In fistulating Crohn’s disease, surgery and medical treatment aim to close and maintain closure of the fistula.

#### Non-drug treatment

In addition to drug treatment, management options for Crohn’s disease include smoking cessation and attention to nutrition, which plays an important role in supportive care. Surgery may be considered in certain patients with early disease limited to the distal ileum and in severe or chronic active disease.

#### Drug treatment

**Treatment of acute disease**

**Monotherapy**

A corticosteroid (either prednisolone p. 639 or methylprednisolone p. 638 or intravenous hydrocortisone p. 637), is used to induce remission in patients with a first presentation or a single inflammatory exacerbation of Crohn’s disease in a 12-month period.

In patients with distal ileal, ileocaecal or right-sided colonic disease, in whom a conventional corticosteroid is unsuitable or contra-indicated, budesonide p. 43 may be
Considered. Budesonide is less effective but may cause fewer side-effects than other corticosteroids, as systemic exposure is limited. Aminosalicylates (such as sulfasalazine p. 42 and mesalazine p. 39) are an alternative option in these patients. They are less effective than a corticosteroid or budesonide, but may be preferred because they have fewer side-effects. Aminosalicylates and budesonide are not appropriate for severe presentations or exacerbations.

Add-on treatment

Add on treatment is prescribed if there are two or more inflammatory exacerbations in a 12-month period, or the corticosteroid dose cannot be reduced.

Azathioprine p. 787 or mercaptopurine p. 844 [unlicensed indications] can be added to a corticosteroid or budesonide to induce remission. In patients who cannot tolerate azathioprine or mercaptopurine or in whom thiopurine methyltransferase (TPMT) activity is deficient, methotrexate p. 844 can be added to a corticosteroid.

Under specialist supervision, monoclonal antibody therapies, adalimumab p. 1008 and infliximab p. 1016, are options for the treatment of severe, active Crohn’s disease, following inadequate response to conventional therapies or in those who are intolerant of or have contra-indications to conventional therapy. Vedolizumab p. 44 is recommended as a treatment option for moderate to severely active Crohn’s disease when therapy with adalimumab or infliximab is unsuccessful, is contra-indicated or not tolerated. See also National funding/access decisions for adalimumab, infliximab and vedolizumab.

Adalimumab and infliximab can be used as mono-therapy or combined with an immunosuppressant although there is uncertainty about the comparative effectiveness and long-term side-effects of therapy.

Maintenance of remission

Patients who choose not to receive maintenance treatment during remission should be made aware of the symptoms that may suggest a relapse (most frequently unintended weight loss, abdominal pain, diarrhoea and general ill-health). For those who choose not to receive maintenance treatment during remission, a suitable follow-up plan should be agreed upon and information provided on how to access healthcare if a relapse should occur.

Azathioprine or mercaptopurine [unlicensed indications] as monotherapy can be used to maintain remission when previously used with a corticosteroid to induce remission. They may also be used in patients who have not previously received these drugs (particularly those with adverse prognostic factors such as early age of onset, perianal disease, corticosteroid use at presentation, and severe presentations). Methotrexate can be used to maintain remission only in patients who required methotrexate to induce remission, or who are intolerant of or are not suitable for azathioprine or mercaptopurine for maintenance. Corticosteroids or budesonide should not be used.

Fistulating Crohn’s disease

Perianal fistulae are the most common occurrence in patients with fistulating Crohn’s disease. Treatment may not be necessary for simple, asymptomatic perianal fistulae. When fistulae are symptomatic, local drainage and surgery may be required in conjunction with the medical therapy.

Metronidazole p. 512 or ciprofloxacin p. 527 [unlicensed indications], alone or in combination, can improve symptoms of fistulating Crohn’s disease but complete healing occurs rarely. Metronidazole is usually given for 1 month, but no longer than 3 months because of concerns about peripheral neuropathy. Other antibacterials should be given if specifically indicated (e.g. in sepsis associated with fistulae and perianal disease) and for managing bacterial overgrowth in the small bowel.

Either azathioprine or mercaptopurine [unlicensed indications] is used to control the inflammation in fistulating Crohn’s disease and they are continued for maintenance.

Infliximab p. 1016 is recommended for patients with active fistulating Crohn’s disease who have not responded to conventional therapy (including antibacterials, drainage and immunosuppressive treatments), or who are intolerant of or have contra-indications to conventional therapy. Infliximab should be used after ensuring that all sepsis is actively draining.

Abscess drainage, fistulotomy, and seton insertion may be appropriate, particularly before infliximab treatment.

Azathioprine p. 787, mercaptopurine p. 844, or infliximab should be continued as maintenance treatment for at least one year.

For the management of non-perianal fistulating Crohn’s disease (including entero-gynaecological and enterovesical fistulae) surgery is the only recommended approach.

Useful Resources

www.nice.org.uk/guidance/cg152

Ulcerative colitis

Description of condition

Ulcerative colitis is a chronic inflammatory condition, characterised by diffuse mucosal inflammation—it has a relapsing–remitting pattern. It is a life-long disease that is associated with significant morbidity. It most commonly presents between the ages of 15 and 25 years, although diagnosis can be made at any age.

The pattern of inflammation is continuous, extending from the rectum upwards to a varying degree. Inflammation of the rectum is referred to as proctitis, and inflammation of the rectum and sigmoid colon as proctosigmoiditis. Left-sided colitis refers to disease involving the colon distal to the splenic flexure. Extensive colitis affects the colon proximal to the splenic flexure, and includes pan–colitis, where the whole colon is involved. Common symptoms of active disease or relapse include bloody diarrhoea, an urgent need to defaecate, and abdominal pain.

Ulcerative colitis is classified as subacute if it is moderate-to–severely active disease which can be managed in an outpatient setting, and does not require hospitalisation or consideration of urgent surgical intervention.

Complications associated with ulcerative colitis include an increased risk of colorectal cancer, secondary osteoporosis, venous thromboembolism and toxic megacolon.

Aims of treatment

Treatment is focussed on treating active disease to manage symptoms and to induce and maintain remission.
Drug treatment

**Overview**
Management of ulcerative colitis is dependent on factors such as clinical severity, extent of disease, and patient preference. Clinical and laboratory investigations are used to determine the extent and severity of disease and to guide treatment. Severity is classified as mild, moderate or severe by using the Truelove and Witts’ Severity Index to assess bowel movements, heart rate, erythrocyte sedimentation rate and the presence of pyrexia, melaena or anaemia—see the NICE guideline for Ulcerative Colitis for further information (Useful resources below).

The extent of disease should be considered when choosing the route of administration for aminosalicylates and corticosteroids; whether oral treatment, topical treatment or both are to be used. If the inflammation is distal, a rectal preparation is adequate but if the inflammation is extended, systemic medication is required. Either suppositories or enemas can be offered, taking into account the patient’s preferences. 

Rectal foam preparations and suppositories can be used when patients have difficulty retaining liquid enemas. Diarrhoea associated with ulcerative colitis is sometimes treated with anti-diarrhoeal drugs (such as loperamide hydrochloride p. 65 or codeine phosphate p. 431) on the advice of a specialist; however their use is contra-indicated in acute ulcerative colitis as they can increase the risk of toxic megacolon. A macrogol-containing osmotic laxative (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 55) may be useful for proximal faecal loading in proctitis. 

Oral aminosalicylates for the treatment of ulcerative colitis are available in different preparations and release forms. The preparation and dosing schedule should be chosen taking into account the delivery characteristics and suitability for the patient. When used to maintain remission, single daily doses of oral aminosalicylates can be more effective than multiple daily dosing, but may result in more side-effects.

**Treatment of acute mild-to-moderate ulcerative colitis**
Acute treatment to induce remission generally consists of an aminosalicylate with or without a corticosteroid. Oral and rectal aminosalicylate in combination can be used as first line treatment in patients with acute, mild-to-moderate extensive ulcerative colitis; as this is associated with higher rates of improvement in disease activity.

**Proctitis and proctosigmoiditis**
Aminosalicylates are recommended as first-line treatment for patients with a mild-to-moderate initial presentation or inflammatory exacerbation. Using a rectal aminosalicylate (mesalazine p. 39 or sulfasalazine p. 42) alone is likely to be more effective for patients with proctitis and proctosigmoiditis. Monotherapy with an oral aminosalicylate (balsalazide sodium p. 39, mesalazine, olsalazine sodium p. 42, sulfasalazine) can be considered for patients who prefer not to use enemas or suppositories, although this may not be as effective.

A rectal corticosteroid (budesonide p. 43, hydrocortisone p. 637 or prednisolone p. 639) or oral prednisolone can be considered in patients who are intolerant to, decline, or have a contra-indication to aminosalicylates.

Oral prednisolone should be considered for the treatment of patients with subacute proctitis or proctosigmoiditis.

**Left-sided or extensive ulcerative colitis**
First-line treatment in patients with left-sided or extensive ulcerative colitis is a high induction dose of an oral aminosalicylate, with addition of a rectal aminosalicylate or oral beclometasone dipropionate if necessary. Oral prednisolone alone is recommended for patients who cannot tolerate or who decline aminosalicylates, in whom aminosalicylates are contra-indicated or in patients with subacute left-sided or extensive ulcerative colitis.

**Initial treatment failure in all extents of mild-to-moderate disease**
In all patients who are treated with an aminosalicylate, if there are no improvements within four weeks of initial treatment or if symptoms worsen, addition of oral prednisolone to aminosalicylate therapy can be considered (discontinue beclometasone dipropionate p. 43 if adding oral prednisolone). If there is still no response after 2–4 weeks of prednisolone, consider adding oral tacrolimus p. 791 [unlicensed indication] to induce remission. Budesonide multiformix (a corticosteroid that is taken orally but exerts its action topically in the colon) is licensed for inducing remission in mild-to-moderate active ulcerative colitis in adults for whom aminosalicylate treatment is not sufficient and can be considered as an additional therapeutic option.

Moderate disease may require treatment with a monoclonal antibody due to inadequate response to conventional treatment or if conventional treatment is not tolerated or contra-indicated (see Monoclonal antibodies for ulcerative colitis below).

**Treatment of acute severe ulcerative colitis**
Acute severe ulcerative colitis of any extent can be life-threatening and is regarded as a medical emergency. Immediate hospital admission is required for treatment.

Intravenous corticosteroids (such as hydrocortisone or methylprednisolone p. 638) should be given to induce remission in patients with acute severe ulcerative colitis (at first presentation or an exacerbation) while assessing the need for surgery. If intravenous corticosteroids are contra-indicated, declined or cannot be tolerated, then intravenous ciclosporin p. 788 [unlicensed indication] or surgery should be considered. A combination of intravenous ciclosporin with intravenous corticosteroids, or surgery is second line therapy for patients who have little or no improvement within 72 hours of starting intravenous corticosteroids or whose symptoms worsen despite treatment.

Research has shown that infliximab p. 1016 is as effective as ciclosporin and, in practice, it is commonly used in these patients instead of ciclosporin—see also Monoclonal antibodies for acute ulcerative colitis, below.

In patients who experience an initial response to steroids followed by deterioration, stool cultures should be taken to exclude the presence of pathogens; cytomegalovirus activation should be considered.

**Monoclonal antibodies for acute ulcerative colitis**
Adalimumab p. 1008, golimumab p. 1014, infliximab p. 1016 and vedolizumab p. 44 can be used to treat moderate-to-severe active ulcerative colitis following an inadequate response to conventional treatment options, or if conventional treatment options are not tolerated or contra-indicated. Treatment with these agents is continued into the maintenance phase, if effective and tolerated. See also National funding/access decisions for adalimumab, golimumab, infliximab and vedolizumab.

Infliximab can be used to treat acute exacerbations of severely active ulcerative colitis if ciclosporin p. 788 is contra-indicated or clinically inappropriate.

**Maintaining remission in mild, moderate or severe ulcerative colitis**
To reduce the chances of relapse occurring, maintenance therapy with an aminosalicylate is recommended in most patients. Corticosteroids are not suitable for maintenance treatment because of their side-effects.

After a mild-to-moderate inflammatory exacerbation of proctitis or proctosigmoiditis, a rectal aminosalicylate can be started alone or in combination with an oral aminosalicylate, administered daily or as part of an intermittent regimen.
(such as twice to three times weekly or the first seven days of each month). An oral aminosalicylate can be used alone in patients who prefer not to use enemas or suppositories, although, this may not be as effective.

A low-dose of oral aminosalicylate is given to maintain remission in patients after a mild-to-moderate inflammatory exacerbation of left-sided or extensive ulcerative colitis.

When used to maintain remission, single daily doses of oral aminosalicylates can be more effective than multiple daily dosing, but may result in more side-effects.

Oral azathioprine p. 787 or mercaptopurine p. 844 [unlicensed indications] can be considered to maintain remission, if there has been two or more inflammatory exacerbations in a 12-month period that required treatment with systemic corticosteroids, or if remission is not maintained by aminosalicylates, or following a single acute severe episode.

There is no evidence to support the use of methotrexate p. 844 to induce or maintain remission in ulcerative colitis, though its use is common in clinical practice.

Monoclonal antibodies for maintaining remission of ulcerative colitis

Treatment with these agents is continued into the maintenance phase, if effective and tolerated in acute disease. See also National funding/access decisions for adalimumab, golimumab, infliximab and vedolizumab.

Non-drug treatment

Surgery may be necessary as emergency treatment for severe ulcerative colitis that does not respond to drug treatment. Patients can also choose to have elective surgery for unresponsive or frequently relapsing disease that is affecting their quality of life.

Useful Resources

AMINOSALICYLATES

Aminosalicylates

- **SIDE-EFFECTS**
  - Rare Acute pancreatitis • agranulocytosis • alopecia • aplastic anaemia • arthralgia • blood disorders • eosinophilia • fibrosing alveolitis • hepatitis • interstitial nephritis • leucopenia • lupus erythematosus-like syndrome • methaemoglobinemia • myalgia • myocarditis • nephrotic syndrome • neutropenia • pericarditis • peripheral neuropathy • renal dysfunction • skin reactions • Stevens-Johnson syndrome • thrombocytopenia
  - Frequency not known Abdominal pain • diarrhoea • exacerbation of symptoms of colitis • headache • hypersensitivity reactions • nausea • rash • urticaria • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- Blood Disorders A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in salicylate hypersensitivity.
- **RENAL IMPAIRMENT** Renal function should be monitored more frequently in renal impairment.
- **MONITORING REQUIREMENTS** Renal function should be monitored before starting an oral aminosalicylate, at 3 months of treatment, and then annually during treatment.

- **PATIENT AND CARER ADVICE**
  - Blood disorders Patients receiving aminosalicylates, and their carers, should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise that occurs during treatment.

Balsalazide sodium

- **INDICATIONS AND DOSE**
  - Treatment of mild to moderate ulcerative colitis, acute attack
    - **BY MOUTH**
    - Adult: 2.25 g 3 times a day until remission occurs or for up to maximum of 12 weeks
  - **Maintenance of remission of ulcerative colitis**
    - **BY MOUTH**
    - Adult: 1.5 g twice daily (max. per dose 3 g), adjusted according to response; maximum 6 g per day

- **CAUTIONS** History of asthma
- **INTERACTIONS** Appendix 1: balsalazide
- **SIDE-EFFECTS** Cholelithiasis
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Diarrhoea may develop in the infant. Monitor breast-fed infants for diarrhoea.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**
  - CAUTIONARY AND ADVISORY LABELS 21, 25
  - Colazide (Almirall Ltd) Balsalazide disodium 750 mg Colazide 750mg capsules 130 capsule POM £30.42 DT price = £30.42

Mesalazine

- **INDICATIONS AND DOSE**
  - **ASACOL® MR 400MG TABLETS**
    - Treatment of mild to moderate ulcerative colitis, acute attack
      - **BY MOUTH**
      - Child 12-17 years: 800 mg 3 times a day
      - Adult: 2.4 g daily in divided doses
    - **Maintenance of remission of ulcerative colitis and Crohn's ileo-colitis**
      - **BY MOUTH**
      - Child 12-17 years: 400–800 mg 2–3 times a day
      - Adult: 1.2–2.4 g daily in divided doses
    - **ASACOL® MR 800MG TABLETS**
      - Treatment of mild to moderate ulcerative colitis, acute attack
        - **BY MOUTH**
        - Adult: 2.4–4.8 g daily in divided doses
    - **Maintenance of remission of ulcerative colitis**
      - **BY MOUTH**
      - Adult: Up to 2.4 g once daily, alternatively up to 2.4 g daily in divided doses
    - **Maintenance of remission of Crohn's ileo-colitis**
      - **BY MOUTH**
      - Adult: Up to 2.4 g daily in divided doses
### ASACOL® FOAM ENEMA
- **Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region**
  - **By Rectum**
  - Adult: 1 g daily for 4–6 weeks, to be administered into the rectum

- **Treatment of acute attack of mild to moderate ulcerative colitis, affecting the descending colon**
  - **By Rectum**
  - Adult: 2 g once daily for 4–6 weeks, to be administered into the rectum

### ASACOL® SUPPOSITORIES
- **Treatment of acute attack of mild to moderate ulcerative colitis and maintenance of remission**
  - **By Rectum**
  - Adult: 0.75–1.5 g daily in divided doses, last dose to be administered at bedtime

### IPOCOL®
- **Treatment of mild to moderate ulcerative colitis, acute attack**
  - **By Mouth**
  - Adult: 2.4 g daily in divided doses

### Maintenance of remission of ulcerative colitis
- **By Mouth**
  - Adult: 1.2–2.4 g daily in divided doses

### MEZAVANT® XL
- **Treatment of mild to moderate ulcerative colitis, acute attack**
  - **By Mouth**
  - Adult: 2.4 g daily in divided doses
  - Up to 500 mg/kg 5–10 times a day

### OCTASA®
- **Treatment of mild to moderate ulcerative colitis, acute attack**
  - **By Mouth**
  - Adult: 2.4–4.8 g once daily, alternatively 2.4–4.8 g daily in divided doses, dose over 2.4 g daily in divided doses only

### Maintenance of remission of ulcerative colitis and Crohn's ileo-colitis
- **By Mouth**
  - Adult: 1.2–2.4 g once daily, alternatively daily in divided doses

### PENTASA® GRANULES
- **Treatment of mild to moderate ulcerative colitis, acute attack**
  - **By Mouth**
  - Child 5–17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
  - Child 5–17 years (body-weight 40 kg and above): 1–2 g twice daily, total daily dose may alternatively be given in 3–4 divided doses
  - Adult: Up to 4 g once daily, alternatively up to 4 g daily in 2–4 divided doses

### Maintenance of remission of ulcerative colitis
- **By Mouth**
  - Child 5–17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
  - Child 5–17 years (body-weight 40 kg and above): 2 g once daily
  - Adult: 2 g once daily

### PENTASA® RETENTION ENEMA
- **Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission**
  - **By Rectum**
  - Adult: 1 g once daily, dose to be administered at bedtime

### PENTASA® SUPPOSITORIES
- **Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region**
  - **By Rectum**
  - Child 12–17 years: 1 g once daily, dose to be administered at bedtime

### PENTASA® TABLETS
- **Treatment of mild to moderate ulcerative colitis, acute attack**
  - **By Mouth**
  - Adult: Up to 4 g once daily, alternatively up to 4 g daily in 2–3 divided doses

### Maintenance of remission of ulcerative colitis
- **By Mouth**
  - Adult: 2 g once daily

### SALOFALK® ENEMA
- **Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission**
  - **By Rectum**
  - Adult: 2 g once daily

### SALOFALK® GRANULES
- **Treatment of mild to moderate ulcerative colitis, acute attack**
  - **By Mouth**
  - Child 5–17 years (body-weight up to 40 kg): 30–50 mg/kg once daily, dose preferably given in the morning, alternatively 10–20 mg/kg 3 times a day
  - Child 5–17 years (body-weight 40 kg and above): 1.5–3 g once daily, dose preferably given in the morning, alternatively 0.5–1 g 3 times a day
  - Adult: 1.5–3 g once daily, dose preferably taken in the morning, alternatively 0.5–1 g 3 times a day

### SALOFALK® RETENTION ENEMA
- **Treatment of acute attack of mild to moderate ulcerative colitis affecting sigmoid colon and rectum**
  - **By Rectum**
  - Child 12–17 years: 2 g once daily, dose to be administered into the rectum at bedtime, alternatively 2 g daily in 2 divided doses
  - Adult: 2 g once daily, dose to be administered into the rectum at bedtime, alternatively 2 g daily in 2 divided doses

### RETENTION ENEMA
- **Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region**
  - **By Rectum**
  - Adult: 1 g once daily, dose to be administered at bedtime

### Maintenance, ulcerative proctitis
- **By Rectum**
  - Adult: 1 g daily
**Salofalk® Suppositories**
Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectum, sigmoid colon and descending colon
- **By Rectum**
  - Adult: 0.5–1 g 2–3 times a day, adjusted according to response, dose to be given using 500 mg suppositories

Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectum
- **By Rectum**
  - Adult: 1 g daily, preferably at bedtime, dose to be given using 1 g suppositories

**Salofalk® Tablets**
Treatment of mild to moderate ulcerative colitis, acute attack
- **By Mouth**
  - Child 5–17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
  - Child 5–17 years (body-weight 40 kg and above): 0.5–1 g 3 times a day
  - Adult: 0.5–1 g 3 times a day

Maintenance of remission of ulcerative colitis
- **By Mouth**
  - Child 5–17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
  - Child 5–17 years (body-weight 40 kg and above): 500 mg 3 times a day
  - Adult: 500 mg 3 times a day

**Dose Equivalence and Conversion**
- There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.

- **Unlicensed Use**
  - With oral use in children **Asacol®** (all preparations) not licensed for use in children under 18 years. **Pentasa®** granules and **Salofalk®** tablets and granules not licensed for use in children under 6 years.
  - With rectal use in children **Salofalk®** rectal foam no dose recommendations for children (age range not specified by manufacturer).

- **Contra-Indications** Blood clotting abnormalities (in children)

- **Caution**
  - Elderly: pulmonary disease

- **Interactions**
  - Appendix 1: mesalazine

- **Side-Effects**
  - Rare: Dizziness
  - Very rare: Oligospermia (reversible)

- **Pregnancy** Negligible quantities cross placenta.

- **Breast Feeding** Diarrhoea reported in breast-fed infants, but negligible amounts of mesalazine detected in breast milk.

- **Hepatic Impairment** Avoid in severe impairment.

- **Renal Impairment**
  - In adults Use with caution. Avoid if eGFR less than 20 mL/minute/1.73 m².
  - In children Use with caution. Avoid if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

- **Directions for Administration**

  **Pentasa® Tablets** Tablets may be halved, quartered, or dispersed in water, but should not be chewed.

  **Salofalk® Granules** Granules should be placed on tongue and washed down with water without chewing.

  **Pentasa® Granules** Granules should be placed on tongue and washed down with water or orange juice without chewing.

In children Contents of one sachet should be weighed and divided immediately before use; discard any remaining granules.

**Prescribing and Dispensing Information**
There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.

Flavours of granule formulations of **Salofalk®** may include vanilla.

**Patient and Carer Advice**
If it is necessary to switch a patient to a different brand of mesalazine, the patient should be advised to report any changes in symptoms.

Some products may require special administration advice; patients and carers should be informed.

**Medicinal Forms**
There can be variation in the licensing of different medicines containing the same drug.

**Modified-release Tablet**

**Sulfasalazine (Sulphasalazine)**

**Indications and dose**

**Treatment of acute attack of mild to moderate and severe ulcerative colitis / Active Crohn’s disease**

- **By mouth**
  - Adult: 1–2 g 4 times a day until remission occurs, corticosteroids may also be given, if necessary

- **By rectum**
  - Adult: 0.5–1 g twice daily, administered alone or in conjunction with oral therapy, morning and night after a bowel movement

**Maintenance of remission of mild to moderate and severe ulcerative colitis**

- **By mouth**
  - Adult: 500 mg 4 times a day

- **By rectum**
  - Adult: 0.5–1 g twice daily, administered alone or in conjunction with oral therapy, morning and night after a bowel movement

**Active rheumatoid arthritis (administered on expert advice)**

- **By mouth**
  - Adult: Initially 500 mg daily, increased in steps of 500 mg every week, increased to 2–3 g daily in divided doses, enteric coated tablets to be administered

**Caution**

Acute porphyrias p. 969 · G6PD deficiency · history of allergy · history of asthma · maintain adequate fluid intake · risk of haematological toxicity · risk of hepatic toxicity · slow acetylator status

**Interactions**

Appendix 1: sulfasalazine

**Side-effects**

- **Common or very common** Blood disorders · cough · dizziness · fever · Heinz body anaemia · insomnia · megaloblastic anaemia · proteinuria · pruritus · stomatitis · taste disturbances · tinnitus

- **Uncommon** Alopecia · convulsions · depression · dyspnoea · vasculitis

**Frequency not known** Anaphylaxis · aseptic meningitis · ataxia · crystalluria · disturbances of smell · epidermal necrosis · exfoliative dermatitis · gastro-intestinal intolerance · hallucinations · hypersensitivity reactions · leucopenia (especially in patients with rheumatoid arthritis) · loss of appetite · neutropenia (especially in patients with rheumatoid arthritis) · oligospermia · parotitis · photosensitivity · rashes · serum sickness · some soft contact lenses may be stained · thrombocytopenia (especially in patients with rheumatoid arthritis) · yellow-orange discoloration of other body fluids · yellow-orange discoloration of skin · yellow-orange discoloration of urine

**Side-effects, further information**

- **Gastro-intestinal side effects** Upper gastro-intestinal side-effects common over 4 g daily.

---

ENTOCORT® CAPSULES
Mild to moderate Crohn’s disease affecting the ileum or ascending colon
▶ BY MOUTH
▶ Adult: 9 mg once daily for up to 8 weeks; reduce dose for the last 2–4 weeks of treatment, to be taken in the morning

ENTOCORT® ENEMA
Ulcerative colitis involving rectal and recto-sigmoid disease
▶ BY RECTUM
▶ Adult: 1 enema daily for 4 weeks, to be administered at bedtime

● CAUTIONS
▶ With systemic use Autoimmune hepatitis

● INTERACTIONS → Appendix 1: corticosteroids

● HEPATIC IMPAIRMENT
▶ With systemic use When used in autoimmune hepatitis liver function tests should be monitored every 2 weeks for 1 month, then at least every 3 months.

● DIRECTIONS FOR ADMINISTRATION
Granules should be placed on tongue and washed down with water without chewing.

● PRESCRIBING AND DISPENSING INFORMATION
Flavours of granule formulations may include lemon.

ENTOCORT® CAPSULES
Dispense modified-release capsules in original container (contains desiccant).

● PATIENT AND CARER ADVICE
Patients or carers should be given advice on how to administer budesonide granules.

CORTIMENT®
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (October 2016) that budesonide (Cortiment®) is accepted for restricted use within NHS Scotland for induction of remission of mild-to-moderate active ulcerative colitis where aminosalicylate treatment is not sufficient, and only if patients present with active left-sided disease and/or proctitis who are not suitable for oral prednisolone, as an alternative to budesonide rectal formulations or off-label oral budesonide.

BUDENOFALK® CAPSULES
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (April 2015) that Budenofalk® gastro-resistant capsules are accepted for restricted use within NHS Scotland for the treatment of autoimmune hepatitis in non-cirrhotic patients who are intolerant of conventional oral corticosteroids (prednisolone) with severe corticosteroid-related side effects (actual or anticipated) such as psychosis, poorly controlled diabetes or osteoporosis.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet
CAUTIONARY AND ADVISORY LABELS 25
▶ CORTIMENT (Ferring Pharmaceuticals Ltd)
Budesonide 9 mg Cortiment 9mg modified-release tablets | 30 tablet (POD) £75.00 DT price = £75.00

Gastro-resistant capsule
CAUTIONARY AND ADVISORY LABELS 5, 10, 22, 25
▶ BUDENOFALK (Dr. Falk Pharma UK Ltd)
Budesonide 3 mg Budenofalk 3mg gastro-resistant capsules | 100 capsule (POD) £75.05 DT price = £75.05

Foam
EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, propylene glycol, sorbic acid

▶ Budenofalk (Dr. Falk Pharma UK Ltd)
Budesonide 2 mg per 1 actuation Budenofalk 2mg foam enema | 14 dose (POD) £57.11

Modified-release capsule
CAUTIONARY AND ADVISORY LABELS 5, 10, 25
▶ Entocort CR (Tillotts Pharma Ltd)
Budesonide 3 mg Entocort CR 3mg capsules | 100 capsule (POD) £84.15 DT price = £84.15

Gastro-resistant granules
CAUTIONARY AND ADVISORY LABELS 5, 10, 22, 25
▶ Budenofalk (Dr. Falk Pharma UK Ltd)
Budesonide 9 mg Budenofalk 9mg gastro-resistant granules sachets | 60 sachet (POD) £135.00

Enema
▶ Entocort (Tillotts Pharma Ltd)
Budesonide 20 microgram per 1 ml Entocort 2mg/100ml enema | 7 enema (POD) £33.66

IMMUNOSUPPRESSANTS → MONOCLONAL ANTIBODIES, ANTI-LYMPHOCYTE

Vedolizumab

04-Apr-2016

▶ DRUG ACTION
Vedolizumab is a monoclonal antibody that binds specifically to the α4β7 integrin, which is expressed on gut homing T helper lymphocytes and causes a reduction in gastrointestinal inflammation.

▶ INDICATIONS AND DOSE
Moderate to severe active ulcerative colitis in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor (under expert supervision)
▶ BY INTRAVENOUS INFUSION
▶ Adult: Initially 300 mg, then 300 mg after 2 weeks, followed by 300 mg after 4 weeks, followed by 300 mg every 8 weeks, dose to be given over 30 minutes, if treatment is interrupted or response decreases, dosing frequency may be increased—consult product literature; review treatment if no response within 10 weeks of initial dose

Moderate to severe active Crohn’s disease in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor (under expert supervision)
▶ BY INTRAVENOUS INFUSION
▶ Adult: Initially 300 mg, then 300 mg after 2 weeks, followed by 300 mg after 4 weeks, followed by 300 mg every 8 weeks, dose to be given over 30 minutes, if no response is observed, an additional dose of 300 mg may be given 10 weeks after initial dose; if treatment is interrupted or response decreases, dosing frequency may be increased—consult product literature; review treatment if no response within 14 weeks of initial dose

▶ CONTRA-INDICATIONS
Severe active infection

▶ CAUTIONS
Controlled chronic severe infection · history of recurring severe infection · previous treatment with natalizumab (wait at least 12 weeks between natalizumab use and initiation of vedolizumab unless potential benefit outweighs risk) · previous treatment with rituximab

CAUTIONS, FURTHER INFORMATION
▶ Risk of infection Patients must be screened for tuberculosis before starting treatment; if latent tuberculosis is diagnosed, appropriate treatment must be initiated prior to vedolizumab treatment; if tuberculosis is diagnosed during treatment, discontinue vedolizumab until infection is resolved.

Patients should be brought up to date with current immunisation schedule before initiating treatment.

▶ INTERACTIONS → Appendix 1: monoclonal antibodies
**SIDE-EFFECTS**

- **Common or very common** Acne, arthralgia, back pain, constipation, cough, dyspepsia, eczema, erythema, flatulence, gastroenteritis, headache, hypertension, infection (increased susceptibility to viral, fungal and bacterial infections), malaise, muscle spasms, muscular weakness, nasal congestion, nasopharyngitis, nosebleed, night sweats, oropharyngeal pain, paraesthesia, pharyngitis, pruritus, pyrexia, rash, sinusitis.

- **Uncommon** Folliculitis, infusion-related reactions.

- **Frequency not known** Dizziness.

**SIDE-EFFECTS, FURTHER INFORMATION**

Infusion-related reactions, infusion-related and hypersensitivity reactions have been reported. Patients should be observed continuously during each infusion for signs and symptoms of acute hypersensitivity reactions; they should also be observed for 2 hours after the initial two infusions, and for 1 hour after subsequent infusions. Discontinue treatment if a severe infusion-related or other severe reaction occurs and initiate appropriate treatment (e.g. adrenaline and antihistamines); if a mild to moderate infusion-related reaction occurs, interrupt infusion or reduce infusion rate and initiate appropriate treatment (if reaction subsides the infusion may be continued)—consider pretreatment with an antihistamine, hydrocortisone, and/or paracetamol prior to subsequent infusions in patients who experience mild to moderate infusion-related reactions.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during and for at least 18 weeks after treatment.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**MONITORING REQUIREMENTS**

- Manufacturer advises monitor closely for infection before, during and after treatment—potential increased risk of opportunistic infection.

- Manufacturer advises monitor for new onset or worsening neurological signs and symptoms ( withhold treatment if progressive multifocal leukoencephalopathy (PML) is suspected).

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Entyvio®), give intermittently in Sodium chloride 0.9%; allow vial to reach room temperature then reconstitute with 4.8 mL of water for injection (using a syringe with a 21–25 gauge needle); gently swirl vial for at least 15 seconds, do not shake vigorously or invert; allow to stand for up to 20 minutes (gently swirl vial if needed), leave for an additional 10 minutes if not dissolved; gently invert vial three times, withdraw 5 mL of reconstituted solution (using a syringe with a 21–25 gauge needle), and add to 250 mL of infusion fluid; gently mix and give over 30 minutes.

**PATIENT AND CARER ADVICE** Patients should be provided with a patient alert card.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- **Vedolizumab for treating moderately to severely active Crohn’s disease after prior therapy (August 2015)** NICE TA352

Vedolizumab is recommended as an option for the treatment of moderate to severe active Crohn’s disease in adults if:

- a tumour necrosis factor-alpha inhibitor has failed (that is, the disease has responded inadequately or has lost response to treatment) or

- a tumour necrosis factor-alpha inhibitor cannot be tolerated or is contra-indicated,

and the manufacturer provides vedolizumab with the discount agreed in the patient access scheme.

Vedolizumab should be given as a planned course of treatment until treatment fails, or surgery is needed, or until 12 months after starting treatment, whichever is the shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

Patients currently receiving vedolizumab whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

**Scottish Medicines Consortium (SMC) Decisions**

The **Scottish Medicines Consortium** has advised (July 2015) that vedolizumab (Entyvio®) is accepted for restricted use within NHS Scotland for the treatment of adult patients with moderately to severely active Crohn’s disease who have had an inadequate response with, lost response to, or were intolerant to a TNF antagonist; it is also accepted for use in NHS Scotland for the treatment of adult patients with moderately to severely active ulcerative colitis who have had an inadequate response with, lost response to, or were intolerant to either conventional therapy or a TNF antagonist.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- **Entyvio (Takeda UK Ltd)** ▼ Vedolizumab 300 mg Entyvio 300mg powder for concentrate for solution for infusion vials | 1 vial (£50) £2,050.00

---

**1.4 Irritable bowel syndrome**

**Irritable bowel syndrome**

**Description of condition**

**Irritable bowel syndrome** (IBS) is a common, chronic, relapsing, and often life-long condition, mainly affecting people aged between 20 and 30 years. It is more common in women. Symptoms include abdominal pain or discomfort, disordered defaecation (either diarrhoea, or constipation with straining, urgency, and incomplete evacuation), passage of mucus, and bloating. Symptoms are usually relieved by defaecation. Obtaining an accurate clinical diagnosis of IBS prior to treatment is crucial.

**Aims of treatment**

The treatment of IBS is focused on symptom control, in order to improve quality of life.

**Non-drug treatment**

Diet and lifestyle changes are important for effective self-management of IBS. Patients should be encouraged to increase physical activity, and advised to eat regularly, without missing meals or leaving long gaps between meals. Dietary advice should also include, limiting fresh fruit consumption to no more than 3 portions per day. The fibre intake of patients with IBS should be reviewed. If an increase in dietary fibre is required, soluble fibre such as ispaghula husk p. 53, or foods high in soluble fibre such as oats, are recommended. Intake of insoluble fibre (e.g. bran) and ‘resistant starch’ should be reduced or discouraged as they may exacerbate symptoms. Fluid intake (mostly water) should be increased to at least 8 cups each day and the intake of caffeine, alcohol and fizzy drinks reduced. The artificial sweetener sorbitol should be avoided in patients with...
diarrhoea. Where probiotics are being used, continue for at least 4 weeks while monitoring the effect.

If a patient’s symptoms persist following lifestyle and dietary advice, single food avoidance and exclusion diets may be an option under the supervision of a dietitian or medical specialist.

**Drug treatment**

The choice of drug treatment depends on the nature and severity of the symptoms. Many drug treatment options for IBS are available over-the-counter.

Antispasmodic drugs (such as alverine citrate p. 84, mebeverine hydrochloride p. 84 and peppermint oil below) can be taken in addition to dietary and lifestyle changes. A laxative (excluding lactulose p. 55 as it may cause bloating) can be used to treat constipation. Patients who have not responded to laxatives from the different classes and who have had constipation for at least 12 months, can be treated with linaclotide p. 47. Loperamide hydrochloride p. 65 is the first-line choice of anti-motility drug for relief of diarrhoea. Patients with IBS should be advised how on to adjust their dose of laxative or anti-motility drug according to stool consistency, with the aim of achieving a soft, well-formed stool. See Constipation p. 51, for information on other drugs used for chronic constipation.

A low-dose tricyclic antidepressant, such as amitriptyline hydrochloride p. 355 [unlicensed indication], can be used for abdominal pain or discomfort as a second-line option in patients who have not responded to antispasmodics, anti-motility drugs, or laxatives. A selective serotonin reuptake inhibitor may be considered in those who do not respond to a tricyclic antidepressant [unlicensed indication].

Psychological intervention can be offered to patients who have no relief of IBS symptoms after 12 months of drug treatment.

**Useful Resources**

www.nice.org.uk/guidance/cg61

**ANTISPASMODICS**

**Mebeverine with ispaghula husk**

04-Feb-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, mebeverine hydrochloride p. 84, ispaghula husk p. 53.

**INDICATIONS AND DOSE**

**Irritable bowel syndrome**

- **BY MOUTH**
  - Child 12-17 years: 1 sachet twice daily, in water, morning and evening, 30 minutes before food and 1 sachet daily if required, taken 30 minutes before midday meal
  - Adult: 1 sachet twice daily, in water, morning and evening, 30 minutes before food and 1 sachet daily if required, taken 30 minutes before midday meal

**DIRECTIONS FOR ADMINISTRATION**

Contents of one sachet should be stirred into a glass (approx. 150 mL) of cold water and drunk immediately.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer ispaghula husk with mebeverine granules.

**Peppermint oil**

**INDICATIONS AND DOSE**

**COLPERMIN®**

Relief of abdominal colic and distension, particularly in irritable bowel syndrome

- **BY MOUTH**
  - Child 15-17 years: 1–2 capsules 3 times a day for up to 3 months if necessary, capsule to be swallowed whole with water
  - Adult: 1–2 capsules 3 times a day for up to 3 months if necessary, capsule to be swallowed whole with water

**MINTEC®**

Relief of abdominal colic and distension, particularly in irritable bowel syndrome

- **BY MOUTH**
  - Adult: 1–2 capsules 3 times a day for up to 2–3 months if necessary, dose to be taken before meals, swallowed whole with water

**CAUTIONS**

- Sensitivity to menthol

**INTERACTIONS**

Appendix 1: peppermint oil

**SIDE-EFFECTS**

- Rare Allergic reactions - ataxia - bradycardia - headache - muscle tremor - rash
- Frequency not known Heartburn - perianal irritation

**PREGNANCY**

Not known to be harmful.

**BREAST FEEDING**

Significant levels of menthol in breast milk unlikely.

**DIRECTIONS FOR ADMINISTRATION**

Capsules should not be broken or chewed because peppermint oil may irritate mouth or oesophagus.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant capsule**

- **CAUTIONARY AND ADVISORY LABELS** 13, 22
- **EXCIPIENTS:** May contain Aspartame
- **ELECTROLYTES:** May contain Potassium
- **Fybogel Mebeverine** (Reckitt Benckiser Healthcare (UK) Ltd)
  - Mebeverine hydrochloride 135 mg, Ispaghula husk
  - 3.5 gram Fybogel Mebeverine effervescent granules sachets orange sugar-free 10 sachet £4.64 DT price = £4.64
1.5 Short bowel syndrome

Description of condition
Patients with a shortened bowel due to large surgical resection (with or without stoma formation) may require medical management to ensure adequate absorption of nutrients and fluid. Absorption of oral medication is also often impaired.

Aims of treatment
The management of short bowel syndrome focuses on ensuring adequate nutrition and drug absorption, thereby reducing the risk of complications resulting from these effects.

Drug treatment

Nutritional deficiencies

Patients with a short bowel may require replacement of vitamins and minerals depending on the extent and position of the bowel resection. Deficiencies in vitamins A, B12, D, E, and K, essential fatty acids, zinc, and selenium can occur.

Hypomagnesaemia is common and is treated with oral or intravenous magnesium supplementation (see under Magnesium, in Minerals p. 962), though administration of oral magnesium may cause diarrhoea. Occasionally the use of oral alfalcacidol p. 991 and correction of sodium depletion may be useful. Nutritional support can range from oral supplements to parenteral nutrition, depending on the severity of intestinal failure.

Diarrhoea and high output stomas

Diarrhoea is common in short bowel syndrome and can be due to multiple factors. Use of oral rehydration salts can be considered in order to promote adequate hydration. Oral intake influences the volume of stool passed, so reducing food intake will lessen diarrhoea, but will also exacerbate the problems of undernutrition. A patient may require parenteral nutrition to allow them to eat less, if the extent of diarrhoea is unacceptable.

Pharmacological treatment may be necessary, with the choice of drug depending on the potential for side-effects and the degree of resection.

Antimotility drugs

Loperamide hydrochloride p. 65 and codeine phosphate p. 431 reduce intestinal motility and thus exert antidiarrhoeal actions. Loperamide hydrochloride is preferred as it is not sedative and does not cause dependence or fat malabsorption. High doses of loperamide hydrochloride [unlicensed] may be required in patients with a short bowel due to disrupted enterohepatic circulation and rapid gastrointestinal transit time. If the desired response is not obtained with loperamide hydrochloride, codeine phosphate may be added to therapy.

Co-phenoton p. 64 has traditionally been used alone or in combination with other medications to help decrease faecal output. Co-phenoton crosses the blood–brain barrier and can produce central nervous system side-effects, which may limit its use; the potential for dependence and anticholinergic effects may also restrict its use.

Colestyramine

In patients with an intact colon and less than 100 cm of ileum resected, colestyramine p. 191 can be used to bind the unabsorbed bile salts and reduce diarrhoea. When colestyramine is given to these patients, it is important to monitor for evidence of fat malabsorption (steatorrhoea) or fat-soluble vitamin deficiencies.

Antisecretory drugs

Drugs that reduce gastric acid secretion reduce jejunalostomy output. Omeprazole p. 78 is rarely absorbed in the duodenum and upper small bowel, but if less than 50 cm of jejunal remains, it may need to be given intravenously. Use of a proton pump inhibitor alone does not eliminate the need for further intervention for fluid control (such as antimotility agents, intravenous fluids, or oral rehydration salts).

Octreotide [unlicensed indication] reduces ileostomy diarrhoea and large volume jejunalostomy output by inhibiting multiple pro-secretory substances. There is insufficient evidence to establish its role in the management of short bowel syndrome.

Growth factors

Growth factors can be used to facilitate intestinal adaptation after surgery in patients with short bowel syndrome, thus enhancing fluid, electrolyte, and micronutrient absorption.

Teduglutide p. 48 is an analogue of endogenous human glucagon-like peptide 2 (GLP-2) which is licensed for use in the management of short bowel syndrome. It may be...
considered after a period of stabilisation following surgery, during which intravenous fluids and nutritional support should have been optimised.

**Drug absorption**

For *Prescribing in patients with stoma*, see Stoma care p. 94.

Many drugs are incompletely absorbed by patients with a short bowel and may need to be prescribed in much higher doses than usual (such as levothyroxine, warfarin, oral contraceptives, and digoxin) or may need to be given intravenously.

Several factors can alter the absorption of drugs taken by mouth in patients with a compromised gastrointestinal system. The most important factors are the length of intestine available for drug absorption, and which section has been removed. The small intestine, with its large surface area and high blood flow, is the most important site of drug absorption. The larger the amount of the small intestine that has been removed, the higher the possibility that drug absorption will be affected. Other factors, such as gastric emptying and gastric transit time, also affect drug handling.

Dosage forms with quick dissolution (soluble tablets) should be used. Uncoated tablets and liquid formulations may also be suitable. Before prescribing liquid formulations, prescribers should consider the osmolarity, excipient content and volume required. Hypersmolar liquids and some excipients (such as sorbitol) can result in fluid loss. The calorie density of oral supplements should also be considered, as it will influence the volume to be taken.

Other drugs used for Short bowel syndrome

Cimetidine, p. 72

**AMINO ACIDS AND DERIVATIVES**

**Teduglutide**

- **DRUG ACTION** Teduglutide is an analogue of human glucagon-like peptide-2 (GLP-2), which preserves mucosal integrity by promoting growth and repair of the intestine.

- **INDICATIONS AND DOSE**
  
  **Short bowel syndrome (initiated under specialist supervision)**
  
  - **BY SUBCUTANEOUS INJECTION**
  - **Adult:** 0.05 mg/kg once daily, dose to be administered to alternating quadrants of the abdomen; alternatively the thigh can be used, for optimal injection volume per body weight, consult product literature. Review treatment after 6 months

- **CONTRA-INDICATIONS** Active or suspected malignancy • history of gastro-intestinal malignancy (in previous 5 years)

- **CAUTIONS** Abrupt withdrawal of parenteral support (reduce gradually with concomitant monitoring of fluid status) • cardiac insufficiency • cardiovascular disease • colo-rectal polyps • hypertension

- **SIDE-EFFECTS**
  
  - **Common or very common** Abdominal distension • abdominal pain • allergic dermatitis • anxiety • arthralgia • chest pain • cholecystitis • cholostasis • congestive heart failure • cough • decreased appetite • dyspnoea • flushing • headache • intestinal obstruction • nausea • night sweats • pancreatitis • paraesthesia • peripheral oedema • rash • renal colic • sleep disorder • vomiting
  
  - **Uncommon** Syncope

- **Frequency not known** Gastro-intestinal neoplasia • pancreatic duct stenosis • pancreatic infection

- **ALLERGY AND CROSS-SENSITIVITY** Manufacturer advises caution in patients with tetracycline hypersensitivity.

- **PREGNANCY** Specialist sources indicate use if necessary—no human data available.

- **BREAST FEEDING** Manufacturer advises avoid—toxicity in animal studies.

- **RENAI IMPAIRMENT** Manufacturer advises use half the daily dose in moderate or severe impairment and end-stage renal disease.

- **MONITORING REQUIREMENTS** Manufacturer advises monitoring of small bowel function, gall bladder, bile ducts and pancreas during treatment.

- **TREATMENT CESSATION** Caution when discontinuing treatment—risk of dehydration.

- **PATIENT AND CARER ADVICE** Patients with cardiovascular disease should seek medical attention if they notice sudden weight gain, swollen ankles or dyspnoea—may indicate increased fluid absorption.

**CONTRA-INDICATIONS**

- Gastro-intestinal neoplasia
- Pancreatic duct stenosis
- Pancreatic infection

**ALLERGY AND CROSS-SENSITIVITY**

- Tetracycline hypersensitivity

**PREGNANCY**

- Specialist sources indicate use if necessary

**BREAST FEEDING**

- Avoid—risk of toxicity in animal studies

**RENAI IMPAIRMENT**

- Use half the daily dose in moderate or severe impairment and end-stage renal disease

**MONITORING REQUIREMENTS**

- Monitoring of small bowel function, gall bladder, bile ducts and pancreas during treatment

**TREATMENT CESSATION**

- Caution when discontinuing treatment—risk of dehydration

**PATIENT AND CARER ADVICE**

- Seek medical attention if sudden weight gain, swollen ankles or dyspnoea

**MEDIcINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

**Citric acid with magnesium carbonate**

(Formulated as a bowel cleansing preparation)

- **INDICATIONS AND DOSE**
  
  - **Bowel evacuation for surgery, colonoscopy or radiological examination**
  
  - **BY MOUTH**
  
  - **Child 5–9 years:** One-third of a sachet to be given at 8 a.m. the day before the procedure and, one-third of a sachet to be given between 2 and 4 p.m. the day before the procedure
  
  - **Child 10–17 years:** 0.5–1 sachet, given at 8 a.m. the day before the procedure and 0.5–1 sachet, given between 2 and 4 p.m. the day before the procedure
  
  - **Adult:** 1 sachet, given 8 a.m. the day before the procedure and 1 sachet, given between 2 and 4 p.m. the day before the procedure, use half the dose in frail elderly patients

- **CONTRA-INDICATIONS** Acute severe colitis • gastric retention • gastro-intestinal obstruction • gastro-intestinal perforation • toxic megalocolon

- **CAUTIONS** Children • colitis (avoid if acute severe colitis) • debilitated • elderly • hypovolaemia (should be corrected before administration of bowel cleansing preparations) • impaired gag reflex or possibility of regurgitation or aspiration • patients with fluid and electrolyte disturbances
CAUTIONS, FURTHER INFORMATION
Adequate hydration should be maintained during treatment.

- **INTERACTIONS** → Appendix 1: bowel cleansing preparations

- **SIDE-EFFECTS**
  - Common or very common: Abdominal distension, abdominal pain, nausea, vomiting
  - Uncommon: Dehydration, dizziness, electrolyte disturbances, headache

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Abdominal pain: Abdominal pain is usually transient and can be reduced by taking preparation more slowly.

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Use with caution.

- **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.

- **RENAL IMPAIRMENT**
  - In adults: Avoid if eGFR less than 30 mL/minute/1.73 m² — risk of hypermagnesaemia.
  - In children: Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m² — risk of hypermagnesaemia.

- **MONITORING REQUIREMENTS** Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.

- **DIRECTIONS FOR ADMINISTRATION** One sachet should be reconstituted with 200 mL of hot water; the solution should be allowed to cool for approx. 30 minutes before drinking.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Reconstitution of one sachet containing 11.57 g magnesium carbonate and 17.79 g anhydrous citric acid provides a solution containing magnesium citrate with 118 mmol Mg²⁺.
  - Flavours of oral powders may include lemon and lime.

- **PATIENT AND CARER ADVICE** Low residue or fluid only diet (e.g. water, fruit squash, clear soup, black tea or coffee) recommended before procedure (according to prescriber’s advice) and copious intake of clear fluids recommended until procedure. Patient or carers should be given advice on how to administer oral powder.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Effervescent powder**
  - **CAUTIONARY AND ADVISORY LABELS** 13, 10

(Formulated as a bowel cleansing preparation)

**INDICATIONS AND DOSE**

**Bowel cleansing before radiological examination, colonoscopy, or surgery**

- **INITIALLY BY MOUTH**
  - **Adult:** Initially 2 litres daily for 2 doses: first dose of reconstituted solution taken on the evening before procedure and the second dose on the morning of procedure, alternatively (by mouth) initially 250 mL every 10–15 minutes, reconstituted solution to be administered, alternatively (by nasogastric tube) initially 20–30 mL/minute, starting on the day before procedure until 4 litres have been consumed

**SIDE-EFFECTS** → Appendix 1: bowel cleansing preparations

**SIDE-EFFECTS, FURTHER INFORMATION**

- Abdominal pain
- Abdominal distention
- Anal discomfort
- Constipation
- Dehydration
- Fatigue
- Headache
- Nausea
- Vomiting

**PREGNANCY**

Manufacturers advise use only if essential—no information available.

**PEDIATRICS**

- Adult: 1 sachet taken before 8 a.m, then 1 sachet after 6–8 hours

**PHARMACOKINETICS**

For CitraFleet®: Acts within 3 hours of first dose.

**CONTRA-INDICATIONS**

- Acute severe colitis
- Gastric retention
- Gastro-intestinal obstruction
- Gastro-intestinal perforation
- Toxic megacolon

**CAUTIONS**

- Colitis (avoid if acute severe colitis)
- Debilitated patients
- Elderly
- Fluid and electrolyte disturbances
- Heart failure
- Hypovolaemia (should be corrected before administration of bowel cleansing preparations)
- Impaired gag reflex or possibility of regurgitation or aspiration

**INTERACTIONS**

- **LAXATIVES**

**LAXATIVES > STIMULANT LAXATIVES**

**Magnesium citrate with sodium picosulfate**

(Formulated as a bowel cleansing preparation)

**INDICATIONS AND DOSE**

**CITRAFLEET® SACHETS**

**Bowel evacuation on day before radiological examination, endoscopy, or surgery**

- **BY MOUTH**
  - **Adult:** 1 sachet taken before 8 a.m, then 1 sachet after 6–8 hours

**PHARMACOKINETICS**

For Picolax®: Acts within 3 hours of first dose.

**CONTRA-INDICATIONS**

- Acute severe colitis
- Ascites
- Congestive cardiac failure
- Gastric retention
- Gastro-intestinal obstruction
- Gastro-intestinal perforation
- Gastro-intestinal ulceration
- Toxic megacolon

**CAUTIONS**

- Cardiac disease (avoid in congestive cardiac failure)
- Children
- Colitis (avoid if acute severe colitis)
- Debilitated patients
- Elderly
- Fluid and electrolyte disturbances
- Hypovolaemia (should be corrected before administration)
- Impaired gag reflex or possibility of regurgitation or aspiration
- Recent gastro-intestinal surgery

**SIDE-EFFECTS**

- **Common or very common** Abdominal distention
- Abdominal pain
- Anal discomfort
- Constipation
- Dehydration
- Fatigue
- Headache
- Nausea
- Vomiting

**PREGNANCY**

Caution.

**BREAST FEEDING**

Caution.

**HEPATIC IMPAIRMENT**

Avoid in hepatic coma if risk of renal failure.
Constipation

2.2 Constipation

Description of condition

Constipation is defaecation that is unsatisfactory because of infrequent stools, difficult stool passage, or seemingly incomplete defaecation. It can occur at any age and is commonly seen in women, the elderly, and during pregnancy.

It is important for those who complain of constipation to understand that bowel habit can vary considerably in frequency without doing harm. Some people erroneously consider themselves constipated if they do not have a bowel movement each day.

New onset constipation, especially in patients over 50 years of age, or accompanying symptoms such as anaemia, abdominal pain, weight loss, or overt or occult blood in the stool should provoke urgent investigation because of the risk of malignancy or other serious bowel disorder. In those patients with secondary constipation caused by a drug, the drug should be reviewed.

Overview

In all patients with constipation, an increase in dietary fibre, adequate fluid intake and exercise is advised. Diet should be balanced and contain whole grains, fruits and vegetables. Fibre intake should be increased gradually (to minimise flatulence and bloating). The effects of a high-fibre diet may be seen in a few days although it can take as long as 4 weeks. Adequate fluid intake is important (particularly with a high-fibre diet or fibre supplements), but can be difficult for some people (for example, the frail or elderly).

Fruits high in fibre and sorbitol, and fruit juices high in sorbitol, can help prevent and treat constipation. Misconceptions about bowel habits have led to excessive laxative use. Laxative abuse may lead to hypokalaemia.

Before prescribing laxatives it is important to be sure that the patient is constipated and that the constipation is not secondary to an underlying undiagnosed complaint.

Laxatives

Bulk-forming laxatives

Bulk-forming laxatives include bran, ispaghula husk p. 53, methylcellulose p. 53 and sterculia p. 54. They are of particular value in adults with small hard stools if fibre cannot be increased in the diet. Onset of action is up to 72 hours. Symptoms of flatulence, bloating, and cramping may be exacerbated. Adequate fluid intake must be maintained to avoid intestinal obstruction.

Methylcellulose, ispaghula husk and sterculia may be used in patients who cannot tolerate bran. Methylcellulose also acts as a faecal softener.

Stimulant laxatives

Stimulant laxatives include bisacodyl p. 59, sodium picosulfate p. 62, and members of the anthraquinone group (senna p. 61, co-danthramer p. 60 and co-danthrusate p. 60). Stimulant laxatives increase intestinal motility and often cause abdominal cramp; manufacturer advises they should be avoided in intestinal obstruction.

The use of co-danthramer and co-danthrusate is limited to constipation in terminally ill patients because of potential carcinogenicity (based on animal studies) and evidence of genotoxicity.

Docusate sodium p. 58 is believed to act as both a stimulant laxative and as a faecal softener (below). Glycerol suppositories act as a lubricant and as a rectal stimulant by virtue of the mildly irritant action of glycerol.

Faecal softeners

Faecal softeners are claimed to act by decreasing surface tension and increasing penetration of intestinal fluid into the faecal mass. Docusate sodium and glycerol p. 61 suppositories have softening properties. Enemas containing arachis oil p. 58 (ground-nut oil, peanut oil) lubricate and soften impacted faeces and promote a bowel movement. Liquid paraffin p. 59 has also been used as a lubricant for the passage of stools but manufacturer advises that it should be used with caution because of its adverse effects, which include anal seepage and the risks of granulomatous disease of the gastro-intestinal tract or of lipid pneumonia on aspiration.

Osmotic laxatives

Osmotic laxatives increase the amount of water in the large bowel, either by drawing fluid from the body into the bowel or by retaining the fluid they were administered with. Lactulose p. 55 is a semi-synthetic disaccharide which is not absorbed from the gastro-intestinal tract. It produces an osmotic diarrhoea of low faecal pH, and discourages the proliferation of ammonia-producing organisms. It is
therefore useful in the treatment of hepatic encephalopathy. Macrogols (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 55) are inert polymers of ethylene glycol which sequester fluid in the bowel; giving fluid with macrogols may reduce the dehydrating effect sometimes seen with osmotic laxatives.

**Other drugs used in constipation**

Linaclotide p. 47 is a guanylate cyclase-C receptor agonist that is licensed for the treatment of moderate to severe irritable bowel syndrome associated with constipation. It increases intestinal fluid secretion and transit, and decreases visceral pain.

Lubiprostone p. 54 is a chloride-channel activator that is licensed for the treatment of chronic idiopathic constipation in adults whose condition has not responded adequately to lifestyle changes (including dietary changes).

Prucalopride p. 58 is a selective serotonin 5HT₄-receptor agonist with prokinetic properties. It is licensed for the treatment of chronic constipation in women, when other laxatives have failed to provide an adequate response.

**Bowel cleansing preparations**

Bowel cleansing preparations are used before colonic surgery, colonoscopy or radiological examination to ensure the bowel is free of solid contents; examples include macrogol 3350 with anhydrous sodium sulphate, potassium chloride, sodium bicarbonate and sodium chloride p. 50, citric acid with magnesium carbonate p. 48, magnesium citrate with sodium picosulfate p. 50 and sodium acid phosphate with sodium phosphate p. 57. Bowel cleansing treatments are not treatments for constipation.

**Management**

**Short-duration constipation**

In the management of short-duration constipation (where dietary measures are ineffective) treatment should be started with a bulk-forming laxative, ensuring adequate fluid intake. If stools remain hard, add or switch to an osmotic laxative. If stools are soft but difficult to pass or the person complains of inadequate emptying, a stimulant laxative should be added.

**Opioid-induced constipation**

See also **Constipation** under Prescribing in palliative care p. 23. In patients with opioid-induced constipation, an osmotic laxative (or docusate sodium to soften the stools) and a stimulant laxative is recommended. Bulk-forming laxatives should be avoided.

Naloxegol p. 63 is recommended for the treatment of opioid-induced constipation when response to other laxatives is inadequate.

Methylnaltrexone bromide p. 62 is licensed for the treatment of opioid-induced constipation when response to other laxatives is inadequate. Manufacturer advises that in patients receiving palliative care, methylnaltrexone bromide should be used as an adjunct to existing laxative therapy.

**Faecal impaction**

The treatment of faecal impaction depends on the stool consistency. In patients with hard stools, a high dose of an oral macrogol (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride) may be considered. In those with soft stools, or with hard stools after a few days treatment with a macrogol, an oral stimulant laxative should be started or added to the previous treatment. If the response to oral laxatives is inadequate, for soft stools consider rectal administration of bisacodyl, and for hard stools rectal administration of glycerol alone, or glycerol plus bisacodyl. Alternatively, a docusate sodium p. 58 or sodium citrate p. 743 enema may be tried.

If the response is still insufficient, a sodium acid phosphate with sodium phosphate p. 57 or arachis oil p. 58 retention enema may be necessary. For hard faeces it can be helpful to give the arachis oil enema overnight before giving a sodium acid phosphate with sodium phosphate or sodium citrate enema the following day. Enemas may need to be repeated several times to clear hard impacted faeces.

**Chronic constipation**

In the management of chronic constipation, treatment should be started with a bulk-forming laxative, whilst ensuring good hydration. If stools remain hard, add or change to an osmotic laxative such as a macrogol. Lactulose p. 55 is an alternative if macrogols are not effective, or not tolerated. If the response is inadequate, a stimulant laxative can be added. The dose of laxative should be adjusted gradually to produce one or two soft, formed stools per day.

If at least two laxatives (from different classes) have been tried at the highest tolerated recommended doses for at least 6 months, the use of prucalopride p. 58 (in women only) or lubiprostone p. 54 should be considered. If treatment with prucalopride is not effective after 4 weeks, or lubiprostone is not effective after 2 weeks, the patient should be re-examined and the benefit of continuing treatment reconsidered.

Laxatives can be slowly withdrawn when regular bowel movements occur without difficulty, according to the frequency and consistency of the stools. If a combination of laxatives has been used, reduce and stop one laxative at a time; if possible, the stimulant laxative should be reduced first. However, it may be necessary to also adjust the dose of the osmotic laxative to compensate.

**Constipation in pregnancy and breast-feeding**

If dietary and lifestyle changes fail to control constipation in pregnancy, fibre supplements in the form of bran or wheat are likely to help women experiencing constipation in pregnancy, and raise no serious concerns about side-effects to the mother or foetus. A bulk-forming laxative is the first choice during pregnancy if fibre supplements fail. An osmotic laxative, such as lactulose, can also be used. Bisacodyl p. 59 or senna p. 61 may be suitable if a stimulant effect is necessary but use of senna should be avoided near term or if there is a history of unstable pregnancy. Stimulant laxatives are more effective than bulk-forming laxatives but are more likely to cause side-effects (diarrhoea and abdominal discomfort), reducing their acceptability to patients. Docusate sodium and glycerol p. 61 suppositories can also be used.

A bulk-forming laxative is the first choice during breast-feeding, if dietary measures fail. Lactulose or a macrogol may be used if stools remain hard. As an alternative, a short course of a stimulant laxative such as bisacodyl or senna can be considered.

**Constipation in children**

Early identification of constipation and effective treatment can improve outcomes for children. Without early diagnosis and treatment, an acute episode of constipation can lead to anal fissure and become chronic. The first-line treatment for children with constipation requires the use of a laxative in combination with dietary modification or with behavioural interventions. Diet modification alone is not recommended as first-line treatment.

In children an increase in dietary fibre, adequate fluid intake, and exercise is advised. Diet should be balanced and contain fruits, and vegetables, high-fibre bread, baked beans, and wholegrain breakfast cereals. Unprocessed bran (which may cause bloating and flatulence and reduces the absorption of micronutrients) is not recommended. If faecal impaction is not present (or has been treated), the child should be treated promptly with a laxative. A macrogol (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 55) is preferred as first-line management. If the response is inadequate, add
Faecal impaction in children

- **Drugs Action**: Treatment of faecal impaction may initially increase symptoms of soiling and abdominal pain. In children over 1 year of age with faecal impaction, an oral preparation containing a macrogol (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride) is used to clear faecal mass and to establish and maintain soft well-formed stools, using an escalating dose regimen depending on symptoms and response. If disimpaction does not occur after 2 weeks, a stimulant laxative can be added or if stools are hard, used in combination with an osmotic laxative such as lactulose.

**LAXATIVES** > **BULK-FORMING LAXATIVES**

**Ispaghula husk**

- **Drug Action**: Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

- **Indications and Dose**
  - **Constipation**
    - **Adult**: 1 sachet or 3 capsule daily, dose to be taken two to three times daily, preferably after meals.
    - **Child**: 1 sachet or capsule daily, dose to be taken two to three times daily, preferably after meals.

- **Contra-Indications**: Colonotony - difficulty in swallowing - faecal impaction - infective bowel disease - intestinal obstruction.

- **Caution**: Adequate fluid intake should be maintained to avoid intestinal obstruction.

- **Side-Effects**: Abdominal distension - flatulence - gastro-intestinal impaction - gastro-intestinal obstruction - hypersensitivity.

- **Prescribing and Dispensing Information**: Flavours of soluble granules formulations may include lemon, orange, or banana.

- **Handling and Storage**: Ispaghula husk contains potent allergens. Individuals exposed to the product (including those handling the product) can develop hypersensitivity reactions such as rhinitis, conjunctivitis, bronchospasm and in some cases, anaphylaxis.

- **Patient and Carer Advice**: Manufacturer advises that preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed. Patients and their carers should be advised that the full effect may take some days to develop and should be given advice on how to administer ispaghula husk.

- **Medicinal Forms**: There can be variation in the licensing of different medicines containing the same drug.

**Effervescent granules**

- **Drug Action**: Ispaghula 3.5g effervescent granules sachets gluten free sugar free sugar-free 30 sachet DT price = £2.72.
- **Indications and Dose**
  - **Adult**: 1 sachet twice daily, dose to be given in water preferably taken after food, morning and evening.
  - **Child**: 1 sachet twice daily, dose to be given in water preferably taken after food, morning and evening.

**Granules**

- **Drug Action**: Ispaghula 3.5g effervescent granules sachets gluten free sugar-free 30 sachet DT price = £2.72.

**Methyldroxide**

- **Drug Action**: Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

- **Indications and Dose**
  - **Constipation**: 1 sachet or capsule daily, dose to be taken two to three times daily, preferably after meals.

- **Contra-Indications**: Colonotony - difficulty in swallowing - faecal impaction - infective bowel disease - intestinal obstruction.

- **Caution**: Adequate fluid intake should be maintained to avoid intestinal obstruction.

- **Side-Effects**: Abdominal distension (especially during the first few days of treatment) - flatulence (especially during the first few days of treatment) - gastro-intestinal impaction - gastro-intestinal obstruction - hypersensitivity.

- **Prescribing and Dispensing Information**: In constipation the dose should be taken with at least 300 mL liquid. In diarrhoea, ileostomy, and colostomy control, avoid liquid intake for 30 minutes before and after dose.

- **Handling and Storage**: Ispaghula husk contains potent allergens. Individuals exposed to the product (including those handling the product) can develop hypersensitivity reactions such as rhinitis, conjunctivitis, bronchospasm and in some cases, anaphylaxis.

- **Patient and Carer Advice**: Patients and their carers should be advised that the full effect may take some days to develop and should be given advice on how to administer ispaghula husk.

**Gastro-intestinal system**

- **Drug Action**: Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

- **Indications and Dose**
  - **Adult**: 1 sachet or capsule daily, dose to be taken two to three times daily, preferably after meals.
  - **Child**: 1 sachet or capsule daily, dose to be taken two to three times daily, preferably after meals.

- **Contra-Indications**: Colonotony - difficulty in swallowing - faecal impaction - infective bowel disease - intestinal obstruction.

- **Caution**: Adequate fluid intake should be maintained to avoid intestinal obstruction.

- **Side-Effects**: Abdominal distension (especially during the first few days of treatment) - flatulence (especially during the first few days of treatment) - gastro-intestinal impaction - gastro-intestinal obstruction - hypersensitivity.

- **Prescribing and Dispensing Information**: In constipation the dose should be taken with at least 300 mL liquid. In diarrhoea, ileostomy, and colostomy control, avoid liquid intake for 30 minutes before and after dose.

- **Handling and Storage**: Ispaghula husk contains potent allergens. Individuals exposed to the product (including those handling the product) can develop hypersensitivity reactions such as rhinitis, conjunctivitis, bronchospasm and in some cases, anaphylaxis.

- **Patient and Carer Advice**: Patients and their carers should be advised that the full effect may take some days to develop and should be given advice on how to administer ispaghula husk.

MAGNESIUM HYDROXIDE

INDICATIONS AND DOSE

Constipation
- By mouth
- Adult: 30–45 mL as required, dose to be given mixed with water at bedtime

CONTRA-INDICATIONS
- Acute gastro-intestinal conditions
- Debilitated patients - elderly
- INTERACTIONS
- Appendix 1: magnesium
- SIDE-EFFECTS
- Colic
- HEPATIC IMPAIRMENT
- Avoid in hepatic coma if risk of renal failure.
- RENAL IMPAIRMENT
- Avoid or reduce dose. Increased risk of toxicity in renal impairment.
- PRESCRIBING AND DISPENSING INFORMATION
- When prepared extemporaneously, the BP states Magnesium Hydroxide Mixture, BP consists of an aqueous suspension containing about 8% hydrated magnesium oxide.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.
- Oral suspension
  - Phillips’ Milk of Magnesia (Omega Pharma Ltd)
    - Magnesium hydroxide 83 mg per 1 mL Phillips’ Milk of Magnesia
    - 415 mg/5 mL oral suspension sugar-free £2.32
  - Combinations available: Liquid paraffin with magnesium hydroxide, p. 59

SODIUM ACID PHOSPHATE WITH SODIUM PHOSPHATE

INDICATIONS AND DOSE

Constipation (using Phosphates Enema BP Formula B) | Bowel evacuation before abdominal radiological procedures, endoscopy, and surgery (using Phosphates Enema BP Formula B)
- By rectum
  - Child 3–6 years: 45–65 mL once daily
  - Child 7–11 years: 65–100 mL once daily
  - Child 12–17 years: 100–128 mL once daily
  - Adult: 128 mL daily

FLEET® READY-TO-USE ENEMA
- Constipation | Bowel evacuation before abdominal radiological procedures | Bowel evacuation before endoscopy | Bowel evacuation before surgery
- By rectum
- Adult: 118 mL

FLEET® PHOSPHO-SODA
- Bowel evacuation before colonoscopic surgery | Bowel evacuation before colonoscopy | Bowel evacuation before radiological examination
- By mouth
- Adult: 45 mL twice daily, each dose must be diluted with half a glass (120 mL) of cold water, followed by one full glass (240 mL) of cold water, timing of doses is dependent on the time of the procedure, for morning procedure, the first dose should be taken at 7 a.m. and second at 7 p.m. on day before the procedure; for afternoon procedure, first dose should be taken at 7 p.m. on day before and second dose at 7 a.m. on day of the procedure

PHARMACOKINETICS
- For Fleet® Phospho-soda: Onset of action is within half to 6 hours of first dose.
LAXATIVES > SELECTIVE 5-HT₄ RECEPTOR AGONISTS

Prucalopride

**DRUG ACTION** A selective serotonin 5HT₄-receptor agonist with prokinetic properties.

**INDICATIONS AND DOSE**

- **Chronic constipation when other laxatives fail to provide an adequate response**
  - **BY MOUTH**
  - Adult: 2 mg once daily, review treatment if no response after 4 weeks
  - Elderly: Initially 1 mg once daily, increased if necessary to 2 mg once daily, review treatment if no response after 4 weeks

**CONTRA-INDICATIONS** Crohn’s disease · intestinal obstruction · intestinal perforation · toxic megacolon · ulcerative colitis

**CAUTIONS** History of arrhythmias · history of ischaemic heart disease

**SIDE-EFFECTS**

- Common or very common Abdominal pain · decreased appetite · diarrhoea · dizziness · dyspepsia · fatigue · flatulence · headache · nausea · polyuria · rectal bleeding · vomiting
- Uncommon Fever · malaise · palpitation · tremor

**SIDE-EFFECTS, FURTHER INFORMATION**

Manufacturer advises that side-effects generally occur at the start of treatment and are usually transient.

**CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment.

**PREGNANCY**

Manufacturer advises avoid—limited data available.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk.

**HEPATIC IMPAIRMENT** In severe impairment, manufacturer advises reduced dose of 1 mg once daily; increased if necessary to 2 mg once daily.

**RENAL IMPAIRMENT** Manufacturer recommends a reduced dose of 1 mg daily if eGFR less than 30 mL/minute/1.73 m².

**PATIENT AND CARER ADVICE**

Driving and skilled tasks

Manufacturer advises that dizziness and fatigue may initially affect ability to drive or operate machinery.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Prucalopride for the treatment of chronic constipation in women (December 2010) NICE TA211

Prucalopride is recommended as an option for the treatment of chronic constipation in women for whom treatment with at least 2 laxatives from different classes, at the highest tolerated recommended doses for at least 6 months, has failed to provide adequate relief and invasive treatment for constipation is being considered. If treatment with prucalopride is not effective after 4 weeks, the patient should be re-examined and the benefit of continuing treatment reconsidered.

Prucalopride should only be prescribed by a clinician with experience of treating chronic constipation, after careful review of the patient’s previous courses of laxative treatments.

www.nice.org.uk/TA211

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (June 2011) that prucalopride (Resolor®) is not recommended for use within NHS Scotland for the symptomatic treatment of chronic constipation of women in whom laxatives fail to provide adequate relief.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Resolor** (Shire Pharmaceuticals Ltd)
  - Prucalopride (as Prucalopride succinate) 1 mg Resolor tablets 28 tablet [Pres] £8.69 DT price = £4.69
  - Prucalopride (as Prucalopride succinate) 2 mg Resolor tablets 28 tablet [Pres] £9.52 DT price = £5.52

LAXATIVES > SOFTENING LAXATIVES

Arachis oil

**INDICATIONS AND DOSE**

To soften impacted faeces

- **BY RECTUM**
  - Adult: 130 mL as required

**CAUTIONS**

- Hypersensitivity to soya · intestinal obstruction

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated if history of hypersensitivity to arachis oil or peanuts.

**DIRECTIONS FOR ADMINISTRATION**

Warm enema in warm water before use.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Enema**

- **Arachis oil (Non-proprietary)**
  - Arachis oil 1 ml per 1 ml Arachis oil 130ml enema 1 enema [Pres] £47.50 DT price = £47.50

Docusate sodium

**(Diocyl sodium sulphasuccinate)**

**INDICATIONS AND DOSE**

- **Chronic constipation**
  - **BY MOUTH**
    - Child 6 months-1 year: 12.5 mg 3 times a day, adjusted according to response, use paediatric oral solution
    - Child 2-11 years: 12.5–25 mg 3 times a day, adjusted according to response, use paediatric oral solution
    - Child 12-17 years: Up to 500 mg daily in divided doses, adjusted according to response
Adult: Up to 500 mg daily in divided doses, adjusted according to response

**By rectum**

Adult: 120 mg for 1 dose

**Contraindications**

**Indications and dose**

**Constipation**

**By mouth**

Adult: 400 mg, to be administered with barium meal

**By rectum**

Adult: 120 mg for 1 dose

**Pharmacokinetics**

Oral preparations act within 1–2 days; response to rectal administration usually occurs within 20 minutes.

**Unlicensed use**

*Adult oral solution and capsules* not licensed for use in children under 12 years.

**Contra-indications**

Avoid in intestinal obstruction.

**Caution**

Do not give with liquid paraffin - excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia - rectal preparations not indicated if haemorrhoids or anal fissure.

**Interactions**

*Appendix 1: docusate sodium*

**Side-effects**

Abdominal cramp - diarrhea (excessive use) - hypokalaemia - rash

**Pregnancy**

Not known to be harmful - manufacturer advises caution.

**Breastfeeding**

With oral use: Present in milk following oral administration - manufacturer advises caution.

With rectal use: Rectal administration not known to be harmful.

**Directions for administration**

With oral use in children: For administration by mouth, solution may be mixed with milk or squash.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

- **Docusate sodium (Non-proprietary)**
  - Docusate sodium 2.5 mg per 1 ml: Docusate 12.5mg/5ml oral solution sugar-free free sugar-free | 300 ml [P] £7.79 DT price = £5.29
  - Docusate sodium 10 mg per 1 ml: Docusate 50mg/5ml oral solution sugar-free free sugar-free | 300 ml [P] £7.99 DT price = £7.99
- **Docusol** (Typharm Ltd)
  - Docusate sodium 2.5 mg per 1 ml: Docusol Paediatric 12.5mg/5ml oral solution sugar-free free | 300 ml [P] £5.29 DT price = £5.29

**Enema**

- **Norgalax** (Essential Pharma Ltd)
  - Docusate sodium 12 mg per 1 gram: Norgalax 120mg/10g enema | 6 enema [P] £28.00

**Capsule**

- **Dicotyl** (UCB Pharma Ltd)
  - Docusate sodium 100 mg: Dicotyl 100mg capsules | 30 capsule [P] £2.09 DT price = £2.09 | 100 capsule [P] £6.98
- **DulcoEase** (Boehringer Ingelheim Self-Medication Division)
  - Docusate sodium 100 mg: DulcoEase 100mg capsules | 30 capsule CSL £3.20 DT price = £2.09

**Combinations available:** *Co-danthrusate*, p. 60

**Liquid paraffin with magnesium hydroxide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, liquid paraffin above, magnesium hydroxide p. 57.

**Indications and dose**

**Constipation**

**By mouth**

Adult: 5–20 mL as required

**Prescribing and dispensing information**

Liquid paraffin and magnesium hydroxide preparations are on sale to the public.

When prepared extemporaneously, the BP states Liquid Paraffin and Magnesium Hydroxide Oral Emulsion, BP consists of 25% liquid paraffin in aqueous suspension containing 6% hydrated magnesium oxide.

**Less suitable for prescribing**

Liquid paraffin with magnesium hydroxide is less suitable for prescribing.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

**Laxatives**

**Stimulant laxatives**

**Bisacodyl**

**Indications and dose**

**Constipation**

**By mouth**

- Child 4–17 years: 5–20 mg once daily, adjusted according to response, dose to be taken at night
- Adult: 5–10 mg once daily increased if necessary up to 20 mg once daily, dose to be taken at night

**By rectum**

- Child 2–17 years: 5–10 mg once daily, adjusted according to response
- Adult: 10 mg once daily, dose to be taken in the morning

**Bowel clearance before radiological procedures and surgery**

**Initially by mouth**

- Adult: 10 mg twice daily, doses to be taken in the morning and evening on the day before... continued →
Co-danthramer

INDICATIONS AND DOSE

Constitution in terminally ill patients (standard strength capsules)
- By mouth using capsules
  - Child 6–11 years: 1 capsule once daily, dose should be taken at night
  - Child 12–17 years: 1–2 capsules once daily, dose should be taken at night
  - Adult: 1–2 capsules once daily, dose should be taken at night

Constitution in terminally ill patients (strong capsules)
- By mouth using capsules
  - Child 6–11 years: 1–2 capsules once daily, dose should be given at night
  - Adult: 1–2 capsules once daily, dose should be given at night

PHARMACOKINETICS

Tablets act in 10–12 hours; suppositories act in 20–60 minutes.

CONTRA-INDICATIONS

Acute abdominal conditions (in children) • acute inflammatory bowel disease • acute surgical abdominal conditions (in adults) • intestinal obstruction • severe dehydration

CAUTIONS

Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia • risk of electrolyte imbalance with prolonged use (in children)

INTERACTIONS

Appendix 1: bisacodyl

SIDE-EFFECTS

Abdominal cramp • diarrhoea and vomiting

CAUTIONARY AND ADVISORY LABELS

May be suitable for constipation in pregnancy, if a stimulant effect is necessary.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, suppository, enema

Gastro-resistant tablet

Cautionary and advisory labels 5, 25

Bisacodyl (non-proprietary)
- Bisacodyl 5 mg: Bisacodyl 5 mg gastro-resistant tablets | 60 tablet | £3.25 DT price = £1.96 | 100 tablet | £5.40 | 500 tablet | £25.73 | 1000 tablet | £51.45
- Dulco-Lax (bisacodyl) (Boehringer Ingelheim Self-Medication Division)
  - Bisacodyl 5 mg: Dulcolax 5 mg gastro-resistant tablets | 40 tablet | £2.44 | 100 tablet | £3.60

Enema

Bisacodyl (non-proprietary)
- Bisacodyl 333.333 microgram per 1 ml: Fleet Bisacodyl 10 mg/30 ml enema | 1 enema | No price available

Suppository

Bisacodyl (non-proprietary)
- Bisacodyl 10 mg: Bisacodyl 10 mg suppositories | 12 suppository | £3.53 DT price = £3.53
- Dulco-Lax (bisacodyl) (Boehringer Ingelheim Self-Medication Division)
  - Bisacodyl 5 mg: Dulcolax 5 mg suppositories for children | 5 suppository | £1.04 DT price = £1.04
  - Bisacodyl 10 mg: Dulcolax 10 mg suppositories | 12 suppository | £2.35 DT price = £3.53

Co-danthrusate

INDICATIONS AND DOSE

Constitution in terminally ill patients
- By mouth using capsules
  - Child 6–11 years: 1 capsule once daily, to be taken at night

20-Apr-2016
Child 12-17 years: 1–3 capsules once daily, to be taken at night
Adult: 1–3 capsules once daily, to be taken at night
**LOCAL IRRITATION**

**MEDICINAL FORMS**

**DOSE EQUIVALENCE AND CONVERSION**

- Co-danthrusate capsules contain dantron 50 mg and docusate 50 mg per 5 mL.
- Co-danthrusate capsules contain dantron 50 mg and docusate 60 mg per capsule.

- CONTRA-INDICATIONS Acute abdominal conditions (in children) - acute inflammatory bowel disease - acute surgical abdominal conditions (in adults) - intestinal obstruction - severe dehydration
- **CAUTIONS** Excessive use of stimulant laxatives can cause diarrhea and related effects such as hypokalaemia - may cause local irritation - *rodent* studies indicate potential carcinogenic risk

- INTERACTIONS → Appendix 1: dantron, docusate sodium
- **SIDE-EFFECTS** Abdominal cramp - urine may be coloured red
- **PREGNANCY** Manufacturers advise avoid - limited information available.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS** 14 (urine red)
- Co-danthrusate (Non-proprietary)
  - Dantron 10 mg per 1 mL, Docusate sodium 12 mg per 1 mL Co-danthrusate 50mg/60mg/5ml oral suspension sugar free sugar-free 200 mL [POM] £89.92 DT price = £89.92

**Capsule**

**CAUTIONARY AND ADVISORY LABELS** 14 (urine red)
- Co-danthrusate (Non-proprietary)
  - Dantron 50 mg, Docusate sodium 60 mg Co-danthrusate 50mg/60mg capsules | 63 capsule [POM] no price available DT price = £52.50

**Glycerol**

**(Glycerin)**

**INDICATIONS AND DOSE**

**Constipation**

- **BY MOUTH USING TABLETS**
  - Child 6–17 years: 7.5–30 mg once daily, adjusted according to response
  - Adult: 7.5–15 mg daily (max. per dose 30 mg daily), dose usually taken at bedtime; initial dose should be low then gradually increased, higher doses may be prescribed under medical supervision
- **BY MOUTH USING SYRUP**
  - Child 1 month–3 years: 3.75–15 mg once daily, adjusted according to response
  - Child 4–17 years: 3.75–30 mg once daily, adjusted according to response
  - Adult: 7.5–15 mg once daily (max. per dose 30 mg daily), dose usually taken at bedtime, higher doses may be prescribed under medical supervision

**PHARMACOKINETICS**

Onset of action 8–12 hours.

**UNLICENSED USE** Tablets not licensed for use in children under 6 years. Syrup not licensed for use in children under 2 years.

Doses in BNF adhere to national guidelines and may differ from those in product literature.

**CONTRA-INDICATIONS** Intestinal obstruction - undiagnosed abdominal pain

**INTERACTIONS** → Appendix 1: senna

**SIDE-EFFECTS** Abdominal spasm - discoloration of urine - pruritus

**SIDE-EFFECTS, FURTHER INFORMATION** Prolonged or excessive use of stimulant laxatives can cause diarrhea and related effects such as hypokalaemia.

**PREGNANCY** [G6] Specialist sources indicate suitable for use in pregnancy. [D]

**BREAST FEEDING** [G6] Specialist sources indicate suitable for use in breast-feeding in infants over 1 month. [D]

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Senna for constipation www.medicinesforchildren.org.uk/senna-for-constipation

**NATIONAL FUNDING/ACCESS DECISIONS** NHS restrictions Senokot® tablets.

**EXCEPTIONS TO LEGAL CATEGORY** Senna is on sale to the public for use in children over 12 years; doses on packs may vary from those in BNF Publications.
### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

- **Senokot** (Forum Health Products Ltd, Reckitt Benckiser Healthcare (UK) Ltd)
  - **Sennoside B (as Sennosides)** 1.5 mg per ml Senokot 7.5mg/5ml Syrup Pharmacy sugar free sugar-free | 500 ml | £4.76 DT price = £4.76

**Tablet**

- **Senna (Non-proprietary)**
  - **Sennoside B (as Sennosides)** 7.5 mg Senna 7.5mg tablets | 20 tablet | £1.00 | 60 tablet | £2.50 DT price = £2.01 |
  - **Senna** (Non-proprietary) 7.5 mg Senna 7.5mg tablets | 20 tablet | £1.00 |

- **Ex-Lax Senna** (Novartis Consumer Health UK Ltd)
  - **Sennoside B (as Sennosides)** 12 mg Ex-Lax Senna 12mg pills | 20 tablet GSSL | £1.54

- **Senokot** (Reckitt Benckiser Healthcare (UK) Ltd, Forum Health Products Ltd)
  - **Sennoside B (as Sennosides)** 7.5 mg Senokot 7.5mg tablets | 20 tablet GSL | £1.61 | 60 tablet GSSL | £4.20 DT price = £2.01 |
  - **Senna** (Non-proprietary) 7.5 mg Senokot 7.5mg tablets | 20 tablet GSSL | £5.49 | 500 tablet GSSL | £12.50

- **Sennoside B (as Sennosides)** 15 mg Senokot Max Strength 15mg tablets | 24 tablet GSSL | £3.23 | 48 tablet GSSL | £5.69 DT price = £5.69

### Senna with ispaghula husk

The properties listed below are those particular to the combination only. For the properties of the components please consider, senna p. 61, ispaghula husk p. 53.

- **Indications and dose**
  - **Constipation**
    - **By mouth**
      - Child 12–17 years: 5–10 g once daily, to be taken at night, 5 g equivalent to one level spoonful of granules
      - Adult: 5–10 g once daily, to be taken at night, 5 g equivalent to one level spoonful of granules
  - **Side-effects**
    - **Common or very common** Abdominal cramp
    - **Uncommon** Dizziness, nausea, vomiting
    - **Frequency not known** Angioedema, pruritus, rash, syncope

- **Interactions**
  - **Appendix 1: senna**

- **Pregnancy**
  - Manufacturer advises avoid during pregnancy.

- **Directions for administration**
  - Take at night with at least 150 mL liquid.

- **Medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug.

### Sodium picosulfate

**Sodium picosulfate** (Sodium picosulfate)

- **Drug action** Sodium picosulfate is a stimulant laxative. After metabolism in the colon it stimulates the mucosa thereby increasing the motility of the large intestine.

- **Indications and dose**
  - **Constipation**
    - **By mouth**
      - Child 1 month–3 years: 2.5–10 mg once daily, adjusted according to response
      - Child 4–17 years: 2.5–20 mg once daily, adjusted according to response
      - Adult: 5–10 mg once daily, dose to be taken at bedtime

### Opioid Receptor Antagonists

**Methylnaltrexone bromide**

- **Drug action** Methylnaltrexone bromide is a peripherally acting opioid-receptor antagonist. It therefore blocks the gastro-intestinal (constipating) effects of opioids without altering their central analgesic effects.

- **Indications and dose**
  - **Opioid-induced constipation in patients with chronic pain (except palliative care patients with advanced illness)**
    - **By subcutaneous injection**
      - Adult: 12 mg once daily if required, to be given as 4–7 doses weekly
  - **Adjunct to other laxatives in opioid-induced constipation in advanced illness (palliative care patients)**
    - **By subcutaneous injection**
      - Adult (body-weight up to 38 kg): 150 micrograms/kg once daily on alternate days for maximum duration of treatment 4 months, two consecutive doses may be given 24 hours apart if no response to treatment on the preceding day
      - Adult (body-weight 38–61 kg): 8 mg once daily on alternate days for maximum duration of treatment 4 months, two consecutive doses may be given 24 hours apart if no response to treatment on the preceding day
      - Adult (body-weight 62–114 kg): 12 mg once daily on alternate days for maximum duration of treatment 4 months, two consecutive doses may be given 24 hours apart if no response to treatment on the preceding day
Naloxegol

20-Jun-2016

**DRUG ACTION**

Naloxegol is a peripherally acting opioid receptor antagonist. It therefore decreases the constipating effects of opioids without altering their central analgesic effects.

**INDICATIONS AND DOSE**

**Opioid-induced constipation when response to laxatives inadequate**

- **BY MOUTH**

- **Adult:** 25 mg once daily, to be taken in the morning

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises reduce initial dose to 12.5 mg daily with concurrent use of moderate inhibitors of CYP3A4, increasing to 25 mg daily if well tolerated.

**CONTRA-INDICATIONS**

Gastro-intestinal or peritoneum malignancy (risk of gastro-intestinal perforation) · known or suspected gastro-intestinal obstruction · patients at risk of recurrent gastro-intestinal obstruction · recurrent or advanced ovarian cancer (risk of gastro-intestinal perforation) · vascular endothelial growth factor (VEGF) inhibitor treatment (risk of gastro-intestinal perforation)

**CAUTIONS**

Alzheimer’s disease (advanced) · cardiovascular disease · CNS metastases · congestive heart failure (symptomatic) · Crohn’s disease · diverticulitis (active or recurrent) · multiple sclerosis (active) · peptic ulcer disease (severe) · primary brain malignancies · QT interval over 500 milliseconds · recent history of myocardial infarction (within 6 months)

**CAUTIONS, FURTHER INFORMATION**

- Disruptions to blood-brain barrier Manufacturer advises caution in patients with clinically important disruptions to the blood-brain barrier (e.g., advanced Alzheimer’s disease, active multiple sclerosis, primary brain malignancies) — risk of uptake into the CNS.

- Cardiovascular disorders Safety and efficacy has not been established in patients with these conditions.

**INTERACTIONS**

- **Appendix 1: naloxegol**

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain · diarrhoea · dizziness · flatulence · injection site reactions · nausea · opioid withdrawal symptoms (usually mild to moderate) · vomiting

**FURTHER INFORMATION**

- Palliative care see www.palliativedrugs.com/formulary/en/opioid-antagonists.html

**HANDLING AND STORAGE**

- Protect from light.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Relistor (Swedish Orphan Biovitrum Ltd)**

  - Methyltnaltrexone bromide 20 mg per 1 ml Relistor 12mg/0.6ml solution for injection vials | 1 vial [P] £21.05 | 7 vial [P] £147.35

**NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (TAs)**

  - Naloxegol for treating opioid induced constipation (July 2015) NICE TA345

  Naloxegol is recommended as a possible treatment for opioid induced constipation in patients whose response to laxatives is inadequate.

  www.nice.org.uk/TA345

- **MEDICINAL FORMS**

  - There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS**

  - **Moventig (Kyowa Kirin Ltd)**

    - Naloxegol (as Naloxegol oxalate) 12.5 mg Moventig 12.5mg tablets | 30 tablet [P] £55.20 DT price = £55.20

    - Naloxegol (as Naloxegol oxalate) 25 mg Moventig 25mg tablets | 30 tablet [P] £55.20 DT price = £55.20
3 Diarrhoea

Acute diarrhoea

Management of acute diarrhoea

The priority in acute diarrhoea, as in gastro-enteritis, is the prevention or reversal of fluid and electrolyte depletion. This is particularly important in infants and in frail and elderly patients. Oral rehydration preparations are used in the prevention or reversal of fluid and electrolyte depletion. Severe depletion of fluid and electrolytes requires immediate admission to hospital and urgent replacement.

Antimotility drugs

Antimotility drugs relieve symptoms of acute diarrhoea by binding to opioid receptors in the gastrointestinal tract and thereby prolonging the duration of intestinal transit. They are used in the management of uncomplicated acute diarrhoea in adults, however, are not recommended for acute diarrhoea in young children; fluid and electrolyte replacement are of primary importance in severe cases of acute diarrhoea and may also be necessary in cases of dehydration.

Loperamide hydrochloride p. 65 is used due to its action on opioid receptors in the gastrointestinal tract and because it does not readily cross the blood-brain barrier. Loperamide hydrochloride can also be used for faecal incontinence [unlicensed indication] after the underlying cause of incontinence has been addressed.

Antimotility drugs have a role in Inflammatory bowel disease p. 36 and in Stoma care p. 94.

Antispasmodics

Antispasmodics are occasionally of value in treating abdominal cramp associated with diarrhoea but they should not be used for primary treatment. Antispasmodics and antiemetics should be avoided in young children with gastro-enteritis because they are rarely effective and have troublesome side-effects.

Antibacterial drugs

Antibacterial drugs are generally unnecessary in simple gastro-enteritis because the complaint usually resolves quickly without them, and infective diarrhoeas in the UK often have a viral cause. Systemic bacterial infection does, however, need appropriate systemic treatment.

Ciprofloxacin p. 527 is occasionally used for prophylaxis against travellers’ diarrhoea, but routine use is not recommended. Lactobacillus preparations have not been shown to be effective.

Adsorbents and bulk-forming drugs

Adsorbents such as kaolin p. 66 are not recommended for acute diarrhoeas. Bulk-forming drugs, such as ispaghula husk p. 53, methylcellulose p. 53, and sterculia p. 54 are useful in controlling diarrhoea associated with diverticular disease. Colestryramine p. 191 binds unabsorbed bile salts and provides symptomatic relief of diarrhoea following ileal disease or resection.

Enkephalinase inhibitors

Racecadotril p. 66 is a pro-drug of thiorphan. Thiorphan is an enkephalinase inhibitor that inhibits the breakdown of endogenous opioids, thereby reducing intestinal secretions. Racecadotril is licensed, as an adjunct to rehydration, for the symptomatic treatment of uncomplicated acute diarrhoea; it should only be used in children over 3 months of age when usual supportive measures, including oral rehydration, are insufficient to control the condition. Racecadotril does not affect the duration of intestinal transit.

Other drugs used for Diarrhoea: Codeine phosphate, p. 431

Co-phenotre

INDICATIONS AND DOSE

Adjucent to rehydration in acute diarrhoea

BY MOUTH

- Child 4-8 years: 1 tablet 3 times a day
- Child 9-11 years: 1 tablet 4 times a day
- Child 12-15 years: 2 tablets 3 times a day
- Child 16-17 years: Initially 4 tablets, followed by 2 tablets every 6 hours until diarrhoea controlled
- Adult: Initially 4 tablets, followed by 2 tablets every 6 hours until diarrhoea controlled

Control of faecal consistency after colostomy or ileostomy

BY MOUTH

- Child 4-8 years: 1 tablet 3 times a day
- Child 9-11 years: 1 tablet 4 times a day
- Child 12-15 years: 2 tablets 3 times a day
- Child 16-17 years: Initially 4 tablets, then 2 tablets 4 times a day
- Adult: Initially 4 tablets, then 2 tablets 4 times a day

• UNLICENSED USE: Not licensed for use in children under 4 years.
• CONTRA-INDICATIONS: Gastro-intestinal obstruction • intestinal atony • myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) • paralytic ileus • prostatic enlargement (in adults) • pyloric stenosis • severe ulcerative colitis • significant bladder outflow obstruction • toxic megacolon • urinary retention

• CAUTIONS: Presence of subclinical doses of atropine may give rise to atropine side-effects in susceptible individuals or in overdosage. Young children are particularly susceptible to overdosage. Symptoms may be delayed and observation is needed for at least 48 hours after ingestion.

• INTERACTIONS: Appendix 1: atropine, opioids

• SIDE-EFFECTS

- Very rare: Angle-closure glaucoma
- Frequency not known: Abdominal pain • anorexia • confusion (particularly in the elderly) • constipation • dilation of the pupils with loss of accommodation • dry mouth • dryness of the skin • fever • flushing • giddiness • nausea • photophobia • reduced bronchial secretions • transient bradycardia (followed by tachycardia, palpitation and arrhythmias) • urinary retention • urinary urgency • vomiting

• PREGNANCY: Manufacturer advises caution.
• BREAST FEEDING: May be present in milk.
• HEPATIC IMPAIRMENT: Avoid in jaundice.
• DIRECTIONS FOR ADMINISTRATION: For administration by mouth tablets may be crushed.
• PRESCRIBING AND DISPENSING INFORMATION: A mixture of diphenoxylate hydrochloride and atropine sulfate in the mass proportions 100 parts to 1 part respectively.

• EXCEPTIONS TO LEGAL CATEGORY: Co-phenotre 2.5/0.025 can be sold to the public for adults and children over 16 years (provided packs do not contain more than 20 tablets) as an adjunct to rehydration in acute diarrhoea (max. daily dose 10 tablets).
**Contraindications**

- Acute abdomen · delayed gastric emptying · heart failure secondary to chronic lung disease · phaeochromocytoma

**Cautions**

Cardiac arrhythmias · pancreatitis · severe cor pulmonale

**Interactions**

- Abdominal pain · agitation · amenorrhoea · anorexia · asthenia · bronchospasm · delirium · disorientation · dyspepsia · exacerbation of pancreatitis · excitation · hypotension · hypothermia · inhibition of cough reflex · malaise · muscle fasciculation · myoclonus · nystagmus · paraesthesia · paralytic ileus · raised intracranial pressure · restlessness · rhabdomyolysis · seizures · syncope · taste disturbance

**Breastfeeding**

Therapeutic doses unlikely to affect infant.

**Renal Impairment**

Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**Prescribing and Dispensing Information**

When prepared extemporaneously, the BP states Kaolin and Morphine Mixture, BP consists of light kaolin or light kaolin (natural) 20%, sodium bicarbonate 5%, and chloroform and morphine tincture 4% in a suitable vehicle. Contains anhydrous morphine 550–800 micrograms/10 mL.

**Less Suitable for Prescribing**

Kaolin and Morphine Mixture, BP (Kaolin and Morphine Oral Suspension) is less suitable for prescribing.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Oral Suspension**

- **Kaolin with morphine (Non-proprietary)**
  - Morphine hydrochloride 91.6 microgram per 1 mL, Sodium bicarbonate 50 mg per 1 mL, Kaolin light 200 mg per 1 mL, Chlorof orm 5 mL per 1 litre Kaolin and Morphine mixture 1 200 ml  
  - £1.67 DT price = £1.67 (GS)

**Loperamide Hydrochloride**

**Indications and Dose**

Symptomatic treatment of acute diarrhoea

- **By mouth**
  - Child 4-7 years: 1 mg 3–4 times a day for up to 3 days only
  - Child 8-11 years: 2 mg 4 times a day for up to 5 days
  - Child 12-17 years: Initially 4 mg, followed by 2 mg for up to 5 days, dose to be taken after each loose stool; usual dose 6–8 mg daily; maximum 16 mg per day

**Chronic diarrhoea**

- **By mouth**
  - Adult: Initially 4–8 mg daily in divided doses, adjusted according to response; maintenance up to 16 mg daily in 2 divided doses

**Faecal incontinence**

- **By mouth**
  - Adult: Initially 500 micrograms daily, adjusted according to response, maximum daily dose to be given in divided doses; maximum 16 mg per day

**Pain of bowel colic in palliative care**

- **By mouth**
  - Adult: 2–4 mg 4 times a day

**Unlicensed Use**

- In children **Capsules** not licensed for use in children under 8 years. **Syrup** not licensed for use in children under 4 years.

- In adults Use for faecal incontinence is an unlicensed indication.

**Contra-Indications**

Active ulcerative colitis · antibiotic-associated colitis · conditions where abdominal distension develops · conditions where inhibition of peristalsis should be avoided

**Cautions**

Not recommended for children under 12 years (in children)

**Interactions**

- **Common or very common**
  - Dizziness · flatulence · headache · nausea

- **Uncommon**
  - Abdominal pain · drowsiness · dry mouth · dyspepsia · rash · vomiting

- **Rare**
  - Fatigue · hypotonia · paralytic ileus · Stevens-Johnson syndrome · toxic epidermal necrolysis · urinary retention

**Pregnancy**

Manufacturers advise avoid—not information available.

**Breastfeeding**

Amount probably too small to be harmful.

**Hepatic Impairment**

Risk of accumulation—manufacturer advises caution.

**Prescribing and Dispensing Information**

Palliative care

**Patient and Carer Advice**

Medicines for Children leaflet: Loperamide for diarrhoea [www.medicinesforchildren.org.uk/loperamide-for-diarrhoea](http://www.medicinesforchildren.org.uk/loperamide-for-diarrhoea)

**Exceptions to Legal Category**

Loperamide can be sold to the public, for use in adults and children over 12 years, provided it is licensed and labelled for the treatment of acute diarrhoea.

In adults Loperamide can be sold to the public, provided it is licensed and labelled for the treatment of acute diarrhoea associated with irritable bowel syndrome (after initial diagnosis by a doctor) in adults over 18 years of age.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **Loperamide hydrochloride (Non-proprietary)**
  - Loperamide hydrochloride 2 mg Loperamide 2mg tablets  | 30 tablet  
  - £2.15 DT price = £2.15
Loperamide with simeticone

The properties listed below are those particular to the combination only. For the properties of the components please consider, loperamide hydrochloride p. 65, simeticone p. 70.

**INDICATIONS AND DOSE**

**Acute diarrhoea with abdominal colic**
- **By mouth**
  - Child 12-17 years: Initially 1 tablet, then 1 tablet, after each loose stool, for up to 2 days; maximum 4 tablets per day
  - Adult: Initially 2 tablets, then 1 tablet, after each loose stool, for up to 2 days; maximum 4 tablets per day

**INTERACTIONS** → Appendix 1: loperamide

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Imodium Plus** (McNeil Products Ltd)
  - Loperamide hydrochloride 2 mg, Simeticone (as Simeticone)
    - 125 mg Imodium Plus caplets | 12 tablet (£3.66

ANTIDIARRHOEALS > ENKEPHALINASE INHIBITORS

**Racecadotril**

**INDICATIONS AND DOSE**

Adjuvact to rehydration, for the symptomatic treatment of uncomplicated acute diarrhoea
- **By mouth using capsules**
  - Adult: Initially 100 mg, then 100 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days, dose to be taken preferably before food
  - **By mouth using granules**
    - Child 3 months-17 years (body-weight up to 9 kg): 10 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
    - Child 3 months-17 years (body-weight 9-12 kg): 20 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
    - Child 3 months-17 years (body-weight 13-27 kg): 30 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
    - Child 3 months-17 years (body-weight 28 kg and above): 60 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days

**SIDE-EFFECTS**
- **Common or very common** Headache (in adults)
- **Uncommon** Erythema, rash
- **Frequency not known** Angioedema, pruritus, urticaria

**SIDE-EFFECTS, FURTHER INFORMATION**

Skin reactions Severe skin reactions have been reported—discontinue treatment immediately.

**PREGNANCY**

Manufacturer advises avoid—no information available.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

- In adults: Manufacturer advises caution.
- In children: Manufacturer advises avoid.

**RENAL IMPAIRMENT**

- In adults: Manufacturer advises caution.
- In children: Manufacturer advises avoid.

**DIRECTIONS FOR ADMINISTRATION**

Granules may be added to food or mixed with water or bottle feeds and then taken immediately.

**PATIENT AND CARER ADVICE**

Patients and carers should be given advice on how to administer racecadotril capsules.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium, has advised (July 2014) that racecadotril (Hidrasec®) is not recommended for use within NHS Scotland for the treatment of acute diarrhoea in children because there is insufficient evidence that it improves the recovery rate.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Granules**
- **EXCIPIENTS:** May contain Sucrose
  - Hidrasec (Lincoln Medical Ltd)
    - Racecadotril 10 mg: Hidrasec infants 10mg granules sachets | 20 sachet (£8.42
    - Racecadotril 30 mg: Hidrasec Children 30mg granules sachets | 20 sachet (£8.42

ANTIDIARRHOEALS > INTESTINAL ADSORBENTS

**Kaolin**

**INDICATIONS AND DOSE**

Diarrhoea (not recommended for acute diarrhoea)
- **By mouth**
  - Adult: 10–20 ml every 4 hours

**INTERACTIONS** → Appendix 1: kaolin

**DIRECTIONS FOR ADMINISTRATION**

Warm and apply poultice directly or between layers of muslin; avoid application of overheated poultice.

**PRESCRIBING AND DISPENSING INFORMATION**

Flavours of oral liquid formulations may include peppermint.

When prepared extemporaneously, the BP states Kaolin mixture, BP consists of light kaolin or light kaolin (natural) 20%, light magnesium carbonate 5%, sodium bicarbonate 5% in a suitable vehicle with a peppermint flavour.

**LESS SUITABLE FOR PRESCRIBING**

Kaolin Mixture BP is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.
4 Disorders of gastric acid and ulceration

4.1 Dyspepsia

**Dyspepsia**

**Overview**

Dyspepsia covers upper abdominal pain, fullness, early satiety, bloating, and nausea. It can occur with gastric and duodenal ulceration and, gastric cancer, but most commonly it is of uncertain origin.

Urgent endoscopic investigation is required if dyspepsia is accompanied by ‘alarm features’ (e.g. bleeding, dysphagia, recurrent vomiting, or weight loss). Urgent investigation should also be considered for patients over 55 years with unexplained, recent-onset dyspepsia that has not responded to treatment.

Patients with dyspepsia should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, smoking cessation, and raising the head of the bed. Some medications may cause dyspepsia—these should be stopped, if possible.

Antacids may provide some symptomatic relief, however if symptoms persist in uninvestigated dyspepsia, treatment involves a proton pump inhibitor for up to 4 weeks. A proton pump inhibitor can be used intermittently to control symptoms long term. Patients with uninvestigated dyspepsia, who do not respond to an initial trial with a proton pump inhibitor, should be tested for Helicobacter pylori and given eradication therapy if *H. pylori* is present. Alternatively, particularly in populations where *H. pylori* infection is more likely, the ‘test and treat’ strategy for *H. pylori* can be used before a trial with a proton pump inhibitor.

If *H. pylori* is present in patients with functional (investigated, non-ulcer) dyspepsia, eradication therapy should be provided. If symptoms persist, treatment with either a proton pump inhibitor or a histamine H₂-receptor antagonist can be given for 4 weeks. These antisecretory drugs can be used intermittently to control symptoms long term. However, most patients with functional dyspepsia do not benefit symptomatically from *H. pylori* eradication therapy or antisecretory drugs.

**Antacids**

Antacids (usually containing aluminium or magnesium compounds) can often relieve symptoms in ulcer dyspepsia and in non-erosive gastro-oesophageal reflux; they are also sometimes used in functional (non-ulcer) dyspepsia but the evidence of benefit is uncertain. Antacids are best given when symptoms occur or are expected, usually between meals and at bedtime, although additional doses may be required. Conventional doses of liquid magnesium–aluminium antacids promote ulcer healing, but less well than antisecretory drugs; proof of a relationship between healing and neutralising capacity is lacking. Liquid preparations are more effective than tablet preparations.

Aluminium- and magnesium-containing antacids (e.g. aluminium hydroxide p. 964, magnesium carbonate p. 69, co-magdalrox p. 68 and magnesium trisilicate p. 69), being relatively insoluble in water, are long-acting if retained in the stomach. They are suitable for most antacid purposes. Magnesium-containing antacids tend to be laxative whereas aluminium-containing antacids may be constipating; antacids containing both magnesium and aluminium may reduce these colonic side-effects. Aluminium accumulation does not appear to be a risk if renal function is normal.

The acid-neutralising capacity of preparations that contain more than one antacid may be the same as simpler preparations. Complexes such as hydrotalcite confer no special advantage.

Sodium bicarbonate p. 950 should no longer be prescribed alone for the relief of dyspepsia but it is present as an ingredient in many indigestion remedies. However, it retains a place in the management of urinary-tract disorders and acidosis.

Bismuth-containing antacids (unless chelates) are not recommended because absorbed bismuth can be neurotoxic, causing encephalopathy; they tend to be constipating.

Calcium-containing antacids can induce rebound acid secretion: with modest doses the clinical significance is doubtful, but prolonged high doses also cause hypercalcaemia and alkalosis, and can precipitate the milk-alkali syndrome.

**Simeticone**

Simeticone p. 70 (activated dimeticone p. 1134) is added to an antacid as an antifoaming agent to relieve flatulence. These preparations may be useful for the relief of hiccup in palliative care.

**Alginates**

Alginates taken in combination with an antacid increases the viscosity of stomach contents and can protect the oesophageal mucosa from acid reflux. Some alginate-containing preparations form a viscous gel (‘raft’) that floats on the surface of the stomach contents, thereby reducing symptoms of reflux. The amount of additional ingredient or antacid in individual preparations varies widely, as does their sodium content, so that preparations may not be freely interchangeable.

**ANTACIDS > ALGINATE**

**Alginic acid**

+ INDICATIONS AND DOSE
+ **GAVISCON INFANT® POWDER SACHETS**

Management of gastro-oesophageal reflux disease

▶ BY MOUTH

- Child 1–23 months (body-weight 4.5 kg and above): 1 dose as required, to be mixed with feeds (or water, for breast-fed infants); maximum 6 doses per day
- Child 1–23 months (body-weight 4.5 kg and above): 2 doses as required, to be mixed with feeds (or water, for breast-fed infants); maximum 12 doses per day

+ CONTRA-INDICATIONS

- Intestinal obstruction • preterm neonates • where excessive water loss likely (e.g. fever, diarrhoea, vomiting, high room temperature)

**GAVISCON INFANT® POWDER SACHETS**

Concurrent use of preparations containing thickening agents

+ **HEPATIC IMPAIRMENT**

In patients with fluid retention, avoid antacids containing large amounts of sodium. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.

+ **RENAL IMPAIRMENT**

In patients with fluid retention, avoid antacids containing large amounts of sodium.

+ **PRESCRIBING AND DISPENSING INFORMATION**

Each half of the dual-sachet is identified as ‘one dose’. To avoid errors prescribe with directions in terms of ‘dose’.
ANTACIDS > ALUMINIUM AND MAGNESIUM

Co-magaldrox

The properties listed below are those particular to the combination only. For the properties of the components please consider, aluminium hydroxide p. 964, magnesium hydroxide p. 57.

● INDICATIONS AND DOSE

MAALOX 

Dyspepsia

▷ BY MOUTH
  ▷ Child 14–17 years: 10–20 mL, to be taken 20–60 minutes after meals, and at bedtime or when required
  ▷ Adult: 10–20 mL, to be taken 20–60 minutes after meals, and at bedtime or when required

MUCOGEL®

Dyspepsia

▷ BY MOUTH
  ▷ Child 12–17 years: 10–20 mL 3 times a day, to be taken 20–60 minutes after meals, and at bedtime, or when required
  ▷ Adult: 10–20 mL 3 times a day, to be taken 20–60 minutes after meals, and at bedtime, or when required

● INTERACTIONS → Appendix 1: antacids

● PRESCRIBING AND DISPENSING INFORMATION

Co-magaldrox is a mixture of aluminium hydroxide and magnesium hydroxide; the proportions are expressed in the form x/y where x and y are the strengths in milligrams per unit dose of magnesium hydroxide and aluminium hydroxide respectively.

MUCOGEL® Mucogel® suspension is low in sodium.

MAALOX® Maalox® suspension is low in sodium.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

ELECTROLYTES: May contain Potassium, sodium
  ▷ Acidex Advance (Pinewood Healthcare) Magnesium bicarbonate 20 mg per 1 mL, Sodium alginate 100 mg per 1 mL Acidex Advance oral suspension dried peppermint sugar-free | 250 mL [P] £0.21 sugar-free | 500 mL [P] £0.42 DT price = £0.12
  ▷ Gaviscon Infant (Chemidex Pharma Ltd) Magnesium bicarbonate 25 mg per 1 mL, Sodium alginate 225 mg Gaviscon Infant oral powder sachets sugar-free | 15 dual dose sachet [GL] £0.82 DT price = £0.82

Chewable tablet

EXCIPIENTS: May contain Aspartame
ELECTROLYTES: May contain Potassium, sodium
  ▷ Sodium alginate with potassium bicarbonate (Non-proprietary) Potassium bicarbonate 100 mg, Sodium alginate 500 mg Sodium alginate 500mg / Potassium bicarbonate 100mg chewable tablets sugar free sugar-free | 60 tablet [GL] no price available DT price = £3.07
  ▷ Brands may include Gaviscon Advance

Co-simalcite

● INDICATIONS AND DOSE

Dyspepsia

▷ BY MOUTH
  ▷ Child 8–11 years: 5 mL 4 times a day as required, to be taken between meals and at bedtime
  ▷ Child 12–17 years: 10 mL 4 times a day as required, to be taken between meals and at bedtime
  ▷ Adult: 10 mL 4 times a day as required, to be taken between meals and at bedtime

● CONTRA-INDICATIONS

Hypophosphataemia · infants · neonates
CONTRA-INDICATIONS, FURTHER INFORMATION
  ▷ Aluminium-containing antacids Aluminium-containing antacids should not be used in neonates and infants because accumulation may lead to increased plasma-aluminium concentrations.
**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**

- Constipation and diarrhoea: Magnesium-containing antacids tend to be laxative whereas aluminium-containing antacids may be constipating; antacids containing both magnesium and aluminium may reduce these colonic side-effects.

**HEPATIC IMPAIRMENT** Avoid; can cause constipation which can precipitate coma. Avoid in hepatic coma; risk of renal failure.

**RENAL IMPAIRMENT** Antacids containing magnesium salts should be avoided or used at a reduced dose because there is an increased risk of toxicity.

- In adults: There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).
- In children: Aluminium-containing antacids should not be used in children with renal impairment, because accumulation may lead to increased plasma-aluminium concentrations.

**PRESCRIBING AND DISPENSING INFORMATION**

**Magnesium trisilicate**

- **INDICATIONS AND DOSE**
  - **Dyspepsia**
    - **BY MOUTH USING CHEWABLE TABLETS**
      - Adult: 1–2 tablets as required

- **CONTRA-INDICATIONS**
  - Hypophosphataemia

- **INTERACTIONS**
  - Appendix 1: antacids

**Magnesium carbonate with magnesium hydroxide and aluminium hydroxide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, simeticone p. 70, aluminium hydroxide p. 964.

- **INDICATIONS AND DOSE**
  - **Dyspepsia**
    - **BY MOUTH**
      - Child 12-17 years: 5–10 mL 4 times a day, to be taken after meals and at bedtime, or when required
      - Adult: 5–10 mL 4 times a day, to be taken after meals and at bedtime, or when required

- **INTERACTIONS**
  - Appendix 1: antacids

**Médicinales**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- **Altacite Plus** (Peckforton Pharmaceuticals Ltd)
  - Simeticone 25 mg per 1 mL, Hydrotalcite 100 mg per 1 mL
  - Alumina lactate oral suspension sugar-free: 100 mL £4.00 sugar-free / 500 ml £5.20 DT price = £5.20

**Antacids > Magnesium**

**Magnesium carbonate**

- **INDICATIONS AND DOSE**
  - **Dyspepsia**
    - **BY MOUTH USING ORAL SUSPENSION**
      - Adult: 10 mL 3 times a day, dose to be taken in water

- **CONTRA-INDICATIONS**
  - Hypophosphataemia

**Magnesium trisilicate with magnesium carbonate and sodium bicarbonate**

The properties listed below are those particular to the combination only. For the properties of the components please consider, magnesium trisilicate above, magnesium carbonate above, sodium bicarbonate p. 950.

- **INDICATIONS AND DOSE**
  - **Dyspepsia**
    - **BY MOUTH**
      - Child 5-11 years: 5–10 mL 3 times a day, alternatively as required, dose to be made up with water
      - Child 12-17 years: 10–20 mL 3 times a day, alternatively as required, dose to be made up with water
      - Adult: 10–20 mL 3 times a day, alternatively as required, dose to be made up with water

- **CONTRA-INDICATIONS**
  - Hypophosphataemia • Severe renal failure

- **CAUTIONS**
  - Heart failure • Hypomagnesaemia • Hypertension • Metabolic alkalosis • Respiratory alkalosis

- **INTERACTIONS**
  - Appendix 1: antacids

- **SIDE-EFFECTS**
  - Belching due to liberated carbon dioxide • Diarrhoea
**Gastro-intestinal system**

- **HEPATIC IMPAIRMENT** In patients with fluid retention avoid antacids containing large amounts of sodium. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.
- **RENAAL IMPAIRMENT** Magnesium trisilicate and magnesium carbonate mixtures have high sodium content; avoid in patients with fluid retention.
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Magnesium Trisilicate Mixture, BP consists of 5% each of magnesium trisilicate, light magnesium carbonate, and sodium bicarbonate in a suitable vehicle with a peppermint flavour.

**MEDITCINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- Magnesium trisilicate with magnesium carbonate and sodium bicarbonate (Non-proprietary).
- Magnesium carbonate light 50 mg per 1 ml, Magnesium trisilicate 50 mg per 1 ml, Sodium bicarbonate 50 mg per 1 ml Magnesium trisilicate oral suspension | 200 ml £1.65 DT price = £1.65

**MEDITCINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- Magnesium trisilicate with magnesium carbonate and sodium bicarbonate (Non-proprietary).
- Magnesium carbonate light 50 mg per 1 ml, Magnesium trisilicate 50 mg per 1 ml, Sodium bicarbonate 50 mg per 1 ml Magnesium trisilicate oral suspension | 200 ml £1.65 DT price = £1.65

**ANTIOFOAMING DRUGS**

**Simeticone (Activated dimeticone)**

- **DRUG ACTION** Simeticone (activated dimeticone) is an antifoaming agent.

- **INDICATIONS AND DOSE**
  - **DENTINOX®**
    - **Colic / Wind pains**
      - **BY MOUTH**
        - Child 1 month–1 year: 2.5 mL, to be taken with or after each feed; may be added to bottle feed; maximum 6 doses per day
      - **INFACOL®**
        - **Colic / Wind pains**
          - **BY MOUTH**
            - Child 1 month–1 year: 0.5–1 mL, to be taken before feeds

- **PRESCRIBING AND DISPENSING INFORMATION**
  - **DENTINOX®** The brand name Dentinox® is also used for other preparations including teething gel.
  - **PATIENT AND CARER ADVICE**
    - **INFACOL®** Patients or carers should be given advice on use of the Infacol® dropper.
  - **LESS SUITABLE FOR PRESCRIBING**
    - **INFACOL®** Infacol® is less suitable for prescribing (evidence of benefit in infantile colic uncertain).
    - **DENTINOX®** Dentinox® colic drops are less suitable for prescribing (evidence of benefit in infantile colic uncertain).

- **MEDITCINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- **Infacol** (Teva UK Ltd)
  - Simeticone 40 mg per 1 ml Infacol 40mg/ml oral suspension sugar-free | 50 ml £2.71 DT price = £2.71
- **Dentinox Infant** (Dendron Ltd)
  - Simeticone 8.4 mg per 1 ml Dentinox infant colic drops | 100 ml £1.73

Combinations available: Co-similacite, p. 68 · Simeticone with aluminium hydroxide and magnesium hydroxide, p. 69

---

**4.2 Gastric and duodenal ulceration**

**Peptic ulceration**

**Overview**

Peptic ulceration commonly involves the stomach, duodenum, and lower oesophagus; after gastric surgery it involves the gastro-enterostomy stoma. Healing can be promoted by general measures, stopping smoking and taking antacids and by antisecretory drug treatment, but relapse is common when treatment ceases. Nearly all duodenal ulcers and most gastric ulcers not associated with NSAIDs are caused by Helicobacter pylori.

**Helicobacter pylori infection**

Eradication of Helicobacter pylori reduces recurrence of gastric and duodenal ulcers and the risk of rebleeding. It also causes regression of most localised gastric mucosa associated lymphoid-tissue (MALT) lymphomas. The presence of H. pylori should be confirmed before starting eradication treatment. Acid inhibition combined with antibacterial treatment is highly effective in the eradication of H. pylori; reinfection is rare. Antibiotic associated colitis is an uncommon risk.

For initial treatment, a one-week triple-therapy regimen that comprises a proton pump inhibitor, clarithromycin p. 508, and either amoxicillin p. 518 or metronidazole p. 512 can be used. However, if a patient has been treated with metronidazole for other infections, a regimen containing a proton pump inhibitor, amoxicillin and clarithromycin is preferred for initial therapy. If a patient has been treated with a macrolide for other infections, a regimen containing a proton pump inhibitor, amoxicillin and metronidazole is preferred for initial therapy. These regimens eradicate H. pylori in about 85% of cases. There is usually no need to continue antisecretory treatment (with a proton pump inhibitor or H2-receptor antagonist), however, if the ulcer is large, or complicated by haemorrhage or perforation, then antisecretory treatment is continued for a further 3 weeks. Treatment failure usually indicates antibacterial resistance or poor compliance. Resistance to amoxicillin is rare. However, resistance to clarithromycin and metronidazole is common and can develop during treatment.

Two-week triple-therapy regimens offer the possibility of higher eradication rates compared to one-week regimens, but adverse effects are common and poor compliance is likely to offset any possible gain.

Two-week dual-therapy regimens using a proton pump inhibitor and a single antibacterial are licensed, but produce low rates of H. pylori eradication and are not recommended. Tinidazole p. 514 is also used occasionally for H. pylori eradication as an alternative to metronidazole; tinidazole should be combined with antisecretory drugs and other antibacterials.

Routine retesting, to confirm eradication, is not necessary unless the patient has gastric MALT lymphoma or complicated H. pylori associated peptic ulcer.

A two-week regimen comprising a proton pump inhibitor plus tripotassium dicitratobismuthate, plus tetracycline p. 536, plus metronidazole can be used for eradication failure. Alternatively, the patient can be referred for endoscopy and treatment based on the results of culture and sensitivity testing.

See under NSAID-associated ulcers for the role of H. pylori eradication therapy in patients starting or taking a NSAID. Also see Dyspepsia p. 67 for H. pylori eradication in patients with dyspepsia.
Recommended regimens for *Helicobacter pylori* eradication in adults

**Test for *Helicobacter pylori***

13C-Urea breath test kits are available for the diagnosis of gastro-duodenal infection with *Helicobacter pylori*. The test involves collection of breath samples before and after ingestion of an oral solution of 13C-urea; the samples are sent for analysis by an appropriate laboratory. The test should not be performed within 4 weeks of treatment with an antibacterial or within 2 weeks of treatment with an antisecretory drug. A specific 13C-urea breath test kit for children is available (*Helicobacter Test INFAI* for children of the age 3–11). However, the appropriateness of testing for *H. pylori* infection in children has not been established.

**NSAID-associated ulcers**

Gastro-intestinal bleeding and ulceration can occur with NSAID use. The risk of serious upper gastro-intestinal side-effects varies between individual NSAIDs. Whenever possible, the NSAID should be withdrawn if an ulcer occurs.

Patients at high risk of developing gastro-intestinal complications with a NSAID include those aged over 65 years, those with a history of peptic ulcer disease or serious gastro-intestinal complication, those taking other medicines that increase the risk of gastro-intestinal side-effects, or those with serious co-morbidity (e.g. cardiovascular disease, diabetes, renal or hepatic impairment). In those at risk of ulceration, a proton pump inhibitor can be considered for protection against gastric and duodenal ulcers associated with non-selective NSAIDs; a H2-receptor antagonist such as ranitidine p. 74 given at twice the usual dose or misoprostol p. 75 are alternatives. Colic and diarrhoea may limit the dose of misoprostol. Its use is most appropriate for the frail or very elderly from whom NSAIDs cannot be withdrawn. A combination of a cyclo-oxygenase-2 selective inhibitor with a proton pump inhibitor may be more appropriate for those with a history of upper gastro-intestinal bleeding or 3 or more risk factors for gastro-intestinal ulceration, but see NSAIDs and Cardiovascular Events.

NSAID use and *H. pylori* infection are independent risk factors for gastro-intestinal bleeding and ulceration. In patients already taking a NSAID, eradication of *H. pylori* is unlikely to reduce the risk of NSAID-induced bleeding or ulceration. However, in patients with dyspepsia or a history of gastric or duodenal ulcer, who are *H. pylori* positive, and who are about to start long-term treatment with a non-selective NSAID, eradication of *H. pylori* may reduce the overall risk of ulceration.

In a patient who has developed an ulcer, if the NSAID can be discontinued, a proton pump inhibitor usually produces the most rapid healing; alternatively, the ulcer can be treated with a H2-receptor antagonist or misoprostol. On healing, patients should be tested for *H. pylori* and given eradication therapy if *H. pylori* is present (see also Test for *Helicobacter pylori*).

If treatment with a non-selective NSAID needs to continue, the following options are suitable:

- Treat ulcer with a proton pump inhibitor and on healing continue the proton pump inhibitor (dose not normally reduced because asymptomatic ulcer recurrence may occur);
- Treat ulcer with a proton pump inhibitor and on healing switch to misoprostol for maintenance therapy (colic and diarrhoea may limit the dose of misoprostol);
- Treat ulcer with a proton pump inhibitor and switch non-selective NSAID to a cyclo-oxygenase-2 selective inhibitor, but see NSAIDs and Cardiovascular Events; on healing, continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

If treatment with a cyclo-oxygenase-2 selective inhibitor needs to continue, treat ulcer with a proton pump inhibitor; on healing continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

**GASTROPROTECTIVE COMPLEXES AND CHELATORS**

**Chelates and complexes**

**Overview**

Sucralfate below may act by protecting the mucosa from acid-pepsin attack in gastric and duodenal ulcers. It is a complex of aluminium hydroxide and sulfated sucrose but has minimal antacid properties.

**Sucralfate**

- **INDICATIONS AND DOSE**

  **Benign gastric ulceration | Benign duodenal ulceration**

  - By mouth
    - Child 15–17 years: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day
    - Adult: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day
Chronic gastritis
- **BY MOUTH**
- **Adult**: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day

**Prophylaxis of stress ulceration in child under intensive care**
- **BY MOUTH**
- **Child 15-17 years**: 1 g 6 times a day; maximum 8 g per day

**Prophylaxis of stress ulceration**
- **BY MOUTH**
- **Adult**: 1 g 6 times a day; maximum 8 g per day

**UNLICENSED USE**

**CAUTIONS**
Patients under intensive care (Important: reports of bezoar formation)

**CAUTIONS, FURTHER INFORMATION**
Bezoar formation Following reports of bezoar formation associated with sucralfate, caution is advised in seriously ill patients, especially those receiving concomitant enteral feeds or those with predisposing conditions such as delayed gastric emptying.

**INTERACTIONS** → Appendix 1: sucralfate

**SIDE-EFFECTS**
- **Common or very common** Constipation
- **Uncommon** Back pain · bezoar formation · diarrhoea · dizziness · drowsiness · dry mouth · earache · flatulence · gastric discomfort · indigestion · nausea · rash

**PREGNANCY**
No evidence of harm; absorption from gastrointestinal tract negligible.

**BREAST FEEDING**
Amount probably too small to be harmful.

**RENAL IMPAIRMENT**
Use with caution; aluminium is absorbed and may accumulate.

**DIRECTIONS FOR ADMINISTRATION**
Administration of sucralfate and enteral feeds should be separated by 1 hour and for administration by mouth, sucralfate should be given 1 hour before meals. *Oral suspension* blocks fine-bore feeding tubes. Crushed *tablets* may be dispersed in water.

**PRESCRIBING AND DISPENSING INFORMATION**
Flavours of oral liquid formulations may include aniseed and caramel.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension

*Tablet*
CAUTIONYAR AND ADVISORY LABELS 5
- *Sucralfate (Non-proprietary)*
- *Sucralfate 1 gram* Sulcrate 1g tablets | 100 tablet no price available Carafate 1g tablets | 100 tablet no price available

### H$_2$-RECEPTOR ANTAGONISTS

#### H$_2$-receptor antagonists

**Overview**
Histamine H$_2$-receptor antagonists heal gastric and duodenal ulcers by reducing gastric acid output as a result of histamine H$_2$-receptor blockade; they are also used to relieve symptoms of gastro-oesophageal reflux disease. H$_2$-receptor antagonists should not normally be used for Zollinger-Ellison syndrome because proton pump inhibitors are more effective.

**H$_2$-receptor antagonists**

</tr>
</tbody>
</table>

**Maintenance treatment with low doses for the prevention of peptic ulcer disease has largely been replaced in *Helicobacter pylori* positive patients by eradication regimens.**

In adults, H$_2$-receptor antagonists are used for the treatment of functional dyspepsia and may be used for the treatment of uninvestigated dyspepsia without alarm features. H$_2$-receptor antagonist therapy can promote healing of NSAID-associated ulcers (particularly duodenal).

Treatment with a H$_2$-receptor antagonist has not been shown to be beneficial in haematemesis and melaena, but prophylactic use reduces the frequency of bleeding from gastroduodenal erosions in hepatic coma, and possibly in other conditions requiring intensive care. H$_2$-receptor antagonists also reduce the risk of acid aspiration in obstetric patients at delivery (Mendelson’s syndrome).

**H$_2$-receptor antagonists**

- **CAUTIONS** Signs and symptoms of gastric cancer (in adults)

**CAUTIONS, FURTHER INFORMATION**
- **Gastric cancer**
  - In adults H$_2$-receptor antagonists might mask symptoms of gastric cancer; particular care is required in patients presenting with ‘alarm features’ in such cases gastric malignancy should be ruled out before treatment.

**SIDE-EFFECTS**
- **Common or very common** Diarrhoea · dizziness · headache
- **Uncommon** Erythema multiforme · rash · toxic epidermal necrolysis
- **Rare** Arthralgia · blood disorders · bradycardia · cholestatic jaundice · confusion · depression · hallucinations · hepatitis · leucopenia · myalgia · pancytopenia · psychiatric reactions · thrombocytopenia
- **Frequency not known** Gynaecomastia · impotence

**SIDE-EFFECTS, FURTHER INFORMATION**
Psychiatric reactions, including confusion, depression, and hallucinations occur particularly in the elderly or the very ill.

**Cimetidine**

**INDICATIONS AND DOSE**

**Benign duodenal ulceration**
- **BY MOUTH**
  - Adult: 400 mg twice daily for at least 4 weeks, to be taken with breakfast and at night, alternatively 800 mg once daily for at least 4 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg once daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

**Benign gastric ulceration**
- **BY MOUTH**
  - Adult: 400 mg twice daily for 6 weeks, to be taken with breakfast and at night, alternatively 800 mg daily for 6 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg once daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

**NSAID-associated ulceration**
- **BY MOUTH**
  - Adult: 400 mg twice daily for 8 weeks, to be taken with breakfast and at night, alternatively 800 mg daily for 8 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night
Gastric and duodenal ulceration

**Reflex oesophagitis**
- **BY MOUTH**
  - Adult: 400 mg 4 times a day for 4–8 weeks

**Prophylaxis of stress ulceration**
- **BY MOUTH**
  - Adult: 200–400 mg every 4–6 hours

**Gastric acid reduction in obstetrics**
- **BY MOUTH**
  - Adult: Initially 400 mg, to be administered at start of labour, then increased if necessary up to 400 mg every 4 hours, do not use syrup in prophylaxis of acid aspiration; maximum 2.4 g per day

**Gastric acid reduction during surgical procedures**
- **BY MOUTH**
  - Adult: 400 mg, to be given 90–120 minutes before induction of general anaesthesia

**Short-bowel syndrome**
- **BY MOUTH**
  - Adult: 400 mg twice daily, adjusted according to response, to be taken with breakfast and at bedtime

**To reduce degradation of pancreatic enzyme supplements**
- **BY MOUTH**
  - Adult: 0.8–1.6 g daily in 4 divided doses, to be taken 1–1½ hours before meals

**INTERACTIONS** 
- Appendix 1: H₂ receptor antagonists

**SIDE-EFFECTS**
- Common or very common: Malaise
- Uncommon: Tachycardia
- Rare: Intestinal nephritis
- Very rare: Alopecia, galactorrhoea, pancreatitis, vasculitis

**PREGNANCY**
- Manufacturer advises avoid unless essential.

**NURSING AND BREASTFEEDING**
- Significant amount present in milk—not known to be harmful, but manufacturer advises avoid.

**HEPATIC IMPAIRMENT**
- Reduce dose. Increased risk of confusion.

**RENAL IMPAIRMENT**
- Reduce dose to 200 mg 4 times daily if eGFR 30–50 mL/minute/1.73 m². Reduce dose to 200 mg 3 times daily if eGFR 15–30 mL/minute/1.73 m². Reduce dose to 200 mg twice daily if eGFR less than 15 mL/minute/1.73 m². Occasional risk of confusion.

**EXCEPTIONS TO LEGAL CATEGORY**
- Cimetidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks’ supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity (max. single dose 200 mg, max. daily dose 800 mg), and for the prophylactic management of nocturnal heartburn (single night-time dose 100 mg).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Oral solution**
- May contain Propylene glycol
  - Cimetidine (Non-proprietary)
    - Cimetidine 40 mg per 1 ml Cimetidine 200mg/5ml oral solution sugar free sugar-free | 300 ml [Pom] £14.24–£14.25 DT price = £14.25
  - Tagamet (Essential Pharma Ltd)
    - Cimetidine 40 mg per 1 ml Tagamet 200mg/5ml syrup | 600 ml [Pom] £28.49 DT price = £28.49

**Tablet**
- Cimetidine (Non-proprietary)
  - Cimetidine 200 mg Cimetidine 200mg tablets | 60 tablet [Pom] £45.59 | 120 tablet [Pom] £120.00
  - Cimetidine 400 mg Cimetidine 400mg tablets | 60 tablet [Pom] £120.00 DT price = £15.31
  - Cimetidine 800 mg Cimetidine 800mg tablets | 30 tablet [Pom] no price available DT price = £9.09

**Tagamet** (Chemidex Pharma Ltd)
- Cimetidine 200 mg Tagamet 200mg tablets | 120 tablet [Pom] £19.58
- Cimetidine 400 mg Tagamet 400mg tablets | 60 tablet [Pom] £22.62 DT price = £15.31
- Cimetidine 800 mg Tagamet 800mg tablets | 30 tablet [Pom] £22.62 DT price = £9.09

**Famotidine**

**INDICATIONS AND DOSE**
- Treatment of benign gastric and duodenal ulceration
  - **BY MOUTH**
    - Adult: 40 mg once daily for 4–8 weeks, dose to be taken at night

- Maintenance treatment of duodenal ulceration
  - **BY MOUTH**
    - Adult: 20 mg once daily, dose to be taken at night

**Reflex oesophagitis**
- **BY MOUTH**
  - Adult: 20–40 mg twice daily for 6–12 weeks; maintenance 20 mg twice daily

**INTERACTIONS**
- Appendix 1: H₂ receptor antagonists

**SIDE-EFFECTS**
- Common or very common: Constipation
- Uncommon: Fatigue, vomiting, anorexia, dry mouth, flatulence, nausea, taste disorders
- Very rare: Chest tightness, interstitial pneumonia, paraesthesia, seizures

**PREGNANCY**
- Manufacturer advises avoid unless potential benefit outweighs risk.

**NURSING AND BREASTFEEDING**
- Present in milk—not known to be harmful but manufacturer advises avoid.

**RENAL IMPAIRMENT**
- Use normal dose every 36–48 hours or use half normal dose if eGFR less than 50 mL/minute/1.73 m². Seizures reported very rarely.

**EXCEPTIONS TO LEGAL CATEGORY**
- Famotidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks’ supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink including when they cause sleep disturbance (max. single dose 10 mg, max. daily dose 20 mg).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Famotidine (Non-proprietary)
  - Famotidine 20 mg Famotidine 20mg tablets | 28 tablet [Pom] £22.00 DT price = £21.79
  - Famotidine 40 mg Famotidine 40mg tablets | 28 tablet [Pom] £39.00 DT price = £38.98

**Nizatidine**

**INDICATIONS AND DOSE**
- Benign gastric, duodenal or NSAID-associated ulceration
  - **BY MOUTH**
    - Adult: 300 mg once daily for 4–8 weeks, dose to be taken in the evening, alternatively 150 mg twice daily for 4–8 weeks; maintenance 150 mg once daily, dose to be taken at night

- Gastro-oesophageal reflux disease
  - **BY MOUTH**
    - Adult: 150–300 mg twice daily for up to 12 weeks

**INTERACTIONS**
- Appendix 1: H₂ receptor antagonists
**Gastro-intestinal system**

**PREGNANCY**  
Manufacturer advises avoid unless essential.

**BREAST FEEDING**  
Amount too small to be harmful.

**HEPATIC IMPAIRMENT**  
Manufacturer advises caution.

**RENAL IMPAIRMENT**  
Use half normal dose if eGFR less than 20 mL/minute/1.73 m². Use one-quarter normal dose if eGFR less than 20 mL/minute/1.73 m².

**EXCEPTIONS TO LEGAL CATEGORY**  
Nizatidine can be sold to the public for the prevention and treatment of symptoms of food-related heartburn and meal-induced indigestion in adults and children over 16 years; max. single dose 75 mg, max. daily dose 150 mg for max. 14 days.

**SID-E-EFFECTS**  
Common or very common  
Sweating

**INTERACTIONS**  
**Nizatidine** (Non-proprietary)  
Nizatidine 300 mg Nizatidine 300 mg capsules | 30 capsule  
£15.43 DT price = £15.43

**INDICATIONS AND DOSE**  
**Benign gastric ulceration | Duodenal ulceration**

- **BY MOUTH**
  - Child 1–5 months: 1 mg/kg 3 times a day
  - Child 6 months–2 years: 2–4 mg/kg twice daily
  - Child 3–11 years: 2–4 mg/kg twice daily (max. per dose 150 mg)
  - Child 12–17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night
  - Adult: 150 mg twice daily for 4–8 weeks, alternatively 300 mg once daily for 4–8 weeks, dose to be taken at night

**Chronic episodic dyspepsia**
- **BY MOUTH**
  - Adult: 150 mg twice daily for 6 weeks, alternatively 300 mg once daily for 6 weeks, dose to be taken at night

**NSAID-associated gastric ulceration**
- **BY MOUTH**
  - Adult: 150 mg twice daily for up to 8 weeks, alternatively 300 mg once daily for up to 8 weeks, dose to be taken at night

**NSAID-associated duodenal ulcer**
- **BY MOUTH**
  - Adult: 300 mg twice daily for 4 weeks, to achieve a higher healing rate

**Prophylaxis of NSAID-associated gastric ulcer** | **Prophylaxis of NSAID-associated duodenal ulcer**

- **BY MOUTH**
  - Adult: 300 mg twice daily

**Gastro-oesophageal reflux disease**

- **BY MOUTH**
  - Adult: 150 mg twice daily for up to 8 weeks or if necessary 12 weeks, alternatively 300 mg once daily for up to 8 weeks or if necessary 12 weeks, dose to be taken at night

**Moderate to severe gastro-oesophageal reflux disease**
- **BY MOUTH**
  - Adult: 600 mg daily in 2–4 divided doses for up to 12 weeks

**Long-term treatment of healed gastro-oesophageal reflux disease**

- **BY MOUTH**
  - Adult: 150 mg twice daily

**Gastric acid reduction (prophylaxis of acid aspiration) in obstetrics**
- **BY MOUTH**
  - Adult: 150 mg, dose to be given at onset of labour, then 150 mg every 6 hours

**Gastric acid reduction (prophylaxis of acid aspiration) in surgical procedures**

- **INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
  - Adult: 50 mg, to be given 45–60 minutes before induction of anaesthesia, intravenous injection diluted to 20 mL and given over at least 2 minutes, alternatively (by mouth) 150 mg, to be given 2 hours before induction of anaesthesia and also when possible on the preceding evening

**Prophylaxis of stress ulceration**

- **INITIALLY BY SLOW INTRAVENOUS INJECTION**
  - Adult: 50 mg every 8 hours, dose to be diluted to 20 mL and given over at least 2 minutes, then (by mouth) 150 mg twice daily, may be given when oral feeding commences

**Reflux oesophagitis and other conditions where gastric acid reduction is beneficial**

- **BY MOUTH**
  - Child 1–5 months: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
  - Child 6 months–2 years: 2–4 mg/kg twice daily
  - Child 3–11 years: 2–4 mg/kg twice daily (max. per dose 150 mg)
  - Child 12–17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night
  - Adult: 150 mg twice daily for 4–8 weeks, alternatively 300 mg once daily for 4–8 weeks, dose to be taken at night

**Conditions where reduction of gastric acidity is beneficial and oral route not available**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 50 mg every 6–8 hours
  - **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 50 mg, dose to be diluted to 20 mL and given over at least 2 minutes; may be repeated every 6–8 hours

**UNLICENSED USE**  
Oral preparations not licensed for use in children under 3 years. Injection not licensed for use in children under 6 months. Doses given for prophylaxis of NSAID-associated gastric or duodenal ulcer, and prophylaxis of stress ulceration, are not licensed.

**INTERACTIONS**  
Appendix 1: H₂ receptor antagonists

**SIDE-EFFECTS**  
Uncommon  
Blurred vision

**INTERVENTIONS**  
Alopecia · interstitial nephritis · involuntary movement disorders · pancreatitis

**PREGNANCY**  
Manufacturer advises avoid unless essential, but not known to be harmful.

**BREAST FEEDING**  
In adults Use half normal dose if eGFR less than 50 mL/minute/1.73 m².
PROSTAGLANDIN ANALOGUES AND PROSTAMIDES

GASTROPROTECTIVE

Misoprostol

- **DRUG ACTION** Misoprostol is a synthetic prostaglandin analogue that has antisecretory and protective properties, promoting healing of gastric and duodenal ulcers. It also acts as a potent uterine stimulant.

- **INDICATIONS AND DOSAGE**
  - Benign gastric ulceration
  - Benign duodenal ulceration
  - NSAID-associated ulceration
    - **BY MOUTH**
      - Adult: 800 micrograms daily in 2–4 divided doses continued for at least 4 weeks or may be continued for up to 8 weeks if required, dose to be taken with breakfast (or main meals) and at bedtime

- **Prophylaxis of NSAID-induced gastric ulcer** | **Prophylaxis of duodenal ulcer**
  - **BY MOUTH**
  - Adult: 200 micrograms 4 times a day, reduced if not tolerated to 200 micrograms 2–3 times a day, use lower dose is less effective

- **CAUTIONS** Conditions where hypotension might precipitate severe complications (e.g. cerebrovascular disease, cardiovascular disease) - inflammatory bowel disease

- **SIDE-EFFECTS**
  - Common or very common: Diarrhoea
  - Frequency not known: Abdominal pain - abnormal vaginal bleeding - dizziness - dyspepsia - flatulence - intermenstrual bleeding - menorrhagia - nausea - postmenopausal bleeding - rashes - vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Diarrhoea: May occasionally be severe and require withdrawal, reduced by giving single doses not exceeding 200 micrograms and by avoiding magnesium-containing antacids.

- **CONCEPTION AND CONTRACEPTION**
  - Manufacturer advises that misoprostol should not be used in women of childbearing age unless pregnancy has been excluded. In such patients it is advised that misoprostol should only be used if the patient takes effective contraceptive measures and has been advised of the risks of taking misoprostol if pregnant.

- **PREGNANCY**
  - Avoid—potent uterine stimulant (has been used to induce abortion). Teratogenic risk in first trimester.

- **BREAST FEEDING**
  - Present in milk, but amount probably too small to be harmful.
Proton pump inhibitors

**DRUG ACTION** Proton pump inhibitors inhibit gastric acid secretion by blocking the hydrogen-potassium adenosine triphosphatase enzyme system (the ‘proton pump’) of the gastric parietal cell.

**IMPORTANT SAFETY INFORMATION**

**MHRA ADVICE: PROTON PUMP INHIBITORS (PPIs): VERY LOW RISK OF SUBACUTE CUTANEOUS LUPUS ERYTHEMATOSUS (SEPTEMBER 2015)**

Very infrequent cases of subacute cutaneous lupus erythematosus (SCLE) have been reported in patients taking PPIs. Drug-induced SCLE can occur weeks, months or even years after exposure to the drug.

If a patient treated with a PPI develops lesions—especially in sun-exposed areas of the skin—and it is accompanied by arthralgia:

- Advise them to avoid exposing the skin to sunlight;
- Consider SCLE as a possible diagnosis;
- Consider discontinuing PPI treatment unless it is imperative for a serious acid-related condition; a patient who develops SCLE with a particular PPI may be at risk of the same reaction with another;
- In most cases, symptoms resolve on PPI withdrawal; topical or systemic steroids might be necessary for treatment of SCLE only if there are no signs of remission after a few weeks or months.

**CAUTIONS** Can increase the risk of fractures (particularly when used at high doses for over a year in the elderly) — may increase the risk of gastro-intestinal infections (including Clostridium difficile infection) — may mask the symptoms of gastric cancer (in adults) — patients at risk of osteoporosis.

**CAUTIONS, FURTHER INFORMATION**

- Risk of osteoporosis Patients at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D, and if necessary, receive other preventative therapy.
- Gastric cancer Particular care is required in those presenting with ‘alarm features’, in such cases gastric malignancy should be ruled out before treatment.

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain · constipation · diarrhoea · flatulence · gastro-intestinal disturbances · headache · nausea · vomiting
- **Uncommon** Arthralgia · dizziness · dry mouth · fatigue · myalgia · paraesthesia · peripheral oedema · pruritus · rash · sleep disturbances
- **Rare** Alopecia · anaphylaxis · blood disorders · bronchospasm · confusion · depression · fever · gynaecomastia · hallucinations · hepatitis · hypersensitivity reactions · hypomagnesaemia (usually after 1 year of treatment, but sometimes after 3 months of treatment) · hyponatraemia · interstitial nephritis · jaundice · leucocytosis · leucopenia · pancytopenia · photosensitivity · Stevens-Johnson syndrome · stomatitis · sweating · taste disturbance · thrombocytopenia · toxic epidermal necrolysis · visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

Rebound acid hypersecretion and protracted dyspepsia may occur after stopping prolonged treatment with a proton pump inhibitor.

**MONITORING REQUIREMENTS** Measurement of serum-magnesium concentrations should be considered before and during prolonged treatment with a proton pump inhibitor, especially when used with other drugs that cause hypomagnesaemia or with digoxin.

**PRESCRIBING AND DISPENSING INFORMATION** A proton pump inhibitor should be prescribed for appropriate indications at the lowest effective dose for the shortest period; the need for long-term treatment should be reviewed periodically.

---

**Esomeprazole**

**INDICATIONS AND DOSE**

**NSAID-associated gastric ulcer**

- **BY MOUTH**
  - Adult: 20 mg once daily for 4–8 weeks
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Adult: 20 mg daily continue until oral administration possible, injection to be given over at least 3 minutes

**Prophylaxis of NSAID-associated gastric ulcer in patients with an increased risk of gastroduodenal complications who require continued NSAID treatment**

- **BY MOUTH**
  - Adult: 20 mg daily

**Prophylaxis of NSAID-associated gastric or duodenal ulcer**

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 20 mg daily continue until oral administration possible, injection to be given over at least 3 minutes

**Gastro-oesophageal reflux disease (in the presence of erosive reflux oesophagitis)**

- **BY MOUTH**
  - Child 1–11 years (body-weight 10–19 kg): 10 mg once daily for 8 weeks
  - Child 11–17 years: 20 mg once daily for 8 weeks
  - Child 12–17 years: Initially 40 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed or symptoms persist; maintenance 20 mg daily
  - Adult: Initially 40 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed or symptoms persist; maintenance 20 mg daily

**SYMPTOMATIC TREATMENT OF GASTRO-OESOPHAGEAL REFUX DISEASE IN THE ABSENCE OF OESOPHAGITIS**

- **BY MOUTH**
  - Child 1–11 years (body-weight 10 kg and above): 10 mg once daily for up to 8 weeks
  - Child 12–17 years: 20 mg once daily for up to 4 weeks
  - Adult: 20 mg once daily for up to 4 weeks, then 20 mg daily if required

**BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

- Adult: 20 mg once daily continue until oral administration is possible, injection to be given over at least 3 minutes
Zollinger–Ellison syndrome

▶ BY MOUTH

▶ Adult: Initially 40 mg twice daily, adjusted according to response; usual dose 80–160 mg daily, daily doses above 80 mg should be given in 2 divided doses

Severe peptic ulcer bleeding (following endoscopic treatment)

▶ INITIALLY BY INTRAVENOUS INFUSION

▶ Adult: Initially 80 mg, to be given over 30 minutes, then (by continuous intravenous infusion) 8 mg/hour for 72 hours, then (by mouth) 40 mg once daily for 4 weeks

Helicobacter pylori eradication in combination with clarithromycin and amoxicillin or metronidazole

▶ BY MOUTH

▶ Adult: 20 mg twice daily

UNLICENSED USE Tablets and capsules not licensed for use in children 1–11 years.

INTERACTIONS ▶ Appendix 1: proton pump inhibitors

PREGNANCY ▶ Appendix 1: clarithromycin

BREAST FEEDING Manufacturer advises caution—no information available.

HEPATIC IMPAIRMENT

▶ In adults In severe hepatic impairment max. 20 mg daily. Severe peptic ulcer bleeding in severe hepatic impairment, initial intravenous infusion of 80 mg, then by continuous intravenous infusion, 4 mg/hour for 72 hours.

▶ In children 1–11 years max. 10 mg daily in severe impairment. 12–17 years max. 20 mg daily in severe impairment.

RENAL IMPAIRMENT Manufacturer advises caution in severe renal insufficiency.

DIRECTIONS FOR ADMINISTRATION

▶ With intravenous use in adults For intravenous infusion (Nexium®), give continuously or intermittently in Sodium Chloride 0.9%; reconstitute 40–80 mg with up to 100 mL infusion fluid; for intermittent infusion, give requisite dose over 10–30 minutes; stable for 12 hours in Sodium Chloride 0.9%.

▶ With oral use Do not chew or crush capsules; swallow whole or mix capsule contents in water and drink within 30 minutes. Do not crush or chew tablets; swallow whole or disperse in water and drink within 30 minutes. Disperse the contents of each sachet of gastro-resistant granules in approx. 15 mL water. Stir and leave to thicken for a few minutes; stir again before administration and use within 30 minutes; rinse container with 15 mL water to obtain full dose. For administration through a gastric tube, consult product literature.

PATIENT AND CARER ADVICE

▶ With oral use Counselling on administration of gastro-resistant capsules, tablets, and granules advised.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Gastro-resistant capsule

▶ Esomeprazole (Non-proprietary)

Esomeprazole (as Esomeprazole magnesiuim dihydrate)

20 mg Esomeprazole 20mg gastro-resistant capsules | 28 capsule | £12.95 DT price = £2.64

Esomeprazole (as Esomeprazole magnesium dihydrate)

40 mg Esomeprazole 40mg gastro-resistant capsules | 28 capsule | £17.63 DT price = £3.30

▶ Emozul (Consilient Health Ltd)

Esomeprazole (as Esomeprazole magnesium dihydrate)

Lansoprazole

INDICATIONS AND DOSE

Helicobacter pylori eradication in combination with amoxicillin and clarithromycin; or in combination with amoxicillin and metronidazole; or in combination with clarithromycin and metronidazole

▶ BY MOUTH

▶ Adult: 30 mg twice daily

Benign gastric ulcer

▶ BY MOUTH

▶ Adult: 30 mg once daily for 8 weeks, dose to be taken in the morning

Duodenal ulcer

▶ BY MOUTH

▶ Adult: 30 mg once daily for 4 weeks, dose to be taken in the morning; maintenance 15 mg once daily

NSAID-associated duodenal ulcer | NSAID-associated gastric ulcer

▶ BY MOUTH

▶ Adult: 30 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed

Prophylaxis of NSAID-associated duodenal ulcer | Prophylaxis of NSAID-associated gastric ulcer

▶ BY MOUTH

▶ Adult: 15–30 mg once daily

Zollinger–Ellison syndrome (and other hypersecretory conditions)

▶ BY MOUTH

▶ Adult: Initially 60 mg once daily, adjusted according to response, daily doses of 120 mg or more given in two divided doses continued
Gastro-intestinal system

Disorders of gastric acid and ulceration

JSICINAL FORMS

PROFESSION SPECIFIC INFORMATION

TIENT AND CARER ADVICE

HEPATIC IMPAIRMENT

BR EAST FEEDING

▶ UNLICENSED USE

Lansoprazole doses in BNF may differ from those in product literature. Not licensed at 30 mg twice daily for severe oesophagitis refractory to initial treatment.

▶ INTERACTIONS

Appendix 1: proton pump inhibitors

▶ SIDE-EFFECTS

Very rare: Colitis - raised serum cholesterol - raised triglycerides

Frequency not known: Anorexia - glossitis - impotence - pancreatitis - petechiae - purpura - restlessness - tremor

▶ PREGNANCY

Manufacturer advises avoid.

▶ BREAST FEEDING

Avoid—present in milk in animal studies.

▶ HEPATIC IMPAIRMENT

Use half normal dose in moderate to severe liver disease.

▶ DIRECTIONS FOR ADMINISTRATION

Orodispersible tablets should be placed on the tongue, allowed to disperse and swallowed, or may be swallowed whole with a glass of water. Alternatively, tablets can be dispersed in a small amount of water and administered by an oral syringe or nasogastric tube.

▶ PATIENT AND CARER ADVICE

Counselling on administration of orodispersible tablet advised.

▶ PROFESSION SPECIFIC INFORMATION

Dental practitioners’ formulary

Lansoprazole capsules may be prescribed.

▶ MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

▶ BY MOUTH

Adult: 20 mg twice daily

Benign gastric ulceration

▶ BY MOUTH

Adult: 20 mg once daily for 4 weeks, increased if necessary to 40 mg once daily, in severe or recurrent cases

Prevention of relapse in gastric ulcer

▶ BY MOUTH

Adult: 20 mg once daily, increased if necessary to 40 mg once daily

Prevention of relapse in duodenal ulcer

▶ BY MOUTH

Adult: 20 mg once daily, dose may range between 10–40 mg daily

NSAID-associated duodenal ulcer | NSAID-associated gastric ulcer | NSAID-associated gastroduodenal erosions

▶ BY MOUTH

Adult: 20 mg once daily for 4 weeks, continued for a further 4 weeks if not fully healed

Prophylaxis in patients with a history of NSAID-associated duodenal ulcer who require continued NSAID treatment | Prophylaxis in patients with a history of NSAID-associated gastric ulcer who require continued NSAID treatment | Prophylaxis in patients with a history of NSAID-associated gastroduodenal lesions who require continued NSAID treatment | Prophylaxis in patients with a history of NSAID-associated dyspeptic symptoms who require continued NSAID treatment

▶ BY MOUTH

Adult: 20 mg twice daily

Zollinger–Ellison syndrome

▶ BY MOUTH

Adult: Initially 60 mg once daily; usual dose 20–120 mg daily, total daily doses greater than 80 mg should be given in 2 divided doses

BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

Adult: Initially 60 mg once daily, adjusted according to response, total daily doses greater than 60 mg should be given in 2 divided doses, injection to be given over 5 minutes, infusion to be given over 20–30 minutes

Gastro-oesophageal reflux disease

▶ BY MOUTH

Adult: 20 mg once daily for 4 weeks, continued for a further 4–8 weeks if not fully healed; maintenance 20 mg once daily

Gastro-oesophageal reflux disease refractory to other treatment

▶ BY MOUTH

Adult: 40 mg once daily for 8 weeks; maintenance 20 mg once daily

Acid reflux disease (long-term management)

▶ BY MOUTH

Adult: 10 mg once daily, increased to 20 mg once daily, dose only increased if symptoms return
Acid-related dyspepsia
▶ BY MOUTH
▶ Adult: 10–20 mg once daily for 2–4 weeks according to response

Treatment and prevention of benign gastric ulcers
Treatment and prevention of duodenal ulcers
Treatment and prevention of NSAID-associated ulcers
Treatment and prevention of gastro-oesophageal reflux disease
▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
▶ Adult: 40 mg once daily until oral administration possible, injection to be given over 5 minutes, infusion to be given over 20–30 minutes

Major peptic ulcer bleeding (following endoscopic treatment)
▶ INITIALLY BY INTRAVENOUS INFUSION
▶ Adult: Initially 80 mg, to be given over 40–60 minutes, then (by continuous intravenous infusion) 8 mg/hour for 72 hours, subsequent dose then changed to oral therapy

UNLICENSED USE Treatment of major peptic ulcer bleeding (following endoscopic treatment) is an unlicensed indication.

INTERACTIONS ➔ Appendix 1: proton pump inhibitors

SIDE-EFFECTS Agitation - impotence

PREGNANCY Not known to be harmful.

BREAST FEEDING Present in milk but not known to be harmful.

HEPATIC IMPAIRMENT Not more than 20 mg daily should be needed.

DIRECTIONS FOR ADMINISTRATION For administration by mouth, swallow whole, or disperse Losec MUPS® tablets in water, or mix capsule contents or Losec MUPS® tablets with fruit juice or yoghurt. Preparations consisting of an e/c tablet within a capsule should not be opened.

With intravenous use For intravenous infusion (Losec®), give intermittently or continuously in Glucose 5% or Sodium chloride 0.9%; reconstitute each 40 mg vial with infusion fluid and dilute to 100 mL; for intermittent infusion give 40 mg over 20–30 minutes; stable for 3 hours in glucose 5% or 12 hours in sodium chloride 0.9%.

PATIENT AND CARER ADVICE
With oral use Counselling on administration advised.

PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary
Gastro-resistant omeprazole capsules may be prescribed.

EXCEPTIONS TO LEGAL CATEGORY
With oral use Omeprazole 10 mg tablets can be sold to the public for the short-term relief of reflux-like symptoms (e.g. heartburn) in adults over 18 years, max. daily dose 20 mg for max. 4 weeks, and a pack size of 28 tablets.

4.3 Gastro-oesophageal reflux disease

Management
Gastro-oesophageal reflux disease (including non-erosive gastro-oesophageal reflux and erosive oesophagitis) is associated with heartburn, acid regurgitation, and sometimes, difficulty in swallowing (dysphagia); oesophageal inflammation (oesophagitis), ulceration, and stricture formation may occur and there is an association with asthma.

The management of gastro-oesophageal reflux disease includes drug treatment, lifestyle changes and, in some cases, surgery. Initial treatment is guided by the severity of symptoms and treatment is then adjusted according to response. The extent of healing depends on the severity of the disease, the treatment chosen, and the duration of therapy.

Patients with gastro-oesophageal reflux disease should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, smoking cessation, and raising the head of the bed.

For mild symptoms of gastro-oesophageal reflux disease, initial management may include the use of antacids and alginites. Alginate-containing antacids can form a ‘raft’ that floats on the surface of the stomach contents to reduce reflux and protect the oesophageal mucosa. Histamine H₂-receptor antagonists may relieve symptoms and permit reduction in antacid consumption. However, proton pump inhibitors provide more effective relief of symptoms than H2-receptor antagonists. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by giving treatment intermittently).

For severe symptoms of gastro-oesophageal reflux disease or for patients with a proven or severe pathology (e.g. oesophagitis, oesophageal ulceration, oesophagopharyngeal reflux, Barrett’s oesophagus), initial management involves the use of a proton pump inhibitor; patients need to be reassessed if symptoms persist despite treatment for 4–6 weeks with a proton pump inhibitor. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by reducing the dose of the proton pump inhibitor or by giving it intermittently, or by substituting treatment with a histamine H₂-receptor antagonist). However, for endoscopically confirmed erosive, ulcerative, or strictureing disease, or Barrett’s oesophagus, treatment with a proton pump inhibitor usually needs to be maintained at the minimum effective dose.

Pregnancy
If dietary and lifestyle changes fail to control gastro-oesophageal reflux disease in pregnancy, an antacid or an alginate can be used. If this is ineffective, ranitidine p. 74 can be tried. Omeprazole p. 78 is reserved for women with severe or complicated reflux disease.

Gastro-oesophageal reflux disease in children
Gastro-oesophageal reflux disease is common in infancy but most symptoms resolve without treatment between 12 and 18 months of age. In infants, mild or moderate reflux without complications can be managed initially by changing the frequency and volume of feed; a feed thicker or thickened formula feed can be used (with advice of a dietitian). If necessary, a suitable alginate-containing preparation can be used instead of thickened feeds. For older children, life-style changes similar to those for adults may be helpful followed if necessary by treatment with an alginate-containing preparation.

Children who do not respond to these measures or who have problems such as respiratory disorders or suspected oesophagitis need to be referred to hospital; an H₂-receptor antagonist may be needed to reduce acid secretion. If the oesophagitis is resistant to H₂-receptor blockade, the proton pump inhibitor omeprazole can be tried.

ANTACIDS → ALGINATE

Sodium alginate with calcium carbonate and sodium bicarbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, alginic acid p. 67, sodium bicarbonate p. 950, calcium carbonate p. 958.

- INDICATIONS AND DOSE
  Mild symptoms of gastro-oesophageal reflux disease
    - BY MOUTH
      - Child 6–11 years: 5–10 mL, to be taken after meals and at bedtime
      - Child 12–17 years: 10–20 mL, to be taken after meals and at bedtime
      - Adult: 10–20 mL, to be taken after meals and at bedtime

- INTERACTIONS → Appendix 1: calcium salts, sodium bicarbonate
- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include aniseed or peppermint.

4.4 Helicobacter pylori diagnosis

DIAGNOSTIC AGENTS

Urea (13C)

- INDICATIONS AND DOSE
  Diagnosis of gastro-duodenal Helicobacter pylori infection
    - BY MOUTH
    - Adult: (consult product literature)
Gastro-intestinal system

5  Food allergy

Food allergy 15-Dec-2016

Description of condition
Food allergy is an adverse immune response to a food, commonly associated with cutaneous and gastro-intestinal reactions, and less frequently associated with respiratory reactions and anaphylaxis. It is distinct from food intolerance which is non-immunological. Cow's milk, hen's eggs, soy, wheat, peanuts, tree nuts, and shellfish are the most common allergens. Cross-reactivity between similar foods can occur (e.g. allergy to other mammalian milk in patients with cow's milk allergy).

Management of food allergy
Expt Allergy caused by specific foods should be managed by strict avoidance of the causal food. Sodium cromoglicate p. 260 is licensed as an adjunct to dietary avoidance in patients with food allergy. Educating patients about appropriate nutrition, food preparation, and the risks of accidental exposure is recommended, such as food and drinks to avoid, ensuring adequate nutritional intake, and interpreting food labels. A

Drug treatment
Expt There is low quality evidence to support the use of antihistamines to treat acute, non-life-threatening symptoms (such as flushing and urticaria) if accidental ingestion of allergenic food has occurred (see Antihistamines, under Antihistamines, allergen immunotherapy and allergic emergencies p. 265). Chlorphenamine maleate p. 272 is licensed for the symptomatic control of food allergy. In case of food-induced anaphylaxis, adrenaline/epinephrine p. 15 is the first-line immediate treatment (see also Allergic emergencies, under Antihistamines, allergen immunotherapy and allergic emergencies p. 265). Patients who are at risk of anaphylaxis should be trained to use self-injectable adrenaline/epinephrine. A

6  Gastro-intestinal smooth muscle spasm

Antispasmodics

Antimuscarinics
The intestinal smooth muscle relaxant properties of antimuscarinic and other antispasmodic drugs may be useful in irritable bowel syndrome. Antimuscarinics (formerly termed ‘anticholinergics’) reduce intestinal motility. They can be used for the management of irritable bowel syndrome.

Antimuscarinics that are used for gastro-intestinal smooth muscle spasm include the tertiary amines atropine sulfate p. 1224 and dicycloverine hydrochloride below and the quaternary ammonium compounds propantheline bromide p. 84 and hyoscine butylbromide p. 83. The quaternary ammonium compounds are less lipid soluble than atropine sulfate and are less likely to cross the blood–brain barrier; they are also less well absorbed from the gastro-intestinal tract.

Dicycloverine hydrochloride has a much less marked antimuscarinic action than atropine sulfate and may also have some direct action on smooth muscle. Hyoscine butylbromide is advocated as a gastro-intestinal antispasmodic, but it is poorly absorbed; the injection is useful in endoscopy and radiology. Atropine sulfate and the belladonna alkaloids are outmoded treatments, any clinical virtues being outweighed by atropinic side-effects.

Other antispasmodics
Alverine citrate p. 84, mebeverine hydrochloride p. 84, and peppermint oil p. 46 are believed to be direct relaxants of intestinal smooth muscle and may relieve pain in irritable bowel syndrome. They have no serious adverse effects but, like all antispasmodics, should be avoided in paralytic ileus.

ANTIMUSCARINICS

I Dicycloverine hydrochloride

(Dicyclomine hydrochloride)

- INDICATIONS AND DOSE
Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm
  ▶ BY MOUTH
  - Child 6–23 months: 5–10 mg 3–4 times a day, dose to be taken 15 minutes before feeds
  - Child 2–11 years: 10 mg 3 times a day
  - Child 12–17 years: 10–20 mg 3 times a day
  - Adult: 10–20 mg 3 times a day

- CONTRA-INDICATIONS  Child under 6 months
- INTERACTIONS  → Appendix 1: dicycloverine
- PREGNANCY  Not known to be harmful; manufacturer advises use only if essential.
- BREAST FEEDING  Avoid—present in milk; apnoea reported in infant.
- EXCEPTIONS TO LEGAL CATEGORY  Dicycloverine hydrochloride can be sold to the public provided that max. single dose is 10 mg and max. daily dose is 60 mg.

- MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Oral solution

Dicycloverine hydrochloride with aluminium hydroxide, magnesium oxide and simeticone

The properties listed below are those particular to the combination only. For the properties of the components please consider, dicycloverine hydrochloride p. 82, aluminium hydroxide p. 964, simeticone p. 70.

- **INDICATIONS AND DOSE**
  - Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm
    - **BY MOUTH**
      - Child 12-17 years: 10–20 mL every 4 hours as required
      - Adult: 10–20 mL every 4 hours as required
  - **INTERACTIONS** → Appendix 1: antacids, dicycloverine

- **MEDICINAL FORMS**
  - Oral suspension
    - Kolanticon (Peckforton Pharmaceuticals Ltd)
      - Dicycloverine hydrochloride 500 microgram per 1 ml, Simeticone 4 mg per 1 ml, Magnesium oxide light 20 mg per 1 ml, Aluminium hydroxide dried 40 mg per 1 ml. Kolanticon gel sugar-free | 200 ml £4.00 sugar-free | 500 ml £6.00

Hyoscine butylbromide

- **INDICATIONS AND DOSE**
  - Symptomatic relief of gastro-intestinal or genito-urinary disorders characterised by smooth muscle spasm
    - **BY MOUTH**
      - Child 6-11 years: 10 mg 3 times a day
      - Child 12-17 years: 20 mg 4 times a day
      - Adult: 20 mg 4 times a day
  - **IRRITABLE BOWEL SYNDROME**
    - **BY MOUTH**
      - Adult: 10 mg 3 times a day; increased if necessary up to 20 mg 4 times a day
  - **ACUTE SPASM | SPASM IN DIAGNOSTIC PROCEDURES**
    - Initially by intramuscular injection, or by slow intravenous injection
      - Adult: 20 mg, then (by intramuscular injection or by slow intravenous injection) 20 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 100 mg per day
  - **EXCESSIVE RESPIRATORY SECRETIONS IN PALLIATIVE CARE**
    - **BY MOUTH**
      - Child 1 month-1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
      - Child 2–4 years: 5 mg 3–4 times a day
      - Child 5–11 years: 10 mg 3–4 times a day
      - Child 12–17 years: 20–20 mg 3–4 times a day
    - **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
      - Child 1 month-4 years: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
      - Child 5–11 years: 5–10 mg 3–4 times a day
      - Child 12–17 years: 10–20 mg 3–4 times a day
    - **BY SUBCUTANEOUS INJECTION**
      - Adult: 20 mg every 4 hours if required, adjusted according to response to up to 20 mg every 1 hour
    - **BY SUBCUTANEOUS INFUSION**
      - Adult: 20–120 mg/24 hours

**BOWEL COLIC (IN PALLIATIVE CARE)**

- **BY MOUTH**
  - Child 1 month-1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
  - Child 2–4 years: 5 mg 3–4 times a day
  - Child 5–11 years: 10 mg 3–4 times a day
  - Child 12–17 years: 20–20 mg 3–4 times a day
- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
  - Child 1 month-4 years: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
  - Child 5–11 years: 5–10 mg 3–4 times a day
  - Child 12–17 years: 10–20 mg 3–4 times a day
  - **BY SUBCUTANEOUS INJECTION**
    - Adult: 20 mg every 4 hours if required, adjusted according to response to up to 20 mg every 1 hour
  - **BY SUBCUTANEOUS INFUSION**
    - Adult: 60–300 mg/24 hours

**PHARMACOKINETICS**

Administration by mouth is associated with poor absorption.

**UNLICENSED USE** Tablets not licensed for use in children under 6 years. Injection not licensed for use in children (age range not specified by manufacturer).

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: HYOSCINE BUTYLBROMIDE (BUSCOPAN®) INJECTION: RISK OF SERIOUS ADVERSE EFFECTS IN PATIENTS WITH UNDERLYING CARDIAC DISEASE (FEBRUARY 2017)

The MHRA advises that hyoscine butylbromide injection can cause serious adverse effects including tachycardia, hypotension, and anaphylaxis; several reports have noted that anaphylaxis is more likely to be fatal in patients with underlying coronary heart disease. Hyoscine butylbromide injection is contra-indicated in patients with tachycardia and should be used with caution in patients with cardiac disease; the MHRA recommends that these patients are monitored and that resuscitation equipment and trained personnel are readily available.

**CONTRA-INDICATIONS**

- With intramuscular use or intravenous use or subcutaneous use Tachycardia

**INTERACTIONS** → Appendix 1: hyoscine

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

Anaphylaxis

**SPECIFIC SIDE-EFFECTS**

- **Common or very common**
  - With intramuscular use or intravenous use or subcutaneous use Tachycardia
  - Uncommon
    - With oral use Tachycardia
    - Frequency not known
      - With intramuscular use or intravenous use or subcutaneous use Hypotension
  - **PREGNANCY** Manufacturer advises avoid.
  - **BREAST FEEDING** Amount too small to be harmful.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use in children For administration by mouth, injection solution may be used; content of ampoule may be stored in a refrigerator for up to 24 hours after opening.
- With intravenous use in children For intravenous injection, may be diluted with Glucose 5% or Sodium Chloride 0.9%; give over at least 1 minute.
## Propantheline bromide

### INDICATIONS AND DOSE
**Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm**
- **Adult enuresis**
  - **By mouth**
    - Child 12-17 years: 15 mg 3 times a day, dose to be taken at least one hour before food and 30 mg, dose to be taken at night; maximum 120 mg per day
    - Adult: Initially 15 mg 3 times a day, dose to be taken at least one hour before food and 30 mg, dose to be taken at bedtime, subsequently adjusted according to response; maximum 120 mg per day

### SIDE-EFFECTS
- **Allergic reactions**
- **Dizziness**
- **Driving and skilled tasks**
- **Gastro-intestinal smooth muscle spasm**
- **Irritable bowel syndrome**
- **Jaundice**
- **Wheezing**

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, tablets and liquid.

#### Tablets
- **Pro-Banthine** (Kyowa Kirin Ltd)
  - Propantheline bromide 15 mg Pro-Banthine 15mg tablets | 112 tablet [Pkt] £20.74 DT price = £20.74
- **Propantheline bromide (Non-proprietary)**
  - Propantheline bromide 15 mg Propantheline bromide 15mg tablets | 100 tablet [Pkt] no price available

### PREGNANCY
Manufacturer advises caution.

### UNLICENSED USE
Tablets not licensed for use in children under 12 years.

### INTERACTIONS
- Appendix 1: propantheline

### MEDICATIONS TO BE AVOIDED
- Hyoscine butylbromide

### NOTIFICATION REQUIREMENTS
- No information available.

### PATIENT AND CARER ADVICE
Driving and skilled tasks

## Mebeverine hydrochloride

### INDICATIONS AND DOSE
**Adjunct in gastro-intestinal disorders characterised by smooth muscle spasm**
- **By mouth using immediate-release medicines**
  - Child 10-17 years: 135–150 mg 3 times a day, dose preferably taken 20 minutes before meals
  - Adult: 135–150 mg 3 times a day, dose preferably taken 20 minutes before meals

### SIDE-EFFECTS
- **Allergic reactions**
- **Contraindications** Paralytic ileus
- **Dizziness**
- **Driving and skilled tasks**
- **Irritable bowel syndrome**
- **Jaundice**

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

#### Capsules
- **Alverine citrate (Non-proprietary)**
  - Alverine citrate 60 mg Alverine 60mg capsules | 10 capsule [P] £19.45 DT price = £19.45
  - Alverine citrate 120 mg Alverine 120mg capsules | 60 capsule [P] £23.28 DT price = £23.28
  - Audmonal (Teva UK Ltd)
    - Alverine citrate 60 mg Audmonal 60mg capsules | 10 capsule [P] £14.80 DT price = £14.80
  - Alverine citrate 120 mg Audmonal Forte 120mg capsules | 60 capsule [P] £17.75 DT price = £17.75
- **Gielism** (HFA Healthcare Products Ltd)
  - Alverine citrate 60 mg Gielism 60mg capsules | 100 capsule [P] £19.48 DT price = £19.48
- **Spasmonal** (Meda Pharmaceuticals Ltd)
  - Alverine citrate 60 mg Spasmonal 60mg capsules | 100 capsule [P] £16.45 DT price = £16.45

## Antispasmodics

### Alverine citrate

#### INDICATIONS AND DOSE
**Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm**
- **Dysmenorrhoea**
  - Child 12-17 years: 60–120 mg 1–3 times a day
  - Adult: 60–120 mg 1–3 times a day

#### CONTRA-INDICATIONS
- Intestinal obstruction
- Paraletic ileus

#### SIDE-EFFECTS
- Dizziness
- Dyspnoea
- Headache

#### PREGNANCY
Manufacturer advises caution.

### BREAST FEEDING
Manufacturer advises caution.

### PATIENT AND CARER ADVICE
Driving and skilled tasks

**Dizziness may affect performance of skilled tasks (e.g. driving).**
PREGNANCY Not known to be harmful—manufacturers advise avoid.

BREAST FEEDING Manufacturers advise avoid—no information available.

PATIENT AND CARER ADVICE

In adults Mebeverine hydrochloride can be sold to the public for symptomatic relief of irritable bowel syndrome provided that max. single dose is 135 mg and max. daily dose is 405 mg; for uses other than symptomatic relief of irritable bowel syndrome provided that max. single dose is 100 mg and max. daily dose is 300 mg.

EXCEPTIONS TO LEGAL CATEGORY

GALLSTONES

Description of condition

Gallstones (cholelithiasis) occur when hard mineral or fatty deposits form in the gallbladder. Gallstone disease is a general term that describes the presence of one or more stones in the gallbladder or in the bile duct, and the symptoms and complications that they may cause.

The majority of patients with gallstones remain asymptomatic. When the stones irritate the gallbladder or block part of the biliary system, the patient can experience symptoms such as pain, or infection and inflammation that if left untreated, can lead to severe complications such as biliary colic, acute cholecystitis, cholangitis, pancreatitis, and obstructive jaundice.

Non-drug treatment

Asymptomatic gallbladder stones do not need to be treated unless symptoms develop.

Drug treatment

Analgesia should be offered to control pain symptoms. Paracetamol p. 422 or nonsteroidal anti-inflammatory drugs (see Non-steroidal anti-inflammatory drugs p. 1028) are recommended for intermittent mild-to-moderate pain. Intramuscular diclofenac sodium p. 1034 can be given for severe pain or, if not suitable, an intramuscular opioid (such as morphine p. 439 or pethidine hydrochloride p. 445).

Although ursodeoxycholic acid p. 86 has been used for the management of gallstone disease, there is no evidence to support its use.

USEFUL RESOURCES

INBORN ERRORS OF PRIMARY BILE ACID SYNTHESIS

Description of condition

Inborn errors of primary bile acid synthesis are a group of diseases in which the liver does not produce enough primary bile acids due to enzyme deficiencies. These acids are the main components of the bile, and include cholic acid and chenodeoxycholic acid.
**Primary biliary cholangitis**  
30-May-2017

**Description of condition**
Primary biliary cholangitis (or primary biliary cirrhosis) is a chronic cholestatic disease which develops due to progressive destruction of small and intermediate bile ducts within the liver, subsequently evolving to fibrosis and cirrhosis.

**Treatment**
Ursodeoxycholic acid below is recommended for the management of primary biliary cholangitis, including those with asymptomatic disease. It slows disease progression, but the effect on overall survival is uncertain. Liver transplantation can be considered in patients with advanced primary biliary cholangitis.

**BILE ACIDS**

**Cholic acid**  
21-Mar-2016

- **Drug Action** Cholic acid is the predominant primary bile acid in humans, which can be used to provide a source of bile acid in patients with inborn deficiencies in bile acid synthesis.

- **Indications and Dose**
  
  **Indications of primary bile acid synthesis (initiated by a specialist)**
  
  - **by mouth**
    - Adult: Usual dose 5–15 mg/kg daily; increased in steps of 50 mg daily in divided doses if required, dose to be given with food at the same time each day; Usual maximum 500 mg/24 hours

- **Interactions** → Appendix 1: cholic acid
- **Side-effects** Diarrhoea · gallstones (long term use) · pruritus

**Side-effects, Further Information**
Patients presenting with pruritus and/or persistent diarrhoea should be investigated for potential overdose by a serum and/or urine bile acid assay.

- **Pregnancy** Limited data available—not known to be harmful, manufacturer advises continue treatment.
  
  Manufacturer advises monitor patient parameters more frequently in pregnancy.

- **Breast Feeding** Present in milk but not known to be harmful.

- **Hepatic Impairment** Manufacturer advises monitor closely.

- **Monitoring Requirements** Manufacturer advises monitor serum and/or urine bile-acid concentrations every 3 months for the first year, then every 6 months for three years, then annually; monitor liver function tests at the same or greater frequency.

- **Directions for Administration** Manufacturer advises capsules may be opened and the content added to infant formula, juice, fruit compote, or yoghurt for administration.

- **Patient and Carer Advice** Counselling advised on administration.

**Medicinal Forms**
There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**Ursodeoxycholic acid**

- **Indications and Dose**
  
  **Dissolution of gallstones**
  
  - **by mouth**
    - Adult: 8–12 mg/kg once daily, dose to be taken at bedtime, alternatively 8–12 mg/kg daily in 2 divided doses for up to 2 years; treatment is continued for 3–4 months after stones dissolve

- **Primary biliary cirrhosis**
  
  - **by mouth**
    - Adult: 12–16 mg/kg daily in 3 divided doses for 3 months, then 12–16 mg/kg once daily, dose to be taken at bedtime

- **Contra-Indications** Acute inflammation of the gall bladder · frequent episodes of biliary colic · inflammatory diseases and other conditions of the colon, liver or small intestine which interfere with enterohepatic circulation of bile salts · non-functioning gall bladder · radio-opaque stones

- **Caution** Liver disease

- **Interactions** → Appendix 1: ursodeoxycholic acid

- **Side-Effects**
  
  - Common or very common Diarrhoea
  
  - Very rare Abdominal pain · gallstone calcification · urticaria

- **Frequency not known** Nausea · pruritus · vomiting

- **Pregnancy** No evidence of harm but manufacturer advises avoid.

- **Breast Feeding** Not known to be harmful but manufacturer advises avoid.

- **Hepatic Impairment** Avoid in chronic liver disease (but used in primary biliary cirrhosis).

- **Monitoring Requirements** In primary biliary cirrhosis, monitor liver function every 4 weeks for 3 months, then every 3 months.

- **Patient and Carer Advice** Patients should be given dietary advice (including avoidance of excessive cholesterol and calories).
MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral suspension**

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES ➤ VASOPRESSIN AND ANALOGUES

Terlipressin acetate

**INDICATIONS AND DOSE**

**GLYPRESSIN® INJECTION**

**Bleeding from oesophageal varices**
▶ BY INTRAVENOUS INJECTION
Adult (body-weight up to 50 kg): Initially 2 mg every 4 hours until bleeding controlled, then reduced to 1 mg every 4 hours if required, maximum duration 48 hours
Adult (body-weight 50 kg and above): Initially 2 mg every 4 hours until bleeding controlled, reduced if not tolerated to 1 mg every 4 hours, maximum duration 48 hours

**VARIQUEL® INJECTION**

**Bleeding from oesophageal varices**
▶ BY INTRAVENOUS INJECTION
Adult (body-weight up to 50 kg): Initially 1 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute
Adult (body-weight 50–69 kg): Initially 1.5 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute
Adult (body-weight 70 kg and above): Initially 2 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute

**CAUTIONS**
Arrhythmia • elderly • electrolyte and fluid disturbances • heart disease • history of QT-interval prolongation • respiratory disease • septic shock • uncontrolled hypertension • vascular disease

**SIDE-EFFECTS**
▶ Common or very common Abdominal cramps • arrhythmia • bradycardia • diarrhoea • headache • hypertension • hypotension • pallor • peripheral ischaemia
▶ Uncommon Angina • bronchospasm • convulsions • hot flushes • hyponatraemia • intestinal ischaemia • myocardial infarction • nausea • pulmonary oedema • respiratory failure • tachycardia • vomiting
▶ Rare Dyspnoea
▶ Very rare Hyperglycaemia • stroke
▶ Frequency not known Heart failure • skin necrosis

**PREGNANCY**
Avoid unless benefits outweigh risk—uterine contractions and increased intra-uterine pressure in early pregnancy, and decreased uterine blood flow reported.

**BREAST FEEDING**
Avoid unless benefits outweigh risk—no information available.

**RENAL IMPAIRMENT**
Use with caution in chronic renal failure.

TERPENES

Borneol with camphene, cineole, menthol, menthone and pinene

**INDICATIONS AND DOSE**

**Biliary disorders**
▶ BY MOUTH
Adult: 1–2 capsules 3 times a day, to be taken before food

**LESS SUITABLE FOR PRESCRIBING** Rowachol® is less suitable for prescribing.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant capsule**
CAUTIONARY AND ADVISORY LABELS 22
▶ Rowachol (Meadow Laboratories Ltd)
Cineole 2 mg, Borneol 5 mg, Camphene 5 mg, Menthone 6 mg, Pinene 17 mg, Menthol 32 mg Rowachol gastro-resistant capsules | 50 capsule [PO] £7.35

Terlipressin acetate 120 microgram per 1 ml Glypressin 1mg/8.5ml solution for injection ampoules | 5 ampoule [PO] no price available
▶ Variquel (Sinclair IS Pharma Plc)
Terlipressin acetate 200 microgram per 1 ml Variquel 1mg/5ml solution for injection vials | 5 vial [PO] £89.98 (Hospital only)

**Powder and solvent for solution for injection**
▶ Glypressin (Ferring Pharmaceuticals Ltd)
Terlipressin acetate 1 mg Glypressin 1mg powder and solvent for solution for injection vials | 5 vial [PO] £92.33
▶ Variquel (Alliance Pharmaceuticals Ltd)
Terlipressin acetate 1 mg Variquel 1mg powder and solvent for solution for injection vials | 5 vial [PO] £89.48
Obesity should be managed in an appropriate setting.

Patients should be encouraged to engage in a lifestyle change-related health problems. A waist circumference of 80 cm (90 cm for Asian men), and women with a waist circumference of 80 cm are at increased risk of obesity-related health problems. A waist circumference of >102 cm in men and >88 cm in women indicates a very high risk of obesity-related health problems.

**Aims of treatment**

Management should be aimed at modest, sustainable weight loss and maintenance of a healthy weight, to reduce the risk factors associated with obesity.

**Overview**

Obesity should be managed in an appropriate setting by staff who have been trained in the management of obesity. Patients should be monitored for changes in weight, as well as changes in blood pressure and blood lipids, and for other associated conditions.

An initial assessment should consider potential underlying causes (e.g. hypothyroidism) and a review of the appropriateness of current medications which are known to cause weight gain, e.g. atypical antipsychotics, beta-adrenoceptor blocking drugs, insulin (when used in the treatment of type 2 diabetes), lithium carbonate, lithium citrate, sodium valproate, sulphonylureas, thiazolidinediones, and tricyclic antidepressants.

**Lifestyle changes**

Patients should be encouraged to engage in a sustainable weight management programme which includes strategies to change behaviour, increase physical activity, and improve diet and eating behaviour.

**Drug treatment**

Drug treatment should never be used as the sole element of treatment and should be used as part of an overall weight management plan. An anti-obesity drug should be considered only for those with a BMI of >30 kg/m², in whom diet, exercise and behaviour changes fail to achieve a realistic reduction in weight. In the presence of associated risk factors, it may be appropriate to prescribe an anti-obesity drug to individuals with a BMI of >28 kg/m². A vitamin and mineral supplement may also be considered if there is concern about inadequate micronutrient intake, particularly for vulnerable groups such as the elderly and younger patients.

The effect of management should be monitored on a regular basis with reinforcement of supporting lifestyle advice. Rates of weight loss may be slower in patients with type 2 diabetes, so less strict goals than in those without diabetes may be appropriate.

Orlistat, a lipase inhibitor, reduces the absorption of dietary fat.

**INDICATIONS AND DOSE**

Adjunct in obesity (in conjunction with a mildly hypocaloric diet in individuals with a body mass index (BMI) of 30 kg/m² or more or in individuals with a BMI of 28 kg/m² or more in the presence of other risk factors such as type 2 diabetes, hypertension, or hypercholesterolaemia).

**CONTRA-INDICATIONS** Cholestasis · chronic malabsorption syndrome

**CAUTIONS** Chronic kidney disease · may impair absorption of fat-soluble vitamins · volume depletion

**INTERACTIONS** Appendix 1: orlistat

**SIDE-EFFECTS**

Common or very common Abdominal distension (gastro-intestinal effects minimised by reduced fat intake) · abdominal pain (gastro-intestinal effects minimised by reduced fat intake) · anxiety · faecal incontinence · faecal...
9 Rectal and anal disorders

9.1 Anal fissures

**Anal fissure**

**Description of condition**

An anal fissure is a tear or ulcer in the lining of the anal canal, immediately within the anal margin. Clinical features of anal fissure include bleeding and persistent pain on defecation, and a linear split in the anal mucosa.

**Aims of treatment**

The aim of treatment is to relieve pain and promote healing of the fissure.

**Drug treatment**

**Acute anal fissure**

Initial management of acute anal fissures (present for less than 6 weeks) should focus on ensuring that stools are soft and easily passed. Bulk-forming laxatives (such as ispaghula husk p. 53) are recommended and an osmotic laxative (such as lactulose p. 55) can be considered as an alternative—see also Constipation p. 51, for further information about these laxatives. Short-term use of a topical preparation containing a local anaesthetic (such as lidocaine hydrochloride p. 1242) or a simple analgesic (such as paracetamol p. 422 or ibuprofen p. 1041) may be offered for prolonged burning pain following defecation. If these measures are inadequate, the patient should be referred for specialist treatment in hospital.

**Chronic anal fissure**

Chronic anal fissures (present for 6 weeks or longer, and associated pain, may be treated with glyceryl trinitrate p. 212 rectal ointment 0.4% or 0.2% [unlicensed] (available from Special-order manufacturers p. 1493 or specialist importing companies). Limited evidence suggests that the strength used does not influence the effectiveness, but that the higher strength potentially increases the incidence of side-effects. Healing rates with topical glyceryl trinitrate are marginally superior to placebo, but the incidence of headache as an adverse effect is quite high (about 20-30% of patients). Recurrence of the fissure after treatment is common.

As an alternative to glyceryl trinitrate rectal ointment, chronic anal fissure may also be treated with topical diltiazem hydrochloride 2% p. 152 [unlicensed] or nifedipine 0.2-0.5% p. 157 [unlicensed] (available from Special-order manufacturers p. 1493 or specialist importing companies), which have a lower incidence of adverse effects than topical glyceryl trinitrate. Oral nifedipine [unlicensed indication] and oral diltiazem hydrochloride [unlicensed indication] may be as effective as topical treatment, but the incidence of adverse effects are likely to be higher and topical preparations are preferred.

Patients who do not respond to first-line treatment may be referred to a specialist for local injection of botulinum toxin type A [unlicensed indication].

**Non-drug treatment**

Surgery is an effective option for the management of chronic anal fissure in adults but is generally reserved for those who do not respond to drug treatment.

9.2 Haemorrhoids

**Haemorrhoids**

**Description of condition**

Haemorrhoids, or piles, are abnormal swellings of the vascular mucosal anal cushions around the anus. Internal haemorrhoids arise above the dentate line and are usually painless unless they become strangulated. External haemorrhoids originate below the dentate line and can be itchy or painful. Women are predisposed to developing haemorrhoids during pregnancy.

**Aims of treatment**

The aims of treatment are to reduce the symptoms (pain, bleeding and swelling), promote healing, and prevent recurrence.

**Non-drug treatment**

Stools should be kept soft and easy to pass (to minimise straining) by increasing dietary fibre and fluid intake. Advice about perianal hygiene is helpful to aid healing and reduce irritation and itching.

**Drug treatment**

If constipation is reported, it should be treated. A bulk-forming laxative can be prescribed (see Constipation p. 51) A simple analgesic such as paracetamol p. 422 can be used for pain relief. Opioid analgesics should be avoided as they can cause constipation, and NSAIDs should be avoided if rectal bleeding is present.

Topical preparations that contain a combination of local anaesthetics, corticosteroids, astringents, lubricants, and antiseptics are available—see Related drugs below. They can offer symptomatic relief of local pain and itching but evidence does not suggest that any preparation is more effective than any other.

Topical preparations containing local anaesthetics (lidocaine, benzocaine, cinchocaine and pramocaine) should only be used for a few days as they may cause sensitisation of the anal skin. Local anaesthetics can be absorbed through the rectal mucosa (with a theoretical risk of systemic side effects) and very rarely may cause increased irritation; therefore excessive application should be avoided.

Topical preparations combining corticosteroids with local anaesthetics and soothing agents are available for the management of haemorrhoids. They may ameliorate local perianal inflammation, but no data suggest that they actually reduce haemorrhoidal swelling, bleeding, or protrusion.
Topical corticosteroids are suitable for occasional short-term use (no more than 7 days) after exclusion of infections (such as perianal streptococcal infection, herpes simplex or perianal thrush). Long-term use of corticosteroid creams can cause ulceration or permanent damage due to thinning of the perianal skin and should be avoided. Continuous or excessive use carries a risk of adrenal suppression and systemic corticosteroid effects.

Treatments available from specialists include rubber band ligation, injection sclerotherapy (using phenol p. 92 in oil), infrared coagulation/photocoagulation, bipolar diathermy and direct-current electrotherapy, haemorrhoidectomy, stapled haemorrhoidectomy, and haemorrhoidal artery ligation.

Pregnancy

Bulk forming laxatives are not absorbed, and are therefore safe for use in pregnant women (see Pregnancy, under Constipation p. 51). No topical haemorrhoidal preparations are licensed for use during pregnancy.

If treatment with a topical haemorrhoidal preparation is required, a soothing preparation containing simple, soothing products (not local anaesthetics or corticosteroids) can be considered.

Corticosteroids

Benzyl benzoate with bismuth oxide, bismuth subgallate, hydrocortisone acetate, peru balsam and zinc oxide

---

**INDICATIONS AND DOSE**

**Haemorrhoids | Pruritus ani**

- **BY RECTUM USING OINTMENT**
  - Adult: Apply twice daily for no longer than 7 days, to be applied morning and night and after a bowel movement

- **BY RECTUM USING SUPPOSITORIES**
  - Adult: 1 suppository twice daily for no longer than 7 days, to be inserted night and morning, additional dose after a bowel movement

---

**CAUTIONS**

Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application, particularly in children and infants) - local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

---

**PRESCRIBING AND DISPENSING INFORMATION**

A proprietary brand Anusol Plus HC® (ointment and suppositories) is on sale to the public.

---

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

- **Anusol-Hc** (McNeil Products Ltd)

  - Anusol Hc ointment | 30 gram [POM] £2.49

- **Suppository**
  - **Anusol-Hc** (McNeil Products Ltd)
    - Hydrocortisone acetate 10 mg, Bismuth oxide 24 mg, Benzyl benzoate 33 mg, Peru Balsam 49 mg, Bismuth subgallate 59 mg, Zinc oxide 296 mg
    - Anusol HC suppositories | 12 suppository [POM] £1.74
Cinchoacaine with hydrocortisone

- **INDICATIONS AND DOSE**

  **PROCSEDEYL® OINTMENT**
  **Haemorrhoids | Pruritus ani**
  - **TO THE SKIN, OR BY RECTUM**
  - Child: Apply twice daily, to be administered morning and night and after a bowel movement. Do not use for longer than 7 days
  - Adult: Apply twice daily, to be administered morning and night and after a bowel movement. Apply externally or by rectum. Do not use for longer than 7 days

  **PROCSEDEYL® SUPPOSITORIES**
  **Haemorrhoids | Pruritus ani**
  - **BY RECTUM**
  - Child 12-17 years: 1 suppository, insert suppository night and morning and after a bowel movement. Do not use for longer than 7 days
  - Adult: 1 suppository, insert suppository night and morning and after a bowel movement. Do not use for longer than 7 days

  **UNIROID-HC® OINTMENT**
  **Haemorrhoids | Pruritus ani**
  - **TO THE SKIN, OR BY RECTUM**
  - Child 12-17 years: Apply twice daily, and apply after a bowel movement, apply externally or by rectum, do not use for longer than 7 days
  - Adult: Apply twice daily, and apply after a bowel movement, apply externally or by rectum, do not use for longer than 7 days

  **UNIROID-HC® SUPPOSITORIES**
  **Haemorrhoids | Pruritus ani**
  - **BY RECTUM**
  - Child 12-17 years: 1 suppository, insert twice daily and after a bowel movement. Do not use for longer than 7 days
  - Adult: 1 suppository, insert twice daily and after a bowel movement. Do not use for longer than 7 days

- **CAUTIONS**
  - Local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)
  - There can be variation in the licensing of different medicines containing the same drug.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Ointment**
    - **Proctosedyl** (Sanofi)
      - Cinchoacaine hydrochloride 5 mg per 1 gram, Hydrocortisone 5 mg per 1 gram Proctosedyl ointment | 30 gram | £10.34
    - **Uniroid HC** (Chemidex Pharma Ltd)
      - Cinchoacaine hydrochloride 5 mg per 1 gram, Hydrocortisone 5 mg per 1 gram Uniroid HC ointment | 30 gram | £4.23
  - **Suppository**
    - **Proctosedyl** (Sanofi)
      - Cinchoacaine hydrochloride 5 mg, Hydrocortisone 5 mg Proctosedyl suppositories | 12 suppository | £5.08
    - **Uniroid HC** (Chemidex Pharma Ltd)
      - Cinchoacaine hydrochloride 5 mg, Hydrocortisone 5 mg Uniroid HC suppositories | 12 suppository | £1.31

Cinchoacaine with prednisolone

- **INDICATIONS AND DOSE**

  **PROCSEDEYL® OINTMENT**
  **Haemorrhoids | Pruritus ani**
  - **BY RECTUM USING OINTMENT**
    - Adult: Apply twice daily for 5–7 days, apply 3–4 times a day on the first day if necessary, then apply once daily for a few days after symptoms have cleared
    - **BY RECTUM USING SUPPOSITORIES**
      - Adult: 1 suppository daily for 5–7 days, to be inserted after a bowel movement

  **Haemorrhoids (severe cases) | Pruritus ani (severe cases)**
  - **BY RECTUM USING SUPPOSITORIES**
    - Adult: Initially 1 suppository 2–3 times a day, then 1 suppository daily for a total of 5–7 days, to be inserted after a bowel movement

- **CAUTIONS**
  - Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) - local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Ointment**
  - **Scheriproct** (Bayer Plc)
    - Prednisolone hexanoate 1.9 mg per 1 gram, Cinchoacaine hydrochloride 5 mg per 1 gram Scheriproct ointment | 30 gram | £2.94 DT price = £2.94
  - **Suppository**
    - **Scheriproct** (Bayer Plc)
      - Cinchoacaine hydrochloride 1 mg, Prednisolone hexanoate 1.3 mg Scheriproct suppositories | 12 suppository | £1.38 DT price = £1.38

Hydrocortisone with lidocaine

- **INDICATIONS AND DOSE**

  **Haemorrhoids | Pruritus ani**
  - **BY RECTUM USING AEROSOL SPRAY**
    - Adult: 1 spray up to 3 times a day for no longer than 7 days without medical advice, spray once over the affected area
    - **BY RECTUM USING OINTMENT**
      - Adult: Apply several times daily, for short term use only

- **CAUTIONS**
  - Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) - local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Ointment**
  - **Hydrocortisone with lidocaine (Non-proprietary)**
    - Hydrocortisone acetate 0.200% / Lidocaine 0.275% ointment | 20 gram | £4.19 DT price = £4.19
    - **Xyloproct** (Aspen Pharma Trading Ltd)
      - Hydrocortisone acetate 2.75 mg per 1 gram, Lidocaine 50 mg per 1 gram Xyloproct 5%/0.275% ointment | 20 gram | £4.19 DT price = £4.19
  - **Spray**
    - **Perinal** (Dermal Laboratories Ltd)
      - Hydrocortisone 2 mg per 1 gram, Lidocaine hydrochloride 10 mg per 1 gram Perinal spray | 30 ml | £6.11
## Reduced exocrine secretions

### Exocrine pancreatic insufficiency

**Description of condition**

Exocrine pancreatic insufficiency is characterised by reduced secretion of pancreatic enzymes into the duodenum. The main clinical manifestations are malabsorption and malnutrition, associated with low circulating levels of lipids, fat-soluble vitamins and micronutrients. Patients also present with gastro-intestinal symptoms such as diarrhoea, abdominal cramps and steatorrhoea.

Exocrine pancreatic insufficiency can result from chronic pancreatitis, cystic fibrosis, obstructive pancreatic tumours, coeliac disease, Zollinger-Ellison syndrome, and gastro-intestinal or pancreatic surgical resection.

### Aims of treatment

The aim of treatment is to relieve gastro-intestinal symptoms and to achieve a normal nutritional status.

### Drug treatment

Pancreatic enzyme replacement therapy with pancreatin p. 93 is the mainstay of treatment for exocrine pancreatic insufficiency. Pancreatin contains the three main groups of digestive enzymes: lipase, amylase and protease. These enzymes respectively digest fats, carbohydrates and proteins in their basic components so that they can be absorbed and utilised by the body. Pancreatin should be administered with meals and snacks. The dose should be adjusted, as necessary, to the lowest effective dose according to the symptoms of malabsorption.

There is limited evidence that acid suppression may improve the effectiveness of pancreatin. Acid-suppressing drugs (proton pump inhibitors or H2-receptor antagonists) may be trialled in patients who continue to experience symptoms despite high doses of pancreatin.

## Phenol

### Indications and dose

**Haemorrhoids** (particularly when unprolapsed)

- **By submusosal injection**
  - Adult: 2–3 mL, dose (using phenol 5%) to be injected into the submuscular layer at the base of the pile; several injections may be given at different sites, max. total injected 10 mL at any one time

### Side-effects

- Irritation · tissue necrosis

### Prescribing and dispensing information

When prepared extemporaneously, the BP states Oily Phenol Injection, BP consists of phenol 5% in a suitable fixed oil.

### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

#### Foam

- **Proctofoam HC** (Meda Pharmaceuticals Ltd)
  - Hydrocortisone acetate 10 mg per 1 gram, Pramocaine hydrochloride 10 mg per 1 gram
  - Proctofoam HC foam enema | 40 dose
  - **Price**: £6.07

## Sclerosants

### Phenol

**Indications and dose**

- **Haemorrhoids**
  - **By rectum**
  - Adult: 1 applicatorful 2–3 times a day and 1 applicatorful, after a bowel movement, do not use for longer than 7 days; maximum 4 applicatorfuls per day

**Caution**

Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) · local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- **Phenol (Non-proprietary)**
  - Phenol 50 mg per 1 mL
  - Oily phenol 5% solution for injection 5 mL ampoules | 10 ampoule
  - **Price**: £56.73

#### Foam

- **Proctofoam HC** (Meda Pharmaceuticals Ltd)
  - Hydrocortisone acetate 10 mg per 1 gram, Pramocaine hydrochloride 10 mg per 1 gram
  - Proctofoam HC foam enema | 40 dose
  - **Price**: £6.07

### 10 Reduced exocrine secretions

**Exocrine pancreatic insufficiency**

**Description of condition**

Exocrine pancreatic insufficiency is characterised by reduced secretion of pancreatic enzymes into the duodenum. The main clinical manifestations are malabsorption and malnutrition, associated with low circulating levels of lipids, fat-soluble vitamins and micronutrients. Patients also present with gastro-intestinal symptoms such as diarrhoea, abdominal cramps and steatorrhoea.

Exocrine pancreatic insufficiency can result from chronic pancreatitis, cystic fibrosis, obstructive pancreatic tumours, coeliac disease, Zollinger-Ellison syndrome, and gastro-intestinal or pancreatic surgical resection.
three snacks. Food that is difficult to digest should be avoided, such as legumes (peas, beans, lentils) and high-fibre foods. Alcohol should be avoided completely. Reduced fat diets are not recommended.

Medium-chain triglycerides (see MCT oil, in Borderline mucosa, were thought to be useful in some patients. However evidence has shown that MCT-enriched preparations offer no advantage over a normal balanced diet.

**PANCREATIC ENZYMES**

**Pancreatin**

- **DRUG ACTION** Supplements of pancreatin are given to compensate for reduced or absent exocrine secretion. They assist the digestion of starch, fat, and protein.

- **INDICATIONS AND DOSE**

  **CREON® 10000**
  **Pancreatic insufficiency**
  ▶ **BY MOUTH**
  - Child: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
  - Adult: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

  **CREON® 25000**
  **Pancreatic insufficiency**
  ▶ **BY MOUTH**
  - Child 2–17 years: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
  - Adult: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

  **CREON® 40000**
  **Pancreatic insufficiency**
  ▶ **BY MOUTH**
  - Child 2–17 years: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
  - Adult: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

  **CREON® MICRO**
  **Pancreatic insufficiency**
  ▶ **BY MOUTH**
  - Child: Initially 100 mg, for administration advice, see Directions for administration
  - Adult: Initially 100 mg, for administration advice, see Directions for administration

  **DOSE EQUIVALENCE AND CONVERSION**
  ▶ For Creon® Micro: 100 mg granules = one measured scoopful (scoop supplied with product).

  **NUTRIZYM 22® GASTRO-RESISTANT CAPSULES**
  **Pancreatic insufficiency**
  ▶ **BY MOUTH**
  - Adult: Initially 1–2 capsules, dose to be taken with meals and 1 capsule as required, dose to be taken with snacks, doses should be swallowed whole or contents taken with water, or mixed with acidic fluid or soft food (then swallowed immediately without chewing)

**PANCREASE HL®**

**Pancreatic insufficiency**

▶ **BY MOUTH**

- Child 15–17 years: Initially 1–2 capsules, dose to be taken during each meal and 1 capsule, to be taken with snacks, all doses either taken whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)
- Adult: Initially 1–2 capsules, dose to be taken during each meal and 1 capsule, to be taken with snacks, all doses either taken whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)

**PANCREX®**

**Pancreatic insufficiency**

▶ **BY MOUTH**

- Child 2–17 years: 5–10 g, to be taken just before meals, washed down or mixed with milk or water
- Adult: 5–10 g, to be taken just before meals; washed down or mixed with milk or water

**PANCREX® V**

**Pancreatic insufficiency**

▶ **BY MOUTH**

- Child 1–11 months: 1–2 capsules, contents of capsule to be mixed with feeds
- Child 1–17 years: 2–6 capsules, dose to be taken with each meal either swallowed whole or sprinkled on food
- Adult: 2–6 capsules, dose to be taken with each meal either swallowed whole or sprinkled on food

**PANCREX® V POWDER**

**Pancreatic insufficiency**

▶ **BY MOUTH**

- Child: 0.5–2 g, to be taken before or with meals, washed down or mixed with milk or water
- Adult: 0.5–2 g, to be taken before or with meals, washed down or mixed with milk or water

**PANCREX® V TABLETS**

**Pancreatic insufficiency**

▶ **BY MOUTH**

- Child 2–17 years: 5–15 tablets, to be taken before meals
- Adult: 5–15 tablets, to be taken before meals

**PANCREX® V TABLETS FORTE**

**Pancreatic insufficiency**

▶ **BY MOUTH**

- Child 2–17 years: 6–10 tablets, to be taken before meals
- Adult: 6–10 tablets, to be taken before meals

**CONTRA-INDICATIONS**

**PANCREASE HL®** Should not be used in children aged 15 years or less with cystic fibrosis

**NUTRIZYM 22® GASTRO-RESISTANT CAPSULES** Should not be used in children aged 15 years or less with cystic fibrosis

**CAUTIONS** Can irritate the perioral skin and buccal mucosa if retained in the mouth. Excessive doses can cause perianal irritation

**INTERACTIONS** → Appendix 1: pancreatin

**SIDE-EFFECTS** Abdominal discomfort - hyperuricaemia (associated with very high doses) - hyperuricosuria (associated with very high doses) - mucosal irritation - nausea - skin irritation - vomiting

**PREGNANCY** Not known to be harmful.

**DIRECTIONS FOR ADMINISTRATION** Pancreatin is inactivated by gastric acid therefore manufacturer advises pancreatin preparations are best taken with food (or immediately before or after food). Since pancreatin is inactivated by heat, excessive heat should be avoided if preparations are mixed with liquids or food; manufacturer advises the resulting mixtures should not be kept for more

---

**BNF 74**

**Reduced exocrine secretions**

---

**Gastro-intestinal system**

---
than one hour and any left-over food or liquid containing pancreatin should be discarded. Enteric-coated preparations deliver a higher enzyme concentration in the duodenum (provided the capsule contents are swallowed whole without chewing). Manufacturer advises gastro-resistant granules should be mixed with slightly acidic soft food or liquid such as apple juice, and then swallowed immediately without chewing. Capsules containing enteric-coated granules can be opened and the granules administered in the same way. For infants, Creon Micro® granules can be mixed with a small amount of milk on a spoon and administered immediately — gastro-resistant granules should not be added to the baby’s bottle. Manufacturer advises Pancrex® V powder may be administered via nasogastric tube or gastrostomy tube — consult local and national official guidelines.

**PRESCRIBING AND DISPENSING INFORMATION**
Preparations may contain pork pancreatin — consult product literature.

**HANDLING AND STORAGE**
Hypersensitivity reactions occur occasionally and may affect those handling the powder.

**PATIENT AND CARER ADVICE**
Patients or carers should be given advice on administration.

It is important to ensure adequate hydration at all times in patients receiving higher-strength pancreatin preparations.

Medicines for Children leaflet: Pancreatin for pancreatic insufficiency [www.medicinesforchildren.org.uk](http://www.medicinesforchildren.org.uk)/pancreatin-for-pancreatic-insufficiency

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

### Gastro-resistant capsule
- **Creon** (Mylan Ltd)
  - Protease 600 unit, Amylase 8000 unit, Lipase 10000 unit Creon 10000 gastro-resistant capsules | 100 capsule [P] £12.93
  - Protease 1000 unit, Amylase 18000 unit, Lipase 25000 unit Creon 25000 gastro-resistant capsules | 100 capsule [P] £28.25
  - Protease 1600 unit, Amylase 25000 unit, Lipase 40000 unit Creon 40000 gastro-resistant capsules | 100 capsule [P] £41.80
- **Nutrizym** (Merck Serono Ltd)
  - Protease 1100 unit, Amylase 19800 unit, Lipase 22000 unit Nutrizym 22 gastro-resistant capsules | 100 capsule [P] £33.33

### 11 Stoma care

#### Description of condition
A stoma is an artificial opening on the abdomen to divert flow of faeces or urine into an external pouch located outside of the body. This procedure may be temporary or permanent.

Colostomy and ileostomy are the most common forms of stoma but a gastrostomy, jejunostomy, duodenostomy or caecostomy may also be performed. Understanding the type and extent of surgical intervention in each patient is crucial in managing the patient’s pharmaceutical needs correctly.

**Overview**
Prescribing for patients with stoma calls for special care due to modifications in drug delivery, resulting in a higher risk of sub-optimal absorption. The following is a brief account of some of the main points to be borne in mind.

Enteric-coated and modified-release medicines are unsuitable, particularly in patients with an ileostomy, as there may not be sufficient release of active ingredient. Soluble tablets, liquids, capsules or uncoated tablets are more suitable due to their quicker dissolution. When a solid-dose form such as a capsule or a tablet is given, the contents of the ostomy bag should be checked for any remnants.

Preparations containing sorbitol as an excipient should be avoided, due to its laxative side effects.

#### Analgesics
Opioid analgesics may cause troublesome constipation in colostomy patients. When a non-opioid analgesic is required, paracetamol is usually suitable. Anti-inflammatory analgesics may cause gastric irritation and bleeding; faecal output should be monitored for traces of blood.

#### Antacids
The tendency to diarrhoea from magnesium salts or constipation from aluminium or calcium salts may be increased in patients with stoma.

#### Antisecretory drugs
The gastric acid secretion often increases stoma output. Proton pump inhibitors and somatostatin analogues (octreotide p. 877 and lanreotide p. 876) are often used to reduce this risk.

#### Antidiarrhoeal drugs
Loperamide hydrochloride p. 65 and codeine phosphate p. 431 reduce intestinal motility and decrease water and sodium output from an ileostomy. Loperamide hydrochloride circulates through the enterohepatic circulation, which is disrupted in patients with a short bowel; high doses of loperamide hydrochloride may be required. Codeine phosphate can be added if response with loperamide hydrochloride alone is inadequate.

#### Digoxin
Patients with a stoma are particularly susceptible to hypokalaemia if taking digoxin p. 106, due to fluid and sodium depletion. Potassium supplements or a potassium-sparing diuretic may be advisable with monitoring for early signs of toxicity.
Diuretics
Diuretics should be used with caution in patients with an ileostomy or with urostomy as they may become excessively dehydrated and potassium depletion may easily occur. It is usually advisable to use a potassium-sparing diuretic.

Iron preparations
Iron preparations may cause loose stools and sore skin in these patients. If this is troublesome and if iron is definitely indicated, an intramuscular iron preparation should be used. Modified-release preparations should be avoided for the reasons given above.

Laxatives
Laxatives should not be used in patients with an ileostomy where possible as they may cause rapid and severe loss of water and electrolytes.

Colostomy patients may suffer from constipation and whenever possible should be treated by increasing fluid intake or dietary fibre. Bulk-forming drugs can be tried. If they are insufficient, as small a dose as possible of a stimulant laxative such as senna p. 61 can be used with caution.

Potassium supplements
Liquid formulations are preferred to modified-release formulations. The daily dose should be split to avoid osmotic diarrhoea.

Care of stoma
Patients and their carers are usually given advice about the use of cleansing agents, protective creams, lotions, deodorants, or sealants whilst in hospital, either by the surgeon or by stoma care nurses. Voluntary organisations offer help and support to patients with stoma.

1 Arrhythmias

Arrhythmias

Overview
Management of an arrhythmia requires precise diagnosis of the type of arrhythmia, and electrocardiography is essential; underlying causes such as heart failure require appropriate treatment.

Ectopic beats
If ectopic beats are spontaneous and the patient has a normal heart, treatment is rarely required and reassurance to the patient will often suffice. If they are particularly troublesome, beta-blockers are sometimes effective and may be safer than other suppressant drugs.

Atrial fibrillation
Treatment of patients with atrial fibrillation aims to reduce symptoms and prevent complications, especially stroke. All patients with atrial fibrillation should be assessed for their risk of stroke and thromboembolism. Atrial fibrillation can be managed by either controlling the ventricular rate (‘rate control’) or by attempting to restore and maintain sinus rhythm (‘rhythm control’). At any stage if treatment fails to control symptoms, or, if symptoms reoccur after cardioversion and specialised management is required, referral should be made within 4 weeks. If drug treatment fails to control the symptoms of atrial fibrillation or is unsuitable, ablation strategies can be considered. Review anticoagulation, stroke, and bleeding risk at least annually in all patients with atrial fibrillation.

Acute presentation
All patients with life-threatening haemodynamic instability caused by new-onset atrial fibrillation should undergo emergency electrical cardioversion without delaying to achieve anticoagulation. In patients presenting acutely but without life-threatening haemodynamic instability, rate or rhythm control can be offered if the onset of arrhythmia is less than 48 hours; rate control is preferred if onset is more than 48 hours or uncertain. Consideration of pharmacological or electrical cardioversion should be based on clinical circumstances. If pharmacological cardioversion has been agreed, intravenous amiodarone hydrochloride p. 102, or alternatively flecainide acetate p. 100, can be used (amiodarone hydrochloride is preferred if there is structural heart disease). If urgent rate control is required, a beta-blocker or verapamil hydrochloride p. 159 can be given intravenously.

Cardioversion
Sinus rhythm can be restored by electrical cardioversion, or pharmacological cardioversion with an oral or intravenous antiarrhythmic drug e.g. flecainide acetate or amiodarone hydrochloride. If atrial fibrillation has been present for more than 48 hours, electrical cardioversion is preferred and should not be attempted until the patient has been fully anticoagulated for at least 3 weeks; if this is not possible, parenteral anticoagulation should be commenced, and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks; prior to cardioversion, offer rate control as appropriate.

Drug treatment
Rate control is the preferred first-line drug treatment strategy for atrial fibrillation except in patients with new-onset atrial fibrillation, heart failure secondary to atrial fibrillation, atrial flutter suitable for an ablation strategy, atrial fibrillation with a reversible cause, or if rhythm control is more suitable based on clinical judgement. Ventricular rate can be controlled with a standard beta-blocker (not sotalol hydrochloride p. 105) or a rate-limiting calcium channel blocker such as diltiazem hydrochloride p. 152 [unlicensed indication], or verapamil hydrochloride as monotherapy. Choice of drug should be based on individual symptoms, heart rate, comorbidities, and patient preference. Digoxin p. 106 is usually only effective for controlling the ventricular rate at rest, and should therefore only be used as monotherapy in predominantly sedentary patients with non-paroxysmal atrial fibrillation. When a single drug fails to adequately control the ventricular rate, a combination of two drugs including a beta-blocker, digoxin, or diltiazem hydrochloride can be used. If symptoms are not controlled with a combination of two drugs, a rhythm-control strategy should be considered. If ventricular function is diminished, the combination of a beta-blocker (that is licensed for use in heart failure) and digoxin is preferred. Digoxin is also used when atrial fibrillation is accompanied by congestive heart failure.
If drug treatment is required to maintain sinus rhythm (‘rhythm control’) post-cardioversion, a standard beta-blocker is used. If a standard beta-blocker is not appropriate or is ineffective, consider an oral anti-arrhythmic drug such as sotalol hydrochloride, flecainide acetate, propafenone hydrochloride p. 101, or amiodarone hydrochloride; dronedarone p. 103 may be considered in paroxysmal or persistent atrial fibrillation (see NICE guidance). If necessary, amiodarone hydrochloride can be started 4 weeks before and continuing for up to 12 months after electrical cardioversion to increase success of the procedure, and to maintain sinus rhythm. Flecainide acetate or propafenone hydrochlorides should not be given when there is known ischaemic or structural heart disease. Consider amiodarone hydrochloride in patients with left ventricular impairment or heart failure.

**Paroxysmal atrial fibrillation**

In symptomatic paroxysmal atrial fibrillation, ventricular rhythm is controlled with a standard beta-blocker. Alternatively, if symptoms persist or a standard beta-blocker is not appropriate, an oral anti-arrhythmic drug such as sotalol (see NICE guidance), sotalol hydrochloride, flecainide acetate, propafenone hydrochloride, or amiodarone hydrochloride can be given (see also Paroxysmal supraventricular tachycardia and Supraventricular arrhythmias). In selected patients with infrequent episodes of symptomatic paroxysmal atrial fibrillation, sinus rhythm can be restored using the ‘pill-in-the-pocket’ approach; this involves the patient taking oral flecainide acetate or propafenone hydrochloride to self-treat an episode of atrial fibrillation when it occurs.

**Stroke prevention**

All patients with atrial fibrillation should be assessed for their risk of stroke and the need for thromboprophylaxis; this needs to be balanced with the patient’s risk of bleeding; a NICE guideline (NICE clinical guideline 180 (June 2014). Atrial fibrillation: The management of atrial fibrillation) recommends using the CHA2DS2-VASc assessment tool for stroke risk and the HAS-BLED tool for bleeding risk prior to and during anticoagulation. Risk factors for stroke taken into account by CHA2DS2-VASc include prior ischaemic stroke, transient ischaemic attacks, or thromboembolic events, heart failure, left ventricular systolic dysfunction, vascular disease, diabetes, hypertension, females, and patients over 65 years. Patients with a very low risk of stroke (CHA2DS2-VASc score of 0 for men or 1 for women) do not require an anticoagulant. Oral anticoagulants are contra-indicated for stroke prevention. Parenteral anticoagulation should be offered to patients with new-onset atrial fibrillation who are receiving subtherapeutic or no anticoagulation therapy until assessment is made, and appropriate anticoagulation is started. Oral anticoagulation should be offered to patients with confirmed diagnosis of atrial fibrillation in whom sinus rhythm has not been successfully restored within 48 hours of onset, patients who have had, or are at high risk of recurrence of atrial fibrillation such as those with structural heart disease, prolonged history of atrial fibrillation (more than 12 months), a history of failed attempts at cardioversion, and patients whom the risk of stroke outweighs the risk of bleeding. Anticoagulation treatment should not be withheld solely because of the risk of falls, and choice of treatment should be based on clinical features and patient preferences. Oral anticoagulation may be with a vitamin K antagonist (e.g. warfarin sodium p. 135), or in non-valvular atrial fibrillation with apixaban p. 121, dabigatran etexilate p. 131, or rivaroxaban p. 123. Anticoagulants are also indicated during cardioversion procedures. Aspirin p. 117 is less effective than warfarin sodium at preventing emboli; the modest benefit is offset by the risk of bleeding, and aspirin should not be offered as monotherapy solely for stroke prevention in atrial fibrillation. If anticoagulant treatment is contra-indicated or not tolerated, left atrial appendage occlusion can be considered.

**Atrial flutter**

Like atrial fibrillation, treatment options for atrial flutter involve either controlling the ventricular rate or attempting to restore and maintain sinus rhythm. However, atrial flutter generally responds less well to drug treatment than atrial fibrillation.

Control of the ventricular rate is usually an interim measure pending restoration of sinus rhythm. Ventricular rate can be controlled by administration of a beta-blocker, diltiazem hydrochloride p. 152 [unlicensed indication], or verapamil hydrochloride p. 159; an intravenous beta-blocker or verapamil hydrochloride is preferred for rapid control. Digoxin p. 106 can be added if rate control remains inadequate, and may be particularly useful in those with heart failure.

Conversion to sinus rhythm can be achieved by electrical cardioversion (by cardiac pacing or direct current), pharmacological cardioversion, or catheter ablation. If the duration of atrial flutter is unknown, or it has lasted for over 48 hours, cardioversion should not be attempted until the patient has been fully anticoagulated for at least 3 weeks; if this is not possible, parenteral anticoagulation should be commenced and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks. Direct current cardioversion is usually the treatment of choice when rapid conversion to sinus rhythm is necessary (e.g. when atrial flutter is associated with haemodynamic compromise); catheter ablation is preferred for the treatment of recurrent atrial flutter. There is a limited role for anti-arrhythmic drugs as their use is not always successful. Flecainide acetate p. 100 or propafenone hydrochloride p. 101 can slow atrial flutter, resulting in 1:1 conduction to the ventricles, and should therefore be prescribed in conjunction with a ventricular rate controlling drug such as a beta-blocker, diltiazem hydrochloride [unlicensed indication], or verapamil hydrochloride.

Amiodarone hydrochloride p. 102 can be used when other drug treatments are contra-indicated or ineffective. All patients should be assessed for their risk of stroke and the need for thromboprophylaxis; the choice of anticoagulant is based on the same criteria as for atrial fibrillation.

**Paroxysmal supraventricular tachycardia**

This will often terminate spontaneously or with reflex vagal stimulation such as a Valsalva manoeuvre, immersing the face in ice-cold water, or carotid sinus massage; such manoeuvres should be performed with ECG monitoring.

If the effects of reflex vagal stimulation are transient or ineffective, or if the arrhythmia is causing severe symptoms, intravenous adenosine p. 104 should be given. If adenosine is ineffective or contra-indicated, intravenous verapamil hydrochloride is an alternative, but it should be avoided in patients recently treated with beta-blockers.

Failure to terminate paroxysmal supraventricular tachycardia with reflex vagal stimulation or drug treatment may suggest an arrhythmia of atrial origin, such as focal atrial tachycardia or atrial flutter.

Treatment with direct current cardioversion is needed in haemodynamically unstable patients or when the above measures have failed to restore sinus rhythm (and an alternative diagnosis has not been found).

Recurrent episodes of paroxysmal supraventricular tachycardia can be treated by catheter ablation, or prevented with drugs such as diltiazem hydrochloride, verapamil hydrochloride, beta-blockers including sotalol hydrochloride p. 105, flecainide acetate or propafenone hydrochloride.
Arrhythmias after myocardial infarction
In patients with a paroxysmal tachycardia or rapid irregularity of the pulse it is best not to administer an anti-arrhythmic until an ECG record has been obtained.
Bradycardia, particularly if complicated by hypotension, should be treated with an intravenous dose of atropine sulfate p. 1224 the dose may be repeated if necessary. If there is a risk of asystole, or if the patient is unstable and has failed to respond to atropine sulfate, adrenaline/epinephrine p. 216 should be given by intravenous infusion, and the dose adjusted according to response.

For further advice, refer to the most recent recommendations of the Resuscitation Council (UK) available at www.resus.org.uk.

Ventricular tachycardia
Pulseless ventricular tachycardia or ventricular fibrillation should be treated with immediate defibrillation (see Cardiopulmonary resuscitation).
 Patients with unstable sustained ventricular tachycardia, who continue to deteriorate with signs of hypotension or reduced cardiac output, should receive direct current cardioversion to restore sinus rhythm. If this fails, intravenous amiodarone hydrochloride should be administered and direct current cardioversion repeated.
 Patients with sustained ventricular tachycardia who are haemodynamically stable can be treated with intravenous anti-arrhythmic drugs. Amiodarone hydrochloride is the preferred drug. Flecainide acetate, propafenone hydrochloride, and, although less effective, lidocaine hydrochloride p. 1242 have all been used. If sinus rhythm is not restored, direct current cardioversion or pacing should be considered. Catheter ablation is an alternative if cessation of the arrhythmia is not urgent. Non-sustained ventricular tachycardia can be treated with a beta-blocker.

All patients presenting with ventricular tachycardia should be referred to a specialist. Following restoration of sinus rhythm, patients who remain at high risk of cardiac arrest will require maintenance therapy. Most patients will be treated with an implantable cardioverter defibrillator. Beta-blockers or sotalol hydrochloride (in place of a standard beta-blocker), or amiodarone hydrochloride (in combination with a standard beta-blocker), can be used in addition to the device in some patients; alternatively, they can be used alone when use of an implantable cardioverter defibrillator is not appropriate.

Torsade de pointes
Torsade de pointes is a form of ventricular tachycardia associated with a long QT syndrome (usually drug-induced, but other factors including hypokalaemia, severe bradycardia, and genetic predisposition are also implicated). Episodes are usually self-limiting, but are frequently recurrent and can cause impairment or loss of consciousness. If not controlled, the arrhythmia can progress to ventricular fibrillation and sometimes death.
 Intravenous infusion of magnesium sulfate p. 963 is usually effective. A beta-blocker (but not sotalol hydrochloride) and atrial (or ventricular) pacing can be considered. Anti-arrhythmics can further prolong the QT interval, thus worsening the condition.

Drugs for arrhythmias
Anti-arrhythmic drugs can be classified clinically into those that act on supraventricular arrhythmias (e.g. verapamil hydrochloride), those that act on both supraventricular and ventricular arrhythmias (e.g. amiodarone hydrochloride), and those that act on ventricular arrhythmias (e.g. lidocaine hydrochloride).

Anti-arrhythmic drugs can also be classified according to their effects on the electrical behaviour of myocardial cells during activity (the Vaughan Williams classification) although this classification is of less clinical significance:
- Class I: membrane stabilising drugs (e.g. lidocaine, flecainide)
- Class II: beta-blockers
- Class III: amiodarone; sotalol (also Class II)
- Class IV: calcium-channel blockers (includes verapamil but not dihydropyridines)

The negative inotropic effects of anti-arrhythmic drugs tend to be additive. Therefore special care should be taken if two or more are used, especially if myocardial function is impaired. Most drugs that are effective in countering arrhythmias can also provoke them in some circumstances; moreover, hypokalaemia enhances the arrhythmogenic (pro-arrhythmic) effect of many drugs.

Supraventricular arrhythmias
Adenosine p. 104 is usually the treatment of choice for terminating paroxysmal supraventricular tachycardia. As it has a very short duration of action (half-life only about 8 to 10 seconds, but prolonged in those taking dipyridamole p. 120), most side-effects are short lived. Unlike verapamil hydrochloride p. 159, adenosine can be used after a beta-blocker. Verapamil hydrochloride may be preferable to adenosine in asthma.

Oral administration of a cardiac glycoside (such as digoxin p. 106) slows the ventricular response in cases of atrial fibrillation and atrial flutter. However, intravenous infusion of digoxin is rarely effective for rapid control of ventricular rate. Cardiac glycosides are contra-indicated in supraventricular arrhythmias associated with accessory conducting pathways (e.g. Wolf-Parkinson-White syndrome).

Verapamil hydrochloride is usually effective for supraventricular tachycardias. An initial intravenous dose (important: serious beta-blocker interaction hazard) may be followed by oral treatment; hypotension may occur with large doses. It should not be used for tachyarrhythmias where the QRS complex is wide (i.e. broad complex) unless a supraventricular origin has been established beyond reasonable doubt. It is also contra-indicated in atrial fibrillation or atrial flutter associated with accessory conducting pathways (e.g. Wolf-Parkinson-White syndrome). It should not be used in children with arrhythmias without specialist advice; some supraventricular arrhythmias in childhood can be accelerated by verapamil hydrochloride with dangerous consequences.

Intravenous administration of a beta-blocker such as esmolol hydrochloride p. 149 or propranolol hydrochloride p. 145, can achieve rapid control of the ventricular rate.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone hydrochloride p. 102, beta-blockers, disopyramide p. 99, flecainide acetate p. 100, procainamide (available from special-order manufacturers or specialist importing companies), and propafenone hydrochloride p. 101.

Supraventricular and ventricular arrhythmias
Amiodarone hydrochloride is used in the treatment of arrhythmias, particularly when other drugs are ineffective or contra-indicated. It can be used for paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, and ventricular fibrillation. It can also be used for tachyarrhythmias associated with Wolff-Parkinson-White syndrome. It should be initiated only under hospital or specialist supervision. Amiodarone hydrochloride may be given by intravenous infusion as well as by mouth, and has the advantage of causing little or no myocardial depression. Unlike oral amiodarone hydrochloride, intravenous amiodarone hydrochloride acts relatively rapidly.

Intravenous injection of amiodarone hydrochloride can be used in cardiopulmonary resuscitation for ventricular
fibrillation or pulseless tachycardia unresponsive to other interventions.

Amiodarone hydrochloride has a very long half-life (extending to several weeks) and only needs to be given once daily (but high doses can cause nausea unless divided). Many weeks or months may be required to achieve steady-state plasma-amiodarone concentration; this is particularly important when drug interactions are likely.

**Beta-blockers** act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on automatism and conductivity within the heart. Sotalol has a role in the management of ventricular arrhythmias.

Disopyramide can be given by intravenous injection to control arrhythmias after myocardial infarction (including those not responding to lidocaine hydrochloride p. 1242), but it impairs cardiac contractility. Oral administration of disopyramide is useful, but it has an antimuscarinic effect which limits its use in patients susceptible to angle-closure glaucoma or with prostatic hyperplasia.

Flecainide acetate belongs to the same general class as lidocaine hydrochloride and may be of value for serious symptomatic ventricular arrhythmias. It may also be indicated for junctional re-entry tachycardias and for paroxysmal atrial fibrillation. However, it can precipitate serious arrhythmias in a small minority of patients (including those with otherwise normal hearts).

Propafenone hydrochloride is used for the prophylaxis and treatment of ventricular arrhythmias and also for some supraventricular arrhythmias. It has complex mechanisms of action, including weak beta-blocking activity (therefore caution is needed in obstructive airways disease—contra indicated if severe).

Drugs for supraventricular arrhythmias include adenosine, **cardiac glycosides**, and verapamil hydrochloride. Drugs for ventricular arrhythmias include lidocaine hydrochloride.

*Mexiletine* and procainamide are both available from ‘special-order’ manufacturers or specialist importing companies. (*Mexiletine* can be used for life-threatening ventricular arrhythmias; *procainamide* is given by intravenous injection to control ventricular arrhythmias.

**Ventricular arrhythmias**

Intravenous lidocaine hydrochloride can be used for the treatment of ventricular tachycardia in haemodynamically stable patients, and ventricular fibrillation and pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation, however it is no longer the anti-arrhythmic drug of first choice.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone hydrochloride, **beta-blockers**, disopyramide, flecainide acetate, **procainamide** (available from ‘special-order’ manufacturers or specialist importing companies), and propafenone hydrochloride.

*Mexiletine* is available from ‘special-order’ manufacturers or specialist importing companies for treatment of life-threatening ventricular arrhythmias.

**ANTIARRHYTHMICS > CLASS IA**

### Disopyramide

**INDICATIONS AND DOSE**

Prevention and treatment of ventricular and supraventricular arrhythmias, including after myocardial infarction | Maintenance of sinus rhythm after cardioversion

- **By mouth using immediate-release medicines**
  - Adult: 300–800 mg daily in divided doses
- **By mouth using modified-release medicines**
  - Adult: 250–375 mg every 12 hours

**CONTRA-INDICATIONS** Bundle-branch block associated with first-degree AV block · second- and third-degree AV block or bifascicular block (unless pacemaker fitted) · severe heart failure (unless secondary to arrhythmia) · severe sinus node dysfunction

**CAUTIONS**

- Atrial flutter or atrial tachycardia with partial block · avoid in acute porphyrias p. 969 · elderly · heart failure (avoid if severe) · myasthenia gravis · prostatic enlargement · structural heart disease · susceptibility to angle-closure glaucoma

**INTERACTIONS**

Appendix 1: antiarrhythmics

**SIDE-EFFECTS**

- Angle-closure glaucoma · antimuscarinic effects · AV block · blurred vision · cholestatic jaundice · dry mouth · gastro-intestinal irritation · hypoglycaemia · hypotension · myocardial depression · psychosis · urinary retention · ventricular tachycardia, ventricular fibrillation or torsade de pointes (usually associated with prolongation of QRS complex or QT interval)

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk; may induce labour if used in third trimester.

**BREAST FEEDING**

Present in milk—use only if essential.

Monitor infant for antimuscarinic effects.

**HEPATIC IMPAIRMENT**

Half-life prolonged—may need dose reduction. Avoid modified-release preparation.

**RENAL IMPAIRMENT**

Reduce dose by increasing dose interval; adjust according to response. Avoid modified-release preparation.

**MONITORING REQUIREMENTS**

- Monitor for hypotension, hypoglycaemia, ventricular tachycardia, ventricular fibrillation or torsade de pointes (discontinue if occur).
- Monitor serum potassium.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS**

- 25

**Rythmodan Retard** (Sanofi)

Disopyramide (as Disopyramide phosphate) 250 mg | Rythmodan Retard 250 mg tablets | 60 tablet | £32.08 DT price | £32.08

**Capsule**

- **Disopyramide (Non-proprietary)**
  - Disopyramide 100 mg | Disopyramide 100 mg capsules | 84
    - Capsule | £25.00 DT price | £22.09
  - Disopyramide 150 mg | Disopyramide 150 mg capsules | 84
    - Capsule | £33.40 DT price | £27.58
- **Rythmodan** (Sanofi)
  - Disopyramide 100 mg | Rythmodan 100 mg capsules | 84
    - Capsule | £14.14 DT price | £12.09

**ANTIARRHYTHMICS > CLASS IB**

**Lidocaine hydrochloride**

*(Lignocaine hydrochloride)*

- **INDICATIONS AND DOSE**
  - Cardiopulmonary resuscitation (as an alternative if amiodarone is not available)
    - **BY INTRAVENOUS INJECTION**
    - Adult: 1 mg/kg, do not exceed 3 mg/kg over the first hour

- **CONTRAINICATIONS**
  - All grades of atrioventricular block
  - Severe myocardial depression
  - Sino-atrial disorders

- **CAUTIONS**
  - Acute porphyria (consider infusion with glucose for its anti-porphyrinogenic effects)
  - Congestive cardiac failure (consider lower dose)
  - Post cardiac surgery (consider lower dose)

- **INTERACTIONS**
  - **Appendix 1: antiarrhythmics**

- **SIDE-EFFECTS**
  - **Common or very common**
    - Bradycardia (may lead to cardiac arrest)
    - Confusion
    - Convulsions
    - Dizziness (particularly if injection too rapid)
    - Drowsiness (particularly if injection too rapid)
    - Hypotension (may lead to cardiac arrest)
    - Parasthesia (particularly if injection too rapid)
  - **Rare**
    - Anaphylaxis

- **PREGNANCY**
  - Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk.

- **BREAST FEEDING**
  - Present in milk but amount too small to be harmful.

- **HEPATIC IMPAIRMENT**
  - Caution—increased risk of side-effects.

- **RENAL IMPAIRMENT**
  - Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

- **MONITORING REQUIREMENTS**
  - Monitor ECG and have resuscitation facilities available.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**
  - **Lidocaine hydrochloride (Non-proprietary)**
    - Lidocaine hydrochloride 5 mg per 1 ml
      - Lidocaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule [£1.40]
      - Lidocaine hydrochloride 10 mg per 1 ml
        - Lidocaine 100mg/10ml (1%) solution for injection Mini-Plasco ampoules | 20 ampoule [£1.09]

- **ANTIARRHYTHMICS > CLASS IC**

**Flecainide acetate**

- **INDICATIONS AND DOSE**
  - AV nodal reciprocating tachycardia, arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome), disabling symptoms of paroxysmal atrial fibrillation in patients without left ventricular dysfunction (arrhythmias of recent onset will respond more readily) (specialist supervision in hospital)
  - Ventricular tachyarrhythmias resistant to other treatment (specialist supervision in hospital)
  - **INITIALLY BY SLOW INTRAVENOUS INJECTION**
  - Adult: Initially 2 mg/kg (max. per dose 150 mg), to be given over 10–30 minutes with ECG monitoring, followed by (by intravenous infusion) 1.5 mg/kg/hour if required for 1 hour, then (by intravenous infusion) reduced to 100–250 micrograms/kg/hour for up to 24 hours, maximum cumulative dose of 600 mg in first 24 hours, then transfer to oral treatment

- **SUPRAVENTRICULAR ARRHYTHMIAS**
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
    - Adult: Initially 50 mg twice daily, increased if necessary up to 300 mg daily
  - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
    - Adult: 200 mg daily

- **VENTRICULAR ARRHYTHMIAS (INITIATED UNDER DIRECTION OF HOSPITAL CONSULTANT)**
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
    - Adult: Initially 100 mg twice daily for 3–5 days, maximum 400 mg daily reserved for rapid control or in heavily built patients; for maintenance, reduce to the lowest dose that controls the arrhythmia
Glucose 5% or Sodium Chloride 0.9%. Minimum volume in infusion fluids containing chlorides 500 mL.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **Flecainide acetate (Non-proprietary)**
  - **Flecainide acetate 50 mg** Flecainide 50mg tablets | 60 tablet £13.50 DT price = £8.64
  - **Flecainide acetate 100 mg** Flecainide 100mg tablets | 60 tablet £19.63 DT price = £10.10
- **Tambocor (Meda Pharmaceuticals Ltd)**
  - **Flecainide acetate 50 mg** Tambocor 50mg tablets | 60 tablet £11.57 DT price = £8.64
  - **Flecainide acetate 100 mg** Tambocor 100mg tablets | 60 tablet £16.53 DT price = £10.10

**Solution for injection**

- **Tambocor (Meda Pharmaceuticals Ltd)**
  - **Flecainide acetate 10 mg per 1 ml** Tambocor 150mg/15ml solution for injection ampoules | 5 ampoule £21.99

**Modified-release capsule**

- **Tambocor XL (Meda Pharmaceuticals Ltd)**
  - **Flecainide acetate 200 mg** Tambocor XL 200mg capsules | 30 capsule £14.77

### Propafenone hydrochloride

**INDICATIONS AND DOSE**

Ventricular arrhythmias (specialist supervision in hospital) | Paroxysmal supraventricular tachyarrhythmias which include paroxysmal atrial flutter or fibrillation and paroxysmal re-entrant tachycardias involving the AV node or accessory pathway, where standard therapy ineffective or contra-indicated (specialist supervision in hospital)

- **BY MOUTH**
  - **Adult**: Initially 150 mg 3 times a day, dose to be taken after food, monitor ECG and blood pressure, if QRS interval prolonged by more than 20%, reduce dose or discontinue until ECG returns to normal limits; increased if necessary to 300 mg twice daily (max. per dose 300 mg 3 times a day), dose to be increased at intervals of at least 3 days, reduce total daily dose for patients under 70 kg
  - **Elderly**: Initially 150 mg 3 times a day, dose to be taken after food, monitor ECG and blood pressure, if QRS interval prolonged by more than 20%, reduce dose or discontinue until ECG returns to normal limits; increased if necessary to 300 mg twice daily (max. per dose 300 mg 3 times a day), dose to be increased at intervals of at least 5 days, reduce total daily dose for patients under 70 kg

**CONTRA-INDICATIONS**

- Atrial conduction defects (unless adequately paced) | Brugada syndrome | bundle branch block (unless adequately paced) | cardiogenic shock (except arrhythmia induced) | distal block (unless adequately paced) | electrolyte disturbances | marked hypotension | myasthenia gravis | myocardial infarction within last 3 months | second degree or greater AV block (unless adequately paced) | severe bradycardia | severe obstructive pulmonary disease (due to weak beta-blocking activity) | sinus node dysfunction (unless adequately paced) | uncontrolled congestive heart failure with left ventricular ejection fraction less than 35%

**CAUTIONS**

- Elderly: great caution in mild to moderate obstructive Airways disease owing to beta-blocking activity | heart failure | pacemaker patients | potential for conversion of paroxysmal atrial fibrillation to atrial flutter with 2:1 or 1:1 conduction block

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises reduce dose by half with concurrent use of amiodarone.

**DOSE EQUIVALENCE AND CONVERSION**

- Patients stabilised on 200 mg daily immediate-release flecainide may be transferred to modified-release medicines.

**UNLICENSED USE**

Capsules, tablets and injection: licensed for AV nodal reciprocating tachycardia, arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome), disabling symptoms of paroxysmal atrial fibrillation in patients without left ventricular dysfunction (arrhythmias of recent onset will respond more readily). Immediate-release tablets only: licensed for symptomatic sustained ventricular tachycardia, disabling symptoms of premature ventricular contractions and/or non-sustained ventricular tachycardia in patients resistant to or intolerant of other therapy. Injection only: licensed for ventricular tachyarrhythmias resistant to other treatment.

**CONTRA-INDICATIONS**

Abnormal left ventricular function | atrial conduction defects (unless pacing rescue available) | bundle branch block (unless pacing rescue available) | control of arrhythmias in acute situations (for modified-release forms only) | distal block (unless pacing rescue available) | haemodynamically significant valvular heart disease | heart failure | history of myocardial infarction and either asymptomatic ventricular ectopics or asymptomatic non-sustained ventricular tachycardia | long-standing atrial fibrillation where conversion to sinus rhythm not attempted | second-degree or greater AV block (unless pacing rescue available) | sinus node dysfunction (unless pacing rescue available)

**CAUTIONS**

Atrial fibrillation following heart surgery | elderly (accumulation may occur) | patients with pacemakers (especially those who may be pacemaker dependent because stimulation threshold may rise appreciably)

**INTERACTIONS**

- **Appendix 1: antiarrhythmics**

**SIDE-EFFECTS**

- **Common or very common** Asthenia | dizziness | dyspnoea | fatigue | fever | oedema | pro-arrhythmic effects | visual disturbances

- **Rare** Anemia | confusion | convulsions | depression | dyskinesia | hallucinations | peripheral neuropathy | pneumonitis

- **Frequency not known** Anaemia | anorexia | anxiety | ataxia | corneal deposits | drowsiness | flushing | gastrointestinal disturbances | headache | hepatic dysfunction | hypersensitivity reactions | increased antinuclear antibodies | increased sweating | insomnia | leukopenia | paraesthesia | photosensitivity | rash | syncope | thrombocytopenia | tinnitus | tremor | urticaria | vertigo

**PREGNANCY**

Used in pregnancy to treat maternal and fetal arrhythmias in specialist centres; toxicity reported in animal studies; infant hyperbilirubinemia also reported.

**BREAST FEEDING**

Significant amount present in milk but not known to be harmful.

**HEPATIC IMPAIRMENT**

Avoid or reduce dose in severe impairment.

**RENAL IMPAIRMENT**

Reduce initial oral dose to max. 100 mg daily or reduce intravenous dose by 50%, if eGFR less than 35 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- With intravenous use ECG monitoring and resuscitation facilities must be available.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Tambocor®, give continuously or intermittently in concurrent use
Amiodarone hydrochloride

INDICATIONS AND DOSE
Treatment of arrhythmias, particularly when other drugs are ineffective or contra-indicated (including paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, ventricular fibrillation, and tachyarrhythmias associated with Wolf-Parkinson-White syndrome) (initiated in hospital or under specialist supervision)

- **BY MOUTH**
  - Adult: 200 mg 3 times a day for 1 week, then reduced to 200 mg twice daily for a further week, followed by maintenance dose, usually 200 mg daily or the minimum dose required to control arrhythmia

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 5 mg/kg, to be given over 20–120 minutes with ECG monitoring, subsequent infusions given if necessary according to response; maximum 1.2 g per day

Ventricular fibrillation or pulseless ventricular tachycardia refractory to defibrillation (for cardiopulmonary resuscitation)

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 300 mg, dose to be considered after administration of adrenaline, dose should be given from a pre-filled syringe or diluted in 20 mL Glucose 5%, then (by intravenous injection) 150 mg if required, followed by (by intravenous infusion) 900 mg/24 hours

**IMPORTANT SAFETY INFORMATION**
MHRA/CHM ADVICE: SOFOSBUVIR WITH DACLATASVIR; SOFOSBUVIR AND LEDIPASVIR (MAY 2015); SIMEPREVIR WITH SOFOSBUVIR (AUGUST 2015); RISK OF SEVERE BRADYCARDIA AND HEART BLOCK WHEN TAKEN WITH AMIODARONE
Avoid concomitant use unless other antiarrhythmics cannot be given.

CONTRA-INDICATIONS
GENERAL CONTRA-INDICATIONS
Avoid in severe conduction disturbances (unless pacemaker fitted) - avoid in sinus node disease (unless pacemaker fitted) - iodine sensitivity - sino-atrial heart block (except in cardiac arrest) - sinus bradycardia (except in cardiac arrest) - thyroid dysfunction

SPECIFIC CONTRA-INDICATIONS
- With intravenous use Avoid bolus injection in cardiomyopathy - avoid bolus injection in congestive heart failure - avoid in circulatory collapse - avoid in severe arterial hypotension - avoid in severe respiratory failure

CAUTIONS
GENERAL CAUTIONS
Acute porphyrias p. 969 - conduction disturbances (in excessive dosage) - elderly - heart failure - hypokalaemia - severe bradycardia (in excessive dosage)

SPECIFIC CAUTIONS
- With intravenous use Moderate and transient fall in blood pressure (circulatory collapse precipitated by rapid administration or overdosage) - severe hepatocellular toxicity

INTERACTIONS
Appendix 1: antiarrhythmics

SIDE-EFFECTS
GENERAL SIDE-EFFECTS
- Common or very common Bradycardia - hypothyroidism - hypothyroidism - jaundice - nausea - persistent slate grey skin discoloration - phototoxicity - pulmonary toxicity (including pneumonitis and fibrosis) - raised serum transaminases (may require dose reduction or withdrawal if accompanied by acute liver disorders) - reversible corneal microdeposits (sometimes with night glare) - sleep disorders - taste disturbance

- Uncommon Conduction disturbances - onset or worsening of arrhythmia - peripheral myopathy (usually reversible on withdrawal) - peripheral neuropathy (usually reversible on withdrawal)

- Very rare Alopecia - aplastic anaemia - ataxia - benign intracranial hypertension - bronchospasm (in patients with severe respiratory failure) - chronic liver disease - cirrhosis - epideridymo-orchitis - exfoliative dermatitis - haemolytic anaemia - headache - hypersensitivity - impaired vision due to optic neuritis or optic neuropathy (including blindness) - impotence - rash - sinus arrest - thrombocytopenia - vasculitis - vertigo

- Frequency not known Hot flushes - hypotension - respiratory distress syndrome - sweating

SPECIFIC SIDE-EFFECTS
- Common or very common
  - With intravenous use Injection-site reactions
  - Very rare
  - With intravenous use Anaphylaxis on rapid injection

SIDE-EFFECTS, FURTHER INFORMATION
- Corneal microdeposits Most patients taking amiodarone develop corneal microdeposits (reversible on withdrawal of treatment); these rarely interfere with vision, but drivers may be dazzled by headlights at night. However, if vision is impaired or if optic neuritis or optic neuropathy occur, amiodarone must be stopped to prevent blindness and expert advice sought.
  - Thyroid function Amiodarone contains iodine and can cause disorders of thyroid function; both hypothyroidism and hyperthyroidism can occur. Thyrotoxicosis may be very
refractory, and amiodarone should usually be withdrawn at least temporarily to help achieve control; treatment with carbimazole may be required. Hypothyroidism can be treated with replacement therapy without withdrawing amiodarone if it is essential; careful supervision is required.

- Hepatotoxicity  Amiodarone is also associated with hepatotoxicity and treatment should be discontinued if severe liver function abnormalities or clinical signs of liver disease develop.
- Pulmonary toxicity  Pneumonitis should always be suspected if new or progressive shortness of breath or cough develops in a patient taking amiodarone.
- Peripheral neuropathy  Fresh neurological symptoms should raise the possibility of peripheral neuropathy.

- **PREGNANCY**  Possible risk of neonatal goitre; use only if no alternative.

- **BREAST FEEDING**  Avoid; present in milk in significant amounts; theoretical risk of neonatal hypothyroidism from release of iodine.

- **MONITORING REQUIREMENTS**
  - Thyroid function tests should be performed before treatment and then every 6 months. Clinical assessment of thyroid function alone is unreliable. Thyroxine (T4) may be raised in the absence of hyperthyroidism; therefore triiodothyronine (T3), T4, and thyroid-stimulating hormone (thyrotrophin, TSH) should all be measured. A raised T3 and T4 with a very low or undetectable TSH concentration suggests the development of thyrotoxicosis.
  - Liver function tests required before treatment and then every 6 months.
  - Serum potassium concentration should be measured before treatment.
  - Chest X-ray required before treatment.
  - If concomitant use of amiodarone with sofosbuvir and daclatasvir, simpeprevir and sofosbuvir, or sofosbuvir and ledipasvir cannot be avoided because other anti-arrhythmics are not tolerated or contra-indicated, patients should be closely monitored, particularly during the first weeks of treatment. Patients at high risk of bradycardia should be monitored continuously for 48 hours in an appropriate clinical setting after starting concomitant treatment. Patients who have stopped amiodarone within the last few months and need to start sofosbuvir and daclatasvir, simpeprevir and sofosbuvir, or sofosbuvir and ledipasvir should be monitored.
  - With intravenous use  ECG monitoring and resuscitation facilities must be available. Monitor liver transaminases closely.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use  For *intravenous infusion* (*Cordarone X®*), give continuously or intermittently in Glucose 5%. Suggested initial infusion volume 250 mL given over 20–120 minutes; for repeat infusions up to 1.2 g in max. 500 mL; should not be diluted to less than 600 micrograms/mL. See cardio-pulmonary resuscitation for details of infusion in extreme emergency. Incompatible with Sodium Chloride infusion fluids; avoid equipment containing the plasticizer di-2-ethylhexylphthalate (DEHP).
  - With oral use  For administration *by mouth*, tablets may be crushed and dispersed in water; injection solution should not be given orally (irritant).

- **PATIENT AND CARER ADVICE**  Because of the possibility of phototoxic reactions, patients should be advised to shield the skin from light during treatment and for several months after discontinuing amiodarone; a wide-spectrum sunscreen to protect against both long-wave ultraviolet and visible light should be used.
  
  If taking amiodarone with concomitant sofosbuvir and daclatasvir, simpeprevir and sofosbuvir, or sofosbuvir and ledipasvir, patients and their carers should be told how to recognise signs and symptoms of bradycardia and heart block and advised to seek immediate medical attention if symptoms such as shortness of breath, light-headedness, palpitations, fainting, unusual tiredness or chest pain develop.

- **MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

### Dronedarone

- **DRUG ACTION**  Dronedarone is a multi-channel blocking anti-arrhythmic drug.

### INDICATIONS AND DOSE

**Maintenance of sinus rhythm after cardioversion in clinically stable patients with paroxysmal or persistent atrial fibrillation, when alternative treatments are unsuitable (initiated under specialist supervision)**

- **BY MOUTH**
  - Adult: 400 mg twice daily

- **CONTRA-INDICATIONS**  Atrial conduction defects, bradycardia - complete bundle branch block - distal block - existing or previous heart failure or left ventricular systolic dysfunction - haemodynamically unstable patients - liver toxicity associated with previous amiodarone use - lung toxicity associated with previous amiodarone use - permanent atrial fibrillation - prolonged QT interval - second- or third- degree AV block - sick sinus syndrome (unless pacemaker fitted) - sinus node dysfunction

**CAUTIONS**  Coronary artery disease - correct hypokalaemia and hypomagnesaemia before starting and during treatment

**INTERACTIONS**  → Appendix 1: antiarrhythmics

**SIDE-EFFECTS**

- **Common or very common**  Bradycardia - gastro-intestinal disturbances - heart failure - malaise - pruritis - QT-interval prolongation - raised serum creatinine - rash

- **Uncommon**  Dermatitis - eczema - erythema - interstitial lung disease (investigate if symptoms such as dyspnoea or dry cough develop and discontinue treatment if confirmed) - photosensitivity - pneumonitis (investigate if symptoms such as dyspnoea or dry cough develop and discontinue treatment if confirmed) - pulmonary fibrosis (investigate if symptoms such as dyspnoea or dry cough develop and discontinue treatment if confirmed) - taste disturbance
Rare Liver injury (including life-threatening acute liver failure)

SIDE-EFFECTS, FURTHER INFORMATION

- Liver injury: Liver injury, including life-threatening acute liver failure reported rarely; discontinue treatment if 2 consecutive alanine aminotransferase concentrations exceed 3 times upper limit of normal.
- Heart failure: New onset or worsening heart failure reported. If heart failure or left ventricular systolic dysfunction develops, discontinue treatment.
- Pregnancy: Manufacturer advises avoid—toxicity in animal studies.
- Breastfeeding: Manufacturer advises avoid—present in milk in animal studies.
- Hepatic impairment: Avoid in severe impairment.
- Renal impairment: Avoid if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS

- Ongoing monitoring should occur under specialist supervision.
- Monitor for heart failure.
- Perform ECG at least every 6 months—consider discontinuation if atrial fibrillation reoccurs.
- Measure serum creatinine before treatment and 7 days after initiation—if raised, measure again after a further 7 days and consider discontinuation if creatinine continues to rise.
- Monitor liver function before treatment, 1 week and 1 month after initiation of treatment, then monthly for 6 months, then every 3 months for 6 months and periodically thereafter.

PATIENT AND CARER ADVICE

Heart failure: Patients or their carers should be told how to recognise signs of heart failure and advised to seek prompt medical attention if symptoms such as weight gain, dependent oedema, or dyspnoea develop or worsen.

Hepatic disorders: Patients or their carers should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as abdominal pain, anorexia, nausea, vomiting, fever, malaise, itching, dark urine, or jaundice develop.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Dronedarone for the treatment of non-permanent atrial fibrillation (December 2012) NICE TA197

Dronedarone is an option for the maintenance of sinus rhythm after successful cardioversion in paroxysmal or persistent atrial fibrillation which is not controlled by first-line therapy (usually including beta-blockers), and after alternative options have been considered in patients:

- who have at least 1 of the following cardiovascular risk factors: hypertension requiring drugs of at least 2 different classes, diabetes mellitus, previous transient ischaemic attack, stroke or systemic embolism, left atrial diameter of 50 mm or greater, or age 70 years or older
- who do not have left ventricular systolic dysfunction nor a history of, or current, heart failure

Patients who do not meet the above criteria who are currently receiving dronedarone should have the option to continue treatment until they and their clinicians consider it appropriate to stop.

www.nice.org.uk/TA197

ANTIARRHYTHMICS

Adenosine

INDICATIONS AND DOSE

Rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) Used to aid to diagnosis of broad or narrow complex supraventricular tachycardias

- BY RAPID INTRAVENOUS INJECTION
  - Adult: Initially 6 mg, administer into central or large peripheral vein and give over 2 seconds, cardiac monitoring required, followed by 12 mg after 1–2 minutes if required, then 12 mg after 1–2 minutes if required, increments should not be given if high level AV block develops at any particular dose

Rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) in patients with a heart transplant Aid to diagnosis of broad or narrow complex supraventricular tachycardias in patients with a heart transplant

- BY RAPID INTRAVENOUS INJECTION
  - Adult: Initially 3 mg, administer into a central or large peripheral vein and give over 2 seconds, followed by 6 mg after 1–2 minutes if required, then 12 mg after 1–2 minutes if required, patients with a heart transplant are very sensitive to the effects of adenosine

Used in conjunction with radionuclide myocardial perfusion imaging in patients who cannot exercise adequately or for whom exercise is inappropriate

- BY INTRAVENOUS INFUSION
  - Adult: (consult product literature)

DOSE ADJUSTMENTS DUE TO INTERACTIONS

If essential to give with dipyridamole reduce adenosine dose to a quarter of the usual dose.

UNLICENSED USE

Adenosine doses in the BNF may differ from those in the product literature.

CONTRA-INDICATIONS

- Asthma · chronic obstructive lung disease · decompensated heart failure · long QT syndrome · second- or third-degree AV block and sick sinus syndrome (unless pacemaker fitted) · severe hypotension

CAUTIONS

- Atrial fibrillation with accessory pathway (conduction down anomalous pathway may increase) · atrial flutter with accessory pathway (conduction down anomalous pathway may increase) · autonomic dysfunction · bundle branch block · first-degree AV block · heart transplant · left main coronary artery stenosis · left to right shunt · pericardial effusion · pericarditis · QT-interval prolongation · recent myocardial infarction · severe heart failure · stenotic carotid artery disease with cerebrovascular insufficiency · stenotic valvular heart disease · uncorrected hypovolaemia

INTERACTIONS

Appendix 1: antiarrhythmics
**SIDE-EFFECTS**

- **Common or very common** Angina (discontinue) - apprehension - arrhythmia (discontinue if asystole or severe bradycardia occur) - AV block - dizziness - dyspnoea - flushing - headache - nausea - sinus pause

- **Uncommon** Blurred vision - hyperventilation - metallic taste - palpitation - sweating - weakness

- **Very rare** Bronchospasm - injection-site reactions - transient worsening of intracranial hypertension

- **Frequency not known** Cardiac arrest - convulsions - hypotension (discontinue if severe) - respiratory failure (discontinue) - syncope - vomiting

**PREGNANCY** Large doses may cause fetal toxicity; manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** No information available—unlikely to be present in milk owing to short half-life.

**MONITORING REQUIREMENTS** Monitor ECG and have resuscitation facilities available.

**DIRECTIONS FOR ADMINISTRATION** For rapid intravenous injection give over 2 seconds into central or large peripheral vein followed by rapid Sodium Chloride 0.9% flush; injection solution may be diluted with Sodium Chloride 0.9% if required.

**SOLUTIONS FOR INJECTION**

- **Adenosine (Non-proprietary)**
  - Adenosine 3 mg per 1 ml: Adenosine 6mg/2ml solution for injection vials | 6 vial £6.20–£29.24 (Hospital only)
  - Adenoscan (Sanofi)
    - Adenosine 3 mg per 1 ml: Adenocor 6mg/2ml solution for injection vials | 6 vial £29.94 (Hospital only)

- **Solution for infusion**

  ELECTROLYTES: May contain Sodium
  - Adenosine (Non-proprietary)
    - Adenosine 3 mg per 1 ml: Adenosine 30mg/10ml solution for infusion vials | 6 vial £70.00–£85.57 (Hospital only)
  - Adenoscan (Sanofi)
    - Adenosine 3 mg per 1 ml: Adenoscan 30mg/10ml solution for infusion vials | 6 vial £85.57

**BETA-ADRENOCEPTOR BLOCKERS**

**NON-SELECTIVE**

**Sotalol hydrochloride**

**INDICATIONS AND DOSE**

Symptomatic non-sustained ventricular tachyarrhythmias

- Prophylaxis of paroxysmal atrial tachycardia or fibrillation, paroxysmal AV re-entrant tachycardias (both nodal and involving accessory pathways), and paroxysmal supraventricular tachycardia after cardiac surgery

**BY MOUTH**

- Adult: Initially 80 mg daily in 1–2 divided doses, then increased to 160–320 mg daily in 2 divided doses, dose to be increased gradually at intervals of 2–3 days

**Life-threatening arrhythmias including ventricular tachyarrhythmias**

**BY MOUTH**

- Adult: Initially 80 mg daily in 1–2 divided doses, then increased to 160–320 mg daily in 2 divided doses, dose to be increased gradually at intervals of 2–3 days, higher doses of 480–640 mg daily may be required for life-threatening ventricular arrhythmias (under specialist supervision)

**CONTRA-INDICATIONS** Long QT syndrome (congenital or acquired) - torsade de pointes

**CAUTIONS** Diarrhoea (severe or prolonged)

**INTERACTIONS** → Appendix 1: beta blockers (non-selective)

**SIDE-EFFECTS** Arrhythmogenic (pro-arrhythmic) effect (torsade de pointes—increased risk in females)

**BREAST FEEDING** Water soluble beta-blockers such as sotalol are present in breast milk in greater amounts than other beta blockers.

**RENAL IMPAIRMENT** Use half normal dose if eGFR 30–60 mL/minute/1.73 m²; use one-quarter normal dose if eGFR 10–30 mL/minute/1.73 m². Avoid if eGFR less than 10 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Measurement of corrected QT interval, and monitoring of ECG and electrolytes required; correct hypokalaemia, hypomagnesaemia, or other electrolyte disturbances.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

**CARDIAC GLYCOSIDES**

**Cardiac glycosides**

**Digoxin**

Digoxin is most useful for controlling ventricular response in persistent and permanent atrial fibrillation and atrial flutter. Digoxin also has a role in heart failure.
For management of atrial fibrillation the maintenance dose of digoxin can usually be determined by the ventricular rate at rest, which should not usually be allowed to fall persistently below 60 beats per minute.

Digoxin is now rarely used for rapid control of heart rate (see management of supraventricular arrhythmias). Even with intravenous administration, response may take many hours; persistence of tachycardia is therefore not an indication for exceeding the recommended dose. The intramuscular route is not recommended.

In patients with heart failure who are in sinus rhythm a loading dose is not required, and a satisfactory plasma-digoxin concentration can be achieved over a period of about a week.

Digoxin has a long half-life and maintenance doses need to be given only once daily (although higher doses may be needed to achieve a therapeutic plasma-digoxin concentration can be achieved over a period of about a week). Persistence of tachycardia is therefore not an indication for exceeding the recommended dose. The intramuscular route is not recommended.

In patients with heart failure who are in sinus rhythm a loading dose is not required, and a satisfactory plasma-digoxin concentration can be achieved over a period of about a week.

Unwanted effects depend both on the concentration of digoxin in the plasma and on the sensitivity of the conducting system or of the myocardium, which is often increased in heart disease. It can sometimes be difficult to distinguish between toxic effects and clinical deterioration because symptoms of both are similar. The plasma concentration alone cannot indicate toxicity reliably, but the likelihood of toxicity increases progressively through the range 1.5 to 3 micrograms/litre for digoxin. Digoxin should be used with special care in the elderly, who may be particularly susceptible to digitalis toxicity.

Regular monitoring of plasma-digoxin concentration during maintenance treatment is not necessary unless problems are suspected. Hypokalaemia predisposes the patient to digitalis toxicity; it is managed by giving a potassium-sparing diuretic or, if necessary, potassium supplementation.

If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management. Digoxin-specific antibody fragments are available for reversal of life-threatening overdosage.

**INDICATIONS AND DOSE**

**Rapid digitalisation, for atrial fibrillation or flutter**

- **BY MOUTH**
  - Adult: 0.75–1.5 mg in divided doses, dose to be given over 24 hours, reduce dose in the elderly

**Maintenance, for atrial fibrillation or flutter**

- **BY MOUTH**
  - Adult: Maintenance 125–250 micrograms daily, dose according to renal function and initial loading dose, reduce dose in the elderly

**Heart failure (for patients in sinus rhythm)**

- **BY MOUTH**
  - Adult: 62.5–125 micrograms once daily, reduce dose in the elderly

**Emergency loading dose, for atrial fibrillation or flutter**

- **INITIALLY BY INTRAVENOUS INFUSION**
  - Adult: Loading dose 0.75–1 mg to be given over at least 2 hours, then (by mouth) maintenance, loading dose is rarely necessary, maintenance dose to be started on the day following the loading dose, reduce dose in the elderly

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises reduce dose by half with concurrent use of amiodarone, dronedarone and quinine.

**SIDE-EFFECTS**

- Common or very common Arrhythmias. blurred vision, conduction disturbances, diarrhoea, dizziness, eosinophilia, nausea, rash, vomiting, yellow vision
- Uncommon Depression
- Very rare Anorexia, apathy, confusion, fatigue, gynaecomastia on long-term use, headache, intestinal ischaemia and necrosis, psychosis, thrombocytopenia weakness

**Overdose**

If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management.

**PREGNANCY** May need dosage adjustment.

**BREAST FEEDING** Amount too small to be harmful.

**RENUAL IM PAIRMENT** Reduce dose. Monitor plasma-digoxin concentration in renal impairment.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use Avoid rapid intravenous administration (risk of hypertension and reduced coronary flow). For intravenous infusion (Lanoxin®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of not more than 62.5 micrograms/mL. To be given over at least 2 hours.
- With oral use For oral administration, oral solution must not be diluted.

**PATIENT AND CARER ADVICE** Patient counselling is advised for digoxin elixir (use pipette).

**DOSE EQUIVALENCE AND CONVERSION**

- **Dose may need to be reduced if digoxin (or another cardiac glycoside) has been given in the preceding 2 weeks.**
- **When switching from intravenous to oral route may need to increase dose by 20–33% to maintain the same plasma-digoxin concentration.**

**UNLICENSED USE** Digoxin doses in the BNF may differ from those in product literature.

**CONTRA-INDICATIONS** Constrictive pericarditis (unless to control atrial fibrillation or improve systolic dysfunction— but use with caution) - hypertrrophic cardiomyopathy (unless concomitant atrial fibrillation and heart failure— but use with caution) intermittent complete heart block - myocardiit - second degree AV block - supraventricular arrhythmias associated with accessory conducting pathways e.g. Wolff-Parkinson-White syndrome (although can be used in infancy) - ventricular tachycardia or fibrillation

**CAUTIONS** Hypercalcaemia (risk of digitalis toxicity) - hypokalaemia (risk of digitalis toxicity) - hypomagnesemia (risk of digitalis toxicity) hypoxia (risk of digitalis toxicity) - recent myocardial infarction - severe respiratory disease - sick sinus syndrome - thyroid disease

**INTERACTIONS** → Appendix 1: digoxin

**M EDICINAL FORMS**

2 Bleeding disorders

Antifibrinolytic drugs and haematostatics

Overview

Fibrin dissolution can be impaired by the administration of tranexamic acid below, which inhibits fibrinolysis. It can be used to prevent bleeding or to treat bleeding associated with excessive fibrinolysis (e.g. in surgery, dental extraction, obstetric disorders, and traumatic haemhaemorrhage) and in the management of menorrhagia. Tranexamic acid may also be used in hereditary angioedema, epistaxis, and in the management of menorrhagia. Tranexamic acid may also be used in hereditary angioedema, epistaxis, and in the management of menorrhagia. Tranexamic acid may also be used in hereditary angioedema, epistaxis, and in the management of menorrhagia.

Desmopressin p. 628 is used in the management of mild to moderate haemophilia and von Willebrand’s disease. It is also used for fibrinolytic response testing.

Etamsylate p. 108 reduces capillary bleeding in the presence of a normal number of platelets; it does not act by fibrin stabilisation, but probably by correcting abnormal adhesion. Etamsylate is less effective than other treatments in the management of heavy menstrual bleeding and its use is no longer recommended.

ANTHAEMORRHAGICS ▶ ANTIFIBRINOLYTICS

Tranexamic acid

26-Apr-2017

INDICATIONS AND DOSE

Local fibrinolysis

▶ BY MOUTH

Adult: 1–1.5 g 2–3 times a day, alternatively 15–25 mg/kg 2–3 times a day

▶ INITIALLY BY SLOW INTRAVENOUS INJECTION

Adult: 0.5–1 g 2–3 times a day, to be administered at a rate not exceeding 100 mg/minute, followed by (by continuous intravenous infusion) 25–50 mg/kg if required, dose to be given over 24 hours

Menorrhagia

▶ BY MOUTH

Adult: 1 g 3 times a day for up to 4 days, to be initiated when menstruation has started; maximum 4 g per day

Hereditary angioedema

▶ BY MOUTH

Adult: 1–1.5 g 2–3 times a day, for short-term prophylaxis of hereditary angioedema, tranexamic acid is started several days before planned procedures which may trigger an acute attack of hereditary angioedema (e.g. dental work) and continued for 2–5 days afterwards

Epistaxis

▶ BY MOUTH

Adult: 1 g 3 times a day for 7 days

General fibrinolysis

▶ BY SLOW INTRAVENOUS INJECTION

Adult: 1 g every 6–8 hours, alternatively 15 mg/kg every 6–8 hours, dose to be given at a rate not exceeding 100 mg/minute

Prevention and treatment of significant haemorrhage following trauma

▶ INITIALLY BY SLOW INTRAVENOUS INJECTION

Adult: Loading dose 1 g to be given over 10 minutes, treatment should commence within 8 hours of injury, followed by (by intravenous infusion) 1 g to be given over 8 hours

UNLICENSED USE

Use of tranexamic acid by continuous intravenous infusion for treatment of local fibrinolysis is an unlicensed route of administration.

Not licensed for prevention and treatment of significant haemorrhage following trauma.

CONTRA-INDICATIONS

Fibrinolytic conditions following disseminated intravascular coagulation (unless predominant activation of fibrinolytic system with severe bleeding) - history of convulsions - thromboembolic disease

CAUTIONS

Irregular menstrual bleeding (establish cause before initiating therapy) - massive haematuria (avoid if risk of ureteric obstruction) - patients receiving oral contraceptives (increased risk of thrombosis)

INTERACTIONS → Appendix 1: tranexamic acid

SIDE-EFFECTS

Common or very common Diarrhoea (reduce dose) - nausea - vomiting

Uncommon Dermatitis

Rare Impairment of colour vision (discontinue) - thromboembolic events - visual disturbances (discontinue)

Frequency not known Convulsions (usually with high doses) - hypotension (on rapid intravenous injection) - malaise (on rapid intravenous injection)

PREGNANCY

No evidence of teratogenicity in animal studies; manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.

BREAST FEEDING

Small amount present in milk—antifibrinolytic effect in infant unlikely.

RENAI IMPAIRMENT

Reduce dose—consult product literature for details.

MONITORING REQUIREMENTS

Regular liver function tests in long-term treatment of hereditary angioedema.

DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (Cyklokapron®), give continuously in Glucose 5% or Sodium chloride 0.9%.

downloaded from www.medicalbr.com
2.1 Coagulation factor deficiencies

BLOOD AND RELATED PRODUCTS > COAGULATION PROTEINS

Dried prothrombin complex

(Human prothrombin complex)

**INDICATIONS AND DOSE**

Treatment and peri-operative prophylaxis of haemorrhage in patients with congenital deficiency of factors II, VII, IX, or X if purified specific coagulation factors not available/ Treatment and peri-operative prophylaxis of haemorrhage in patients with acquired deficiency of factors II, VII, IX, or X (e.g. during warfarin treatment)

- **BY INTRAVENOUS INFUSION**
- **Adult:** (consult haematologist)

Major bleeding in patients on warfarin following phytomenadione (initiated under specialist supervision)

- **BY INTRAVENOUS INFUSION**
- **Adult:** 25–50 units/kg

**CONTRA-INdications**

Angina - history of hepatic induced thrombocytopenia - recent myocardial infarction (except in life-threatening haemorrhage following overdosage of oral anticoagulants, and before induction of fibrinolytic therapy)

**CAUTIONS** Disseminated intravascular coagulation - history of myocardial infarction or coronary heart disease - postoperative use - risk of thrombosis

**SIDE-EFFECTS**

- **Rare** Headache
- **Very rare** Anaphylaxis - antibody formation - hypersensitivity reactions - pyrexia
- **Frequency not known** Disseminated intravascular coagulation - nephrotic syndrome - thrombotic events

**PRESCRIBING AND DISPENSING INFORMATION**

Dried prothrombin complex is prepared from human plasma by a suitable fractionation technique, and contains factor IX, together with variable amounts of factors II, VII, and X.

Available from CSL Behring (Beriplex® P/N), Octapharma (Octaplex®).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- **Beriplex P/N** (CSL Behring UK Ltd)
  - Factor II 340 unit, Factor VII 175 unit, Protein S 195 unit, Factor X 410 unit, Protein C 300 unit, Factor IX 255 unit Beriplex P/N 250 powder and solvent for solution for injection vials | 1 vial (£51.20)
  - Factor II 690 unit, Factor VII 350 unit, Protein C 600 unit, Protein S 390 unit, Factor X 820 unit, Factor IX 510 Octaplex P/N 500 powder and solvent for solution for injection vials | 1 vial (£52.50)
  - Factor II 1360 unit, Factor VII 700 unit, Protein C 1200 unit, Protein S 1000 unit, Factor X 1640 unit, Factor IX 1020 Beriplex P/N 1000 powder and solvent for solution for injection vials | 1 vial (£510.00)

- **Octaplex** (Octapharma Ltd)

  - Protein S 880 unit, Factor II 1040 unit, Factor VII 660 unit, Factor IX 1000 unit, Factor X 960 unit, Protein C 880 unit Octaplex 1000unit powder and solvent for solution for injection vials | 1 vial (£416.50)

**Factor IX fraction, dried**

**INDICATIONS AND DOSE**

Treatment and prophylaxis of haemorrhage in congenital factor IX deficiency (haemophilia B)

- **BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION**
- **Adult:** (consult haematologist)

**CONTRA-INdications**

Disseminated intravascular coagulation

**CAUTIONS** Risk of thrombosis—principally with former low purity products

**SIDE-EFFECTS**

Allergic reactions - chills - dizziness - fever - gastro-intestinal disturbances - headache

**PRESCRIBING AND DISPENSING INFORMATION**

Dried factor IX fraction is prepared from human plasma by a suitable fractionation technique; it may also contain clotting factors II, VII, and X.
Factor VIII fraction (recombinant)  
(Eptacog alfa (activated))

**INDICATIONS AND DOSE**

Treatment and prophylaxis of haemorrhage in patients with haemophilia A or B with inhibitors to factors VIII or IX, acquired haemophilia, factor VII deficiency, or Glanzmann’s thrombasthenia

**INDICATIONS**

- Intravenous injection

**SIDE-EFFECTS**

- Hemodynamic instability
- Hypotension
- Palpitation
- Urticaria

**CAUTIONS**

- Disseminated intravascular coagulation - risk of thrombosis
- Hypersensitivity reactions

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- **Eptacog alfa activated 50000 unit** NovoSeven 1mg (50,000 units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection (PDS) £255.20 (Hospital only) NovoSeven 1mg (50,000 units) powder and solvent for solution for injection vials | 1 vial (PDS) £105.40 (Hospital only)
- **Eptacog alfa activated 50000 unit** NovoSeven 2mg (100,000 units) powder and solvent for solution for injection vials | 1 vial (PDS) £200.80 (Hospital only) NovoSeven 2mg (100,000 units) powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection (PDS) £105.40 (Hospital only)

**Factor VIII fraction, dried (Human coagulation factor VIII, dried)**

**INDICATIONS AND DOSE**

Treatment and prophylaxis of haemorrhage in congenital factor VIII deficiency (haemophilia A), acquired factor VIII deficiency | Von Willebrand’s disease

**INDICATIONS**

- Intravenous injection, or by intravenous infusion, or by continuous intravenous infusion

**CAUTIONS**

- Intravascular haemolysis after large or frequently repeated doses in patients with blood groups A, B, or AB—less likely with high potency concentrates

**SIDE-EFFECTS**

**MONITORING REQUIREMENTS**

Monitor for development of factor VIII inhibitors.

**PRESCRIBING AND DISPENSING INFORMATION**

Dried factor VIII fraction is prepared from human plasma by a suitable fractionation technique; it may also contain varying amounts of von Willebrand factor. Optivate®, Fanydi®, and Octanate™ are not indicated for use in von Willebrand’s disease.

Recombinant human coagulation factor VIII including octocog alfa, moroctocog alfa, and simoctocog alfa are not indicated for use in von Willebrand’s disease.

**MEDICINAL FORMS**

For infection control advice, see page 13 of this edition.
2.2 Subarachnoid haemorrhage

**CALCIUM-CHANNEL BLOCKERS**

### Nimodipine

**DRUG ACTION** Nimodipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE**

#### Prevention of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage

- **BY MOUTH**
  - Adult: 60 mg every 4 hours, to be started within 4 days of aneurysmal subarachnoid haemorrhage and continued for 21 days

#### Treatment of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage

- **BY INTRAVENOUS INFUSION**
  - Adult (body-weight up to 70 kg): Initially up to 0.5 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter
  - Adult (body-weight 70 kg and above): Initially 1 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter

**TREATMENT OF ISCHAEMIC NEUROLOGICAL DEFECTS FOLLOWING ANEURYSMAL SUBARACHNOID HAEMORRHAGE IN PATIENTS WITH UNSTABLE BLOOD PRESSURE**

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially up to 0.5 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter

### CONTRA-INDICATIONS

- Acute porphyrias (p. 969)
- Unstable angina
- Within 1 month of myocardial infarction
- Cerebral oedema
- Hypotension
- Severely raised intracranial pressure
- Calcium channel blockers

### INTERACTIONS

- Appendix 1: calcium channel blockers

### SIDE-EFFECTS

- Flushing
- Gastro-intestinal disorders
- Headache
- Hypotension
- Ileus
- Nausea
- Sweating
- Feeling of warmth
- Thrombocytopenia
- Variation in heart-rate

### PREGNANCY

- Manufacturer advises use only if potential benefit outweighs risk

### BREAST FEEDING

- Manufacturer advises avoid—present in milk

### HEPATIC IMPAIRMENT

- Elimination reduced in cirrhosis—monitor blood pressure

### RENAL IMPAIRMENT

- With intravenous use—manufacturer advises monitor renal function closely in renal impairment

### DIRECTIONS FOR ADMINISTRATION

- Avoid concomitant administration of nimodipine infusion and tablets
- With oral use: For administration by mouth, tablets may be crushed or halved but are light sensitive—administer immediately
3 Blood clots

3.1 Blocked catheters and lines

Other drugs used for Blocked catheters and lines

Heparin (unfractionated), p. 128 • Urokinase, p. 133

ANTITHROMBOTIC DRUGS PROSTAGLANDINS, CARDIOVASCULAR

Epoprostenol

Prostacyclin

DRUG ACTION
Epoprostenol is a prostaglandin and a potent vasodilator. It is also a powerful inhibitor of platelet aggregation.

INDICATIONS AND DOSE
Inhibition of platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated. Treatment of primary pulmonary hypertension resistant to other treatments, usually with oral anti-coagulation (initiated by a specialist)

BY CONTINUOUS INTRAVENOUS INFUSION
Adult: (consult product literature)

PHARMACOKINETICS
Short half-life of approximately 3 minutes, therefore it must be administered by continuous intravenous infusion.

CONTRA-INDICATIONS
Severe left ventricular dysfunction

CAUTIONS
Avoid abrupt withdrawal when used for primary pulmonary hypertension (risk of rebound pulmonary hypertension). Extreme caution in coronary artery disease, haemorrhagic diathesis, pulmonary veno-occlusive disease, reconstituted solution highly alkaline—avoid extravasation (irritant to tissues). Risk of pulmonary oedema (dose titration for pulmonary hypertension should be in hospital)

INTERACTIONS
Appendix 1: epoprostenol

SIDE-EFFECTS

Common or very common
Abdominal pain • anxiety • arthralgia • bleeding • bradycardia • chest pain • diarrhoea • flushing • headache • hypotension • jaw pain • nausea • rash • Sepsis • tachycardia • thrombocytopenia • vomiting

Uncommon
Dry mouth • sweating

Very rare
Agitation • hyperthyroidism • malaise • pallor

Frequency not known
Hyperglycaemia • pulmonary oedema (avoid chronic use if occurs during dose titration)

PREGNANCY
Use if potential benefit outweighs risk.

BREAST FEEDING
Manufacturer advises avoid—no information available.

MONITORING REQUIREMENTS
Anticoagulant monitoring required when given with anticoagulants.

TREATMENT CESSATION
Avoid abrupt withdrawal when used for primary pulmonary hypertension (risk of rebound pulmonary hypertension).

DIRECTIONS FOR ADMINISTRATION
For intravenous infusion (Flolan®), give continuously in Sodium chloride 0.9%; reconstitute using the filter and solvent (glycine buffer diluent) provided to make a concentrate; may be diluted further (consult product literature); for pulmonary hypertension dilute further with glycine buffer diluent only and administer via a central venous catheter (can give via peripheral vein until central venous access established); for renal dialysis may be diluted further with sodium chloride 0.9%; protect infusion from light. For intravenous infusion (Veletri®), give continuously in Sodium chloride 0.9%; reconstitute each vial with 5 mL sodium chloride 0.9% then dilute to required concentration with sodium chloride 0.9% (consult product literature); administer through an in-line 0.22 micron filter; for pulmonary hypertension, administer via a central venous catheter (can give via peripheral vein until central venous access established); protect infusion from direct sunlight.

3.2 Thromboembolism

Venous thromboembolism

Overview
Venous thromboembolism includes deep-vein thrombosis and pulmonary embolism, and occurs as a result of thrombus formation in a vein.

Prophylaxis of venous thromboembolism

All patients admitted to hospital should undergo a risk assessment for venous thromboembolism on admission. Patients considered to be at high risk include those anticipated to have a substantial reduction in mobility, those with obesity, malignant disease, history of venous thromboembolism, thrombophilic disorder, or patients over 60 years. Patients with risk factors for bleeding (e.g. acute stroke, thrombocytopenia, acquired or untreated inherited bleeding disorders) should only receive pharmacological
prophylaxis when the risk of bleeding does not outweigh the risk of venous thromboembolism. NICE clinical guideline 92 (January 2010) provides a full list of risk factors, and gives recommendations for prophylaxis. A venous thromboembolism risk assessment checklist is also available from the Department of Health (www.gov.uk/dh).

Patients scheduled for surgery should be offered mechanical prophylaxis (e.g. anti-embolism stockings) on admission if appropriate; prophylaxis on admission should continue until the patient is sufficiently mobile. Choice of mechanical prophylaxis will depend on factors such as the type of surgery, suitability for the patient, and their condition. Patients undergoing general or orthopaedic surgery, who are considered to be at high risk of venous thromboembolism, should be offered pharmacological prophylaxis. Choice of prophylaxis will depend on the type of surgery, suitability for the patient, and local policy. A low molecular weight heparin is suitable in all types of general and orthopaedic surgery; heparin (unfractionated) p. 128 is preferred for patients in renal failure. Fondaparinux sodium p. 123 is an option for patients undergoing hip or knee replacement surgery, hip fracture surgery, gastro-intestinal, bariatric, or urgent gynaecological surgery procedures. The oral anticoagulants apixaban p. 121, dabigatran etexilate p. 131, and rivaroxaban p. 123 are indicated for thromboprophylaxis following hip or knee replacement surgery.

Pharmacological prophylaxis in general surgery should usually continue for 5–7 days, or until sufficient mobility has been re-established. Pharmacological prophylaxis should be extended to 28 days after major cancer surgery in the abdomen or pelvis. Hip or knee replacement surgery, and hip fracture surgery, require an extended duration of pharmacological prophylaxis, depending on the preparation used (consult product literature).

General medical patients who are considered to be at high risk of venous thromboembolism should be offered pharmacological prophylaxis on admission. Choice of prophylaxis will depend on the medical condition, suitability for the patient, and local policy. Patients should receive either a low molecular weight heparin, heparin (unfractionated) (if patient in renal failure), or fondaparinux sodium. Prophylaxis should continue until the patient is no longer considered to be at significant risk of venous thromboembolism. Mechanical prophylaxis (e.g. anti-embolism stockings) can be offered to medical patients in whom pharmacological prophylaxis is contra-indicated, and continued until the patient is sufficiently mobile.

Edoxaban
Edoxaban p. 122, an inhibitor of factor Xa, is given orally for the treatment and prophylaxis of venous thromboembolism, although, it should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy. Duration of therapy should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e. recent surgery, trauma, immobilisation, and longer durations should be based on permanent risk factors or idiopathic deep-vein thrombosis or pulmonary embolism. Edoxaban is also licensed for the prophylaxis of stroke and systemic embolism in patients with non-valvular atrial fibrillation and at least one other risk factor.

Treatment of venous thromboembolism
For the initial treatment of deep-vein thrombosis and pulmonary embolism a low molecular weight heparin is used; alternatively, heparin (unfractionated) is given as an intravenous loading dose, followed by continuous intravenous infusion (using an infusion pump) or (for deep-vein thrombosis only) by intermittent subcutaneous injection. Intermittent intravenous injection of heparin (unfractionated) is no longer recommended. An oral anticoagulant (usually warfarin sodium p. 135 is started at the same time as unfractionated or low molecular weight heparin (the heparin needs to be continued for at least 5 days and until the INR is \geq 2 for at least 24 hours). Laboratory monitoring for heparin (unfractionated), preferably on a daily basis, is essential; determination of the activated partial thromboplastin time (APTT) is the most widely used measure (for heparin (unfractionated). A low molecular weight heparin or, in some circumstances, heparin (unfractionated) is also used in regimens for the management of myocardial infarction and unstable angina.

Management of venous thromboembolism in pregnancy
Heparins are used for the management of venous thromboembolism in pregnancy because they do not cross the placenta. Low molecular weight heparins are preferred because they have a lower risk of osteoporosis and of heparin-induced thrombocytopenia. Low molecular weight heparins are eliminated more rapidly in pregnancy, requiring alteration of the dosage regimen for drugs such as dalteparin sodium p. 126, enoxaparin sodium p. 127, and tinzaparin sodium p. 129. Treatment should be stopped at the onset of labour and advice sought from a specialist on continuing therapy after birth.

Extracorporeal circuits
Heparin (unfractionated) is also used in the maintenance of extracorporeal circuits in cardiopulmonary bypass and haemodialysis.

Haemorrhage
If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate p. 1258 is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

Management of stroke
Overview
Stroke is associated with a significant risk of morbidity and mortality. Patients presenting with acute symptoms should be immediately transferred to hospital for accurate diagnosis of stroke type, and urgent initiation of appropriate treatment; patients should be managed by a specialist multidisciplinary stroke team.

The following notes give an overview of the initial and long-term management of transient ischaemic attack, ischaemic stroke, and intracerebral haemorrhage.

Transient ischaemic attack
Patients suspected of having a transient ischaemic attack should immediately receive aspirin p. 117 (patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive clopidogrel p. 119 [unlicensed use] as an alternative). Following a confirmed diagnosis, patients should receive treatment for secondary prevention (see Long-term Management, under Ischaemic Stroke).

Ischaemic stroke
Initial management
Alteplase p. 210 is recommended in the treatment of acute ischaemic stroke if it can be administered within 4.5 hours of symptom onset; it should be given by medical staff experienced in the administration of thrombolitics and the treatment of acute stroke, preferably within a specialist...
stroke centre. Treatment with aspirin should be initiated 24 hours after thrombolysis (or as soon as possible within 48 hours of symptom onset in patients not receiving thrombolysis); patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive clopidogrel [unlicensed use] as an alternative.

Anticoagulants are not recommended as an alternative to antiplatelet drugs in acute ischaemic stroke in patients who are in sinus rhythm. However, parenteral anticoagulants may be indicated in patients who are symptomatic of, or at high risk of developing, deep vein thrombosis or pulmonary embolism; warfarin sodium p. 135 should not be commenced in the acute phase of ischaemic stroke.

Anticoagulants should be considered after cardio-embolic ischaemic stroke in patients with atrial fibrillation, however patients presenting with atrial fibrillation following a disabling ischaemic stroke should receive aspirin before being considered for anticoagulant treatment. Patients already receiving anticoagulation for a prosthetic heart valve who experience a disabling ischaemic stroke and are at significant risk of haemorrhagic transformation, should have their anticoagulant treatment stopped for 7 days and substituted with aspirin.

Treatment of hypertension in the acute phase of ischaemic stroke can result in reduced cerebral perfusion, and should therefore only be instituted in the event of a hypertensive emergency, or in those patients considered for thrombolysis.

Long-term management
Patients should receive long-term treatment following a transient ischaemic attack or an ischaemic stroke to reduce the risk of further cardiovascular events.

Following a transient ischaemic attack or an ischaemic stroke (not associated with atrial fibrillation), long-term treatment with clopidogrel [unlicensed in transient ischaemic attack] is recommended. If clopidogrel is contra-indicated or not tolerated, patients can receive modified-release dipyridamole p. 120 in combination with aspirin; if both aspirin and clopidogrel are contra-indicated or not tolerated, then modified-release dipyridamole alone is recommended; if both modified-release dipyridamole and clopidogrel are contra-indicated or not tolerated, then aspirin alone is recommended.

Patients with stroke associated with atrial fibrillation should be reviewed for long-term treatment with warfarin sodium or an alternative anticoagulant (see Initial Management under Ischaemic Stroke).

Anticoagulants are not routinely recommended in the long-term prevention of recurrent stroke, except in patients with atrial fibrillation.

A statin should be initiated 48 hours after stroke symptom onset, irrespective of the patient’s serum-cholesterol concentration.

Following the acute phase of ischaemic stroke, blood pressure should be measured and treatment initiated to achieve a target blood pressure of <130/80 mmHg. Beta-blockers should not be used in the management of hypertension following a stroke, unless they are indicated for a co-existing condition.

All patients should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight, alcohol intake, and smoking.

Intracerebral haemorrhage

Initial Management
Surgical intervention may be required following intracerebral haemorrhage to remove the haematoma and relieve intracranial pressure. Patients taking anticoagulants should have this treatment stopped and reversed; anticoagulant therapy has, however, been used in patients with intracerebral haemorrhage who are symptomatic of deep vein thrombosis or pulmonary embolism; placement of a caval filter is an alternative in this situation.

Long-term management
Aspirin therapy should only be given to patients at a high risk of a cardiac ischaemic event. Anticoagulant therapy is not recommended following an intracerebral haemorrhage, even in those with atrial fibrillation, unless the patient is at very high risk of an ischaemic stroke or cardiac ischaemic events; advice from a specialist should be sought in this situation. Blood pressure should be measured and treatment initiated where appropriate, taking care to avoid hypoperfusion. Statins should be avoided following intracerebral haemorrhage, however they can be used with caution when the risk of a vascular event outweighs the risk of further haemorrhage.

Oral anticoagulants

Overview
The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thromb is composed mainly of platelets with little fibrin.

Coumarins and phenindione
The oral anticoagulants warfarin sodium p. 135, acenocoumarol p. 134 and phenindione p. 134, antagonise the effects of vitamin K, and take at least 48 to 72 hours for the anticoagulant effect to develop fully; warfarin sodium is the drug of choice. If an immediate effect is required, unfractionated or low molecular weight heparin must be given concomitantly.

These oral anticoagulants should not be used in cerebral artery thrombosis or peripheral artery occlusion as first-line therapy; aspirin p. 117 is more appropriate for reduction of risk in transient ischaemic attacks. Unfractionated or a low molecular weight heparin (see under Parenteral anticoagulants p. 115) is usually preferred for the prophylaxis of venous thromboembolism in patients undergoing surgery; alternatively, warfarin sodium can be continued in selected patients currently taking long-term warfarin sodium and who are at high risk of thromboembolism (seek expert advice).

Dose
The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.

Target INR
The following indications and target INRs for adults for warfarin take into account recommendations of the British Society for Haematology guidelines on oral anticoagulation with warfarin—fourth edition. Br J Haematol 2011; 154: 311–324:

An INR which is within 0.5 units of the target value is generally satisfactory; larger deviations require dosage adjustment. Target values (rather than ranges) are now recommended.

INR 2.5 for:
• treatment of deep-vein thrombosis or pulmonary embolism (including those associated with antiphospholipid syndrome or for recurrence in patients no longer receiving warfarin sodium)
• atrial fibrillation
• cardioversion—target INR should be achieved at least 3 weeks before cardioversion and anticoagulation should
continue for at least 4 weeks after the procedure (higher target values, such as an INR of 3, can be used for up to 4 weeks before the procedure to avoid cancellations due to low INR)

- mitral stenosis or regurgitation in patients with either atrial fibrillation, a history of systemic embolism, a left atrial thrombus, or an enlarged left atrium
- bioprosthetic heart valves in the mitral position (treat for 3 months), or in patients with a history of systemic embolism (treat for at least 3 months), or with a left atrial thrombus at surgery (treat until clot resolves), or with other risk factors (e.g. atrial fibrillation or a low ventricular ejection fraction)

- acute arterial embolism requiring embolectomy (consider long-term treatment)
- myocardial infarction
- INR 3.5 for:
  - recurrent deep-vein thrombosis or pulmonary embolism in patients currently receiving anticoagulation and with an INR above 2;
  - Mechanical prosthetic heart valves:
    - the recommended target INR depends on the type and location of the valve, and patient-related risk factors
    - consider increasing the INR target or adding an antiplatelet drug, if an embolic event occurs whilst anticoagulated at the target INR.

**Duration**

The risks of thromboembolism recurrence and anticoagulant-related bleeding should be considered when deciding the duration of anticoagulation.

- 6 weeks for isolated calf-vein deep-vein thrombosis
- 3 months for venous thromboembolism provoked by surgery or other transient risk factor (e.g. combined oral contraceptive use, pregnancy, plaster cast)
- at least 3 months for unprovoked proximal deep-vein thrombosis or pulmonary embolism; long-term anticoagulation may be required.

**Haemorrhage**

The main adverse effect of all oral anticoagulants is haemorrhage. Checking the INR and omitting doses when appropriate is essential; if the anticoagulant is stopped but not reversed, the INR should be measured 2–3 days later to ensure that it is falling. The cause of an elevated INR should be considered, and the INR checked before surgery.

**Parenteral anticoagulants**

**Overview**

The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin.
Heparin
Heparin initiates anticoagulation rapidly but has a short duration of action. It is often referred to as ‘standard’ or heparin (unfractionated) p. 128 to distinguish it from the low molecular weight heparins, which have a longer duration of action. Although a low molecular weight heparin is generally preferred for routine use, heparin (unfractionated) can be used in those at high risk of bleeding because its effect can be terminated rapidly by stopping the infusion.

Low molecular weight heparins
Low molecular weight heparins (dalteparin sodium p. 126, enoxaparin sodium p. 127, and tinzaparin sodium p. 129) are usually preferred over heparin (unfractionated) in the prevention of Venous thromboembolism p. 112 because they are as effective and they have a lower risk of heparin-induced thrombocytopenia. The standard prophylactic regimen does not require anticoagulant monitoring. The duration of action of low molecular weight heparins is longer than that of heparin (unfractionated) and once-daily subcutaneous administration is possible for some indications, making them convenient to use.

Low molecular weight heparins are generally preferred over heparin (unfractionated) in the treatment of deep vein thrombosis and pulmonary embolism, and are also used in the treatment of myocardial infarction, unstable coronary artery disease (see under Acute coronary syndromes p. 206) and for the prevention of clotting in extracorporeal circuits.

Dalteparin sodium and tinzaparin sodium (only 20 000 unit/mL syringe) are also licensed for the extended treatment and prophylaxis of venous thromboembolism in patients with solid tumours; treatment is recommended for a duration of 6 months. Treatment should be initiated by healthcare professionals experienced in the treatment of venous thromboembolism.

Heparinoids
Danaparoid sodium p. 125 is a heparinoid used for prophylaxis of deep–vein thrombosis in patients undergoing general or orthopaedic surgery. Providing there is no evidence of cross-reactivity, it also has a role in patients who develop heparin-induced thrombocytopenia.

Argatroban
An oral anticoagulant can be given with argatroban monohydrate p. 130, but it should only be started once thrombocytopenia has substantially resolved.

Hirudins
Bivalirudin, a hirudin analogue, is a thrombin inhibitor which is licensed for unstable angina or non-ST-segment elevation myocardial infarction in patients planned for urgent or early intervention, and as an anticoagulant for patients undergoing percutaneous coronary intervention (including patients with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention—see also Management of ST-segment elevation myocardial infarction (STEMI) in Acute coronary syndromes p. 206).

Heparin flushes
The use of heparin flushes should be kept to a minimum. For maintaining patency of peripheral venous catheters, sodium chloride injection 0.9% is as effective as heparin flushes. The role of heparin flushes in maintaining patency of arterial and central venous catheters is unclear.

Epoprostenol
Epoprostenol (prostacyclin) can be given to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated. It is also licensed for the treatment of primary pulmonary hypertension resistant to other treatment, usually with oral anticoagulation; it should be initiated by specialists in pulmonary hypertension. Epoprostenol is a potent vasodilator. It has a short half-life of approximately 3 minutes and therefore it must be administered by continuous intravenous infusion.

Fondaparinux
Fondaparinux sodium is a synthetic pentasaccharide that inhibits activated factor X.

Other drugs used for Thromboembolism
Streptokinase, p. 211

ANTIDOTES AND CHELATORS

Idarucizumab

17-Mar-2017

- **DRUG ACTION** Idarucizumab is a humanised monoclonal antibody fragment that binds specifically to dabigatran and its metabolites, thereby reversing the anticoagulant effect.

- **INDICATIONS AND DOSE** Rapid reversal of dabigatran for emergency procedures, or in life-threatening or uncontrolled bleeding (specialist supervision in hospital)
  - BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
    - Adult: 5 g, followed by 5 g if required

- **CAUTIONS** Risk of thrombosis

- **FURTHER INFORMATION**
  
  Manufacturer advises to consider re-starting anticoagulant therapy as soon as medically appropriate to reduce the risk of thrombosis. Dabigatran can be re-started 24 hours after administration of idarucizumab; other anticoagulant therapy can be started at any time.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises that one dose of Praxbind® is administered as either two consecutive intravenous infusions, each given over 5–10 minutes, or as a bolus injection.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  
  Scottish Medicines Consortium (SMC) Decisions
  
  The Scottish Medicines Consortium has advised (September 2016) that idarucizumab (Praxbind®) is accepted for use within NHS Scotland for adult patients treated with dabigatran etexilate when rapid reversal of its anticoagulant effects is required for emergency surgery/urgent procedures or in life-threatening or uncontrolled bleeding.

- **MEDIcular FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Solution for infusion**
  
  **EXCIPIENTS:** May contain Polysorbates, sorbitol
  
  **ELECTROLYTES:** May contain Sodium
  
  **Praxbind** (Boehringer Ingelheim Ltd) ▼
  
  Idarucizumab 50 mg per 1 ml Praxbind 2.5g/50ml solution for infusion vials | 2 vial (Pot) £2,400.00 (Hospital only)

ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

Antiplatelet drugs

Overview
Antiplatelet drugs decrease platelet aggregation and inhibit thrombus formation in the arterial circulation, because in faster-flowing vessels, thrombi are composed mainly of platelets with little fibrin.

Use of aspirin below in primary prevention of cardiovascular events, in patients with or without diabetes, is of unproven benefit. Long-term use of aspirin is of benefit in established cardiovascular disease (secondary prevention); unduly high blood pressure must be controlled before aspirin is given. If the patient is at a high risk of gastro-intestinal bleeding, a proton pump inhibitor can be added.

Aspirin is given following coronary bypass surgery. It is also used in atrial fibrillation, for intermittent claudication, for stable angina and acute coronary syndromes, for use following placement of coronary stents and for use in stroke.

Clopidogrel p. 119 is licensed for the prevention of atherothrombotic events in patients with a history of symptomatic ischaemic disease. Clopidogrel, in combination with low-dose aspirin, is also licensed for acute coronary syndrome without ST-segment elevation; in these circumstances the combination is given for up to 12 months (most benefit occurs during the first 3 months; there is no evidence of benefit beyond 12 months). Clopidogrel, in combination with low-dose aspirin, is also licensed for acute myocardial infarction with ST-segment elevation; the combination is licensed for at least 4 weeks, but the optimum treatment duration has not been established. In patients undergoing percutaneous coronary intervention, clopidogrel is used as an adjunct with aspirin. Patients who are not already taking clopidogrel should receive a loading dose prior to procedure.

Clopidogrel is also licensed, in combination with low-dose aspirin, for the prevention of atherothrombotic and thromboembolic events in patients with atrial fibrillation (and at least one risk factor for a vascular event), and for whom warfarin sodium p. 135 is unsuitable.

Use of clopidogrel with aspirin increases the risk of bleeding. Clopidogrel monotherapy may be an alternative when aspirin is contra-indicated, for example in those with aspirin hypersensitivity, or when aspirin is not tolerated despite the addition of a proton pump inhibitor (see also NICE guidance).

Clopidogrel also has uses in stroke. Dipyridamole p. 120 is used by mouth as an adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves. Modified-release preparations are licensed for secondary prevention of ischaemic stroke and transient ischaemic attacks.

Prasugrel p. 208, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention; the combination is usually given for up to 12 months.

Ticagrelor p. 209, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome; the combination is usually given for up to 12 months.

Cangrelor p. 202, in combination with aspirin, is licensed for the reduction of thrombotic cardiovascular events in patients with coronary artery disease undergoing percutaneous coronary intervention (PCI) who have not received treatment with oral clopidogrel, prasugrel or ticagrelor prior to the procedure and in whom oral therapy with these drugs is not suitable. Cangrelor is to be used under expert supervision only.

Antiplatelet drugs and coronary stents
Patients selected for percutaneous coronary intervention, with the placement of a coronary stent, will require dual antiplatelet therapy with aspirin and either cangrelor, clopidogrel, prasugrel, or ticagrelor. Aspirin therapy should continue indefinitely. Clopidogrel is recommended for 1 month following elective percutaneous coronary intervention with placement of a bare-metal stent, and for 12 months if percutaneous coronary intervention with placement of a bare-metal stent was for an acute coronary syndrome; clopidogrel should be given for 12 months following placement of a drug-eluting stent. Clopidogrel should not be discontinued prematurely in patients with a drug-eluting stent—there is an increased risk of stent thrombosis as a result of the eluted drug slowing the re-endothelialisation process. Patients considered to be at high risk of developing late stent thrombosis with a drug-eluting stent may require a longer duration of treatment with clopidogrel. Prasugrel or ticagrelor are alternatives to clopidogrel in certain patients undergoing percutaneous coronary intervention.

Glycoprotein IIb/IIIa inhibitors
Glycoprotein IIb/IIIa inhibitors prevent platelet aggregation by blocking the binding of fibrinogen to receptors on platelets. Abciximab p. 203 is a monoclonal antibody which binds to glycoprotein IIb/IIIa receptors and to other related sites; it is licensed as an adjunct to heparin (unfractionated) p. 128 and aspirin for the prevention of ischaemic complications in high-risk patients undergoing percutaneous transluminal coronary intervention. Abciximab should be used once only (to avoid additional risk of thrombocytopenia). Eptifibatide p. 203 (in combination with heparin (unfractionated) and aspirin) and tirofiban p. 204 (in combination with heparin (unfractionated), aspirin, and clopidogrel) also inhibit glycoprotein IIb/IIIa receptors; they are licensed for use to prevent early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction. Tirofiban is also licensed for use in combination with heparin (unfractionated), aspirin, and clopidogrel, for the reduction of major cardiovascular events in patients with ST-segment elevation myocardial infarction intended for primary percutaneous coronary intervention. Abciximab, eptifibatide and tirofiban should be used by specialists only.

Epoprostenol p. 112 is also used to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated.

Aspirin
(Acetylsalicylic Acid)

INDICATIONS AND DOSE
Cardiovascular disease (secondary prevention)

- **Adult:** 75 mg daily

Management of unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI) / Management of ST-segment elevation myocardial infarction (STEMI)

- **BY MOUTH**
  - **Adult:** 300 mg, chewed or dispersed in water

Suspected transient ischaemic attack

- **BY MOUTH**
  - **Adult:** 300 mg once daily until diagnosis established continued →
Cardiovascular system

Transient ischaemic attack (long-term treatment in combination with dipyridamole) | Ischaemic stroke not associated with atrial fibrillation (in combination with dipyridamole if clopidogrel contra-indicated or not tolerated) | Ischaemic stroke not associated with atrial fibrillation (used alone if clopidogrel and dipyridamole contra-indicated or not tolerated)

- **CONTRA-INDICATIONS** Active peptic ulceration - bleeding disorders (antiplatelet dose) - children under 16 years (risk of Reye’s syndrome) - haemophilia - previous peptic ulceration (analgesic dose) - severe cardiac failure (analgesic dose)

- **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - Reye’s syndrome: Owing to an association with Reye’s syndrome, aspirin-containing preparations should not be given to children under 16 years, unless specifically indicated, e.g. for Kawasaki disease.

- **CAUTIONS** Allergic disease - anaemia - asthma - dehydration - elderly - G6PD deficiency - preferably avoid during fever or viral infection in children (risk of Reye’s syndrome) - previous peptic ulceration (but manufacturers may advise avoidance of low-dose aspirin in history of peptic ulceration) - thyrotoxicosis - uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: aspirin

- **SIDE-EFFECTS** Blood disorders (with analgesic doses) - bronchospasm - confusion (with analgesic doses) - gastrointestinal haemorrhage (occasionally major) - gastrointestinal irritation (with slight asymptomatic blood loss at higher doses) - haemorrhage including subconjunctival haemorrhage (reported with antiplatelet doses) - increased bleeding time - skin reactions in hypersensitive patients - tinnitus (with analgesic doses)

- **Overdose** The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. For specific details on the management of poisoning, see *Aspirin*, under Emergency treatment of poisoning p. 1249.

- **ALLERGY AND CROSS-SENSITIVITY** Aspirin is contra-indicated in history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria, or rhinitis have been precipitated by aspirin or any other NSAID.

- **PREGNANCY** Use antiplatelet doses with caution during third trimester; impaired platelet function and risk of haemorrhage; delayed onset and increased duration of labour with increased blood loss; avoid analgesic doses if possible in last few weeks (low doses probably not harmful); high doses may be related to intra-uterine growth restriction, teratogenic effects, closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of newborn; kernicterus may occur in jaundiced neonates.

- **BREAST FEEDING** Avoid—possible risk of Reyee’s syndrome; regular use of high doses could impair platelet function and produce hypoprothrombinaemia in infant if neonatal vitamin K stores low.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment—increased risk of gastro-intestinal bleeding.

- **RENAL IMPAIRMENT** Use with caution; avoid in severe impairment; sodium and water retention; deterioration in renal function; increased risk of gastro-intestinal bleeding.

- **PRESCRIBING AND DISPENSING INFORMATION** BP directs that when no strength is stated the 300 mg strength should be dispensed, and that when soluble aspirin tablets are prescribed, dispersible aspirin tablets shall be dispensed.

- **PROFESSION SPECIFIC INFORMATION** Dental practitioners’ formulary Aspirin Dispersible Tablets 300 mg may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

  - **Gastro-resistant tablet** CAUTIONARY AND ADVISORY LABELS 5, 25, 32
    - *Aspirin (Non-proprietary)*
      - Aspirin 75 mg | Aspirin 75 mg gastro-resistant tablets | 56 tablet | £64.00
      - Aspirin 300 mg | Aspirin 300 mg gastro-resistant tablets | 100 tablet | £20.34
    - *Micropirin* (Dexcel-Pharma Ltd)
      - Aspirin 75 mg | Micropirin 75 mg gastro-resistant tablets | 28 tablet | £1.45
      - Aspirin 300 mg | Micropirin 300 mg gastro-resistant tablets | 100 tablet | £2.87
    - *Nu-Seals* (Alliance Pharmaceuticals Ltd)
      - Aspirin 75 mg | Nu-Seals 75 gastro-resistant tablets | 56 tablet | £3.12
    - *Aspirin 300 mg* | Aspirin 300 mg gastro-resistant tablets | 100 tablet | £10.47

  - **Tablet** CAUTIONARY AND ADVISORY LABELS 21, 32
    - *Aspirin (Non-proprietary)*
      - Aspirin 75 mg | Aspirin 75 mg tablets | 28 tablet | £1.13
      - Aspirin 300 mg | Aspirin 300 mg tablets | 100 tablet | £1.13
    - *Aspirin 300 mg* | Aspirin 300 mg suppositories | 10 suppository | £18.67
    - *Dispersible tablet* CAUTIONARY AND ADVISORY LABELS 13, 21, 32
      - *Aspirin (Non-proprietary)*
        - Aspirin 75 mg | Aspirin 75 mg dispersible tablets | 28 tablet | £0.70
Clopidogrel

- **INDICATIONS AND DOSE**
  
  Prevention of atherothrombotic events in percutaneous coronary intervention (adjunct with aspirin) in patients not already on clopidogrel
  
  **BY MOUTH**
  
  **Adult:** Loading dose 300 mg, to be taken prior to the procedure, alternatively loading dose 600 mg, higher dose may produce a greater and more rapid inhibition of platelet aggregation
  
  Transient ischemic attack for patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor or acute ischemic stroke for patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor
  
  **BY MOUTH**
  
  **Adult:** 75 mg once daily
  
  Prevention of atherothrombotic events in peripheral arterial disease or within 35 days of myocardial infarction, or within 6 months of ischemic stroke
  
  **BY MOUTH**
  
  **Adult:** 75 mg once daily
  
  Prevention of atherothrombotic events in acute coronary syndrome without ST-segment elevation (given with aspirin)
  
  **BY MOUTH**
  
  **Adult:** Initially 300 mg, then 75 mg daily for up to 12 months
  
  Prevention of atherothrombotic events in acute myocardial infarction with ST-segment elevation (given with aspirin)
  
  **BY MOUTH**
  
  **Adult:** 75 mg once daily

- **UNLICENSED USE**
  600 mg loading dose prior to percutaneous coronary intervention is an unlicensed dose.

- **CONTRA-INDICATIONS**
  Active bleeding

- **CAUTIONS**
  Discontinue 7 days before elective surgery if antiplatelet effect not desirable; patients at risk of increased bleeding from trauma, surgery, or other pathological conditions

- **INTERACTIONS**
  
  → Appendix 1: clopidogrel

- **SIDE-EFFECTS**
  
  Common or very common
  Abdominal pain • bleeding disorders (including gastro-intestinal and intracranial) • diarrhea • dyspepsia

- **Uncommon**
  Constipation • decreased platelets • dizziness • duodenal ulcers • eosinophilia • flatulence • gastric ulcer • gastritis • headache • leucopenia • nausea • paraesthesia • pruritus • rash • vomiting

- **Rare**
  Vertigo

- **Very rare**
  Acquired haemophilia • acute liver failure • agranulocytosis • arthralgia • blood disorders • bronchospasm • colitis • confusion • eosinophilic pneumonia • fever • glomerulonephritis • hallucinations • hepatitis • hypersensitivity-like reactions • interstitial pneumonitis • lichen planus • pancreatitis • pancytopenia • severe thrombocytopenia • Stevens-Johnson syndrome • stomatitis • taste disturbance • thrombocytopenic purpura • toxic epidermal necrolysis • vasculitis

- **ALLERGY AND CROSS-SENSITIVITY**
  Caution with history of hypersensitivity reactions to thienopyridines (e.g. prasugrel).

- **PREGNANCY**
  Manufacturer advises avoid—no information available.

- **BREAST FEEDING**
  Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT**
  Manufacturer advises caution (risk of bleeding). Avoid in severe impairment.

- **RENAL IMPAIRMENT**
  Manufacturer advises caution.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  NICE technology appraisals (TAs)

  - Clopidogrel and modified-release dipyridamole in the prevention of occlusive vascular events (December 2010) NICE TA210
  
  The guidance applies to patients who have had an occlusive vascular event, or who have established peripheral arterial disease. The guidance does not apply to patients who have had, or are at risk of, stroke associated with atrial fibrillation, or who need prophylaxis for occlusive events following coronary revascularisation or carotid artery procedures.

  Clopidogrel monotherapy is recommended as an option to prevent occlusive vascular events in patients who have had:

  - an ischemic stroke, or who have peripheral arterial disease or multivascular disease, or
  - a myocardial infarction, only if aspirin is contra-indicated or not tolerated.

  www.nice.org.uk/TA210

  **Scottish Medicines Consortium (SMC) Decisions**

  The **Scottish Medicines Consortium** has advised (February 2004) that clopidogrel be accepted for restricted use for the treatment of confirmed acute coronary syndrome (without ST-segment elevation), in combination with aspirin.

  Clopidogrel should be initiated in hospital inpatients only.

  The **Scottish Medicines Consortium** has also advised (July 2007) that clopidogrel be accepted for restricted use for patients with ST-segment elevation acute myocardial infarction in combination with aspirin; treatment with clopidogrel is restricted to 4 weeks only.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  **Tablet**

  - **Clopidogrel (Non-proprietary)**
    
    | Clopidogrel 75 mg | 75mg tablets | 28 tablet | £30.53 DT price = £1.13 | £32.71 |
    | Clopidogrel 75 mg | 75mg tablets | 30 tablet | £32.28 |
    | Gropid (Beacon Pharmaceuticals Ltd) | Clopidogrel 75 mg | 75mg tablets | 30 tablet | £32.28 |
    | Plavix (Sanofi) | Clopidogrel 75 mg | 75mg tablets | 30 tablet | £35.64 |
    | Clopidogrel (as Clopidogrel hydrogen sulfate) 300 mg | Plavix 300mg tablets | 30 tablet | £142.54 DT price = £142.54 |
**Dipyridamole**

**INDICATIONS AND DOSE**
Secondary prevention of ischaemic stroke (not associated with atrial fibrillation) and transient ischaemic attacks (used alone or with aspirin) | Adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- **Adult:** 200 mg twice daily, to be taken preferably with food

Adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- **Adult:** 300–600 mg daily in 3–4 divided doses

**Myocardial imaging—diagnostic use only**
- **BY INTRAVENOUS INJECTION**
- **Adult:** (consult product literature)

**CAUTIONS**
- Aortic stenosis · coagulation disorders · heart failure · hypotension · left ventricular outflow obstruction · may exacerbate migraine · myasthenia gravis (risk of exacerbation) · rapidly worsening angina · recent myocardial infarction

**INTERACTIONS** → Appendix 1: dipyridamole

**SIDE-EFFECTS**
- Angioedema · dizziness · gastro-intestinal effects · hot flushes · hypersensitivity reactions · hypotension · increased bleeding after surgery · increased bleeding during surgery · myalgia · rash · severe bronchospasm · tachycardia · throbbing headache · thrombocytopenia · urticaria · worsening symptoms of coronary heart disease

**PREGNANCY**
Not known to be harmful.

**BREAST FEEDING**
Manufacturers advise use only if essential—small amount present in milk.

**PRESCRIBING AND DISPENSING INFORMATION**
Modified-release capsules should be dispensed in original container (pack contains a desiccant) and any capsules remaining should be discarded 6 weeks after opening.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Clopidogrel and modified-release dipyridamole in the prevention of occlusive vascular events (December 2010) NICE TA210
  The guidance applies to patients who have had an occlusive vascular event, or who have established peripheral arterial disease. The guidance does not apply to patients who have had, or are at risk of, stroke associated with atrial fibrillation, or who need prophylaxis for occlusive events following coronary revascularisation or carotid artery procedures.
  Modified-release dipyridamole, in combination with aspirin, is recommended as an option to prevent occlusive vascular events in patients who have had:
  - a transient ischaemic attack, or
  - an ischaemic stroke, only if clopidogrel is contra-indicated or not tolerated.
  Modified-release dipyridamole monotherapy is recommended as an option to prevent occlusive vascular events in patients who have had:
  - an ischaemic stroke, only if aspirin and clopidogrel are contra-indicated or not tolerated, or
  - a transient ischaemic attack, only if aspirin is contra-indicated or not tolerated.

Apixaban

**DRUG ACTION**  Apixaban is a direct inhibitor of activated factor X (factor Xa).

**INDICATIONS AND DOSE**

- **Prophylaxis of venous thromboembolism following knee replacement surgery**
  - By mouth
  - Adult: 2.5 mg twice daily for 10–14 days, to be started 12–24 hours after surgery

- **Prophylaxis of venous thromboembolism following hip replacement surgery**
  - By mouth
  - Adult: 2.5 mg twice daily for 32–38 days, to be started 12–24 hours after surgery

- **Treatment of deep-vein thrombosis | Treatment of pulmonary embolism**
  - By mouth
  - Adult: Initially 10 mg twice daily for 7 days, then maintenance 5 mg twice daily

- **Prophylaxis of recurrent deep-vein thrombosis | Prophylaxis of recurrent pulmonary embolism**
  - By mouth
  - Adult: 2.5 mg twice daily, following completion of 6 months anticoagulant treatment

- **Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and at least one risk factor (such as previous stroke or transient ischaemic attack, symptomatic heart failure, diabetes mellitus, hypertension, or age 75 years and over)**
  - By mouth
  - Adult: 5 mg twice daily, reduce dose to 2.5 mg twice daily in patients with at least two of the following characteristics: age 80 years and over, body-weight less than 61 kg, or serum creatinine 133 micromol/litre and over

**DOSE EQUIVALENCE AND CONVERSION**

- For information on changing from, or to, other anticoagulants, consult product literature.

**CONTRA-INDICATIONS**  Active, clinically significant bleeding · risk factors for major bleeding

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- Risk factors for major bleeding  Manufacturer advises avoid in conditions with significant risk factors for major bleeding, including current or recent gastrointestinal ulceration, malignant neoplasms at high risk of bleeding, recent brain, spinal or ophthalmic surgery, recent intracranial haemorrhage, known or suspected oesophageal varices, arteriovenous malformations, vascular aneurysms or major intrasplanchnic or intracerebral vascular abnormalities.

**CAUTIONS**

- Anaesthesia with postoperative indwelling epidural catheter (risk of paralyis—monitor neurological signs and wait 20–30 hours after apixaban dose before removing catheter and do not give next dose until at least 5 hours after catheter removal) · prosthetic heart valve (efficacy not established) · risk of bleeding

**INTERACTIONS**  → Appendix 1: apixaban

**SIDE-EFFECTS**

- Common or very common  Anaemia · bruising · haemorrhage · nausea
- Uncommon  Hypotension · rash · thrombocytopenia

**PREGNANCY**  Manufacturer advises avoid—no information available.

**BREAST FEEDING**  Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**  Manufacturer advises use with caution in mild-to-moderate impairment; avoid in severe impairment and in hepatic disease associated with coagulopathy and clinically relevant bleeding risk.

**RENAL IMPAIRMENT**

- When used for prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation, reduce dose to 2.5 mg twice daily if serum-creatinine 133 micromol/litre and over is associated with age 80 years and over or body-weight less than 61 kg; reduce dose to 2.5 mg twice daily if creatinine clearance 15–29 mL/minute.

- When used for prophylaxis of venous thromboembolism following knee or hip replacement surgery, prophylaxis of recurrent deep-vein thrombosis or pulmonary embolism, and treatment of deep-vein thrombosis or pulmonary embolism, use with caution if creatinine clearance 15–29 mL/minute. Manufacturer advises avoid if creatinine clearance less than 15 mL/minute—no information available.

**MONITORING REQUIREMENTS**

- Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
- No routine anticoagulant monitoring required (INR tests are unreliable).

**PRESCRIBING AND DISPENSING INFORMATION**

- Duration of treatment should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e recent surgery, trauma, immobolisation.

- Apixaban should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolyis or pulmonary embolectomy.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- **Apixaban for the prevention of venous thromboembolism after total hip or knee replacement in adults (January 2012) NICE TA245**
  
  Apixaban is an option for the prevention of venous thromboembolism in adults after elective hip or knee replacement surgery.
  
  www.nice.org.uk/TA245

- **Apixaban for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation (February 2013) NICE TA275**
  
  Apixaban is an option for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation in accordance with its licensed indication; with one or more of the following risk factors:
  - previous stroke or transient ischaemic attack
  - symptomatic heart failure
  - age ≥ 75 years
  - diabetes mellitus
  - hypertension
  
  The risks and benefits of apixaban compared to warfarin, dabigatran etexilate, and rivaroxaban should be discussed with the patient.
  
  www.nice.org.uk/TA275

- **Apixaban for the treatment and secondary prevention of deep vein thrombosis and/or pulmonary embolism (June 2015) NICE TA341**
  
  Apixaban is an option for the treatment and prevention of recurrent deep vein thrombosis and pulmonary embolism in adults.
  
  www.nice.org.uk/TA341
EDOXaban

EDOXaban is a direct and reversible inhibitor of activated factor X (factor Xa), which prevents conversion of prothrombin to thrombin and prolongs clotting time, thereby reducing the risk of thrombus formation.

INDICATIONS AND DOSE
Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation, in patients with at least one risk factor (such as congestive heart failure, hypertension, aged 75 years and over, diabetes mellitus, previous stroke or transient ischaemic attack)

- BY MOUTH
  - Adult (body-weight up to 61 kg): 30 mg once daily
  - Adult (body-weight 61 kg and above): 60 mg once daily

Treatment of deep-vein thrombosis | Prophylaxis of recurrent deep-vein thrombosis | Treatment of pulmonary embolism | Prophylaxis of recurrent pulmonary embolism

- BY MOUTH
  - Adult (body-weight up to 61 kg): 30 mg once daily, duration of treatment adjusted according to risk factors—consult product literature, treatment should follow initial use of parenteral anticoagulant for at least 5 days
  - Adult (body-weight 61 kg and above): 60 mg once daily, duration of treatment adjusted according to risk factors—consult product literature, treatment should follow initial use of parenteral anticoagulant for at least 5 days

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Manufacturer advises max. dose of 30 mg once daily with concurrent ciclosporin, dronedarone, erythromycin, or ketoconazole.

DOSE EQUIVALENCE AND CONVERSION
- For information on changing from, or to, other anticoagulants, consult product literature.

CONTRA-INDICATIONS
Active bleeding · arteriovenous malformations · current or recent gastrointestinal ulceration · hepatic disease (associated with coagulopathy and clinically relevant bleeding risk) · known or suspected oesophageal varices · major intraspinal or intracerebral vascular abnormalities · presence of malignant neoplasms at high risk of bleeding · recent brain or spinal injury · recent brain, spinal or ophthalmic surgery · recent intracranial haemorrhage · uncontrolled severe hypertension · vascular aneurysms

CONTRA-INDICATIONS, FURTHER INFORMATION
- Risk for major bleeding. Edoxaban treatment is contra-indicated in patients with significant risk factors for major bleeding, these include those listed above.

CAUTIONS
Moderate to severe mitral stenosis (safety and efficacy not established) · prosthetic heart valve (safety and efficacy not established) · risk of bleeding · surgery

CAUTIONS, FURTHER INFORMATION
- Surgery Manufacturer recommends to discontinue treatment at least 24 hours before a surgical procedure;

the risk of bleeding should be weighed against the urgency of the intervention—consult product literature.

INTERACTIONS
- Appendix 1: edoxaban

SIDE-EFFECTS
- Common or very common Anaemia · epistaxis · haemorrhage · nausea · pruritus · rash
- Uncommon Urticaria
- Rare Allergic oedema

SIDE-EFFECTS, FURTHER INFORMATION
- Management of bleeding. Should a bleeding complication arise in a patient receiving edoxaban, the manufacturer recommends to delay the next dose or treatment should be discontinued as appropriate.

PREGNANCY
Manufacturer advises avoid—toxicity in animal studies.

BREAST FEEDING
Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
Manufacturer advises avoid in severe impairment; use with caution in mild to moderate impairment.

RENAL IMPAIRMENT
Manufacturer advises reduce dose to 30 mg once daily in moderate to severe impairment; avoid in end-stage renal disease or in patients undergoing dialysis.

MONITORING REQUIREMENTS
- Manufacturer advises monitor renal function before treatment and when clinically indicated during treatment; monitor hepatic function before treatment and repeat periodically if treatment duration longer than 1 year.
- Manufacturer advises monitor for signs of mucosal bleeding and anaemia in patients at increased risk; treatment should be stopped if severe bleeding occurs.
- No routine anticoagulant monitoring required (INR tests are unreliable).

PATIENT AND CARER ADVICE
Patients should be provided with an alert card and advised to keep it with them at all times.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
- Edoxaban for treating and preventing deep vein thrombosis and pulmonary embolism (August 2015) NICE TA354
  Edoxaban (Lixiana®) is recommended as an option for treating and preventing recurrent deep vein thrombosis and pulmonary embolism.
  www.nice.org.uk/guidance/ta354
- Edoxaban for preventing stroke and systemic embolism in non-valvular atrial fibrillation (September 2015) NICE TA355
  Edoxaban (Lixiana®) is an option for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation, with one or more of the following risk factors:
  - previous stroke or transient ischaemic attack
  - congestive heart failure
  - age ≥75 years
  - diabetes mellitus
  - hypertension
  The risks and benefits of edoxaban treatment compared to warfarin, apixaban, dabigatran etexilate, and rivaroxaban should be discussed with the patient.

MEDICINAL FORMS
There will be variation in the licensing of different medicines containing the same drug.

Tablet
- Lixiana (Daiichi Sankyo UK Ltd)
  - Edoxaban (as Edoxaban tosilate) 15 mg Lixiana 15mg tablets | 10 tablet [P] £18.50 DT price = £18.50
  - Edoxaban (as Edoxaban tosilate) 30 mg Lixiana 30mg tablets | 28 tablet [P] £51.80 DT price = £51.80
  - Edoxaban (as Edoxaban tosilate) 60 mg Lixiana 60mg tablets | 28 tablet [P] £51.80 DT price = £51.80
Fondaparinux sodium

**DRUG ACTION** Fondaparinux sodium is a synthetic pentasaccharide that inhibits activated factor X.

**INDICATIONS AND DOSE**

**Prophylaxis of venous thromboembolism in patients after undergoing major orthopaedic surgery of the hip or leg, or abdominal surgery**
- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 2.5 mg, dose to be given 6 hours after surgery, then 2.5 mg once daily

**Prophylaxis of venous thromboembolism in medical patients immobilised because of acute illness**
- **BY SUBCUTANEOUS INJECTION**
  - Adult: 2.5 mg once daily

**Treatment of superficial-vein thrombosis**
- **BY SUBCUTANEOUS INJECTION**
  - Adult (body-weight 50 kg and above): 2.5 mg once daily for at least 30 days (max. 45 days if high risk of thromboembolic complications), treatment should be stopped 24 hours before surgery and restarted at least 6 hours post operatively

**Treatment of unstable angina and non-ST-segment elevation myocardial infarction**
- **BY SUBCUTANEOUS INJECTION**
  - Adult: 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner), treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively

**Treatment of ST-segment elevation myocardial infarction**
- **INITIALLY BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: Initially 2.5 mg daily for the first day, then (by subcutaneous injection) 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner), treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively

**Treatment of deep-vein thrombosis and pulmonary embolism**
- **BY SUBCUTANEOUS INJECTION**
  - Adult (body-weight up to 50 kg): 5 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be discontinued for at least 5 days and until INR ≥ 2 for at least 24 hours)
  - Adult (body-weight 50-100 kg): 7.5 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be discontinued for at least 5 days and until INR ≥ 2 for at least 24 hours)
  - Adult (body-weight 101 kg and above): 10 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be discontinued for at least 5 days and until INR ≥ 2 for at least 24 hours)

**CONTRA-INDICATIONS** Active bleeding • bacterial endocarditis

**CAUTIONS** Active gastro-intestinal ulcer disease • bleeding disorders • brain surgery • elderly patients • low body-weight • ophthalmic surgery • recent intracranial haemorrhage • risk of catheter thrombus during percutaneous coronary intervention • spinal or epidural anaesthesia (risk of spinal haematoma—avoid if using treatment doses) • spinal surgery

**INTERACTIONS** ➤ Appendix 1: fondaparinux

**SIDE-EFFECTS**
- Common or very common: Anaemia • bleeding • purpura
- Uncommon: Chest pain • dyspnoea • gastro-intestinal disturbances • hepatic impairment • oedema • pruritus • rash • thrombocythaemia • thrombocytopenia
- Rare: Anxiety • confusion • cough • dizziness • drowsiness • flushing • headache • hyperbilirubinaemia • hypokalaemia • hypotension • injection-site reactions • vertigo

**FREQUENCY NOT KNOWN** Atial fibrillation • pyrexia • tachycardia

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs possible risk—no information available.

**BREAST FEEDING** Present in milk in animal studies—manufacturer advises avoid.

**HEPATIC IMPAIRMENT** Caution in severe impairment (increased risk of bleeding).

**RENAL IMPAIRMENT** Increased risk of bleeding in renal impairment.
- When used for prophylaxis of venous thromboembolism and treatment of superficial-vein thrombosis: Reduce dose to 1.5 mg daily if eGFR 20–50 mL/minute/1.73 m².
- When used for treatment of acute coronary syndromes or prophylaxis of venous thromboembolism and treatment of superficial-vein thrombosis: Avoid if eGFR less than 20 mL/minute/1.73 m².
- When used for treatment of venous thromboembolism: Use with caution if eGFR 30–50 mL/minute/1.73 m², avoid if eGFR less than 30 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Arixtra®), give intermittently in Sodium chloride 0.9%. For ST-segment elevation myocardial infarction, add requisite dose to 25–50 mL infusion fluid and give over 1–2 minutes.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Fondaparinux sodium (Non-proprietary)**
  - Fondaparinux sodium 5 mg per 1 ml
  - Fondaparinux sodium 5 mg/0.5ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PSt) £59.65
  - Fondaparinux sodium 12.5 mg per 1 ml
  - Fondaparinux sodium 10mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PSt) £110.70
  - Fondaparinux sodium 5mg/0.4ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PSt) £110.70
  - Arixtra (Aspen Pharma Trading Ltd)
  - Arixtra 2.5mg/0.5ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PSt) £62.79
  - Arixtra 1.5mg/0.3ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PSt) £62.79 (Hospital only)
  - Fondaparinux sodium 12.5 mg per 1 ml
  - Arixtra 7.5mg/0.6ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PSt) £116.53
  - Arixtra 5mg/0.4ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PSt) £116.53
  - Arixtra 10mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PSt) £116.53

Rivaroxaban

**DRUG ACTION** Rivaroxaban is a direct inhibitor of activated factor X (factor Xa).

**INDICATIONS AND DOSE**

**Prophylaxis of venous thromboembolism following knee replacement surgery**
- **BY MOUTH**
  - Adult: 10 mg once daily for 2 weeks, to be started 6–10 hours after surgery
Prophylaxis of venous thromboembolism following hip replacement surgery
- **BY MOUTH**
- Adult: 10 mg once daily for 5 weeks, to be started 6–10 hours after surgery

Initial treatment of deep-vein thrombosis | Initial treatment of pulmonary embolism
- **BY MOUTH**
- Adult: Initially 15 mg twice daily for 21 days, to be taken with food

Continued treatment of deep-vein thrombosis (following initial treatment) | Continued treatment of pulmonary embolism (following initial treatment) | Prophylaxis of recurrent deep-vein thrombosis | Prophylaxis of recurrent pulmonary embolism
- **BY MOUTH**
- Adult: 20 mg once daily, to be taken with food

Prophylaxis of stroke and systemic embolism in patients with non-valvular atrial fibrillation and with at least one of the following risk factors: congestive heart failure, hypertension, previous stroke or transient ischaemic attack, age ≥ 75 years, or diabetes mellitus
- **BY MOUTH**
- Adult: 20 mg once daily, to be taken with food

Prophylaxis of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers (in combination with aspirin alone or aspirin and clopidogrel)
- **BY MOUTH**
- Adult: 2.5 mg twice daily usual duration 12 months

DOSE EQUIVALENCE AND CONVERSION
- For information on changing from, or to, other DOSE EQUIVALENCE AND CONVERSION

CONTRA-INDICATIONS
- Active bleeding
- In acute coronary syndrome—previous stroke
- In acute coronary syndrome—transient ischaemic attack
- Malignant neoplasms
- Oesophageal varices
- Recent brain surgery
- Recent gastrointestinal ulcer
- Recent intracranial haemorrhage
- Recent ophthalmic surgery
- Recent spine surgery
- Significant risk of major bleeding
- Vascular aneurysm

CAUTIONS
- Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis)
- Monitor neurological signs and wait at least 18 hours after rivaroxaban dose before removing catheter and do not give next dose until at least 6 hours after catheter removal
- Bronchiectasis
- Prosthetic heart valve (efficacy not established)
- Risk of bleeding
- Rivaroxaban should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy
- Severe hypertension
- Vascular retinopathy

INTERACTIONS
- Appendix 1: rivaroxaban

SIDE-EFFECTS
- Common or very common
  - Abdominal pain
  - Constipation
  - Diarrhoea
  - Dizziness
  - Dyspepsia
  - Haemorrhage
  - Headache
  - Hypotension
  - Nausea
  - Pain in extremities
  - Pruritus
  - Rash
  - Renal impairment
  - Vomiting
- Uncommon
  - Angioedema
  - Dry mouth
  - Malaise
  - Syncope
  - Tachycardia
  - Thrombocytopenia
- Rare
  - Jaundice
  - Oedema

PREGNANCY
- Manufacturer advises avoid—Toxicity in animal studies.

BREAST FEEDING
- Manufacturer advises avoid—Present in milk in animal studies.

HEPATIC IMPAIRMENT
- Avoid in liver disease with coagulopathy.

RENAL IMPAIRMENT
- When used for treatment of deep-vein thrombosis or pulmonary embolism and prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism, initially 15 mg twice daily for 21 days, then 20 mg once daily (but consider reducing to 15 mg once daily if risk of bleeding outweighs risk of recurrent deep-vein thrombosis or pulmonary embolism) if creatinine clearance 15–49 mL/minute.

For prophylaxis of stroke and systemic embolism in atrial fibrillation, reduce dose to 15 mg once daily if creatinine clearance 15–49 mL/minute.

When used for prophylaxis of venous thromboembolism following knee or hip replacement surgery and prophylaxis of atherothrombotic events in acute coronary syndrome, use with caution if creatinine clearance 15–29 mL/minute.

Use with caution if concomitant use of drugs that increase plasma-rivaroxaban concentration (consult product literature).

Avoid if creatinine clearance less than 15 mL/minute; manufacturer recommends Cockcroft and Gault formula to calculate creatinine clearance.

MONITORING REQUIREMENTS
- Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
- No routine anticoagulant monitoring required (INR tests are unreliable).

DIRECTIONS FOR ADMINISTRATION
- Tablets may be crushed and mixed with water or apple puree just before administration.

PRESCRIBING AND DISPENSING INFORMATION
- Low-dose rivaroxaban, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers. Treatment should be started as soon as possible after the patient has been stabilised following the acute coronary event, at the earliest 24 hours after admission to hospital, and at the time when parenteral anticoagulation therapy would normally be discontinued; the usual duration of treatment is 12 months.

NATIONAL FUNDING/ACCESS DECISIONS
- NICE technology appraisals (TAs)
  - Rivaroxaban for the prevention of venous thromboembolism after total hip or total knee replacement in adults (April 2009) NICE TA170
  - Rivaroxaban is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery.
  - www.nice.org.uk/TA170
  - Rivaroxaban for the prevention of stroke and systemic embolism in atrial fibrillation (May 2012) NICE TA256
  - Rivaroxaban is an option for the prevention of stroke and systemic embolism (in accordance with its licensed indication) in patients with non-valvular atrial fibrillation and with at least one of the following risk factors:
    - Previous stroke or transient ischaemic attack
    - Congestive heart failure
    - Age ≥75 years
    - Diabetes mellitus
    - Hypertension
  - The risks and benefits of rivaroxaban compared with warfarin should be discussed with the patient.
  - www.nice.org.uk/TA256
  - Rivaroxaban for the treatment of deep-vein thrombosis and prevention of recurrent deep-vein thrombosis and pulmonary embolism (July 2012) NICE TA261
  - Rivaroxaban is an option for the treatment of deep-vein thrombosis and prevention of recurrent deep-vein thrombosis and pulmonary embolism in adults after diagnosis of acute deep-vein thrombosis.
  - www.nice.org.uk/TA261

BNF 74
Blood clots
Rivaroxaban for treating pulmonary embolism and preventing recurrent venous thromboembolism (June 2013) NICE TA287
Rivaroxaban is an option for treating pulmonary embolism and preventing recurrent deep-vein thrombosis and pulmonary embolism in adults.
www.nice.org.uk/TA287

Rivaroxaban for preventing adverse outcomes after acute management of acute coronary syndrome (March 2015) NICE TA335
Rivaroxaban is an option within its marketing authorisation, in combination with aspirin plus clopidogrel or aspirin alone, for preventing atherothrombotic events in patients who have had an acute coronary syndrome with elevated cardiac biomarkers.

The patient’s risk of bleeding should be carefully assessed before treatment is initiated and the risks and benefits of rivaroxaban in combination with aspirin plus clopidogrel or with aspirin alone, compared with aspirin plus clopidogrel or aspirin alone should be discussed with the patient.

A decision on continuation of treatment should be taken no later than 12 months after starting treatment.

www.nice.org.uk/TA335

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (January 2012) that rivaroxaban (Xarelto®) is accepted for restricted use within NHS Scotland for the prevention of stroke and systemic embolism in accordance with the licensed indication; use is restricted to patients with poor INR control despite compliance with coumarin anticoagulant therapy, or to patients who are allergic to, or unable to tolerate, a coumarin anticoagulant.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

ANTITHROMBOTIC DRUGS ▶ HEPARINOIDS

Danaparoid sodium

INDICATIONS AND DOSE
Prevention of deep-vein thrombosis in general or orthopaedic surgery

- BY SUBCUTANEOUS INJECTION
- Adult: 750 units twice daily for 7–10 days, initiate treatment before operation, with last pre-operative dose 1–4 hours before surgery

Thromboembolic disease in patients with history of heparin-induced thrombocytopenia

- INITIALLY BY INTRAVENOUS INJECTION
- Adult (body-weight up to 55 kg): Initially 1250 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days
- Adult (body-weight > 55–89 kg): Initially 2500 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days

CONTRA-INDICATIONS

- Active peptic ulcer (unless this is the reason for operation), acute bacterial endocarditis, diabetic retinopathy, epidural anaesthesia (with treatment doses), haemophilia and other haemorrhagic disorders, recent cerebral haemorrhage, severe hypertension, spinal anaesthesia (with treatment doses), thrombocytopenia (unless patient has heparin-induced thrombocytopenia)

CAUTIONS

- Antibodies to heparins (risk of antibody-induced thrombocytopenia), body-weight over 90 kg, recent bleeding, risk of bleeding

INTERACTIONS ▶ Appendix 1: danaparoid

SIDE-EFFECTS

- Bleeding, hypersensitivity reactions, rash

PREGNANCY

- Manufacturer advises avoid—limited information available but not known to be harmful

BREAST FEEDING

- Amount probably too small to be harmful but manufacturer advises avoid

HEPATIC IMPAIRMENT

- Caution in moderate impairment (increased risk of bleeding), avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available

RENAI IMPAIRMENT

- Use with caution in moderate impairment, avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available, increased risk of bleeding in renal impairment, monitor anti-Factor Xa activity

MONITORING REQUIREMENTS

- Monitor anti factor Xa activity in patients with body-weight over 90 kg

DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (Orgaran®), give continuously in Glucose 5% or Sodium chloride 0.9%.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Danaparoid sodium (Non-proprietary)
  - Danaparoid sodium 1250 unit per 1 ml Danaparoid sodium 750 units/0.6ml solution for injection ampoules | 10 ampoule POM £599.99

ANTITHROMBOTIC DRUGS ▶ HEPARINS

Heparins

- CONTRA-INDICATIONS
  - Acute bacterial endocarditis, major trauma, epidural anaesthesia with treatment doses, haemophilia and other haemorrhagic disorders, peptic ulcer, recent cerebral haemorrhage, recent surgery to eye, recent surgery to nervous system, severe hypertension, spinal anaesthesia with treatment doses, thrombocytopenia (including history of heparin-induced thrombocytopenia)

- CAUTIONS
  - Elderly

- SIDE-EFFECTS
  - Rare: Alopecia (on prolonged use), anaphylaxis, angioedema, hyperkalaemia, hypersensitivity reactions, injection-site reactions, osteoporosis (risk lower with low molecular weight heparins), priapism, rebound hyperlipidaemia (following unfractionated heparin withdrawal), skin necrosis, urticaria
  - Frequency not known: Haemorrhage, thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION

- Haemorrhage: If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight

downloaded from www.medicalbr.com
heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

- **Heparin-induced thrombocytopenia** Clinically important heparin-induced thrombocytopenia is immune-mediated and does not usually develop until after 5–10 days; it can be complicated by thrombosis.

  Signs of heparin-induced thrombocytopenia include a 30% reduction of platelet count, thrombosis, or skin allergy. If heparin-induced thrombocytopenia is strongly suspected or confirmed, the heparin should be stopped and an alternative anticoagulant, such as danaparoid, should be given. Ensure platelet counts return to normal range in those who require warfarin.

- **Hyperkalaemia** Inhibition of aldosterone secretion by unfractionated or low molecular weight heparin can result in hyperkalaemia; patients with diabetes mellitus, chronic renal failure, acidosis, raised plasma potassium or those taking potassium-sparing drugs seem to be more susceptible. The risk appears to increase with duration of therapy.

  **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity to unfractionated or low molecular weight heparin.

- **MONITORING REQUIREMENTS**

  - **Heparin-induced thrombocytopenia** Platelet counts should be measured just before treatment with unfractionated or low molecular weight heparin, and regular monitoring of platelet counts may be required if given for longer than 4 days. See the British Society for Haematology’s Guidelines on the diagnosis and management of heparin-induced thrombocytopenia: second edition. Br J Haematol 2012; 159: 528–540.

  - **Hyperkalaemia** Plasma-potassium concentration should be measured in patients at risk of hyperkalaemia before starting the heparin and monitored regularly thereafter, particularly if treatment is to be continued for longer than 7 days.

**Treatment of deep-vein thrombosis, with oral anticoagulant treatment (in patients at increased risk of haemorrhage)** | Treatment of pulmonary embolism, with oral anticoagulant treatment (in patients at increased risk of haemorrhage) |
| ► **BY SUBCUTANEOUS INJECTION** |
| ► Adult: 100 units/kg twice daily until adequate oral anticoagulation established |

- **Unstable coronary artery disease** | **BY SUBCUTANEOUS INJECTION** |
| ► Adult: 120 units/kg every 12 hours (max. per dose 10 000 units twice daily) for 5–8 days |

- **Prevention of clotting in extracorporeal circuits** | **TO THE DEVICE AS A FLUSH** |
| ► Adult: (consult product literature) |

### FRAGMIN ® GRADUATED SYRINGES

- **Unstable coronary artery disease (including non-ST-segment-elevation myocardial infarction)** |
  - **BY SUBCUTANEOUS INJECTION** |
  - Adult: 120 units/kg every 12 hours (max. per dose 10 000 units twice daily) for up to 8 days

- **Patients with unstable coronary artery disease (including non-ST-segment-elevation myocardial infarction)** |
  - **BY SUBCUTANEOUS INJECTION** |
  - Adult (body-weight up to 70 kg and male): 5000 units every 12 hours until the day of the procedure (max. 45 days).
  - Adult (body-weight up to 80 kg and female): 5000 units every 12 hours until the day of the procedure (max. 45 days).
  - Adult (body-weight 70 kg and above and male): 7500 units every 12 hours until the day of the procedure (max. 45 days).
  - Adult (body-weight 80 kg and above and female): 7500 units every 12 hours until the day of the procedure (max. 45 days).

### FRAGMIN ® SINGLE-DOSE SYRINGES

- **Prophylaxis of deep-vein thrombosis in surgical patients—moderate risk** |
  - **BY SUBCUTANEOUS INJECTION** |
  - Adult: Initially 2500 units for 1 dose, dose to be given 1–2 hours before surgery, then 2500 units every 24 hours

- **Prophylaxis of deep-vein thrombosis in surgical patients—high risk** |
  - **BY SUBCUTANEOUS INJECTION** |
  - Adult: Initially 2500 units for 1 dose, dose to be administered 1–2 hours before surgery, followed by 2500 units after 8–12 hours, then 5000 units every 24 hours, alternatively initially 5000 units for 1 dose, dose to be given on the evening before surgery, followed by 5000 units after 24 hours, then 5000 units every 24 hours

- **Prophylaxis of deep-vein thrombosis in medical patients** |
  - **BY SUBCUTANEOUS INJECTION** |
  - Adult: 5000 units every 24 hours

- **Treatment of deep-vein thrombosis, with oral anticoagulant treatment** | **TREATMENT OF PULMONARY EMBOLISM, WITH ORAL ANTICOAGULANT TREATMENT** |
  - **BY SUBCUTANEOUS INJECTION** |
  - Adult (body-weight up to 46 kg): 7500 units once daily until adequate oral anticoagulation established
  - Adult (body-weight 46–56 kg): 10 000 units once daily until adequate oral anticoagulation established
  - Adult (body-weight 57–68 kg): 12 500 units once daily until adequate oral anticoagulation established
  - Adult (body-weight 69–82 kg): 15 000 units once daily until adequate oral anticoagulation established
  - Adult (body-weight 83 kg and above): 18 000 units once daily until adequate oral anticoagulation established

- **Extended treatment and prophylaxis of venous thromboembolism in patients with solid tumours** |
  - **BY SUBCUTANEOUS INJECTION** |
  - Adult (body-weight 40–45 kg): 7500 units once daily for 30 days, then 7500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
  - Adult (body-weight 46–56 kg): 10 000 units once daily for 30 days, then 7500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
Routine monitoring of anti-Factor Xa activity is not required during treatment of deep-vein thrombosis and of pulmonary embolism; blood should be taken 3–4 hours after a dose (recommended plasma concentration of anti-Factor Xa 0.5–1 unit/mL); monitoring not required for once-daily treatment regimen and not generally necessary for twice-daily regimen.

Routine monitoring of anti-Factor Xa activity is not usually required during treatment with dalteparin, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are overweight or obese).

**INDICATIONS AND DOSE**

**Treatment of venous thromboembolism in pregnancy**

- **BY SUBCUTANEOUS INJECTION**
  - Adult (body-weight up to 50 kg): 5000 units twice daily, use body-weight in early pregnancy to calculate the dose
  - Adult (body-weight 50–69 kg): 6000 units twice daily, use body-weight in early pregnancy to calculate the dose
  - Adult (body-weight 70–89 kg): 8000 units twice daily, use body-weight in early pregnancy to calculate the dose
  - Adult (body-weight 90 kg and above): 10 000 units twice daily, use body-weight in early pregnancy to calculate the dose

**Prophylaxis of deep-vein thrombosis, especially in surgical patients—moderate risk**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 20 mg for 1 dose, dose to be given approximately 2 hours before surgery, then 20 mg every 24 hours

**Prophylaxis of deep-vein thrombosis, especially surgical patients—high risk (e.g. orthopaedic surgery)**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 40 mg for 1 dose, dose to be given 12 hours before surgery, then 40 mg every 24 hours

**Prophylaxis of deep-vein thrombosis in medical patients**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 40 mg every 24 hours

**Treatment of deep-vein thrombosis | Treatment of pulmonary embolism**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 1.5 mg/kg every 24 hours until adequate oral anticoagulation established

**Treatment of acute ST-segment elevation myocardial infarction (patients not undergoing percutaneous coronary intervention)**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult 18–74 years: Initially 30 mg, followed by (by subcutaneous injection) 1 mg/kg for 1 dose, then (by subcutaneous injection) 1 mg/kg every 12 hours (max. per dose 100 mg) for up to 8 days, maximum dose applies for the first two subcutaneous doses only

continued →

**Enoxaparin sodium**

**INDICATIONS AND DOSE**

**Treatment of venous thromboembolism in pregnancy**

- **BY SUBCUTANEOUS INJECTION**
  - Adult (body-weight up to 50 kg): 40 mg twice daily, dose based on early pregnancy body-weight
  - Adult (body-weight 50–69 kg): 60 mg twice daily, dose based on early pregnancy body-weight
  - Adult (body-weight 70–89 kg): 80 mg twice daily, dose based on early pregnancy body-weight
  - Adult (body-weight 90 kg and above): 100 mg twice daily, dose based on early pregnancy body-weight

**Prophylaxis of deep-vein thrombosis, especially in surgical patients—moderate risk**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 20 mg for 1 dose, dose to be given approximately 2 hours before surgery, then 20 mg every 24 hours

**Prophylaxis of deep-vein thrombosis, especially surgical patients—high risk (e.g. orthopaedic surgery)**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 40 mg for 1 dose, dose to be given 12 hours before surgery, then 40 mg every 24 hours

**Prophylaxis of deep-vein thrombosis in medical patients**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 40 mg every 24 hours

**Treatment of deep-vein thrombosis | Treatment of pulmonary embolism**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 1.5 mg/kg every 24 hours until adequate oral anticoagulation established

**Treatment of acute ST-segment elevation myocardial infarction (patients not undergoing percutaneous coronary intervention)**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult 18–74 years: Initially 30 mg, followed by (by subcutaneous injection) 1 mg/kg for 1 dose, then (by subcutaneous injection) 1 mg/kg every 12 hours (max. per dose 100 mg) for up to 8 days, maximum dose applies for the first two subcutaneous doses only

continued →
Blood clots

128

BY SUBCUTANEOUS INJECTION

Adult 75 years and over: 750 micrograms/kg every 12 hours (max. per dose 75 mg), maximum dose applies for the first two doses only.

Treatment of acute ST-segment elevation myocardial infarction (patients undergoing percutaneous coronary intervention)

INITIALLY BY INTRAVENOUS INJECTION

Adult 18–74 years: Initially 30 mg, followed by (by subcutaneous injection) 1 mg/kg for 1 dose, then (by subcutaneous injection) 1 mg/kg every 12 hours (max. per dose 100 mg) for up to 8 days, maximum dose applies for the first two subcutaneous doses only, then (by intravenous injection) 300 micrograms/kg for 1 dose, to be given at the time of procedure if the last subcutaneous dose was given more than 8 hours previously.

INITIALLY BY SUBCUTANEOUS INJECTION

Adult 75 years and over: 750 micrograms/kg every 12 hours (max. per dose 75 mg), maximum dose applies for the first two doses only, then (by intravenous injection) 300 micrograms/kg for 1 dose, to be given at the time of procedure if the last subcutaneous dose was given more than 8 hours previously.

Prevention of clotting in extracorporeal circuits

TO THE DEVICE AS A FLUSH

Adult: (consult product literature)

DOSE EQUIVALENCE AND CONVERSION

1 mg equivalent to 100 units.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

Clexane (Sanofi)

Enoxaparin sodium 100 mg per 1 ml

Clexane 60mg/0.6ml solution for injection pre-filled syringes | 10 pre-filled disposable injection £39.26 DT price = £39.26

Clexane 300mg/3ml solution for injection multidose vials | 1 vial £21.23

Clexane 80mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection £55.13 DT price = £55.13

Clexane 40mg/0.4ml solution for injection pre-filled syringes | 10 pre-filled disposable injection £30.27 DT price = £30.27

Clexane 100mg/1ml solution for injection pre-filled syringes | 10 pre-filled disposable injection £72.30 DT price = £72.30

Clexane 20mg/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection £20.86 DT price = £20.86

Enoxaparin sodium 150 mg per 1 ml

Clexane Forte 120mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection £87.93 DT price = £87.93

Clexane Forte 150mg/1ml solution for injection pre-filled syringes | 10 pre-filled disposable injection £99.91 DT price = £99.91

Heparin (unfractionated)

INDICATIONS AND DOSE

Treatment of mild to moderate pulmonary embolism

Treatment of unstable angina

Treatment of acute peripheral arterial occlusion

INITIALLY BY INTRAVENOUS INJECTION

Adult: Loading dose 5000 units, alternatively (by intravenous injection) loading dose 75 units/kg, followed by (by continuous intravenous infusion) 18 units/kg/hour, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly.

Treatment of severe pulmonary embolism

INITIALLY BY INTRAVENOUS INJECTION

Adult: Loading dose 10 000 units, followed by (by continuous intravenous infusion) 18 units/kg/hour, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly.

Treatment of deep-vein thrombosis

INITIALLY BY INTRAVENOUS INJECTION

Adult: Loading dose 5000 units, alternatively (by intravenous injection) loading dose 75 units/kg, followed by (by continuous intravenous infusion) 18 units/kg/hour, alternatively (by subcutaneous injection) 15 000 units every 12 hours, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly.

Thromboprophylaxis in medical patients

BY SUBCUTANEOUS INJECTION

Adult: 5000 units every 8–12 hours.

Thromboprophylaxis in surgical patients

BY SUBCUTANEOUS INJECTION

Adult: 5000 units for 1 dose, to be taken 2 hours before surgery, then 5000 units every 8–12 hours.

Thromboprophylaxis during pregnancy

BY SUBCUTANEOUS INJECTION

Adult: 5000–10 000 units every 12 hours, to be administered with monitoring, Important: prevention of prosthetic heart-valve thrombosis in pregnancy calls for specialist management.

Haemodialysis

INITIALLY BY INTRAVENOUS INJECTION

Adult: Initially 1000–5000 units, followed by (by continuous intravenous infusion) 250–1000 units/hour.
Heparin (unfractionated) (Non-proprietary)

Infusion

- Heparin (unfractionated) (Non-proprietary)
  - Heparin sodium 2 unit per 1 ml
    - Heparin sodium 1,000 units/500 ml infusion Viaflex bags | 1 bag (POM) no price available
  - Heparin sodium 2,000 units/1,000 ml infusion Viaflex bags | 1 bag (POM) no price available

- Heparin sodium 5 unit per 1 ml
  - Heparin sodium 5,000 units/1 litre infusion Viaflex bags | 1 bag (POM) no price available

PREPARATIONS

- Solution for injection
  - Heparin (unfractionated) (Non-proprietary)
    - Heparin sodium 1000 unit per 1 ml
      - Heparin sodium 1,000 units/1 ml solution for injection ampoules | 10 ampoule (POM) £14.85
      - Heparin sodium 5,000 units/5 ml solution for injection vials | 10 vial (POM) £16.50–£37.47
      - Heparin sodium 20,000 units/20 ml solution for injection ampoules | 10 ampoule (POM) £70.80–£70.88
      - Heparin sodium 5,000 units/5 ml solution for injection ampoules | 10 ampoule (POM) £37.45–£37.47

REDUCTIONS AND DISPENSING INFORMATION

- Doses listed take into account the guidelines of the British Society for Haematology.

INTERACTIONS

- Appendix 1: heparin (unfractionated)
- Appendix 1: low molecular-weight heparins
- Appendix 1: molecular weight heparins

PREGNANCY

- Does not cross the placenta; maternal osteoporosis reported after prolonged use; multidose vials may contain benzyl alcohol—some manufacturers advise avoid.

BREAST FEEDING

- Not excreted into milk due to high molecular weight.

HEPATIC IMPAIRMENT

- Risk of bleeding increased—reduce dose or avoid in severe impairment (including oesophageal varices).

RENAL IMPAIRMENT

- Risk of bleeding increased in severe impairment—dose may need to be reduced.

DIRECTIONS FOR ADMINISTRATION

- For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%; administration with a motorised pump is advisable.

PREPARATIONS

- Solution for injection
  - Heparin (unfractionated) (Non-proprietary)
    - Heparin sodium 1000 unit per 1 ml
      - Heparin sodium 1,000 units/1 ml solution for injection ampoules | 10 ampoule (POM) £14.85
      - Heparin sodium 5,000 units/5 ml solution for injection vials | 10 vial (POM) £16.50–£37.47

      - Heparin sodium 50 units/5 ml I.V. flush solution ampoules | 10 ampoule (POM) £14.96 DT price = £14.96
    - Heparin sodium 100 unit per 1 ml
      - Heparin sodium 200 units/2 ml I.V. flush solution ampoules | 10 ampoule (POM) £15.68 DT price = £15.68
      - Heparin sodium 200 units/2 ml patency solution ampoules | 10 ampoule (POM) £15.68 DT price = £15.68

- Multidose vials
  - Heparin sodium 10,000 units/ml
    - No price available
  - Heparin sodium 20,000 units/ml
    - No price available

INDICATIONS AND DOSE

INNOHEP® 10,000 UNITS/ML

- Prophylaxis of deep-vein thrombosis (general surgery)
  - By subcutaneous injection
    - Adult: 3500 units for 1 dose, to be given 2 hours before surgery, then 3500 units every 24 hours

INNOHEP® 20,000 UNITS/ML

- Extended treatment of venous thromboembolism in patients with solid tumours: Prophylaxis of venous thromboembolism in patients with solid tumours
  - By subcutaneous injection
    - Adult: 175 units/kg once daily for up to 6 months

Tinzaparin sodium

- Treatment of deep-vein thrombosis: Treatment of pulmonary embolism
  - By subcutaneous injection
    - Adult: 175 units/kg once daily until adequate oral anticoagulation established, treatment regimens do not require anticoagulation monitoring

- Treatment of venous thromboembolism in pregnancy
  - By subcutaneous injection
    - Adult: 175 units/kg once daily, dose based on early pregnancy body-weight, treatment regimens do not require anticoagulation monitoring

UNLICENCED USE

- Not licensed for the treatment of venous thromboembolism in pregnancy.

- Appendix 1: low molecular-weight heparins

SIDE-EFFECTS

- Uncommon: Headache

PREGNANCY

- Not known to be harmful, low molecular weight heparins do not cross the placenta. Vials contain benzyl alcohol—manufacturer advises avoid.

BREAST FEEDING

- Due to the relatively high molecular weight of tinzaparin and inactivation in the gastrointestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible; however manufacturer advise avoid.

RENAL IMPAIRMENT

- Manufacturer advises caution if eGFR less than 30 ml/minute/1.73 m². Risk of bleeding may be increased. Unfractionated heparin may be preferable. In renal impairment monitoring of anti-Factor Xa may be required if eGFR less than 30 ml/minute/1.73 m².

- Monitoring requirements: Routine monitoring of anti-Factor Xa activity is not usually required during treatment with tinzaparin, but may be necessary in patients at...
increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).

**Antithrombotic Drugs > Thrombin inhibitors, Direct**

### Argatroban monohydrate

#### Indications and dose

**Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment**

- **Initially by continuous intravenous infusion**
  - Adult: Initially 2 micrograms/kg/minute, dose to be adjusted according to activated partial thromboplastin time, (by intravenous infusion) increased to up to 10 micrograms/kg/minute maximum duration of treatment 14 days

**Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment (for dose in cardiac surgery, percutaneous coronary intervention, or critically ill patients)**

- **By continuous intravenous infusion**
  - Adult: (consult product literature)

**Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment (when initiating concomitant warfarin treatment)**

- **By continuous intravenous infusion**
  - Adult: Reduced to 2 micrograms/kg/minute, dose should be temporarily reduced and INR measured after 4–6 hours; warfarin should be initiated at intended maintenance dose (do not give loading dose of warfarin); consult product literature for further details

---

**Bivalirudin**

#### Indications and dose

**Uncommon** Alopeza • constipation • deafness • diarrhoea • dizziness • fever • gastritis • headache • hepatic failure • hepatomegaly • hiccup • hyperbilirubinaemia • hypertension • hypoglycaemia • hypoponataemia • hypotension • malaise • muscle weakness • myalgia • rash • renal impairment • sweating • syncope • tachycardia • visual disturbance • vomiting

**Pregnancy** Manufacturer advises avoid unless essential—limited information available.

**Breast feeding** Avoid—no information available.

**Hepatic impairment** Reduce initial dose to 500 nanograms/kg/minute in moderate impairment. Avoid in severe impairment or in patients with hepatic impairment undergoing percutaneous coronary intervention.

**Monitoring requirements** Determine activated partial thromboplastin time 2 hours after start of treatment, then 2 or 4 hours after infusion rate altered (consult product literature), and at least once daily thereafter.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Exembol®) give continuously in glucose 5% or sodium chloride 0.9%. Dilute each 2.5-ml vial with 250 ml infusion fluid.
1.75 mg/kg/hour during procedure and for up to 4 hours after procedure, then (by intravenous infusion) reduced to 250 micrograms/kg/hour for a further 4–12 hours if necessary

- **CONTRA-INDICATIONS** Active bleeding - bleeding disorders - severe hypertension - subacute bacterial endocarditis
- **CAUTIONS** Brachytherapy procedures - previous exposure to lepirudin (theoretical risk from lepirudin antibodies)
- **INTERACTIONS** ➔ Appendix 1: bivalirudin
- **SIDE-EFFECTS**
  - Common or very common Bleeding (discontinuation) - ecchymosis
  - Uncommon Allergic reactions - anaemia - headache - hypotension - isolated reports of anaphylaxis - nausea - thrombocytopenia
  - Rare Back pain - bradycardia - dyspnoea - tachycardia - thrombosis - vomiting
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
  - When used for percutaneous coronary intervention  Reduce rate of infusion to 1.4 mg/kg/hour if eGFR 30–60 mL/minute/1.73 m² and monitor blood clotting parameters.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Angiox®), give continuously in Glucose 5% or Sodium chloride 0.9%. Reconstitute each 250-mg vial with 5 mL water for injections then withdraw 5 mL and dilute to 50 mL with infusion fluid.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **BNF 74**

  - **NICE technology appraisals (Tas)**
    - Bivalirudin for the treatment of ST-segment elevation myocardial infarction (July 2011) NICE TA230
      - Bivalirudin in combination with aspirin and clopidogrel is recommended for the treatment of adults with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention. [www.nice.org.uk/TA230](http://www.nice.org.uk/TA230)

  - **Scottish Medicines Consortium (SMC) Decisions**
    - The Scottish Medicines Consortium has advised (November 2008) that bivalirudin (Angiox®) is accepted for restricted use within NHS Scotland for patients with acute coronary syndromes planned for urgent or early intervention who would have been considered for treatment with unfractionated heparin in combination with a glycoprotein IIb/IIIa inhibitor; it should not be used as an alternative to heparin alone.
    - The Scottish Medicines Consortium has advised (August 2010) that bivalirudin (Angiox®) is accepted for restricted use within NHS Scotland as an anticoagulant in patients undergoing percutaneous coronary intervention who would have been considered for treatment with unfractionated heparin in combination with a glycoprotein IIb/IIIa inhibitor; it should not be used as an alternative to heparin alone.

- **MEDICINAL FORMS**

  - There can be variation in the licensing of different medicines containing the same drug.

  - **Powder for solution for injection**
    - **Angiox** (The Medicines Company UK Ltd)
      - Bivalirudin 250 mg Angiox 250mg powder for solution for injection vials | 10 vial | Price | no price available

### Dabigatran etexilate

- **DRUG ACTION** Dabigatran etexilate is a direct thrombin inhibitor with a rapid onset of action.

- **INDICATIONS AND DOSE**
  - **Prophylaxis of venous thromboembolism following total knee replacement surgery**
    - **BY MOUTH**
      - Adult 18–74 years: 110 mg, to be taken 1–4 hours after surgery, followed by 220 mg once daily for 9 days, to be taken 12–24 hours after initial dose
      - Adult 75 years and over: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 9 days, to be taken 12–24 hours after initial dose
  - **Prophylaxis of venous thromboembolism following total knee replacement surgery in patients receiving concomitant treatment with amiodarone or verapamil**
    - **BY MOUTH**
      - Adult 18–74 years: 110 mg, to be taken 1–4 hours after surgery, followed by 220 mg once daily for 27–34 days, to be taken 12–24 hours after initial dose
      - Adult 75 years and over: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 27–34 days, to be taken 12–24 hours after initial dose
  - **Prophylaxis of venous thromboembolism following total hip replacement surgery**
    - **BY MOUTH**
      - Adult 18–74 years: 110 mg, to be taken 1–4 hours after surgery, followed by 220 mg once daily for 27–34 days, to be taken 12–24 hours after initial dose
      - Adult 75 years and over: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 27–34 days, to be taken 12–24 hours after initial dose
  - **Prophylaxis of venous thromboembolism following total hip replacement surgery in patients receiving concomitant treatment with amiodarone or verapamil**
    - **BY MOUTH**
      - Adult 18–74 years: 110 mg, to be taken 1–4 hours after surgery, followed by 150 mg daily for 27–34 days, to be taken 12–24 hours after initial dose
      - Adult 75 years and over: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 27–34 days, to be taken 12–24 hours after initial dose

- **Prophylaxis of recurrent deep-vein thrombosis**
  - **Treatment of pulmonary embolism**
  - **Prophylaxis of recurrent pulmonary embolism**
    - **Prophylaxis of recurrent deep-vein thrombosis**
      - **BY MOUTH**
        - Adult 18–74 years: 150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant
        - Adult 75–79 years: 110–150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant
        - Adult 80 years and over: 110 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant

- **Treatment of deep-vein thrombosis in patients with moderate renal impairment**
  - **Treatment of deep-vein thrombosis in patients at increased risk of bleeding**
  - **Treatment of pulmonary embolism in patients with moderate renal impairment**
  - **Prophylaxis of recurrent deep-vein thrombosis in patients at increased risk of bleeding**
  - **Prophylaxis of recurrent deep-vein thrombosis in patients with moderate renal impairment**
  - **Prophylaxis of recurrent pulmonary embolism in patients at increased risk of bleeding**
    - **BY MOUTH**
      - Adult: 110–150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant

Treatment of deep-vein thrombosis in patients receiving concomitant treatment with verapamil | Treatment of pulmonary embolism in patients receiving concomitant treatment with verapamil | Prophylaxis of recurrent deep-vein thrombosis in patients receiving concomitant treatment with verapamil | Prophylaxis of recurrent pulmonary embolism in patients receiving concomitant treatment with verapamil

- **BY MOUTH**
  - Adult: 110 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant

**Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age ≥ 75 years, diabetes mellitus, or hypertension**

- **BY MOUTH**
  - Adult 80 years and over: 75 mg twice daily
  - Adult 18–74 years: 150 mg twice daily
  - Adult 75–79 years: 110–150 mg twice daily
  - Adult 80 years and over: 110 mg twice daily

**Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age ≥ 75 years, diabetes mellitus, or hypertension in patients receiving concomitant treatment with verapamil**

- **BY MOUTH**
  - Adult: 110 mg twice daily

**Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age ≥ 75 years, diabetes mellitus, or hypertension in patients with moderate renal impairment**

- **BY MOUTH**
  - Adult: 110–150 mg twice daily

**DOSE EQUIVALENCE AND CONVERSION**

- For information on changing from, or to, other anticoagulants, consult product literature.

- **CAUTIONS** Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis — give initial dose at least 2 hours after catheter removal and monitor neurological signs) – bacterial endocarditis – bleeding disorders – body-weight less than 50 kg – elderly – gastritis – gastro-oesophageal reflux – oesophagitis – recent biopsy – recent major trauma – thrombocytopenia

- **INTERACTIONS** → Appendix 1: dabigatran

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain – anaemia – diarrhoea – dyspepsia – haemorrhage – nausea

- **PREGNANCY** Manufacturer advises avoid unless essential — toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid — no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease, especially if prothrombin time already prolonged.

- **RENAL IMPAIRMENT**

  When used for prophylaxis of venous thromboembolism following knee or hip replacement surgery, reduce initial dose to 75 mg and subsequent doses to 150 mg once daily if creatinine clearance 30–50 mL/minute; reduce dose to 75 mg once daily if creatinine clearance 30–50 mL/minute and patient receiving concomitant treatment with verapamil.

  When used for treatment of deep-vein thrombosis and pulmonary embolism, prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism, prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation, consider reduced dose of 110 mg twice daily if creatinine clearance 30–50 mL/minute, based on individual assessment of thromboembolic risk and risk of bleeding.

  Avoid if creatinine clearance less than 30 mL/minute. Monitor renal function at least annually (manufacturer recommends Cockcroft and Gault formula to calculate creatinine clearance).

- **MONITORING REQUIREMENTS**

  - Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
  - No routine anticoagulant monitoring required (INR tests are unreliable).
  - Assess renal function (manufacturer recommends Cockcroft and Gault formula to calculate creatinine clearance) before treatment in all patients and at least annually in elderly.

- **DIRECTIONS FOR ADMINISTRATION** When given concomitantly with amiodarone or verapamil, doses should be taken at the same time.

- **PRESCRIBING AND DISPENSING INFORMATION** Dabigatran etexilate, is given orally for prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery; it is also licensed for the treatment of deep-vein thrombosis and pulmonary embolism, and prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism in adults. Duration of treatment should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e recent surgery, trauma, immobilisation, and longer duration of treatment should be based on permanent risk factors, or idiopathic deep-vein thrombosis or pulmonary embolism.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NICE technology appraisals (TAs)**

  - Dabigatran etexilate for the prevention of venous thromboembolism after hip or knee replacement surgery in adults (September 2008) NICE TA157
  - Dabigatran etexilate is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery. www.nice.org.uk/TA157

  - Dabigatran etexilate for the prevention of stroke and systemic embolism in atrial fibrillation (March 2012) NICE TA249
  - Dabigatran etexilate is an option for the prevention of stroke and systemic embolism in patients with non-valvular atrial fibrillation and with one or more of the following risk factors:
    - previous stroke, transient ischaemic attack, or systemic embolism
    - left ventricular ejection fraction <40%
    - symptomatic heart failure
    - age ≥ 75 years
    - age ≥ 65 years in patients with diabetes mellitus, coronary artery disease, or hypertension
The risks and benefits of dabigatran compared to warfarin should be discussed with the patient.

www.nice.org.uk/TA249

Dabigatran etexilate for the treatment and secondary prevention of deep vein thrombosis and pulmonary embolism (December 2014) NICE TA327

Dabigatran etexilate is recommended, within its marketing authorisation, as an option for treating and for preventing recurrent deep vein thrombosis and pulmonary embolism in adults.

www.nice.org.uk/TA327

**ANTITHROMBOTIC DRUGS**

**Tissue plasminogen activators**

---

**Urokinase**

**INDICATIONS AND DOSE**

**Deep-vein thrombosis (thromboembolic occlusive vascular disease)**

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 4400 units/kg, to be given over 10–20 minutes, followed by 100 000 units/hour for 2–3 days

**Pulmonary embolism (thromboembolic occlusive vascular disease)**

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 4400 units/kg, to be given over 10–20 minutes, followed by 4400 units/kg/hour for 12 hours

**Occlusive peripheral arterial disease (thromboembolic occlusive vascular disease)**

- **BY INTRA-ARTERIAL INFUSION**
  - Adult: (consult product literature)
  - Occluded central venous catheters (blocked by fibrin clots)
    - **BY INTRAVENOUS INJECTION**
      - Adult: Inject directly into occluded catheter, to be dissolved in sodium chloride 0.9% to a concentration of 5000 units/mL; use a volume sufficient to fill the catheter lumen; leave for 20–60 minutes then aspirate the lysate; repeat if necessary
  - Occluded arteriovenous haemodialysis shunts (blocked by fibrin clots)
    - **BY INTRAVENOUS INFUSION, OR BY INTRA-ARTERIAL INFUSION**
      - Adult: (consult product literature)

**SYNER-KINASE**

**Deep-vein thrombosis (thromboembolic occlusive vascular disease)**

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 4400 units/kg, to be given over 10 minutes, dose to be made up in 15 mL sodium chloride 0.9%, followed by 4400 units/kg/hour for 12–24 hours

---

**Pulmonary embolism (thromboembolic occlusive vascular disease)**

- **INITIALLY BY INTRAVENOUS INFUSION**
  - Adult: Initially 4400 units/kg, to be given over 10 minutes, dose to be made up in 15 mL sodium chloride 0.9%, followed by (by intravenous infusion) 4400 micrograms/kg/hour for 12 hours, alternatively (by intra-arterial injection) initially 15 000 units/kg, to be injected into pulmonary artery, subsequent doses adjusted according to response; maximum 3 doses per day

**Occlusive peripheral arterial disease**

- **BY INTRA-ARTERIAL INFUSION**
  - Adult: (consult product literature)
  - Occluded intravenous catheters and cannulas (blocked by fibrin clots)
    - **BY INTRA-ARTERIAL INJECTION, OR BY INTRAVENOUS INJECTION**
      - Adult: 5000–25 000 units, to be injected directly into catheter or cannula, dose dissolved in suitable volume of sodium chloride 0.9% to fill the catheter or cannula lumen; leave for 20–60 minutes then aspirate the lysate; repeat if necessary

**INTERACTIONS**

- Appendix 1: urokinase

**BREAST FEEDING**

Manufacturer advises avoid—with no information available.

**HEPATIC IMPAIRMENT**

Dose reduction may be required.

**RENAL IMPAIRMENT**

Dose reduction may be required.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Syner-KINASE®), give continuously or intermittently in Sodium chloride 0.9%.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Urokinase (Non-proprietary)**
  - Urokinase 10000 unit Urokinase 10,000unit powder for solution for injection vials | 1 vial (POM) £33.79
  - Urokinase 50000 unit Urokinase 50,000unit powder for solution for injection vials | 1 vial (POM) £69.70
  - Urokinase 100000 unit Urokinase 100,000unit powder for solution for injection vials | 1 vial (POM) £106.17
  - Urokinase 250000 unit Urokinase 250,000unit powder for solution for injection vials | 1 vial (POM) £185.65
  - Urokinase 500000 unit Urokinase 500,000unit powder for solution for injection vials | 1 vial (POM) £365.00

- **Syner-KINASE** (Syner-Med (Pharmaceutical Products) Ltd)
  - Urokinase 10000 unit Syner-KINASE 10,000unit powder for solution for injection vials | 1 vial (POM) £35.95 (Hospital only)
  - Urokinase 25000 unit Syner-KINASE 25,000unit powder for solution for injection vials | 1 vial (POM) £45.95 (Hospital only)
  - Urokinase 100000 unit Syner-KINASE 100,000unit powder for solution for injection vials | 1 vial (POM) £112.95 (Hospital only)
  - Urokinase 250000 unit Syner-KINASE 250,000unit powder for solution for injection vials | 1 vial (POM) no price available (Hospital only)
  - Urokinase 500000 unit Syner-KINASE 500,000unit powder for solution for injection vials | 1 vial (POM) no price available (Hospital only)
ANTITHROMBOTIC DRUGS > VITAMIN K ANTAGONISTS

Vitamin K antagonists

IMPORTANT SAFETY INFORMATION

A EUROPEAN review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be monitored closely in patients receiving concomitant treatment.

- CONTRA-INDICATIONS Avoid use within 48 hours postpartum, haemorrhagic stroke, significant bleeding
- CAUTIONS Bacterial endocarditis (use only if warfarin otherwise indicated), conditions in which risk of bleeding is increased, history of gastrointestinal bleeding, hyperthyroidism, hypothyroidism, peptic ulcer, postpartum (delay warfarin until risk of haemorrhage is low—usually 5–7 days after delivery), recent ischaemic stroke, current surgery, uncontrolled hypertension
- SIDE-EFFECTS Alopecia, diarrhoea, haemorrhage, hepatic dysfunction, jaundice, nausea, pancreatitis, purpura, pyrexia, rash, skin necrosis, increased risk in patients with protein C or protein S deficiency, vomiting, ‘purple toes’
- CONCEPTION AND CONTRACEPTION Women of childbearing age should be warned of the danger of teratogenicity.
- PREGNANCY Should not be given in the first trimester of pregnancy. Warfarin, acenocoumarol, and phenindione cross the placenta with risk of congenital malformations, and placental, fetal, or neonatal haemorrhage, especially during the last few weeks of pregnancy and at delivery. Therefore, if at all possible, they should be avoided in pregnancy, especially in the first trimester of pregnancy (difficult decisions may have to be made, particularly in women with prosthetic heart valves, atrial fibrillation, or with a history of recurrent venous thrombosis or pulmonary embolism). Stopping these drugs before the sixth week of gestation may largely avoid the risk of fetal abnormality.
- MONITORING REQUIREMENTS
  - The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.
  - It is essential that the INR be determined daily or on alternate days in early days of treatment, then at longer intervals (depending on response), then up to every 12 weeks.
  - Change in patient’s clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing.

- PATIENT AND CARER ADVICE Anticoagulant treatment booklets should be issued to all patients or their carers; these booklets include advice for patients on anticoagulant treatment, an alert card to be carried by the patient at all times, and a section for recording of INR results and dosage information. In England, Wales, and Northern Ireland, they are available for purchase from: 3M Security Print and Systems Limited Gorse Street, Chadderton Oldham OL9 9OH Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores. NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@spsl.uk.com.

In Scotland, treatment booklets and starter information packs can be obtained by emailing stockorders.DPPAS@apsgroup.co.uk or by fax on (0131) 6299 967

Electronic copies of the booklets and further advice are also available at www.npsa.nhs.uk/nrls/alerts-and-directives/alerts/anticoagulant.

Acenocoumarol
(Nicoumalone)

- INDICATIONS AND DOSE
  - Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation
  - Prophylaxis after insertion of prosthetic heart valve
  - Prophylaxis and treatment of venous thrombosis and pulmonary embolism
  - Transient ischaemic attacks

- BY MOUTH
  - Adult: Initially 2–4 mg once daily for 2 days, alternatively initially 6 mg on day 1, then 4 mg on day 2; maintenance 1–8 mg daily, adjusted according to response, dose to be taken at the same time each day, lower doses may be required in patients over 65 years, liver disease, severe heart failure with hepatic congestion, and malnutrition

- CAUTIONS Patients over 65 years
- INTERACTIONS → Appendix 1: coumarins
- SIDE-EFFECTS
  - Rare Anorexia
  - Very rare Vasculitis
- BREAST FEEDING Risk of haemorrhage; increased by vitamin K deficiency—manufacturer recommends prophylactic vitamin K for the infant (consult product literature).
- HEPATIC IMPAIRMENT Use with caution in mild to moderate impairment. Avoid in severe impairment, especially if prothrombin time is already prolonged.
- RENAL IMPAIRMENT Caution in mild to moderate impairment. Avoid in severe impairment.
- PATIENT AND CARER ADVICE Anticoagulant card to be provided.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

Phenindione

- INDICATIONS AND DOSE
  - Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation
  - Prophylaxis after insertion of prosthetic heart valve
  - Prophylaxis and treatment of venous thrombosis and pulmonary embolism

- BY MOUTH
  - Adult: Initially 200 mg on day 1, then 100 mg on day 2, then, adjusted according to response; maintenance 50–150 mg daily
Hypertension

4 Blood pressure conditions

4.1 Hypertension

Overview

Lowering raised blood pressure decreases the risk of stroke, coronary events, heart failure, and renal impairment. Advice on antihypertensive therapy in this section takes into account the recommendations of NICE clinical guidance 127 (August 2011), Hypertension—Clinical management of primary hypertension in adults.

Possible causes of hypertension (e.g. renal disease, endocrine causes), contributory factors, risk factors, and the presence of any complications of hypertension, such as left ventricular hypertrophy, should be established. Patients should be given advice on lifestyle changes to reduce blood pressure or cardiovascular risk; these include smoking cessation, weight reduction, reduction of excessive intake of alcohol and caffeine, reduction of dietary salt, reduction of total and saturated fat, increasing exercise, and increasing fruit and vegetable intake.

Thresholds and targets for treatment

Patients presenting with a blood pressure of 140/90 mmHg or higher when measured in a clinic setting, should be offered ambulatory blood pressure monitoring (or home blood pressure monitoring if ambulatory blood pressure monitoring is unsuitable) to confirm the diagnosis and stage of hypertension.

Stage 1 hypertension:

- Clinic blood pressure 140/90 mmHg or higher, and ambulatory daytime average or home blood pressure average 135/85 mmHg or higher
- Treat patients under 80 years who have stage 1 hypertension and target-organ damage (e.g. left ventricular hypertrophy, chronic kidney disease, hypertensive retinopathy), cardiovascular disease, renal disease, diabetes, or a 10 year cardiovascular risk \( \geq 20\% \); in the absence of these conditions, advise lifestyle changes

---

**INTERACTIONS** → Appendix 1: coumarins

**SIDE-EFFECTS**

- Agranulocytosis
- Eosinophilia
- Exantheme
- Exfoliative dermatitis
- Fever
- Hypersensitivity reactions
- Leucopenia
- Micro-adrenopathy
- Renal damage
- Urine coloured pink or orange

**BREAST FEEDING**

Avoid. Risk of haemorrhage; increased by vitamin K deficiency.

**HEPATIC IMPAIRMENT**

Avoid in severe impairment, especially if prothrombin time is already prolonged.

**RENAL IMPAIRMENT**

Caution in mild to moderate impairment. Avoid in severe impairment.

**PATIENT AND CARER ADVICE**

Anticoagulant card to be provided.

Patient counselling is advised for phenindione tablets (may turn urine pink or orange).

**MEDI CINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Warfarin sodium**

10-Oct-2016

- **INDICATIONS AND DOSE**
  - Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation
  - Prophylaxis after insertion of prosthetic heart valve
  - Prophylaxis and treatment of venous thrombosis and pulmonary embolism
  - Transient ischaemic attacks

- **BY MOUTH**
  - Adult: Initially 5–10 mg, to be taken on day 1; subsequent doses dependent on the prothrombin time, reported as INR (international normalised ratio), a lower induction dose can be given over 3–4 weeks in patients who do not require rapid anticoagulation, elderly patients to be given a lower induction dose; maintenance 3–9 mg daily, to be taken at the same time each day

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: WARFARIN: REPORTS OF CALCIPHYLAXIS (JULY 2016)

An EU-wide review has concluded that on rare occasions, warfarin use may lead to calciphylaxis—patients should be advised to consult their doctor if they develop a painful skin rash; if calciphylaxis is diagnosed, appropriate treatment should be started and consideration should be given to stopping treatment with warfarin. The MHRA has advised that calciphylaxis is most commonly observed in patients with known risk factors such as end-stage renal disease, however cases have also been reported in patients with normal renal function.

- **INTERACTIONS** → Appendix 1: coumarins
- **SIDE-EFFECTS**
- **Pregnancy**
- **Breast Feeding**

**HEPATIC IMPAIRMENT**

Avoid in severe impairment, especially if prothrombin time is already prolonged.

**RENAL IMPAIRMENT**

Use with caution in mild to moderate impairment. In severe renal impairment, monitor INR more frequently.

**PATIENT AND CARER ADVICE**

Anticoagulant card to be provided.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
and review annually. For patients under 40 years with stage 1 hypertension but no overt target-organ damage, cardiovascular disease, renal disease, or diabetes, consider seeking specialist advice for evaluation of secondary causes of hypertension.

Stage 2 hypertension:
- Clinic blood pressure 160/100 mmHg or higher, and ambulatory daytime average or home blood pressure average 150/95 mmHg or higher
- Treat all patients who have stage 2 hypertension, regardless of age

Severe hypertension:
- Clinic systolic blood pressure ≥ 180 mmHg or clinic diastolic blood pressure ≥ 110 mmHg; treat promptly—see Hypertensive Crises, below.

A target clinic blood pressure below 140/90 mmHg is suggested for patients under 80 years; a target ambulatory or home blood pressure average (during the patient’s waking hours) of below 135/85 mmHg is suggested for patients under 80 years; see also Hypertension in the Elderly, below. A target clinic blood pressure below 130/80 mmHg should be considered for those with established atherosclerotic cardiovascular disease, or diabetes in the presence of kidney, eye, or cerebrovascular disease. In some individuals it may not be possible to reduce blood pressure below the suggested targets despite the use of appropriate therapy.

Drug treatment of hypertension
A single antihypertensive drug is often inadequate in the management of hypertension, and additional antihypertensive drugs are usually added in a step-wise manner until control is achieved. Unless it is necessary to lower the blood pressure urgently (see Hypertensive Crises), an interval of at least 4 weeks should be allowed to determine response; clinicians should ensure antihypertensive drugs are titrated to the optimum or maximum tolerated dose at each step of treatment.

Response to drug treatment may be affected by age and ethnicity.

Patients under 55 years:
- Step 1
  - ACE inhibitor; if not tolerated, offer an angiotensin-II receptor antagonist. If both ACE inhibitors and angiotensin-II receptor antagonists are contra-indicated or not tolerated, consider a beta-blocker; beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or at high risk of developing diabetes.

Step 2
- ACE inhibitor or angiotensin-II receptor antagonist in combination with a calcium-channel blocker. If a calcium-channel blocker is not tolerated or if there is evidence of, or a high risk of, heart failure, give a thiazide-related diuretic (e.g. chlortalidone or indapamide). If a beta-blocker was given at Step 1, add a calcium channel blocker in preference to a thiazide-related diuretic (see Step 1).

Step 3
- ACE inhibitor or angiotensin-II receptor antagonist in combination with a calcium-channel blocker and a thiazide-related diuretic.

Step 4 (resistant hypertension)
- Consider seeking specialist advice
- Add low-dose spironolactone [unlicensed indication], or use high-dose thiazide related diuretic if plasma-potassium concentration above 4.5 mmol/litre
- Monitor renal function and electrolytes

Patients over 55 years, and patients of any age who are of African or Caribbean family origin:

- Step 1
  - Calcium-channel blocker; if not tolerated or if there is evidence of, or a high risk of, heart failure, give a thiazide-related diuretic (e.g. chlortalidone or indapamide).

Step 2
- Calcium-channel blocker or thiazide-related diuretic in combination with an ACE inhibitor or angiotensin-II receptor antagonist (an angiotensin-II receptor antagonist in combination with a calcium-channel blocker is preferred in patients of African or Caribbean family origin). Steps 3 and 4
- Treat as for patients under 55 years

Other measures to reduce cardiovascular risk

Aspirin p. 117 reduces the risk of cardiovascular events and myocardial infarction. Unduly high blood pressure must be controlled before aspirin is given. Unless contra-indicated, aspirin is recommended for all patients with established cardiovascular disease. Use of aspirin in primary prevention, in those with or without diabetes, is of unproven benefit. For the role of aspirin in the prevention of stroke in patients with atrial fibrillation, see Arrhythmias p. 96.

Statins are also of benefit in cardiovascular disease or in those who are at high risk of developing cardiovascular disease.

Hypertension in the elderly
Benefit from antihypertensive therapy is evident up to at least 80 years of age, but it is probably inappropriate to apply a strict age limit when deciding on drug therapy. Patients who reach 80 years of age while taking antihypertensive drugs should continue treatment, provided that it continues to be of benefit and does not cause significant side-effects. If patients are aged over 80 years when diagnosed with stage 1 hypertension, the decision to treat should be based on the presence of other comorbidities; patients with stage 2 hypertension should be treated as for patients over 55 years. A target clinic blood pressure below 150/90 mmHg is suggested for patients over 80 years; the suggested target ambulatory or home blood pressure average (during the patient’s waking hours) is below 145/85 mmHg.

Isolated systolic hypertension
Isolated systolic hypertension (systolic pressure ≥ 160 mmHg, diastolic pressure < 90 mmHg) is common in patients over 60 years, and is associated with an increased cardiovascular disease risk; it should be treated as for patients with both a raised systolic and diastolic blood pressure. Patients with severe postural hypotension should be referred to a specialist.

Hypertension in diabetes
For patients with diabetes, a target clinic blood pressure below 140/80 mmHg is suggested (below 130/80 mmHg is advised if kidney, eye, or cerebrovascular disease are also present). However, in some individuals, it may not be possible to achieve this level of control despite appropriate therapy. Most patients require a combination of antihypertensive drugs.

Hypertension is common in type 2 diabetes, and antihypertensive treatment prevents macrovascular and microvascular complications. In type 1 diabetes, hypertension usually indicates the presence of diabetic nephropathy. An ACE inhibitor (or an angiotensin-II receptor antagonist) may have a specific role in the management of diabetic nephropathy; in patients with type
2 diabetes, an ACE inhibitor (or an angiotensin-ll receptor antagonist) can delay progression of microalbuminuria to nephropathy.

Hypertension in renal disease
A target clinic blood pressure below 140/90 mmHg is suggested (below 130/80 mmHg is advised in patients with chronic kidney disease and diabetes, or if proteinuria exceeds 1 g in 24 hours). An ACE inhibitor (or an angiotensin-ll receptor antagonist) should be considered for patients with proteinuria; however, ACE inhibitors should be used with caution in renal impairment. Thiazide diuretics may be ineffective and high doses of loop diuretics may be required.

Hypertension in pregnancy
Hypertensive complications in pregnancy can be hazardous for both the mother and the fetus, and are associated with a significant risk of morbidity and mortality; complications can occur in pregnant women with pre-existing chronic hypertension, or in those who develop hypertension in the latter half of pregnancy.

Labetalol hydrochloride p. 143 is widely used for treating hypertension in pregnancy. Methyldopa p. 140 is considered safe for use in pregnancy. Modified-release preparations of nifedipine p. 157 [unlicensed] are also used.

The following advice takes into account the recommendations of NICE Clinical Guideline 107 (August 2010), Hypertension in Pregnancy.

Pregnant women with chronic hypertension who are already receiving antihypertensive treatment should have their drug therapy reviewed. In uncomplicated chronic hypertension, a target blood pressure of <150/100 mmHg is recommended; women with target-organ damage as a result of chronic hypertension, and in women with chronic hypertension who have given birth, a target blood pressure of <140/90 mmHg is advised. Long-term antihypertensive treatment should be reviewed 2 weeks following the birth.

Women managed with methyldopa during pregnancy should discontinue treatment and restart their original antihypertensive medication within 2 days of the birth.

Women are at high risk of developing pre-eclampsia if they have chronic kidney disease, diabetes mellitus, autoimmune disease, chronic hypertension, or if they have had hypertension during a previous pregnancy; these women are advised to take aspirin p. 117 once daily [unlicensed indication] from week 12 of pregnancy until the baby is born. Women with more than one moderate risk factor (first pregnancy, aged ≥40 years, pregnancy interval >10 years, BMI ≥ 35 kg/m² at first visit, multiple pregnancy, or family history of pre-eclampsia) for developing pre-eclampsia are also advised to take aspirin once daily [unlicensed indication] from week 12 of pregnancy until the baby is born.

Women with pre-eclampsia or gestational hypertension who present with a blood pressure over 150/100 mmHg, should receive initial treatment with oral labetalol hydrochloride to achieve a target blood pressure of <150 mmHg systolic, and diastolic 80–100 mmHg. If labetalol hydrochloride is unsuitable, methyldopa or modified-release nifedipine may be considered. Women with gestational hypertension or pre-eclampsia who have been managed with methyldopa during pregnancy should discontinue treatment within 2 days of the birth. Women with a blood pressure of ≥160/110 mmHg who require critical care during pregnancy or after birth should receive immediate treatment with either oral or intravenous labetalol hydrochloride, intravenous hydralazine hydrochloride p. 175, or oral modified-release nifedipine to achieve a target blood pressure of <150 mmHg systolic, and diastolic 80–100 mmHg.

Also see use of magnesium sulfate p. 963 in pre-eclampsia and eclampsia.

Hypertensive crises
If blood pressure is reduced too quickly in the management of hypertensive crises, there is a risk of reduced organ perfusion leading to cerebral infarction, blindness, deterioration in renal function, and myocardial ischaemia.

A hypertensive emergency is defined as severe hypertension with acute damage to the target organs (e.g. signs of papilloedema or retinal haemorrhage, or the presence of clinical conditions such as acute coronary syndromes, acute aortic dissection, acute pulmonary oedema, hypertensive encephalopathy, acute cerebral infarction, intracerebral or subarachnoid haemorrhage, eclampsia, or rapidly progressing renal failure); prompt treatment with intravenous antihypertensive therapy is generally required. Over the first few minutes or within 2 hours, blood pressure should be reduced by 20–25%. When intravenous therapy is indicated, treatment options include sodium nitropusside p. 177 [unlicensed], nicardipine hydrochloride p. 156, labetalol hydrochloride, glyceryl trinitrate p. 212, phenolamine mesilate p. 177, hydralazine hydrochloride, or esmolol hydrochloride p. 149; choice of drug is dependent on concomitant conditions and clinical status of the patient.

Severe hypertension (blood pressure >180/110 mmHg) without acute target-organ damage is defined as a hypertensive urgency; blood pressure should be reduced gradually over 24–48 hours with oral antihypertensive therapy, such as labetalol hydrochloride, or the calcium-channel blockers amloclidine p. 150 or felodipine p. 154. Use of sublingual nifedipine is not recommended.

Also see advice on short-term management of hypertensive episodes in pheochromocytoma.

Phaeochromocytoma
Long-term management of phaeochromocytoma involves surgery. However, surgery should not take place until there is adequate blockade of both alpha- and beta-adrenoceptors; the optimal choice of drug therapy remains unclear. Alpha-blockers are used in the short-term management of hypertensive episodes in pheochromocytoma. Once alpha blockade is established, tachycardia can be controlled by the cautious addition of a beta-blocker; a cardioselective beta-blocker is preferred.

Phenoxybenzamine hydrochloride p. 176, a powerful alpha-blocker, is effective in the management of phaeochromocytoma but it has many side-effects.

Phentolamine mesilate is a short-acting alpha-blocker used mainly during surgery of phaeochromocytoma; its use for the diagnosis of phaeochromocytoma has been superseded by measurement of catecholamines in blood and urine.

Metrosine (available from ‘special-order’ manufacturers or specialist importing companies) inhibits the enzyme tyrosine hydroxylase, and hence the synthesis of catecholamines. It is rarely used in the pre-operative management of phaeochromocytoma, and long term in patients unsuitable for surgery; an alpha-adrenoceptor blocking drug may also be required. Metirosine should not be used to treat essential hypertension.

Antihypertensive drugs
Vasodilator antihypertensive drugs
Vasodilators have a potent hypotensive effect, especially when used in combination with a beta-blocker and a thiazide. Important: see Hypertension (hypertensive crises) for a warning on the hazards of a very rapid fall in blood pressure.

Hydralazine hydrochloride p. 175 is given by mouth as an adjunct to other antihypertensives for the treatment of
resistant hypertension but is rarely used; when used alone it causes tachycardia and fluid retention.

Sodium nitroprusside p. 177 [unlicensed] is given by intravenous infusion to control severe hypertensive emergencies when parenteral treatment is necessary.

Minoxidil p. 176 should be reserved for the treatment of severe hypertension resistant to other drugs. Vasodilatation is accompanied by increased cardiac output and tachycardia and the patients develop fluid retention. For this reason the addition of a beta-blocker and a diuretic (usually furosemide p. 221, in high dosage) are mandatory. Hypertrichosis is troublesome and renders this drug unsuitable for females.

Prazosin p. 739, doxazosin p. 738, and terazosin p. 741 have alpha-blocking and vasodilator properties.

Ambrisentan p. 179, bosentan p. 179, iloprost p. 178, macitentan p. 180, sildenafil p. 766, and tadalafil p. 767 are licensed for the treatment of pulmonary arterial hypertension and should be used under specialist supervision. Epoprostenol p. 112 can be used in patients with primary pulmonary hypertension resistant to other treatments. Bosentan is also licensed to reduce the number of new digital ulcers in patients with systemic sclerosis and ongoing digital ulcer disease. Bosentan p. 180 is licensed for the treatment of pulmonary arterial hypertension and chronic thromboembolic pulmonary hypertension; it should be used under specialist supervision.

Sitaxentan has been withdrawn from the market because the benefit of treatment does not outweigh the risk of severe hepatotoxicity.

**Centrally acting antihypertensive drugs**

Methyldopa p. 140 is a centrally acting antihypertensive; it may be used for the management of hypertension in pregnancy.

Clonidine hydrochloride p. 139 has the disadvantage that sudden withdrawal of treatment may cause severe rebound hypertension.

Moxonidine p. 140, a centrally acting drug, is licensed for mild to moderate essential hypertension. It may have a role when thiazides, calcium-channel blockers, ACE inhibitors, and beta-blockers are not appropriate or have failed to control blood pressure.

**Adrenergic neurone blocking drugs**

Adrenergic neurone blocking drugs prevent the release of noradrenaline from postganglionic adrenergic neurones. These drugs do not control supine blood pressure and may cause postural hypotension. For this reason they have largely fallen from use, but may be necessary with other therapy in resistant hypertension.

Guanethidine monosulfate p. 177, which also depletes the nerve endings of noradrenaline, is licensed for rapid control of blood pressure, however alternative treatments are preferred.

**Alpha-adrenoceptor blocking drugs**

Prazosin has post-synaptic alpha-blocking and vasodilator properties and rarely causes tachycardia. It may, however, reduce blood pressure rapidly after the first dose and should be introduced with caution. Doxazosin, indoramin p. 738, and terazosin have properties similar to those of prazosin.

Alpha-blockers can be used with other antihypertensive drugs in the treatment of resistant hypertension.

**Prostatic hyperplasia**

Alfuzosin hydrochloride p. 737, doxazosin, indoramin, prazosin, tamsulosin hydrochloride p. 739, and terazosin are indicated for benign prostatic hyperplasia.

---

**Drugs affecting the renin-angiotensin system**

**Angiotensin-converting enzyme inhibitors**

Angiotensin-converting enzyme inhibitors (ACE inhibitors) inhibit the conversion of angiotensin I to angiotensin II. They have many uses and are generally well tolerated. The main indications of ACE inhibitors are shown below.

**Heart failure**

ACE inhibitors are used in all grades of heart failure, usually combined with a beta-blocker. Potassium supplements and potassium-sparing diuretics should be discontinued before introducing an ACE inhibitor because of the risk of hyperkalaemia. However, a low dose of spironolactone p. 185 may be beneficial in severe heart failure and can be used with an ACE inhibitor provided serum potassium is monitored carefully. Profound first-dose hypotension may occur when ACE inhibitors are introduced to patients with heart failure who are already taking a high dose of a loop diuretic (e.g. furosemide p. 221 80 mg daily or more). Temporary withdrawal of the loop diuretic reduces the risk, but may cause severe rebound pulmonary oedema. Therefore, for patients on high doses of loop diuretics, the ACE inhibitor may need to be initiated under specialist supervision. An ACE inhibitor can be initiated in the community in patients who are receiving a low dose of a diuretic or who are not otherwise at risk of severe hypotension; nevertheless, care is required and a very low dose of the ACE inhibitor is given initially.

**Hypertension**

An ACE inhibitor may be the most appropriate initial drug for hypertension in younger Caucasian patients; Afro-Caribbean patients, those aged over 55 years, and those with primary aldosteronism respond less well. ACE inhibitors are particularly indicated for hypertension in patients with type 1 diabetes with nephropathy. They may reduce blood pressure very rapidly in some patients particularly in those receiving diuretic therapy.

**Diabetic nephropathy**

ACE inhibitors have a role in the management of diabetic nephropathy.

**Prophylaxis of cardiovascular events**

ACE inhibitors are used in the early and long-term management of patients who have had a myocardial infarction. ACE inhibitors may also have a role in preventing cardiovascular events.

**Initiation under specialist supervision**

ACE inhibitors should be initiated under specialist supervision and with careful clinical monitoring in those with severe heart failure or in those:

- receiving multiple or high-dose diuretic therapy (e.g. more than 80 mg of furosemide daily or its equivalent);
- receiving concomitant angiotensin II receptor antagonist or aliskiren;
- with hypovolaemia;
- with hyponatraemia (plasma-sodium concentration below 130 mmol/litre);
- with hypotension (systolic blood pressure below 90 mmHg);
- with unstable heart failure;
- receiving high-dose vasodilator therapy;
- known renovascular disease.

**Renal effects**

Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if features mentioned below present); hyperkalaemia and other side-effects of ACE inhibitors are more common in those with
impaired renal function and the dose may need to be reduced. Although ACE inhibitors now have a specialised role in some forms of renal disease, including chronic kidney disease, they also occasionally cause impairment of renal function which may progress and become severe in other circumstances (at particular risk are the elderly). A specialist should be involved if renal function is significantly reduced as a result of treatment with an ACE inhibitor.

Concomitant treatment with NSAIDs increases the risk of renal damage, and potassium-sparing diuretics (or potassium-containing salt substitutes) increase the risk of hyperkalaemia.

In patients with severe bilateral renal artery stenosis (or severe stenosis of the artery supplying a single functioning kidney), ACE inhibitors reduce or abolish glomerular filtration and are likely to cause severe and progressive renal failure. They are therefore not recommended in patients known to have these forms of critical renovascular disease.

ACE inhibitor treatment is unlikely to have an adverse effect on overall renal function in patients with severe unilateral renal artery stenosis and a normal contralateral kidney, but glomerular filtration is likely to be reduced (or even abolished) in the affected kidney and the long-term consequences are unknown.

ACE inhibitors are therefore best avoided in patients with known or suspected renovascular disease, unless the blood pressure cannot be controlled by other drugs. If ACE inhibitors are used, they should be initiated only under specialist supervision and renal function should be monitored regularly.

ACE inhibitors should also be used with particular caution in patients who may have undiagnosed and clinically silent renovascular disease. This includes patients with peripheral vascular disease or those with severe generalised atherosclerosis.

ACE inhibitors in combination with other drugs

See also, Concomitant use of drugs affecting the renin-angiotensin system, below.

Concomitant diuretics

ACE inhibitors can cause a very rapid fall in blood pressure in volume-depleted patients; treatment should therefore be initiated with very low doses. If the dose of diuretic is greater than 80 mg furosemide or equivalent, the ACE inhibitor should be initiated under close supervision and in some patients the diuretic dose may need to be reduced or the diuretic discontinued at least 24 hours beforehand (may not be possible in heart failure—risk of pulmonary oedema). If high-dose diuretic therapy cannot be stopped, close observation is recommended after administration of the first dose of ACE inhibitor, for at least 2 hours or until the blood pressure has stabilised.

Combination products

Products incorporating an ACE inhibitor with a thiazide diuretic or a calcium-channel blocker are available for the management of hypertension. Use of these combination products should be reserved for patients whose blood pressure has not responded adequately to a single antihypertensive drug and who have been stabilised on the individual components of the combination in the same proportions.

Angiotensin-II receptor antagonists

Azilsartan medoxomil p. 169, candesartan cilexetil p. 170, eprosartan p. 170, irbesartan p. 170, losartan potassium p. 171, olmesartan medoxomil p. 172, telmisartan p. 173, and valsartan p. 174 are angiotensin-II receptor antagonists with many properties similar to those of the ACE inhibitors. However, unlike ACE inhibitors, they do not inhibit the breakdown of bradykinin and other kinins, and thus are less likely to cause the persistent dry cough which can complicate ACE inhibitor therapy. They are therefore a useful alternative for patients who have to discontinue an ACE inhibitor because of persistent cough.

An angiotensin-II receptor antagonist may be used as an alternative to an ACE inhibitor in the management of heart failure or diabetic nephropathy. Candesartan cilexetil and valsartan are also licensed as adjuncts to ACE inhibitors under specialist supervision, in the management of heart failure when other treatments are unsuitable.

Renal effects

Angiotensin-II receptor antagonists should be used with caution in renal artery stenosis (see also Renal effects under Angiotensin-converting enzyme inhibitors, above).

Renin inhibitor

Aliskiren is a renin inhibitor that is licensed for the treatment of hypertension.

Concomitant use of drugs affecting the renin-angiotensin system

Combination therapy with two drugs affecting the renin-angiotensin system (ACE inhibitors, angiotensin-II receptor antagonists, and aliskiren p. 175 is not recommended due to an increased risk of hyperkalaemia, hypotension, and renal impairment, compared to use of a single drug. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor with an angiotensin-II receptor antagonist. There is some evidence that the benefits of combination use of an ACE inhibitor with candesartan or valsartan may outweigh the risks in selected patients with heart failure for whom other treatments are unsuitable, however, the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparing diuretic is not recommended.

For patients currently taking combination therapy, the need for continued combined therapy should be reviewed. If combination therapy is considered essential, it should be carried out under specialist supervision, with close monitoring of blood pressure, renal function, and electrolytes (particularly potassium); monitoring should be considered at the start of treatment, then monthly, and also after any change in dose or during intercurrent illness.
Methyldopa

**INDICATIONS AND DOSE**

**Hypertension**

- **BY MOUTH**
  - Adult: Initially 250 mg 2–3 times a day, dose should be increased gradually at intervals of at least 2 days; maximum 3 g per day
  - Elderly: Initially 125 mg twice daily, dose should be increased gradually; maximum 2 g per day

**CONTRA-INDICATIONS**

- Acute porphyria
- Depression
- Phaeochromocytoma

**CAUTIONS**

- History of depression

**INTERACTIONS**

- Appendix 1: methyldopa

**SIDE-EFFECTS**

- Amenorrhoea
- Arthralgia
- Asthenia
- Bell’s palsy
- Bone-marrow depression
- Bradycardia
- Decreased libido
- Depression
- Dizziness
- Drug fever
- Dry mouth
- Eosinophilia
- Exacerbation of angina
- Failure of ejaculation
- Gastro-intestinal disturbances
- Gynaecomastia
- Haemolytic anaemia
- Headache
- Hepatitis
- Hyperprolactinaemia
- Hypersensitivity reactions
- Impaired mental acuity
- Impotence
- Jaundice
- Leucopenia
- Lupus erythematosus-like syndrome
- Mild psychosis
- Myalgia
- Myocarditis
- Nasal congestion
- Nightmares
- Oedema
- Pancreatitis
- Paraesthesia
- Parkinsonism
- Pericarditis
- Postural hypotension
- Rash
- Sedation
- Sialadenitis
- Stomatitis
- Thrombocytopenia
- Toxic epidermal necrolysis

**SIDE-EFFECTS, FURTHER INFORMATION**

Side-effects are minimised if the daily dose is kept below 1 g.

**PREGNANCY**

- Not known to be harmful.

**BREAST FEEDING**

- Amount too small to be harmful.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution in history of liver disease. Avoid in active liver disease.

**RENAL IMPAIRMENT**

- Start with small dose. Increased sensitivity to hypotensive and sedative effect.

**MONITORING REQUIREMENTS**

- Monitor blood counts and liver-function before treatment and at intervals during first 6–12 weeks or if unexplained fever occurs.

**EFFECT ON LABORATORY TESTS**

- Interference with laboratory tests. Positive direct Coombs’ test in up to 20% of patients (may affect blood cross-matching).

**PATIENT AND CARER ADVICE**

- Driving and skilled tasks
  - Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

| CAUTIONARY AND ADVISORY LABELS | Methyldopa anhydrous 250 mg tablets | £16.26 DT price = £5.37 |
| Methyldopa anhydrous 500 mg tablets | £25.18 DT price = £9.57 |
| Aldomet 500mg tablets | £6.15 |

Moxonidine

**INDICATIONS AND DOSE**

- Mild to moderate essential hypertension
  - **BY MOUTH**
    - Adult: 200 micrograms once daily for 3 weeks, dose to be taken in the morning, then increased if necessary to 400 micrograms daily in 1–2 divided doses (max. per dose 400 micrograms), maximum daily dose to be given in 2 divided doses; maximum 600 micrograms per day

**CONTRA-INDICATIONS**

- Bradycardia
- Conduction disorders
- Second- or third-degree AV block
- Severe heart failure
- Sick sinus syndrome
- Sino-atrial block

**CAUTIONS**

- First-degree AV block
- Moderate heart failure
- Severe coronary artery disease
- Unstable angina

**INTERACTIONS**

- Appendix 1: moxonidine

**SIDE-EFFECTS**

- Back pain
- diarrhoea
- Dizziness
- Dry mouth
- Dyspepsia
- Insomnia
- Nausea
- Pruritus
- Rash
- Somnolence
- Vomiting

- Uncommon
  - Angioedema
  - Bradycardia
  - Neck pain
  - Nervousness
  - Oedema
  - Tinnitus
Pregnancy

Manufacturer advises avoid—no information available.

Breast Feeding

Present in milk—manufacturer advises avoid.

Renal Impairment

Max. single dose 200 micrograms and max. daily dose 400 micrograms if eGFR 30–60 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².

Treatment Cessation

Avoid abrupt withdrawal (if concomitant treatment with beta-blocker has to be stopped, discontinue beta-blocker first, then moxonidine after a few days).

Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

Beta-Adrenoceptor Blockers

Beta-adrenoceptor blocking drugs

Overview

Beta-adrenoceptor blocking drugs (beta-blockers) block the beta-adrenoceptors in the heart, peripheral vasculature, bronchi, pancreas, and liver.

Many beta-blockers are now available and in general they are all equally effective. There are, however, differences between them, which may affect choice in treating particular diseases or individual patients.

Intrinsic sympathomimetic activity (ISA, partial agonist activity) represents the capacity of beta-blockers to stimulate as well as to block adrenergic receptors.

Oxprenolol hydrochloride p. 144, pindolol p. 145, acebutolol p. 146, and celiprolol hydrochloride p. 148 have intrinsic sympathomimetic activity; they tend to cause less coldness of the extremities (may be less common with those with ISA), and are, therefore, relatively cardioselective, but they are not cardiospecific. They have a lesser effect on airways resistance but are not free of this side-effect.

Beta-blockers are also associated with fatigue, coldness of the extremities (may be less common with those with ISA), and sleep disturbances with nightmares (may be less common with the water-soluble beta-blockers).

Beta-blockers can affect carbohydrate metabolism, causing hypoglycaemia or hyperglycaemia in patients with or without diabetes; they can also interfere with metabolic and autonomic responses to hypoglycaemia, thereby masking symptoms such as tachycardia. However, beta-blockers are not contra-indicated in diabetes, although the cardioselective beta-blockers may be preferred. Beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia. Beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or in those at high risk of developing diabetes.

Hypertension

The mode of action of beta-blockers in hypertension is not understood, but they reduce cardiac output, alter baroceptor reflex sensitivity, and block peripheral adrenoceptors. Some beta-blockers depress plasma renin secretion. It is possible that a central effect may also partly explain their mode of action.

Beta-blockers are effective for reducing blood pressure but other antihypertensives are usually more effective for reducing the incidence of stroke, myocardial infarction, and cardiovascular mortality, especially in the elderly. Other antihypertensives are therefore preferred for routine initial treatment of uncomplicated hypertension.

In general, the dose of a beta-blocker does not have to be high.

Beta-blockers can be used to control the pulse rate in patients with phaeochromocytoma. However, they should never be used alone as beta-blockade without concurrent alpha-blockade may lead to a hypertensive crisis. For this reason phenoxybenzamine hydrochloride p. 176 should always be used together with the beta-blocker.

Angina

By reducing cardiac work beta-blockers improve exercise tolerance and relieve symptoms in patients with angina (see management of stable angina and acute coronary syndromes for further details). As with hypertension there is no good evidence of the superiority of any one drug, although occasionally a patient will respond better to one beta-blocker than to another. There is some evidence that sudden
withdrawal may cause an exacerbation of angina and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped. There is a risk of precipitating heart failure when beta-blockers and verapamil are used together in established ischaemic heart disease.

**Myocardial infarction**

For specific comments see management of ST-segment elevation myocardial infarction and non-ST-segment elevation myocardial infarction.

Several studies have shown that some beta-blockers can reduce the recurrence rate of myocardial infarction. However, uncontrolled heart failure, hypotension, bradycardia, and obstructive airways disease render beta-blockers unsuitable in some patients following a myocardial infarction. Atenolol and metoprolol tartrate may reduce early mortality after intravenous and subsequent oral administration in the acute phase, while acebutolol, metoprolol tartrate, propranolol hydrochloride p. 145, and timolol maleate p. 146 have protective value when started in the early convalescent phase. The evidence relating to other beta-blockers is less convincing; some have not been tested in trials of secondary prevention.

**Arrhythmias**

Beta-blockers act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. They can be used in conjunction with digoxin to control the ventricular response in atrial fibrillation, especially in patients with thyrotoxicosis. Beta-blockers are also useful in the management of supraventricular tachycardias, and are used to control those following myocardial infarction.

Esmolol hydrochloride p. 149 is a relatively cardioselective beta-blocker with a very short duration of action, used intravenously for the short-term treatment of supraventricular arrhythmias, sinus tachycardia, or hypertension, particularly in the peri-operative period. It may also be used in other situations, such as acute myocardial infarction, when sustained beta-blockade might be hazardous.

Sotalol hydrochloride p. 105, a non-cardioselective beta-blocker with additional class III anti-arrhythmic activity, is used for prophylaxis in paroxysmal supraventricular arrhythmias. It also suppresses ventricular ectopic beats and non-sustained ventricular tachycardia. It has been shown to be more effective than lidocaine in the termination of spontaneous sustained ventricular tachycardia due to coronary disease or cardiomyopathy. However, it may induce torsade de pointes in susceptible patients.

**Heart failure**

Beta-blockers may produce benefit in heart failure by blocking sympathetic activity. Bisoprolol fumarate p. 148 and carvedilol p. 143 reduce mortality in any grade of stable heart failure; nebivolol p. 149 is licensed for stable mild to moderate heart failure in patients over 70 years. Treatment should be initiated by those experienced in the management of heart failure.

**Thyrotoxicosis**

Beta-blockers are used in pre-operative preparation for thyroidectomy. Administration of propranolol hydrochloride p. 145 can reverse clinical symptoms of thyrotoxicosis within 4 days. Routine tests of increased thyroid function remain unaltered. The thyroid gland is rendered less vascular thus making surgery easier.

**Other uses**

Beta-blockers have been used to alleviate some symptoms of anxiety; probably patients with palpitation, tremor, and tachycardia respond best. Beta-blockers are also used in the prophylaxis of migraine. Betaxolol p. 1079, carteolol hydrochloride p. 1078, levobunolol hydrochloride p. 1078, and timolol maleate p. 1079 are used topically in glaucoma.

---

**Beta-adrenoceptor blockers (systemic)**

- **CONTRA-INDICATIONS**  
  Asthma - cardiogenic shock - hypotension - marked bradycardia - metabolic acidosis - phaeochromocytoma (apart from specific use with alpha-blockers) - Prinzmetal’s angina - second-degree AV block - severe peripheral arterial disease - sick sinus syndrome - third-degree AV block - uncontrolled heart failure

- **CONTRA-INDICATIONS, FURTHER INFORMATION**  
  Bronchospasm  
  Beta-blockers, including those considered to be cardioselective, should usually be avoided in patients with a history of asthma, bronchospasm or a history of obstructive airways disease. However, when there is no alternative, a cardioselective beta-blocker can be given to these patients with caution and under specialist supervision. In such cases the risk of inducing bronchospasm should be appreciated and appropriate precautions taken.

- **CAUTIONS**  
  Diabetes - first-degree AV block - history of obstructive airways disease (introduce cautiously) - myasthenia gravis - portal hypertension (risk of deterioration in liver function) - psoriasis - symptoms of hypoglycaemia may be masked - symptoms of thyrotoxicosis may be masked

- **SIDE-EFFECTS**
  - Rare: Dry eyes (reversible on withdrawal) - rashes (reversible on withdrawal)

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Bradycardia  
    With administration by intravenous injection, excessive bradycardia can occur and may be countered with intravenous injection of atropine sulfate.

- **Overdose**  
  Therapeutic overdosages with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. For details on the management of poisoning, see Beta-blockers, under Emergency treatment of poisoning p. 1253.

- **ALLERGY AND CROSS-SENSITIVITY**
  Caution is advised in patients with a history of hypersensitivity—may increase sensitivity to allergens and result in more serious hypersensitivity response. Furthermore beta-adrenoceptor blockers may reduce response to adrenaline (epinephrine).

- **PREGNANCY**  
  Beta-blockers may cause intra-uterine growth restriction, neonatal hypoglycaemia, and bradycardia; the risk is greater in severe hypertension.

- **BREAST FEEDING**  
  With systemic use in the mother, infants should be monitored as there is a risk of possible toxicity due to beta-blockade. However, the amount of most beta-blockers present in milk is too small to affect infants.

- **MONITORING REQUIREMENTS**  
  Monitor lung function (in patients with a history of obstructive airway disease).

- **TREATMENT CESSATION**  
  Avoid abrupt withdrawal especially in ischaemic heart disease. Sudden cessation of a beta-blocker can cause a rebound worsening of
myocardial ischaemia and therefore gradual reduction of
dose is preferable when beta-blockers are to be stopped.

**BETA-ADRENOCEPTOR BLOCKERS › ALPHA- AND BETA-ADRENOCEPTOR
BLOCKERS**

---

**Carvedilol**

### INDICATIONS AND DOSE

**Hypertension**

- **By mouth**
  - Adult: Initially 12.5 mg once daily for 2 days, then
    increased to 25 mg once daily; increased if necessary
    up to 50 mg daily, dose to be increased at intervals of at
    least 2 weeks and can be given as a single dose or in
    divided doses
  - Elderly: Initially 12.5 mg daily, initial dose may provide
    satisfactory control

**Angina**

- **By mouth**
  - Adult: Initially 12.5 mg twice daily for 2 days, then
    increased to 25 mg twice daily

**Adjunct to diuretics, digoxin, or ACE inhibitors in
symptomatic chronic heart failure**

- **By mouth**
  - Adult: Initially 3.125 mg twice daily, dose to be taken
    with food, then increased to 6.25 mg twice daily, then
    increased to 12.5 mg twice daily, then increased to
    25 mg twice daily, dose should be increased at intervals
    of at least 2 weeks up to the highest tolerated dose,
    max. 25 mg twice daily in patients with severe heart
    failure or body-weight less than 85 kg; max. 50 mg
twice daily in patients over 85 kg

---

**CONTRA-INDICATIONS**

Acute or decompensated heart failure requiring intravenous inotropes

**INTERACTIONS**

- Appendix 1: beta blockers (non-selective)

**SIDE-EFFECTS**

Allergic skin reactions  · angina  · AV block  ·
changes in liver enzymes  · depressed mood  · disturbances
of micturition  · influenza-like symptoms  · leucopenia  ·
nasal stuffiness  · postural hypotension  · thrombocytopenia  ·
wheezing

**PREGNANCY**

Information on the safety of carvedilol during
pregnancy is lacking. If carvedilol is used close to delivery,
infants should be monitored for signs of alpha-blockade
(as well as beta-blockade).

**BREAST FEEDING**

Infants should be monitored as there is a risk
of possible toxicity due to alpha-blockade (in addition
to beta-blockade).

**HEPATIC IMPAIRMENT**

Avoid in hepatic impairment.

**MONITORING REQUIREMENTS**

Monitor renal function during dose titration in patients with heart failure who also have renal impairment, low blood pressure, ischaemic heart disease, or diffuse vascular disease.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines
containing the same drug. Forms available from special-order
manufacturers include: oral suspension

### Tablet

**CAUTIONARY AND ADVISORY LABELS** 8

- **Carvedilol (Non-proprietary)**
  - Carvedilol 3.125 mg Carvedilol 3.125mg tablets  | 28 tablet [POM]
    £8.00 DT price = £0.82
  - Carvedilol 6.25 mg Carvedilol 6.25mg tablets  | 28 tablet [POM]
    £8.99 DT price = £0.31
  - Carvedilol 12.5 mg Carvedilol 12.5mg tablets  | 28 tablet [POM]
    £9.99 DT price = £0.31
  - Carvedilol 25 mg Carvedilol 25mg tablets  | 28 tablet [POM]
    £12.50 DT price = £0.44

---

**Labetalol hydrochloride**

### INDICATIONS AND DOSE

**Controlled hypotension in anaesthesia**

- By intravenous infusion, or by intravenous injection

**Hypertension of pregnancy**

- **By intravenous infusion**
  - Adult: Initially 20 mg/hour, then increased if necessary
to 40 mg/hour after 30 minutes, then increased if
necessary to 80 mg/hour after 30 minutes, then
increased if necessary to 160 mg/hour after 30 minutes,
adjusted according to response; Usual maximum
160 mg/hour

- **By mouth**
  - Adult: Use dose for hypertension

**Hypertension following myocardial infarction**

- **By intravenous infusion**
  - Adult: 15 mg/hour, then increased to up to
    120 mg/hour, dose to be increased gradually

**Hypertensive emergencies**

- **By intravenous injection**
  - Adult: 50 mg, to be given over at least 1 minute, then
    50 mg every 5 minutes if required until a satisfactory
    response occurs; maximum 200 mg per course

- **By intravenous infusion**
  - Adult: Initially 2 mg/minute until a satisfactory
    response is achieved, then discontinue; usual dose
    50–200 mg

**Hypertension**

- **By mouth**
  - Adult: Initially 100 mg twice daily, dose to be increased
    at intervals of 14 days; usual dose 200 mg twice daily,
    increased if necessary up to 800 mg daily in 2 divided
    doses, to be taken with food, higher doses to be given in
    2–3 divided doses; maximum 2.4 g per day

  - Elderly: Initially 50 mg twice daily, dose to be increased
    at intervals of 14 days; usual dose 200 mg twice daily,
    increased if necessary up to 800 mg daily in 2 divided
    doses, to be taken with food, higher doses to be given in
    2–3 divided doses; maximum 2.4 g per day

- **By intravenous injection**
  - Adult: 50 mg, dose to be given over at least 1 minute,
    then 50 mg after 5 minutes if required; maximum
    200 mg per course

- **By intravenous infusion**
  - Adult: Initially 2 mg/minute until a satisfactory
    response is achieved, then discontinue; usual dose
    50–200 mg

---

**CAUTIONS**

Liver damage

**INTERACTIONS**

- Appendix 1: beta blockers (non-selective)

**SIDE-EFFECTS**

- Rare  · Lichenoid rash

**Frequency not known**

Difficulty in micturition  · epigastric pain  · liver damage  · nausea  · postural hypotension  · vomiting  · weakness

**PREGNANCY**

The use of labetalol in maternal hypertension
is not known to be harmful, except possibly in the first trimester. If labetalol is used close to delivery, infants
should be monitored for signs of alpha-blockade (as well as beta-blockade).

**BREAST FEEDING**

Infants should be monitored as there is a
risk of possible toxicity due to alpha-blockade (in addition
to beta-blockade).

**HEPATIC IMPAIRMENT**

Avoid—severe hepatocellular injury reported.

**RENAL IMPAIRMENT**

Dose reduction may be required.
**Liver damage**  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Solution for injection**

- **Labetalol hydrochloride (Non-proprietary)**
  - Labetalol hydrochloride 5 mg per 1 mL  Labetalol 100 mg/20 mL solution for injection ampoules  | 5 ampoule (Pm)  £44.44–£53.33

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

- Hepatic impairment: Manufacturer advises caution.
- Renal impairment: Increase dosage interval if eGFR less than 50 mL/minute/1.73 m².

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 8, 21

**OXPRENOLON hydrochloride**

**INDICATIONS AND DOSE**

**Hypertension | Angina**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 80–160 mg daily in 2–3 divided doses, then increased if necessary up to 320 mg daily
  - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: Initially 160 mg once daily, then increased if necessary up to 320 mg daily

**Arrhythmias**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 40–240 mg daily in 2–3 divided doses; maximum 240 mg per day

**Anxiety symptoms (short-term use)**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 40–80 mg daily in 1–2 divided doses

**INTERACTIONS**

- **Appendix 1: beta blockers (non-selective)**

**Heparic IMPAIRMENT**

- **Reduce dose.**

**MEDICATIONS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 8

- Corgard (Sanofi)
  - Nadolol 80 mg  Corgard 80 mg tablets  | 28 tablet (Pm)  £6.00 DT price = £5.00

**NON-SELECTIVE BETA-ADRENOCEPTOR BLOCKERS**

**Nadolol**

**INDICATIONS AND DOSE**

**Hypertension**

- **BY MOUTH**
  - Adult: Initially 80 mg once daily, then increased in steps of up to 80 mg every week if required, doses higher than the maximum are rarely necessary; maximum 240 mg per day

**Angina**

- **BY MOUTH**
  - Adult: Initially 40 mg once daily, then increased if necessary up to 160 mg daily, doses should be increased at weekly intervals, maximum dose rarely is used; maximum 240 mg per day

**Arrhythmias**

- **BY MOUTH**
  - Adult: Initially 40 mg once daily, then increased if necessary up to 160 mg once daily, doses should be increased at weekly intervals; reduced to 40 mg daily if bradycardia occurs

**Migraine prophylaxis**

- **BY MOUTH**
  - Adult: Initially 40 mg once daily, then increased in steps of 40 mg every week, adjusted according to response; maintenance 80–160 mg once daily

**INTERACTIONS**

- **Appendix 1: beta blockers (non-selective)**

**MEDICATIONS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Pindolol

**INDICATIONS AND DOSE**

**Hypertension**

- **BY MOUTH**
  - Adult: Initially 5 mg 2–3 times a day, alternatively 15 mg once daily, doses to be increased as required at weekly intervals; maintenance 15–30 mg daily; maximum 45 mg per day

**Anxiety**

- **BY MOUTH**
  - Adult: 2.5–5 mg up to 3 times a day

**INTERACTIONS** → Appendix 1: beta blockers (non-selective)

**RENAL IMPAIRMENT**

May adversely affect renal function in severe impairment—manufacturer advises avoid.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

Propranolol hydrochloride

**INDICATIONS AND DOSE**

**Thyrotoxicosis (adjunct)**

- **BY MOUTH**
  - Adult: 10–40 mg 3–4 times a day

**Thyrotoxic crisis**

- **BY INTRAVENOUS INJECTION**
  - Adult: 1 mg, to be given over 1 minute, dose may be repeated if necessary at intervals of 2 minutes, maximum total dose is 5 mg in anaesthesia; maximum 10 mg per course

**INTERACTIONS** → Appendix 1: beta blockers (non-selective)

**SIDE-EFFECTS**

- Rare: Dry eyes (reversible on withdrawal)

**HEPATIC IMPAIRMENT**

Reduce oral dose.

**RENAL IMPAIRMENT**

Manufacturer advises caution; dose reduction may be required.

**PRESCRIBING AND DISPENSING INFORMATION**

Modified-release preparations can be used for once daily administration.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral solution**

Hypertension

- **BY MOUTH**
  - Adult: Initially 80 mg twice daily, dose should be increased at weekly intervals as required; maintenance 160–320 mg daily

Prophylaxis of variceal bleeding in portal hypertension

- **BY MOUTH**
  - Adult: Initially 40 mg twice daily, then increased to 80 mg twice daily (max. per dose 160 mg twice daily), dose to be adjusted according to heart rate

Phaeochromocytoma (only with an alpha-blocker) in preparation for surgery

- **BY MOUTH**
  - Adult: 60 mg daily for 3 days before surgery

Phaeochromocytoma (only with an alpha-blocker) in patients unsuitable for surgery

- **BY MOUTH**
  - Adult: 30 mg daily

Angina

- **BY MOUTH**
  - Adult: Initially 40 mg 2–3 times a day; maintenance 120–240 mg daily

Hypertrophic cardiomyopathy / Anxiety tachycardia

- **BY MOUTH**
  - Adult: 10–40 mg 3–4 times a day

Anxiety with symptoms such as palpitation, sweating and tremor

- **BY MOUTH**
  - Adult: 40 mg once daily, then increased if necessary to 40 mg 3 times a day

Prophylaxis after myocardial infarction

- **BY MOUTH**
  - Adult: Initially 40 mg 4 times a day for 2–3 days, then 80 mg twice daily, start treatment 5 to 21 days after infarction

Essential tremor

- **BY MOUTH**
  - Adult: 80–240 mg daily in divided doses

Arrhythmias

- **BY MOUTH**
  - Adult: 10–40 mg 3–4 times a day

- **BY INTRAVENOUS INJECTION**
  - Adult: 1 mg, to be given over 1 minute, dose may be repeated if necessary at intervals of 2 minutes, maximum 10 mg per course (5 mg in anaesthesia)
Timolol with amiloride and hydrochlorothiazide

The properties listed below are those particular to the combination only. For the properties of the components please consider, timolol maleate above, amiloride hydrochloride p. 223, hydrochlorothiazide p. 162.

- **INDICATIONS AND DOSE**
  - **Hypertension**
    - BY MOUTH
      - Adult: 1–2 tablets daily
  - **INTERACTIONS** → Appendix 1: beta blockers (non-selective), thiazide diuretics

BREAST FEEDING

Acebutolol and water soluble beta-blockers are present in breast milk in greater amounts than other beta-blockers.

RENAL IMPAIRMENT

Halve dose if eGFR 25–50 mL/minute/1.73 m²; use quarter dose if eGFR less than 25 mL/minute/1.73 m²; do not administer more than once daily.

MEDIeczAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Atenolol

INDICATIONS AND DOSE

Hypertension

BY MOUTH

Adult: 25–50 mg daily, higher doses are rarely necessary

Angina

BY MOUTH

Adult: 100 mg daily in 1–2 divided doses

Arrhythmias

BY MOUTH

Adult: 50–100 mg daily

BY INTRAVENOUS INJECTION

Adult: 2.5 mg every 5 minutes (max. per dose 10 mg), repeated if necessary, given at a rate of 1 mg/minute

BY INTRAVENOUS INFUSION

Adult: 150 micrograms/kg every 12 hours if required, to be given over 20 minutes

Migraine prophylaxis

BY MOUTH

Adult: 50–200 mg daily in divided doses

DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (Tenormin®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Suggested infusion time 20 minutes.

MEDIeczAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

Tenormin (AstraZeneca UK Ltd)

Atenolol 500 microgram per 1 ml  
Tenormin 5mg/10ml solution for injection ampoules | 10 ampule | £34.45 (Hospital only)

Oral solution

Tenormin 100mg tablets | 28 tablet | £6.49 DT price = £0.75

Early intervention within 12 hours of myocardial infarction

INITIALLY BY INTRAVENOUS INJECTION

Adult: Initially 5 mg, to be given over 5 minutes, followed by (by mouth) 50 mg after 15 minutes, then (by mouth) 50 mg after 12 hours, then (by mouth) 100 mg daily

UNLICENSED USE

Use of atenolol for migraine prophylaxis is an unlicensed indication.

INTERACTIONS

Appendix 1: beta blockers (selective)

BREAST FEEDING

Water soluble beta-blockers such as atenolol are present in breast milk in greater amounts than other beta blockers.

RENAl IMPAIRMENT

With oral use Max. 50 mg daily if eGFR 15–35 mL/minute/1.73 m²; max. 25 mg daily or 50 mg on alternate days if eGFR less than 15 mL/minute/1.73 m².

With intravenous use Max. 10 mg on alternate days if eGFR 15–35 mL/minute/1.73 m²; max.10 mg every 4 days if eGFR less than 15 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (Tenormin®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Suggested infusion time 20 minutes.

Atenolol with nifedipine

The properties listed below are those particular to the combination only. For the properties of the components please consider, atenolol above, nifedipine p. 157.

INDICATIONS AND DOSE

Hypertension

BY MOUTH

Adult: 1 capsule daily, increased if necessary to 1 capsule twice daily

Elderly: 1 capsule daily

Angina

BY MOUTH

Adult: 1 capsule twice daily

INTERACTIONS

Appendix 1: beta blockers (selective), calcium channel blockers

PRESCRIBING AND DISPENSING INFORMATION

Only indicated when calcium-channel blocker or beta-blocker alone proves inadequate.
**Cardiovascular system**

**CONTRA-INDICATIONS**
- Very rare

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Modified-release capsule**

**CAUTIONARY AND ADVISORY LABELS 8, 25**
- Tenil (AstraZeneca UK Ltd)
  - Nifedipine 20 mg, Atenolol 50 mg modified-release capsules | 28 capsule
  - Dose: 10 mg daily in severe renal impairment.

**Bisoprolol fumarate**

**INDICATIONS AND DOSE**

**Hypertension | Angina**
- **BY MOUTH**
  - Adult: 5–10 mg once daily; maximum 20 mg per day

**Adjunct in heart failure**
- **BY MOUTH**
  - Adult: Initially 1.25 mg once daily for 1 week, dose to be taken in the morning, then increased if tolerated to 2.5 mg once daily for 1 week, then increased if tolerated to 3.75 mg once daily for 1 week, then increased if tolerated to 5 mg once daily for 4 weeks, then increased if tolerated to 7.5 mg once daily for 4 weeks, then increased if tolerated to 10 mg once daily; maximum 10 mg per day

**CONTRA-INDICATIONS**
- Acute or decompensated heart failure requiring inotropic support – sino-atrial block

**CAUTIONS**
- Ensure heart failure not worsening before increasing dose

**INTERACTIONS** → Appendix 1: beta blockers (selective)

**SIDE-EFFECTS**
- Uncommon
  - Cramp
  - Depression
  - Muscle weakness
- Rare
  - Hearing impairment
  - Hypertriglyceridaemia
  - Syncope
- Very rare
  - Conjunctivitis

**HEPATIC IMPAIRMENT**
- Max. 10 mg daily in severe impairment.

**RENAL IMPAIRMENT**
- Reduce dose if eGFR less than 20 mL/minute/1.73 m² (max. 10 mg daily).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 8, 22**
- **Bisoprolol fumarate (Non-proprietary)**
  - Bisoprolol fumarate 1.25 mg Bisoprolol 1.25mg tablets | 28 tablet
  - Dose: 10 mg daily, alternatively increased if necessary to 50 mg daily.

**CONTRACOR (Tillomed Laboratories Ltd)**
- **Bisoprolol fumarate 1.25 mg**
  - Concor 1.25mg tablets | 28 tablet
  - **DT price = £0.87**
- **Bisoprolol fumarate 2.5 mg**
  - Concor 2.5mg tablets | 28 tablet
  - **DT price = £0.78**

**Celiprolol hydrochloride**

**INDICATIONS AND DOSE**
- Mild to moderate hypertension
- **BY MOUTH**
  - Adult: 200 mg once daily, dose to be taken in the morning, then increased if necessary to 400 mg once daily

**INTERACTIONS** → Appendix 1: beta blockers (selective)

**SIDE-EFFECTS**
- Rare
  - Depression
  - Pneumonitis
- Frequency not known
  - Hot flushes

**BREAST FEEDING**
- Manufacturers advise avoidance.

**HEPATIC IMPAIRMENT**
- Consider dose reduction.

**RENAL IMPAIRMENT**
- Reduce dose by half if eGFR 15–40 mL/minute/1.73 m². Avoid if eGFR less than 15 mL/minute/1.73 m².

**MEDITINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 8, 22**
- **Celiprolol hydrochloride (Non-proprietary)**
  - Celiprolol hydrochloride 200 mg Celiprolol 200mg tablets | 28 tablet
  - **DT price = £0.29**
  - Celiprolol hydrochloride 400 mg Celiprolol 400mg tablets | 28 tablet
  - **DT price = £0.38**
- **Celectol (Zeneca)**
  - Celectol hydrochloride 200 mg Celectol 200mg tablets | 28 tablet
  - **DT price = £0.18**
  - Celectol hydrochloride 400 mg Celectol 400mg tablets | 28 tablet
  - **DT price = £0.38**

**Co-tenidone**

**INDICATIONS AND DOSE**
- **Hypertension**
  - **BY MOUTH**
  - Adult: 50/12.5 mg daily, alternatively increased if necessary to 100/25 mg daily, doses higher than 50 mg atenolol rarely necessary

**DOSE EQUIVALENCE AND CONVERSION**
- A mixture of atenolol and chlortalidone in mass proportions corresponding to 4 parts of atenolol and 1 part chlortalidone.

**INTERACTIONS** → Appendix 1: beta blockers (selective), thiazide diuretics

**SIDE-EFFECTS**
- Allergic interstitial nephritis
  - Jaundice

**PREGNANCY**
- Avoid. Diuretics not used to treat hypertension in pregnancy.

**BREAST FEEDING**
- Atenolol present in milk in greater amounts than some other beta-blockers. Possible toxicity due to beta-blockade—monitor infant. Large doses of chlortalidone may suppress lactation.

**RENAL IMPAIRMENT**
- Avoid if eGFR less than 30 mL/minute/1.73 m²—consider alternative treatment.
MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet
CAUTIONARY AND ADVISORY LABELS 8

▶ Co-tenidone (Non-proprietary)
Chlortalidone 12.5 mg, Atenolol 50 mg Co-tenidone 50mg/12.5mg tablets | 28 tablet | £0.40 DT price = £1.65
Chlortalidone 25 mg, Atenolol 100 mg Co-tenidone 100mg/25mg tablets | 28 tablet | £0.40 DT price = £1.68
▶ Tenoret (AstraZeneca UK Ltd)
Chlortalidone 12.5 mg, Atenolol 50 mg Tenoret 50mg/12.5mg tablets | 28 tablet | £0.18 DT price = £1.65
▶ Tenoretic (AstraZeneca UK Ltd)
Chlortalidone 25 mg, Atenolol 100 mg Tenoret 100mg/25mg tablets | 28 tablet | £0.18 DT price = £1.68

SECTION 1: BLOOD VESSELS AND BLOOD PRESSURE INHIBITION

Esmolol hydrochloride

INDICATIONS AND DOSE
Short-term treatment of supraventricular arrhythmias (including atrial fibrillation, atrial flutter, sinus tachycardia). Tachycardia and hypertension in peri-operative period

▶ BY INTRAVENOUS INFUSION
Adult: 50–200 micrograms/kg/minute, consult product literature for details of dose titration and doses during peri-operative period

INTERACTIONS  Appendix 1: beta blockers (selective)
SIDE-EFFECTS Thrombophlebitis - venous irritation
BREAST FEEDING Manufacturer advises avoidance.
RENAL IMPAIRMENT Manufacturer advises caution.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
▶ Brevibloc (Baxter Healthcare Ltd)
Esmolol hydrochloride 10 mg per 1 ml Brevibloc Premixed 100mg/1ml solution for injection vials | 5 vial | no price available

Solution for infusion
▶ Brevibloc (Baxter Healthcare Ltd)
Esmolol hydrochloride 10 mg per 1 ml Brevibloc Premixed 2.5g/250ml infusion bags | 1 bag | £89.69

Metoprolol tartrate

INDICATIONS AND DOSE
Hypertension
▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Adult: Initially 100 mg daily, increased if necessary to 200 mg daily in 1–2 divided doses, high doses are rarely required; maximum 400 mg per day
▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
Adult: 200 mg once daily

Angina
▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Adult: 50–100 mg 2–3 times a day
▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
Adult: 200–400 mg daily

Arrhythmias
▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Adult: Usual dose 50 mg 2–3 times a day, then increased if necessary up to 300 mg daily in divided doses
▶ BY INTRAVENOUS INJECTION
Adult: Up to 5 mg, dose to be given at a rate of 1–2 mg/minute, then up to 5 mg after 5 minutes if required, total dose of 10–15 mg

Migraine prophylaxis
▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Adult: 100–200 mg daily in divided doses
▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
Adult: 200 mg daily

Early intervention within 12 hours of infarction
▶ INITIALY BY INTRAVENOUS INJECTION
Adult: Initially 5 mg every 2 minutes, to a max. of 15 mg, followed by (by mouth) 50 mg every 6 hours for 48 hours, to be taken 15 minutes after intravenous injection; (by mouth) maintenance 200 mg daily in divided doses

INTERACTIONS  Appendix 1: beta blockers (selective)
Hepatic impairment Reduce dose in severe impairment.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Modified-release tablet
CAUTIONARY AND ADVISORY LABELS 8, 25

Metoprolol tartrate 1 mg per 1 ml Betaloc I.V. 5mg/5ml solution for injection ampoules | 5 ampoule | £0.50 (Hospital only)

Nebivolol

INDICATIONS AND DOSE
Essential hypertension
▶ BY MOUTH
Adult: 5 mg daily
Elderly: Initially 2.5 mg daily, then increased if necessary to 5 mg daily

Hypertension in patient with renal impairment
▶ BY MOUTH
Adult: Initially 2.5 mg once daily, then increased if necessary to 5 mg once daily

Adjunct in stable mild to moderate heart failure
▶ BY MOUTH
Adult: 5 mg once daily; then increased if tolerated to 2.5 mg once daily, then increased if tolerated to 5 mg once daily for 1–2 weeks, then increased if tolerated to 10 mg once daily

Adult: 12.5 mg once daily for 1–2 weeks, then increased if tolerated to 2.5 mg once daily, then increased if tolerated to 5 mg once daily for 1–2 weeks, then increased if tolerated to 10 mg once daily
Calcium-channel blockers

Overview
Calcium-channel blockers differ in their predilection for the various therapeutic sites of action and, therefore, their therapeutic effects are disparate, with much greater variation than those of beta-blockers. There are important differences between verapamil hydrochloride p. 159, diltiazem hydrochloride p. 152, and the dihydropyridine calcium-channel blockers (amlodipine below, felodipine p. 154, lacidipine p. 155, lercanidipine hydrochloride p. 156, nicardipine hydrochloride p. 156, nifedipine p. 157, and nimodipine p. 111). Verapamil hydrochloride and diltiazem hydrochloride should usually be avoided in heart failure because they may further depress cardiac function and cause clinically significant deterioration.

Verapamil hydrochloride is used for the treatment of angina, hypertension, and arrhythmias. It is a highly negatively inotropic calcium-channel blocker and it reduces cardiac output, slows the heart rate, and may impair atrioventricular conduction. It may precipitate heart failure, exacerbate conduction disorders, and cause hypotension at high doses and should not be used with beta-blockers. Constipation is the most common side-effect.

Nifedipine relaxes vascular smooth muscle and dilates coronary and peripheral arteries. It has more influence on vessels and less on the myocardium than does verapamil hydrochloride and unlike verapamil hydrochloride has no anti-arrhythmic activity. It rarely precipitates heart failure because any negative inotropic effect is offset by a reduction in left ventricular work.

Nifedipine hydrochloride has similar effects to those of nifedipine and may produce less reduction of myocardial contractility. Amlodipine and felodipine also resemble nifedipine and nicardipine hydrochloride in their effects and do not reduce myocardial contractility and they do not produce clinical deterioration in heart failure. They have a longer duration of action and can be given once daily. Nifedipine, nicardipine hydrochloride, amlodipine, and felodipine are used for the treatment of angina or hypertension. All are valuable in forms of angina associated with coronary vasospasm. Side-effects associated with vasodilatation such as flushing and headache (which become less obtrusive after a few days), and ankle swelling (which may respond only partially to diuretics) are common.

Intravenous nicardipine hydrochloride is licensed for the treatment of acute life-threatening hypertension, for example in the event of malignant arterial hypertension or hypertensive encephalopathy; aortic dissection, when a short-acting beta-blocker is not suitable, or in combination with a beta-blocker when beta-blockade alone is not effective; severe pre-eclampsia, when other intravenous anti-hypertensives are not recommended or are contra-indicated; and for treatment of postoperative hypertension.

Nimodipine is related to nifedipine but the smooth muscle relaxant effect preferentially acts on cerebral arteries. Its use is confined to prevention and treatment of vascular spasm following aneurysmal subarachnoid haemorrhage.

Diltiazem hydrochloride is effective in most forms of angina; the longer-acting formulation is also used for hypertension. It may be used in patients for whom beta-blockers are contra-indicated or ineffective. It has a less negative inotropic effect than verapamil hydrochloride and significant myocardial depression occurs rarely. Nevertheless because of the risk of bradycardia it should be used with caution in association with beta-blockers.

Unstable angina
Calcium-channel blockers do not reduce the risk of myocardial infarction in unstable angina. The use of diltiazem hydrochloride or verapamil hydrochloride should be reserved for patients resistant to treatment with beta-blockers.

Calcium-channel blockers

Drug action
Calcium-channel blockers (less correctly called ‘calcium-antagonists’) interfere with the inward displacement of calcium ions through the slow channels of active cell membranes. They influence the myocardial cells, the cells within the specialised conducting system of the heart, and the cells of vascular smooth muscle. Thus, myocardial contractility may be reduced, the formation and propagation of electrical impulses within the heart may be depressed, and coronary or systemic vascular tone may be diminished.

Side-effects

Overdose
Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur.

For details on the management of poisoning, see Calcium-channel blockers, under Emergency treatment of poisoning p. 1254.

Treatment cessation
There is some evidence that sudden withdrawal of calcium-channel blockers may be associated with an exacerbation of myocardial ischaemia.

Amlodipine

Drug action
Amlodipine is a dihydropyridine calcium-channel blocker.

Indications and dose

Prophylaxis of angina

Calcium-channel blockers

CONTRA-INDICATIONS
Acute or decompensated heart failure requiring intravenous inotropes

INTERACTIONS
Appendix 1: beta blockers (selective)

SIDE-EFFECTS
Depression · oedema

BREAST FEEDING
Manufacturers advise avoidance.

HEPATIC IMPAIRMENT
No information available—manufacturer advises avoid.

RENAL IMPAIRMENT
Manufacturer advises avoid in heart failure if serum creatinine greater than 250 micromol/litre.
Hypertension

BY MOUTH

Adult: Initially 5 mg once daily; maximum 10 mg per day

DOSE EQUVALENE AND CONVERSION

Tables from various suppliers may contain different salts (e.g. amlodipine besilate, amlodipine maleate, and amlodipine mesilate) but the strength is expressed in terms of amlodipine (base); tablets containing different salts are considered interchangeable.

CONTRA-INDICATIONS Cardiogenic shock · significant aortic stenosis · unstable angina

SIDE-EFFECTS

Common or very common Abdominal pain · dizziness · fatigue · flushing · headache · nausea · oedema · palpitation · sleep disturbances

Uncommon Alopecia · arthralgia · asthenia · back pain · chest pain · dry mouth · dyspepsia · gastro-intestinal disturbances · gynaecomastia · hypotension · impotence · mood changes · muscle cramps · myalgia · paraesthesia · pruritus · purpura · rashes · rhinitis · skin discolouration · sweating · syncope · taste disturbances · tinnitus · tremor · urinary disturbances · visual disturbances · weight changes

Very rare Angioedema · arhythmias · cholestasis · coughing · gastritis · gingival hyperplasia · hepatitis · hyperglycaemia · jaundice · myocardial infarction · pancreatitis · peripheral neuropathy · tachycardia · thrombocytopenia · urticaria · vasculitis

Frequency not known Erythema multiforme

Overdose In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

PREGNANCY No information available—manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension.

BREAST FEEDING Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT May need dose reduction—half-life prolonged.

DIRECTIONS FOR ADMINISTRATION Tablets may be dispered in water.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

Amlodipine (Non-proprietary)

Amlodipine 1 mg per 1 ml Amlodipine 5mg/5ml oral solution sugar free sugar-free | 150 ml £75.76 DT price = £75.76

Amlodipine 2 mg per 1 ml Amlodipine 10mg/5ml oral solution sugar free sugar-free | 150 ml £115.73 DT price = £115.73

Tablet

Amlodipine (Non-proprietary)

Amlodipine 5 mg Amlodipine 5mg tablets | 28 tablet £9.42 DT price = £0.73

Amlodipine 10 mg Amlodipine 10mg tablets | 28 tablet £14.07 DT price = £0.79

Istin (Pfizer Ltd)

Amlodipine 5 mg Istin 5mg tablets | 28 tablet £11.08 DT price = £0.73

Amlodipine 10 mg Istin 10mg tablets | 28 tablet £16.55 DT price = £0.79

Combinations available: Olmesartan with amlodipine, p. 172 · Olmesartan with amlodipine and hydrochlorothiazide, p. 173

Amlodipine with valsartan

The properties listed below are those particular to the combination only. For the properties of the components please consider, amlodipine p. 150, valsartan p. 174.

INDICATIONS AND DOSE

Hypertension in patients stabilised on the individual components in the same proportions

BY MOUTH

Adult: (consult product literature)

INTERACTIONS → Appendix 1: angiotensin-II receptor antagonists, calcium channel blockers

MEDICINAL FORMS

In the licensing of different medicines containing the same drug.

Tablet

Exforge (Novartis Pharmaceuticals UK Ltd)

Amlodipine (as Amlodipine besilate) 5 mg, Valsartan 80 mg Exforge 5mg/80mg tablets | 28 tablet £20.11 DT price = £20.11

Amlodipine (as Amlodipine besilate) 10 mg, Valsartan 160 mg Exforge 10mg/160mg tablets | 28 tablet £26.51 DT price = £26.51

Amlodipine (as Amlodipine besilate) 5 mg, Valsartan 160 mg Exforge 5mg/160mg tablets | 28 tablet £26.51 DT price = £26.51

Clevadipine

INDICATIONS AND DOSE

Hypertension in the peri-operative setting (specialist use only)

BY INTRAVENOUS INFUSION

Adult: Initially 2 mg/hour, dose may be doubled every 90 seconds as necessary; usual dose 4–6 mg/hour (max. per dose 32 mg/hour); maximum 500 mg per day

CONTRA-INDICATIONS Defective lipid metabolism · uncorrected critical aortic stenosis

CAUTIONS Hypertrophic obstructive cardiomyopathy (risk of reduced oxygen delivery) · lipid load restrictions (injection has a high lipid content) · mitral stenosis (risk of reduced oxygen delivery) · patients who are unable to increase their heart rate adequately to compensate for reduced blood pressure

INTERACTIONS → Appendix 1: calcium channel blockers

SIDE-EFFECTS

Common or very common Acute kidney injury · arrhythmias · chest pain · oedema · tachycardia

Uncommon Bradycardia · congestive heart failure · constipation · dizziness · headache · hypoxia · nausea · pulmonary congestion · vomiting

Rare Ileus

Frequency not known Systemic hypotension

SIDE-EFFECTS, FURTHER INFORMATION

Hypotension and reflex tachycardia Manufacturer advises that systemic hypotension and reflex tachycardia have been reported—consider decreasing the dose by half or stopping the infusion.

ALLERGY AND CROSS-SENSITIVITY Contra—indicated in patients with hypersensitivity to peanut, soy products, or egg products.

PREGNANCY Manufacturer advises avoid unless essential—totoxicity in animal studies (recommendation also supported by specialist sources).

BREAST FEEDING Manufacturer advises avoid—no information available.

MONITORING REQUIREMENTS Manufacturer advises monitor heart rate and blood pressure continuously during...
Diltiazem hydrochloride

**INDICATIONS AND DOSE**

**Prophylaxis and treatment of angina**
- **BY MOUTH**
  - Adult: Initially 60 mg 3 times a day, adjusted according to response; maximum 360 mg per day
  - Elderly: Initially 60 mg twice daily, adjusted according to response; maximum 360 mg per day

**ADIZEM-SR ™ CAPSULES**

**Mild to moderate hypertension**
- **BY MOUTH**
  - Adult: 120 mg twice daily, dose form not appropriate for initial dose titration

- **BY MOUTH**
  - Adult: Initially 240 mg once daily; increased if necessary to 300 mg once daily, dose form not appropriate for initial dose titration in the elderly

**DILCARDIA ™ SR**

**Angina | Mild to moderate hypertension**
- **BY MOUTH**
  - Adult: Initially 90 mg twice daily; increased if necessary to 180 mg twice daily

**CONTRA-INDICATIONS**

Acute porphyrias p. 969 • left ventricular failure with pulmonary congestion • second- or
Rare ▶ SIDE-EFFECTS

- **SIDE-EFFECTS**
- **Common or very common** Asthenia · AV block · bradycardia · dizziness · gastrointestinal disturbances · headache · hot flushes · hypotension · malaise · oedema (notably of ankles) · palpitation · sino-atrial block
- **Rare** Erythema multiforme · exfoliative dermatitis · photosensitivity · rashes
- **Frequency not known** Depression · extrapyramidal symptoms · gum hyperplasia · gynaecomastia · hepatitis

**OVERDOSE**

In overdose, diltiazem has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.

**PREGNANCY** Avoid.

**BREAST FEEDING** Significant amount present in milk—no evidence of harm but avoid unless no safer alternative.

**HEPATIC IMPAIRMENT** Reduce dose.

**TILDIEM RETARD** Dose for mild to moderate hypertension—initially 120 mg once a day; increased if necessary to 120 mg twice a day.

For treatment of angina, dose form not appropriate for initial titration; up to 120 mg twice a day may be required.

**SLOZEM** Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

**DILZEM XL** Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

**ANGITIL XL** Dose form not appropriate for initial dose titration.

**DILCARDIA SR** Dose for angina and mild to moderate hypertension—initially 60 mg twice a day; maximum 90 mg twice a day.

**TILDIEM LA** Dose for angina and mild to moderate hypertension—initially 200 mg daily; increased if necessary to 300 mg daily.

**VIAZEM XL** Dose for angina and mild to moderate hypertension—initially 120 mg once daily, adjusted according to response.

**ADIZEM-XL** Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

**ZEMTARD** Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

**RENAIIMPAIRMENT** Start with smaller dose.

**TILDIEM RETARD** Dose for mild to moderate hypertension—initially 120 mg once a day; increased if necessary to 120 mg twice a day.

For treatment of angina, dose form not appropriate for initial titration; up to 120 mg twice a day may be required.

**SLOZEM** Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

**DILZEM XL** Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

**ANGITIL XL** Dose form not appropriate for initial dose titration.

**DILCARDIA SR** Dose for angina and mild to moderate hypertension—initially 60 mg twice a day; maximum 90 mg twice a day.

**TILDIEM LA** Dose for angina and mild to moderate hypertension—initially 200 mg daily; increased if necessary to 300 mg daily.

**VIAZEM XL** Dose for angina and mild to moderate hypertension—initially 120 mg once daily, adjusted according to response.

**ADIZEM-XL** Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

**ZEMTARD** Dose for angina and mild to moderate hypertension—initially 120 mg once daily.

**PRESCRIBING AND DISPENSING INFORMATION**

The standard formulations containing 60 mg diltiazem hydrochloride are licensed as generics and there is no requirement for brand name dispensing. Although their means of formulation has called for the strict designation ‘modified-release’, their duration of action corresponds to that of tablets requiring administration more frequently.

Different versions of modified-release preparations containing more than 60 mg diltiazem hydrochloride may not have the same clinical effect. To avoid confusion between these different formulations of diltiazem, prescribers should specify the brand to be dispensed.

**PATIENT AND CARER ADVICE**

**TILDIEM RETARD** Tablet membrane may pass through gastro-intestinal tract unchanged, but being porous has no effect on efficacy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, cream, ointment, gel

Felodipine

**DRUG ACTION** Felodipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE**

**Prophylaxis of angina**
- **BY MOUTH**
  - Adult: Initially 5 mg once daily; increased if necessary to 10 mg once daily, to be taken in the morning
  - Elderly: Initially 2.5 mg once daily; increased if necessary to 10 mg once daily, to be taken in the morning

**Hypertension**
- **BY MOUTH**
  - Adult: Initially 5 mg once daily; usual maintenance 5–10 mg once daily, to be taken in the morning, doses above 20 mg daily rarely needed
  - Elderly: Initially 2.5 mg daily; usual maintenance 5–10 mg once daily, to be taken in the morning, doses above 20 mg daily rarely needed

**CONTRA-INDICATIONS** Cardiac outflow obstruction - significant cardiac valvular obstruction (e.g. aortic stenosis) - uncontrolled heart failure - unstable angina - within 1 month of myocardial infarction

**CAUTIONS** Predisposition to tachycardia - severe left ventricular dysfunction - withhold if cardiogenic shock develops - withhold if existing pain worsens shortly after initiating treatment - withhold if ischaemic pain occurs shortly after initiating treatment

**INTERACTIONS** → Appendix 1: calcium channel blockers

**SIDE-EFFECTS**
- **Common or very common** Flushing, headache, peripheral oedema
- **Uncommon** Abdominal pain, dizziness, malaise, nausea, palpitation, paraesthesia, pruritus, rash, tachycardia
- **Rare** Arthralgia, impotence, myalgia, syncope, vomiting
- **Very rare** Gum hyperplasia, leucocytoclastic vasculitis, photosensitivity, urinary frequency

**PREGNANCY** Avoid; toxicity in animal studies; may inhibit labour.

**BREAST FEEDING** Present in milk but amount probably too small to be harmful.

**HEPATIC IMPAIRMENT** Dose reduction may be required.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS 25**

- **Felodipine (Non-proprietary)**
  - **Felodipine 2.5 mg** Felodipine 2.5mg modified-release tablets | 28 tablet [Pom] no price available DT price = £5.31
  - **Felodipine 5 mg** Felodipine 5mg modified-release tablets | 28 tablet [Pom] £4.21 DT price = £4.21
  - **Felodipine 10 mg** Felodipine 10mg modified-release tablets | 28 tablet [Pom] £5.66 DT price = £5.66
  - **Cardioplen XL (Chiesi Ltd)**
    - **Felodipine 2.5 mg** Cardioplen XL 2.5mg tablets | 28 tablet [Pom] £5.68 DT price = £5.68
    - **Felodipine 5 mg** Cardioplen XL 5mg tablets | 28 tablet [Pom] £3.87 DT price = £3.87
    - **Felodipine 10 mg** Cardioplen XL 10mg tablets | 28 tablet [Pom] £4.21 DT price = £4.21
  - **Folpik XL (Teva UK Ltd)**
    - **Felodipine 2.5 mg** Folpik XL 2.5mg tablets | 28 tablet [Pom] £6.31 DT price = £6.31
    - **Felodipine 5 mg** Folpik XL 5mg tablets | 28 tablet [Pom] £4.21 DT price = £4.21
    - **Felodipine 10 mg** Folpik XL 10mg tablets | 28 tablet [Pom] £7.21 DT price = £7.21
**CONTRA-INDICATIONS**

- Hypotension not severe
- Aortic stenosis
- Chronic heart failure
- Cardiogenic shock
- Depression
- Arthralgia

**INTERACTIONS**

- Common or very common
- Frequency not known

**SIDE-EFFECTS**

- Abdominal discomfort
- Dizziness
- Dyspnoea
- Fatigue
- Flushing
- Headache
- Palpitation
- Peripheral oedema
- Polyuria
- Rash
- Tachycardia
- Hypotension
- Weight gain
- Anaemia
- Anorexia
- Anxiety
- Arrhythmia
- Arterial hypertension
- Blood disorders
- Bradycardia
- Cough
- Depression
- Drowsiness
- Erectile dysfunction
- Gum hyperplasia
- Heart failure
- Hypersensitivity reactions
- Leucopenia
- Nausea
- Paraesthesia
- Thrombocytopenia
- Visual disturbance
- Vomiting
- Gynaecomastia
- Hepatitis

**OVERDOSE**

In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

**PREGNANCY**

May inhibit labour. Risk to fetus should be balanced against risk of uncontrolled maternal hypertension.

**PARENTERAL**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

1.25 mg twice daily, increased if necessary after 3–4 weeks according to response; maintenance dose of 2.5 mg or 5 mg once daily may be sufficient.

**RENA L IMPAIRMENT**

Use with caution.

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

## Lacidipine

**DRUG ACTION**

Lacidipine is a dihydropyridine calcium-channel blocker.

### INDICATIONS AND DOSE

**Hypertension**

**BY MOUTH**

- Adult: Initially 2 mg daily; increased if necessary to 4 mg daily; in combination with cimetidine or within 1 month of myocardial infarction, dose increases should occur at intervals of 3–4 weeks, to be taken preferably in the morning.

**SIDE-EFFECTS**

- Common or very common
- Rare
- Aggravation of angina
- Asthenia
- Erythema
- Gastrointestinal disturbances
- Gum hyperplasia
- Mood disturbances
- Muscle cramps
- Polyuria
- Pruritus
- Skin rash

**CONTRA-INDICATIONS**

- Acute porphyrias p. 969
- Aortic stenosis
- Aortic valvular disease
- Cardiogenic shock
- Unstable angina

**CAUTIONS**

Cardiac conduction abnormalities

**INTERACTIONS**

Appendix 1: calcium channel blockers

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Lacidipine (Non-proprietary)
  - Lacidipine 2 mg: Lacidipine 2 mg tablets | 28 tablet | £6.85 DT price = £2.13
  - Lacidipine 4 mg: Lacidipine 4 mg tablets | 28 tablet | £6.85 DT price = £2.17
  - Molap (Rivopharm UK Ltd)
  - Lacidipine 4 mg: Lacidipine 4 mg tablets | 28 tablet | £2.90 DT price = £2.17
  - Motens (GlaxoSmithKline UK Ltd)
  - Lacidipine 2 mg: Lacidipine 2 mg tablets | 28 tablet | £2.95 DT price = £2.13
  - Lacidipine 4 mg: Lacidipine 4 mg tablets | 28 tablet | £3.10 DT price = £2.17
### Lercanidipine hydrochloride

**DRUG ACTION**  
Lercanidipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE**

**Mild to moderate hypertension**
- **BY MOUTH**
  - Adult: Initially 10 mg once daily; increased if necessary to 20 mg daily, dose can be adjusted after 2 weeks

**CONTRA-INDICATIONS**  
Acute porphyrias p. 969 - aortic stenosis - uncontrolled heart failure - unstable angina - within 1 month of myocardial infarction

**CAUTIONS**  
Left ventricular dysfunction - sick sinus syndrome (if pacemaker not fitted)

**INTERACTIONS**  
Appendix 1: calcium channel blockers

**SIDE-EFFECTS**
- **Uncommon**  
  - Dizziness - flushing - headache - palpitation - peripheral oedema - tachycardia
- **Rare**  
  - Angina - asthenia - drowsiness - gastrointestinal disturbances - myalgia - polyuria - rash
- **Very rare**  
  - Gingival hyperplasia - hypotension - myocardial infarction

**Overdose**

In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

**PREGNANCY**  
Manufacturer advises avoid — no information available.

**BREAST FEEDING**  
Manufacturer advises avoid.

**HEPATIC IMPAIRMENT**  
Avoid in severe disease.

**RENAL IMPAIRMENT**  
Avoid if eGFR less than 30 mL/minute/1.73 m².

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

### Nicardipine hydrochloride

**DRUG ACTION**  
Nicardipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE**

**Prophylaxis of angina**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 20 mg 3 times a day, then increased to 30 mg 3 times a day, dose increased after at least 3 days; usual dose 60–120 mg daily

**Mild to moderate hypertension**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 20 mg 3 times a day, then increased to 30 mg 3 times a day, dose increased after at least 3 days; usual dose 60–120 mg daily
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: Initially 30 mg twice daily; increased if necessary up to 45 mg twice daily, usual dose 30–60 mg twice daily

---

### Life-threatening hypertension (specialist use only) | Postoperative hypertension (specialist use only)

**BY CONTINUOUS INTRAVENOUS INFUSION**

- **Adult:** Initially 3–5 mg/hour for 15 minutes, increased in steps of 0.5–1 mg every 15 minutes, adjusted according to response, maximum rate 15 mg/hour, reduce dose gradually when target blood pressure achieved; maintenance 2–4 mg/hour
- **Elderly:** Initially 1–5 mg/hour, then adjusted in steps of 500 micrograms/hour after 30 minutes, adjusted according to response, maximum rate 15 mg/hour

**Life-threatening hypertension in patients with hepatic or renal impairment (specialist use only) | Postoperative hypertension in patients with hepatic or renal impairment (specialist use only)**

**BY CONTINUOUS INTRAVENOUS INFUSION**

- **Adult:** Initially 1–5 mg/hour, then adjusted in steps of 500 micrograms/hour after 30 minutes, adjusted according to response, maximum rate 15 mg/hour

**Acute life-threatening hypertension in pregnancy (specialist use only)**

**BY CONTINUOUS INTRAVENOUS INFUSION**

- **Adult:** Initially 1–5 mg/hour, then adjusted in steps of 500 micrograms/hour after 30 minutes, adjusted according to response, usual maximum rate 4 mg/hour in treatment of pre-eclampsia (maximum rate 15 mg/hour)

**CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS**

- Acute porphyrias p. 969 - cardiogenic shock - significant or advanced aortic stenosis - unstable or acute attacks of angina

**SPECIFIC CONTRA-INDICATIONS**

- With intravenous use: Avoid within 8 days of myocardial infarction - compensatory hypertension
- With oral use: Avoid within 1 month of myocardial infarction

**CAUTIONS**

**GENERAL CAUTIONS**

Congestive heart failure - elderly - pulmonary oedema - significantly impaired left ventricular function - stroke - withdraw if ischaemic pain occurs or existing pain worsens within 30 minutes of initiating treatment or increasing dose

**SPECIFIC CAUTIONS**

- With intravenous use: Elevated intracranial pressure - portal hypertension

**INTERACTIONS**  
Appendix 1: calcium channel blockers

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hypotension and reflex tachycardia: Systemic hypotension and reflex tachycardia with rapid reduction of blood pressure may occur — during intravenous use consider stopping infusion or decreasing dose by half.

**Overdose**

In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

**PREGNANCY**

May inhibit labour. Not to be used in multiple pregnancy (twins or more) unless there is no other acceptable alternative. Toxicity in animal studies. Risk of severe maternal hypotension and fatal foetal hypoxia—
avoid excessive decrease in blood pressure. For treatment of acute life-threatening hypertension only.

**BREAST FEEDING** Manufacturer advises avoid—present in breast milk.

**HEPATIC IMPAIRMENT**

- With oral use Use with caution—consider using lowest initial dose and extending dosing interval according to individual response.
- With intravenous use Use with caution—use lower initial dose.

**RENAL IMPAIRMENT**

- With oral use Consider using lowest initial dose and extending dosing interval according to individual response.
- With intravenous use Use with caution—use lower initial dose.

**MONITORING REQUIREMENTS** Monitor blood pressure and heart rate at least every 5 minutes during intravenous infusion, and then until stable, and continue monitoring for at least 12 hours after end of infusion.

**DIRECTIONS FOR ADMINISTRATION** Intravenous nicardipine should only be administered under the supervision of a specialist and in a hospital or intensive care setting in which patients can be closely monitored.

For intravenous infusion give continuously in Glucose 5%; dilute dose in infusion fluid to a final concentration of 100–200 micrograms/mL (undiluted solution via central venous line only) and give via volumetric infusion pump or syringe driver; protect from light; to minimise peripheral venous irritation, change site of infusion every 12 hours; risk of adsorption on to plastic of infusion set in the presence of saline solutions; incompatible with bicarbonate or alkaline solutions—consult product literature.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Modified-release capsule**

- **Cardene SR (Astellas Pharma Ltd)**
  - Nicardipine hydrochloride 30 mg Cardene SR 30mg capsules  | 56 capsule PoM £7.15 DT price = £7.15
  - Nicardipine hydrochloride 45 mg Cardene SR 45mg capsules  | 56 capsule PoM £10.40 DT price = £10.40

**Solution for infusion**

- **Nicardipine hydrochloride (Non-proprietary)**
  - Nicardipine hydrochloride 1 mg per 1 ml Nicardipine 10mg/10ml solution for injection ampoules  | 5 ampoule PoM £50.00

**Capsule**

- **Nicardipine hydrochloride (Non-proprietary)**
  - Nicardipine hydrochloride 20 mg Nicardipine 20mg capsules  | 56 capsule PoM £8.38 DT price = £6.00
  - Nicardipine hydrochloride 30 mg Nicardipine 30mg capsules  | 56 capsule PoM £9.73 DT price = £6.96
  - **Cardene (Astellas Pharma Ltd)**
  - Nicardipine hydrochloride 20 mg Cardene 20mg capsules  | 56 capsule PoM £6.00 DT price = £6.00
  - Nicardipine hydrochloride 30 mg Cardene 30mg capsules  | 56 capsule PoM £6.96 DT price = £6.96

---

**Nifedipine**

**DRUG ACTION** Nifedipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE**

- **Raynaud’s syndrome**
  - Adult: Initially 5 mg 3 times a day, then adjusted according to response to 20 mg 3 times a day

**Cardene**

- **Hypertension**
  - Adult: 10 mg 3 times a day

**Cardene SR**

- **Hypertension**
  - Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

**Adalat Retard**

- **Hypertension | Angina prophyaxis**
  - Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

**Adalat LA**

- **Hypertension**
  - Adult: 20–30 mg once daily, increased if necessary up to 90 mg once daily

**Angina prophyaxis**

- Adult: 30 mg once daily, increased if necessary up to 90 mg once daily

**Adalat Retard**

- **Hypertension | Angina prophyaxis**
  - Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

**Adalat XL**

- **Hypertension | Angina prophyaxis**
  - Adult: 30 mg daily, increased if necessary up to 90 mg daily

**Coracten SR**

- **Hypertension | Angina prophyaxis**
  - Adult: Initially 10 mg twice daily, increased if necessary up to 40 mg twice daily

**Coracten XL**

- **Hypertension | Angina prophyaxis**
  - Adult: Initially 30 mg daily, increased if necessary up to 90 mg daily

**Fortipine LA 40**

- **Hypertension | Angina prophyaxis**
  - Adult: Initially 40 mg once daily, increased if necessary to 80 mg daily in 1–2 divided doses

**Nifedipress™ MR**

- **Hypertension | Angina prophyaxis**
  - Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

TENSIPINE MR

Hypertension | Angina prophylaxis

▶ BY MOUTH
▶ Adult: Initially 10 mg twice daily, adjusted according to response to 40 mg twice daily

VALNI XL

Severe hypertension | Prophylaxis of angina

▶ BY MOUTH
▶ Adult: 30 mg once daily, increased if necessary up to 90 mg once daily

● UNLICENSED USE Not licensed for use in postponing premature labour.

● CONTRA-INDICATIONS Acute attacks of angina • cardiogenic shock • significant aortic stenosis • unstable angina • within 1 month of myocardial infarction

● CAUTIONS Diabetes mellitus • elderly • heart failure • poor cardiac reserve • severe hypertension • short-acting formulations are not recommended for angina or long-term management of hypertension; their use may be associated with large variations in blood pressure and reflex tachycardia • significantly impaired left ventricular function (heart failure deterioration observed) • withdrawal if ischaemic pain occurs or existing pain worsens shortly after initiating treatment

ADALAT LA Crohn’s disease • decreased lumen diameter of the gastro-intestinal tract • history of gastro-intestinal obstruction • history of oesophageal obstruction • inflammatory bowel disease

CAUTIONS, FURTHER INFORMATION

Dose form not appropriate for use where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, or inflammatory bowel disease (including Crohn’s disease).

VALNI XL Decreased lumen diameter of gastro-intestinal tract • history of gastro-intestinal obstruction • history of oesophageal obstruction • ileostomy after proctocolectomy • inflammatory bowel disease

CAUTIONS, FURTHER INFORMATION

Dose form not appropriate for use where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, inflammatory bowel disease, or ileostomy after proctocolectomy.

● INTERACTIONS → Appendix 1: calcium channel blockers

● SIDE-EFFECTS

▶ Common or very common Asthenia • dizziness • gastro-intestinal disturbance • headache • hypotension • lethargy • oedema • palpitation • vasodilatation

▶ Uncommon Angioedema • anxiety • chills • dyspnœa • dysuria • epistaxis • erectile dysfunction • hypersensitivity reactions • jaundice • joint swelling • migraine • myalgia • nasal congestion • nocturia • paraesthesia • polyuria • pruritus • rash • sleep disturbance • sweating • syncope • tachycardia • tremor • urticaria • vertigo • visual disturbance

▶ Rare Anorexia • gum hyperplasia • hyperglycaemia • male infertility • mood disturbances • photosensitivity reactions • purpura

▶ Frequency not known Agranulocytosis • anaphylaxis • bezoar formation (with some modified-release preparations) • dysphagia • gynaecomastia • intestinal obstruction • intestinal ulcer

Overdose

In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

● PREGNANCY May inhibit labour; manufacturer advises avoid before week 20, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension. Use only if other treatment options are not indicated or have failed.

● BREAST FEEDING Amount too small to be harmful but manufacturers advise avoid.

● HEPATIC IMPAIRMENT Dose reduction may be required in severe liver disease.

Some modified-release formulations may not be suitable for dose titration in hepatic disease—consult product literature.

ADALAT LA Dose form not appropriate.

VALNI XL Dose form not appropriate.

● DIRECTIONS FOR ADMINISTRATION

FORTIPINE LA 40 Take with or just after food, or a meal.

● PRESCRIBING AND DISPENSING INFORMATION

Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of nifedipine, prescribers should specify the brand to be dispensed.

Palliative care

For further information on the use of nifedipine in palliative care, see www.palliativecare.org.uk/formulary/en/nifedipine.html.

● PATIENT AND CARER ADVICE

ADALAT LA Tablet membrane may pass through gastro-intestinal tract unchanged, but being porous has no effect on efficacy.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Verapamil hydrochloride

**INDICATIONS AND DOSE**

- **Treatment of supraventricular arrhythmias**
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 40–120 mg 3 times a day
  - **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 5–10 mg, to be given over 2 minutes, preferably with ECG monitoring
  - Elderly: 5–10 mg, to be given over 3 minutes, preferably with ECG monitoring
- **Paroxysmal tachyarrhythmias**
  - **BY SLOW INTRAVENOUS INJECTION**
  - Adult: Initially 5–10 mg, followed by 5 mg after 5–10 minutes if required, to be given over 2 minutes, preferably with ECG monitoring
  - Elderly: Initially 5–10 mg, followed by 5 mg after 5–10 minutes if required, to be given over 3 minutes, preferably with ECG monitoring
- **Angina**
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 80–120 mg 3 times a day
- **Hypertension**
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 240–480 mg daily in 2–3 divided doses
- **Prophylaxis of cluster headache (initiated under specialist supervision)**
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 240–960 mg daily in 3–4 divided doses

**HALF SECURON® SR**

- **Hypertension (in patients new to verapamil)**
  - **BY MOUTH**
  - Adult: Initially 120 mg daily, increased if necessary to 240 mg daily
- **Hypertension**
  - **BY MOUTH**
  - Adult: 240 mg daily, increased if necessary up to 480 mg daily
- **Angina**
  - **BY MOUTH**
  - Adult: 240 mg twice daily, may sometimes be reduced to once daily

**UNLICENSED USE**

- With oral use Prophylaxis of cluster headaches is an unlicensed indication.

**CONTRA-INDICATIONS**

- Acute porphyrias p. 969 - atrial flutter or fibrillation associated with accessory conducting pathways (e.g. Wolff-Parkinson-White-syndrome) - bradycardia - cardiogenic shock - history of heart failure (even if controlled by therapy) - history of significantly impaired left ventricular function (even if controlled by...
therapy · hypotension · second- and third-degree AV block · sick sinus syndrome · sino-atrial block

- **CAUTIONS** Acute phase of myocardial infarction (avoid if bradycardia, hypotension, left ventricular failure) · first-degree AV block

- **INTERACTIONS** → Appendix 1: calcium channel blockers

- **SIDE-EFFECTS**
  - Common or very common Constipation
  - Uncommon Ankle oedema · dizziness · fatigue · flushing · headache · nausea · vomiting
  - Rare Allergic reactions · angioedema · arthralgia · astystole · bradycardia · erythema · erythromelalgia · gingival hyperplasia after long-term treatment · gynaecomastia · hypertension · increased prolactin concentration · myalgia · paraesthesia · pruritus · Stevens-Johnson syndrome · urticaria

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Intravenous administration or high doses · Hypotension, heart failure, bradycardia, heart block, and astystole are side-effects associated with intravenous administration or high doses.

- **OVERDOSE**
  - In overdose, verapamil has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.

- **PREGNANCY** May reduce uterine blood flow with fetal hypoxia. Manufacturer advises avoid in first trimester unless absolutely necessary. May inhibit labour.

- **BREAST FEEDING** Amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Oral dose may need to be reduced.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  - **INTERACTIONS** → Appendix 1: potassium-sparing diuretics, thiazide diuretics

  - **MEDICINAL FORMS**

    - There can be variation in the licensing of different medicines containing the same drug.

    - **Tablet**
      - EXCIPIENTS: May contain Gluten
      - Navispare (AMCO)
        - Cyclopenthiazide 250 microgram, Amiloride hydrochloride 2.5 mg · Navispare 2.5mg/250microgram tablets | 28 tablet (POD) £3.24 DT price = £3.24

  - **DIURETICS**

    - **THIAZIDES AND RELATED DIURETICS**

    - **Thiazides and related diuretics**

      - **CONTRA-INDICATIONS** Addison’s disease · hypercalcaemia · hyponatraemia · refractory hypokalaemia · symptomatic hyperuricaemia

      - **CAUTIONS** Diabetes · gout · hyperaldosteronism · malnourishment · nephrotic syndrome · systemic lupus erythematosus

      - **CAUTIONS, FURTHER INFORMATION**

        - **Potassium loss** Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.

        - Hypokalaemia is dangerous in severe cardiovascular disease and in patients also being treated with cardiac glycosides. Often the use of potassium-sparing diuretics avoids the need to take potassium supplements.

        - Potassium supplements or potassium-sparing diuretics are seldom necessary when thiazides are used in the routine treatment of hypertension.

        - In hepatic failure, hypokalaemia caused by diuretics can precipitate encephalopathy, particularly in alcoholic cirrhosis.

        - Elderly Lower initial doses of diuretics should be used in the elderly because they are particularly susceptible to the side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).

        - Existing conditions Thiazides and related diuretics can exacerbate diabetes, gout, and systemic lupus erythematosus.

      - **SIDE-EFFECTS**

        - Common or very common Altered plasma-lipid concentrations · gout · hypercalcaemia · hyperglycaemia ·
hyperuricaemia • hypochloraemic alkalosis • hypokalaemia • hypomagnesaemia • hyponatraemia • metabolic and electrolyte disturbances • mild gastrointestinal disturbances • postural hypotension

- **Uncommon**
  - Agranulocytosis • blood disorders • impotence • leucopenia • thrombocytopenia

- **Frequency not known**
  - Cardiac arrhythmias • dizziness • headache • hypersensitivity reactions • intrahepatic cholestasis • pancreatitis • paraesthesia • photosensitivity • pneumonitis • pulmonary oedema • severe skin reactions • visual disturbances

- **PREGNANCY**
  - Thiazides and related diuretics should not be used to treat gestational hypertension. They may cause neonatal thrombocytopenia, bone marrow suppression, jaundice, electrolyte disturbances, and hypoglycaemia; placental perfusion may also be reduced. Stimulation of labour, uterine inertia, and meconium staining have also been reported.

- **HEPATIC IMPAIRMENT**
  - Caution in mild to moderate impairment. Avoid in severe liver disease. Hypokalaemia may precipitate coma in hepatic impairment, although hypokalaemia can be prevented by using a potassium-sparing diuretic. There is an increased risk of hypomagnesaemia in alcoholic cirrhosis.

- **RENAL IMPAIRMENT**
  - Thiazides and related diuretics are ineffective if eGFR is less than 30 mL/minute/1.73 m² and should be avoided. Metolazone remains effective if eGFR is less than 30 mL/minute/1.73 m² but is associated with a risk of excessive diuresis. Electrolytes should be monitored in renal impairment.

- **MONITORING REQUIREMENTS**
  - Electrolytes should be monitored, particularly with high doses and long-term use.

### Bendroflumethiazide

(Bendrofluazide)

- **INDICATIONS AND DOSE**

  - **Oedema**
    - Adult: Initially 5–10 mg once daily or on alternate days, dose to be taken in the morning, then maintenance 5–10 mg 1–3 times a week

  - **Hypertension**
    - Adult: 2.5 mg daily, dose to be taken in the morning, higher doses are rarely necessary

- **INTERACTIONS** → Appendix 1: thiazide diuretics

- **BREAST FEEDING**
  - The amount present in milk is too small to be harmful. Large doses may suppress lactation.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  - **Tablet**
    - Bendroflumethiazide (Non-proprietary)
      - Bendroflumethiazide 2.5 mg: Bendroflumethiazide 2.5 mg tablets | 28 tablet [Pres] £3.65 DT price = £0.66 | 500 tablet [Pres] £21.85
      - Bendroflumethiazide 5 mg: Bendroflumethiazide 5 mg tablets | 28 tablet [Pres] £9.80 DT price = £0.86 | 500 tablet [Pres] no price available
      - Aprinox (AMCo)
        - Bendroflumethiazide 2.5 mg: Aprinox 2.5 mg tablets | 500 tablet [Pres] £27.31
      - Neo-Naclex (AMCo)
        - Bendroflumethiazide 2.5 mg: Neo-Naclex 2.5 mg tablets | 28 tablet [Pres] £0.33 DT price = £0.66

    Combinations available: **Timolol with bendroflumethiazide**, p. 146

- **CONTRA-INDICATIONS**
  - Anuria • hyperkalaemia

- **CAUTIONS**
  - Diabetes mellitus • elderly

- **SIDE-EFFECTS**
  - Abdominal pain • agitation • alopecia • angina • anorexia • arrhythmias • arthralgia • confusion • constipation • cough • diarrhoea • dizziness • dry mouth • dyspepsia • dysphoria • encephalopathy • fever • flatulence • flushing • gastro-intestinal bleeding • headache • hyperkalaemia • insomnia • jaundice • malaise • muscle cramp • nasal congestion • nausea • palpitation • paraesthesia • postural hypotension • pruritus • raised intra-ocular pressure • rash • respiratory distress • restlessness • sexual dysfunction • sweating • thirst • tinnitus • tremor • urinary disturbances • visual disturbance • vomiting • weakness

- **BREAST FEEDING**
  - Avoid—no information regarding amiloride component available. Amount of hydrochlorothiazide in milk probably too small to be harmful. Large doses of hydrochlorothiazide may suppress lactation.

- **RENAL IMPAIRMENT**
  - Manufacturers advise avoid in severe impairment. Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).

- **MONITORING REQUIREMENTS**
  - Monitor electrolytes.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

  - **Tablet**
    - Co-amilozide (Non-proprietary)
      - Amiloride hydrochloride 2.5 mg, Hydrochlorothiazide 25 mg: Amiloride hydrochloride 2.5 mg tablets | 28 tablet [Pres] £6.05 DT price = £6.05
      - Amiloride hydrochloride 5 mg, Hydrochlorothiazide 50 mg: Amiloride hydrochloride 5 mg tablets | 28 tablet [Pres] £1.29 DT price = £1.02
      - Moduretic (Merck Sharp & Dohme Ltd)
        - Amiloride hydrochloride 2.5 mg, Hydrochlorothiazide 25 mg: Moduretic 25 tablets | 28 tablet [Pres] £0.86 DT price = £6.05
        - Amiloride hydrochloride 5 mg, Hydrochlorothiazide 50 mg: Moduretic 50 tablets | 28 tablet [Pres] £1.29 DT price = £1.02
Hydrochlorothiazide

- **INDICATIONS AND DOSE**
  
  Indications listed in combination monographs (available in the UK only in combination with other drugs)

  ▶ BY MOUTH
  
  ▶ Adult: Doses listed in combination monographs

- **INTERACTIONS** → Appendix 1: thiazide diuretics

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

Indapamide

- **DRUG ACTION**
  
  Indapamide is a thiazide-like diuretic with antihypertensive effects. At lower doses, vasodilatation is more prominent than diuresis; the diuretic effect becomes more apparent with higher doses.

- **INDICATIONS AND DOSE**
  
  Essential hypertension

  ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

  ▶ Adult: 2.5 mg daily, dose to be taken in the morning

  ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

  ▶ Adult: 1.5 mg daily, dose to be taken preferably in the morning

- **CAUTIONS**
  
  Acute porphyrias p. 969

- **INTERACTIONS** → Appendix 1: thiazide diuretics

- **SIDE-EFFECTS**
  
  Diuresis (with doses above 2.5 mg daily) · palpitation

- **ALLERGY AND CROSS-SENSITIVITY**
  
  Contra-indicated if history of hypersensitivity to sulphonamides.

- **BREAST FEEDING**
  
  Present in milk—manufacturer advises avoid.

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension · modified-release tablet

- **Combinations available:** Perindopril arginine with indapamide, p. 167

**DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM** → ACE INHIBITORS

Angiotensin-converting enzyme inhibitors

- **CONTRA-INDICATIONS**
  
  The combination of an ACE inhibitor with aliskiren is contra-indicated in patients with an eGFR less than 60 mL/minute/1.73 m² · the combination of an ACE inhibitor with aliskiren is contra-indicated in patients with diabetes mellitus

- **CAUTIONS**
  
  Afro-Caribbean patients (may respond less well to ACE inhibitors) · concomitant diuretics · diabetes (may lower blood glucose) · first dose hypotension (especially in patients taking high doses of diuretics, on a low-sodium diet, on dialysis, dehydrated, or with heart failure) · peripheral vascular disease or generalised atherosclerosis (risk of clinically silent renovascular disease) · primary aldosteronism (patients may respond less well to ACE inhibitors) · the risk of agranulocytosis is possibly increased in collagen vascular disease (blood counts recommended) · use with care (or avoid) in those with a history of idiopathic or hereditary angioedema · use with care in patients with hypertrophic cardiomyopathy · use with care in patients with severe or symptomatic aortic stenosis (risk of hypotension)

- **CAUTIONS, FURTHER INFORMATION**
  
  Anaphylactoid reactions To prevent anaphylactoid reactions, ACE inhibitors should be avoided during dialysis with high-flux polycrylicnitrile membranes and during low-density lipoprotein apheresis with dextran sulfate; they should also be withheld before desensitisation with wasp or bee venom.

- **SIDE-EFFECTS**
  
  Pruritus · abdominal pain · altered liver function tests · angioedema (onset may be delayed; higher incidence reported in Afro-Caribbean patients) · arthralgia · blood disorders · bronchospasm · cholestatic jaundice · constipation · diarrhoea · dizziness · dyspepsia · eosinophilia · fatigue · fever · fulminant hepatic necrosis · haemolytic anaemia · headache · hepatic failure · hepatitis · hyperkalaemia · hypoglycaemia · leucocytosis · leucopenia · malaise · myalgia · nausea · neutropenia · pancreatitis · paraesthesia · persistent dry cough · photosensitivity · positive antinuclear antibody · profound hypotension · raised erythrocyte sedimentation rate · rash · renal impairment · rhinitis · serositis · sinusitis · sore throat · taste disturbance · thrombocytopenia · urticaria · vasculitis · vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  
  Hepatic effects In light of reports of cholestatic jaundice, hepatitis, fulminant hepatic necrosis, and hepatic failure, ACE inhibitors should be discontinued if marked elevation of hepatic enzymes or jaundice occur.

- **ALLERGY AND CROSS-SENSITIVITY**
  
  ACE inhibitors are contra-indicated in patients with hypersensitivity to ACE inhibitors (including angioedema).
Captopril

### INDICATIONS AND DOSE

**Hypertension**

- **BY MOUTH**
  - Adult: Initially 12.5–25 mg twice daily, then increased if necessary up to 150 mg daily in 2 divided doses, doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken
  - Elderly: Initially 6.25 mg twice daily, then increased if necessary up to 150 mg daily in 2 divided doses, doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken

**Essential hypertension if used in volume depletion, cardiac decompensation, or renovascular hypertension**

- **BY MOUTH**
  - Adult: Initially 6.25–12.5 mg for 1 dose (under close medical supervision), then 6.25–12.5 mg twice daily; increased if necessary up to 100 mg daily in 1–2 divided doses, doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken

**Heart failure**

- **BY MOUTH**
  - Adult: Initially 6.25–12.5 mg 2–3 times daily, then increased if tolerated to up to 150 mg daily in divided doses, dose to be increased gradually at intervals of at least 2 weeks

**Short-term treatment within 24 hours of onset of myocardial infarction in clinically stable patients**

- **BY MOUTH**
  - Adult: Initially 6.25 mg, then increased to 12.5 mg after 2 hours, followed by 25 mg after 12 hours; increased if tolerated to 50 mg twice daily for 4 weeks

**Prophylaxis of symptomatic heart failure after myocardial infarction in clinically stable patients with asymptomatic left ventricular dysfunction (starting 3–16 days after infarction) (under close medical supervision)**

- **BY MOUTH**
  - Adult: Initially 6.25 mg daily, then increased to 12.5 mg 3 times a day for 2 days, then increased if tolerated to 25 mg 3 times a day, then increased if tolerated to 75–150 mg daily in 2–3 divided doses, doses exceeding 75 mg per day to be increased gradually

**Diabetic nephropathy in type 1 diabetes mellitus**

- **BY MOUTH**
  - Adult: 75–100 mg daily in divided doses

### INTERACTIONS

- Appendix 1: ACE inhibitors

### SIDE-EFFECTS

- **Common or very common**
  - Alopecia · dry mouth · dyspnoea · sleep disorder

- **Uncommon**
  - Angina · arrhythmia · flushing · pallor · palpitation · Raynaud’s syndrome · tachycardia

- **Rare**
  - Anorexia · stomatitis

- **Very rare**
  - Allergic alveolitis · blurred vision · cardiac arrest · cardiogenic shock · cerebrovascular events · confusion · depression · eosinophilic pneumonia · glossitis · gynaeacomastia · hyponatraemia · impotence · peptic ulcer · photosensitivity · Stevens-Johnson syndrome · syncope

### BREAST FEEDING

Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant’s blood pressure.

### RENAL IMPAIRMENT

Reduce dose; max. initial dose 50 mg if eGFR above 40 ml/minute/1.73 m²; max. initial dose 25 mg daily (do not exceed 100 mg daily) if eGFR 20–40 ml/minute/1.73 m²; max. initial dose 12.5 mg daily (do not exceed 75 mg daily) if eGFR 10–20 ml/minute/1.73 m²; max. initial dose 6.25 mg daily (do not exceed 37.5 mg daily) if eGFR less than 10 ml/minute/1.73 m².

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

#### Tablet

- **Captopril (Non-proprietary)**
  - Captopril 12.5 mg Captopril 12.5mg tablets | 56 tablet [P] £2.80 DT price = £2.44 | 100 tablet [P] £5.00
  - Captopril 25 mg Captopril 25mg tablets | 56 tablet [P] £4.52 DT price = £0.92 | 100 tablet [P] £8.07
  - Captopril 50 mg Captopril 50mg tablets | 56 tablet [P] £5.83 DT price = £2.47 | 100 tablet [P] £10.41
  - Capoten (Bristol-Myers Squibb Pharmaceuticals Ltd)
    - Captopril 25 mg Capoten 25mg tablets | 28 tablet [P] £5.26
  - Ecopace (AMCO)
    - Captopril 12.5 mg Ecopace 12.5mg tablets | 56 tablet [P] £0.48 DT price = £2.44
    - Captopril 25 mg Ecopace 25mg tablets | 56 tablet [P] £0.60 DT price = £0.92
    - Captopril 50 mg Ecopace 50mg tablets | 56 tablet [P] £0.72 DT price = £2.47

#### Oral solution

**ELECTROLYTES:** May contain Sodium

- **Noyada** (Martindale Pharmaceuticals Ltd)
  - Captopril 1 mg per 1 ml Noyada 5mg/5ml oral solution sugar-free | 100 ml [P] £98.21 DT price = £98.21
  - Captopril 5 mg per 1 ml Noyada 25mg/5ml oral solution sugar-free | 100 ml [P] £108.94 DT price = £108.94

### Co-zidocapt

The properties listed below are those particular to the combination only. For the properties of the components please consider, captopril above, hydrochlorothiazide p. 162.

#### INDICATIONS AND DOSE

**Mild to moderate hypertension in patients stabilised on the individual components in the same proportions**

- **BY MOUTH**
  - Adult: (consult product literature)

#### INTERACTIONS

- Appendix 1: ACE inhibitors, thiazide diuretics
Enalapril maleate

**INDICATIONS AND DOSE**

**Hypertension**

- **BY MOUTH**
  - Adult: Initially 5 mg once daily, lower initial doses may be required when used in addition to diuretics or in renal impairment; maintenance 20 mg once daily; maximum 40 mg per day

**Heart failure**

- **BY MOUTH**
  - Adult (under close medical supervision): Initially 2.5 mg once daily, increased if tolerated to 10–20 mg twice daily, dose to be increased gradually over 2–4 weeks

**Prevention of symptomatic heart failure in patients with asymptomatic left ventricular dysfunction**

- **BY MOUTH**
  - Adult (under close medical supervision): Initially 2.5 mg once daily, increased if tolerated to 10–20 mg twice daily, dose to be increased gradually over 2–4 weeks

**SIDE-EFFECTS**

- **Common or very common** Asthenia, blurred vision, depression, dyspepsia
- **Uncommon** Alopecia, anorexia, arrhythmias, confusion, drowsiness, dry mouth, flushing, hyponatraemia, ileus, impotence, insomnia, muscle cramps, nervousness, palpitation, peptic ulcer, sweating, tinnitus, vertigo
- **Rare** Abnormal dreams, allergic alveolitis, exfoliative dermatitis, glossitis, gynaecomastia, pempigus, pulmonary infiltrates, Raynaud's syndrome, Stevens-Johnson syndrome, stomatitis, toxic epidermal necrolysis
- **Very rare** Gastro-intestinal angioedema

**BREAST FEEDING**

Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant's blood pressure.

**HEPATIC IMPAIRMENT**

Enalapril is a prodrug and requires close monitoring in patients with hepatic impairment.

**RENAL IMPAIRMENT**

Max. initial dose 2.5 mg daily if eGFR less than 30 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**

Tablets may be crushed and suspended in water immediately before use.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **Enalapril maleate (Non-proprietary)**
  - Enalapril maleate 2.5 mg Enalapril 2.5mg tablets | 28 tablet £5.65 DT price = £3.46
  - Enalapril maleate 5 mg Enalapril 5mg tablets | 28 tablet £9.13 DT price = £0.84
  - Enalapril maleate 10 mg Enalapril 10mg tablets | 28 tablet £18.74 DT price = £0.90
  - Enalapril maleate 20 mg Enalapril 20mg tablets | 28 tablet £35.63 DT price = £0.98

---

**Enalapril with hydrochlorothiazide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, enalapril maleate above, hydrochlorothiazide p. 162.

**INDICATIONS AND DOSE**

Mild to moderate hypertension in patients stabilised on the individual components in the same proportions

- **BY MOUTH**
  - Adult: (consult product literature)

**INTERACTIONS**

Appendix 1: ACE inhibitors, thiazide diuretics

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Enalapril with hydrochlorothiazide (Non-proprietary)**
  - Hydrochlorothiazide 12.5 mg, Enalapril maleate 20 mg Enalapril 20mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet £60.00 DT price = £19.98
- **Innozide** (Merck Sharp & Dohme Ltd)
  - Hydrochlorothiazide 12.5 mg, Enalapril maleate 20 mg Innozide 20mg/12.5mg tablets | 28 tablet £13.90 DT price = £19.98

---

**Fosinopril sodium**

**INDICATIONS AND DOSE**

**Hypertension**

- **BY MOUTH**
  - Adult: Initially 10 mg daily for 4 weeks, then increased if necessary up to 40 mg daily, doses over 40 mg not shown to increase efficacy

**Congestive heart failure (adjunct) (under close medical supervision)**

- **BY MOUTH**
  - Adult: Initially 10 mg once daily, then increased if tolerated to 40 mg once daily, doses to be increased gradually

**INTERACTIONS**

Appendix 1: ACE inhibitors

**SIDE-EFFECTS**

Chest pain, musculoskeletal pain

**BREAST FEEDING**

Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

**HEPATIC IMPAIRMENT**

Fosinopril is a prodrug and requires close monitoring in patients with hepatic impairment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **Fosinopril sodium (Non-proprietary)**
  - Fosinopril sodium 10 mg Fosinopril 10mg tablets | 28 tablet £28.50 DT price = £7.87
  - Fosinopril sodium 20 mg Fosinopril 20mg tablets | 28 tablet £38.98 DT price = £7.07
**Imidapril hydrochloride**

### INDICATIONS AND DOSE

#### Essential hypertension

- **BY MOUTH**
  - Adult: Initially 5 mg daily, increased if necessary to 10 mg daily, dose to be taken before food, doses to be increased at intervals of at least 3 weeks; maximum 20 mg per day
  - Elderly: Initially 2.5 mg daily, increased if necessary to 10 mg daily, dose to be taken before food, doses to be increased at intervals of at least 3 weeks

#### Renal impairment

- Initial dose 2.5 mg daily if eGFR 30–80 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Tanatril** (Mitsubishi Tanabe Pharma Europe Ltd)
  - Imidapril hydrochloride 5 mg Tanatril 5mg tablets | 28 tablet [PO] £6.40 DT price = £6.40
  - Imidapril hydrochloride 10 mg Tanatril 10mg tablets | 28 tablet [PO] £7.22 DT price = £7.22
  - Imidapril hydrochloride 20 mg Tanatril 20mg tablets | 28 tablet [PO] £8.67 DT price = £8.67

**Lisinopril**

### INDICATIONS AND DOSE

#### Hypertension

- **BY MOUTH**
  - Adult: Initially 10 mg once daily; usual maintenance 20 mg once daily; maximum 80 mg per day

#### Hypertension, when used in addition to diuretic, in cardiac decompensation or in volume depletion

- **BY MOUTH**
  - Adult: Initially 2.5–5 mg once daily; usual maintenance 20 mg once daily; maximum 80 mg per day

#### Short-term treatment following myocardial infarction in haemodynamically stable patients—systolic blood pressure over 120 mmHg

- **BY MOUTH**
  - Adult: Initially 5 mg, taken within 24 hours of myocardial infarction, followed by 5 mg, to be taken 24 hours after initial dose, then 10 mg, to be taken 24 hours after second dose, then 10 mg once daily for 6 weeks (or continued if heart failure), temporarily reduce maintenance dose to 5 mg and if necessary 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment; withdraw if prolonged hypotension occurs during treatment (systolic blood pressure less than 90 mmHg for more than 1 hour)

#### Short-term treatment following myocardial infarction in haemodynamically stable patients—systolic blood pressure 100–120 mmHg

- **BY MOUTH**
  - Adult: Initially 2.5 mg once daily, maintenance 5 mg once daily, increase to maintenance dose only after at least 3 days of the initial dose, should not be started after myocardial infarction if systolic blood pressure less than 100 mmHg, temporarily reduce maintenance dose to 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment; withdraw if prolonged hypotension occurs (systolic blood pressure less than 90 mmHg for more than 1 hour)

#### Renal complications of diabetes mellitus

- **BY MOUTH**
  - Adult: Initially 2.5–5 mg once daily, adjusted according to response; usual dose 10–20 mg once daily

### SIDE-EFFECTS

- **INTERACTIONS** → Appendix 1: ACE inhibitors
- **SIDE-EFFECTS** Blurred vision · bronchitis · confusion · depression · dry mouth · dyspnoea · glositis · ileus · impotence · sleep disturbances · tinnitus
- **BREAST FEEDING** Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.
- **HEPATIC IMPAIRMENT** Imidapril is a prodrug and requires close monitoring in patients with hepatic impairment.

### INTERACTIONS

- **INTERACTIONS** → Appendix 1: ACE inhibitors
- **SIDE-EFFECTS** Uncommon Raynaud’s syndrome · vertigo · asthma · cerebrovascular accident · confusion · impotence · mood changes · myocardial infarction · palpitation · sleep disturbances · tachycardia
- **Rare** Alopecia · dry mouth · gynaecostasia · psoriasis
- **Very rare** Allergic alveolitis · pemphigus · profuse sweating · pulmonary infiltrates · Stevens-Johnson syndrome · toxic epidermal necrolysis
- **BREAST FEEDING** Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

#### Renal impairment

- Max. initial doses 5–10 mg daily if eGFR 30–80 mL/minute/1.73 m² (max. 40 mg daily); 2.5–5 mg daily if eGFR 10–30 mL/minute/1.73 m² (max. 40 mg daily); 2.5 mg daily if eGFR less than 10 mL/minute/1.73 m².

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Oral solution

- **Lisinopril (Non-proprietary)**
  - Lisinopril 1 mg per 1 ml Lisinopril 5mg/5ml oral solution sugar free sugar-free | 150 ml [PO] £154.11 DT price = £154.11

### Tablet

- **Lisinopril (Non-proprietary)**
  - Lisinopril 2.5 mg Lisinopril 2.5mg tablets | 28 tablet [PO] £1.51 DT price = £0.71
  - Lisinopril 5 mg Lisinopril 5mg tablets | 28 tablet [PO] £7.80 DT price = £0.73
  - Lisinopril 10 mg Lisinopril 10mg tablets | 28 tablet [PO] £9.60 DT price = £0.79

## Lisinopril with hydrochlorothiazide

The properties listed below are those particular to the combination only. For the properties of the components please consider, lisinopril p. 165, hydrochlorothiazide p. 162.

### INDICATIONS AND DOSE

**Mild to moderate hypertension in patients stabilised on the individual components in the same proportions**

- **BY MOUTH**
- **Adult:** (consult product literature)

### INTERACTIONS

→ Appendix 1: ACE inhibitors, thiazide diuretics

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- **Lisinopril with hydrochlorothiazide (Non-proprietary)**
  - Lisinopril 10 mg, Hydrochlorothiazide 12.5 mg
    - Perindopril 2.5 mg, Hydrochlorothiazide 12.5mg tablets: 28 tablet (\textit{Pmd}) £12.99 DT price = £4.99
  - Hydrochlorothiazide 12.5 mg, Lisinopril 20 mg
    - Perindopril 10 mg, Hydrochlorothiazide 12.5mg tablets: 28 tablet (\textit{Pmd}) £14.65 DT price = £1.82
  - Carace Plus (Merk Sharp & Dohme Ltd)
    - Hydrochlorothiazide 12.5 mg, Lisinopril 20 mg, Carace Plus 20 tablets: 28 tablet (\textit{Pmd}) £11.43 DT price = £1.82
  - Zestoretic 10 (AstraZeneca UK Ltd)
    - Lisinopril 10 mg, Hydrochlorothiazide 12.5 mg, Zestoretic 10 tablets: 28 tablet (\textit{Pmd}) £6.81 DT price = £4.99
  - Zestoretic 20 (AstraZeneca UK Ltd)
    - Hydrochlorothiazide 12.5 mg, Lisinopril 20 mg, Zestoretic 20 tablets: 28 tablet (\textit{Pmd}) £11.52 DT price = £1.82

## Moexipril hydrochloride

### INDICATIONS AND DOSE

**Essential hypertension (monotherapy)**

- **BY MOUTH**
  - **Adult:** Initially 7.5 mg once daily, adjusted according to response; maintenance 7.5–15 mg once daily; maximum 30 mg per day
  - **Elderly:** Initially 3.75 mg once daily, adjusted according to response; maintenance 7.5–15 mg once daily; maximum 30 mg per day

**Essential hypertension when used in addition with nifedipine or other antihypertensive drug**

- **BY MOUTH**
  - **Adult:** Initially 3.75 mg once daily, adjusted according to response; maintenance 7.5–15 mg once daily; maximum 30 mg per day

### CAUTIONS

Significant mitral valve stenosis

### INTERACTIONS

→ Appendix 1: ACE inhibitors

### SIDE-EFFECTS

- Very rare: Numbness
- Frequency not known: Alopecia, angina, appetite, arrhythmias, blurred vision, cerebrovascular accident, confusion, depression, drowsiness, dry mouth, dysphonia, flushing, hyperuricaemia, impotence, myocardial infarction, palpitation, pephigus, sleep disturbance, Stevens-Johnson syndrome, sweating, syncope, tachycardia, tinnitus, toxic epidermal necrolysis, weight changes

### BREAST FEEDING

Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

### HEPATIC IMPAIRMENT

Initial dose 3.75 mg once daily. Moexipril is a prodrug and requires close monitoring in patients with hepatic impairment.

### RENAL IMPAIRMENT

If eGFR less than 40 mL/minute/1.73 m², initial dose 3.75 mg once daily titrated to max. 15 mg once daily.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 22

- **Coversyl Arginine** (Servier Laboratories Ltd)
  - Perindopril arginine 2.5 mg, Hydrochlorothiazide 12.5mg tablets: 28 tablet (\textit{Pmd}) £4.43 DT price = £4.43
  - Perindopril arginine 5 mg, Hydrochlorothiazide 12.5mg tablets: 28 tablet (\textit{Pmd}) £6.28 DT price = £6.28
  - Perindopril arginine 10 mg, Hydrochlorothiazide 12.5mg tablets: 28 tablet (\textit{Pmd}) £10.65 DT price = £10.65

## Perindopril arginine

### INDICATIONS AND DOSE

**Hypertension**

- **BY MOUTH**
  - **Adult:** Initially 2.5 mg once daily for 1 month, dose to be taken in the morning, then, adjusted according to response; maximum 10 mg per day
  - **Elderly:** Initially 2.5 mg once daily for 1 month, dose to be taken in the morning, then, adjusted according to response; maximum 10 mg per day

**Hypertension, if used in addition to diuretic, or in cardiac decompensation or volume depletion**

- **BY MOUTH**
  - **Adult:** Initially 2.5 mg once daily for 1 month, dose to be taken in the morning, then, adjusted according to response; maximum 10 mg per day

**Symptomatic heart failure (adjunct) (under close medical supervision)**

- **BY MOUTH**
  - **Adult:** Initially 2.5 mg once daily for 2 weeks, then increased if tolerated to 5 mg once daily, dose to be taken in the morning

**Prophylaxis of cardiac events following myocardial infarction or revascularisation in stable coronary artery disease**

- **BY MOUTH**
  - **Adult:** Initially 5 mg once daily for 2 weeks, then increased if tolerated to 10 mg once daily, dose to be taken in the morning
  - **Elderly:** Initially 2.5 mg once daily for 1 week, then increased if tolerated to 5 mg once daily for 1 week, then increased if tolerated to 10 mg once daily, dose to be taken in the morning

### INTERACTIONS

→ Appendix 1: ACE inhibitors

### SIDE-EFFECTS

Asthenia, mood disturbances, sleep disturbances

### HEPATIC IMPAIRMENT

Perindopril is a prodrug and requires close monitoring in patients with hepatic impairment.

### RENAL IMPAIRMENT

Max. initial dose 2.5 mg once daily if eGFR 30–60 mL/minute/1.73 m²; 2.5 mg once daily on alternate days if eGFR 15–30 mL/minute/1.73 m².

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- **Coversyl Arginine** (Servier Laboratories Ltd)
  - Perindopril arginine 2.5 mg, Hydrochlorothiazide tablets: 28 tablet (\textit{Pmd}) £4.43 DT price = £4.43
  - Perindopril arginine 5 mg, Hydrochlorothiazide tablets: 28 tablet (\textit{Pmd}) £6.28 DT price = £6.28
  - Perindopril arginine 10 mg, Hydrochlorothiazide tablets: 28 tablet (\textit{Pmd}) £10.65 DT price = £10.65
**Perindopril arginine with indapamide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, perindopril arginine p. 166, indapamide p. 162.

#### INDICATIONS AND DOSE

**Hypertension not adequately controlled by perindopril alone**

- **BY MOUTH**
- **Adult:** (consult product literature)

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

Quinapril with hydrochlorothiazide

The properties listed below are those particular to the combination only. For the properties of the components please consider, quinapril p. 167, hydrochlorothiazide p. 162.

**INDICATIONS AND DOSE**

Hypertension in patients stabilised on the individual components in the same proportions
- **BY MOUTH**
- Adult: (consult product literature)

**INTERACTIONS** → Appendix 1: ACE inhibitors, thiazide diuretics

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Quinapril with hydrochlorothiazide (Non-proprietary)
  - Quinapril (as Quinapril hydrochloride) 10 mg, Hydrochlorothiazide 12.5 mg Quinapril 10mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet [Pom] £11.75 DT price = £11.75
  - Accuretic (Pfizer Ltd)
  - Quinapril (as Quinapril hydrochloride) 10 mg, Hydrochlorothiazide 12.5 mg Accuretic 12.5mg/10mg tablets | 28 tablet [Pom] £11.75 DT price = £11.75

Ramipril

**INDICATIONS AND DOSE**

Hypertension
- **BY MOUTH**
- Adult: Initially 1.25–2.5 mg once daily, increased if necessary up to 10 mg once daily, dose to be increased at intervals of 2–4 weeks

Symptomatic heart failure (adjunct) (under close medical supervision)
- **BY MOUTH**
- Adult: Initially 1.25 mg once daily, increased if tolerated to 10 mg daily, preferably taken in 2 divided doses, increase dose gradually at intervals of 1–2 weeks

Prophylaxis after myocardial infarction in patients with clinical evidence of heart failure (started at least 48 hours after infarction)
- **BY MOUTH**
- Adult: Initially 2.5 mg twice daily for 3 days, then increased to 5 mg twice daily

Prophylaxis after myocardial infarction in patients with clinical evidence of heart failure (started at least 48 hours after infarction) when initial dose not tolerated
- **BY MOUTH**
- Adult: 1.25 mg twice daily for 2 days, then increased to 2.5 mg twice daily, then increased to 5 mg twice daily, withdraw treatment if dose cannot be increased to 2.5 mg twice daily

Prevention of cardiovascular events in patients with atherosclerotic cardiovascular disease or with diabetes mellitus and at least one additional risk factor for cardiovascular disease
- **BY MOUTH**
- Adult: Initially 2.5 mg once daily for 1–2 weeks, then increased to 5 mg once daily for a further 2–3 weeks, then increased to 10 mg once daily

Nephropathy (consult product literature)
- **BY MOUTH**
- Adult: Initially 1.25 mg once daily for 2 weeks, then increased to 2.5 mg once daily for a further 2 weeks, then increased if tolerated to 5 mg once daily

**INTERACTIONS** → Appendix 1: ACE inhibitors

**SIDE-EFFECTS**

- Common or very common Bronchitis · dyspnoea · muscle cramps · stomatitis · syncope
- Uncommon Angina · anxiety · arhythmias · chest pain · decreased libido · depression · dry mouth · flushing · impotence · loss of appetite · myocardial infarction · nervousness · palpitations · peripheral oedema · sweating · tachycardia · visual disturbances
- Rare Confusion · conjunctivitis · impaired hearing · onycholysis · tinnitus · tremor
- Frequency not known Alopecia · cerebrovascular accident · erythema multiforme · gynaecomastia · hyponatraemia · pemphigoid exanthema · precipitation or exacerbation of Raynaud’s syndrome · skin reactions · sleep disturbance · Stevens-Johnson syndrome · toxic epidermal necrolysis

**BREAST FEEDING** Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

**HEPATIC IMPAIRMENT** Max. daily dose 2.5 mg. Ramipril is a prodrug and requires close monitoring in patients with hepatic impairment.

**RENAL IMPAIRMENT** Max. daily dose 5 mg if eGFR 30–60 mL/minute/1.73 m²; max. initial dose 1.25 mg once daily (do not exceed 5 mg daily) if eGFR less than 30 mL/minute/1.73 m².

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral solution**
- **Ramipril (Non-proprietary)**
  - Ramipril 500 microgram per 1 ml Ramipril 2.5mg/5ml oral solution sugar free sugar-free | 150 ml [Pom] £96.00 DT price = £96.00

  - Ramipril 10 mg Ramipril 10mg capsules | 28 capsule [Pom] £2.20 DT price = £2.20
Ramipril with felodipine

The properties listed below are those particular to the combination only. For the properties of the components please consider, ramipril p. 168, felodipine p. 154.

- **INDICATIONS AND DOSE**
  - **Hypertension in patients stabilised on the individual components in the same proportions**
    - BY MOUTH
    - Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: ACE inhibitors, calcium channel blockers

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Modified-release tablet**
    - CAUTIONARY AND ADVISORY LABELS 25
      - **Triapin** (Sanofi)
        - Felodipine 2.5 mg, Ramipril 2.5 mg Triapin 2.5mg/2.5mg modified-release tablets | 28 tablet | £24.55
        - Felodipine 5 mg, Ramipril 5 mg Triapin 5mg/5mg modified-release tablets | 28 tablet | £16.13 DT price = £16.13

- **Trandolapril**

- **INDICATIONS AND DOSE**
  - **Mild to moderate hypertension**
    - BY MOUTH
    - Adult: Initially 500 micrograms once daily; increased to 1–2 mg once daily, dose to be increased at intervals of 2–4 weeks; maximum 4 mg per day
  - **Prophylaxis after myocardial infarction in patients with left ventricular dysfunction (starting as early as 3 days after infarction)**
    - BY MOUTH
    - Adult: Initially 500 micrograms once daily, then increased to up to 4 mg once daily, doses to be increased gradually

- **INTERACTIONS** → Appendix 1: ACE inhibitors
- **SIDE-EFFECTS**
  - Alopecia, angina, arrhythmias, arthralgia, bronchitis, cerebral haemorrhage, dry mouth, dysphonia, hot flushes, ileus, myocardial infarction, nervousness, palpitation, psoriasis-like efflorescence, skin reactions, sleep disturbances, Stevens-Johnson syndrome, sweating, syncope, tachycardia, toxic epidermal necrolysis, transient ischaemic attacks

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Symptomatic hypotension If symptomatic hypotension develops during titration, do not increase dose further; if possible, reduce dose of any adjunctive treatment and if this is not effective or feasible, reduce dose of trandolapril.

- **BREAST FEEDING**
  - Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

- **HEPATIC IMPAIRMENT**
  - Trandolapril is a prodrug and requires close monitoring in patients with hepatic impairment.

- **RENAL IMPAIRMENT**
  - Max. 2 mg daily if eGFR less than 10 mL/minute/1.73 m².

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Capsule**
- **Trandolapril (Non-proprietary)**
  - Trandolapril 500 microgram Trandolapril 500microgram capsules | 14 capsule | £1.66 DT price = £1.66

**DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM** → ANGIOTENSIN II RECEPTOR ANTAGONISTS

**Angiotensin II receptor antagonists**

- **CONTRA-INDICATIONS**
  - The combination of an angiotensin-II receptor antagonist with aliskiren is contra-indicated in patients with an eGFR less than 60 mL/minute/1.73 m²: the combination of an angiotensin-II receptor antagonist with aliskiren is contra-indicated in patients with diabetes mellitus.

- **CAUTIONS**
  - Afro-Caribbean patients—particularly those with left ventricular hypertrophy (may not benefit from an angiotensin-II receptor antagonist) or aortic or mitral valve stenosis—elderly (lower initial doses may be appropriate).
  - Hypertrophic cardiomyopathy: patients with a history of angioedema: patients with primary aldosteronism (may not benefit from an angiotensin-II receptor antagonist) renal artery stenosis.

- **SIDE-EFFECTS**
  - Hyperkalaemia, angioedema (may be delayed onset) symptomatic hypotension including dizziness (particularly in patients with intravascular volume depletion, e.g. those taking high-dose diuretics).

- **PREGNANCY**
  - Angiotensin-II receptor antagonists should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; neonatal skull defects and oligohydramnios have also been reported.

- **BREAST FEEDING**
  - Information on the use of angiotensin-II receptor antagonists in breast-feeding is limited. They are not recommended in breast-feeding and alternative treatment options, with better established safety information during breast-feeding, are available.

- **RENAL IMPAIRMENT**
  - Use with caution, starting with low dose, and adjust according to response.

- **MONITORING REQUIREMENTS**
  - Monitor plasma-potassium concentration, particularly in the elderly and in patients with renal impairment.

**Azilsartan medoxomil**

- **INDICATIONS AND DOSE**
  - **Hypertension**
    - BY MOUTH
    - Adult 18–74 years: Initially 40 mg once daily, increased if necessary to 80 mg once daily
    - Adult 75 years and over: Initially 20–40 mg once daily, increased if necessary to 80 mg once daily

  - **Hypertension with intravascular volume depletion**
    - BY MOUTH
    - Adult: Initially 20–40 mg daily, increased if necessary to 80 mg daily

- **CAUTIONS**
  - Heart failure

- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists

- **SIDE-EFFECTS**
  - **Common or very common** Diarrhoea, raised creatine kinase
  - **Uncommon** Hyperuricaemia, peripheral oedema, raised creatinine, malaise
Hepatic impairment
Manufacturer advises to consider initial dose of 20 mg in mild to moderate impairment (limited information available). Manufacturer advises avoid in severe impairment (no information available). Manufacturer advises monitor closely in mild to moderate hepatic impairment (limited information available).

Renal impairment
Manufacturer advises caution in severe impairment—no information available.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

Candesartan cilexetil

INDICATIONS AND DOSE
Hypertension

BY MOUTH

Adult: Initially 8 mg once daily, increased if necessary up to 32 mg once daily, doses to be increased at intervals of 4 weeks; usual dose 8 mg once daily

Hypertension with intravascular volume depletion

BY MOUTH

Adult: Initially 4 mg once daily, increased if necessary up to 32 mg daily, doses to be increased at intervals of 4 weeks; usual dose 8 mg once daily

Heart failure with impaired left ventricular systolic function when ACE inhibitors are not tolerated
Heart failure with impaired left ventricular systolic function in conjunction with an ACE inhibitor (under expert supervision)

BY MOUTH

Adult: Initially 4 mg once daily, increased at intervals of at least 2 weeks to ‘target’ dose of 32 mg once daily or to maximum tolerated dose

Contra-indications
Cholestatics

Interactions
Appendix 1: angiotensin-II receptor antagonists

Side-effects

Common or very common
Headache • vertigo

Very rare
Arthralgia • back pain • blood disorders • cough • hepatitis • hyponatraemia • myalgia • nausea • pruritus • rash • urticaria

Hepatic impairment
Initially 4 mg once daily in mild or moderate liver impairment. Avoid in severe hepatic impairment.

Renal impairment
Initially 4 mg daily. Use with caution if eGFR less than 15 mL/minute/1.73 m²—limited experience.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

Tablet

Candesartan cilexetil (Non-proprietary)

Candesartan cilexetil 2 mg Candesartan 2mg tablets | 7 tablet (POM) £3.40 DT price = £1.92

Candesartan cilexetil 8 mg Candesartan 8mg tablets | 28 tablet (POM) £9.89 DT price = £0.98
Candesartan cilexetil 16 mg Candesartan 16mg tablets | 28 tablet (POM) £12.72 DT price = £1.15

Edarbi

Teveten

Eprosartan

INDICATIONS AND DOSE
Hypertension

BY MOUTH

Adult: 600 mg once daily

INTERACTIONS
Appendix 1: angiotensin-II receptor antagonists

SIDE-EFFECTS

Common or very common
Headache • nausea • rhinitis • diarrhoea • malaise • vomiting

Hepatic impairment
Caution in mild or moderate liver disease. Avoid in severe impairment.

Renal impairment
Caution if eGFR less than 30 mL/minute/1.73 m².

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

Tablet

Candesartan cilexetil 32 mg Candesartan 32mg tablets | 28 tablet (POM) £16.13 DT price = £1.59
Amias (Takeda UK Ltd)

Candesartan cilexetil 2 mg Amias 2mg tablets | 7 tablet (POM) £3.58 DT price = £1.92

Irbesartan

INDICATIONS AND DOSE
Hypertension

BY MOUTH

Adult 18–74 years: Initially 150 mg once daily, increased if necessary to 300 mg once daily

Adult 75 years and over: Initially 75–150 mg once daily, increased if necessary to 300 mg once daily

Hypertension in patients receiving haemodialysis

BY MOUTH

Adult: Initially 75–150 mg once daily, increased if necessary to 300 mg once daily

Renal disease in hypertensive type 2 diabetes mellitus

BY MOUTH

Adult 18–74 years: Initially 150 mg once daily, increased if tolerated to 300 mg once daily

Adult 75 years and over: Initially 75–150 mg once daily, increased if tolerated to 300 mg once daily
Renal disease in hypertensive type 2 diabetes mellitus in patients receiving haemodialysis

- **BY MOUTH**
- Adult: Initially 75–150 mg once daily, increased if tolerated to 300 mg once daily

**INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists

**SIDE-EFFECTS**
- **Common or very common** Fatigue, musculoskeletal pain, nausea, vomiting
- **Uncommon** Chest pain, cough, diarrhoea, dyspepsia, flushing, sexual dysfunction, tachycardia
- **Rare** Rash, urticaria
- **Very rare** Arthralgia, cutaneous vasculitis, headache, hepatitis, myalgia, renal dysfunction, taste disturbance, tinnitus

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- **Irbesartan (Non-proprietary)**
  - **Irbesartan 75 mg** Irbesartan 75mg tablets | 28 tablet [pos] £9.21 DT price = £0.97
  - **Irbesartan 150 mg** Irbesartan 150mg tablets | 28 tablet [pos] £11.25 DT price = £1.19
  - **Irbesartan 300 mg** Irbesartan 300mg tablets | 28 tablet [pos] £15.13 DT price = £1.63
- **Aprovel (Sanofi)**
  - **Irbesartan 75 mg** Aprovel 75mg tablets | 28 tablet [pos] £9.69 DT price = £0.97
  - **Irbesartan 150 mg** Aprovel 150mg tablets | 28 tablet [pos] £11.84 DT price = £1.19
  - **Irbesartan 300 mg** Aprovel 300mg tablets | 28 tablet [pos] £15.93 DT price = £1.63
- **Ifrimasta (Consilient Health Ltd)**
  - **Irbesartan 75 mg** Ifrimasta 75mg tablets | 28 tablet [pos] £8.23 DT price = £0.97
  - **Irbesartan 150 mg** Ifrimasta 150mg tablets | 28 tablet [pos] £10.06 DT price = £1.19
  - **Irbesartan 300 mg** Ifrimasta 300mg tablets | 28 tablet [pos] £13.54 DT price = £1.63

**Irbesartan with hydrochlorothiazide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, irbesartan p. 170, hydrochlorothiazide p. 162.

**INDICATIONS AND DOSE**

Hypertension not adequately controlled with irbesartan alone

- **BY MOUTH**
- **Adult:** (consult product literature)

**INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists, thiazide diuretics

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Irbesartan with hydrochlorothiazide (Non-proprietary)**
  - **Hydrochlorothiazide 12.5 mg, Irbesartan 150 mg** Irbesartan 150mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet [pos] £10.06 DT price = £4.65
  - **Hydrochlorothiazide 25 mg, Irbesartan 300 mg** Irbesartan 300mg / Hydrochlorothiazide 25mg tablets | 28 tablet [pos] £13.54 DT price = £6.61
  - **Hydrochlorothiazide 12.5 mg, Irbesartan 300 mg** Irbesartan 300mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet [pos] £13.54 DT price = £2.00

- **CoAprovel (Sanofi)**
  - **Hydrochlorothiazide 12.5 mg, Irbesartan 150 mg** CoAprovel 150mg/12.5mg tablets | 28 tablet [pos] £11.84 DT price = £4.65
  - **Hydrochlorothiazide 25 mg, Irbesartan 300 mg** CoAprovel 300mg/25mg tablets | 28 tablet [pos] £15.93 DT price = £6.61
  - **Hydrochlorothiazide 12.5 mg, Irbesartan 300 mg** CoAprovel 300mg/12.5mg tablets | 28 tablet [pos] £15.93 DT price = £2.00

**Losartan potassium**

**INDICATIONS AND DOSE**

Diabetic nephropathy in type 2 diabetes mellitus

- **BY MOUTH**
- Adult 18–75 years: Initially 50 mg once daily for several weeks, then increased if necessary to 100 mg once daily
- Adult 76 years and over: Initially 25 mg once daily for several weeks, then increased if necessary to 100 mg once daily

**Chronic heart failure when ACE inhibitors are unsuitable or contra-indicated**

- **BY MOUTH**
- Adult: Initially 12.5 mg once daily, increased if tolerated up to 150 mg once daily, doses to be increased at weekly intervals

**Hypertension (including reduction of stroke risk in hypertension with left ventricular hypertrophy)**

- **BY MOUTH**
- Adult 18–75 years: Initially 50 mg once daily for several weeks, then increased if necessary to 100 mg once daily
- Adult 76 years and over: Initially 25 mg once daily for several weeks, then increased if necessary to 100 mg once daily

**Hypertension with intravascular volume depletion**

- **BY MOUTH**
- Adult 18–75 years: Initially 25 mg once daily for several weeks, then increased if necessary up to 100 mg once daily

**CAUTIONS**

Severe heart failure

**INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists

**SIDE-EFFECTS**
- **Common or very common** Vertigo
- **Uncommon** Angina, dyspnoea, gastro-intestinal disturbances, headache, malaise, oedema, palpitation, pruritus, rash, sleep disorders, urticaria
- **Rare** Atrial fibrillation, cerebrovascular accident, hepatitis, paraesthesia, syncope
- **Frequency not known** Anaemia, anaphylaxis, arthralgia, cough, depression, erectile dysfunction, Henoch–Schönlein purpura, hyponatraemia, myalgia, pancreatitis, photosensitivity, renal impairment, rhabdomyolysis, thrombocytopenia, tinnitus, vasculitis

**HEPATIC IMPAIRMENT**

Consider dose reduction in mild to moderate impairment. Manufacturer advises avoid in severe impairment—no information available.

**PRESCRIBING AND DISPENCING INFORMATION**

Flavours of oral liquid formulations may include berry–citrus.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution and sugar-free oral suspension

- **Cozaar (Merck Sharp & Dohme Ltd)**
  - **Losartan potassium 2.5 mg per 1 ml** Cozaar 2.5mg/ml oral suspension sugar-free | 200 ml [pos] £53.68 DT price = £53.68

**Tablet**

- **Losartan potassium (Non-proprietary)**
  - **Losartan potassium 12.5 mg** Losartan 12.5mg tablets | 28 tablet [pos] £30.00 DT price = £26.66
Losartan with hydrochlorothiazide

The properties listed below are those particular to the combination only. For the properties of the components please consider, losartan potassium p. 171, hydrochlorothiazide p. 162.

- **INDICATIONS AND DOSE**
  - Hypertension not adequately controlled with losartan alone
    - **BY MOUTH**
    - Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists, thiazide diuretics

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - Losartan with hydrochlorothiazide (Non-proprietary)
    - Hydrochlorothiazide 12.5 mg, Losartan potassium 50 mg
    - Tablet (POM) £13.75 DT price = £1.31
    - Hydrochlorothiazide 25 mg, Losartan potassium 100 mg
    - Tablet (POM) £16.18 DT price = £1.55
  - Cozaar-Comp (Merck Sharp & Dohme Ltd)
    - Hydrochlorothiazide 12.5 mg, Losartan potassium 50 mg
    - Cozaar-Comp 50mg/12.5mg tablets | 28 tablet (POM) £12.80 DT price = £1.31
    - Hydrochlorothiazide 25 mg, Losartan potassium 100 mg
    - Cozaar-Comp 100mg/25mg tablets | 28 tablet (POM) £16.18 DT price = £1.55

- **Olmesartan medoxomil**

  - **INDICATIONS AND DOSE**
    - Hypertension in patients stabilised on the individual components in the same proportions
    - **BY MOUTH**
    - Adult: (consult product literature)

  - **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists, calcium channel blockers

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - Sevikar (Daiichi Sankyo UK Ltd)
    - Amlodipine (as Amlodipine besilate) 5 mg, Olmesartan medoxomil 20 mg
    - Sevikar 20mg/5mg tablets | 28 tablet (POM) £16.95
    - Amlodipine (as Amlodipine besilate) 10 mg, Olmesartan medoxomil 40 mg
    - Sevikar 40mg/10mg tablets | 28 tablet (POM) £16.95
    - Amlodipine (as Amlodipine besilate) 5 mg, Olmesartan medoxomil 40 mg
    - Sevikar 40mg/5mg tablets | 28 tablet (POM) £16.95

**2 Blood pressure conditions**

- **Losartan potassium 25 mg** Losartan 25mg tablets | 28 tablet (POM) £16.18 DT price = £0.80
- **Losartan potassium 50 mg** Losartan 50mg tablets | 28 tablet (POM) £12.80 DT price = £0.86
- **Losartan potassium 100 mg** Losartan 100mg tablets | 28 tablet (POM) £16.18 DT price = £0.99
  - Cozaar (Merck Sharp & Dohme Ltd)
    - Losartan potassium 12.5 mg | 28 tablet (POM) £9.70 DT price = £26.66
    - Losartan potassium 25 mg | 28 tablet (POM) £16.18 DT price = £0.90
    - Losartan potassium 50 mg | 28 tablet (POM) £12.80 DT price = £0.86
    - Losartan potassium 100 mg | 28 tablet (POM) £16.18 DT price = £0.99
  - Olmesartan medoxomil (Non-proprietary)
    - Olmetec 10 mg
    - Olmetec 20 mg
    - Olmetec 40 mg

- **INDICATIONS AND DOSE**
  - Usually, blood pressure conditions
  - Angina
  - Cough
  - Headache: myalgia, pruritus, thrombocytopenia, urticaria
  - **HEPATIC IMPAIRMENT**
    - Dose should not exceed 20 mg daily in moderate impairment. Manufacturer advises avoid in severe impairment—no information available.
  - **RENAL IMPAIRMENT**
    - Max. 20 mg daily if eGFR 20–60 mL/minute/1.73 m². Avoid if eGFR less than 20 mL/minute/1.73 m².

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  **Tablet**
  - Olmesartan medoxomil (Non-proprietary)
    - Olmesartan medoxomil 10 mg
    - Olmesartan medoxomil 20 mg
    - Olmesartan medoxomil 40 mg

  **Cozaar-Comp**
  - Losartan with hydrochlorothiazide (Non-proprietary)
    - Losartan with hydrochlorothiazide 12.5mg tablets | 28 tablet (POM) £13.75 DT price = £1.31
    - Losartan with hydrochlorothiazide 25mg tablets | 28 tablet (POM) £16.18 DT price = £1.55

  **Sevikar**
  - Amlodipine (as Amlodipine besilate) 5 mg, Olmesartan medoxomil 20 mg
  - Amlodipine (as Amlodipine besilate) 10 mg, Olmesartan medoxomil 40 mg
  - Amlodipine (as Amlodipine besilate) 5 mg, Olmesartan medoxomil 40 mg

- **Olmesartan with amlodipine**

  The properties listed below are those particular to the combination only. For the properties of the components please consider, olmesartan medoxomil above, amlodipine p. 150.

- **INDICATIONS AND DOSE**
  - Hypertension
  - Given in the same proportions

  **INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists, calcium channel blockers

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - Sevikar (Daiichi Sankyo UK Ltd)
    - Amlodipine (as Amlodipine besilate) 5 mg, Olmesartan medoxomil 20 mg
    - Sevikar 20mg/5mg tablets | 28 tablet (POM) £16.95
    - Amlodipine (as Amlodipine besilate) 10 mg, Olmesartan medoxomil 40 mg
    - Sevikar 40mg/10mg tablets | 28 tablet (POM) £16.95
    - Amlodipine (as Amlodipine besilate) 5 mg, Olmesartan medoxomil 40 mg
    - Sevikar 40mg/5mg tablets | 28 tablet (POM) £16.95

- **Complaints**
  - Common or very common
  - Uncommon
  - Angina: rash: vertigo

- **CONTRA-INDICATIONS**
  - Biliary obstruction

- **SIDE-EFFECTS**
  - Common or very common
  - Uncommon
  - Angina: rash: vertigo

- **Very rare**
  - Headache: myalgia: pruritus: thrombocytopenia: urticaria

- **Appendix**

  - Appendix 1: angiotensin-II receptor antagonists, calcium channel blockers
Olmesartan with amlodipine and hydrochlorothiazide

The properties listed below are those particular to the combination only. For the properties of the components please consider, olmesartan medoxomil p. 172, amlodipine p. 150, hydrochlorothiazide p. 162.

**INDICATIONS AND DOSE**

Hypertension in patients stabilised on the individual components in the same proportions, or for hypertension not adequately controlled with olmesartan and amlodipine

- **BY MOUTH**
- Adult: (consult product literature)

**INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists, calcium channel blockers, thiazide diuretics

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Sevikar HCT** (Daiichi Sankyo UK Ltd)
  - Amlodipine besilate 5 mg, Hydrochlorothiazide 12.5 mg, Olmesartan medoxomil 20 mg, Sevikar HCT 20mg/5mg/12.5mg tablets | 28 tablet (PO) £16.95
  - Amlodipine besilate 5 mg, Hydrochlorothiazide 25 mg, Olmesartan medoxomil 40 mg, Sevikar HCT 40mg/5mg/25mg tablets | 28 tablet (PO) £16.95
  - Amlodipine besilate 10 mg, Hydrochlorothiazide 25 mg, Olmesartan medoxomil 40 mg, Sevikar HCT 40mg/10mg/25mg tablets | 28 tablet (PO) £16.95
  - Amlodipine besilate 5 mg, Hydrochlorothiazide 12.5 mg, Olmesartan medoxomil 40 mg, Sevikar HCT 40mg/5mg/12.5mg tablets | 28 tablet (PO) £16.95
  - Amlodipine besilate 10 mg, Hydrochlorothiazide 12.5 mg, Olmesartan medoxomil 40 mg, Sevikar HCT 40mg/10mg/12.5mg tablets | 28 tablet (PO) £16.95

**Olmesartan with hydrochlorothiazide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, olmesartan medoxomil p. 172, hydrochlorothiazide p. 162.

**INDICATIONS AND DOSE**

Hypertension not adequately controlled with olmesartan alone

- **BY MOUTH**
- Adult: (consult product literature)

**INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists, thiazide diuretics

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Olmetec Plus** (Daiichi Sankyo UK Ltd)
  - Hydrochlorothiazide 12.5 mg, Olmesartan medoxomil 20 mg, Olmetec Plus 20mg/12.5mg tablets | 28 tablet (PO) £12.95 DT price = £12.95
  - Olmesartan medoxomil 20 mg, Hydrochlorothiazide 25 mg, Olmetec Plus 20mg/25mg tablets | 28 tablet (PO) £12.95 DT price = £12.95
  - Hydrochlorothiazide 12.5 mg, Olmesartan medoxomil 40 mg, Olmetec Plus 40mg/12.5mg tablets | 28 tablet (PO) £17.50 DT price = £17.50

**Telmisartan**

**INDICATIONS AND DOSE**

Hypertension

- **BY MOUTH**
- Adult: Initially 20–40 mg once daily for at least 4 weeks, increased if necessary up to 80 mg once daily

Prevention of cardiovascular events in patients with established atherosclerotic cardiovascular disease, or type 2 diabetes mellitus with target-organ damage

- **BY MOUTH**
- Adult: 80 mg once daily

**INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists

**SIDE-EFFECTS**

- **Common or very common** Arthralgia - back pain - chest pain - eczema - gastro-intestinal disturbances - influenza-like symptoms - leg cramps - myalgia - pharyngitis - sinusitis - urinary-tract infection
- **Uncommon** Abnormal vision - anxiety - dry mouth - flatulence - increased sweating - tendinitis-like symptoms - vertigo
- **Rare** Blood disorders - bradycardia - depression - dyspnoea - eosinophilia - increase in uric acid - insomnia - pruritus - rash - tachycardia
- **Frequency not known** Asthenia - syncope

**HEPATIC IMPAIRMENT**

20–40 mg once daily in mild or moderate impairment. Avoid in severe impairment or biliary obstruction.

**RENAL IMPAIRMENT**

Manufacturer advises initial dose of 20 mg once daily in severe impairment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Telmisartan (Non-proprietary)**
  - Telmisartan 20 mg Telmisartan 20mg tablets | 28 tablet (PO) £1.01–£1.05 DT price = £1.01
  - Telmisartan 40 mg Telmisartan 40mg tablets | 28 tablet (PO) £1.07–£1.09 DT price = £1.08
  - Telmisartan 80 mg Telmisartan 80mg tablets | 28 tablet (PO) £1.46–£1.56 DT price = £1.46
  - Micardis (Boehringer Ingelheim Ltd)
  - Micardis 20 mg Micardis 20mg tablets | 28 tablet (PO) £1.10 DT price = £1.01
  - Micardis 40 mg Micardis 40mg tablets | 28 tablet (PO) £1.36 DT price = £1.18
  - Micardis 80 mg Micardis 80mg tablets | 28 tablet (PO) £1.70 DT price = £1.46
- **Tolura** (Consilient Health Ltd)
  - Tolura 20 mg Tolura 20mg tablets | 28 tablet (PO) £1.10 DT price = £1.01
  - Tolura 40 mg Tolura 40mg tablets | 28 tablet (PO) £1.36 DT price = £1.18
  - Tolura 80 mg Tolura 80mg tablets | 28 tablet (PO) £1.70 DT price = £1.46

**Telmisartan with hydrochlorothiazide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, telmisartan above, hydrochlorothiazide p. 162.

**INDICATIONS AND DOSE**

Hypertension not adequately controlled by telmisartan alone

- **BY MOUTH**
- Adult: (consult product literature)
INTERACTIONS 

- Appendix 1: angiotensin-II receptor antagonists, thiazide diuretics

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Telmisartan with hydrochlorothiazide (Non-proprietary)
  - Hydrochlorothiazide 12.5 mg, Telmisartan 40 mg
  - Telmisartan 80mg / hydrochlorothiazide 12.5mg tablets | 28 tablet (POM) £13.61 DT price = £13.61
  - Hydrochlorothiazide 25 mg, Telmisartan 80 mg
  - Telmisartan 80mg / hydrochlorothiazide 25mg tablets | 28 tablet (POM) £10.99–£17.00 DT price = £17.00
  - Hydrochlorothiazide 12.5 mg, Telmisartan 80 mg

  - Hydrochlorothiazide 12.5 mg, Telmisartan 80 mg
  - Tolucombi 80mg/12.5mg tablets | 28 tablet (POM) £17.00 DT price = £17.00

INDICATIONS AND DOSE

Blood pressure conditions

- BP SUCCESSION
  - BY MOUTH

Hypertension

- Adult: Initially 80 mg once daily, increased if necessary up to 320 mg daily, doses to be increased at intervals of 4 weeks

Hypertension with intravascular volume depletion

- BY MOUTH

- Adult: Initially 40 mg once daily, increased if necessary up to 320 mg daily, doses to be increased at intervals of 4 weeks

Heart failure when ACE inhibitors cannot be used, or in conjunction with an ACE inhibitor when a beta-blocker cannot be used

- Heart failure, in conjunction with an ACE inhibitor when a beta-blocker cannot be used (under expert supervision)

- BY MOUTH

- Adult: Initially 40 mg twice daily, increased to up to 160 mg twice daily, doses to be increased at intervals of at least 2 weeks

Myocardial infarction with left ventricular failure or left ventricular systolic dysfunction (adjunct)

- BY MOUTH

- Adult: Initially 20 mg twice daily, increased if necessary up to 160 mg twice daily, doses to be increased over several weeks if tolerated

CONTRA-INDICATIONS

- Biliary cirrhosis • cholestasis

INTERACTIONS

- Appendix 1: angiotensin-II receptor antagonists

SIDE-EFFECTS

- Common or very common Renal impairment

- Uncommon Acute renal failure • cough • fatigue • gastrointestinal disturbance • headache • syncope

- Frequency not known Hypersensitivity reactions • myalgia • neutropenia • pruritus • rash • serum sickness • thrombocytopenia • vasculitis

HEPATIC IMPAIRMENT

- Max. dose 80 mg daily in mild to moderate impairment. Avoid in severe hepatic impairment.

RENAL IMPAIRMENT

- Use with caution if eGFR less than 10 mL/minute/1.73 m²—no information available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral solution

- Diovan (Novartis Pharmaceuticals UK Ltd)
  - Valsartan 3 mg per 1 ml Diovan 3mg/1ml oral solution | 160 ml (POM) £7.20

Tablet

- Valsartan (Non-proprietary)
  - Valsartan 40 mg
  - Valsartan 40mg tablets | 7 tablet (POM) £5.00 DT price = £3.11 | 28 tablet (POM) no price available
  - Valsartan 80 mg
  - Valsartan 80mg tablets | 28 tablet (POM) £13.69 DT price = £13.69

- Valsartan 160 mg
  - Valsartan 160mg tablets | 28 tablet (POM) £14.69 DT price = £14.69
  - Valsartan 320 mg
  - Valsartan 320mg tablets | 28 tablet (POM) £20.23 DT price = £13.01

Capsule

- Valsartan (Non-proprietary)
  - Valsartan 40 mg
  - Valsartan 40mg capsules | 28 capsule (POM) £13.97 DT price = £3.31
  - Valsartan 80 mg
  - Valsartan 80mg capsules | 28 capsule (POM) £13.97 DT price = £2.21
  - Valsartan 160 mg
  - Valsartan 160mg capsules | 28 capsule (POM) £18.41 DT price = £4.05

Combinations available: Amlodipine with valsartan, p. 151

Valsartan with hydrochlorothiazide

The properties listed below are those particular to the combination only. For the properties of the components please consider, valsartan above, hydrochlorothiazide p. 162.

INDICATIONS AND DOSE

Hypertension not adequately controlled by valsartan alone

- BY MOUTH

- Adult: (consult product literature)

INTERACTIONS

- Appendix 1: angiotensin-II receptor antagonists, thiazide diuretics

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Valsartan with hydrochlorothiazide (Non-proprietary)
  - Hydrochlorothiazide 12.5 mg, Valsartan 80 mg

  - Valsartan 80mg / hydrochlorothiazide 12.5mg tablets | 28 tablet (POM) £13.97 DT price = £7.74

  - Hydrochlorothiazide 25 mg, Valsartan 160 mg

  - Valsartan 160mg / hydrochlorothiazide 25mg tablets | 28 tablet (POM) £18.41 DT price = £10.41

  - Hydrochlorothiazide 12.5 mg, Valsartan 160 mg

  - Valsartan 160mg / hydrochlorothiazide 12.5mg tablets | 28 tablet (POM) £18.41 DT price = £2.19

- Co-Diovan (Novartis Pharmaceuticals UK Ltd)

  - Hydrochlorothiazide 12.5 mg, Valsartan 80 mg

  - Co-Diovan 80mg/12.5mg tablets | 28 tablet (POM) £16.76 DT price = £7.74

  - Hydrochlorothiazide 25 mg, Valsartan 160 mg

  - Co-Diovan 160mg/25mg tablets | 28 tablet (POM) £22.09 DT price = £10.41

  - Hydrochlorothiazide 12.5 mg, Valsartan 160 mg

  - Co-Diovan 160mg/12.5mg tablets | 28 tablet (POM) £22.09 DT price = £2.19
DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM

RENIN INHIBITORS

Aliksiren

- **Drug Action**: Renin inhibitors inhibit renin directly; renin converts angiotensinogen to angiotensin I.

- **Indications and Dose**
  - Essential hypertension either alone or in combination with other antihypertensives
    - By Mouth
    - Adult: 150 mg once daily, increased if necessary to 300 mg once daily

- **Contra-Indications**: Concomitant treatment with an ACE inhibitor or an angiotensin-II receptor antagonist in patients with an eGFR less than 60 mL/minute/1.73 m². Concomitant treatment with an ACE inhibitor or an angiotensin-II receptor antagonist in patients with diabetes mellitus - hereditary angioedema - idiopathic angioedema.

- **Caution**: Combination treatment with an ACE inhibitor - combination treatment with an angiotensin-II receptor antagonist - concomitant use of diuretics (first doses may cause hypotension - initiate with care) - history of angioedema - moderate to severe congestive heart failure - patients at risk of renal impairment - salt depletion (first doses may cause hypotension - initiate with care) - volume depletion (first doses may cause hypotension - initiate with care).

**Caution, Further Information**

- Concomitant use of drugs affecting the renin-angiотensin system
  - Combination therapy with two drugs affecting the renin-angiотensin system (ACE inhibitors, angiotensin-II receptor antagonists, and aliskiren) is not recommended due to an increased risk of hyperkalaemia, hypotension, and renal impairment, compared to use of a single drug.
  - Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor with an angiotensin-II receptor antagonist. There is some evidence that the benefits of combination use of an ACE inhibitor with candesartan or valsartan may outweigh the risks in selected patients with heart failure for whom other treatments are unsuitable, however, the concomitant use of this combination, together with a aldosterone antagonist or a potassium-sparing diuretic is not recommended. For patients currently taking combination therapy, the need for continued combined therapy should be reviewed. If combination therapy is considered essential, it should be carried out under specialist supervision, with close monitoring of blood pressure, renal function, and electrolytes (particularly potassium); monitoring should be considered at the start of treatment, then monthly, and also after any change in dose or during intercurrent illness.

**Interactions**

- **Appendix 1: aliskiren**

- **Side-Effects**
  - Common or very common: Arthralgia - dizziness - hyperkalaemia - diarrhoea
  - Uncommon: Acute renal failure (reversible on discontinuation of treatment) - hypotension - palpitation - peripheral oedema - cough - pruritus - rash - Stevens-Johnson syndrome - toxic epidermal necrolysis - urticaria
  - Rare: Anaemia - angioedema - erythema
  - Frequency not known: Liver disorders - nausea - vertigo - vomiting

**Side-Effects, Further Information**

- If diarrhoea severe or persistent discontinue treatment.

**Pregnancy**

- Manufacturer advises avoid - no information available; other drugs acting on the renin-angiотensin system have been associated with fetal malformations and neonatal death.

**Breast Feeding**

- Present in milk in animal studies - manufacturer advises avoid.

**Renal Impairment**

- Avoid if eGFR is less than 30 mL/minute/1.73 m² - no information available. Use with caution in renal artery stenosis - no information available. Monitor plasma-potassium concentration in renal impairment.

**Monitoring Requirements**

- Monitor patients with a history of angioedema closely during treatment.

**National Funding/Access Decisions**

- Scottish Medicines Consortium (SMC) Decisions
  - The Scottish Medicines Consortium has advised (January 2010) that aliskiren (Rasilez ®) is not recommended for use within NHS Scotland.

**Medicinal Forms**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Cautionary and Advisory Labels 21**
  - Rasilez (Novartis Pharmaceuticals UK Ltd)
  - Aliskiren (as Aliskiren hemifumarate) 150 mg: Rasilez 150 mg tablets | 28 tablet (P掌柜): £20.51 DT price = £18.51
  - Aliskiren (as Aliskiren hemifumarate) 300 mg: Rasilez 300 mg tablets | 28 tablet (P掌柜): £34.27 DT price = £34.27

**Vasodilators**

Vasodilator Antihypertensives

Hydralazine hydrochloride

- **Indications and Dose**
  - Moderate to severe hypertension (adjunct)
    - By Mouth
    - Adult: Initially 25 mg twice daily, increased if necessary up to 50 mg twice daily
  - Heart failure (with long acting nitrate) (initiated in hospital or under specialist supervision)
    - By Mouth
    - Adult: Initially 25 mg 3–4 times a day, subsequent doses to be increased every 2 days if necessary; usual maintenance 50–75 mg 4 times a day
  - Hypertensive emergencies (including during pregnancy)
    - Hypertension with renal complications
      - By Intravenous Infusion
        - Adult: Initially 200–300 micrograms/minute; usual maintenance 50–150 micrograms/minute
      - By Slow Intravenous Injection
        - Adult: 5–10 mg, to be diluted with 10 mL sodium chloride 0.9%; dose may be repeated after 20–30 minutes

- **Contra-Indications** Acute porphyrias p. 969- cor pulmonale - dissecting aortic aneurysm - high output heart failure - idiopathic systemic lupus erythematosus - myocardial insufficiency due to mechanical obstruction - severe tachycardia

- **Caution**: Cerebrovascular disease - coronary artery disease (may provoke angina, avoid after myocardial infarction until stabilised) - occasionally blood pressure reduction too rapid even with low parenteral doses

**Interactions**

- **Appendix 1: hydralazine**

- **Side-Effects**
  - Rare: Rash
  - Frequency not known: Abnormal liver function - agitation - anorexia - anxiety - arthralgia - blood disorders - dizziness - dysphoria - fever - fluid retention - flushing - gastrointestinal disturbances - haematuria - haemolytic anaemia - headache - hypotension - increased lacrimation - jaundice -
leucopenia • myalgia • nasal congestion • palpitation • paraesthesia • peripheral neuritis • polynuereits • proteinuria • raised plasma creatinine • systemic lupus erythematosus-like syndrome after long-term therapy with over 100 mg daily (or less in women and in slow acetylator individuals) • tachycardia • thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION
The incidence of side-effects is lower if the dose is kept below 100 mg daily, but systemic lupus erythematous should be suspected if there is unexplained weight loss, arthritis, or any other unexplained ill health.

PREGNANCY Neonatal thrombocytopenia reported, but risk should be balanced against risk of uncontrolled maternal hypertension. Manufacturer advises avoid before third trimester.

BREAST FEEDING Present in milk but not known to be harmful. Monitor infant in breast-feeding.

HEPATIC IMPAIRMENT Reduce dose.

RENAL IMPAIRMENT Reduce dose if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS Manufacturer advises test for antinuclear factor and for proteinuria every 6 months and check acetylator status before increasing dose above 100 mg daily, but evidence of clinical value unsatisfactory.

DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Apresoline®) give continuously in Sodium chloride 0.9%. Suggested infusion volume 500 mL.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

EXCIPIENTS: May contain Gluten, propylene glycol

Hydralazine hydrochloride (Non-proprietary)

| Hydralazine hydrochloride 25 mg | Hydralazine hydrochloride 25mg tablets | 56 tablet [POM] £8.92 DT price = £6.60 | 84 tablet [POM] £14.00 |
| Hydralazine hydrochloride 50 mg | Hydralazine hydrochloride 50mg tablets | 56 tablet [POM] £16.82 DT price = £12.45 |
| Apresoline (AMCo) | Hydralazine hydrochloride 25 mg | Apresoline 25mg tablets | 84 tablet [POM] £3.38 |
| Powder for solution for injection | Hydralazine hydrochloride (Non-proprietary) |
| Hydralazine hydrochloride 20 mg | Hydralazine 20mg powder for concentrate for solution for injection ampoules | 5 ampoule [POM] £64.50 |
| Hydralazine hydrochloride 20 mg | Hydralazine hydrochloride 20 mg powder for solution for injection ampoules | 5 ampoule [POM] £11.09 |

Minoxidil

INDICATIONS AND DOSE
Severe hypertension, in addition to a diuretic and a beta-blocker

BY MOUTH
Adult: Initially 5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg, increased at intervals of at least 3 days, seldom necessary to exceed 50 mg daily; maximum 100 mg per day

Elderly: Initially 2.5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg, increased at intervals of at least 3 days, seldom necessary to exceed 50 mg daily; maximum 100 mg per day

CONTRA-INDICATIONS Phaeochromocytoma

CAUTIONS Acute porphyrias p. 969 • after myocardial infarction (until stabilised) • angina

INTERACTIONS ➔ Appendix 1: minoxidil

SIDE-EFFECTS Breast tenderness • gastro-intestinal disturbances • hypertrichosis • peripheral oedema • rashes • reversible rise in creatinine and blood urea nitrogen • sodium retention • tachycardia • water retention • weight gain

PREGNANCY Avoid—possible toxicity including reduced placental perfusion. Neonatal hirsutism reported.

BREAST FEEDING Present in milk but not known to be harmful.

RENAL IMPAIRMENT Use with caution in significant impairment.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet

▷ Loniten (Pfizer Ltd)

| Minoxidil 2.5 mg | Loniten 2.5mg tablets | 60 tablet [POM] £8.88 DT price = £8.88 |
| Minoxidil 5 mg | Loniten 5mg tablets | 60 tablet [POM] £15.83 DT price = £15.83 |
| Minoxidil 10 mg | Loniten 10mg tablets | 60 tablet [POM] £30.68 DT price = £30.68 |

4.1a Hypertension associated with phaeochromocytoma

Other drugs used for Hypertension associated with phaeochromocytoma Propranolol hydrochloride, p. 145

VASODILATORS ➔ PERIPHERAL VASODILATORS

Phenoxybenzamine hydrochloride

INDICATIONS AND DOSE
Hypertension in phaeochromocytoma

BY MOUTH
Adult: Initially 10 mg daily, increased in steps of 10 mg daily until hypertension controlled or treatment not tolerated; maintenance 1–2 mg/kg daily in 2 divided doses

CONTRA-INDICATIONS During recovery period after myocardial infarction (usually 3–4 weeks) • history of cerebrovascular accident

CAUTIONS Avoid contact with skin (risk of contact sensitisation) • avoid in acute porphyrias p. 969 • carcinogenic in animals • cerebrovascular disease • congestive heart failure • elderly • severe ischaemic heart disease

SIDE-EFFECTS Rare Gastro-intestinal disturbances

Frequency not known Inhibition of ejaculation • lassitude • miosis • nasal congestion • postural hypotension (with dizziness and marked compensatory tachycardia)

PREGNANCY Hypotension may occur in newborn.

BREAST FEEDING May be present in milk.

RENAL IMPAIRMENT Use with caution.

HANDLING AND STORAGE Owing to risk of contact sensitisation healthcare professionals should avoid contamination of hands.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

▷ Phenoxybenzamine hydrochloride (Non-proprietary)

| Phenoxybenzamine hydrochloride 10 mg | Phenoxybenzamine 10mg capsules | 30 capsule [POM] £97.38 DT price = £97.38 |
Phentolamine mesilate

- **INDICATIONS AND DOSE**
  - Hypertensive crises due to phaeochromocytoma e.g. during surgery
    - **BY INTRAVENOUS INJECTION**
    - Adult: 2–5 mg, repeated if necessary

- **Diagnosis of phaeochromocytoma**
  - **BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: (consult product literature)

- **CONTRA-INDICATIONS**
  - Angina - coronary insufficiency
  - evidence of coronary artery disease
  - history of myocardial infarction
  - hypotension

- **CAUTIONS**
  - Elderly - gastritis - peptic ulcer

- **INTERACTIONS**
  - → Appendix 1: phentolamine

- **SIDE-EFFECTS**
  - Acute or prolonged hypotension
  - angina
  - arrhythmias - chest pain - diarrhoea - dizziness - flushing
  - nasal congestion - nausea - postural hypotension
  - tachycardia - vomiting

- **PREGNANCY**
  - Use with caution — may cause marked decrease in maternal blood pressure with resulting fetal anoxia.

- **BREAST FEEDING**
  - Manufacturer advises avoid — no information available.

- **RENAL IMPAIRMENT**
  - Manufacturer advises caution — no information available.

- **MONITORING REQUIREMENTS**
  - Monitor blood pressure and heart rate.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Forms available from special order manufacturer include: Solution for injection.

### 4.1b Hypertensive crises

- **Other drugs used for Hypertensive crises**
  - Hydralazine hydrochloride, p. 175
  - Labetalol hydrochloride, p. 143

#### ANTIADRENERGIC AGENTS, PERIPHERALLY ACTING

<table>

</tbody>
</table>

- **CONTRA-INDICATIONS**
  - Heart failure - phaeochromocytoma

- **CAUTIONS**
  - Asthma - cerebral arteriosclerosis - coronary arteriosclerosis - history of peptic ulceration

- **INTERACTIONS**
  - → Appendix 1: guanethidine

- **SIDE-EFFECTS**
  - Diarrhoea - drowsiness - failure of ejaculation - fluid retention - headache - nasal congestion - postural hypotension

- **PREGNANCY**
  - Postural hypotension and reduced uteroplacental perfusion. Should not be used to treat hypertension in pregnancy.

- **RENAL IMPAIRMENT**
  - Reduce dose if eGFR 40–65 mL/minute/1.73 m². Avoid if eGFR less than 40 mL/minute/1.73 m².

- **LESS SUITABLE FOR PRESCRIBING**
  - Guanethidine monosulfate is less suitable for prescribing.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for injection**
    - Guanethidine monosulfate (Non-proprietary)
      - Guanethidine monosulfate 10 mg per 1 ml
      - Guanethidine 10mg/1ml solution for injection ampoules 15 ampoule £224.15

#### Sodium nitroprusside

- **INDICATIONS AND DOSE**
  - Hypertensive emergencies
    - **BY INTRAVENOUS INFUSION**
      - Adult: Initially 0.5–1.5 micrograms/kg/minute, adjusted in steps of 500 nanograms/kg/minute every 5 minutes, usual dose 0.5–8 micrograms/kg/minute, use lower doses if already receiving other antihypertensives, stop if response unsatisfactory with max. dose in 10 minutes, lower initial dose of 300 nanograms/kg/minute has been used

  - **Maintenance of blood pressure at 30–40% lower than pretreatment diastolic blood pressure**
    - **BY INTRAVENOUS INFUSION**
      - Adult: 20–400 micrograms/minute, use lower doses for patients being treated with other antihypertensives

  - **Controlled hypotension in anaesthesia during surgery**
    - **BY INTRAVENOUS INFUSION**
      - Adult: Up to 1.5 micrograms/kg/minute

  - **Acute or chronic heart failure**
    - **BY INTRAVENOUS INFUSION**
      - Adult: Initially 10–15 micrograms/minute, increased every 5–10 minutes as necessary; usual dose 10–200 micrograms/minute normally for max. 3 days

- **UNLICENSED USE**
  - Not licensed for use in the UK.

- **CONTRA-INDICATIONS**
  - Compensatory hypertension - Leber’s optic atrophy - severe vitamin B₁₂ deficiency

- **CAUTIONS**
  - Elderly - hyponatraemia - hypothermia - hypothyroidism - impaired cerebral circulation - ischaemic heart disease

- **INTERACTIONS**
  - → Appendix 1: sodium nitroprusside

- **SIDE-EFFECTS**
  - Abdominal pain - acute transient phlebitis - anxiety - dizziness - headache - nausea - palpitation - perspiration - reduced platelet count - retching - retrosternal discomfort

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Side-effects associated with rapid reduction in blood pressure: Headache, dizziness, nausea, retching, abdominal pain, perspiration, palpitation, anxiety, retrosternal discomfort — reduce infusion rate if any of these side-effects occur.

- **Overdose**
  - Side-effects caused by excessive plasma concentration of the cyanide metabolite include tachycardia, sweating, hyperventilation, arrhythmias, marked metabolic acidosis (discontinue and give antidote, see cyanide in Emergency treatment of poisoning p. 1255).

- **PREGNANCY**
  - Avoid prolonged use — potential for accumulation of cyanide in fetus.

- **BREAST FEEDING**
  - No information available. Caution advised due to thiocyanate metabolite.

- **HEPATIC IMPAIRMENT**
  - Use with caution. Avoid in hepatic failure — cyanide or thiocyanate metabolites may accumulate.
178 Blood pressure conditions

- **RENAL IMPAIRMENT** Avoid prolonged use—cyanide or thiocyanate metabolites may accumulate.
- **MONITORING REQUIREMENTS** Monitor blood pressure (including intra-arterial blood pressure) and blood-cyanide concentration, and if treatment exceeds 3 days, also blood thiocyanate concentration.
- **TREATMENT CESSATION** Avoid sudden withdrawal—terminate infusion over 15–30 minutes.
- **DIRECTIONS FOR ADMINISTRATION** For continuous intravenous infusion in Glucose 5%, infuse via infusion device to allow precise control. For further details, consult product literature. Protect infusion from light.
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder and solvent for solution for infusion**
    - Sodium nitroprusside (Non-proprietary)
    - Sodium nitroprusside dihydrate 50 mg Sodium nitroprusside 50mg powder and solvent for solution for infusion vials | 1 vial | no price available

4.1c Pulmonary hypertension

Other drugs used for Pulmonary hypertension
Epoprostenol, p. 112 - Sildenafil, p. 766 - Tadalafil, p. 767

ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

Selexipag 22-May-2017

- **DRUG ACTION** Selexipag is a selective prostacyclin (IP) receptor agonist.

  - **INDICATIONS AND DOSE** Pulmonary arterial hypertension either as combination therapy (if insufficiently controlled with an endothelin receptor antagonist and/or a phosphodiesterase type-5 inhibitor), or as monotherapy (initiated under specialist supervision)
    - **BY MOUTH**
      - Adult: Initially 200 micrograms twice daily, increased in steps of 200 micrograms twice daily at weekly intervals up to the highest tolerated dose, usual maintenance 200–1600 micrograms twice daily, initial dose and first dose after each dose increase should be taken in the evening; maximum 3200 micrograms per day

- **CONTRA-INDICATIONS** Cerebrovascular event (within the last 3 months) - congenital or acquired valvular defects with myocardial function disorders (not related to pulmonary hypertension) - decompensated cardiac failure (unless under close medical supervision) - myocardial infarction (within last 6 months) - severe arhythmias - severe coronary heart disease - unstable angina
- **CAUTIONS** Elderly (limited information available)
- **INTERACTIONS** → Appendix 1: selexipag
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain - anaemia - arthralgia - decreased appetite - diarrhoea - erythema - flushing - headache - hyperthyroidism - hypotension - jaw pain - myalgia - nasal congestion - nasopharyngitis - nausea - pain in extremity - rash - urticaria - vomiting
  - **Uncommon** Sinus tachycardia
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises reduce initial dose to 200 micrograms once daily in moderate impairment and increase in steps of 200 micrograms once daily at weekly intervals, as tolerated. Manufacturer advises avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution with dose titration in severe impairment.
- **PATIENT AND CARER ADVICE**
  - Missed doses Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time; if a dose is missed for 3 days or more, treatment should be restarted at a lower dose and then increased—consult product literature.
- **MEDICINAL FORMS**

ANTITHROMBOTIC DRUGS > PROSTAGLANDINS, CARDIOVASCULAR

Iloprost

- **INDICATIONS AND DOSE** Idiopathic or familial pulmonary arterial hypertension (initiated under specialist supervision)
  - **BY INHALATION OF NEBULISED SOLUTION**
  - Adult: Initially 2.5 micrograms for 1 dose, increased to 5 micrograms for 1 dose, increased if tolerated to 5 micrograms 6–9 times a day, adjusted according to response; reduced if not tolerated to 2.5 micrograms 6–9 times a day, reduce to lower maintenance dose if high dose not tolerated

- **CONTRA-INDICATIONS** Conditions which increase risk of haemorrhage - congenital or acquired valvular defects of the myocardium - decompensated cardiac failure (unless under close medical supervision) - pulmonary veno-occlusive disease - severe arhythmias - unstable angina - within 6 months of myocardial infarction
- **CAUTIONS** Acute pulmonary infection - chronic obstructive pulmonary disease - hypotension (do not initiate if systolic blood pressure below 85 mmHg); severe asthma - unstable pulmonary hypertension with advanced right heart failure
- **INTERACTIONS** → Appendix 1: iloprost
- **SIDE-EFFECTS**
  - **Common or very common** Chest pain - cough - diarrhoea - dyspnoea - haemorrhage - headache - hypotension - jaw pain - nausea - oral irritation - rash - throat pain - vomiting
  - **Frequency not known** Bronchospasm - taste disturbance - thrombocytopenia - wheezing

Downloaded from www.medicalbr.com
ENDOTHELIN RECEPTOR ANTAGONISTS

Ambrisentan

**INDICATIONS AND DOSE**
Pulmonary arterial hypertension (initiated under specialist supervision)

- **BY MOUTH**
  - Adult: 5 mg once daily, increased if necessary to 10 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
Manufacturer advises max. dose 5 mg daily and close monitoring with concurrent use of cyclosporin.

**CONTRA-INDICATIONS**
- Idiopathic pulmonary fibrosis

**CAUTIONS**
- Not to be initiated in significant anaemia

**INTERACTIONS → Appendix 1: ambrisentan**

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain, anaemia, chest pain, constipation, diarrhoea, dizziness, dyspnoea, epistaxis, flushing, headache, heart failure, hypotension, malaise, nausea, palpitation, peripheral oedema, upper respiratory tract disorders, vomiting
- **Uncommon** Autoimmune hepatitis, hepatic injury, syncope

**CONCEPTION AND CONTRACEPTION**
Exclude pregnancy before treatment and ensure effective contraception during treatment. Monthly pregnancy tests advised.

**PREGNANCY**
Avoid (teratogenic in *animal* studies).

**BREAST FEEDING**
Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**
Avoid in severe impairment.

**RENAL IMPAIRMENT**
Use with caution if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**
- Monitor haemoglobin concentration or haematocrit after 1 month and 3 months of starting treatment, and periodically thereafter (reduce dose or discontinue treatment if significant decrease in haemoglobin concentration or haematocrit observed).
- Monitor liver function before treatment, and monthly thereafter—discontinue if liver enzymes raised significantly or if symptoms of liver impairment develop.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (October 2008) that ambrisentan (*Volibris®*) should be prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

**MEDIcular system 179**

**Bosentan**

**INDICATIONS AND DOSE**
Pulmonary arterial hypertension (initiated under specialist supervision)

- **BY MOUTH**
  - Adult: Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily (max. per dose 250 mg); maximum 500 mg per day

**Systemic scleroderma with ongoing digital ulcer disease (to reduce number of new digital ulcers)**

- **BY MOUTH**
  - Adult: Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily

**CONTRA-INDICATIONS**
- Acute porphyrias p. 969
- **CAUTIONS**
  - Not to be initiated if systemic systolic blood pressure is below 85 mmHg
  - **INTERACTIONS → Appendix 1: bosentan**

**SIDE-EFFECTS**
- **Common or very common** Anaemia, diarrhoea, flushing, gastro-oesophageal reflux, headache, hypotension, oedema, palpitation, syncope
- **Uncommon** Leucopenia, neutropenia, thrombocytopenia
- **Rare** Liver cirrhosis, liver failure

**CONCEPTION AND CONTRACEPTION**
Effective contraception required during administration (hormonal contraception not considered effective). Monthly pregnancy tests advised.

**PREGNANCY**
Avoid (teratogenic in *animal* studies).

**BREAST FEEDING**
Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**
Avoid in moderate and severe impairment.

**MONITORING REQUIREMENTS**
- Monitor haemoglobin before and during treatment (monthly for first 4 months, then 3-monthly).
- Monitor liver function before treatment, at monthly intervals during treatment, and 2 weeks after dose increase (reduce dose or suspend treatment if liver enzymes raised significantly)—discontinue if symptoms of liver impairment.

**TREATMENT CESSATION**
Avoid abrupt withdrawal—withdraw treatment gradually.
**Guanylate Cyclase Stimulators**

**Riociguat**

**INDICATIONS AND DOSE**

Chronic thromboembolic pulmonary hypertension that is recurrent or persistent following surgery, or is inoperable (initiated under specialist supervision) | Monotherapy or in combination with an endothelin receptor antagonist for idiopathic or hereditary pulmonary arterial hypertension, or pulmonary arterial hypertension associated with connective tissue disease (initiated under specialist supervision)

▶ **BY MOUTH**

Adult: Initially 1 mg 3 times a day for 2 weeks, increased in steps of 0.5 mg 3 times a day, dose to be increased every 2 weeks, increased to up to 2.5 mg 3 times a day (max. per dose 2.5 mg 3 times a day), increase up to maximum dose only if systolic blood pressure ≥ 95 mmHg and no signs of hypotension, if treatment interrupted for 3 or more days, restart at 1 mg three times daily for 2 weeks and titrate as before, during titration, reduce dose by 0.5 mg three times daily if systolic blood pressure falls below 95 mmHg and patient shows signs of hypotension

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: PULMONARY HYPERTENSION ASSOCIATED WITH IDIOPATHIC INTERSTITIAL PNEUMONIAS (PH-IIP) (AUGUST 2016)

Interim results from a terminated study to investigate the efficacy and safety of riociguat in patients with symptomatic PH-IIP, showed increased mortality and increased risk of serious adverse events in the riociguat group compared with the placebo group. The MHRA has advised that use of riociguat is contra-indicated in these patients and that existing treatment for this unauthorised indication should be discontinued.

**CONTRA-INDICATIONS**

History of serious haemoptysis - previous bronchial artery embolisation - pulmonary hypertension associated with idiopathic interstitial pneumonias - pulmonary veno-occlusive disease

**CAUTIONS**

Autonomic dysfunction - elderly (risk of hypotension) - hypotension (do not initiate if systolic blood pressure below 95 mmHg) - hypovolaemia - severe left ventricular outflow obstruction

**SIDE-EFFECTS**

Common or very common Anaemia - constipation - diarrhoea - dizziness - dyspepsia - dysphagia - epistaxis - gastritis - gastro-oesophageal reflux - haemoptysis - headache - hypotension - nasal congestion - nausea - palpitation - peripheral oedema - vomiting

Uncommon Pulmonary haemorrhage

**CONCEPTION AND CONTRACEPTION**

Effective contraception required during treatment. Monthly pregnancy tests advised.

**PREGNANCY**

Avoid—toxicity in animal studies.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Titrated dose cautiously in moderate impairment. Manufacturer advises avoid in severe impairment—no information available.
4.2 Hypotension and shock

Sympathomimetics

Inotropic sympathomimetics

Shock
Shock is a medical emergency associated with a high mortality. The underlying causes of shock such as haemorrhage, sepsis, or myocardial insufficiency should be corrected. The profound hypotension of shock must be treated promptly to prevent tissue hypoxia and organ failure. Volume replacement is essential to correct the hypovolaemia associated with haemorrhage and sepsis but may be detrimental in cardiogenic shock. Depending on haemodynamic status, cardiac output may be improved by the use of sympathomimetic inotropes such as adrenaline/epinephrine p. 216, dobutamine p. 215 or dopamine hydrochloride below. In septic shock, when fluid replacement and inotropic support fail to maintain blood pressure, the vasoconstrictor noradrenaline/norepinephrine p. 183 may be considered. In cardiogenic shock peripheral resistance is frequently high and to raise it further may worsen myocardial performance and exacerbate tissue ischaemia.

The use of sympathomimetic inotropes and vasoconstrictors should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring.

See also advice on the management of anaphylactic shock in Anti-histamines, allergen immunotherapy and allergic emergencies p. 266.

Vasoconstrictor sympathomimetics
Vasoconstrictor sympathomimetics raise blood pressure transiently by acting on alpha-adrenergic receptors to constrict peripheral vessels. They are sometimes used as an emergency method of elevating blood pressure where other measures have failed.

The danger of vasoconstrictors is that although they raise blood pressure they also reduce perfusion of vital organs such as the kidney.

Spinal and epidural anaesthesia may result in sympathetic block with resultant hypotension. Management may include intravenous fluids (which are usually given prophylactically), oxygen, elevation of the legs, and injection of a pressor drug such as ephedrine hydrochloride p. 261. As well as constricting peripheral vessels ephedrine hydrochloride also accelerates the heart rate (by acting on beta receptors). Use is made of this dual action of ephedrine hydrochloride to manage associated bradycardia (although intravenous injection of atropine sulfate p. 1224 may also be required if bradycardia persists).

**Dopamine hydrochloride**

- **INDICATIONS AND DOSE** Cardiogenic shock in infarction or cardiac surgery
  - BY INTRAVENOUS INFUSION
    - Adult: Initially 2–5 micrograms/kg/minute

- **SIDE-EFFECTS**
  - Common or very common Chest pain - dyspnoea - headache - hypotension - nausea - palpitation - tachycardia - vasoconstriction - vomiting
  - Uncommon Bradycardia - gangrene - hypertension - mydriasis
  - Rare Fatal ventricular arrhythmias

- **PRECAUTIONS** No evidence of harm in animal studies—manufacturer advises use only if potential benefit outweighs risk.

- **DIRECTIONS FOR ADMINISTRATION** Dopamine concentrate for intravenous infusion to be diluted before use.
  For intravenous infusion give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to max. concentration of 3.2 mg/mL; incompatible with bicarbonate.

- **MEDICATION FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

**Solution for infusion**

- Dopamine hydrochloride (Non-proprietary)
  - Dopamine hydrochloride 40 mg per 1 ml Dopamine 200mg/5ml solution for infusion ampoules | 5 ampoule £10.80, 10 ampoule £19.04
  - Dopamine 200mg/5ml concentrate for solution for infusion ampoules | 10 ampoule no price available
  - Dopamine hydrochloride 160 mg per 1 ml Dopamine 800mg/5ml solution for infusion ampoules | 10 ampoule £34.00
**Cardiovascular system**

**CONTRA-INDICATIONS**
- Hypertension
- Cirrhosis - coronary vascular thrombosis - diabetes mellitus - elderly - extravasation at injection site may cause necrosis - following myocardial infarction - hypercapnia - hyperthyroidism - hypoxia - mesenteric vascular thrombosis - peripheral vascular thrombosis - Prinzmetal's variant angina - uncorrected hypovolaemia

**INTERACTIONS**
- Hypertensive response - Metaraminol has a longer duration of action than noradrenaline, and an excessive vasopressor response may cause a prolonged rise in blood pressure.

**SIDE-EFFECTS**
- Angle-closure glaucoma - anorexia - anxiety - arrhythmias - bradycardia - confusion - dyspnoea - fatal ventricular arrhythmia reported in Laennec’s cirrhosis - headache - hypotension - hypoxia - insomnia - nausea - palpitation - peripheral ischaemia - psychosis - tachycardia - tremor - urinary retention - vomiting - weakness

**PREGNANCY**
- May reduce placental perfusion - manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**
- Manufacturer advises caution - no information available.

**MONITORING REQUIREMENTS**
- Monitor blood pressure and rate of flow frequently.

**DIRECTIONS FOR ADMINISTRATION**
- For intravenous infusion (Aramine®), give continuously or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Suggested volume 500 mL.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**
- **Metaraminol** (Non-proprietary)
  - Metaraminol (as Metaraminol tartrate) 10 mg per
  - 1 ml Metaraminol 10mg/2ml solution for injection ampoules: PCT £31.27

---

**PRESSURE INFLATORS**

**INDICATIONS AND DOSE**
- Severe orthostatic hypotension due to autonomic dysfunction when corrective factors have been ruled out and other forms of treatment are inadequate
  - **BY MOUTH**
    - Adult: Initially 2.5 mg 3 times a day, increased if necessary up to 10 mg 3 times a day, dose to be increased at weekly intervals, according to blood pressure measurements; usual maintenance 10 mg 3 times a day, avoid administration at night; the last daily dose should be taken at least 4 hours before bedtime

**CONTRA-INDICATIONS**

**CAUTIONS**
- Atherosclerotic cardiovascular disease (especially with symptoms of intestinal angina or claudication of the legs) - autonomic dysfunction - elderly (manufacturer recommends cautious dose titration) - prostate disorders

**INTERACTIONS**
- Appendix 1: sympathomimetics, vasoconstrictor

**SIDE-EFFECTS**
- Common or very common: Chills - dyspepsia - flushing - headache - nausea - paraesthesia - piloerection - pruritus - rash - stomatitis - supine hypertension (dose dependent) - urinary disorders

- Uncommon: Excitability - irritability - reflex bradycardia - restlessness - sleep disorders

- Rare: Hepatic dysfunction - palpitations - tachycardia

- Frequency not known: Abdominal pain - anxiety - confusion - diarrhea - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
- Supine hypertension: Manufacturer advises that treatment must be stopped if supine hypertension is not controlled by reducing the dose.

**CONCEPTION AND CONTRACEPTION**
- Manufacturer recommends effective contraception during treatment in women of childbearing potential.

**PREGNANCY**
- Manufacturer advises avoid - toxicity in animal studies.

**BREAST FEEDING**
- Manufacturer advises avoid - no information available.

**RENAL IMPAIRMENT**
- Manufacturer advises avoid in severe or acute impairment.

**MONITORING REQUIREMENTS**
- Manufacturer advises measure hepatic and renal function before treatment and at regular intervals during treatment.
  - Manufacturer advises regular monitoring of supine and standing blood pressure due to the risk of hypertension in the supine position.

**PATIENT AND CARER ADVICE**
- Manufacturer advises that patients report symptoms of supine hypertension (such as chest pain, palpitations, shortness of breath, headache and blurred vision) immediately. The risk of supine hypertension at night can be reduced by raising the head of the bed.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Bramox** (Brancaster Pharma Ltd)
  - Midodrine hydrochloride 2.5 mg: Bramox 2.5mg tablets: 100 tablet: PCT £5.05 DT price = £5.05
  - Midodrine hydrochloride 5 mg: Bramox 5mg tablets: 100 tablet: PCT £7.50 DT price = £7.50
Noradrenaline/norepinephrine

- **INDICATIONS AND DOSE**
  - **Acute hypotension**
    - **BY INTRAVENOUS INFUSION**
      - Adult: Initially 0.16–0.33 mL/minute, adjusted according to response, to be given via central venous catheter, of a solution containing noradrenaline 40 micrograms(base)/mL.

- **DOSE EQUIVALENCE AND CONVERSION**
  - 1 mg of noradrenaline base is equivalent to 2 mg of noradrenaline acid tartrate. **Doses expressed as the base.**

- **CONTRA-INDICATIONS**
  - Hypertension

- **CAUTIONS**
  - Coronary vascular thrombosis • diabetes mellitus • elderly • extravasation at injection site may cause necrosis • following myocardial infarction • hypercapnia • hyperthyroidism • hypoxia • mesenteric vascular thrombosis • peripheral vascular thrombosis • Prinzmetal’s variant angina • uncorrected hypovolaemia

- **INTERACTIONS**
  - Appendix 1: sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS**
  - Angle-closure glaucoma • anorexia • anxiety • arrhythmias • bradycardia • confusion • dyspnoea • headache • hypertension • hypoxia • insomnia • nausea • palpitation • peripheral ischaemia • psychosis • tachycardia • tremor • urinary retention • vomiting • weakness

- **PREGNANCY**
  - Avoid—may reduce placental perfusion.

- **MONITORING REQUIREMENTS**
  - Monitor blood pressure and rate of flow frequently.

- **DIRECTIONS FOR ADMINISTRATION**
  - For treatment of acute hypotension in adults, use a solution containing noradrenaline 40 micrograms (base)/mL. For **intravenous infusion**, give continuously in Glucose 5% or Sodium Chloride and glucose via a controlled infusion device. For administration via syringe pump, dilute 2 mg (2 mL of solution) noradrenaline base with 48 mL infusion fluid. For administration via drip counter dilute 20 mg (20 mL of solution) noradrenaline base with 480 mL infusion fluid; give through a central venous catheter; incompatible with alkalis.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - For a period of time, preparations on the UK market may be described as either noradrenaline base or noradrenaline acid tartrate; doses in the BNF are expressed as the base.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

  - **Solution for infusion**
    - Noradrenaline/norepinephrine (Non-proprietary)
      - Noradrenaline (as Noradrenaline acid tartrate) 1 mg per 1 mL Noradrenaline (Norepinephrine) 4mg/4ml concentrate for solution for infusion ampoules | 10 ampoule (£0.59) £4.40
      - Noradrenaline (base) 8mg/8ml concentrate for solution for infusion ampoules | 10 ampoule (£0.59) £11.60
      - Noradrenaline (base) 2mg/2ml solution for infusion ampoules | 5 ampoule (£0.59) £12.00 (Hospital only)
      - Noradrenaline (base) 4mg/4ml solution for infusion ampoules | 5 ampoule (£0.59) £22.00 (Hospital only)
      - Noradrenaline (base) 4mg/4ml concentrate for solution for infusion ampoules | 10 ampoule (£0.59) £58.00
      - Noradrenaline (Norepinephrine) 2mg/2ml concentrate for solution for Infusion ampoules | 5 ampoule (£0.59) £11.00

Phenylephrine hydrochloride

- **INDICATIONS AND DOSE**
  - **Acute hypotension**
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
      - Adult: Initially 2–5 mg, followed by 1–10 mg, after at least 15 minutes if required
    - **BY SLOW INTRAVENOUS INJECTION**
      - Adult: 100–500 micrograms, repeated as necessary after at least 15 minutes
    - **BY INTRAVENOUS INFUSION**
      - Adult: Initially up to 180 micrograms/minute, reduced to 30–60 micrograms/minute, adjusted according to response

- **CONTRA-INDICATIONS**
  - Hypertension • severe hyperthyroidism

- **CAUTIONS**
  - Coronary disease • coronary vascular thrombosis • diabetes • elderly • extravasation at injection site may cause necrosis • following myocardial infarction • hypercapnia • hyperthyroidism • hypoxia • mesenteric vascular thrombosis • peripheral vascular thrombosis • Prinzmetal’s variant angina • susceptibility to angle-closure glaucoma • uncorrected hypovolaemia

- **CAUTIONS, FURTHER INFORMATION**
  - Hypertensive response Phenylephrine has a longer duration of action than noradrenaline (norepinephrine), and an excessive vasopressor response may cause a prolonged rise in blood pressure.

- **INTERACTIONS**
  - Appendix 1: sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS**
  - Angle-closure glaucoma • anorexia • anxiety • arrhythmias • bradycardia (also reflex bradycardia) • confusion • dyspnoea • headache • hypertension • hypoxia • insomnia • nausea • palpitation • tachycardia • peripheral ischaemia • psychosis • tremor • urinary retention • vomiting • weakness

- **PREGNANCY**
  - Avoid if possible; malformations reported following use in first trimester; fetal hypoxia and bradycardia reported in late pregnancy and labour.

- **MONITORING REQUIREMENTS**
  - Contra-indicated in hypertension—monitor blood pressure and rate of flow frequently.

- **DIRECTIONS FOR ADMINISTRATION**
  - For **intravenous infusion** give intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute 10 mg in 500 mL infusion fluid.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

  - **Solution for injection**
    - Phenylephrine hydrochloride (Non-proprietary)
      - Phenylephrine (as Phenylephrine hydrochloride) 50 microgram per 1 mL Phenylephrine 500micrograms/10ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (£0.50) £15.00
      - 10 pre-filled disposable injection (£0.50) £150.00
    - Phenylephrine hydrochloride 100 microgram per 1 mL Phenylephrine 1mg/10ml solution for injection ampoules | 10 ampoule (£0.50) £4.00
    - Phenylephrine hydrochloride 10 mg per 1 mL Phenylephrine 10mg/1ml solution for injection ampoules | 10 ampoule (£0.50) £99.12
5  Heart failure

Heart failure

Drug treatment

Drug treatment of heart failure associated with a reduced left ventricular ejection fraction (left ventricular systolic dysfunction) is covered below; optimal management of heart failure with a preserved left ventricular ejection fraction has not been established.

The treatment of chronic heart failure aims to relieve symptoms, improve exercise tolerance, reduce the incidence of acute exacerbations, and reduce mortality. An ACE inhibitor, titrated to a 'target dose' (or the maximum tolerated dose if lower), together with a beta-blocker, form the basis of treatment for all patients with heart failure due to left ventricular systolic dysfunction.

An ACE inhibitor is generally advised for patients with asymptomatic left ventricular systolic dysfunction or symptomatic heart failure. An angiotensin-II receptor antagonist may be a useful alternative for patients who, because of side-effects such as cough, cannot tolerate ACE inhibitors; a relatively high dose of the angiotensin-II receptor antagonist may be required to produce benefit. Candesartan cilexetil p. 170 or valsartan p. 174 may be given under specialist supervision as adjuncts to an ACE inhibitor in the treatment of heart failure when other treatments are unsuitable; the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparing diuretic is not recommended. The combination of valsartan with sacubitril p. 186, an angiotensin-II receptor antagonist with a neprilysin inhibitor, may be a suitable alternative for those patients already stabilised on an ACE inhibitor or angiotensin-II receptor antagonist.

The beta-blockers bisoprolol fumarate p. 148 and carvedilol p. 143 are of value in any grade of stable heart failure due to left ventricular systolic dysfunction; nebivolol p. 149 is licensed for stable mild to moderate heart failure in patients over 70 years. Beta-blocker treatment should be started by those experienced in the management of heart failure, at a very low dose and titrated very slowly over a period of weeks or months. Symptoms may deteriorate initially, calling for adjustment of concomitant therapy.

The aldosterone antagonist spironolactone p. 185 can be added to an ACE inhibitor and a beta-blocker in patients who continue to remain symptomatic (particularly in those with moderate to severe heart failure); low doses of spironolactone reduce symptoms and mortality in these patients. If spironolactone cannot be used, eplerenone p. 185 may be considered for the management of heart failure after an acute myocardial infarction with evidence of left ventricular systolic dysfunction, or for chronic mild heart failure with left ventricular systolic dysfunction. Close monitoring of serum creatinine, eGFR, and potassium is necessary, particularly following any change in treatment or any change in the patient's clinical condition.

Patients who cannot tolerate an ACE inhibitor or an angiotensin-II receptor antagonist, or in whom they are contra-indicated, may be given isosorbide dinitrate p. 214 with hydralazine hydrochloride p. 175 but this combination may be poorly tolerated. The combination of isosorbide dinitrate and hydralazine hydrochloride may be considered in addition to standard therapy with an ACE inhibitor and a beta-blocker in patients who continue to remain symptomatic (particularly in patients of African or Caribbean origin who have moderate to severe heart failure).

Digoxin p. 106 improves symptoms of heart failure and exercise tolerance and reduces hospitalisation due to acute exacerbations but it does not reduce mortality. Digoxin is reserved for patients with worsening or severe heart failure due to left ventricular systolic dysfunction who remain symptomatic despite treatment with an ACE inhibitor and a beta-blocker in combination with either an aldosterone antagonist, candesartan cilexetil, or isosorbide dinitrate with hydralazine hydrochloride.

Patients with fluid overload should also receive either a loop or a thiazide diuretic (with salt or fluid restriction where appropriate). A thiazide diuretic may be of benefit in patients with mild heart failure and good renal function; however, thiazide diuretics are ineffective in patients with poor renal function (eGFR less than 30 mL/minute/1.73 m²) and a loop diuretic is preferred. If diuresis with a single diuretic is insufficient, a combination of a loop diuretic and a thiazide diuretic may be tried; addition of metolazone p. 225 may also be considered but the resulting diuresis may be profound and care is needed to avoid potentially dangerous electrolyte disturbances.

**Other drugs used for Heart failure**

**Bendroflumethiazide**, p. 161 • Captopril, p. 163 • Chlorothalidone, p. 224 • Co-amilozide, p. 161 • Clopenthiazide, p. 225 • Enalapril maleate, p. 164 • Fosinopril sodium, p. 164 • Glyceril trinitrate, p. 212 • Isosorbide mononitrate, p. 214 • Ivabradine, p. 205 • Lisinopril, p. 165 • Losartan potassium, p. 171 • Metoprolol tartrate, p. 149 • Perindopril arginine, p. 166 • Perindopril erbumine, p. 167 • Prasozin, p. 739 • Quinapril, p. 167 • Ramipril, p. 168 • Sodium nitroprusside, p. 177

**DIURETICS > POTASSIUM-SPARRING DIURETICS > ALDOSTERONE ANTAGONISTS**

**Co-Flumactone**

The properties listed below are those particular to the combination only. For the properties of the components please consider, spironolactone p. 185.

- **INDICATIONS AND DOSE**
  - **Congestive heart failure**
    - **BY MOUTH**
      - Adult: Initially 100/100 mg daily; maintenance 25/25–200/200 mg daily, maintenance dose not recommended because spironolactone generally given in lower dose

- **INTERACTIONS** Appendix 1: aldosterone antagonists, thiazide diuretics

- **LESS SUITABLE FOR PRESCRIBING** Co-Flumactone tablets are less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Aldactide (Pfizer Ltd)
  - Hydroflumethiazide 25 mg, Spironolactone 25 mg Aldactide 25 tablets | 100 tablet (£3.42) £20.23 DT price = £20.23
  - Hydroflumethiazide 50 mg, Spironolactone 50 mg Aldactide 50 tablets | 28 tablet (£3.10) £10.70 | 100 tablet (£3.10) £38.23 DT price = £38.23
Eplerenone

**INDICATIONS AND DOSE**

Adjuvant in stable patients with left ventricular ejection fraction ≤ 40% with evidence of heart failure, following myocardial infarction (start therapy within 3–14 days of event) | Adjunct in chronic mild heart failure with left ventricular ejection fraction ≤ 30% | DOSE ADJUSTMENTS DUE TO INTERACTIONS

- **BY MOUTH**
  - Adult: Initially 25 mg daily, then increased to 50 mg daily, increased within 4 weeks of initial treatment

- **INTERACTIONS** | Appendix 1: aldosterone antagonists

- **SIDE-EFFECTS**
  - Common or very common | Azotaemia • constipation • cough • diarrhoea • dizziness • hyperkalaemia • hypotension • muscle spasm • musculoskeletal pain • nausea • pruritus • rash • renal impairment • syncope
  - Uncommon | Arterial thrombosis • atrial fibrillation • back pain • cholecystitis • dehydration • dyslipidaemia • eosinophilia • epidermal growth factor receptor decreased • flatulence • gynaecomastia • headache • hyperglycaemia • hypoaesthesia • hyponatraemia • hypothyroidism • insomnia • malaise • pharyngitis • postural hypotension • pyelonephritis • sweating • tachycardia • vomiting
  - Frequency not known | Angioedema

- **PREGNANCY** | Manufacturer advises caution — no information available.

- **BREAST FEEDING** | Manufacturer advises use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** | Avoid in severe impairment.

- **RENAL IMPAIRMENT** | Initially 25 mg on alternate days if eGFR 30–60 mL/minute/1.73 m², adjust dose according to serum-potassium concentration — consult product literature. Avoid if eGFR less than 30 mL/minute/1.73 m². Increased risk of hyperkalaemia in renal impairment — close monitoring required.

- **MONITORING REQUIREMENTS** | Monitor plasma-potassium concentration before treatment, during initiation, and when dose changed.

**COMMON OR VERY COMMON**

- Rash
- Muscle spasm
- Arterial thrombosis

**CONTRA-INDICATIONS**

- Hyperkalaemia
- Elderly

**INTERACTIONS**

- **PRECAUTIONS**
  - Addon’s disease • anuria • hyperkalaemia
- **CAUTIONS**
  - Acute porphyrias p. 969 • elderly • potential metabolic products carcinogenic in rodents

**SIDE-EFFECTS**

- Acute renal failure • agranulocytosis • alopecia • benign breast tumour • breast pain • changes in libido • confusion • dizziness • drowsiness • electrolyte disturbances • gastro-intestinal disturbances • gynaecomastia • hepatotoxicity • hyperkalaemia (discontinue) • hypertrichosis • hyperuricaemia • hyponatraemia • leg cramps • leucopenia • malaise • menstrual disturbances • rash • Stevens-Johnson syndrome • thrombocytopenia

**PREGNANCY**

- Use only if potential benefit outweighs risk — feminisation of male fetus in animal studies.

**BREAST FEEDING**

- Metabolites present in milk, but amount probably too small to be harmful.

**RENAL IMPAIRMENT**

- Avoid in acute renal insufficiency or severe impairment. Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).

**MONITORING REQUIREMENTS**

- Monitor electrolytes — discontinue if hyperkalaemia occurs (in severe heart failure monitor potassium and creatinine 1 week after initiation and after any dose increase, monthly for first 3 months, then every 3 months for 1 year, and then every 6 months).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Eplerenone (Non-proprietary)**
  - Eplerenone 25 mg | Eplerenone 25 mg tablets | 28 tablet | £42.72 DT price = £4.14
  - Eplerenone 50 mg | Eplerenone 50 mg tablets | 28 tablet | £42.72 DT price = £5.37
  - **Inspira** (Pfizer Ltd)
    - Eplerenone 25 mg | Inspira 25 mg tablets | 28 tablet | £42.72 DT price = £4.14
    - Eplerenone 50 mg | Inspira 50 mg tablets | 28 tablet | £42.72 DT price = £5.37

**Spironolactone**

**INDICATIONS AND DOSE**

Oedema | Ascites in cirrhosis of the liver

- **BY MOUTH**
  - Adult: 100–400 mg daily, adjusted according to response

**Malignant ascites**

- **BY MOUTH**
  - Adult: Initially 100–200 mg daily, then increased if necessary to 400 mg daily, maintenance dose adjusted according to response

**Nephrotic syndrome**

- **BY MOUTH**
  - Adult: 100–200 mg daily

**Oedema in congestive heart failure**

- **BY MOUTH**
  - Adult: Initially 25 mg once daily, then adjusted according to response to 50 mg once daily

**Resistant hypertension (adjunct)**

- **BY MOUTH**
  - Adult: Initially 25 mg once daily

**Primary hyperaldosteronism in patients awaiting surgery**

- **BY MOUTH**
  - Adult: 100–400 mg daily, may be used for long-term maintenance if surgery inappropriate, use lowest effective dose

**UNLICENSED USE**

- Resistant hypertension (adjunct) unlicensed indication.

**CONTRA-INDICATIONS**

- Addison’s disease • anuria • hyperkalaemia

**CAUTIONS**

- Acute porphyrias p. 969 • elderly • potential metabolic products carcinogenic in rodents

**INTERACTIONS**

- **PRECAUTIONS**
  - Addon’s disease • anuria • hyperkalaemia

Cardiovascular system

DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM

〈 ANGIOTENSIN II RECEPTOR ANTAGONISTS

Valsartan with sacubitril

The properties listed below are those particular to the combination only. For the properties of the components please consider, valsartan p. 174.

DRUG ACTION
Sacubitril (a prodrug) inhibits the breakdown of natriuretic peptides resulting in varied effects including increased diuresis, natriuresis, and vasodilatation.

INDICATIONS AND DOSE
Symptomatic chronic heart failure with reduced ejection fraction (in patients not currently taking an ACE inhibitor or angiotensin II receptor antagonist, or stabilised on low doses of either of these agents)

BY MOUTH
Adult: Initially 26/24 mg twice daily for 3–4 weeks, increased if tolerated to 51/49 mg twice daily for 3–4 weeks, then increased if tolerated to 103/97 mg twice daily.

Symptomatic chronic heart failure with reduced ejection fraction (in patients currently stabilised on an ACE inhibitor or angiotensin II receptor antagonist)

BY MOUTH
Adult: Initially 51/49 mg twice daily for 2–4 weeks, increased if tolerated to 103/97 mg twice daily, consider a starting dose of 26/24 mg if systolic blood pressure less than 100 mmHg.

DOSE EQUIVALENCE AND CONVERSION
Entresto® tablets contain valsartan and sacubitril; the proportions are expressed in the form x/y where x and y are the strength in milligrams of valsartan and sacubitril respectively. Valsartan, in this formulation, is more bioavailable than other tablet formulations—26 mg, 51 mg, and 103 mg valsartan is equivalent to 40 mg, 80 mg and 160 mg, respectively. Furthermore, note that the 26/24 mg, 51/49 mg and 103/97 mg strengths are sometimes referred to as a total of both drug strengths, that is, 50 mg, 100 mg and 200 mg, respectively.

CONTRA-INDICATIONS
Concomitant use of ACE inhibitor (separate administration by 36 hours) • systolic blood pressure less than 100 mmHg

INTERACTIONS
Appendix 1: angiotensin-II receptor antagonists, sacubitril

SIDE-EFFECTS
Common or very common Anaemia • diarrhoea • gastritis • hypoglycaemia • hypokalaemia • nausea • vertigo

PREGNANCY
Manufacturer advises avoid—toxicity with sacubitril in animal studies.

BREAST FEEDING
Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
Manufacturer advises starting dose of 26/24 mg twice daily in moderate impairment. Contra-indicated in severe impairment.

RENAL IMPAIRMENT
Manufacturer recommends a starting dose of 26/24 mg twice daily if eGFR less than 30 mL/minute/1.73m². Also consider this starting dose if eGFR 30 to 60 mL/minute/1.73m².

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
Sacubitril valsartan for treating symptomatic chronic heart failure with reduced ejection fraction (April 2016) NICE TA388

Sacubitril valsartan is recommended as an option for treating symptomatic chronic heart failure with reduced ejection fraction, only in adults:

• with New York Heart Association class II to IV symptoms and
• a left ventricular ejection fraction of 35% or less and
• who are already taking a stable dose of an ACE inhibitor or angiotensin II receptor antagonist.

Enoximone

DRUG ACTION
Enoximone is a phosphodiesterase-type 3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

INDICATIONS AND DOSE
Congestive heart failure where cardiac output reduced and filling pressures increased

BY SLOW INTRAVENOUS INJECTION
Adult: Initially 0.5–1 mg/kg, rate not exceeding 12.5 mg/minute, then 500 micrograms/kg every 30 minutes until satisfactory response or total of 3 mg/kg given; maintenance, initial dose of up to 3 mg/kg may be repeated every 3–6 hours as required.

BY INTRAVENOUS INFUSION
Adult: Initially 90 micrograms/kg/minute, dose to be given over 10–30 minutes, followed by 5–20 micrograms/kg/minute, dose to be given as either a continuous or intermittent infusion; maximum 24 mg/kg per day.

CAUTIONS
Heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction

SIDE-EFFECTS
Chills • diarrhoea • ectopic beats • fever • headache • hypotension • insomnia • nausea • oliguria • supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias) • upper and lower limb pain • urinary retention • ventricular tachycardia (more likely in patients with pre-existing arrhythmias) • vomiting

PREGNANCY
Manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING
Manufacturer advises caution—no information available.

HEPATIC IMPAIRMENT
Dose reduction may be required.

RENAL IMPAIRMENT
Consider dose reduction.

MONITORING REQUIREMENTS
Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.
Milrinone

- **DRUG ACTION** Milrinone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

- **INDICATIONS AND DOSE**
  - **Short-term treatment of severe congestive heart failure unresponsive to conventional maintenance therapy (not immediately after myocardial infarction)**
  - **Acute heart failure**, including low output states following heart surgery
    - **INITIALLY BY INTRAVENOUS INJECTION**
    - **Adult:** Initially 50 micrograms/kg, given over 10 minutes, followed by (by intravenous infusion) 375–750 nanograms/kg/minute usually given following surgery for up to 12 hours or in congestive heart failure for 48–72 hours; maximum 1.13 mg/kg per day

- **CONTRA-INDICATIONS** Severe hypovolaemia

- **CAUTIONS** Correct hypokalaemia · heart failure associated with hypertrophic cardiomyopathy · stenotic or obstructive valvular disease or other outlet obstruction

- **SIDE-EFFECTS**
  - **Common or very common** Ectopic beats · headache · hypotension · supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias) · ventricular tachycardia
  - **Uncommon** Chest pain · hypokalaemia · thrombocytopenia · tremor · ventricular fibrillation
  - **Very rare** Anaphylaxis · bronchospasms · rash

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Reduce dose and monitor response if eGFR less than 50 mL/minute/1.73 m²—consult product literature for details.

- **MONITORING REQUIREMENTS**
  - Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.

- **DIRECTIONS FOR ADMINISTRATION** Avoid extravasation.

  - For **intravenous injection** (Primacor®) give continuously in Glucose 5% or Sodium chloride 0.9%; dilute to a suggested concentration of 200 micrograms/mL.

- **PRESCRIBING AND DISPENSING INFORMATION** Sustained haemodynamic benefit has been observed after administration of phosphodiesterase type-3 inhibitors, but there is no evidence of any beneficial effect on survival.

### Dopexamine hydrochloride

- **DRUG ACTION** Dopexamine acts on beta receptors in cardiac muscle to produce a positive inotropic effect; and on peripheral dopamine receptors to increase renal perfusion; it is reported not to induce vasoconstriction.

- **INDICATIONS AND DOSE**

  - **Inotropic support and vasodilator in exacerbations of chronic heart failure and in heart failure associated with cardiac surgery**
    - **BY INTRAVENOUS INFUSION**
    - **Adult:** 0.5 microgram/kg/minute, to be administered into central or large peripheral vein, then increased if necessary to 1 microgram/kg/minute, increased if necessary up to 6 micrograms/kg/minute, in increments of 0.5–1 microgram/kg/minute at intervals of not less than 15 minutes

- **CONTRA-INDICATIONS** Aortic stenosis · hypertrophic cardiomyopathy · left ventricular outlet obstruction · phaeochromocytoma · thrombocytopenia

- **CAUTIONS** Correct hypovolaemia before starting and during treatment · hyperglycaemia · hypertension (may raise blood pressure) · hyperthyroidism · hypokalaemia · myocardial infarction · recent angina

- **INTERACTIONS** → Appendix 1: sympathomimetics, inotropic

- **SIDE-EFFECTS**

  - **Common or very common** Angina · arrhythmias · bradycardia · dyspnoea · headache · myocardial infarction · nausea · reversible thrombocytopenia · sweating · tachycardia · tremor · vomiting

- **PREGNANCY** No information available—manufacturer advises avoid.

- **MONITORING REQUIREMENTS** Monitor blood pressure, pulse, plasma potassium, and blood glucose.

- **TREATMENT CESSATION** Avoid abrupt withdrawal.

- **DIRECTIONS FOR ADMINISTRATION** Concentrate for intravenous infusion to be diluted before use. For **continuous intravenous infusion**, dilute to a concentration of 400 or 800 micrograms/mL with Glucose 5% or Sodium Chloride 0.9% · max. concentration via large peripheral vein 1 mg/mL, concentrations up to 4 mg/mL may be infused via central vein; give via infusion pump or other device which provides accurate control of rate; contact with metal in infusion apparatus should be minimised; incompatible with bicarbonate.

### Medicinal forms

- **There can be variation in the licensing of different medicines containing the same drug.**

  - **Solution for infusion**
    - **Dopacard** (Teva UK Ltd)
      - Dopexamine hydrochloride 10 mg per 1 ml
      - Dopacard 50mg/5ml concentrate for solution for infusion ampoules | 10 ampoule £225.00 (Hospital only)
6 Hyperlipidaemia

Lipid-regulating drugs

Primary and secondary prevention of cardiovascular disease
Preventative measures should be taken in individuals with a high risk of developing cardiovascular disease (primary prevention) and to prevent recurrence of events in those with established cardiovascular disease (secondary prevention).

Primary prevention
Individuals at high risk of developing cardiovascular disease include those who have diabetes mellitus, chronic kidney disease (eGFR < 60 mL/minute/1.73 m²) and/or albuminuria, and those with familial hypercholesterolaemia. The risk also increases with age; those aged 85 years and over are at particularly high risk, especially if they smoke or have hypertension. Preventative measures are also required for other individuals who are considered to be at high risk of developing atherosclerotic cardiovascular disease based on risk estimated using risk calculators (see Risk calculators); those with a 10-year risk of cardiovascular disease of 10% or more stand to benefit most from drug treatment. Patients with a 10-year cardiovascular risk of less than 10% may benefit from an assessment of their lifetime risk (using the JBS3 tool—see Risk calculators for more detail), discussion on the impact of lifestyle interventions and, if necessary, drug therapy.

Risk calculators
Risk assessment calculators are recommended by both NICE (clinical guideline 181 (July 2014), Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease) and JBS3 (Joint British Societies' consensus recommendations for the prevention of cardiovascular disease 2014). They should not be used in patients at high cardiovascular risk. Both calculators are unsuitable for assessing risk in those aged 85 years and over, and NICE advises against using a risk assessment tool in those with type 1 diabetes mellitus.

The QRISK 2 risk calculator www.qrisk.org/ is recommended by NICE clinical guideline 181, and the JBS3 risk calculator www.jbs3risk.com/pages/risk_calculator.hml is endorsed by JBS3. Both tools assess cardiovascular risk—coronary heart disease (angina and myocardial infarction), stroke, and transient ischaemic attack, on the basis of lipid profile, systolic blood pressure, gender, age, ethnicity, smoking status, BMI, chronic kidney disease, diabetes mellitus, atrial fibrillation, treated hypertension, rheumatoid arthritis, or a family history of premature cardiovascular disease. Risk assessment tools underestimate risk in patients with additional risk due to existing conditions or medication, such as:
- serious mental disorder
- autoimmune disorders such as systemic lupus
- erythematous and other systemic inflammatory disorders
- antiretroviral treatment
- medication causing dyslipidaemia as a side-effect e.g. antipsychotics, corticosteroids, or immunosuppressants
- triglyceride concentration > 4.5 mmol/litre

Cardiovascular disease risk is also underestimated in those who are already taking antihypertensive or lipid-regulating drugs, and in those who have recently stopped smoking. Severe obesity (BMI > 40 kg/m²) also increases cardiovascular risk; the need for further treatment of risk factors in patients below the cardiovascular risk threshold for treatment should be based on clinical judgement.

Preventative measures for primary prevention
All patients at high risk of cardiovascular disease should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight management, alcohol consumption, and smoking cessation.

Offer a statin as first-line drug treatment if lifestyle modifications are inappropriate or ineffective (see also Statins for the prevention of cardiovascular disease). Lipid-regulating drug treatment must be combined with advice on diet and lifestyle measures, and where appropriate, treatment of comorbidities and secondary causes of dyslipidaemia.

Secondary prevention
Statins should be offered to all patients, including the elderly, with cardiovascular disease such as those with coronary heart disease (including history of angina or acute myocardial infarction), occlusive arterial disease (including peripheral vascular disease, non-haemorrhagic stroke, or transient ischaemic attacks).

Preventative measures for secondary prevention
Patients should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight management, alcohol consumption, and smoking cessation, however, initiation of lipid-regulating drug treatment should not be delayed to manage modifiable risk factors, and must be combined with advice on diet and lifestyle measures, and where appropriate, treatment of co-morbidities and secondary causes of dyslipidaemia.

Statins for the prevention of cardiovascular disease
A statin reduces the risk of cardiovascular disease events, and is the drug of first choice for primary and secondary prevention of cardiovascular disease. Before starting treatment with statins, secondary causes of dyslipidaemia should be addressed; these include uncontrolled diabetes mellitus, hepatic disease, nephrotic syndrome, and excessive alcohol consumption. Patients with hypothyroidism should receive adequate thyroid replacement therapy (before assessing the requirement for lipid-regulating treatment if for primary prevention) because correcting hypothyroidism itself may resolve the lipid abnormality. Untreated hypothyroidism increases the risk of myositis with lipid-regulating drugs.

For the purpose of reducing cardiovascular risk, NICE Clinical Guideline 181 (NICE clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease) defines statins by the percentage reduction in LDL-cholesterol they achieve:

For primary prevention, NICE Clinical Guideline 181 recommends that atorvastatin p. 196 a high-intensity statin (when prescribed at a dose of at least 20 mg/day [unlicensed dose]), should be offered to those with a 10-year risk of cardiovascular disease of 10% or more; patients aged 85 years and over may benefit from atorvastatin to reduce the risk of non-fatal myocardial infarction. For secondary prevention, atorvastatin is also recommended [unlicensed indication]. Patients taking a low-intensity statin should discuss the benefits and risks of switching to a high-intensity statin at their next medication review.

A statin should be considered for all adults with type 1 diabetes mellitus, particularly those aged 40 years and over, or who have had diabetes for more than 10 years, or who have established nephropathy, or other risk factors for cardiovascular disease. JBS3 recommendations (Joint British Societies’ consensus recommendations for the prevention of

Total cholesterol, HDL-cholesterol, and non-HDL cholesterol concentrations should be checked 3 months after starting treatment with a high intensity statin. NICE Clinical Guideline 181 recommends aiming for a reduction in non-HDL cholesterol concentration greater than 40%; JBS3 recommends a target non-HDL cholesterol concentration below 2.5 mmol/litre. If these are not achieved, ensure lifestyle modifications are optimised and consider increasing the dose of the statin if started on less than atorvastatin 80 mg and the patient is judged to be at higher risk because of comorbidities, risk score or, using clinical judgement.

Specialist advice should be sought about treatment options for patients at high risk of cardiovascular disease or those with existing cardiovascular disease, who are intolerant of three different statins.

**Fibrates** should not be routinely used for primary or secondary prevention. Nicotinic acid p. 194, **bile acid sequestrants**, and **omega-3 fatty acid compounds** are not recommended for primary or secondary prevention.

### Hypercholesterolaemia, hypertriglyceridaemia, and familial hypercholesterolaemia

A statin is also the drug of first choice for treating hypercholesterolaemia and moderate hypertriglyceridaemia. Severe hyperlipidaemia not adequately controlled with a maximal dose of a statin may require the use of an additional lipid-regulating drug such as ezetimibe p. 191; such treatment should generally be supervised by a specialist.

A number of conditions, some familial, are characterised by very high LDL-cholesterol concentration, high triglyceride concentration, or both. Fenofibrate p. 193 may be added to statin therapy if triglycerides remain high even after the LDL-cholesterol concentration has been reduced adequately; nicotinic acid may also be used to further lower triglyceride or LDL-cholesterol concentration.

Combination of a statin with a fibrate or with nicotinic acid carries an increased risk of side-effects (including rhabdomyolysis) and should be used under specialist supervision; monitoring of liver function and creatine kinase should also be considered. The concomitant administration of gemfibrozil with a statin increases the risk of rhabdomyolysis considerably—this combination should not be used.

A statin is recommended for all patients with familial hypercholesterolaemia. A ‘high-intensity’ statin (as defined in NICE Clinical Guideline 71, August 2008. Identification and management of familial hypercholesterolaemia) e.g. rosuvastatin p. 197 (initiated by a specialist) or atorvastatin p. 196 should be considered in order to achieve the recommended reduction in LDL-cholesterol concentration of greater than 50% from baseline; a ‘high-intensity’ statin is one that produces a greater LDL-cholesterol reduction than simvastatin 40 mg. Patients with heterozygous familial hypercholesterolaemia who have contra-indications to, or are intolerant of, statins should receive ezetimibe. The combination of a statin and ezetimibe can be considered if a statin alone fails to provide adequate control (or if intolerance limits dose titration), and when a switch to an alternative statin is being considered. Patients for whom statins and ezetimibe are inappropriate, should be referred to a specialist for the consideration of treatment with a bile acid sequestrant, nicotinic acid, or a fibrate.

The prescribing of drug therapy in homozygous familial hypercholesterolaemia should be undertaken in a specialist centre.

Advice from the MHRA: there is an increased risk of myopathy associated with high-dose (80 mg) simvastatin. The 80 mg dose should be considered only in patients with severe hypercholesterolaemia and high risk of cardiovascular complications who have not achieved their treatment goals on lower doses, when the benefits are expected to outweigh the potential risks.

### Statins

Statins are more effective than other lipid-regulating drugs at lowering LDL-cholesterol concentration but they are less effective than the fibrates in reducing triglyceride concentration. However, statins reduce cardiovascular disease events and total mortality irrespective of the initial cholesterol concentration.

### Alirocumab and evolocumab

Alirocumab p. 199 and evolocumab p. 200 are licensed for the treatment of primary hypercholesterolaemia (heterozygous familial and non-familial) or mixed dyslipidaemia as an adjunct to dietary measures. They can be used in combination with a statin, or with a statin and other lipid-regulating therapies, in patients unable to achieve their LDL-cholesterol treatment goals with the maximum tolerated dose of a statin. They can be used alone or in combination with other lipid-regulating therapies if a statin is contra-indicated or not tolerated. Evolocumab is also licensed for the treatment of homozygous familial hypercholesterolaemia in combination with other lipid-lowering therapies.

### Bile acid sequestrants

Bile acid sequestrants effectively reduce LDL-cholesterol but can aggravate hypertriglyceridaemia. Treatment with bile acid sequestrants may be appropriate under specialist supervision if statins and ezetimibe are inappropriate, and when LDL-cholesterol is severely raised, for example in familial hypercholesterolaemia.
Fibrates
Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

Lomitapide
Lomitapide p. 201 is licensed as an adjunct to dietary measures and other lipid-regulating drugs for the treatment of homozgyous familial hypercholesterolaemia.

Nicotinic acid group
The value of nicotinic acid is limited by its side-effects, especially vasodilatation.
Nicotinic acid is used by specialists in combination with a statin if the statin alone cannot adequately control dyslipidaemia (raised LDL-cholesterol, triglyceridaemia, and low HDL-cholesterol).
Acipimox p. 194 seems to have fewer side-effects than nicotinic acid but may be less effective in its lipid-regulating capabilities.

Omega-3 fatty acid compounds
There is no evidence that omega-3 fatty acid compounds reduce the risk of cardiovascular disease.

Other drugs used for Hyperlipidaemia

Bile acid sequestrants

- **DRUG ACTION** Bile acid sequestrants act by binding bile acids, preventing their reabsorption; this promotes hepatic conversion of cholesterol into bile acids; the resultant increased LDL-receptor activity of liver cells increases the clearance of LDL-cholesterol from the plasma.
- **CAUTIONS** Interference with the absorption of fat-soluble vitamins (supplements of vitamins A, D, K, and folic acid may be required when treatment is prolonged).
- **SIDE-EFFECTS** Constipation, diarrhoea, gastro-intestinal discomfort, hypertriglyceridaemia (aggravation), hypoprothrombinaemia associated with vitamin K deficiency, increased risk of bleeding, nausea, vomiting.
- **PREGNANCY** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.
- **BREAST FEEDING** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.

**CONTRA-INDICATIONS** Biliary obstruction · bowel obstruction.

**CAUTIONS** Gastro-intestinal motility disorders · inflammatory bowel disease · major gastro-intestinal surgery.

**INTERACTIONS** → Appendix 1: colesevelam.

**SIDE-EFFECTS** Headache · myalgia.

**HEPATIC IMPAIRMENT** Manufacturer advises caution.

**MONITORING REQUIREMENTS** Patients receiving ciclosporin should have their blood-ciclosporin concentration monitored before, during, and after treatment with colesevelam.

**DIRECTIONS FOR ADMINISTRATION** Other drugs should be taken at least 4 hours before or after colesevelam to reduce possible interference with absorption.

**PATIENT AND CARER ADVICE** Patient counselling on administration is advised for colesevelam hydrochloride tablets (avoid other drugs at same time).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS** 21
- **Cholestagel**
  - Cholestagel 625 mg tablets → £6.10
  - Cholestagel 625 mg tablets 30 tablets → £18.30

**Colestipol hydrochloride**

- **INDICATIONS AND DOSE**
Hyperlipidaemias, particularly type IIa, in patients who have not responded adequately to diet and other appropriate measures.

- **BY MOUTH**
  - Adult: Initially 5 g 1–2 times a day, increased in steps of 5 g every month if required, total daily dose may be given in 1–2 divided doses; maximum 30 g per day.

- **INTERACTIONS** → Appendix 1: colestipol.

- **DIRECTIONS FOR ADMINISTRATION** The contents of each sachet should be mixed with at least 100 mL of water or other suitable liquid such as fruit juice or skimmed milk; alternatively it can be mixed with thin soups, cereals, yoghurt, or pulpy fruits ensuring at least 100 mL of liquid is provided.

  Other drugs should be taken at least 1 hour before or 4–6 hours after colestipol to reduce possible interference with absorption.

- **PATIENT AND CARER ADVICE** Patient counselling on administration is advised for colestipol hydrochloride granules (avoid other drugs at same time).

- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Granules**

- **CAUTIONARY AND ADVISORY LABELS** 13
  - **Colestid** (Pfizer Ltd)
    - Colestipol hydrochloride 5 gram tablets → £15.05
    - Colestid Orange 5 gram granules sachets sugar-free → £15.05

**Tablet**

- **Colestipol hydrochloride (Non-proprietary)**
  - Colestipol hydrochloride 1 gram tablets → £12.00

Colestyramine

(Cholestyramine)

**INDICATIONS AND DOSE**

Hyperlipidaemias, particularly type IIa, in patients who have not responded adequately to diet and other appropriate measures | Primary prevention of coronary heart disease in men aged 35–59 years with primary hypercholesterolaemia who have not responded to diet and other appropriate measures

- **BY MOUTH**
  - **Adult:** Initially 4 g daily, increased in steps of 4 g every week; increased to 12–24 g daily in 1–4 divided doses, adjusted according to response; maximum 36 g per day

Pruritus associated with partial biliary obstruction and primary biliary cirrhosis

- **BY MOUTH**
  - **Adult:** 4–8 g once daily

Diarrhoea associated with Crohn’s disease, ileal resection, vagotomy, diabetic vagal neuropathy, and radiation

- **BY MOUTH**
  - **Adult:** Initially 4 g daily, increased in steps of 4 g every week; increased to 12–24 g daily in 1–4 divided doses, adjusted according to response, if no response within 3 days an alternative therapy should be initiated; maximum 36 g per day

Accelerated elimination of teriflunomide

- **BY MOUTH**
  - **Adult:** 8 g 3 times a day for 11 days; reduced to 4 g 3 times a day, dose should only be reduced if not tolerated

Accelerated elimination of leflunomide (washout procedure)

- **BY MOUTH**
  - **Adult:** 8 g 3 times a day for 11 days

**CONTRA-INDICATIONS** Complete biliary obstruction (not likely to be effective)

**INTERACTIONS** → Appendix 1: colestyramine

**SIDE-EFFECTS**

- Rare: Intestinal obstruction
- Frequency not known: Hyperchloraemic acidosis (on prolonged use)

**DIRECTIONS FOR ADMINISTRATION** The contents of each sachet should be mixed with at least 150 mL of water or other suitable liquid such as fruit juice, skinned milk, thin soups, and pulpy fruits with a high moisture content.

Other drugs should be taken at least 1 hour before or 4–6 hours after colestyramine to reduce possible interference with absorption.

**PATIENT AND CARER ADVICE** Patient counselling on administration is advised for colestyramine powder (avoid other drugs at same time).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Powder**

**CAUTIONARY AND ADVISORY LABELS** 13

**EXCipients:** May contain Aspartame, sucrose

- **Colestyramine (Non-proprietary)**
  - **Colestyramine anhydrous 4 gram**
    - Colestyramine 4 g oral powder sachets | 50 sachet (Pkt) no price available DT price = £10.76
    - Colestyramine 4g oral powder sachets sugar free sugar-free | 50 sachet (Pkt) £27.68–£30.00 DT price = £27.68
  - **Questran** (Bristol-Myers Squibb Pharmaceuticals Ltd)
    - **Colestyramine anhydrous 4 gram**
      - Questran Light 4 g oral powder sachets | 50 sachet (Pkt) £16.15 DT price = £27.68

**LIPID MODIFYING DRUGS > CHOLESTEROL ABSORPTION INHIBITORS**

**Ezetimibe**

19-May-2016

**DRUG ACTION** Ezetimibe inhibits the intestinal absorption of cholesterol. If used alone, it has a modest effect on lowering LDL-cholesterol, with little effect on other lipoproteins.

**INDICATIONS AND DOSE**

Adjoint to dietary measures and statin treatment in primary hypercholesterolaemia | Adjunct to dietary measures and statin in homozygous familial hypercholesterolaemia | Primary hypercholesterolaemia (if statin inappropriate or not tolerated) | Adjunct to dietary measures in homozygous sitosterolaemia

- **BY MOUTH**
  - **Adult:** 10 mg daily

**INTERACTIONS** → Appendix 1: ezetimibe

**SIDE-EFFECTS**

- Common or very common: Fatigue, gastro-intestinal disturbances, headache, myalgia
- Rare: Anaphylaxis, angioedema, arthralgia, hepatitis, hypersensitivity reactions - rash
- Very rare: Cholelithiasis, myopathy, pancreatitis, raised creatine kinase, rhabdomyolysis, thrombocytopenia

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risks—no information available.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Avoid in moderate and severe impairment—may accumulate.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Ezetimibe for treating primary heterozygous-familial and non-familial hypercholesterolaemia (February 2016) NICE TA385

This guidance should be used with NICE’s guidelines on cardiovascular disease: risk assessment and reduction, including lipid modification and familial hypercholesterolaemia: identification and management (see Lipid-regulating drugs p. 188).

Ezetimibe, alone, is recommended as an option for the treatment of primary (heterozygous-familial or non-familial) hypercholesterolaemia in adult patients in whom initial statin therapy is contra-indicated, or who are intolerant of initial statin therapy.

Ezetimibe, in combination with initial statin therapy, is also recommended as an option for the treatment of primary (heterozygous-familial or non-familial) hypercholesterolaemia in adult patients when:

- serum total or low-density lipoprotein (LDL) cholesterol concentration is not appropriately controlled either after appropriate dose titration of initial statin therapy or because dose titration is limited by intolerance to the initial statin therapy
- a change from initial statin therapy to an alternative statin is being considered.

When prescribing ezetimibe in combination with statin, ezetimibe should be prescribed on the basis of lowest acquisition cost.

www.nice.org.uk/TA385
Bezafibrate

**DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

**INDICATIONS AND DOSE** Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated

**CONTRA-INDICATIONS** Gall bladder disease · hypoalbuminaemia · nephrotic syndrome · photosensitivity to fibrates

**CAUTIONS** Correct hypothyroidism before initiating treatment

**INTERACTIONS** → Appendix 1: fibrates

**SIDE-EFFECTS**
- **Uncommon** Alopecia · cholestasis · dizziness · erectile dysfunction · headache · myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis) — special risk in renal impairment · photosensitivity reactions · pruritus · rash · renal failure · urticaria
- **Rare** Pancreatitis · peripheral neuropathy
- **Very rare** Anaemia · gallstones · increased platelet count · interstitial lung disease · leucopenia · pancytopenia · Stevens-Johnson syndrome · thrombocytopenic purpura · toxic epidermal necrolysis

**PREGNANCY** Manufacturers advise avoid—no information available.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Avoid in severe liver disease.

**RENAL IMPAIRMENT** Reduce dose to 400 mg daily if eGFR 40–60 mL/minute/1.73 m². Reduce dose to 200 mg every 1–2 days if eGFR 15–40 mL/minute/1.73 m². Avoid immediate-release preparations if eGFR less than 15 mL/minute/1.73 m². Avoid modified-release preparations if eGFR less than 60 mL/minute/1.73 m². Myotoxicity · Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

**MONITORING REQUIREMENTS** Consider monitoring of liver function and creatine kinase when fibrates used in combination with a statin.

**PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

### MEDICINAL FORMS

- **Bezafibrate (Merck Sharp & Dohme Ltd)**
  - **Ezetimibe 10 mg** Ezetimibe 10 mg tablets | 28 tablet [POM] £26.31 DT price = £26.31
  - **Combinations available:** Simvastatin with ezetimibe, p. 199

**LIPID MODIFYING DRUGS**

**FIBRATES**

### Ciprofibrate

**DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

**INDICATIONS AND DOSE** Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated

**CONTRA-INDICATIONS** Gall bladder disease · hypoalbuminaemia · nephrotic syndrome · photosensitivity to fibrates

**CAUTIONS** Correct hypothyroidism before initiating treatment

**INTERACTIONS** → Appendix 1: fibrates

**SIDE-EFFECTS**
- **Common or very common** Abdominal distension · anorexia · diarrhoea · nausea
- **Uncommon** Alopecia · cholestasis · dizziness · erectile dysfunction · headache · myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis) — special risk in renal impairment · photosensitivity reactions · pruritus · rash · renal failure · urticaria
- **Rare** Pancreatitis · peripheral neuropathy
- **Very rare** Anaemia · gallstones · increased platelet count · interstitial lung disease · leucopenia · pancytopenia · Stevens-Johnson syndrome · thrombocytopenic purpura · toxic epidermal necrolysis
- **Frequency not known** Pneumonitis · pulmonary fibrosis

**PREGNANCY** Manufacturers advise avoid—toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.

**RENAL IMPAIRMENT** Reduce dose to 100 mg on alternate days in moderate impairment. Avoid in severe impairment. Myotoxicity · Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Modiﬁed-release tablet**

- **Bezafibrate (Non-proprietary)** Bezafibrate 400 mg Bezafibrate 400 mg modified-release tablets | 28 tablet [POM] no price available | 30 tablet [POM] no price available DT price = £7.63
- **Bezalip Mono (Teva UK Ltd)** Bezafibrate 400 mg Bezalip Mono 400 mg modified-release tablets | 30 tablet [POM] £7.63 DT price = £7.63
- **Fibrazate XL (Sandoz Ltd)** Bezafibrate 400 mg Fibrazate XL 400 mg tablets | 30 tablet [POM] £6.87 DT price = £7.63

### Tableau

CAUTIONARY AND ADVISORY LABELS 21

- **Bezafibrate (Non-proprietary)** Bezafibrate 200 mg Bezafibrate 200 mg tablets | 100 tablet [POM] £8.50 DT price = £4.36
- **Bezalip (Teva UK Ltd)** Bezafibrate 200 mg Bezalip 200 mg tablets | 100 tablet [POM] £8.63 DT price = £4.36
**Fenofibrate**

**DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

**INDICATIONS AND DOSE**

Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia | Adjunct to statin in mixed hyperlipidaemia if triglycerides and HDL-cholesterol inadequately controlled in patients at high cardiovascular risk

- **BY MOUTH USING CAPSULES**
- Adult: Initially 200 mg daily, then increased if necessary to 267 mg daily, maximum 200 mg daily with concomitant statin, 267 mg capsules not appropriate for initial dose titration
- **BY MOUTH USING TABLETS**
- Adult: 160 mg daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises max. dose 200 mg daily with concurrent use of a statin.

**CONTRA-INDICATIONS** Gall bladder disease · pancreatitis (unless due to severe hypertriglyceridaemia) · photosensitivity to ketoprofen

**CAUTIONS** Correct hypothyroidism before initiating treatment

**INTERACTIONS** → Appendix 1: fibrates

**SIDE-EFFECTS**

- **Common or very common** Abdominal distension · anorexia · diarrhoea · nausea
- **Uncommon** Alopecia · cholestasis · dizziness · erectile dysfunction · headache · myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis)—special risk in renal impairment · pancreatitis · photosensitivity reactions · pruritus · pulmonary embolism · rash · renal failure · urticaria
- **Rare** Hepatitis · peripheral neuropathy
- **Very rare** Anaemia · gallstones · increased platelet count · interstitial lung disease · leucopenia · pancytopenia · Stevens–Johnson syndrome · thrombocytopenic purpura · toxic epidermal necrolysis
- **Frequency not known** Interstitial pneumopathies

**PREGNANCY** Avoid—embryotoxicity in *animal* studies.

**BREAST FEEDING** Avoid—no information available.

**HEPATIC IMPAIRMENT** Avoid.

**RENAL IMPAIRMENT** Manufacturer advises max. 67 mg daily if eGFR 30–59 mL/minute/1.73 m².

Manufacturer advises use with caution in mild-to-moderate impairment; avoid if eGFR less than 30 mL/minute/1.73 m².

Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

**MONITORING REQUIREMENTS** Manufacturer advises monitor hepatic transaminases every 3 months during the first 12 months of treatment and periodically thereafter—discontinue treatment if levels increase to more than 3 times the upper limit of normal; monitor serum creatinine levels during the first 3 months of treatment and periodically thereafter—interrupt treatment if creatinine level is 50% above the upper limit of normal.

**PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

**Fenofibrate (Non-proprietary)**

- **Ciprofibrate**
  - 100 mg Ciprofibrate 100mg tablets | 28 tablet POM £134.21 DT price = £112.96

**Combination available:** Simvastatin with fenofibrate, p. 199

---

**Gemfibrozil**

**DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

**INDICATIONS AND DOSE**

Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in primary hypercholesterolaemia if statin contra-indicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia | Adjunct to diet and other appropriate measures in primary prevention of cardiovascular disease in men with hyperlipidaemias if statin contra-indicated or not tolerated

- **BY MOUTH**
- Adult: 1.2 g daily in 2 divided doses, maintenance 0.9–1.2 g daily

**CONTRA-INDICATIONS** History of gall-bladder or biliary tract disease including gallstones · photosensitivity to fibrates
**CONTRA-INDICATIONS**
Active peptic ulcer disease · arterial bleeding

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain · dyspepsia · flushing · headache · malaise · urticaria
- **Uncommon** Anaphylactoid reaction · arthralgia · bronchospasm · erythema · myalgia · myositis · nausea · pruritus · rash
- **Frequency not known** Diarrhoea · dry eyes · vasodilatation

**PREGNANCY** Manufacturer advises avoid—no information available.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**RENAL IMPAIRMENT** Reduce dose to 250 mg 1–2 times daily if eGFR 30–60 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Monitor hepatic and renal function.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

Nicotinic acid

- **DRUG ACTION** In doses of 1.5 to 3 g daily, it lowers both cholesterol and triglyceride concentrations by inhibiting synthesis; it also increases HDL-cholesterol.

- **INDICATIONS AND DOSE**
  Adjunct to statin in dyslipidaemia or used alone if statin not tolerated
  - **BY MOUTH**
  - Adult: (consult product literature)

- **CONTRA-INDICATIONS** Active peptic ulcer disease · arterial bleeding
- **CAUTIONS** Acute myocardial infarction · diabetes mellitus · gout · history of peptic ulceration · unstable angina
- **INTERACTIONS** → Appendix 1: nicotinic acid

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · diarrhoea · dyspepsia · flushing · headache · malaise · urticaria
  - **Uncommon** Dizziness · headache · hypophosphataemia · increase in uric acid · palpitation · peripheral oedema · prolonged prothrombin time · reduced platelet count · shortness of breath · tachycardia
  - **Rare** Hypotension · insomnia · myalgia · myasthenia · myopathy · reduced glucose tolerance · rhinitis · syncope
  - **Very rare** Anorexia · rhabdomyolysis · visual disturbance
  - **Frequency not known** Jaundice

- **SIDE-EFFECTS, FURTHER INFORMATION**
  Prostaglandin-mediated symptoms. Prostaglandin-mediated symptoms (such as flushing) can be reduced by low initial doses taken with meals or, if patient taking aspirin, aspirin dose should be taken 30 minutes before nicotinic acid.

- **PREGNANCY** No information available—manufacturer advises avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** Present in milk—avoid.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment. Discontinue if severe abnormalities in liver function tests. Manufacturer advises monitor liver function in mild to moderate hepatic impairment.

- **RENAL IMPAIRMENT** Manufacturer advises use with caution—no information available.

---

**LIPID MODIFYING DRUGS**

**NICOTINIC ACID DERIVATIVES**

**Acipimox**

- **INDICATIONS AND DOSE**
  Adjunct or alternative treatment in hyperlipidaemias of types IIb and IV in patients who have not responded adequately to other lipid-regulating drugs such as a statin or fibrate, and lifestyle changes (including diet, exercise, and weight reduction)
  - **BY MOUTH**
  - Adult: 250 mg 2–3 times a day
LIPID MODIFYING DRUGS  STATINS

**Statins**

- **DRUG ACTION** Statins competitively inhibit 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, an enzyme involved in cholesterol synthesis, especially in the liver.
- **CAUTIONS** Elderly - high alcohol intake - history of liver disease - hypothyroidism - patients at increased risk of muscle toxicity, including myopathy or rhabdomyolysis (e.g. those with a personal or family history of muscular disorders, previous history of muscular toxicity and a high alcohol intake)

**CAUTIONS, FURTHER INFORMATION**

- **Muscle effects** Muscle toxicity can occur with all statins, however the likelihood increases with higher doses and in certain patients (see below). Statins should be used with caution in patients at increased risk of muscle toxicity, including those with a personal or family history of muscular disorders, previous history of muscular toxicity, a high alcohol intake, renal impairment or hypothyroidism.

In patients at increased risk of muscle effects, a statin should not usually be started if the baseline creatine kinase concentration is more than 5 times the upper limit of normal (some patients may present with an extremely elevated baseline creatine kinase concentration, for example because of a physical occupation or vigorous exercise—specialist advice should be sought regarding consideration of statin therapy in these patients).

- **Hypothyroidism** Hypothyroidism should be managed adequately before starting treatment with a statin.

**SIDE-EFFECTS**

- **Rare** Hepatitis - jaundice
- **Very rare** Hepatic failure - interstitial lung disease - lupus erythematosus-like reactions - pancreatitis

- **Frequency not known** Alopecia - altered liver function tests - amnesia - arthralgia - asthenia - depression - dizziness - fatigue - gastrointestinal disturbances - headache - hyperglycaemia - hypersensitivity reactions - may be associated with the development of diabetes mellitus (particularly in those already at risk of the condition) - myalgia - myopathy - myositis - paraesthesia - peripheral neuropathy - pruritus - rash - rhabdomyolysis - sexual dysfunction - sleep disturbance - thrombocytopenia - urticaria - visual disturbance

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Muscle effects** The risk of myopathy, myositis, and rhabdomyolysis associated with statin use is rare. Although myalgia has been reported commonly in patients receiving statins, muscle toxicity truly attributable to statin use is rare. Muscle toxicity can occur with all statins, however the likelihood increases with higher doses.

If muscular symptoms or raised creatine kinase occur during treatment, other possible causes (e.g. vigorous physical activity, hypothyroidism, infection, recent trauma, and drug or alcohol addiction) should be excluded before statin therapy is implicated, particularly if statin treatment has previously been tolerated for more than 3 months. When a statin is suspected to be the cause of myopathy, and creatine kinase concentration is markedly elevated (more than 5 times upper limit of normal), or if muscular symptoms are severe, treatment should be discontinued. If symptoms resolve and creatine kinase concentrations return to normal, the statin should be reintroduced at a lower dose and the patient monitored closely; an alternative statin should be prescribed if unacceptable side-effects are experienced with a particular statin. Statin therapy should not be discontinued in the event of small, asymptomatic elevations of creatine kinase. Routine monitoring of creatine kinase is unnecessary in asymptomatic patients.

Statins should not be discontinued if there is an increase in the blood-glucose concentration or HbaA1C as the benefits continue to outweigh the risks.

- **Interstitial lung disease** If patients develop symptoms such as dyspnoea, cough, and weight loss, they should seek medical attention.

- **PREGNANCY** Statins should be avoided in pregnancy (discontinue 3 months before attempting to conceive) as congenital anomalies have been reported and the decreased synthesis of cholesterol possibly affects fetal development.

- **HEPATIC IMPAIRMENT** Statins should be used with caution in those with a history of liver disease. Avoid in active liver disease or when there are unexplained persistent elevations in serum transaminases.

- **MONITORING REQUIREMENTS**

  - Before starting treatment with statins, at least one full lipid profile (non-fasting) should be measured, including total cholesterol, HDL-cholesterol, non-HDL-cholesterol (calculated as total cholesterol minus HDL-cholesterol), and triglyceride concentrations, thyroid-stimulating hormone, and renal function should also be assessed.

  - Liver function There is little information available on a rational approach to liver-function monitoring; however, NICE suggests that liver enzymes should be measured before treatment, and repeated within 3 months and at 12 months of starting treatment, unless indicated at other times by signs or symptoms suggestive of hepatotoxicity (NICE clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease).

  - Those with serum transaminases that are raised, but less than 3 times the upper limit of the reference range, should not be routinely excluded from statin therapy. Those with serum transaminases of more than 3 times the upper limit of the reference range should discontinue statin therapy.

- **Creatine kinase** Before initiation of statin treatment, creatine kinase concentration should be measured in patients who have had persistent, generalised, unexplained muscle pain (whether associated or not with previous lipid-regulating drugs); if the concentration is more than 5 times the upper limit of normal, a repeat measurement should be taken after 7 days. If the repeat concentration remains above 5 times the upper limit, statin treatment should not be started; if concentrations are still raised but less than 5 times the upper limit, the statin should be started at a lower dose.

- **Diabetes** Patients at high risk of diabetes mellitus should have fasting blood-glucose concentration or HbaA1C checked before starting statin treatment, and then repeated after 3 months.

**PATIENT AND CARER ADVICE** Advise patients to report promptly unexplained muscle pain, tenderness, or weakness.
Atorvastatin

**INDICATIONS AND DOSE**

Primary hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures [Combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures]

- **BY MOUTH**
  - Adult: Usual dose 10 mg once daily; increased if necessary up to 80 mg once daily, dose to be increased at intervals of at least 4 weeks

Heterozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures

- **BY MOUTH**
  - Adult: Initially 10 mg once daily, then increased to 40 mg once daily, dose to be increased at intervals of at least 4 weeks; maximum 80 mg per day

Primary prevention of cardiovascular events in patients at high risk of a first cardiovascular event

- **BY MOUTH**
  - Adult: 20 mg once daily, dose can be increased if necessary

Secondary prevention of cardiovascular events

- **BY MOUTH**
  - Adult: 80 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises if concurrent use of ciclosporin is appropriate measures who have not responded adequately to diet and other appropriate measures [Homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures]

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Combined (mixed) hyperlipidaemia (types IIa and IIb)

**LICENSED USE**

Not licensed for secondary prevention of cardiovascular events. Starting dose of 20 mg once daily is not licensed for the primary prevention of cardiovascular events.

**CAUTIONS**

Haemorrhagic stroke

**INTERACTIONS**  Appendix 1: statins

**SIDE-EFFECTS**

- Common or very common Back pain · epistaxis · hyperglycaemia · nasopharyngitis · pharyngeolaryngeal pain
- Uncommon Anorexia · blurred vision · chest pain · hypoglycaemia · malaise · neck pain · peripheral oedema · pyrexia · tinnitus · weight gain
- Rare Cholestasis · Stevens-Johnson syndrome · toxic epidermal necrolysis
- Very rare Gynaecomastia · hearing loss

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**RENAI IMPAIRMENT**

In chronic kidney disease, for primary and secondary prevention of cardiovascular events [unlicensed starting dose in primary prevention; unlicensed in secondary prevention], initially 20 mg once daily, increased if necessary (on specialist advice if eGFR < 30 mL/minute/1.73 m²); max. 80 mg once daily.

**PATIENT AND CARER ADVICE**

Patient counselling is advised for atorvastatin tablets (muscle effects).

Fluvastatin

**INDICATIONS AND DOSE**

Adjunct to diet in primary hypercholesterolaemia or combined (mixed) hyperlipidaemia (types IIa and IIb)

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 20–40 mg daily, dose to be taken in the evening, increased if necessary up to 80 mg daily in 2 divided doses, dose to be adjusted at intervals of at least 4 weeks

**LICENSED USE**

Not licensed for secondary prevention of cardiovascular events.

**CAUTIONS**

Haemorrhagic stroke

**INTERACTIONS**  Appendix 1: statins

**SIDE-EFFECTS**

- Very rare Vasculitis

**BREAST FEEDING**

Manufacturer advises avoid—no information available.
Pravastatin sodium

- **INDICATIONS AND DOSE**
  
  Adjunct to diet for primary hypercholesterolaemia or combined (mixed) hyperlipidaemias in patients who have not responded adequately to dietary control
  
  **BY MOUTH**
  
  Adult: 10–40 mg daily, dose to be taken at night, dose to be adjusted at intervals of at least 4 weeks
  
  Prevention of cardiovascular events in patients with previous myocardial infarction or unstable angina
  
  Adjunct to diet to prevent cardiovascular events in patients with hypercholesterolaemia
  
  **BY MOUTH**
  
  Adult: 40 mg daily, dose to be taken at night
  
  Reduction of hyperlipidaemia in patients receiving immunosuppressive therapy following solid-organ transplantation
  
  **BY MOUTH**
  
  Adult: Initially 20 mg daily, then increased if necessary up to 40 mg daily, dose to be taken at night, close medical supervision is required if dose is increased to maximum dose

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises initial dose 20 mg daily with concurrent use of ciclosporin, increasing with caution to 40 mg daily—no specific recommendation made for children.

Manufacturer advises reduce dose by half with concurrent use of ombitasvir with paritaprevir and ritonavir.

- **INTERACTIONS** → Appendix 1: statins
- **SIDE-EFFECTS**
  
  - **Uncommon** Abnormal urination • dysuria • nocturia • urinary frequency
  
  - **Very rare** Fulminant hepatic necrosis
- **BREAST FEEDING**
  
  Manufacturer advises avoid—small amount of drug present in breast milk.
- **RENAIML IMPAIRMENT**
  
  Manufacturer advises initial dose of 10 mg once daily in moderate to severe impairment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

- **CAUTIONARY AND ADVISORY LABELS**

**Pravastatin sodium**

- **INDICATIONS AND DOSE**
  
  Primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures
  
  **BY MOUTH**
  
  Adult 18–69 years: Initially 5–10 mg once daily, then increased if necessary to 20 mg once daily, dose to be increased at intervals of at least 4 weeks
  
  Adult (patients of Asian origin): Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased at intervals of at least 4 weeks.
  
  Adult 70 years and over: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased at intervals of at least 4 weeks
  
  Primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures and who have risk factors for myopathy or rhabdomyolysis
  
  **BY MOUTH**
  
  Adult: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased at intervals of at least 4 weeks

**Patient counselling is advised**

Appendix 1: statins

Appendix 1: statins

Manufacturer advises doses above 30 mL/minute/1.73 m².

**PATIENT AND CARER ADVICE**

Patient counselling is advised for fluvastatin tablets/capsules (muscle effects).

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2004) that fluvastatin is accepted for restricted use for the secondary prevention of coronary events after percutaneous coronary angioplasty; if the patient has previously been receiving another statin, then there is no need to change the statin.

Downloaded from www.medicalbr.com
Severe primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures, in patients with high cardiovascular risk (under expert supervision)

BY MOUTH

Adult: Initially 5–10 mg once daily, increased if necessary to 20 mg once daily, then increased if necessary to 40 mg once daily, dose to be increased at intervals of at least 4 weeks

Prevention of cardiovascular events in patients at high risk of a first cardiovascular event

BY MOUTH

Adult: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily

Prevention of cardiovascular events in patients at high risk of a first cardiovascular event and with risk factors for myopathy or rhabdomyolysis

BY MOUTH

Adult: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises initially 5 mg daily with concurrent use of bezafibrate, ciprobate, and fenofibrate—40 mg dose is contra-indicated.

Manufacturer advises initially 5 mg daily with concurrent use of clopidogrel—max. dose 20 mg daily.

Manufacturer advises initially 5 mg daily with concurrent use of simpeprrev—max. dose 10 mg daily.

Manufacturer advises max. dose 5 mg daily with concurrent ombitasvir, paritaprevir, and ritonavir given with dasabuvir, but max. 10 mg daily with concurrent ombitasvir, paritaprevir, and ritonavir given without dasabuvir.

Manufacturer advises max. dose 10 mg daily with concurrent use of sofosbuvir with velpatasvir, or elbasvir with grazoprevir.

Manufacturer advises reduce dose by half with concurrent use of teriflunomide.

CAUTIONS Patients of Asian origin

INTERACTIONS Appendix 1: statins

SIDE-EFFECTS

Common or very common Proteinuria

Very rare Gynaeomastia; haematuria

Frequency not known Oedema; Stevens-Johnson syndrome

BREAST FEEDING Manufacturer advises avoid—no information available.

RENAL IMPAIRMENT Initially 5 mg once daily (do not exceed 20 mg daily) if eGFR 30–60 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².

PATIENT AND CARER ADVICE Patient counselling is advised for rosvustatin tablets (muscle effects).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

Creator (AstraZeneca Ltd)

Rosuvastatin (as Rosuvastatin calcium) 5 mg Creator 5mg tablets | 28 tablet | P&L 18.03 DT price = £18.03 Rosuvastatin (as Rosuvastatin calcium) 10 mg Creator 10mg tablets | 28 tablet | P&L 18.03 DT price = £18.03 Rosuvastatin (as Rosuvastatin calcium) 20 mg Creator 20mg tablets | 28 tablet | P&L 26.02 DT price = £26.02 Rosuvastatin (as Rosuvastatin calcium) 40 mg Creator 40mg tablets | 28 tablet | P&L 25.69 DT price = £25.69

Simvastatin

INDICATIONS AND DOSE

Primary hypercholesterolaemia, or combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures

BY MOUTH

Adult: 10–20 mg once daily, then increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

Homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures

BY MOUTH

Adult: Initially 40 mg once daily, then increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

Prevention of cardiovascular events in patients with atherosclerotic cardiovascular disease or diabetes mellitus

BY MOUTH

Adult: Initially 20–40 mg once daily, increased if necessary up to 80 mg once daily, adjusted at intervals of at least 4 weeks, dose to be taken at night; 80 mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises max. 10 mg daily with concurrent use of bezafibrate or ciprobate.

Manufacturer advises max. 20 mg daily with concurrent use of amiodarone, amiodipine, or ranolazine.

Manufacturer advises reduce dose with concurrent use of some moderate inhibitors of CYP3A4 (max. 20 mg daily with verapamil and diltiazem).

Manufacturer advises max. 40 mg daily with concurrent use of lomitapide or ticagrelor.

Manufacturer advises max. 20 mg daily with concurrent use of elbasvir with grazoprevir.

INTERACTIONS Appendix 1: statins

SIDE-EFFECTS

Rare Anaemia

Frequency not known Tendinopathy

BREAST FEEDING Manufacturer advises avoid—no information available.

RENAL IMPAIRMENT Doses above 10 mg daily should be used with caution if eGFR less than 30 mL/minute/1.73 m².

PATIENT AND CARER ADVICE Patient counselling is advised for simvastatin tablets/oral suspension (muscle effects).

EXCEPTIONS TO LEGAL CATEGORY Simvastatin 10 mg tablets can be sold to the public to reduce risk of first coronary event in individuals at moderate risk of coronary heart disease (approx. 10–15% risk of major event in 10 years), max. daily dose 10 mg and pack size of 28 tablets; treatment should form part of a programme to reduce risk of coronary heart disease.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension

EXCIPIENTS May contain Propylene glycol

Simvastatin (Non-proprietary)

Simvastatin 4 mg per 1 ml Simvastatin 20mg/5ml oral suspension sugar free sugar-free | 150 ml P&L £126.87 DT price = £126.41

Simvastatin 8 mg per 1 ml Simvastatin 40mg/5ml oral suspension sugar free sugar-free | 150 ml P&L £193.80 DT price = £193.09
Simvastatin with ezetimibe

The properties listed below are those particular to the combination only. For the properties of the components please consider, simvastatin p. 198, ezetimibe p. 191.

- **INDICATIONS AND DOSE**
  Homozygous familial hypercholesterolaemia, primary hypercholesterolaemia, and mixed hyperlipidaemia in patients over 10 years stabilised on the individual components in the same proportions, or for patients not adequately controlled by statin alone
  - BY MOUTH
  - Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: ezetimibe, statins

Simvastatin with fenofibrate

The properties listed below are those particular to the combination only. For the properties of the components please consider, simvastatin p. 198, fenofibrate p. 193.

- **INDICATIONS AND DOSE**
  Adjunct to diet and exercise in mixed dyslipidaemia, when LDL-cholesterol levels are adequately controlled with the corresponding dose of simvastatin monotherapy (in patients at high cardiovascular risk)
  - BY MOUTH
  - Adult: 20/145 mg once daily, alternatively 40/145 mg once daily, dose should be based on previous simvastatin monotherapy dose

- **CAUTIONS** History of pulmonary embolism

- **INTERACTIONS** → Appendix 1: fibrates, statins

- **SIDE-EFFECTS**
  - Common or very common Gastroenteritis
  - Uncommon Dermatitis - eczema

- **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 60 mL/minute/1.73 m²; use with caution if eGFR 60–89 mL/minute/1.73 m²

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **CAUTIONARY AND ADVISORY LABELS** 25
  - **EXCIPIENTS:** May contain Butylated hydroxyanisole, lecithin
  - **Cholib** (Mylan Ltd)
    - Simvastatin 20 mg, Fenofibrate 145 mg Cholib 145mg/20mg tablets | 30 tablet | £7.71 DT price = £4.71
    - Cholib 145mg/40mg tablets | 30 tablet | £8.33 DT price = £5.33

**LIPID MODIFYING DRUGS › OTHER**

**Alirocumab** 24-Oct-2016

- **DRUG ACTION** Alirocumab binds to a pro-protein involved in the regulation of LDL receptors on liver cells; receptor numbers are increased, which results in increased uptake of LDL-cholesterol from the blood.

- **INDICATIONS AND DOSE**
  Primary hypercholesterolaemia or mixed dyslipidaemia in patients who have not responded adequately to other appropriate measures (in combination with a statin, or with a statin and other lipid-lowering therapies, or with other lipid-lowering therapies or alone if a statin contra-indicated or not tolerated)
  - BY SUBCUTANEOUS INJECTION
  - Adult: 75–150 mg every 2 weeks, adjusted according to response, to be administered into the thigh, abdomen or upper arm, dose adjustments should be made at 4-weekly intervals

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

- **SIDE-EFFECTS**
  - Common or very common Oropharyngeal pain · pruritus · rhinorrhea
  - Rare · Eczema (discoid) · urticaria
  - Frequency not known Vascularis

- **PREGNANCY** Manufacturer advises avoid unless clinical condition requires treatment—maternal toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in severe impairment—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises use with caution in severe impairment—no information available.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage outside refrigerator.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  **NICE technology appraisals (Tas)**
  - Alirocumab for treating primary hypercholesterolaemia and mixed dyslipidaemia (June 2016) NICE TA393
  Alirocumab is recommended as an option for treating primary hypercholesterolaemia or mixed dyslipidaemia, only if:
  - Low-density lipoprotein cholesterol (LDL-C) concentrations are persistently above the thresholds specified in the NICE documentation and
  - the manufacturer provides alirocumab with the discount agreed in the patient access scheme.
Patients whose treatment was started before this guidance was published should continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA393

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (Aug 2016) that alirocumab (Praluent®) is accepted for restricted use within NHS Scotland for treatment of primary hypercholesterolaemia or mixed dyslipidaemia (alone or in combination with other lipid lowering therapies, as specified within it’s license), for specialist use only and only in patients at high cardiovascular risk as follows: ● patients with heterozygous familial hypercholesterolaemia (HeFH) and LDL-C >5.0mmol/L, for primary prevention of cardiovascular events, or ● patients with HeFH and LDL-C >3.5mmol/L, for secondary prevention of cardiovascular events, or ● patients at high risk due to previous cardiovascular events and LDL-C ≥4.0mmol/L, or ● patients with recurrent/polyvascular disease and LDL-C ≥3.5mmol/L
This advice is contingent upon the continuing availability of the Patient Access Scheme (PAS) in NHS Scotland or a list price that is equivalent or lower.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Solution for injection
EXCipients: May contain Polysorbates
- Praluent (Sanofi) ▼
  Alirocumab 75 mg per 1 ml Praluent 75mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection £168.00 | 2 pre-filled disposable injection £336.00
- Alirocumab 150 mg per 1 ml Praluent 150mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection £168.00 | 2 pre-filled disposable injection £336.00

Evolocumab
DRUG ACTION Evolocumab binds to a pro-protein involved in the regulation of LDL receptors on liver cells; receptor numbers are increased, which results in increased uptake of LDL-cholesterol from the blood.

INDICATIONS AND DOSE
Primary hypercholesterolaemia or mixed dyslipidaemia in patients who have not responded adequately to other appropriate measures (in combination with a statin, or with a statin and other lipid-lowering therapies, or with other lipid-lowering therapies or alone if a statin contra-indicated or not tolerated)
- BY SUBCUTANEOUS INJECTION
  - Adult: 140 mg every 2 weeks, alternatively 420 mg every month, to be administered into the thigh, abdomen or upper arm
Homzygous familial hypercholesterolaemia (in combination with other lipid-lowering therapies)
- BY SUBCUTANEOUS INJECTION
  - Adult: Initially 420 mg every month; increased if necessary to 420 mg every 2 weeks, if inadequate response after 12 weeks of treatment, to be administered into the thigh, abdomen or upper arm
Homzygous familial hypercholesterolaemia in patients on apheresis (in combination with other lipid-lowering therapies)
- BY SUBCUTANEOUS INJECTION
  - Adult: 420 mg every 2 weeks, to correspond with apheresis schedule, to be administered into the thigh, abdomen or upper arm

INTERACTIONS ➔ Appendix 1: monoclonal antibodies

SIDE-EFFECTS
- Common or very common Arthralgia · back pain · influenza · nasopharyngitis · nausea · rash · upper respiratory tract infection
- Uncommon Urticaria
- PREGNANCY Manufacturer advises avoid unless essential—limited information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises monitor in moderate impairment—possible reduced efficacy; use with caution in severe impairment—no information available.
- RENAL IMPAIRMENT Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m²—no information available.
- HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage outside refrigerator.
- PATIENT AND CARER ADVICE Patients and their carers should be given training in subcutaneous injection technique.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
- Evolocumab for treating primary hypercholesterolaemia and mixed dyslipidaemia (June 2016) NICE TA257
  Evolocumab is recommended as an option for treating primary hypercholesterolaemia or mixed dyslipidaemia, only if:
  - it is given at a dose of 140 mg every 2 weeks; and
  - low-density lipoprotein cholesterol (LDL-C) concentrations are persistently above the thresholds specified in the NICE documentation; and
  - the manufacturer provides evolocumab with the discount agreed in the patient access scheme.
Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA394

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (February 2017) that evolocumab (Repatha®) is accepted for restricted use within NHS Scotland for the treatment of primary hypercholesterolaemia (heterozygous familial hypercholesterolaemia and non-familial) or mixed dyslipidaemia (alone or in combination with other lipid lowering therapies, as specified within its license), for specialist use only when administered at a dose of 140 mg every 2 weeks and only in patients at high cardiovascular risk as follows:
- patients with heterozygous familial hypercholesterolaemia (HeFH) and LDL-C 5mmol/L or greater for primary prevention of cardiovascular events, or
- patients with HeFH and LDL-C 3.5mmol/L or greater for secondary prevention of cardiovascular event, or
- patients at high risk due to previous cardiovascular events and LDL-C 4mmol/L or greater, or
- patients with recurrent/polyvascular disease and LDL-C 3.5mmol/L or greater
This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.
Lomitapide

**DRUG ACTION** Lomitapide, an inhibitor of microsomal triglyceride transfer protein (MTP), reduces lipoprotein secretion and circulating concentrations of lipoprotein-borne lipids such as cholesterol and triglycerides.

**INDICATIONS AND DOSE**
Adjunct to dietary measures and other lipid-regulating drugs with or without low-density lipoprotein apheresis in homozygous familial hypercholesterolaemia (under expert supervision)

- **BY MOUTH**
  - Adult: Initially 5 mg daily for 2 weeks, dose to be taken at least 2 hours after evening meal, then increased if necessary to 10 mg daily, for at least 4 weeks, then increased to 20 mg daily for at least 4 weeks, then increased in steps of 20 mg daily, adjusted at intervals of at least 4 weeks; maximum 60 mg per day

**CONTRA-INDICATIONS** Significant or chronic bowel disease

**CAUTIONS** Concomitant use of hepatotoxic drugs

**SIDE-EFFECTS**
- Common or very common  
  - Bloating, abdominal pain, appetite changes, constipation, diarrhoea, dizziness, dyspepsia, eechymosis, eructation, erythematous rash, flatulence, gastro-oesophageal reflux disease, gastroenteritis, haemorrhoids, headache, hepatic steatosis, hepatomegaly, hypokalaemia, leucopenia, malaise, migraine, muscle spasms, nausea, neutropenia, raised serum transaminases, tenesmus, vomiting, weight loss
- Uncommon  
  - Abnormal gait, anaemia, arthralgia, chest pain, drowsiness, dry mouth, dry skin, eye swelling, gastrointestinal haemorrhage, haematemesis, haematuria, hyperbilirubinaemia, joint swelling, myalgia, pain in extremities, paraesthesia, proteinuria, pyrexia, sweating, vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**
- Raised transaminases: Reduce dose if serum transaminases raised during treatment (consult product literature).

**CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before treatment and ensure effective contraception used.

**PREGNANCY** Avoid—teratogenicity and embryotoxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Reduce dose if serum transaminases raised during treatment (consult product literature). Max. 40 mg daily in mild impairment. Avoid in moderate to severe impairment, or if unexplained persistent abnormal liver function tests.

**MEDICINAL FORMS**
- **Solution for injection**
  - Repatha (Amgen Ltd)  
    - Evolocumab 140 mg per 1ml Repatha 140mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £170.00
  - Repatha SureClick (Amgen Ltd)  
    - Evolocumab 140 mg per 1ml Repatha SureClick 140mg/1ml solution for injection pre-filled disposable devices | 2 pre-filled disposable injection £340.20

**SIDE-EFFECTS**
- Common or very common
- Rare
- Very rare

**INTERACTIONS**
- **BY MOUTH**
  - Adult: 1 capsule daily, dose to be taken with food

**CAUTIONARY AND ADVISORY LABELS**

**RENA L IMPAIRMENT** Max. 40 mg daily in end-stage renal disease.

**MONITORING REQUIREMENTS**
- Monitor liver function tests before treatment, then at least monthly and before each dose increase for first year, then at least every 3 months and before each dose increase thereafter.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Capsule**
- Lojuxta (Amryt Pharma) ▼
  - Lomitapide 5 mg Lojuxta 5mg capsules | 28 capsule £17,765.00

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (November 2002) that omega-3-acid ethyl esters are not recommended for use within NHS Scotland for the treatment of hypertriglyceridaemia.
7 Myocardial ischaemia

Stable angina

Overview

It is important to distinguish stable angina from unstable angina. Stable angina usually results from atherosclerotic plaques in the coronary arteries that restrict blood flow and oxygen supply to the heart; it is often precipitated by exertion and relieved by rest. Treatment involves management of acute anginal pain, and long-term management to prevent angina attacks and to reduce the risk of cardiovascular events.

Management

Acute attacks of stable angina should be managed with sublingual glyceryl trinitrate p. 212 which can be taken immediately before performing activities that are known to bring on an attack. If attacks occur more than twice a week, regular drug therapy is required and should be introduced in a step-wise manner according to response.

Patients with stable angina should be given a beta-blocker or a calcium-channel blocker. In those with left-ventricular dysfunction, beta-blocker treatment should be started at a very low dose and titrated very slowly over a period of weeks or months. If a beta-blocker or a calcium-channel blocker alone fails to control symptoms adequately, a combination of a beta-blocker and a dihydropyridine calcium-channel blocker (e.g. amlopidine p. 150, felodipine p. 154, modified-release nifedipine p. 157) should be used; if this combination is not appropriate due to intolerance of, or contra-indication to, either beta-blockers or calcium-channel blockers, addition of a long-acting nitrate, ivabradine p. 205, nicorandil p. 206, or ranolazine p. 205 can be considered.

For those patients in whom both beta-blockers and calcium-channel blockers are not tolerated or are contra-indicated, monotherapy with a long-acting nitrate, ivabradine, nicorandil, or ranolazine should be considered.

Response to treatment should be assessed every 2–4 weeks after initiating or changing drug therapy; the drug should be titrated (according to symptom control) to the maximum tolerated dose. Consider referring the patient to a specialist if a combination of two drugs fails to control symptoms. Addition of a third antianginal drug should only be considered if symptom control is not achieved with two drugs and the patient is either due to undergo a revascularisation procedure, or a revascularisation procedure is considered inappropriate. See the use of antiplatelet drugs in patients undergoing coronary stenting.

For long-term prevention of cardiovascular events, see Prevention of cardiovascular events.

Antianginal drugs

Nitrates, calcium-channel blockers, and potassium channel activators (use in adults only) have a vasodilating and, consequently, blood pressure lowering effect. Vasodilators can act in heart failure by arteriolar dilatation which reduces both peripheral vascular resistance and left ventricular pressure during systole resulting in improved cardiac output. They can also cause venous dilatation which results in dilatation of capacitance vessels, increase of venous pooling, and diminution of venous return to the heart (decreasing left ventricular end-diastolic pressure).

Nicorandil, a potassium-channel activator with a nitrate component, has both arterial and venous vasodilating properties and is licensed for the prevention and long-term treatment of angina. Nicorandil has similar efficacy to other antianginal drugs in controlling symptoms; it may produce additional symptomatic benefit in combination with other antianginal drugs (unlicensed indication).

Ivabradine lowers the heart rate by its action on the sinus node. It is licensed for the treatment of angina in patients who are in normal sinus rhythm in combination with a beta-blocker, or when beta-blockers are contra-indicated or not tolerated. Ivabradine, in combination with standard therapy including a beta-blocker (unless contra-indicated or not tolerated), is also licensed for mild to severe stable chronic heart failure in patients who are in sinus rhythm.

Ranolazine is licensed as adjunctive therapy in patients who are inadequately controlled or intolerant of first-line antianginal drugs.

Other drugs used for Myocardial ischaemia

ACE inhibitors

ACE inhibitors are used to treat hypertension and angina. They improve survival in patients with heart failure in sinus rhythm. They can also cause venous dilatation which results in dilatation of capacitance vessels, increase of venous pooling, and diminution of venous return to the heart (decreasing left ventricular end-diastolic pressure).

Nicorandil, a potassium-channel activator with a nitrate component, has both arterial and venous vasodilating properties and is licensed for the prevention and long-term treatment of angina. Nicorandil has similar efficacy to other antianginal drugs in controlling symptoms; it may produce additional symptomatic benefit in combination with other antianginal drugs (unlicensed indication).

Ivabradine lowers the heart rate by its action on the sinus node. It is licensed for the treatment of angina in patients who are in normal sinus rhythm in combination with a beta-blocker, or when beta-blockers are contra-indicated or not tolerated. Ivabradine, in combination with standard therapy including a beta-blocker (unless contra-indicated or not tolerated), is also licensed for mild to severe stable chronic heart failure in patients who are in sinus rhythm.

Ranolazine is licensed as adjunctive therapy in patients who are inadequately controlled or intolerant of first-line antianginal drugs.

ANTITHROMBOTIC DRUGS

Cangrelor

DRUG ACTION

Cangrelor is a direct P2Y12 platelet receptor antagonist that blocks adenosine diphosphate induced platelet activation and aggregation.

INDICATIONS AND DOSE

In combination with aspirin for the reduction of thrombotic cardiovascular events in patients with coronary artery disease undergoing percutaneous coronary intervention (PCI) who have not received an oral P2Y12 inhibitor (e.g. clopidogrel, prasugrel, ticagrelor) prior to the PCI procedure and in whom oral therapy with a P2Y12 inhibitor is not suitable (under expert supervision)

INITIALLY BY INTRAVENOUS INJECTION

Adult: Initially 30 micrograms/kg, to be given as a bolus dose, followed immediately by (by intravenous infusion) 4 micrograms/kg/minute, start treatment before percutaneous coronary intervention and continue infusion for at least 2 hours or for the duration of intervention if longer; maximum duration of infusion 4 hours
CONTRA-INDICATIONS  Active bleeding · history of stroke · history of transient ischaemic attack · patients at increased risk of bleeding (e.g. impaired haemostasis, irreversible coagulation disorders, major surgery or trauma, uncontrolled severe hypertension)

CAUTIONS  Disease states associated with increased bleeding risk

INTERACTIONS  

SIDE-EFFECTS

Dyspnoea · ecchymosis · haematoma · haemorrhage (including gastrointestinal and intracranial)

Uncommon  Acute renal failure · cardiac tamponade · epistaxis · haemyptysis · rash · retropertioneal haemorrhage (fatalities reported) · urticaria

Rare  Anaemia · bruising · thrombocytopenia

Very rare  Menorrhagia

PREGNANCY  Manufacturer advises avoid — toxicity in animal studies.

BREAST FEEDING  Manufacturer advises potential risk to infant — no information available.

RENAL IMPAIRMENT  Manufacturer advises caution in severe renal impairment — increased risk of bleeding.

DIRECTIONS FOR ADMINISTRATION  For intravenous bolus injection and intravenous infusion, reconstitute each 50 mg vial with 5 mL of water for injection and gently swirl, do not shake vigorously. Withdraw 5 mL of reconstituted solution, add to 250 mL of either Sodium Chloride 0.9% or Glucose 5% and mix thoroughly. The bolus injection and infusion should be administered from the infusion solution.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

Kengreal  (Chiesi Ltd) ▼

Cangrelor (as Cangrelor tetrasodium) 50 mg  Kengreal 50 mg powder for concentrate for solution for injection / infusion vials | 10 vial  £2,500.00 (Hospital only)

ANTITHROMBOTIC DRUGS > GLYCOPROTEIN IIb/IIIa INHIBITORS

Abciximab

INDICATIONS AND DOSE

Prevention of ischaemic cardiac complications in patients undergoing percutaneous coronary intervention (specialist use only)

INITIALLY BY INTRAVENOUS INJECTION

Adult: Initially 250 micrograms/kg, to be given over 1 minute, then (by intravenous infusion) 125 nanograms/kg/minute (max. per dose 10 micrograms/minute), to be started up to 24 hours before possible percutaneous coronary intervention and continue infusion for 12 hours after intervention

Short-term prevention of myocardial infarction in patients with unstable angina not responding to conventional treatment and who are scheduled for percutaneous coronary intervention (specialist use only)

INITIALLY BY INTRAVENOUS INJECTION

Adult: Initially 250 micrograms/kg, to be given over 1 minute, then (by intravenous infusion) 125 nanograms/kg/minute (max. per dose 10 micrograms/minute), to be started up to 24 hours before possible percutaneous coronary intervention and continue infusion for 12 hours after intervention

CONTRA-INDICATIONS  Active internal bleeding · arteriovenous malformation or aneurysm · haemorrhagic diathesis · hypertensive retinopathy · intracranial neoplasm · intracranial or intraspinal surgery or trauma within last 2 months · major surgery within last 2 months · severe hypertension · stroke within last 2 years · thrombocytopenia · vasculitis

CAUTIONS  Discontinue if uncontrollable serious bleeding occurs or emergency cardiac surgery needed (consult product literature for details of procedures to minimise bleeding) · elderly

INTERACTIONS  

SIDE-EFFECTS

Common or very common  Back pain · bleeding manifestations · bradycardia · chest pain · fever · headache · hypotension · nausea · puncture site pain · thrombocytopenia · vomiting

Rare  Adult respiratory distress · cardiac tamponade · hypersensitivity reactions

PREGNANCY  Manufacturer advises avoid if potential benefit outweighs risk — no information available.

BREAST FEEDING  Manufacturer advises avoid — no information available.

HEPATIC IMPAIRMENT  Avoid in severe liver disease — increased risk of bleeding.

RENAL IMPAIRMENT  Caution in severe impairment — increased risk of bleeding.

MONITORING REQUIREMENTS

Measure baseline prothrombin time, activated clotting time, activated partial thromboplastin time, platelet count, haemoglobin and haematocrit.

Monitor haemoglobin and haematocrit 12 hours and 24 hours after start of treatment and platelet count 2–4 hours and 24 hours after start of treatment.

DIRECTIONS FOR ADMINISTRATION  For intravenous infusion (Reopro ®), give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute requisite dose in infusion fluid and give via infusion pump; filter upon dilution through a non-pyrogenic low protein binding 0.2, 0.22, or 5 micron filter or upon administration through an in-line non-progenic low protein-binding 0.2 or 0.22 micron filter.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Reopro  (Janssen-Cilag Ltd)

Abciximab 2 mg per 1 ml  Reopro 10 mg/5 ml solution for injection vials | 1 vial  £250.24

Eptifibatide

INDICATIONS AND DOSE

In combination with aspirin and unfractionated heparin for the prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction and with last episode of chest pain within 24 hours (specialist use only)

INITIALLY BY INTRAVENOUS INJECTION

Adult: Initially 180 micrograms/kg, then (by intravenous infusion) 2 micrograms/kg/minute for up to 72 hours (up to 96 hours if percutaneous coronary intervention during treatment)

CONTRA-INDICATIONS  Abnormal bleeding within 30 days · aneurysm · arteriovenous malformation · haemorrhagic diathesis · history of haemorrhagic stroke · increased INR · increased prothrombin time · intracranial disease · major surgery or severe trauma within 6 weeks · neoplasm · severe hypertension · stroke within last 30 days · thrombocytopenia

diabetes · hypertensive retinopathy · intracranial neoplasm · intracranial or intraspinal surgery or trauma within last 2 months · major surgery within last 2 months · severe hypertension · stroke within last 2 years · thrombocytopenia · vasculitis

CAUTIONS  Discontinue if uncontrollable serious bleeding occurs or emergency cardiac surgery needed (consult product literature for details of procedures to minimise bleeding) · elderly

INTERACTIONS  

SIDE-EFFECTS

In combination with aspirin and unfractionated heparin for the prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction and with last episode of chest pain within 24 hours (specialist use only)

INITIALLY BY INTRAVENOUS INJECTION

Adult: Initially 180 micrograms/kg, then (by intravenous infusion) 2 micrograms/kg/minute for up to 72 hours (up to 96 hours if percutaneous coronary intervention during treatment)

CONTRA-INDICATIONS  Abnormal bleeding within 30 days · aneurysm · arteriovenous malformation · haemorrhagic diathesis · history of haemorrhagic stroke · increased INR · increased prothrombin time · intracranial disease · major surgery or severe trauma within 6 weeks · neoplasm · severe hypertension · stroke within last 30 days · thrombocytopenia
In combination with unfractionated heparin, aspirin, and clopidogrel for reduction of major cardiovascular events in patients with ST-segment elevation myocardial infarction (STEMI) intended for primary percutaneous coronary intervention (PCI) (initiated under specialist supervision)

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: 25 micrograms/kg, to be given over 3 minutes at start of percutaneous coronary intervention, then (by intravenous infusion) 150 nanograms/kg/minute for 12–24 hours, maximum duration of treatment 48 hours

- **CONTRA-INDICATIONS** Abnormal bleeding within 30 days—history of aneurysm—history of arteriovenous malformation—history of haemorrhagic stroke—history of intracranial disease—history of neoplasm—increased INR—increased prothrombin time—severe hypertension—stroke within 30 days—thrombocytopenia

- **CAUTIONS** Active peptic ulcer (within 3 months)—acute pericarditis—anaemia—aortic dissection—cardiogenic shock—discontinue if intra-aortic balloon pump necessary—discontinue if thrombolytic therapy necessary—discontinue immediately if serious or uncontrollable bleeding occurs—discontinue if emergency cardiac surgery necessary—elderly—faecal occult blood—haematuria—haemorrhagic retinopathy—low body-weight—major surgery within 3 months (avoid if within 6 weeks)—organ biopsy or lithotripsy within last 2 weeks—puncture of non-compressible vessel within 24 hours—risk of bleeding (within 3 months)—severe heart failure—severe trauma within 3 months (avoid if within 6 weeks)—traumatic or protracted cardiopulmonary resuscitation within last 2 weeks—uncontrolled severe hypertension—vasculitis

- **INTERACTIONS** → Appendix 1: tirofiban

- **SIDE-EFFECTS** Bleeding manifestations—fever—headache—nausea—reversible thrombocytopenia

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of bleeding.

- **RENAL IMPAIRMENT** Reduce infusion to 1 microgram/kg/minute if eGFR 30–50 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Measure baseline prothrombin time, activated partial thromboplastin time, platelet count, haemoglobin, haematocrit and serum creatinine.
  - Monitor haemoglobin, haematocrit and platelets within 6 hours after start of treatment, then at least once daily.

- **MEDICINAL FORMS**

  - **Solution for injection**
    - **Integrilin (GlaxoSmithKline UK Ltd)**
      - Eptifibatide 2 mg per 1 ml Integrilin 20mg/10ml solution for injection vials | 1 vial (POM) £13.61 (Hospital only)

  - **Solution for infusion**
    - **Integrilin (GlaxoSmithKline UK Ltd)**
      - Eptifibatide 750 microgram per 1 ml Integrilin 75mg/100ml solution for infusion vials | 1 vial (POM) £42.79 (Hospital only)

### Tirofiban

- **INDICATIONS AND DOSE**

  In combination with unfractionated heparin, aspirin, and clopidogrel for prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (NSTEMI) and with last episode of chest pain within 12 hours (with angiography planned for 4–48 hours after diagnosis) (initiated under specialist supervision)

  - **BY INTRAVENOUS INFUSION**
    - Adult: Initially 400 nanograms/kg/minute for 30 minutes, then 100 nanograms/kg/minute for at least 48 hours (continue during and for 12–24 hours after percutaneous coronary intervention), maximum duration of treatment 108 hours

  In combination with unfractionated heparin, aspirin, and clopidogrel for prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (NSTEMI) and with last episode of chest pain within 12 hours (with angiography within 4 hours of diagnosis) (initiated under specialist supervision)

  - **INITIALLY BY INTRAVENOUS INJECTION**
    - Adult: 25 micrograms/kg, to be given over 3 minutes at start of percutaneous coronary intervention, then (by intravenous infusion) 150 nanograms/kg/minute for 12–24 hours, maximum duration of treatment 48 hours

- **CONTRA-INDICATIONS** Abnormal bleeding within 30 days—history of aneurysm—history of arteriovenous malformation—history of haemorrhagic stroke—history of intracranial disease—history of neoplasm—increased INR—increased prothrombin time—severe hypertension—stroke within 30 days—thrombocytopenia

- **CAUTIONS** Active peptic ulcer (within 3 months)—acute pericarditis—anaemia—arterial dissection—cardiogenic shock—discontinue if intra-aortic balloon pump necessary—discontinue if thrombolytic therapy necessary—discontinue immediately if serious or uncontrollable bleeding occurs—discontinue if emergency cardiac surgery necessary—elderly—faecal occult blood—haematuria—haemorrhagic retinopathy—low body-weight—major surgery within 3 months (avoid if within 6 weeks)—organ biopsy or lithotripsy within last 2 weeks—puncture of non-compressible vessel within 24 hours—risk of bleeding (within 3 months)—severe heart failure—severe trauma within 3 months (avoid if within 6 weeks)—traumatic or protracted cardiopulmonary resuscitation within last 2 weeks—uncontrolled severe hypertension—vasculitis

- **INTERACTIONS** → Appendix 1: tirofiban

- **SIDE-EFFECTS** Bleeding manifestations—fever—headache—nausea—reversible thrombocytopenia

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of bleeding.

- **RENAL IMPAIRMENT** Use half normal dose if eGFR less than 30 mL/minute/1.73 m². Increased risk of bleeding. Monitor carefully if eGFR less than 60 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor platelet count, haemoglobin and haematocrit before treatment, 2–6 hours after start of treatment and then at least once daily.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Aggrastat®), give continuously in Glucose 5% or Sodium chloride 0.9%. Withdraw 50 mL infusion fluid from 250 mL bag and replace with 50 mL tirofiban concentrate (250 micrograms/mL) to give a final concentration of 50 micrograms/mL.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for infusion**
    - **Aggrastat (Correvio GmbH)**
      - Tirofiban (as Tirofiban hydrochloride) 250 microgram per 1 ml Aggrastat 12.5mg/50ml concentrate for solution for infusion vials | 1 vial (POM) no price available (Hospital only)

    - **Infusion**
      - **ELECTROLYTES:** May contain Sodium
        - **Tirofiban (Non-proprietary)**
          - Tirofiban (as Tirofiban hydrochloride) 50 microgram per 1 ml Tirofiban 12.5mg/250ml infusion bags | 1 bag (POM) £160.72 (Hospital only)
**Piperazine derivatives**

**Ranolazine**

- **Indications and dose**
  - As adjunctive therapy in the treatment of stable angina in patients inadequately controlled or intolerant of first-line antianginal therapies
  - **By mouth**
    - Adult: Initially 375 mg twice daily for 2–4 weeks, then increased to 500 mg twice daily, then adjusted according to response to 750 mg twice daily; reduced if not tolerated to 375–500 mg twice daily

- **Cautions**
  - Body-weight less than 60 kg: elderly: moderate to severe congestive heart failure: QT interval prolongation

- **Interactions** → Appendix 1: ranolazine

- **Side-effects**
  - Common or very common: Asthenia: constipation: dizziness: headache: nausea: vomiting

- **Rare**

- **Pregnancy**
  - Manufacturer advises avoid unless essential—no information available.

- **Breast Feeding**
  - Manufacturer advises avoid—no information available.

- **Renal impairment**
  - Use with caution if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m².

- **Patient and carer advice**
  - Patient alert card to be provided.

- **National funding/access decisions**
  - Scottish Medicines Consortium (SMC) Decisions
    - The Scottish Medicines Consortium has advised (October 2012) that ranolazine (Ranexa®) is not recommended for use within NHS Scotland.

- **Medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Modified-release tablet**
    - CAUTIONARY AND ADVISORY LABELS 25
    - Ranexa (A. Menarini Farmaceutica Internazionale SRL)
      - Ranolazine 375 mg Ranexa 375 mg modified-release tablets | 60 tablet (PoS) £48.98 DT price = £48.98
      - Ranolazine 500 mg Ranexa 500 mg modified-release tablets | 60 tablet (PoS) £48.98 DT price = £48.98
      - Ranolazine 750 mg Ranexa 750 mg modified-release tablets | 60 tablet (PoS) £48.98 DT price = £48.98

**Selective sinus node If inhibitors**

- **Ivabradine**

  - **Indications and dose**
    - Treatment of angina in patients in normal sinus rhythm
    - **By mouth**
      - Adult: Initially 5 mg twice daily for 3–4 weeks, then increased if necessary to 7.5 mg twice daily; reduced if not tolerated to 2.5–5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute
      - Elderly: Initially 2.5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute

  - **Mild to severe chronic heart failure**
    - **By mouth**
      - Adult: Initially 5 mg twice daily for 2 weeks, then increased if necessary to 7.5 mg twice daily; reduced if not tolerated to 2.5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute

  - **Dose adjustments due to interactions**
    - Manufacturer advises reduce initial dose to 2.5 mg twice daily with concurrent use of moderate CYP3A4 inhibitors (except diltiazem, erythromycin and verapamil where concurrent use is contra-indicated).

  - **Contra-indications**
    - Acute myocardial infarction: cardiogenic shock: congenital QT syndrome: do not initiate for angina if heart rate below 70 beats per minute: do not initiate for chronic heart failure if heart rate below 75 beats per minute: immediately after cerebrovascular accident: patients dependent on pacemaker: second- and third-degree heart block: severe hypotension: sick-sinus syndrome: sino-atrial block: unstable angina: unstable or acute heart failure

  - **Cautions**
    - Atrial fibrillation or other arrhythmias (treatment ineffective): elderly: in angina, consider stopping if there is no or limited symptom improvement after 3 months: intraventricular conduction defects: mild to moderate hypotension (avoid if severe): retinitis pigmentosa

  - **Interactions** → Appendix 1: ivabradine

  - **Side-effects**
    - Common or very common: Atrial fibrillation: blurred vision: bradycardia: dizziness: first-degree heart block: headache: phosphenes: ventricular extrasystoles: visual disturbances
    - Very rare: Second and third-degree heart block: sick sinus syndrome

  - **Pregnancy**
    - Manufacturer advises avoid—toxicity in animal studies.

  - **Breast Feeding**
    - Present in milk in animal studies—manufacturer advises avoid.

  - **Renal impairment**
    - Manufacturer advises caution in moderate impairment. Avoid in severe impairment.

  - **Monitoring requirements**
    - Monitor regularly for atrial fibrillation (consider benefits and risks of continued treatment if atrial fibrillation occurs).
    - Monitor for bradycardia, especially after any dose increase, and discontinue if resting heart rate persistently below 50 beats per minute or continued symptoms of bradycardia despite dose reduction.
NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- **Ivabradine for the treatment of chronic heart failure (November 2012) NICE TA267**
  - Ivabradine, in combination with standard therapy including a beta-blocker (unless contra-indicated or not tolerated), an ACE inhibitor, and an aldosterone antagonist, is an option for treating mild to severe stable chronic heart failure in patients who:
    - have a left ventricular ejection fraction of < 35%, and
    - are in sinus rhythm with a heart rate of >75 beats per minute
  - Ivabradine should be initiated only by a heart failure specialist after 4 weeks of stable optimal standard therapy; monitoring and dose titration should be carried out by a heart failure specialist, or a GP with special interest in heart failure, or by a heart failure specialist nurse.
  - **www.nice.org.uk/TA267**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2012) that ivabradine (Procoralan®) is accepted for restricted use within NHS Scotland in accordance with its licensed indication for heart failure only if resting heart rate remains >75 beats per minute despite optimal standard therapy.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Procoralan** (Servier Laboratories Ltd)
  - Ivabradine (as ivabradine hydrochloride) 5 mg Procoralan 5 mg tablets | 56 tablet [DT] £40.17 DT price = £40.17
  - Ivabradine (as ivabradine hydrochloride) 7.5 mg Procoralan 7.5 mg tablets | 56 tablet [DT] £40.17 DT price = £40.17

VASODILATORS POTASSIUM-CHANNEL OPENERS

**Nicorandil**

24-Feb-2016

- **INDICATIONS AND DOSE**
  - **Prophylaxis and treatment of stable angina (second-line)**
    - **BY MOUTH**
      - Adult: Initially 5–10 mg twice daily, then increased if tolerated to 40 mg twice daily; usual dose 10–20 mg twice daily, use lower initial dose regimen if patient susceptible to headache

- **CONTRA-INDICATIONS**
  - Acute pulmonary oedema · cardiogenic shock · hypovolaemia · left ventricular failure with low filling pressures · severe hypotension

- **CAUTIONS**
  - Acute myocardial infarction with acute left ventricular failure and low filling pressures · diverticular disease (risk of fistula formation or bowel perforation) · G6PD deficiency · heart failure (class III–IV) · hyperkalaemia · low systolic blood pressure

- **INTERACTIONS**
  - **Appendix 1: nicorandil**

- **SIDE-EFFECTS**
  - **Common or very common** Cutaneous vasodilation with flushing · dizziness · headache (especially on initiation, usually transitory) · increase in heart rate (at high doses) · nausea · rectal bleeding · vomiting · weakness
  - **Uncommon** Angiodyema · hypotension · myalgia · oral ulceration
  - **Rare** Abdominal pain · anal ulceration · cholestasis · gastrointestinal ulceration · hepatitis · jaundice · pruritus · rash · skin ulceration
  - **Very rare** Eye ulceration
  - **Frequency not known** Gastrointestinal haemorrhage

SIDE-EFFECTS, FURTHER INFORMATION

- **Nicorandil-induced ulceration** Nicorandil can cause serious skin, mucosal, and eye ulceration; including gastrointestinal ulcers, which may progress to perforation, haemorrhage, fistula or abscess. Stop treatment if ulceration occurs and consider an alternative.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** No information available—manufacturer advises avoid.

- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks** Patients should be warned not to drive or operate machinery until it is established that their performance is unimpaired.

- **MEDICINAL FORMS**
  - **Tablet**
    - **Nicorandil (Non-proprietary)**
      - Nicorandil 10 mg Nicorandil 10mg tablets | 60 tablet [POM] £7.71 DT price = £2.15
      - Nicorandil 20 mg Nicorandil 20mg tablets | 60 tablet [POM] £14.64 DT price = £4.24
    - **Ikorel (Zentiva)**
      - Nicorandil 10 mg Ikorel 10mg tablets | 60 tablet [POM] £7.71 DT price = £2.15
      - Nicorandil 20 mg Ikorel 20mg tablets | 60 tablet [POM] £14.64 DT price = £4.24

7.1 Acute coronary syndromes

Acute coronary syndromes

**Overview**

Acute coronary syndromes encompass a spectrum of conditions which include unstable angina, and myocardial infarction with or without ST-segment elevation. Patients with different acute coronary syndromes may present similarly; definitive diagnosis is made on the basis of clinical presentation, ECG changes, and measurement of biochemical cardiac markers.

Unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI)

These are related acute coronary syndromes that fall between the classifications of stable angina and ST-segment elevation myocardial infarction (STEMI). They usually occur as a result of atheromatous plaque rupture, and are often characterised by stable angina that suddenly worsens, recurring or prolonged angina at rest, or new onset of severe angina. Patients with unstable angina have no evidence of myocardial necrosis, whereas in NSTEMI, myocardial necrosis (less significant than with STEMI) will be evident. There is a risk of progression to STEMI or sudden death, particularly in patients who experience pain at rest.

Management of unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI)

These conditions are managed similarly; the aims of management are to provide supportive care and pain relief during the acute attack and to prevent further cardiac events and death. For advice on the management of patients with acute ST-segment elevation myocardial infarction (STEMI), see below.

**Initial management**

- **Oxygen** should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hypoxia should be avoided and particular care
is required in patients with chronic obstructive airways disease. **Nitrates** are used to relieve ischaemic pain. If sublingual glyceryl trinitrate p. 212 is not effective, intravenous or buccal glyceryl trinitrate or intravenous isosorbide dinitrate p. 214 is given. If pain continues, diamorphine hydrochloride p. 433 or morphine p. 439 can be given by slow intravenous injection; an antiemetic such as metoclopramide hydrochloride 411 should also be given.

Aspirin p. 117 (chewed or dispersed in water) is given for its antiplatelet effect. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel p. 119 should also be given. Prasugrel p. 208 is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance). Ticagrelor p. 209 is also an alternative to clopidogrel (see NICE guidance). Patients should also receive either heparin (unfractionated) p. 128, a **low molecular weight heparin**, or fondaparinux sodium p. 123.

Patients without contra-indications should receive **beta-blockers** which should be continued indefinitely. In patients without left ventricular dysfunction and in whom beta-blockers are inappropriate, diltiazem hydrochloride p. 152 or verapamil hydrochloride p. 159 can be given.

The glycoprotein IIb/IIIa inhibitors eptifibatide p. 203 (in combination with heparin (unfractionated) and aspirin) and tirofiban p. 204 (in combination with heparin (unfractionated), aspirin, and clopidogrel) can be used for unstable angina or for NSTEMI in patients at a high risk of either myocardial infarction or death.

In intermediate- and high-risk patients, abciximab p. 203 or eptifibatide (in combination with heparin (unfractionated) and aspirin), or tirofiban (in combination with heparin (unfractionated), aspirin, and clopidogrel) can also be used in patients undergoing percutaneous coronary intervention, to reduce the immediate risk of vascular occlusion. In intermediate- and high-risk patients in whom early intervention is planned, bivalirudin p. 130 can be considered as an alternative to the combination of a glycoprotein IIb/IIIa inhibitor plus a heparin.

Revascularisation procedures are often appropriate for patients with unstable angina or NSTEMI; see Antiplatelet drugs p. 117 for the use of antiplatelet drugs in patients undergoing coronary stenting.

**Long-term management**

The need for long-term angina treatment or for coronary angiography should be assessed. Most patients will require standard angina treatment to prevent recurrence of symptoms.

**ST-segment elevation myocardial infarction (STEMI)**

This is an acute coronary syndrome where atheromatous plaque rupture leads to thrombosis and myocardial ischaemia, with irreversible necrosis of the heart muscle, often leading to long-term complications. STEMI can also occasionally occur as a result of coronary spasm or embolism, arteritis, spontaneous thrombosis, or sudden severe elevation in blood pressure.

**Management of ST-segment elevation myocardial infarction (STEMI)**

These notes give an overview of the initial and long-term management of myocardial infarction with ST segment elevation (STEMI). For advice on the management of non-ST-segment elevation myocardial infarction (NSTEMI) and unstable angina, see above. The aims of management of STEMI are to provide supportive care and pain relief, to promote reperfusion and to reduce mortality. Oxygen, nitrates, and diamorphine hydrochloride or morphine can provide initial support and pain relief; aspirin and percutaneous coronary intervention or thrombolitics promote reperfusion; anticoagulants help to reduce re-occlusion and systemic embolisation; long-term use of aspirin, beta-blockers, ACE inhibitors, and statins help to reduce mortality further.

Local guidelines for the management of myocardial infarction should be followed where they exist.

**Initial management**

**Oxygen** should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hyperoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

The pain (and anxiety) of myocardial infarction is managed with slow intravenous injection of diamorphine hydrochloride or morphine; an antiemetic such as metoclopramide hydrochloride (or, if left ventricular function is not compromised, cyclizine p. 409) by intravenous injection should also be given.

Aspirin (chewed or dispersed in water) is given for its antiplatelet effect. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel, should also be given. Prasugrel, is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance). Ticagrelor, is also an alternative to clopidogrel (see NICE guidance).

Patency of the occluded artery can be restored by percutaneous coronary intervention or by giving a **thrombolytic drug**, unless contra-indicated. Percutaneous coronary intervention is the preferred method; a **glycoprotein IIb/IIIa inhibitor** can be used to reduce the risk of immediate vascular occlusion in intermediate- and high-risk patients. Patients undergoing percutaneous coronary intervention should also receive either heparin (unfractionated) or a low molecular weight heparin (e.g. enoxaparin sodium p. 127); bivalirudin is an alternative to the combination of a glycoprotein IIb/IIIa inhibitor plus a heparin (see also NICE guidance). In patients who cannot be offered percutaneous coronary intervention within 90 minutes of diagnosis, a thrombolytic drug should be administered along with either heparin (unfractionated) (for maximum 2 days), a low molecular weight heparin (e.g. enoxaparin sodium), or fondaparinux sodium. See use of antiplatelet drugs in patients undergoing coronary stenting in Antiplatelet drugs p. 177.

Patients who do not receive reperfusion therapy (with percutaneous coronary intervention or a thrombolytic) should be treated with either fondaparinux sodium, enoxaparin sodium, or heparin (unfractionated). Prescribers should consult product literature and local protocols (where they exist) for details of anticoagulant dose and duration.

**Nitrates** are used to relieve ischaemic pain. If sublingual glyceryl trinitrate p. 212 is not effective, intravenous glyceryl trinitrate or isosorbide dinitrate p. 214 is given.

Early administration of some **beta-blockers** has been shown to be of benefit and should be given to patients without contra-indications.

**ACE inhibitors**, and angiotensin-II receptor antagonists if an ACE inhibitor cannot be used, are also of benefit to patients who have no contra-indications; in hypertensive and normotensive patients treatment with an ACE inhibitor, or an angiotensin-II receptor antagonist, can be started within 24 hours of the myocardial infarction and continued for at least 5–6 weeks (see below for long-term treatment). All patients should be closely monitored for hyperglycaemia; those with diabetes or raised blood-glucose concentration should receive insulin p. 673.

**Long-term management**

Long-term management following STEMI involves the use of several drugs which should ideally be started before the patient is discharged from hospital.

Aspirin p. 117 should be given to all patients, unless contra-indicated. The addition of clopidogrel p. 119 has been shown to reduce morbidity and mortality. Prasugrel p. 208 or
ticagrelor p. 209 are alternatives to clopidogrel in certain patients. For those intolerant of clopidogrel, and who are at low risk of bleeding, the combination of warfarin sodium p. 135 and aspirin should be considered. In those intolerant of both aspirin and clopidogrel, warfarin sodium alone can be used. Warfarin sodium should be continued for those who are already being treated for another indication, such as atrial fibrillation, with the addition of aspirin if there is a low risk of bleeding. The combination of aspirin with clopidogrel or warfarin sodium increases the risk of bleeding. Low-dose rivaroxaban p. 123, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following STEMI—see Prevention of cardiovascular events. For details of antiplatelet drug duration following coronary stenting—see also Antiplatelet drugs and coronary stents in Antiplatelet drugs p. 117.

- **Beta-blockers** should be given to all patients in whom they are not contra-indicated. Acetobutolol p. 146, metoprolol tartrate p. 149, propranolol hydrochloride p. 145 and timolol maleate p. 146 are suitable; for patients with left ventricular dysfunction, carvedilol p. 143, bisoprolol fumarate p. 148, or long-acting metoprolol tartrate may be appropriate.

- **Diltiazem hydrochloride** p. 152 (unlicensed) or verapamil hydrochloride p. 159 can be considered if a beta-blocker cannot be used; however, they are contra-indicated in those with left ventricular dysfunction. Other calcium-channel blockers have no place in routine long-term management after a myocardial infarction.

An **ACE inhibitor** should be considered for all patients, especially those with evidence of left ventricular dysfunction. If an ACE inhibitor cannot be used, an angiotensin-II receptor antagonist may be used for patients with heart failure. A relatively high dose of either the ACE inhibitor or angiotensin-II receptor antagonist may be required to produce benefit.

**Nitrates** are used for patients with angina.

Eplerenone p. 185 is licensed for use following a myocardial infarction in those with left ventricular dysfunction and evidence of heart failure.

See also the role of **statins** in preventing recurrent cardiovascular events in Lipid-regulating drugs p. 188.

**Prevention of cardiovascular events**

Patients with stable angina, unstable angina, or NSTEMI should be given advice and treatments to reduce their cardiovascular risk. The importance of life-style changes, especially stopping smoking, should be emphasised. Aspirin should be given indefinitely. Antihypertensive treatment should be initiated if appropriate, and a **statin** should also be given.

In patients with stable angina, addition of an **ACE inhibitor** should be considered for patients with diabetes (and should be continued if indicated for a co-morbidity).

In patients with unstable angina or NSTEMI, clopidogrel is given, in combination with aspirin, for up to 12 months—most benefit occurs during the first 3 months. Prasugrel or ticagrelor are alternatives to clopidogrel in certain patients. An ACE inhibitor should also be given.

Low-dose rivaroxaban, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers.

**Other drugs used for Acute coronary syndromes**

Captopril, p. 163  •  Dalteparin sodium, p. 126  •  Lisinopril, p. 165  •  Perindopril arginine, p. 166  •  Perindopril erbumine, p. 167  •  Ramipril, p. 168  •  Trandolapril, p. 169  •  Valsartan, p. 174

**Antithrombotic Drugs**  •  **Antiplatelet Drugs**

**Prasugrel**

- **INDICATIONS AND DOSE**

  In combination with aspirin for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention

  - **BY MOUTH**
    - Adult 18–74 years (body-weight up to 60 kg): Initially 60 mg for 1 dose, then 5 mg once daily usually for up to 12 months
    - Adult 18–74 years (body-weight 60 kg and above): Initially 60 mg for 1 dose, then 10 mg once daily usually for up to 12 months
    - Adult 75 years and over: Initially 60 mg for 1 dose, then 5 mg once daily usually for up to 12 months

Patients undergoing coronary angiography within 48 hours of admission for unstable angina or NSTEMI

  - **BY MOUTH**
    - Adult: Loading dose 60 mg, not to be administered until the time of percutaneous coronary intervention in order to minimise the risk of bleeding, maintenance dose of 10 mg or 5 mg daily should then be selected as appropriate based on age and weight

Alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention

  - **BY MOUTH**
    - Adult: 60 mg, as a single dose

- **CONTRA-INDICATIONS**
  - Active bleeding · history of stroke or transient ischaemic attack

- **CAUTIONS**
  - Body-weight less than 60 kg · discontinue at least 7 days before elective surgery if antiplatelet effect not desirable · elderly · patients at increased risk of bleeding (e.g. from recent trauma, surgery, gastro-intestinal bleeding, or active peptic ulcer disease)

- **INTERACTIONS**  → Appendix 1: prasugrel

- **SIDE-EFFECTS**
  - Common or very common  
    - Anaemia  
    - Gastro-intestinal haemorrhage  
    - Haematoma  
    - Haematuria  
    - Haemorrhage  
    - Intracranial haemorrhage  
  - Uncommon  
    - Angioedema  
    - Hypersensitivity reactions  
    - Rare  
    - Thrombocytopenia  
    - Frequency not known  
    - Thrombotic thrombocytopenic purpura

- **ALLERGY AND CROSS-SENSITIVITY**
  - Caution in patients with history of hypersensitivity reactions to thienopyridines (e.g. clopidogrel).

- **PREGNANCY**
  - Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT**
  - Use with caution in moderate impairment—increased risk of bleeding. Avoid in severe impairment.

- **RENAL IMPAIRMENT**
  - Use with caution—increased risk of bleeding.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NICE technology appraisals (TAs)**

  - Prasugrel with percutaneous coronary intervention for treating acute coronary syndromes (July 2014) NICE TA317

  Prasugrel 10 mg in combination with aspirin is recommended as an option, within its marketing authorisation, for preventing atherothrombotic events in adults with acute coronary syndrome (unstable angina (UA), non-ST segment elevation myocardial infarction
(NSTEMI) or ST segment elevation myocardial infarction (STEMI) having primary or delayed percutaneous coronary intervention.

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (August 2009) that prasugrel (Efient®), in combination with aspirin, be accepted for restricted use within NHS Scotland for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention who are eligible to receive the 10 mg dose of prasugrel.

### Medicinal Forms
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Efient (Eli Lilly and Company Ltd)
  - Prasugrel (as Prasugrel hydrochloride) 5 mg Efient 5mg tablets | 28 tablet | £47.56 DT price = £47.56
  - Prasugrel (as Prasugrel hydrochloride) 10 mg Efient 10mg tablets | 28 tablet | £47.56 DT price = £47.56

### Ticagrelor

#### Indications and Dose
In combination with aspirin for the prevention of atherothrombotic events in patients with acute coronary syndrome
- **By Mouth**
  - Adult: Initially 180 mg for 1 dose, then 90 mg twice daily usually for up to 12 months
**Alternative to clopidogrel in patients undergoing percutaneous coronary intervention**
- **By Mouth**
  - Adult: 180 mg, as a single dose

#### Contraindications
- Active bleeding - history of intracranial haemorrhage

#### Cautions
- Asthma - bradycardia (unless pacemaker fitted)
  - chronic obstructive pulmonary disease - discontinue 7 days before elective surgery if antiplatelet effect not desirable - history of hyperuricaemia - patients at increased risk of bleeding (e.g. from recent trauma, surgery, gastrointestinal bleeding, or coagulation disorders) - second- or third-degree AV block (unless pacemaker fitted)
  - sick sinus syndrome (unless pacemaker fitted)

#### Interactions
- → Appendix 1: ticagrelor

#### Side-effects
- **Common or very common** Bruising - dyspnoea - haemorrhage
  - Abdominal pain - diarrhoea - dizziness
  - dyspepsia - gastritis - headache - nausea - pruritus - rash - vomiting
  - Rare Confusion - constipation - hyperuricaemia - parasthesia - raised serum creatinine - vertigo

#### Pregnancy
- Manufacturer advises avoid — toxicity in animal studies.

#### Breast Feeding
- Manufacturer advises avoid — present in milk in animal studies.

#### Hepatic Impairment
- Avoid in moderate or severe impairment — no information available.

#### Monitoring Requirements
- Monitor renal function 1 month after initiation.

#### National Funding/Access Decisions

**NICE technology appraisals (TAs)**
- Ticagrelor for the treatment of acute coronary syndromes (October 2011) NICE TA236
  - Ticagrelor, in combination with low-dose aspirin, is recommended for up to 12 months as a treatment option in adults with acute coronary syndromes, that is, people:
    - with ST-segment elevation myocardial infarction—defined as ST elevation or new left bundle branch block on electrocardiogram—that cardiologists intend to treat with primary percutaneous coronary intervention, or
    - with non-ST-segment elevation myocardial infarction (NSTEMI), or
    - admitted to hospital with unstable angina—defined as ST or T wave changes on electrocardiogram suggestive of ischaemia plus one of the characteristics defined below. Before ticagrelor is continued beyond the initial treatment, the diagnosis of unstable angina should first be confirmed, ideally by a cardiologist. Characteristics to be used in defining treatment with ticagrelor for unstable angina are:
      - age 60 years or older,
      - previous myocardial infarction or previous coronary artery bypass grafting,
      - coronary artery disease with stenosis of 50% or more in at least two vessels,
      - previous ischaemic stroke,
      - previous transient ischaemic attack, carotid stenosis of at least 50%, or cerebral revascularisation,
      - diabetes mellitus,
      - peripheral arterial disease, or
      - chronic renal dysfunction (creatinine clearance less than 60 mL/minute/1.73 m²).
  
  www.nice.org.uk/TA236

- Ticagrelor for preventing atherothrombotic events after myocardial infarction (December 2016) NICE TA420
  - Ticagrelor, in combination with aspirin, is recommended within its marketing authorisation as an option for preventing atherothrombotic events in adults who had a myocardial infarction and who are at high risk of a further event. Treatment should be stopped when clinically indicated or at a maximum of 3 years.
  
  www.nice.org.uk/TA420

#### Medicinal Forms
- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Brilique (AstraZeneca UK Ltd)
  - Ticagrelor 60 mg Brilique 60mg tablets | 56 tablet | £54.60 DT price = £54.60
  - Ticagrelor 90 mg Brilique 90mg tablets | 56 tablet | £54.60 DT price = £54.60

### Antithrombotic Drugs

**Tissue Plasminogen Activators**

### Fibrinolytic Drugs

**Overview**
The value of thrombolytic drugs for the treatment of myocardial infarction has been established. Streptokinase p. 211 and alteplase p. 210 have been shown to reduce mortality. Reteplase p. 211 and tenecteplase p. 211 are also licensed for acute myocardial infarction. Thrombolytic drugs are indicated for any patient with acute myocardial infarction for whom the benefit is likely to outweigh the risk of treatment. Trials have shown that the benefit is greatest in those with ECG changes that include ST segment elevation (especially in those with anterior infarction) and in patients with bundle branch block. Patients should not be denied thrombolytic treatment on account of age alone because...
mortality in the elderly is high and the reduction in mortality is the same as in younger patients. Alteplase should be given within 6–12 hours of symptom onset, retpalase and streptokinase within 12 hours of symptom onset, but ideally all should be given within 1 hour; use after 12 hours requires specialist advice. Tenecteplase should be given as early as possible and usually within 6 hours of symptom onset. Alteplase, streptokinase and urokinase p. 133 can be used for other thromboembolic disorders such as deep-vein thrombosis and pulmonary embolism. Alteplase is also used for acute ischaemic stroke. Urokinase is also licensed to restore the patency of the placenta in the first 18 weeks of pregnancy. There is also a risk of maternal haemorrhage throughout pregnancy and post-partum, and also a theoretical risk of fetal haemorrhage throughout pregnancy.

**Hepatic Impairment** Avoid in severe hepatic impairment as there is an increased risk of bleeding.

### Fibrinolytics

- **Drug Action** Fibrinolytic drugs act as thrombolytics by activating plasminogen to form plasmin, which degrades fibrin and so breaks up thrombi.
- **Contra-Indications** Active pulmonary disease with cavitation or recent surgery (including dental extraction); recent symptoms of possible peptic ulceration; recent trauma; recent symptoms of possible cerebral bleeding; hypotension can usually be controlled by elevating the patient’s legs, or by reducing the rate of infusion or stopping it temporarily.
- **Caution** Conditions in which thrombolysis might give rise to embolic complications such as enlarged left atrium with atrial fibrillation (risk of dissolution of clot and subsequent embolisation); elderly; external chest compression; hypertension; risk of bleeding (including that from venuepuncture or invasive procedures).
- **Side-Effects** Allergic reactions; anaphylaxis; angina (when used in myocardial infarction); back pain; bleeding (usually limited to the site of injection, but can occur from other sites); cerebral oedema (caused by reperfusion); convulsions; fever; flushing; hypotension; intracerebral haemorrhage; nausea; pulmonary oedema (caused by reperfusion); rash; recurrent ischaemia (when used in myocardial infarction); reperfusion arrhythmias (when used in myocardial infarction); uveitis; vomiting.

**Side-Effects, Further Information**

- **Bleeding** Serious bleeding calls for discontinuation of the thrombolytic and may require administration of coagulation factors and antifibrinolytic drugs (e.g. tranexamic acid). Rarely further embolism may occur (either due to clots that break away from the original thrombus or to cholesterol crystal emboli).
- **Hypotension** Hypotension can usually be controlled by elevating the patient’s legs, or by reducing the rate of infusion or stopping it temporarily.
- **Pregnancy** Thrombolytic drugs can possibly lead to premature separation of the placenta in the first 18 weeks of pregnancy. There is also a risk of maternal haemorrhage throughout pregnancy and post-partum, and also a theoretical risk of fetal haemorrhage throughout pregnancy.

### Alteplase

(rt-PA; Tissue-type plasminogen activator)

- **Indications and Dose**
  - **Acute Myocardial Infarction, Accelerated Regimen**
    - Initially by intravenous injection
    - Adult (body-weight up to 65 kg): Initially 15 mg, to be initiated within 6 hours of symptom onset, followed by (by intravenous infusion) 0.75 mg/kg, to be given over 30 minutes, then (by intravenous infusion) 0.5 mg/kg, to be given over 60 minutes, maximum total dose of 100 mg administered over 90 minutes
    - Adult (body-weight 65 kg and above): Initially 15 mg, to be initiated within 6 hours of symptom onset, followed by (by intravenous infusion) 50 mg, to be given over 60 minutes, then (by intravenous infusion) 35 mg, to be given over 60 minutes, maximum total dose of 100 mg administered over 90 minutes
  - **Acute Myocardial Infarction**
    - Initially by intravenous injection
    - Adult: Initially 10 mg, to be initiated within 6–12 hours of symptom onset, followed by (by intravenous infusion) 50 mg, to be given over 60 minutes, then (by intravenous infusion) 10 mg infusion dose to be given over 30 minutes, total dose of 100 mg over 3 hours; maximum 1.5 mg/kg in patients less than 65 kg
  - **Pulmonary embolism**
    - Initially by intravenous injection
    - Adult: Initially 10 mg, to be given over 1–2 minutes, followed by (by intravenous infusion) 90 mg, to be given over 2 hours, maximum 1.5 mg/kg in patients less than 65 kg
  - **Acute Ischaemic Stroke (Under Specialist Neurology Physician Only)**
    - By intravenous infusion
    - Adult 18–79 years: Initially 900 micrograms/kg (max. per dose 90 mg), treatment must begin within 4.5 hours of symptom onset, to be given over 60 minutes, the initial 10% of dose is to be administered by intravenous injection and the remainder by intravenous infusion

### ACTILYSE CATHFLO®

Thrombolytic treatment of occluded central venous access devices (including those used for haemodialysis)

- **By intravenous injection**
- Adult: (Consult product literature)

- **Contra-Indications**
  - When used for acute ischaemic stroke
  - Convulsion accompanying stroke
  - History of stroke in patients with diabetes
  - Hyperglycaemia
  - Hypoglycaemia
  - Severe stroke
  - Stroke in last 3 months

- **Interactions** → Appendix 1: alteplase

- **Side-Effects** Risk of cerebral bleeding increased in acute stroke

- **Allergy and Cross-Sensitivity** Contra-indicated if history of hypersensitivity to gentamicin (residue from manufacturing process).

- **Monitoring Requirements**
  - When used for acute ischaemic stroke
  - Monitor for intracranial haemorrhage, and monitor blood pressure (antihypertensive recommended if systolic above 180 mmHg or diastolic above 105 mmHg).

- **Directions for Administration** For intravenous infusion (Actilyse®), give intermittently or continuously in Sodium chloride 0.9%; dissolve in water for injections to a concentration of 1 mg/mL or 2 mg/mL and infuse intravenously; alternatively dilute the solution further in...
the infusion fluid to a concentration of not less than 200 micrograms/mL; not to be infused in glucose solution.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Actilyse for the treatment of acute ischaemic stroke (September 2012) NICE TA264
      - Actilyse is recommended for the treatment of acute ischaemic stroke in adults in accordance with its licensed indication if:
        - treatment is started as early as possible within 4.5 hours of onset of stroke symptoms, and
        - intracranial haemorrhage has been excluded by appropriate imaging techniques.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection.
    - **Actilyse** (Boehringer Ingelheim Ltd)
      - Actilyse 10 mg: Actilyse 10mg powder and solvent for solution for injection vials | 1 vial (POM) £172.80
      - Actilyse 20 mg: Actilyse 20mg powder and solvent for solution for injection vials | 1 vial (POM) £259.20
    - **Actilyse Cathflo** (Boehringer Ingelheim Ltd)
      - Actilyse 10 mg: Actilyse Cathflo 2mg powder and solvent for solution for injection vials | 5 vial (Hospital only) £225.00

- **Powder and solvent for solution for infusion**
  - **Actilyse** (Boehringer Ingelheim Ltd)
    - Actilyse 50 mg: Actilyse 50mg powder and solvent for solution for infusion vials | 1 vial (POM) £432.00

- **Tenecteplase**
  - **INDICATIONS AND DOSE**
    - **Acute myocardial infarction**
      - **BY INTRAVENOUS INJECTION**
        - Adult: 30–50 mg (max. per dose 50 mg), dose to be given over 10 seconds and Initiated within 6 hours of symptom onset, dose varies according to body weight—consult product literature
    - **INTERACTIONS** → Appendix 1: tenecteplase
    - **BREAST FEEDING** Manufacturer advises avoid breastfeeding for 24 hours after dose (express and discard milk during this time).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Powder and solvent for solution for injection**
      - **Streptokinase (Non-proprietary)**
        - Streptokinase 1.5 mega u: Biofactor Streptokinase 1.5million unit powder for solution for infusion vials | 1 vial (POM) £83.44
        - Streptokinase 250000 unit: Biofactor Streptokinase 250,000unit powder for solution for infusion vials | 1 vial (POM) £15.91
        - Streptokinase 750000 unit: Biofactor Streptokinase 750,000unit powder for solution for infusion vials | 1 vial (POM) £41.72

- **Streptokinase**
  - **INDICATIONS AND DOSE**
    - **Acute myocardial infarction**
      - **BY INTRAVENOUS INJECTION**
        - Adult: 1 500 000 units, to be initiated within 12 hours of symptom onset, dose to be given over 60 minutes
      - **Deep-vein thrombosis | Pulmonary embolism | Acute arterial thromboembolism | Central retinal venous or arterial thrombosis**
        - **BY INTRAVENOUS INJECTION**
          - Adult: 250 000 units, dose to be given over 30 minutes, then 100 000 units every 1 hour for up to 12–72 hours, duration is adjusted according to condition with monitoring of clotting parameters (consult product literature)
    - **INTERACTIONS** → Appendix 1: streptokinase
    - **SIDE-EFFECTS**
      - Rare: Guillain-Barré syndrome

- **ALLERGY AND CROSS-SENSITIVITY**
  - Contra-indicated if previous allergic reaction to either streptokinase or anistreplase (no longer available). Prolonged persistence of antibodies to streptokinase and anistreplase (no longer available) can reduce the effectiveness of subsequent treatment; therefore, streptokinase should not be used again beyond 4 days of first administration of either streptokinase or anistreplase.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion (Streptase®), give continuously or intermittently; reconstitute with sodium chloride 0.9%, then dilute further with Glucose 5% or Sodium Chloride 0.9% after reconstitution.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Powder for solution for infusion**
      - **Tenecteplase**
        - Tenecteplase 8000 unit: Biofactor Tenecteplase 8000unit powder and solvent for solution for injection vials | 1 vial (POM) £85.61

- **NITRATES**
  - **Overview**
    - Nitrates have a useful role in angina. Although they are potent coronary vasodilators, their principal benefit follows from a reduction in venous return which reduces left ventricular work. Unwanted effects such as flushing, headache, and postural hypotension may limit therapy, especially when angina is severe or when patients are unusually sensitive to the effects of nitrates.

    - **Sublingual glyceryl trinitrate** p. 212 is one of the most effective drugs for providing rapid symptomatic relief of angina, but its effect lasts only for 20 to 30 minutes; the 300-microgram tablet is often appropriate when glyceryl trinitrate is first used. The aerosol spray provides an alternative method of rapid relief of symptoms for those who find difficulty in dissolving sublingual preparations. Duration of action may be prolonged by transdermal preparations (but tolerance may develop).
Isosorbide dinitrate p. 214 is active sublingually and is a more stable preparation for those who only require nitrates infrequently. It is also effective by mouth for prophylaxis; although the effect is slower in onset, it may persist for several hours. Duration of action of up to 12 hours is claimed for modified-release preparations. The activity of isosorbide dinitrate may depend on the production of active metabolites, the most important of which is isosorbide mononitrate p. 214. Isosorbide mononitrate itself is also licensed for angina prophylaxis; modified-release formulations (for once daily administration) are available.

Glyceryl trinitrate or isosorbide dinitrate may be tried by intravenous injection when the sublingual form is ineffective in patients with chest pain due to myocardial infarction or severe ischaemia. Intravenous injections are also useful in the treatment of congestive heart failure.

### Nitrates

**CONTRA-INDICATIONS**
- Aortic stenosis
- Cardiac tamponade
- Constrictive pericarditis
- Hypertrophic cardiomyopathy
- Hypotensive conditions
- Hypovolaemia
- Marked anaemia
- Mitral stenosis
- Raised intracranial pressure due to head trauma
- Toxic pulmonary oedema

**CAUTIONS**
- Heart failure due to obstruction
- Hyperthermia
- Hypothyroidism
- Hypoxaemia
- Malnutrition
- Metal-containing transdermal systems should be removed before magnetic resonance imaging procedures, cardioversion, or diathermy
- Recent history of myocardial infarction
- Susceptibility to angle-closure glaucoma
- Tolerance
- Ventilation and perfusion abnormalities

**CAUTIONS, FURTHER INFORMATION**
- Tolerance: Many patients on long-acting or transdermal nitrates rapidly develop tolerance (with reduced therapeutic effects). Reduction of blood-nitrate concentrations to low levels for 4 to 12 hours each day usually maintains effectiveness in such patients. If tolerance is suspected during the use of transdermal patches they should be left off for 8–12 hours (usually overnight) in each 24 hours; in the case of modified-release tablets of isosorbide dinitrate (and conventional formulations of isosorbide mononitrate), the second of the two daily doses should be given after about 8 hours rather than after 12 hours. Conventional formulations of isosorbide mononitrate should not usually be given more than twice daily unless small doses are used; modified-release formulations of isosorbide mononitrate should only be given once daily, and used in this way do not produce tolerance.

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- **Common or very common**: Dizziness, postural hypotension, tachycardia, throbbing headache
- **Uncommon**: Flushing, heartburn, nausea, rash, syncope, temporary hypoxaemia, vomiting
- **Very rare**: Angle-closure glaucoma
- **Frequency not known**: Paradoxical bradycardia

**SPECIFIC SIDE-EFFECTS**
- **Uncommon**: With transdermal use: Application site reactions with transdermal patches
- **Frequency not known**: With intravenous use: Abdominal pain, apprehension, diaphoresis, muscle twitching, palpitation; prolonged administration has been associated with methaemoglobinemia, restlessness, retrosternal discomfort, severe hypotension

### Nitroglycerin

**INDICATIONS AND DOSE**

**Prophylaxis and treatment of angina**
- **By sublingual administration using sublingual tablets**
  - Adult: 0.3–1 mg, dose may be repeated as required

**Control of hypertension and myocardial ischaemia during and after cardiac surgery**
- Induction of controlled hypotension during surgery
- Congestive heart failure
- Unstable angina
  - **By intravenous infusion**
    - Adult: 10–200 micrograms/minute (max. per dose 400 micrograms/minute), adjusted according to response
  - Adult: 1–2 sprays, dose be administered under tongue and then close mouth

**Anal fissure**
- **By rectum using ointment**
  - Adult: Apply 2.5 centimetres every 12 hours until pain stops. Max. duration of use 8 weeks, apply to anal canal, 2.5 cm of ointment contains 1.5 mg of glyceryl trinitrate

**Deponit (R)**

**Prophylaxis of angina**
- **By transdermal application**
  - Adult: One ‘5’ or one ‘10’ patch to be applied to lateral chest wall, upper arm, thigh, abdomen, or shoulder; increase to two ‘10’ patches every 24 hours if necessary, to be replaced every 24 hours, sitting replacement patch on different area

**Minitran (R)**

**Prophylaxis of angina**
- **By transdermal application**
  - Adult: One ‘5’ patch to be applied to chest or upper arm; replace every 24 hours, sitting replacement patch on different area, dose to be altered according to response

**Maintenance of venous patency (‘5’ patch only)**
- **By transdermal application**
  - Adult: (consult product literature)
Prophylaxis of angina
▶ BY TRANSDERMAL APPLICATION
▶ Adult: One 0.2mg/h patch to be applied to chest or outer upper arm and replaced every 24 hours, siting replacement patch on different area, dose adjusted according to response; maximum 15 mg per day

Prophylaxis of angina
▶ TO THE SKIN
▶ Adult: Usual dose 1–2 inches every 3–4 hours as required, to be measured on to Applirule® and applied (usually to chest, arm, or thigh) without rubbing in and secured with surgical tape, approx. 800 micrograms/hour absorbed from 1 inch of ointment.

Prophylaxis of angina (to determine dose)
▶ TO THE SKIN
▶ Adult: ½ inch to be administered on first day then increased by ½ inch/day until headache occurs, then reduced by ½ inch, to be measured on to Applirule® and applied (usually to chest, arm, or thigh) without rubbing in and secured with surgical tape, approx. 800 micrograms/hour absorbed from 1 inch of ointment.

Prophylaxis of phlebitis and extravasation (*5 patch only)
▶ BY TRANSDERMAL APPLICATION
▶ Adult: (consult product literature)

INTERACTIONS
▶ Appendix 1: nitrates

SIDE-EFFECTS
▶ With rectal use Burning • diarrhoea • itching • rectal bleeding

PREGNANCY
Not known to be harmful.

DIRECTIONS FOR ADMINISTRATION
▶ With intravenous use For intravenous infusion (Nitrocine®, Nitronal®), give continuously in Glucose 5% or Sodium Chloride 0.9%. For Nitrocine®, suggested infusion concentration 100 micrograms/ml; incompatible with polyvinyl chloride infusion containers such as Vialflex® or Steriflex®; use glass or polyethylene containers or give via a syringe pump.

▶ With intravenous use Glass or polyethylene apparatus is preferable; loss of potency will occur if PVC is used. Glyceryl trinitrate 1 mg/ml to be diluted before use or given undiluted with syringe pump. Glyceryl trinitrate 5 mg/ml to be diluted before use.

PRESCRIBING AND DISPENSING INFORMATION
▶ With sublingual use Glyceryl trinitrate tablets should be supplied in glass containers of not more than 100 tablets, closed with a foil-lined cap, and containing no cotton wool wadding; they should be discarded after 8 weeks in use.

PATIENT AND CARER ADVICE
Rectal ointment should be discarded 8 weeks after first opening.

PERCUTOL® Patients or carers should be given advice on how to administer glyceryl trinitrate ointment.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (January 2008) that glyceryl trinitrate 0.4% ointment (Rectogesic®) is not recommended for use within NHS Scotland for the relief of pain associated with chronic anal fissure.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

Solution for infusion
EXCIPIENTS: May contain Ethanol, propylene glycol
▶ Glyceryl trinitrate (Non-proprietary)
Glyceryl trinitrate 1 mg per 1 ml Glyceryl trinitrate 50mg/50ml solution for infusion vials | 1 vial (PDM) £15.90 | 25 vial (PDM) no price available
Glyceryl trinitrate 5 mg per 1 ml Glyceryl trinitrate 50mg/10ml solution for infusion ampoules | 5 ampoule (PDM) £64.90
Glyceryl trinitrate 25mg/5ml solution for infusion ampoules | 5 ampoule (PDM) £32.45
▶ Nitrocin® (Aspire Pharma Ltd)
Glyceryl trinitrate 1 mg per 1 ml Nitroglycerin 10mg/10ml solution for infusion ampoules | 10 ampoule (PDM) £58.75 (Hospital only)
▶ Nitronal® (Merck Serono Ltd)
Glyceryl trinitrate 1 mg per 1 ml Nitroglycerin 5mg/5ml solution for infusion ampoules | 10 ampoule (PDM) £18.04
Nitroglycerin 50mg/50ml solution for infusion vials | 1 vial (PDM) £14.76

Sublingual tablet
CAUTIONARY AND ADVISORY LABELS
▶ Glyceryl trinitrate (Non-proprietary)
Glyceryl trinitrate 300 microgram GTN 300microgram sublingual tablets | 100 tablet (P) £2.20 DT price = £2.30
Glyceryl trinitrate 300microgram sublingual tablets | 100 tablet (P) no price available DT price = £2.30
Glyceryl trinitrate 500 microgram Glyceryl trinitrate 500microgram sublingual tablets | 100 tablet (P) £5.73 DT price = £5.73
Glyceryl trinitrate 600 microgram Glyceryl trinitrate 600microgram sublingual tablets | 100 tablet (P) no price available

Transdermal patch
▶ DepoNitr® (Aspire Pharma Ltd)
Glyceryl trinitrate 5 mg per 24 hour DepoNitr 5 transdermal patches | 28 patch (P) £12.77
Glyceryl trinitrate 10 mg per 24 hour DepoNitr 10 transdermal patches | 28 patch (P) £14.06
▶ Minitrans (Meira Pharmaceuticals Ltd)
Glyceryl trinitrate 5 mg per 24 hour Minitran 5 transdermal patches | 30 patch (P) £1.62
Glyceryl trinitrate 10 mg per 24 hour Minitran 10 transdermal patches | 30 patch (P) £12.07
Glyceryl trinitrate 15 mg per 24 hour Minitran 15 transdermal patches | 30 patch (P) £14.19
▶ Nitro-Dur® (Merck Sharp & Dohme Ltd)
Glyceryl trinitrate 5 mg per 24 hour Nitro-Dur 0.2mg/hour transdermal patches | 28 patch (P) £10.59
Glyceryl trinitrate 10 mg per 24 hour Nitro-Dur 0.4mg/hour transdermal patches | 28 patch (P) £11.72
Glyceryl trinitrate 15 mg per 24 hour Nitro-Dur 0.6mg/hour transdermal patches | 28 patch (P) £12.90
▶ Transderm-Nitro® (Novartis Pharmaceuticals UK Ltd)
Glyceryl trinitrate 5 mg per 24 hour Transderm-Nitro 5 transdermal patches | 28 patch (P) £10.46
Glyceryl trinitrate 10 mg per 24 hour Transderm-Nitro 10 transdermal patches | 28 patch (P) £22.49

Rectal ointment
EXCIPIENTS: May contain Propylene glycol, wool fat and related substances including lanolin
▶ Rectogesic® (Kyowa Kirin Ltd)
Glyceryl trinitrate 4 mg per 1 gram Rectogesic 0.4% rectal ointment | 30 gram (PDM) £39.30 DT price = £39.30

Ointment
EXCIPIENTS: May contain Wool fat and related substances including lanolin
▶ Percutol® (Aspire Pharma Ltd)
Glyceryl trinitrate 20 mg per 1 gram Percutol 2% ointment | 60 gram (P) £79.00 DT price = £79.00

Sublingual spray
CAUTIONARY AND ADVISORY LABELS
▶ Glyceryl trinitrate (Non-proprietary)
Glyceryl trinitrate 400 microgram per 1 dose Glyceryl trinitrate 400micrograms/dose pump sublingual spray | 180 dose (P) £2.63 DT price = £1.79 | 200 dose (P) £2.71 DT price = £1.83
Glyceryl trinitrate 400micrograms/dose aerosol sublingual spray | 180 dose (P) £3.20 DT price = £2.03 | 200 dose (P) £3.50 DT price = £3.50

Cardiovascular system
Cardiovascular system

Isosorbide dinitrate

**INDICATIONS AND DOSE**

**Prophylaxis of angina** | Adjunct in congestive heart failure

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- **Adult:** 30–120 mg daily in divided doses
- **BY INTRAVENOUS INFUSION**
- **Adult:** 2–10 mg/hour, increased if necessary up to 20 mg/hour

**Left ventricular failure**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- **Adult:** 40–160 mg daily in divided doses, increased if necessary up to 240 mg daily in divided doses
- **BY INTRAVENOUS INFUSION**
- **Adult:** Initially 2–10 mg/hour, increased if necessary up to 20 mg/hour

**Prophylaxis of angina**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- **Adult:** 40 mg daily in 1–2 divided doses, increased if necessary to 60–80 mg daily in 2–3 divided doses

**INTERACTIONS**

- Appendix 1: nitrates

**PREGNANCY**

May cross placenta—manufacturers advise avoid unless potential benefit outweighs risk.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Isoket 0.05% ®, Isoket 0.1% ®), give continuously in Glucose 5% or Sodium chloride 0.9%. Adsorbed to some extent by polyvinyl chloride infusion containers; preferably use glass or polyethylene containers or give via a syringe pump; Isoket 0.05% ® can alternatively be administered undiluted using a syringe pump with a glass or rigid plastic syringe. Glass or polyethylene infusion apparatus is preferable; loss of potency if PVC used.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS**

| Isoket Retard |
| Isoket Retard 20 mg |
| Isoket Retard 40 mg |

**Tablet**

| Isosorbide dinitrate (Non-proprietary) |
| Isosorbide dinitrate 10 mg |
| Isosorbide dinitrate 20 mg |

**Solution for injection**

| Isosorbide dinitrate (Non-proprietary) |
| Isosorbide dinitrate 1 mg per 1 ml |

**ISOTOARD ®**

**Prophylaxis of angina**

- **BY MOUTH**
- **Adult:** Initially 0.5 tablet once daily, to minimise the occurrence of headache, then 1 tablet once daily, then increased if necessary to 2 tablets daily, dose to be taken in the morning

**ISODUR ®**

**Prophylaxis of angina**

- **BY MOUTH**
- **Adult:** 25–50 mg once daily, then increased if necessary to 50–100 mg once daily, dose to be taken in the morning

**ISOBID ®**

**Prophylaxis of angina**

- **BY MOUTH**
- **Adult:** Initially 0.5 tablet once daily for 2–4 days, to minimise the occurrence of headache, then 1 tablet once daily, then increased if necessary to 2 tablets once daily, dose to be taken in the morning

**ISOMO RETARD ®**

**Prophylaxis of angina**

- **BY MOUTH**
- **Adult:** 1 tablet once daily, dose to be taken in the morning

**ISOTARD ®**

**Prophylaxis of angina**

- **BY MOUTH**
- **Adult:** 25–60 mg once daily, if headaches occur with 60 mg tablet, half a 60 mg tablet may be given for 2–4 days, then increased if necessary to 50–120 mg once daily, dose to be taken in the morning

---

**Isosorbide mononitrate**

**INDICATIONS AND DOSE**

**Prophylaxis of angina | Adjunct in congestive heart failure**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- **Adult:** Initially 20 mg 2–3 times a day, alternatively initially 40 mg twice daily, increased if necessary up to 120 mg daily in divided doses

**Prophylaxis of angina (for patients who have not previously had a nitrate) | Adjunct in congestive heart failure (for patients who have not previously had a nitrate)**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- **Adult:** Initially 10 mg twice daily, increased if necessary up to 120 mg daily in divided doses

**CHEMYDUR ® 60XL**

**Prophylaxis of angina**

- **BY MOUTH**
- **Adult:** Initially 0.5 tablet daily for 2–4 days, to minimise possibility of headache, then 1 tablet daily, increased if necessary to 2 tablets daily, dose to be taken in the morning

**ELANTAN ® LA**

**Prophylaxis of angina**

- **BY MOUTH**
- **Adult:** 25–50 mg once daily, then increased if necessary to 50–100 mg once daily, dose to be taken in the morning, the lowest effective dose should be used

**IMDUR ®**

**Prophylaxis of angina**

- **BY MOUTH**
- **Adult:** Initially 0.5 tablet once daily, to minimise the occurrence of headache, then 1 tablet once daily, then increased if necessary to 2 tablets once daily, dose to be taken in the morning

**ISIB ® 60XL**

**Prophylaxis of angina**

- **BY MOUTH**
- **Adult:** Initially 0.5 tablet once daily for 2–4 days, to minimise the occurrence of headache, then 1 tablet once daily, then increased if necessary to 2 tablets once daily, dose to be taken in the morning
MODISAL™ XL
Prophylaxis of angina
¬ BY MOUTH
¬ Adult: Initially 0.5 tablet once daily for 2–4 days, to minimise the occurrence of headache, then 1 tablet once daily, increased if necessary to 2 tablets once daily, dose to be taken in the morning

SYMPATHOMIMETICS ▶ INOTROPIC

Dobutamine

• DRUG ACTION Dobutamine is a cardiac stimulant which acts on beta1 receptors in cardiac muscle, and increases contractility with little effect on rate.

• INDICATIONS AND DOSE

Inotropic support in infusion, cardiac surgery, cardiomyopathies, septic shock, cardiogenic shock, and during positive end expiratory pressure ventilation
¬ BY INTRAVENOUS INFUSION
  • Adult: Usual dose 2.5–10 micrograms/kg/minute, adjusted according to response, alternatively 0.5–40 micrograms/kg/minute

Cardiac stress testing
¬ BY INTRAVENOUS INFUSION
  • Adult: (consult product literature)

• CONTRA-INDICATIONS Phaeochromocytoma
• CAUTIONS Acute heart failure · acute myocardial infarction · arrhythmias · correct hypercapnia before starting and during treatment · correct hypervolaemia before starting and during treatment · correct hypoxia before starting and during treatment · correct metabolic acidosis before starting and during treatment · diabetes mellitus · elderly ·
extravasation may cause tissue necrosis · extreme caution or avoid in marked obstruction of cardiac ejection (such as idiopathic hypertrophic subaortic stenosis) · hyperthyroidism · ischaemic heart disease · occlusive vascular disease · severe hypotension · susceptibility to angle-closure glaucoma · tachycardia · tolerance may develop with continuous infusions longer than 72 hours

- **INTERACTIONS** → Appendix 1: sympathomimetics, inotropic
- **SIDE-EFFECTS**
  - Rare Psychosis
  - Very rare Angle-closure glaucoma · AV block · bradycardia · cardiac arrest · coronary artery spasm · hypokalaemia · myocardial infarction · petechial bleeding
  - Frequency not known Anxiety · arrhythmias · bronchospasm · cerebral haemorrhage · chest pain · dyspnoea · eosinophilia · fever · headache · hypertension (marked increase in systolic blood pressure indicates overdose) · hypotension · increased urinary urgency · myoclonic spasm · nausea · palpitation · paraesthesia · phlebitis · pruritus of scalp · pulmonary oedema · rash · reduced platelet aggregation (on prolonged use) · tachycardia · tremor · vomiting
- **PREGNANCY** No evidence of harm in animal studies — manufacturers advise avoid use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor serum-potassium concentration.
- **DIRECTIONS FOR ADMINISTRATION** Dobutamine injection should be diluted before use or given undiluted with syringe pump. Dobutamine concentrate for intravenous infusion should be diluted before use.
  - For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of 0.5–1 mg/mL and give via an infusion pump; give higher concentration (max. 5 mg/mL) through central venous catheter; incompatible with bicarbonate and other strong alkaline solutions.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for infusion** EXCIPIENTS: May contain Sulfites
    - Dobutamine (Non-proprietary)
      - Dobutamine (as Dobutamine hydrochloride) 5 mg per 1 ml Dobutamine 250mg/50ml solution for infusion vials | 1 vial (£7.50)
      - Dobutamine (as Dobutamine hydrochloride) 12.5 mg per 1 ml Dobutamine 250mg/20ml concentrate for solution for infusion ampoules | 5 ampoule (£26.00–£26.25)

### 7.1a Cardiac arrest

#### Cardiopulmonary resuscitation

**Overview**
The algorithm for cardiopulmonary resuscitation (Life support algorithm (image) p. 1533) reflects the most recent recommendations of the Resuscitation Council (UK). These guidelines are available at www.resus.org.uk.

Cardiac arrest can be associated with ventricular fibrillation, pulseless ventricular tachycardia, asystole, and pulseless electrical activity (electromechanical dissociation). Adrenaline/epinephrine below 1 in 10000 (100 micrograms/mL) is recommended by intravenous injection repeated every 3–5 minutes if necessary. Administration through a central line results in a faster response than peripheral administration, however placement of a central line must not interfere with chest compressions; drugs administered peripherally must be followed by a flush of at least 20 mL Sodium Chloride 0.9% injection to aid entry into the central circulation. Intravenous injection of amiodarone hydrochloride p. 102 should be considered after adrenaline/epinephrine to treat ventricular fibrillation or pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation. An additional dose of amiodarone hydrochloride can be given if necessary, followed by an intravenous infusion of amiodarone hydrochloride. Lidocaine hydrochloride p. 1242, is an alternative if amiodarone hydrochloride is not available. Atropine sulfate p. 1064 is no longer recommended in the treatment of asystole or pulseless electrical activity. During cardiopulmonary arrest if intravenous access cannot be obtained, the intrasosseous route can be used instead. Drug administration via the endotracheal route is no longer recommended.

For the management of acute anaphylaxis, see allergic emergencies under Antihistamines, allergen immunotherapy and allergic emergencies p. 265.

**SYMPATHOMIMETICS** → VASOCONSTRICCTOR

#### Adrenaline/epinephrine

- **DRUG ACTION** Acts on both alpha and beta receptors and increases both heart rate and contractility (beta<sub>1</sub> effects); it can cause peripheral vasodilatation (alpha effect); it can cause peripheral vasodilation (beta<sub>2</sub> effect) or vasoconstriction (an alpha effect).

- **INDICATIONS AND DOSE**
  - **Cardiopulmonary resuscitation**
    - BY INTRAVENOUS INJECTION
      - Adult: 1 mg every 3–5 minutes as required, a 1 in 10 000 (100 micrograms/mL) solution is recommended
    - **Acute hypotension**
      - BY CONTINUOUS INTRAVENOUS INFUSION
      - Neonate: Initially 100 nanograms/kg/minute, adjusted according to response, higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension.
    - **Child**
      - Initially 100 nanograms/kg/minute, adjusted according to response, higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension
      - BY INTRAMUSCULAR INJECTION
      - Child 1 month–5 years: 150 micrograms, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, suitable syringe to be used for measuring small volume; injected preferably into the anterolateral aspect of the middle third of the thigh
      - Child 6–11 years: 300 micrograms, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, to be injected preferably into the anterolateral aspect of the middle third of the thigh
      - Child 12–17 years: 500 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, 300 micrograms (0.3 mL) to be administered if child small or prepubertal
      - Adult: 500 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the
thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function.

**Acute anaphylaxis when there is doubt as to the adequacy of the circulation (specialist use only) / Angioedema (if laryngeal oedema is present) (specialist use only)**

- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 50 micrograms, using 0.5 mL of the dilute 1 in 10 000 adrenaline injection, dose to be repeated according to response, if multiple doses required, adrenaline should be given as a slow intravenous infusion stopping when a response has been obtained.

**Control of bradycardia in patients with arrhythmias after myocardial infarction, if there is a risk of asystole, or if the patient is unstable and has failed to respond to atropine**

- **BY INTRAVENOUS INFUSION**
  - Adult: 2–10 micrograms/minute, adjusted according to response.

**EMERADE® 150 MICROGRAMS**

**Acute anaphylaxis (for self-administration)**

- **BY INTRAMUSCULAR INJECTION**
  - Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
  - Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children.

**EMERADE® 300 MICROGRAMS**

**Acute anaphylaxis (for self-administration)**

- **BY INTRAMUSCULAR INJECTION**
  - Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
  - Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

**EMERADE® 500 MICROGRAMS**

**Acute anaphylaxis (for self-administration for patients at risk of severe anaphylaxis)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 12-17 years: 500 micrograms, then 500 micrograms after 5–15 minutes as required
  - Adult: 500 micrograms, then 500 micrograms after 5–15 minutes as required

**EPIPEN® AUTO-INJECTOR 0.3MG**

**Acute anaphylaxis (for self-administration)**

- **BY INTRAMUSCULAR INJECTION**
  - Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
  - Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

**EPIPEN® JR AUTO-INJECTOR 0.15MG**

**Acute anaphylaxis (for self-administration)**

- **BY INTRAMUSCULAR INJECTION**
  - Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
  - Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children.

**JEXT® 150 MICROGRAMS**

**Acute anaphylaxis (for self-administration)**

- **BY INTRAMUSCULAR INJECTION**
  - Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
  - Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children.

**JEXT® 300 MICROGRAMS**

**Acute anaphylaxis (for self-administration)**

- **BY INTRAMUSCULAR INJECTION**
  - Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
  - Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

- **UNLICENSED USE**
  - With intramuscular use for acute anaphylaxis in children Auto-injectors delivering 150-microgram dose of adrenaline may not be licensed for use in children with body-weight under 15 kg.
  - With intravenous use for acute hypotension in children Adrenaline 1 in 1000 (1 mg/mL) solution is not licensed for intravenous administration.

### IMPORTANT SAFETY INFORMATION

**SAFE PRACTICE**

Intravenous route should be used with extreme care by specialists only.

**CAUTIONS**

- Arteriosclerosis (in adults) · arrhythmias · cerebrovascular disease · cor pulmonale · diabetes mellitus · elderly · hypercalcaemia · hyperreflexia · hypertension · hyperthyroidism · hypokalaemia · ischaemic heart disease · obstructive cardiomyopathy · occlusive vascular disease · organic brain damage · phaeochromocytoma · prostate disorders · psychoneurosis · severe angina · susceptibility to angle-closure glaucoma

### INTERACTIONS

Appendix 1: sympathomimetics, vasoconstrictor

### SIDE-EFFECTS

- Angina · angle-closure glaucoma · anorexia · anxiety · arrhythmias · cold extremities · confusion · difficulty in micturition · dizziness · dry mouth · dyspnoea · headache · hyperglycaemia · hypersalivation · hypertension (risk of cerebral haemorrhage) · hypokalaemia · insomnia · ketogenic acidosis · mydriasis · myocardial infarction · nausea · pallor · palpitation · psychosis · pulmonary oedema (on excessive dosage or extreme sensitivity) · restless · sweating · tachycardia · tissue necrosis at injection site · tissue necrosis of bowel · tissue necrosis of extremities · tissue necrosis of kidneys · tissue necrosis of liver · tremor · urinary retention · vomiting · weakness

### PREGNANCY

May reduce placental perfusion and cause tachycardia, cardiac irregularities, and extrasystoles in fetus. Can delay second stage of labour. Manufacturers advise use only if benefit outweighs risk.

### BREAST FEEDING

Present in milk but unlikely to be harmful as poor oral bioavailability.

### RENAL IMPAIRMENT

Manufacturers advise use with caution in severe impairment.

### MONITORING REQUIREMENTS

Monitor blood pressure and ECG.

### DIRECTIONS FOR ADMINISTRATION

Acute hypotension

- With intravenous use in children For continuous intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9% and give through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. Neonatal intensive care, dilute 3 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 100 nanograms/kg/minute; infuse through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. These infusions are usually made up with adrenaline 1 in 1000 (1 mg/mL) solution.
Cardiopulmonary resuscitation

- With intravenous use in adults Administration through a central line results in a faster response than peripheral administration, however placement of a central line must not interfere with chest compressions; drugs administered peripherally must be followed by a flush of at least 20 mL. Sodium Chloride 0.9% injection to aid entry into the central circulation.

**PRESCRIBING AND DISPENSING INFORMATION** It is important, in acute anaphylaxis where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

Great vigilance is needed to ensure that the correct strength of adrenaline injection is used; anaphylactic shock kits need to make a very clear distinction between the 1 in 10 000 strength and the 1 in 1000 strength.

Patients with severe allergy should be instructed in the self-administration of adrenaline by intramuscular injection.

Packs for self-administration need to be clearly labelled with instructions on how to administer adrenaline (intramuscularly, preferably at the midpoint of the outer thigh, through light clothing if necessary) so that in the case of rapid collapse someone else is able to give it. It is important to ensure individuals at risk and their carers understand that:

- two injection devices should be carried at all times to treat symptoms until medical assistance is available; if, after the first injection, the individual does not start to feel better, the second injection should be given 5 to 15 minutes after the first;
- an ambulance should be called after every administration, even if symptoms improve;
- the individual should lie down with their legs raised (unless they have breathing difficulties, in which case they should sit up) and should not be left alone. Adrenaline for administration by intramuscular injection is available in 'auto-injectors' (e.g. **Emerade**®, **EpiPen**®, or **Jext**®), pre-assembled syringes fitted with a needle suitable for very rapid administration (if necessary by a bystander or a healthcare provider if it is the only preparation available); injection technique is device specific.

To ensure patients receive the auto-injector device that they have been trained to use, prescribers should specify the brand to be dispensed.

**PATIENT AND CARER ADVICE**

Individuals at considerable risk of anaphylaxis need to carry (or have available) adrenaline at all times and the patient, or their carers, need to be instructed in advance when and how to inject it.

**JEXT® 300 MICROGRAMS** 1.1 mL of the solution remains in the auto-injector device after use.

**JEXT® 150 MICROGRAMS** 1.25 mL of the solution remains in the auto-injector device after use.

**EPIPEN® JR AUTO-INJECTOR 0.15MG** 1.7 mL of the solution remains in the auto-injector device after use.

**EMERADE® 300 MICROGRAMS** 0.2 mL of the solution remains in the auto-injector device after use.

**EPIPEN® AUTO-INJECTOR 0.3MG** 1.7 mL of the solution remains in the auto-injector device after use.

**EMERADE® 500 MICROGRAMS** No solution remains in the auto-injector device after use.

**EMERADE® 150 MICROGRAMS** 0.35 mL of the solution remains in the auto-injector device after use. Medicines for Children leaflet: Adrenaline auto-injector for anaphylaxis www.medicinesforchildren.org.uk/adrenaline-for-anaphylaxis

**EXCEPTIONS TO LEGAL CATEGORY** POM restriction does not apply to the intramuscular administration of up to 1 mg of adrenaline injection 1 in 1000 (1 mg/mL) for the emergency treatment of anaphylaxis.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

**EXCIPIENTS:** May contain Sulphites

- **Adrenaline/epinephrine (Non-proprietary)**

**Diuretics**

**Overview**

Thiazides are used to relieve oedema due to chronic heart failure and, in lower doses, to reduce blood pressure.

Loop diuretics are used in pulmonary oedema due to left ventricular failure and in patients with chronic heart failure.

Combination diuretic therapy may be effective in patients with oedema resistant to treatment with one diuretic. Vigorous diuresis, particularly with loop diuretics, may induce acute hypotension; rapid reduction of plasma volume should be avoided.
Thiazides and related diuretics

Thiazides and related compounds are moderately potent diuretics; they inhibit sodium reabsorption at the beginning of the distal convoluted tubule. They act within 1 to 2 hours of oral administration and most have a duration of action of 12 to 24 hours; they are usually administered early in the day so that the diuresis does not interfere with sleep.

In the management of hypertension a low dose of a thiazide produces a maximal or near-maximal blood pressure lowering effect, with very little biochemical disturbance. Higher doses cause more marked changes in plasma potassium, sodium, uric acid, glucose, and lipids, with little advantage in blood pressure control. Chlortalidone p. 224 and indapamide p. 162 are the preferred diuretics in the management of hypertension. Thiazides also have a role in chronic heart failure.

Bendrofluamide p. 161 can be used for mild or moderate heart failure; it is licensed for the treatment of hypertension but is no longer considered the first-line diuretic for this indication, although patients with stable and controlled blood pressure currently taking bendrofluamide can continue treatment.

Chlortalidone, a thiazide–related compound, has a longer duration of action than the thiazides and may be given on alternate days to control oedema. It is also useful if acute retention is liable to be precipitated by a more rapid diuresis or if patients dislike the altered pattern of micturition caused by other diuretics. Chlortalidone can also be used under close supervision for the treatment of ascites due to cirrhosis in stable patients.

Xipamide p. 225 and indapamide are chemically related to chlortalidone. Indapamide is claimed to lower blood pressure with less metabolic disturbance, particularly less aggravation of diabetes mellitus.

Metolazone p. 225 is particularly effective when combined with a loop diuretic (even in renal failure); profound diuresis can occur and the patient should therefore be monitored carefully.

The thiazide diuretics benztiazide, clopamide, cyclopenthiazide p. 225, hydrochlorothiazide, and hydroflumethiazide do not offer any significant advantage over other thiazides and related diuretics.

Loop diuretics

Loop diuretics are used in pulmonary oedema due to left ventricular failure; intravenous administration produces relief of breathlessness and reduces pre-load sooner than would be expected from the time of onset of diuresis. Loop diuretics are also used in patients with chronic heart failure. Diuretic-resistant oedema (except lymphoedema and oedema due to peripheral venous stasis or calcium–channel blockers) can be treated with a loop diuretic combined with a thiazide or related diuretic (e.g. bendrofluamide or metolazone).

If necessary, a loop diuretic can be added to antihypertensive treatment to achieve better control of blood pressure in those with resistant hypertension, or in patients with impaired renal function or heart failure. Loop diuretics can exacerbate diabetes (but hyperglycaemia is less likely than with thiazides) and gout. If there is an enlarged prostate, urinary retention can occur, although this is less likely if small doses and less potent diuretics are used initially.

Furosemide p. 221 and bumetanide p. 220 are similar in activity; both act within 1 hour of oral administration and diuresis is complete within 6 hours so that, if necessary, they can be given twice in one day without interfering with sleep. Following intravenous administration furosemide has a peak effect within 30 minutes. The diuresis associated with these drugs is dose related.

Torasemide p. 222 has properties similar to those of furosemide and bumetanide, and is indicated for oedema and for hypertension.

Potassium-sparing diuretics and aldosterone antagonists

Amiloride hydrochloride p. 223 and triamterene p. 224 on their own are weak diuretics. They cause retention of potassium and are therefore given with thiazide or loop diuretics as a more effective alternative to potassium supplements. See compound preparations with thiazides or loop diuretics.

Potassium supplements must not be given with potassium-sparing diuretics. Administration of a potassium sparing diuretic to a patient receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.

Aldosterone antagonists

Spironolactone p. 185 potentiates thiazide or loop diuretics by antagonising aldosterone; it is a potassium-sparing diuretic. Spironolactone is of value in the treatment of oedema and ascites caused by cirrhosis of the liver; furosemide can be used as an adjunct. Low doses of spironolactone are beneficial in moderate to severe heart failure and when used in resistant hypertension [unlicensed indication]. Spironolactone is also used in primary hyperaldosteronism (Conn’s syndrome). It is given before surgery or if surgery is not appropriate, in the lowest effective dose for maintenance.

Eplerenone p. 185 is licensed for use as an adjunct in left ventricular dysfunction with evidence of heart failure after a myocardial infarction; it is also licensed as an adjunct in chronic mild heart failure with left ventricular systolic dysfunction.

Potassium supplements must not be given with aldosterone antagonists

Potassium-sparing diuretics with other diuretics

Although it is preferable to prescribe thiazides and potassium-sparing diuretics separately, the use of fixed combinations may be justified if compliance is a problem. Potassium-sparing diuretics are not usually necessary in the routine treatment of hypertension, unless hypokalaemia develops.

Other diuretics

Mannitol p. 222 is an osmotic diuretic that can be used to treat cerebral oedema and raised intra-ocular pressure.

Mercurial diuretics are effective but are now almost never used because of their nephrotoxicity.

The carbonic anhydrase inhibitor acetazolamide p. 1080 is a weak diuretic and is little used for its diuretic effect. It is used for prophylaxis against mountain sickness [unlicensed indication] but is not a substitute for acclimatisation.

Acetazolamide and eye drops of dorzolamide p. 1081 and brinzolamide p. 1080 inhibit the formation of aqueous humour and are used in glaucoma.

Diuretics with potassium

Many patients on diuretics do not need potassium supplements. For many of those who do, the amount of potassium in combined preparations may not be enough, and for this reason their use is to be discouraged.

Diuretics with potassium and potassium-sparing diuretics should not usually be given together. Diuretics and potassium supplements should be prescribed separately for children.

Other drugs used for Oedema

Diamorphine hydrochloride, p. 433
Loop diuretics

- **DRUG ACTION** Loop diuretics inhibit reabsorption from the ascending limb of the loop of Henle in the renal tubule and are powerful diuretics.
- **CONTRA-INDICATIONS** Anuria - comatose and precomatose states associated with liver cirrhosis - renal failure due to nephrotic or hepatotoxic drugs - severe hypokalaemia - severe hyponatraemia
- **CAUTIONS** Can exacerbate diabetes (but hyperglycaemia less likely than with thiazides) - can exacerbate gout - hypotension should be corrected before initiation of treatment - hypovolaemia should be corrected before initiation of treatment - urinary retention can occur in prostatic hyperplasia

**CAUTIONS, FURTHER INFORMATION**
- **Elderly** Lower initial doses of diuretics should be used in the elderly because they are particularly susceptible to the side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).
- **Potassium loss** Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.
- **Hypokalaemia** is dangerous in severe cardiovascular disease and in patients also being treated with cardiac glycosides. Often the use of potassium-sparing diuretics avoids the need to take potassium supplements.
- In hepatic failure, hypokalaemia caused by diuretics can precipitate encephalopathy, particularly in alcoholic cirrhosis.
- Urinary retention If there is an enlarged prostate, urinary retention can occur, although this is less likely if small doses and less potent diuretics are used initially; an adequate urinary output should be established before initiating treatment.

- **SIDE-EFFECTS**
  - **Very rare** Hyperuricaemia
  - **Frequency not known** Acute urinary retention - blood disorders - bone marrow depression - deafness (usually with high doses and rapid intravenous administration, and in renal impairment) - electrolyte disturbances - hepatic encephalopathy - hyperglycaemia (less common than with thiazides) - hypocalcaemia - hypochloraemia - hypokalaemia - hypomagnesaemia - hyponatraemia - leucopenia - metabolic alkalosis - mild gastrointestinal disturbances - pancreatitis - photosensitization - postural hypotension - pruritus - rash - temporary increase in serum cholesterol and triglyceride concentration - thrombocytopenia - tinnitus (usually with high doses and rapid intravenous administration, and in renal impairment) - visual disturbances

- **HEPATIC IMPAIRMENT** Hypokalaemia induced by loop diuretics may precipitate hepatic encephalopathy and coma — potassium-sparing diuretics can be used to prevent this. Diuretics can increase the risk of hypomagnesaemia in alcoholic cirrhosis, leading to arrhythmias.
- **RENAL IMPAIRMENT** High doses of loop diuretics may occasionally be needed in renal impairment. High doses or rapid intravenous administration can cause tinnitus and deafness.
- **MONITORING REQUIREMENTS** Monitor electrolytes during treatment.

---

Bumetanide

- **INDICATIONS AND DOSE**
  - **Oedema**
    - **BY MOUTH**
      - Adult: 1 mg, dose to be taken in the morning, then 1 mg after 6–8 hours if required
      - Elderly: 500 micrograms daily, this lower dose may be sufficient in elderly patients
  - **Oedema, severe cases**
    - **BY MOUTH**
      - Adult: Initially 5 mg daily, increased in steps of 5 mg every 12–24 hours, adjusted according to response

- **INTERACTIONS** → Appendix 1: loop diuretics
- **SIDE-EFFECTS** Breast pain - gynaecomastia - musculoskeletal pain (associated with high doses in renal failure)
- **PREGNANCY** Bumetanide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition.
- **BREAST FEEDING** No information available. May inhibit lactation.

- **MEDIATIONAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Oral solution**

- **Bumetanide (Non-proprietary)**
  - Bumetanide 200 microgram per 1 ml Bumetanide 1mg/5ml oral solution sugar free sugar-free | 150 ml [POSM] £198.00 DT price = £198.00

**Tablet**

- **Bumetanide (Non-proprietary)**
  - Bumetanide 1 mg Bumetanide 1mg tablets | 28 tablet [POSM] £7.35 DT price = £6.98
  - Bumetanide 5 mg Bumetanide 5mg tablets | 28 tablet [POSM] £7.00 DT price = £6.98

**Combinations available:** *Amiloride with bumetanide*, p. 224

---

Co-amilofruse

- **INDICATIONS AND DOSE**
  - **Oedema**
    - **BY MOUTH**
      - Adult: 2.5/20–10/80 mg daily, dose to be taken in the morning

**DOSE EQUIVALENCES AND CONVERSION**

  - A mixture of amiloride hydrochloride and furosemide (frusenide) in the mass proportions of 1 part amiloride hydrochloride to 8 parts furosemide (frusenide).

- **CONTRA-INDICATIONS** Addison’s disease - anuria - comatose or precomatose states associated with liver cirrhosis - dehydration - hyperkalaemia - hypovolaemia - renal failure - severe hypokalaemia - severe hyponatraemia

- **CAUTIONS** Correct hypovolaemia before using in oliguria - diabetes mellitus - elderly - gout - hepatorenal syndrome - hypoproteinaemia - hypotension - impaired micturition - prostatic enlargement

- **INTERACTIONS** → Appendix 1: loop diuretics, potassium-sparing diuretics
- **SIDE-EFFECTS** Agranulocytosis - anaphylaxis - aplastic anaemia - blood disorders - bone marrow depression (withdraw treatment) - confusion - deafness (usually in renal impairment or in hypoproteinaemia) - dry mouth - eosinophilia - exfoliative dermatitis - gastrointestinal disturbances - gout - haemolytic anaemia - hepatic encephalopathy - hyperglycaemia - hypersensitivity
Furosemide
(Frusemide)

INDICATIONS AND DOSE

Oedema

- **BY MOUTH**
- Adult: Initially 40 mg daily, dose to be taken in the morning, then maintenance 20–40 mg daily
- Initially by intramuscular injection, or by slow intravenous injection, or by intravenous infusion

Resistant oedema

- **BY MOUTH**
- Adult: 80–120 mg daily
- Initially by intramuscular injection, or by slow intravenous injection, or by intravenous infusion

- Adult: Initially 20–50 mg, then (by intramuscular injection or by intravenous injection or by intravenous infusion) increased in steps of 20 mg every 2 hours if required, doses greater than 50 mg given by intravenous infusion only; maximum 1.5 g per day

CAUTIONS

- Hepatorenal syndrome - hypoproteinaemia may reduce diuretic effect and increase risk of side-effects
- INTERACTIONS - Appendix 1: loop diuretics
- SIDE-EFFECTS - Gout - intrahepatic cholestasis
- PREGNANCY - Furosemide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition
- BREAST FEEDING - Amount too small to be harmful. May inhibit lactation

DIRECTIONS FOR ADMINISTRATION

- Intravenous administration rate should not usually exceed 4 mg/minute however single doses of up to 80 mg may be administered more rapidly; a lower rate of infusion may be necessary in renal impairment. For intravenous infusion (Lasix®), give continuously in Sodium chloride 0.9%; infusion pH must be above 5.5; glucose solutions are unsuitable.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Furosemide (Non-proprietary)
  - Furosemide 20 mg: 28 tablet | 28 tablet | 56 tablet | £1.07
  - Furosemide 40 mg: 28 tablet | 56 tablet | £1.07
  - Furosemide 80 mg: 28 tablet | 56 tablet | £1.52

- Frumil (sanofi)
  - Frumil LS 20mg/2.5mg tablets: 18 tablet | 28 tablet | £4.32
  - Frumil 5mg tablets: 28 tablet | 56 tablet | £1.04

Solution for injection

- Furosemide 10 mg per 1 ml: 250ml/25ml solution for injection ampoules | 10 ampoule | £0.60

- Furosemide 40 mg per 1 ml: 250ml/5ml solution for injection ampoules | 10 ampoule | £2.10

Solution for oral feeding

- Frusol (Sanofi)
  - Frusol 20mg | 50mg | 80mg | 160mg | 180mg | 200mg | 230mg | 260mg | 280mg

- Lasix (Merck)
Furosemide with potassium chloride

The properties listed below are those particular to the combination only. For the properties of the components please consider, furosemide p. 221, potassium chloride p. 968.

- **INDICATIONS AND DOSE**
  - **Oedema**
    - BY MOUTH
    - Adult: 0.5–2 tablets daily, dose to be taken in the morning

- **INTERACTIONS** → Appendix 1: loop diuretics, potassium chloride

- **DIRECTIONS FOR ADMINISTRATION**
  - Furosemide with modified-release potassium chloride tablets should be swallowed whole with plenty of fluid during meals while sitting or standing.

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be given advice on how to administer furosemide with potassium chloride tablets.

- **LESS SUITABLE FOR PRESCRIBING**
  - Furosemide with potassium chloride tablets are less suitable for prescribing.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Modified-release tablet**
  - **CAUTIONARY AND ADVISORY LABELS 25, 27**
  - Diumide-K Continus (Teofarma)
    - Furosemide 40 mg, Potassium chloride 600 mg
      - Diumide-K Continus tablets 30 tablet [POM] £3.00

- **Furosemide with triamterene**

The properties listed below are those particular to the combination only. For the properties of the components please consider, furosemide p. 221, triamterene p. 224.

- **INDICATIONS AND DOSE**
  - **Oedema**
    - BY MOUTH
    - Adult: 0.5–2 tablets daily, dose to be taken in the morning

- **CONTRA-INDICATIONS**
  - Anuria · comatose or precomatose states associated with liver cirrhosis · dehydration · hyperkalaemia · hypovolaemia · renal failure · severe hypokalaemia · severe hyponatraemia

- **CAUTIONS**
  - Diabetes mellitus · elderly · gout · hepatorenal syndrome · hypotension · impaired micturition · may cause blue fluorescence of urine · prostatic enlargement

- **INTERACTIONS** → Appendix 1: loop diuretics, potassium-sparing diuretics

- **SIDE-EFFECTS**
  - **Rare**
    - Agranulocytosis · anaphylaxis · aplastic anaemia · blood disorders · bone marrow depression (withdraw treatment) · deafness (usually in renal impairment or in hypoproteinaemia) · eosinophilia · exfoliative dermatitis · haemolytic anaemia · hypersensitivity reactions · intrahepatic cholestasis · leucopenia · pancreatitis · paraesthesia · photosensitivity · purpura · rash · thrombocytopenia · tinnitus (usually in renal impairment or in hypoproteinaemia)

  - **Frequency not known**
    - Dry mouth · electrolyte disturbances · gastro-intestinal disturbances · gout · hyperglycaemia (less common than with thiazides) · hyperkalaemia · hyperuricaemia · hypocalcaemia · hypokalaemia · hypomagnesaemia · hyponatraemia · hypotension · metabolic alkalosis · temporary increase in plasma cholesterol and triglyceride concentration · triamterene found in kidney stones

  - **BREAST FEEDING**
    - Triamterene present in milk—manufacturer advises avoid. Furosemide may inhibit lactation.

  - **HEPATIC IMPAIRMENT**
    - Increased risk of hypomagnesaemia in alcoholic cirrhosis. Hypokalaemia may precipitate coma.

  - **RENAL IMPAIRMENT**
    - May need high doses. Avoid in severe impairment. Monitor plasma-potassium concentration in renal impairment (high risk of hyperkalaemia).

  - **MONITORING REQUIREMENTS**
    - Monitor electrolytes.

  - **PATIENT AND CARER ADVICE**
    - Urine may look slightly blue in some lights.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS 14**
  - Frusene (Orion Pharma (UK) Ltd)

      - **Torasemide 10 mg**
        - Torem 10mg tablets 28 tablet [POM] £8.14 DT price = £4.14

**DIURETICS > OSMOTIC DIURETICS**

Mannitol

- **INDICATIONS AND DOSE**
  - **Cerebral oedema**
    - BY INTRAVENOUS INFUSION
    - Adult: 0.25–2 g/kg, repeated if necessary, to be administered over 30–60 minutes, dose may be repeated 1–2 times after 4–8 hours
Raised intra-ocular pressure

▶ By intravenous infusion
Adult: 0.25–2 g/kg, repeated if necessary, to be administered over 30–60 minutes, dose may be repeated 1–2 times after 4–8 hours

● CONTRA-INDICATIONS Anuria · intracranial bleeding (except during craniotomy) · severe cardiac failure · severe dehydration · severe pulmonary oedema

● CAUTIONS Extravasation causes inflammation and thrombophlebitis

● SIDE-EFFECTS
▶ Uncommon Electrolyte imbalance · fluid imbalance · hypotension · thrombophlebitis
▶ Rare Anaphylaxis · arrhythmia · blurred vision · chest pain · chills · convulsions · cramp · dehydration · dizziness · dry mouth · fever · focal osmotic nephrosis · headache · hypersensitivity reactions · hypertension · nausea · oedema · pulmonary oedema · raised intracranial pressure · rhinitis · skin necrosis · thirst · urinary retention · urticaria · vomiting
▶ Very rare Acute renal failure · congestive heart failure

● PREGNANCY Manufacturer advises avoid unless essential—no information available.

● BREAST FEEDING Manufacturer advises avoid unless essential—no information available.

● RENAL IMPAIRMENT Use with caution in severe impairment.

● PRE-TREATMENT SCREENING Assess cardiac function before treatment.

● MONITORING REQUIREMENTS Monitor fluid and electrolyte balance, serum osmolality, and cardiac, pulmonary and renal function.

● DIRECTIONS FOR ADMINISTRATION For mannitol 20%, an in-line filter is recommended (15-micron filters have been used).

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Peripheral vascular disease

Classification and management

Peripheral vascular disease can be either occlusive (e.g. intermittent claudication) in which occlusion of the peripheral arteries is caused by atherosclerosis, or vasospastic (e.g. Raynaud’s syndrome). Peripheral arterial occlusive disease is associated with an increased risk of cardiovascular events; this risk is reduced by measures such as smoking cessation, effective control of blood pressure, regulating blood lipids, optimising glycaemic control in diabetes, taking aspirin p. 117 in a dose of 75 mg daily, and possibly weight reduction in obesity. Exercise training can improve symptoms of intermittent claudication; revascularisation procedures may be appropriate.

Nafldirofuryl oxalate p. 227 can alleviate symptoms of intermittent claudication and improve pain-free walking distance in moderate disease. Patients taking nafldirofuryl oxalate should be assessed for improvement after 3–6 months.

Cilostazol below is licensed for use in intermittent claudication to improve walking distance in patients without peripheral tissue necrosis who do not have pain at rest; use is restricted to second-line treatment where lifestyle modifications and other appropriate interventions have failed to improve symptoms. Cilostazol should be initiated by those experienced in the management of intermittent claudication. Patients receiving cilostazol should be assessed for improvement after 3 months; consider discontinuation of treatment if there is no clinically relevant improvement in walking distance.

Inositol nicotinate p. 227 and pentoxifylline p. 228 are not established as being effective for the treatment of intermittent claudication.

Management of Raynaud’s syndrome includes avoidance of exposure to cold and stopping smoking. More severe symptoms may require vasodilator treatment, which is most often successful in primary Raynaud’s syndrome. Nifedipine p. 157 is useful for reducing the frequency and severity of vasospastic attacks. Alternatively, nafldirofuryl oxalate may produce symptomatic improvement; inositol nicotinate (a nicotinic acid derivative) may also be considered. Pentoxifylline, prazosin p. 739, and moxisylyte p. 227 are not established as being effective for the treatment of Raynaud’s syndrome.

 Vasodilator therapy is not established as being effective for chilblains.

ANTITHROMBOTIC DRUGS > ANTIPLATELET DRUGS

Cilostazol

INDICATIONS AND DOSE

Intermittent claudication in patients without rest pain and no peripheral tissue necrosis

BY MOUTH

Adult: 100 mg twice daily, to be taken 30 minutes before food, cilostazol should be initiated by those experienced in the management of intermittent claudication, patients receiving cilostazol should be assessed for improvement after 3 months; consider discontinuation of treatment if there is no clinically relevant improvement in walking distance

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises reduce dose to 50 mg twice daily with concurrent use of potent inhibitors of CYP3A4, potent inhibitors of CYP2C19, omeprazole and erythromycin.

CONTRA-INDICATIONS

Active peptic ulcer - congestive heart failure - coronary intervention in previous 6 months - haemorrhagic stroke in previous 6 months - history of severe tachyarrhythmia - myocardial infarction in previous 6 months - poorly controlled hypertension - predisposition to bleeding - proliferative diabetic retinopathy - prolongation of QT interval - severe atrial flutter - unstable angina

CAUTIONS

Atrial fibrillation - atrial or ventricular ectopy - diabetes mellitus (higher risk of intraocular bleeding) - mild to moderate atrial flutter - stable coronary disease - surgery

INTERACTIONS → Appendix I: cilostazol

SIDE-EFFECTS

Common or very common Abdominal pain - angina - anorexia - arrhythmia - diarrhoea - dizziness - dyspepsia - ecchymosis - flatulence - headache - malaise - nausea - oedema - palpitation - pharyngitis - pruritus - rash - rhinitis - tachycardia - vomiting

Rare Bleeding disorders - increased urinary frequency - renal impairment - thrombocytopenia

FREQUENCY NOT KNOWN Agranulocytosis - aplastic anaemia - conjunctivitis - hepatitis - hot flushes - hypertension - leucopenia - pancytopenia - pyrexia - Stevens-Johnson syndrome - thrombocytopenia - tinnitus - toxic epidermal necrosis

SIDE-EFFECTS, FURTHER INFORMATION

Blood Disorders A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

PREGNANCY

Avoid—toxicity in animal studies.

BREAST FEEDING

Present in milk in animal studies—manufacturer advises avoid.

HEPATIC IMPAIRMENT

Avoid in moderate or severe liver disease.

RENAL IMPAIRMENT

Avoid if eGFR less than 25 mL/minute/1.73 m².

PATIENT AND CARER ADVICE

Blood disorders Patients should be advised to report any unexplained bleeding, bruising, sore throat, or fever.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Cilostazol, nafldirofuryl oxalate, pentoxifylline and inositol nicotinate for the treatment of intermittent claudication in people with peripheral arterial disease (May 2011) NICE TA223 Cilostazol is not recommended for the treatment of intermittent claudication in patients with peripheral arterial disease; patients currently receiving this treatment should have the option to continue until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA223

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (October 2005) that cilostazol is not recommended for the treatment of intermittent claudication within NHS Scotland.
MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
▶ Cilostazol (Non-proprietary)
Cilostazol 50 mg Cilostazol 50mg tablets | 56 tablet £40.05 DT price = £40.05
Cilostazol 100 mg Cilostazol 100mg tablets | 56 tablet £31.70 DT price = £3.33
▶ Pletal (Otsuka Pharmaceuticals (U.K.) Ltd) ▼
Cilostazol 50 mg Pletal 50mg tablets | 56 tablet £35.31 DT price = £40.05
Cilostazol 100 mg Pletal 100mg tablets | 56 tablet DT price = £3.33

LIPID MODIFYING DRUGS ▶ NICOTINIC ACID DERIVATIVES

Inositol nicotinate

INDICATIONS AND DOSE
Peripheral vascular disease
▶ BY MOUTH
Adult: 3 g daily in 2–3 divided doses; maximum 4 g per day

CONTRA-INDICATIONS
Acute phase of a cerebrovascular accident • recent myocardial infarction

CAUTIONS
Cerebrovascular insufficiency • unstable angina

SIDE-EFFECTS
Dizziness • flushing • headache • hypotension • nausea • oedema • paraesthesia • rash • syncope • vomiting

PREGNANCY
No information available—manufacturer advises avoid unless potential benefi ts outweigh risks.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
▶ Cilostazol, naftidrofuryl oxalate, pentoxifylline and inositol nicotinate for the treatment of intermittent claudication in people with peripheral arterial disease (May 2011) NICE TA223
Inositol nicotinate is not recommended for the treatment of intermittent claudication in patients with peripheral arterial disease; patients currently receiving treatment should have the option to continue until they and their clinician consider it appropriate to stop.

**Sodium tetracycl decyl sulfate**

**INDICATIONS AND DOSE**

Sclerotherapy of reticular veins and spider veins in legs and varicose veins

> **BY INTRAVENOUS INJECTION**

**ADULT:** Test dose recommended before each treatment (consult product literature)

**CONTRA-INDICATIONS**

Acute infection, asthma, blood disorders, deep vein thrombosis, high risk of thromboembolism, hyperthrombroidism, inability to walk, neoplasm, occlusive arterial disease, phlebitis, pulmonary embolism, recent acute superficial thrombophlebitis, recent surgery, respiratory disease, significant valvular incompetence in deep veins, skin disease, symptomatic patent foramen ovale (if administered as foam), uncontrolled diabetes mellitus, varicose veins caused by tumours (unless tumour removed)

**CAUTIONS**

Arterial disease, asymptomatic patent foramen ovale (use smaller volumes and avoid Valsalva manoeuvre immediately after administration), extravasation may cause necrosis of tissues, history of migraine (use smaller volumes), resuscitation facilities must be available, venous insufficiency with lymphoedema (pain and inflammation may worsen)

**SIDE-EFFECTS**

- **Common or very common** Local burning, local pain
- **Rare** Phlebitis, skin discoloration, superficial thrombophlebitis, telangiectatic matting
- **Uncommon** Deep vein thrombosis, scotoma
- **Very rare** Anaphylaxis, circulatory collapse, diarrhoea, dry mouth, fever, hot flushes, hypersensitivity reactions, nausea, necrosis of skin and tissues, palpitation, pulmonary embolism, sloughing of skin and tissues, stroke, swollen tongue, transient ischaemic attack, vasculitis, vomiting, weakness

**PREGNANCY**

Avoid unless benefit outweighs risk—no information available.

**BREAST FEEDING**

Use with caution—no information available.

Respiratory system, drug delivery

Inhalation
This route delivers the drug directly to the airways; the dose required is smaller than when given by mouth and side-effects are reduced.

Inhaler devices
These include pressurised metered-dose inhalers, breath-actuated inhalers, and dry powder inhalers. Many patients can be taught to use a pressurised metered-dose inhaler effectively but some patients, particularly the elderly and children, find them difficult to use. Spacer devices can help such patients because they remove the need to co-ordinate actuation with inhalation. Dry powder inhalers may be useful in adults and children over 5 years who are unwilling or unable to use a pressurised metered-dose inhaler. Alternatively, breath-actuated inhalers are suitable for adults and older children provided they can use the device effectively.

Pressurised metered-dose inhalers are an effective and convenient method of drug administration in mild to moderate asthma.

On changing from a pressurised metered-dose inhaler to a dry powder inhaler, patients may notice a lack of sensation in the mouth and throat previously associated with each actuation. Coughing may also occur.

The patient should be instructed carefully on the use of the inhaler and it is important to check that the inhaler continues to be used correctly because inadequate inhalation technique may be mistaken for a lack of response to the drug.

Spacer devices
Spacer devices remove the need for coordination between actuation of a pressurised metered-dose inhaler and inhalation. The spacer device reduces the velocity of the aerosol and subsequent impaction on the oropharynx and allows more time for evaporation of the propellant so that a larger proportion of the particles can be inhaled and deposited in the lungs. Spacer devices are particularly useful for patients with poor inhalation technique, for children, for patients requiring high doses of inhaled corticosteroids, for nocturnal asthma, and for patients prone to candidiasis with inhaled corticosteroids. The size of the spacer is important, the larger spacers with a one-way valve (Volumatic®) being most effective. It is important to prescribe a spacer device that is compatible with the metered-dose inhaler, see devices below. Spacer devices should not be regarded as interchangeable; patients should be advised not to switch between spacer devices.

Use and care of spacer devices
Patients should inhale from the spacer device as soon as possible after actuation because the drug aerosol is very short-lived; single-dose actuation is recommended. Tidal breathing is as effective as single breaths. The device should be cleaned once a month by washing in mild detergent and then allowed to dry in air without rinsing; the mouthpiece should be wiped clean of detergent before use. Some manufacturers recommend more frequent cleaning, but this should be avoided since any electrostatic charge may affect drug delivery. Spacer devices should be replaced every 6–12 months.

Nebulisers
Solutions for nebulisation are available for use in severe acute asthma. They are administered over 5–10 minutes from a nebuliser usually driven by oxygen in hospital.

Patients with a severe attack of asthma should preferably have oxygen during nebulisation since beta₂ agonists can increase arterial hypoxaemia.

A nebuliser converts a solution of a drug into an aerosol for inhalation. It is used to deliver higher doses of drug to the airways than is usual with standard inhalers. The main indications for use of a nebuliser are to deliver:

- a beta₂ agonist or ipratropium bromide p. 239 to a patient with an acute exacerbation of asthma or of chronic obstructive pulmonary disease;
- a beta₂ agonist, corticosteroid, or ipratropium bromide on a regular basis to a patient with severe asthma or reversible airways obstruction when the patient is unable to use other inhalational devices;
- an antibiotic (such as colistimethate sodium p. 525) or a mucolytic to a patient with cystic fibrosis;
- Budesonide p. 251 or adrenaline/epinephrine to a child with severe croup;
- Pentamidine isetionate p. 569 for the prophylaxis and treatment of pneumocystis pneumonia.

The use of nebulisers in chronic persistent asthma and chronic obstructive pulmonary disease should be considered only:

- after a review of the diagnosis;
- after review of therapy (see also Chronic Obstructive Pulmonary Disease) and the patient’s ability to use hand-held devices;
- after increased doses of inhaled therapy from hand-held inhalers (with a spacer if necessary) have been tried for 2 weeks;
- if the patient remains breathless, despite correctly using optimal therapy.

Before prescribing a nebuliser, a home trial should preferably be undertaken to monitor response for up to 2 weeks on standard treatment and up to 2 weeks on nebulised treatment. If prescribed, patients must:
have clear instructions from a doctor, specialist nurse, physiotherapist, or pharmacist on the use of the nebuliser (including maintenance and cleaning) and on peak-flow monitoring;

be instructed not to treat acute attacks at home without also seeking help;

have regular follow-up by a doctor, specialist nurse or physiotherapist after about 1 month and annually thereafter.

The proportion of a nebuliser solution that reaches the lungs depends on the type of nebuliser and although it can be as high as 30%, it is more frequently close to 10% and sometimes below 10%. The remaining solution is left in the nebuliser as residual volume or is deposited in the mouthpiece and tubing. The extent to which the nebulised solution is deposited in the airways or alveoli depends on the droplet size, pattern of breath inhalation, and condition of the lung. Droplets with a mass median diameter of 1–5 microns are deposited in the airways and are therefore appropriate for asthma, whereas a particle size of 1–2 microns is needed for alveolar deposition of pentamidine isetionate to combat pneumocystis infection. The type of nebuliser is therefore chosen according to the deposition required and according to the viscosity of the solution.

Jet nebulisers
Jet nebulisers are more widely used than ultrasonic nebulisers. Most jet nebulisers require an optimum gas flow rate of 6–8 litres/minute and in hospital can be driven by piped air or oxygen; in acute asthma the nebuliser should be driven by oxygen. Domiciliary oxygen cylinders do not provide an adequate flow rate therefore an electrical compressor is required for domiciliary use.

For patients at risk of hypercapnia, such as those with chronic obstructive pulmonary disease, oxygen can be dangerous and the nebuliser should be driven by air. If oxygen is required, it should be given simultaneously by nasal cannula.

Tubing
The Department of Health has reminded users of the need to use the correct grade of tubing when connecting a nebuliser to a medical gas supply or compressor.

Ultrasonic nebulisers
Ultrasonic nebulisers produce an aerosol by ultrasonic vibration of the drug solution and therefore do not require a gas flow; they are not suitable for the nebulisation of some drugs, such as dornase alfa p. 280 and nebulised suspensions.

Nebuliser diluent
Nebulisation may be carried out using an undiluted nebuliser solution or it may require dilution beforehand. The usual diluent is sterile sodium chloride 0.9% (physiological saline).

In England and Wales nebulisers and compressors are not available on the NHS (but they are free of VAT); some nebulisers (but not compressors) are available on form GP10A in Scotland (for details consult Scottish Drug Tariff).

Oral
The oral route is used when administration by inhalation is not possible. Systemic side-effects occur more frequently when a drug is given orally rather than by inhalation. Drugs given by mouth for the treatment of asthma include beta₂ agonists, corticosteroids, theophylline p. 263, and leukotriene receptor antagonists.

Parenteral
Drugs such as beta₂ agonists, corticosteroids, and aminophylline p. 261 can be given by injection in acute severe asthma when administration by nebulisation is inadequate or inappropriate. If the patient is being treated in the community, urgent transfer to hospital should be arranged.

Peak flow meters
When used in addition to symptom-based monitoring, peak flow monitoring has not been proven to improve asthma control in either adults or children, however measurement of peak flow may be of benefit in adult patients who are ‘poor perceivers’ and hence slow to detect deterioration in their asthma, and for those with more severe asthma.

When peak flow meters are used, patients must be given clear guidelines as to the action they should take if their peak flow falls below a certain level. Patients can be encouraged to adjust some of their own treatment (within specified limits) according to changes in peak flow rate.

Peak flow charts should be issued to patients where appropriate, and are available to purchase from:

- 3M Security Print and Systems Limited. Gorse Street, Chadderton, Oldham, OL9 9QH. Tel: 0845 610 1112
- GP practices can obtain supplies through their Area Team stores.
- NHS Hospitals can order supplies from www.nhsforms.co.uk/ or by emailing nhsforms@mmm.com.
- In Scotland, peak flow charts can be obtained by emailing stockorders.dpps@apsgroup.co.uk.

NICE technology appraisals (TAs)
Inhaler devices for children under 5 years with chronic asthma (August 2000) NICE TA10

When selecting inhaler devices for children under 5 years with chronic asthma, a child’s needs and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid and bronchodilator therapy should be delivered by pressurised metered-dose inhaler and spacer device, with a facemask if necessary;
- if this is not effective, and depending on the child’s condition, nebulised therapy may be considered and, in children over 3 years, a dry powder inhaler may also be considered.

www.nice.org.uk/TA10

Inhaler devices for children 5–15 years with chronic asthma (March 2002) NICE TA38

When selecting inhaler devices for children between 5–15 years with chronic asthma, a child’s needs, ability to develop and maintain effective technique, and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid therapy should be routinely delivered by a pressurised metered-dose inhaler and spacer device;
- for other inhaled drugs, particularly bronchodilators, a wider range of devices should be considered;
- children and their carers should be trained in the use of the chosen device; suitability of the device should be reviewed at least annually. Inhaler technique and compliance should be monitored.

www.nice.org.uk/TA38

1 Airways disease, obstructive

Asthma

Description of condition
Asthma is a common chronic inflammatory condition of the airways characterised by bronchoconstriction. The most frequent symptoms are cough, wheezing, chest tightness,
and shortness of breath. The bronchoconstriction is usually reversible (either spontaneously or with the aid of medication) leading to intermittent symptoms, but in some patients with chronic asthma the inflammation may result in irreversible airway obstruction. Occasionally, asthma symptoms can get gradually or suddenly worse provoking an acute asthma attack that, if severe, may require hospitalisation.

Aims of treatment

In clinical practice, patients may choose to balance the aims of asthma management against the potential side-effects or inconvenience of taking medication necessary to achieve perfect control. Complete control of asthma is defined as no daytime symptoms, no night-time awakening due to asthma, no asthma attacks, no need for rescue medication, no limitations on activity including exercise, and normal lung function (in practical terms FEV1, and/or peak flow > 80% predicted or best).

Lifestyle changes

Weight loss in overweight patients may lead to an improvement in asthma symptoms. Parents with asthma should be advised about the danger to themselves and to their children with asthma, of smoking, and be offered appropriate support to stop smoking. Breathing exercise programmes (including physiotherapist-taught methods) can be offered as an adjuvant to drug treatment in order to improve quality of life and reduce symptoms.

Management of chronic asthma

A stepwise approach aims to stop symptoms quickly and to improve peak flow. Start at the step most appropriate to initial severity of asthma. The aim is to achieve early control and to maintain it by stepping up treatment as necessary and stepping down treatment when control is good. Before initiating a new drug consider whether diagnosis is correct, check compliance and inhaler technique, and eliminate trigger factors for acute attacks.

Adult and child over 5 years

Step 1—Mild intermittent asthma

- Start inhaled short-acting beta2 agonist (such as salbutamol p. 244 or terbutaline sulfate p. 246) as required.
- Patients using more than one short-acting bronchodilator inhaler a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma.
- Inhaled ipratropium bromide p. 259, (or, if over 12 years, short-acting beta2 agonist tablets and syrup, or theophylline p. 263) also act as short-acting bronchodilators but inhaled short-acting beta2 agonists are preferred.
- Move to step 2 if the patient presents with any one of the following features; is using an inhaled beta2 agonist three times a week or more, being symptomatic three times a week or more, experiencing night-time symptoms at least once a week, or has had an asthma attack in the last 2 years.

Step 2—Regular preventive therapy

- Consider adding regular inhaled standard-dose corticosteroid (alternatives to inhaled corticosteroid are leukotriene receptor antagonists, theophylline, inhaled sodium cromoglicate p. 260, or inhaled nedocromil sodium p. 259, but are less effective).

Note, inhaled standard-dose corticosteroid:
- Adult and child over 12 years: 200–800 micrograms/day beclometasone dipropionate p. 249 or equivalent.
- Child 5–12 years: 200–400 micrograms/day beclometasone dipropionate or equivalent.
- Beclometasone dipropionate and budesonide p. 251 are approximately equivalent in clinical practice although there may be variations with different drug delivery devices. Fluticasone p. 253 and mometasone furoate p. 255 provide equal clinical activity to beclometasone dipropionate and budesonide at half the dosage.
- Start the inhaled corticosteroid at a dose appropriate to severity of disease and adjust to the lowest effective dose at which control of asthma is maintained. Inhaled corticosteroids (except ciclesonide p. 253) should be initially taken twice daily, however, the same total daily dose can be considered once a day if good control is established.
- In children, administration of high doses of inhaled corticosteroids may be associated with systemic side-effects, including growth failure, reduced bone mineral density, and adrenal suppression, see individual drug monographs for monitoring information.

If asthma is not adequately controlled, move to step 3.

Step 3—Initial add-on therapy

- Consider adding a regular inhaled long-acting beta2 agonist (LABA) such as formoterol fumarate p. 242 or salmeterol p. 243 (or, in adults only, indacaterol p. 243 or olodaterol p. 243) to be used in conjunction with an inhaled corticosteroid (see also CHM advice for formoterol fumarate and salmeterol).

If the patient is gaining some benefit from addition of a LABA but control is inadequate then continue the LABA and increase dose of inhaled corticosteroid to top end of inhaled standard-dose corticosteroid range. If there is no response to the LABA, discontinue and increase dose of inhaled corticosteroid. If control is still inadequate, start a trial of either a leukotriene receptor antagonist (montelukast p. 258, or zafirlukast p. 259 if over 12 years) or modified-release theophylline.

Step 4—Persistent poor control

Consider the following options:

- Increase dose of inhaled corticosteroid (a spacer should be used).
- Add a leukotriene receptor antagonist, modified-release theophylline, or modified-release oral beta2 agonist (caution in patients already taking a LABA).

Note, increased inhaled corticosteroid dose:
- Adult and child over 12 years: up to 2000 micrograms/day beclometasone dipropionate or equivalent.
- Child 5–12 years: up to 800 micrograms/day beclometasone dipropionate or equivalent.

- Beclometasone dipropionate and budesonide are approximately equivalent in clinical practice although there may be variations with different drug delivery devices. Fluticasone and mometasone furoate provide equal clinical activity to beclometasone dipropionate and budesonide at half the dosage.

Before proceeding to step 5, refer patients with inadequately controlled asthma to specialist care.

Step 5—Continuous or frequent use of oral corticosteroids

- Add a regular oral corticosteroid (prednisolone p. 639, as single daily dose) at lowest dose to provide adequate control; continue high-dose inhaled corticosteroid (in exceptional cases, this may exceed licensed doses).

Child under 5 years

Step 1—Mild intermittent asthma

- Inhaled short-acting beta2 agonist (such as salbutamol or terbutaline sulfate) as required.

Children identified to be using more than one short-acting bronchodilator inhaler a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma.

Move to step 2 if the child presents with any one of the following features; is using an inhaled beta2 agonist three times a week or more, being symptomatic three times a week or more, experiencing night-time symptoms at least once a week.
Step 2—Regular preventer therapy
- Consider adding regular standard-dose inhaled corticosteroid
- If the child is unable to take an inhaled corticosteroid, a leukotriene receptor antagonist (such as montelukast) is an effective first-line preventer.

Note, inhaled standard-dose corticosteroid: *Child under 5 years*: 200–400 micrograms/day beclometasone dipropionate or equivalent
- Beclometasone dipropionate and budesonide are approximately equivalent in clinical practice although there may be variations with different drug delivery devices. Fluticasone p. 253 provides equal activity to beclometasone dipropionate p. 249 and budesonide p. 251 at half the dosage.
- Start inhaled corticosteroid at a dose appropriate to severity of disease and adjust to the lowest effective dose at which control of asthma is maintained.
- Administration of high doses of inhaled corticosteroids in children may be associated with systemic side-effects, including growth failure, reduced bone mineral density and adrenal suppression.
- If asthma is not adequately controlled, move to step 3.

Step 3—Initial add-on therapy
- In children 2–5 years, add a leukotriene receptor antagonist if not added during step 2. If a leukotriene receptor antagonist was added at step 2, reconsider addition of standard-dose inhaled corticosteroid
- In children under 2 years, consider proceeding to step 4.

Step 4—Persistent poor control
- Refer child to respiratory paediatrician.

Stepping down
- Once asthma is controlled, it is recommended to step down therapy and continue to regularly review the patient. When deciding which drug to step down first and at what rate, the severity of asthma, the side-effects of treatment, duration on current dose, the beneficial effect achieved, and the patient’s preference, should be considered.
- Patient should be maintained at the lowest possible dose of inhaled corticosteroid. Reductions should be considered every three months, decreasing the dose by approximately 25–50% each time. Reduce the dose slowly as patients deteriorate at different rates.

Pregnancy and breast-feeding
- Women with asthma should be closely monitored during pregnancy. It is particularly important that asthma should be well controlled during pregnancy; when this is achieved asthma has no important effects on pregnancy, labour, or on the fetus. Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control. Drugs for asthma should preferably be administered by inhalation to minimise exposure of the fetus. Short-acting beta₂ agonists, long-acting beta₂ agonists, oral and inhaled corticosteroids, sodium cromoglicate p. 260, nedocromil sodium p. 259, and oral and intravenous theophyllines can be used as normal during pregnancy. There is limited information on use of leukotriene receptor antagonists during pregnancy, however they may be used if potential benefit outweighs risk. Drugs for asthma, including corticosteroid tablets, can be used as normal and in-line with manufacturers’ recommendations in breast-feeding.
- Severe acute attacks of asthma can have an adverse effect on pregnancy and should be treated promptly in hospital with conventional therapy, including nebulisation of a beta₂ agonist and oral or parenteral administration of a corticosteroid; prednisolone p. 639 is the preferred corticosteroid for oral administration since very little of the drug reaches the fetus. Oxygen should be given immediately to maintain arterial oxygen saturation of 94–98% and prevent maternal and fetal hypoxia.

Exercise-induced asthma
- For most patients, exercise-induced asthma is an illustration of poorly controlled asthma and regular treatment including inhaled corticosteroids should therefore be reviewed. If exercise is a specific problem in patients already taking inhaled corticosteroids who are otherwise well controlled, consider adding either a leukotriene receptor antagonist, a long-acting beta₂ agonist, an oral beta₂ agonist, sodium cromoglicate or nedocromil sodium, or theophylline.

Management of acute asthma

Adults

Levels of severity
- The nature of treatment required for the management of acute asthma depends on the level of severity, described as follows:
- **Moderate acute asthma**
  - Increasing symptoms
  - Peak flow > 50–75% best or predicted
  - No features of acute severe asthma
- **Severe acute asthma**
  - Any one of the following:
    - Peak flow 33–50% best or predicted
    - Respiratory rate > 25/min
    - Heart rate > 110/min
    - Inability to complete sentences in one breath

Life-threatening acute asthma
- Any one of the following, in a patient with severe asthma:
  - Peak flow < 33% best or predicted
  - Arterial oxygen saturation (SpO₂) < 92%
  - Partial arterial pressure of oxygen (PaO₂) < 8 kPa
  - Normal partial arterial pressure of carbon dioxide (PaCO₂) (4.6–6.0 kPa)
  - Silent chest
  - Cyanosis
  - Poor respiratory effort
  - Arrhythmia
  - Exhaustion
  - Altered conscious level
  - Hypotension

Near-fatal acute asthma
- Raised PaCO₂, requiring mechanical ventilation with raised inflation pressures, or both

Management of acute asthma in adults
- Patients with moderate asthma should be treated at home or in primary care according to response to treatment, while patients with severe or life-threatening acute asthma should start treatment as soon as possible and be admitted to hospital immediately following initial assessment.
- Supplementary oxygen should be given to all hypoxaemic patients with acute severe asthma to maintain a SpO₂ level between 94–98%.
- First-line treatment for acute asthma is a high-dose inhaled short-acting beta₂ agonist (salbutamol p. 244 or terbutaline sulfate p. 246) given as soon as possible. A pressurised metered dose inhaler with spacer device is preferred in patients with non-life-threatening acute asthma. Whereas, in patients with life-threatening acute asthma, a beta₂ agonist administered by an oxygen-driven nebuliser is recommended. If the response to an initial dose of short-acting beta₂ agonist is poor, consider continuous nebulisation with an appropriate nebuliser. Intravenous beta₂ agonists are reserved for those patients in whom inhaled therapy cannot be used reliably.
- In all cases of acute asthma, patients should be prescribed an adequate dose of oral prednisolone once daily for at least...
5 days or until recovery. Parenteral hydrocortisone p. 637 or intramuscular methylprednisolone p. 638 are alternatives in patients who are unable to take oral prednisolone.

Nebulised ipratropium bromide p. 239 may be combined with a nebulised beta₂ agonist in patients with acute severe or life-threatening asthma or in those with a poor initial response to beta₂ agonist therapy to provide greater bronchodilation.

There is some evidence that magnesium sulfate p. 963 has bronchodilator effects. A single intravenous dose of magnesium sulfate may be considered in patients with severe acute asthma (peak flow < 50% best or predicted) who have not had a good initial response to inhaled bronchodilator therapy [unlicensed use]. In an acute asthma attack, intravenous aminophylline p. 261 is not likely to produce any additional bronchodilation compared to standard therapy with inhaled bronchodilators and corticosteroids. However, in some patients with near-fatal or life-threatening acute asthma with a poor response to initial therapy, intravenous aminophylline may provide some benefit. Magnesium sulfate by intravenous infusion or aminophylline should only be used after consultation with, or on the recommendation of, senior medical staff.

**Child over 2 years**

**Levels of severity**

The nature of treatment required for the management of acute asthma depends on the level of severity, described as follows:

**Moderate acute asthma**

- Able to talk in sentences
- Arterial oxygen saturation (SpO₂) ≥ 92%
- Peak flow ≥ 50% best or predicted
- Heart rate ≤ 140/minute in children aged 2–5 years; heart rate ≤ 125/minute in children over 5 years
- Respiratory rate ≤ 40/minute in children aged 2–5 years; respiratory rate ≤ 30/minute in children over 5 years

**Severe acute asthma**

- Can’t complete sentences in one breath or too breathless to talk or feed
- SpO₂ < 92%
- Peak flow 33–50% best or predicted
- Heart rate > 140/minute in children aged 2–5 years; heart rate > 125/minute in children aged over 5 years
- Respiratory rate > 40/minute in children aged 2–5 years; respiratory rate > 30/minute in children over 5 years

**Life-threatening acute asthma**

Any one of the following in a child with severe asthma:

- SpO₂ < 92%
- Peak flow < 33% best or predicted
- Silent chest
- Cyanosis
- Poor respiratory effort
- Hypotension
- Exhaustion
- Confusion

**Management of acute asthma in children over 2 years**

Following initial assessment, supplementary high flow oxygen should be given to all children with life-threatening acute asthma or SpO₂ < 94% to achieve normal saturations of 94–98%.

First-line treatment for acute asthma is an inhaled short-acting beta₂ agonist (salbutamol p. 244 or terbutaline sulfate p. 246) given as soon as possible, ideally via a metered dose inhaler and spacer device in mild to moderate acute asthma. Children with severe or life-threatening acute asthma should be transferred to hospital urgently.

In all cases of acute asthma, children should be prescribed an adequate once daily dose of oral prednisolone p. 639. Treatment for up to 3 days is usually sufficient, but the length of course should be tailored to the number of days necessary to bring about recovery. Intravenous hydrocortisone p. 637 should be reserved for severely affected children who are unable to retain oral medication.

Nebulised ipratropium bromide p. 239 can be combined with beta₂ agonist treatment for children with severe or life-threatening acute asthma or in those with a poor initial response to beta₂ agonist therapy to provide greater bronchodilation. Consider adding magnesium sulfate p. 963 to nebulised salbutamol and ipratropium bromide in the first hour in children with a short duration of acute severe asthma symptoms presenting with an oxygen saturation less than 92%.

Children with continuing severe asthma despite frequent nebulised beta₂ agonists and ipratropium bromide plus oral corticosteroids, and those with life-threatening features, need urgent review by a specialist with a view to transfer to a high dependency unit or paediatric intensive care unit (PICU) to receive second-line intravenous therapies.

In a severe asthma attack where the child has not responded to initial inhaled therapy, early addition of a single bolus dose of intravenous salbutamol may be an option. Continuous intravenous infusion of salbutamol, administered under specialist supervision with continuous ECG and electrolyte monitoring, should be considered in children with unreliable inhalation or severe refractory asthma. Aminophylline p. 261 may be considered in children with severe or life-threatening acute asthma unresponsive to maximal doses of bronchodilators and corticosteroids. Aminophylline is not recommended in children with mild to moderate acute asthma. Intravenous magnesium sulfate has been used for acute asthma [unlicensed use] although its place in management is not yet established.

**Child under 2 years**

Inhaled short-acting beta₂ agonists are the initial treatment of choice for acute asthma in children under 2 years. For mild to moderate acute asthma attacks, a metered-dose inhaler with a spacer and mask is the optimal drug delivery device. In a hospital setting, consider oral prednisolone daily for up to 3 days, early in the management of severe acute asthma attacks. For more severe symptoms, inhaled ipratropium bromide in combination with an inhaled beta₂ agonist is also an option.

**Follow up in all cases**

Episodes of acute asthma may be a failure of preventative therapy, review is required to prevent further episodes. A careful history should be taken to establish the reason for the asthma attack. Inhaler technique should be checked and regular treatment should be reviewed. Patients should be given a written asthma action plan aimed at preventing relapse, optimising treatment, and preventing delay in seeking assistance in future attacks. It is essential that the patient’s GP practice is informed within 24 hours of discharge from the emergency department or hospital following an asthma attack. Patients who have had a near-fatal asthma attack should be kept under specialist supervision indefinitely. A respiratory specialist should follow up all patients admitted with a severe asthma attack for at least one year after the admission.

---

**Bronchodilators**

**Adrenoceptor agonists (sympathomimetics)**

Selective beta₂ agonists produce bronchodilation. A short-acting beta₂ agonist is used for immediate relief of asthma symptoms while some long-acting beta₂ agonists are added to an inhaled corticosteroid in patients requiring prophylactic treatment.

The selective beta₂ agonists (selective beta₂-adrenoceptor agonists, selective beta₂ stimulants) such as salbutamol p. 244 or terbutaline sulfate p. 246 are the safest and most effective short-acting beta₂ agonists for asthma. Less
Respiratory system

Short-acting beta\(_2\) agonists
Mild to moderate symptoms of asthma respond rapidly to the inhalation of a selective short-acting beta\(_2\) agonist, such as salbutamol or terbutaline. If a beta\(_2\) agonist inhalation is needed more often than twice a week, or if night-time symptoms occur at least once a week, or if the patient has suffered an exacerbation in the last 2 years, then prophylactic treatment should be considered using a stepped approach. A short-acting beta\(_2\) agonist inhaled immediately before exercise reduces exercise-induced asthma; however, frequent exercise-induced asthma probably reflects poor overall control and calls for reassessment of asthma treatment.

Long-acting beta\(_2\) agonists
Formoterol fumarate p. 242 (eformoterol) and salmeterol p. 243 are longer-acting beta\(_2\) agonists which are administered by inhalation. They should be used for asthma only in patients who regularly use an inhaled corticosteroid. They have a role in the long-term management of chronic asthma and can be useful in nocturnal asthma. Salmeterol should not be used for the relief of an asthma attack; it has a slower onset of action than salbutamol or terbutaline. Formoterol fumarate is licensed for short-term symptom relief and for the prevention of exercise-induced bronchospasm; its speed of onset of action is similar to that of salbutamol. Combination inhalers that contain a long-acting beta\(_2\) agonist and a corticosteroid ensure that long-acting beta\(_2\) agonists are not used without concomitant corticosteroids, but reduce the flexibility to adjust the dose of each component. Indacaterol p. 243 and olodaterol p. 243 are long-acting beta\(_2\) agonists licensed for chronic obstructive pulmonary disease in adults; they are not indicated for the relief of acute bronchospasm. Vilanterol is a long-acting beta\(_2\) agonist available only in a combination inhaler with fluticasone furoate or with umeclidinium p. 240.

Oral
Oral preparations of beta\(_2\) agonists may be used by patients who cannot manage the inhaled route. They are sometimes used for children and the elderly, but inhaled beta\(_2\) agonists are more effective and have fewer side-effects. The longer-acting oral preparations, including bambuterol hydrochloride p. 241, may be of value in nocturnal asthma but they have a limited role and inhaled long-acting beta\(_2\) agonists are usually preferred.

Parenteral
Salbutamol or terbutaline sulfate can be given intravenously for severe or life-threatening acute asthma; patients should be carefully monitored and the dose adjusted according to response and heart rate. The regular use of beta\(_2\) agonists by the subcutaneous route is not recommended since the evidence of benefit is uncertain and it may be difficult to withdraw such treatment once started. In adults, beta\(_2\) agonists may also be given by intramuscular injection.

Children
Selective beta\(_2\) agonists are useful even in children under the age of 18 months. They are most effective by the inhaled route; a pressurised metered-dose inhaler should be used with a spacer device in children under 5 years. A beta\(_2\) agonist may also be given by mouth but administration by inhalation is preferred; a long-acting inhaled beta\(_2\) agonist may be used where appropriate. In severe attacks nebulisation using a selective beta\(_2\) agonist or ipratropium bromide p. 239 is advisable.

Antimuscarinic bronchodilators
Ipratropium bromide can provide short-term relief in chronic asthma, but short-acting beta\(_2\) agonists act more quickly and are preferred. Ipratropium bromide by nebulisation can be added to other standard treatment in life-threatening asthma or if acute asthma fails to improve with standard therapy. The aerosol inhalation of ipratropium bromide can be used for short-term relief in mild chronic obstructive pulmonary disease in patients who are not using a long-acting antimuscarinic drug. Its maximal effect occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day. Aciclividinium bromide p. 238, glycopyrronium bromide p. 238, tiotropium p. 240, and umeclidinium are licensed for the maintenance treatment of adults with chronic obstructive pulmonary disease. They are not suitable for the relief of acute bronchospasm. Tiotropium (via Respimat\textsuperscript{®} device) is also licensed as an adjunct to inhaled corticosteroids and long-acting beta\(_2\) agonists for the maintenance treatment of patients with asthma who have suffered one or more severe exacerbations in the last year.

Theophylline
Theophylline p. 263 is a xanthine used as a bronchodilator in asthma and stable chronic obstructive pulmonary disease; it is not generally effective in exacerbations of chronic obstructive pulmonary disease. Theophylline may have an additive effect when used in conjunction with small doses of beta\(_2\) agonists; the combination may increase the risk of side-effects, including hypokalaemia. Theophylline is given by injection as aminophylline p. 261, a mixture of theophylline with ethylenediamine, which is 20 times more soluble than theophylline alone. Aminophylline injection is needed rarely for severe acute asthma.

Compound bronchodilator preparations
In general, patients are best treated with single-ingredient preparations, such as a selective beta\(_2\) agonist or ipratropium bromide, so that the dose of each drug can be adjusted. This flexibility is lost with compound bronchodilator preparations. However, a combination product may be appropriate for patients stabilised on individual components in the same proportion.

Chronic obstructive pulmonary disease

Management
Smoking cessation reduces the progressive decline in lung function in chronic obstructive pulmonary disease (COPD, chronic bronchitis, or emphysema). Infection can complicate chronic obstructive pulmonary disease and may be prevented by vaccination (pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1207 and influenza vaccine p. 1212).

A trial of a high-dose inhaled corticosteroid or an oral corticosteroid is recommended for patients with moderate or severe airflow obstruction if the diagnosis is in doubt. Symptoms of chronic obstructive pulmonary disease may be alleviated by an inhaled short-acting beta\(_2\) agonist or a...
short-acting antimuscarinic bronchodilator used as required.

When the airways obstruction is more severe, regular inhaled therapy should be used. It is important to check compliance and inhaler technique before initiating a new drug.

If the Forced Expiratory Volume in 1 second (FEV₁), is 50% of predicted or more, either a long-acting antimuscarinic bronchodilator or a long-acting β₂ agonist should be used. Short-acting antimuscarinic bronchodilators should be discontinued when a long-acting antimuscarinic bronchodilator is started. A long-acting β₂ agonist with a corticosteroid in a combination inhaler can be used for patients who remain symptomatic despite regular treatment with a long-acting β₂ agonist.

If FEV₁ is less than 50% of predicted, either a long-acting antimuscarinic bronchodilator or a long-acting β₂ agonist with a corticosteroid in a combination inhaler should be used.

In any patient who remains breathless or continues to have exacerbations, triple therapy with a long-acting β₂ agonist and a corticosteroid in a combination inhaler plus a long-acting antimuscarinic bronchodilator should be used.

If an inhaled corticosteroid is not appropriate, a long-acting antimuscarinic bronchodilator can be used with a long-acting β₂ agonist, (see Use of inhaled therapies in chronic obstructive pulmonary disease algorithm, below).

If symptoms persist or if the patient is unable to use an inhaler, oral modified-release aminophylline p. 261 or theophylline p. 263 can be used.

Indacaterol p. 243 is a long-acting β₂ agonist licensed for the maintenance treatment of chronic obstructive pulmonary disease.

In patients with severe chronic obstructive pulmonary disease associated with chronic bronchitis and a history of frequent exacerbations, roflumilast p. 260 is licensed as an adjunct to existing bronchodilator treatment.

A mucolytic drug may be considered for a patient with a chronic productive cough.

Long-term oxygen therapy prolongs survival in patients with severe chronic obstructive pulmonary disease and hypoxaemia.

During an exacerbation of chronic obstructive pulmonary disease, bronchodilator therapy can be administered through a nebuliser if necessary and oxygen given if appropriate. Aminophylline can be given intravenously if response to nebulised bronchodilators is poor. A short course of oral corticosteroid, such as prednisolone for 7–14 days, should be given if increased breathlessness interferes with daily activities. Antibacterial treatment is required if sputum becomes more purulent than usual, or if there are other signs of infection.

Patients who have had an episode of hypercapnic respiratory failure should be given a 24% or 28% Venturi mask and an oxygen alert card endorsed with the oxygen saturations required during previous exacerbations. Patients and their carers should be instructed to show the card to emergency healthcare providers in the event of an exacerbation.

### Oxygen alert card based on British Thoracic Society guideline for emergency oxygen use in adult patients (October 2008)

Name: 

I am at risk of type II respiratory failure with a raised CO₂ level.

Please use my ___% Venturi mask to achieve an oxygen saturation of ___% to ___% during exacerbations.

Use compressed air to drive nebulisers (with nasal oxygen at 2 litres/minute). If compressed air not available, limit oxygen-driven nebulisers to 6 minutes.

Oxygen alert card is available at [www.brit-thoracic.org.uk](http://www.brit-thoracic.org.uk).

### Croup

#### Management

Mild croup is largely self-limiting, but treatment with a single dose of a corticosteroid (e.g. dexamethasone p. 635) by mouth may be of benefit.

More severe croup (or mild croup that might cause complications) calls for hospital admission; a single dose of a corticosteroid (e.g. dexamethasone or prednisolone p. 639 by mouth) should be administered before transfer to hospital. In hospital, dexamethasone (by mouth or by injection) or budesonide p. 251 (by nebulisation) will often reduce symptoms; the dose may need to be repeated after 12 hours if necessary.

For severe croup not effectively controlled with corticosteroid treatment, nebulised adrenaline/epinephrine solution 1 in 1000 (1 mg/mL) should be given with close clinical monitoring; the effects of nebulised adrenaline/epinephrine last 2–3 hours and the child needs to be monitored carefully for recurrence of the obstruction.

### Oxygen

#### Overview

Oxygen should be regarded as a drug. It is prescribed for hypoxaemic patients to increase alveolar oxygen tension and decrease the work of breathing. The concentration of oxygen required depends on the condition being treated; the administration of an inappropriate concentration of oxygen can have serious or even fatal consequences.

Oxygen is probably the most common drug used in medical emergencies. It should be prescribed initially to achieve a normal or near-normal oxygen saturation; in most acutely ill patients with a normal or low arterial carbon dioxide (PₐCO₂), oxygen saturation should be 94–98% oxygen saturation. However, in some clinical situations such as cardiac arrest and carbon monoxide poisoning it is more appropriate to aim for the highest possible oxygen saturation until the patient is stable. A lower target of 88–92% oxygen saturation is indicated for patients at risk of hypercapnic respiratory failure.

High concentration oxygen therapy is safe in uncomplicated cases of conditions such as pneumonia, pulmonary thromboembolism, pulmonary fibrosis, shock, severe trauma, sepsis, or anaphylaxis. In such conditions low arterial oxygen (PₐO₂) is usually associated with low or
normal arterial carbon dioxide ($P_{a}CO_2$), and therefore there is little risk of hypoventilation and carbon dioxide retention. In acute severe asthma, the arterial carbon dioxide ($P_{a}CO_2$) is usually subnormal but as asthma deteriorates it may rise steeply (particularly in children). These patients usually require high concentrations of oxygen and if the arterial carbon dioxide ($P_{a}CO_2$) remains high despite other treatment, intermittent positive-pressure ventilation needs to be considered urgently.

Low concentration oxygen therapy (controlled oxygen therapy) is reserved for patients at risk of hypercapnic respiratory failure, which is more likely in those with:
- chronic obstructive pulmonary disease;
- advanced cystic fibrosis;
- severe non-cystic fibrosis bronchiectasis;
- severe kyphoscoliosis or severe ankylosing spondylitis;
- severe lung scarring caused by tuberculosis;
- musculoskeletal disorders with respiratory weakness, especially if on home ventilation;
- an overdose of opioids, benzodiazepines, or other drugs causing respiratory depression.

Until blood gases can be measured, initial oxygen should be given using a controlled concentration of 28% or less, titrated towards a target oxygen saturation of 88–92%. The aim is to provide the patient with enough oxygen to achieve an acceptable arterial oxygen tension without worsening carbon dioxide retention and respiratory acidosis. Patients may carry an oxygen alert card.

Domiciliary oxygen
Oxygen should only be prescribed for use in the home after careful evaluation in hospital by respiratory experts. Patients should be advised of the risks of continuing to smoke when receiving oxygen therapy, including the risk of fire. Smoking cessation therapy should be recommended before home oxygen prescription.

Air travel
Some patients with arterial hypoxaemia require supplementary oxygen for air travel. The patient’s requirement should be discussed with the airline before travel.
Long-term oxygen therapy

Long-term administration of oxygen (usually at least 15 hours daily) prolongs survival in some patients with chronic obstructive pulmonary disease.

Assessment for long-term oxygen therapy requires measurement of arterial blood gas tensions. Measurements should be taken on 2 occasions at least 3 weeks apart to demonstrate clinical stability, and not sooner than 4 weeks after an acute exacerbation of the disease. Long-term oxygen therapy should be considered for patients with:

- chronic obstructive pulmonary disease with \( P_a O_2 < 7.3 \) kPa when breathing air during a period of clinical stability;
- chronic obstructive pulmonary disease with \( P_O_2 \) 7.3–8 kPa in the presence of secondary polycythaemia, nocturnal hypoaxaemia, peripheral oedema, or evidence of pulmonary hypertension;
- severe chronic asthma with \( P_a O_2 < 7.3 \) kPa or persistent disabling breathlessness;
- interstitial lung disease with \( P_a O_2 < 8 \) kPa and in patients with \( P_O_2 < 8 \) kPa with disabling dyspnoea;
- cystic fibrosis when \( P_a O_2 < 7.3 \) kPa or if \( P_O_2 \) 7.3–8 kPa in the presence of secondary polycythaemia, nocturnal hypoaxaemia, pulmonary hypertension, or peripheral oedema;
- pulmonary hypertension, without parenchymal lung involvement when \( P_a O_2 < 8 \) kPa;
- neuromuscular or skeletal disorders, after specialist assessment;
- obstructive sleep apnoea despite continuous positive airways pressure therapy, after specialist assessment;
- pulmonary malignancy or other terminal disease with disabling dyspnoea;
- heart failure with daytime \( P_a O_2 < 7.3 \) kPa when breathing air or with nocturnal hypoaxaemia;
- paediatric respiratory disease, after specialist assessment.

Increased respiratory depression is seldom a problem in patients with stable respiratory failure treated with low concentrations of oxygen although it may occur during exacerbations; patients and relatives should be warned to call for medical help if drowsiness or confusion occur.

Short-burst oxygen therapy

Oxygen is occasionally prescribed for short-burst (intermittent) use for episodes of breathlessness not relieved by other treatment in patients with severe chronic obstructive pulmonary disease, interstitial lung disease, heart failure, and in palliative care. It is important, however, that the patient does not rely on oxygen instead of obtaining medical help or taking more specific treatment. Short-burst oxygen therapy can be used to improve exercise capacity and recovery; it should only be continued if there is proven improvement in breathlessness or exercise tolerance.

Ambulatory oxygen therapy

Ambulatory oxygen is prescribed for patients on long-term oxygen therapy who need to be away from home on a regular basis. Patients who are not on long-term oxygen therapy can be considered for ambulatory oxygen therapy if there is evidence of exercise-induced oxygen desaturation and of improvement in blood oxygen saturation and exercise capacity with oxygen. Ambulatory oxygen therapy is not recommended for patients with heart failure or those who smoke.

Oxygen concentrators are more economical for patients who require oxygen for long periods, and in England and Wales can be ordered on the NHS on a regional tendering basis. A concentrator is recommended for a patient who requires oxygen for more than 8 hours a day (or 21 cylinders per month). Exceptionally, if a higher concentration of oxygen is required the output of 2 oxygen concentrators can be combined using a ‘Y’ connection.

A nasal cannula is usually preferred for long-term oxygen therapy from an oxygen concentrator. It can, however, produce dermatitis and mucosal drying in sensitive individuals.

Giving oxygen by nasal cannula allows the patient to talk, eat, and drink, but the concentration of oxygen is not controlled; this may not be appropriate for acute respiratory failure. When oxygen is given through a nasal cannula at a rate of 1–2 litres/minute the inspiratory oxygen concentration is usually low, but it varies with ventilation and can be high if the patient is underventilating.

Arrangements for supplying oxygen

The following oxygen services may be ordered in England and Wales:

- emergency oxygen;
- short-burst (intermittent) oxygen therapy;
- long-term oxygen therapy;
- ambulatory oxygen.

The type of oxygen service (or combination of services) should be ordered on a Home Oxygen Order Form (HOOF); the amount of oxygen required (hours per day) and flow rate should be specified. The clinician will determine the appropriate equipment to be provided. Special needs or preferences should be specified on the HOOF.

The clinician should obtain the patient or carers consent, to pass on the patient’s details to the supplier, the fire brigade, and other relevant organisations. The supplier will contact the patient to make arrangements for delivery, installation, and maintenance of the equipment. The supplier will also train the patient or carer to use the equipment.

The clinician should send the HOOF to the supplier who will continue to provide the service until a revised HOOF is received, or until notified that the patient no longer requires the home oxygen service.

- East of England, North East: BOC Medical: Tel: 0800 136 603 Fax: 0800 169 9989
- South West: Air Liquide: Tel: 0808 202 2229 Fax: 0191 497 3430
- London, East Midlands, North West: Air Liquide: Tel: 0500 823 773 Fax: 0800 781 4610
- Yorkshire and Humberside, West Midlands, Wales: Air Products: Tel: 0800 373 580 Fax: 0800 214 709
- South East Coast, South Central: Dolby Vivisol: Tel: 08443 814 402 Fax: 0800 781 4610

In Scotland refer the patient for assessment by a respiratory consultant. If the need for a concentrator is confirmed the consultant will arrange for the provision of a concentrator through the Common Services Agency. Prescribers should complete a Scottish Home Oxygen Order Form (SHOOF) and email it to Health Facilities Scotland. Health Facilities Scotland will then liaise with their contractor to arrange the supply of oxygen. Further information can be obtained at: www.dolbyvivisol.com/our-services/healthcare-professionals/home-oxygen-services-sco.aspx

In Northern Ireland oxygen concentrators and cylinders should be prescribed on form HS21; oxygen concentrators are supplied by a local contractor. Prescriptions for oxygen cylinders and accessories can be dispensed by pharmacists contracted to provide domiciliary oxygen services.
Antimuscarinics (inhaled)

09-Feb-2016

- **INDICATIONS AND DOSE**
  - Maintenance treatment of chronic obstructive pulmonary disease
  - Adult: 375 micrograms twice daily

- **DOSE EQUIVALENCE AND CONVERSION**
  - Each 375 microgram inhalation of aclidinium bromide delivers 322 micrograms of aclidinium.

- **CAUTIONS**
  - Arrhythmia (when newly diagnosed within last 3 months) - heart failure (hospitalisation with moderate or severe heart failure within last 12 months) - myocardial infarction within last 6 months - unstable angina

- **INTERACTIONS**
  - Appendix 1: aclidinium

- **SIDE-EFFECTS**
  - Uncommon: Dysphonia - stomatitis

- **PREGNANCY**
  - Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING**
  - Manufacturer advises use only if potential benefits outweigh risks.

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be given advice on appropriate inhaler technique.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Inhalation powder**
    - Aclidinium bromide (non-proprietary)
      - Aclidinium bromide 375 microgram per 1 dose: Aclidinium bromide 375 microgram/dose dry powder inhaler | 60 dose | no price available DT price = £28.60
      - Eklira (AstraZeneca UK Ltd)
        - Aclidinium bromide 375 microgram per 1 dose: Eklira 322 micrograms/dose Genuair | 60 dose | £28.60 DT price = £28.60

Aclidinium bromide with formoterol

19-Feb-2016

- **INDICATIONS AND DOSE**
  - Maintenance treatment of chronic obstructive pulmonary disease
  - Adult: 1 inhalation twice daily

Glycopyrronium bromide (Glycopyrrolate)

17-Oct-2016

- **INDICATIONS AND DOSE**
  - Maintenance treatment of chronic obstructive pulmonary disease
  - Adult: 1 capsule once daily

- **DOSE EQUIVALENCE AND CONVERSION**
  - Each capsule delivers 55 micrograms of glycopyrronium bromide (equivalent to 44 micrograms of glycopyrronium).
Glycopyrronium bromide with indacaterol

17-Feb-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, glycopyrronium bromide p. 238, indacaterol p. 243.

- **INDICATIONS AND DOSE**
  - Maintenance treatment of chronic obstructive pulmonary disease
    - **BY INHALATION OF POWDER**
    - Adult: 1 inhalation daily

- **CAUTIONS**
  - Convulsive disorders

- **INTERACTIONS**
  - Appendix 1: beta₂ agonists, glycopyrronium

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be given advice on appropriate inhaler technique and reminded that the capsules are not for oral administration.

- **MEDICINAL FORMS**
  - Phlebitis can be variation in the licensing of different medicines containing the same drug.
  - **Inhalation powder**
    - **Ultibro Breezhaler** (Novartis Pharmaceuticals UK Ltd)
      - Glycopyrronium bromide 54 microgram per 1 dose, Indacaterol (as Indacaterol maleate) 85 microgram per 1 dose
    - Ultibro Breezhaler 85microgram/4microgram inhalation powder capsules with device | 10 capsule pack | £10.83 | 30 capsule pack | £32.50

Ipratropium bromide

24-Feb-2016

- **INDICATIONS AND DOSE**
  - **Reversible airways obstruction**
    - **BY INHALATION OF AEROSOL**
    - Child 1 month-5 years: 20 micrograms 3 times a day
    - Child 6-11 years: 20–40 micrograms 3 times a day
    - Child 12-17 years: 20–40 micrograms 3–4 times a day
  - **Reversible airways obstruction, particularly in chronic obstructive pulmonary disease**
    - **BY INHALATION OF AEROSOL**
    - Adult: 20–40 micrograms 3–4 times a day
    - **BY INHALATION OF NEBULISED SOLUTION**
    - Adult: 250–500 micrograms 3–4 times a day
  - **Acute bronchospasm**
    - **BY INHALATION OF NEBULISED SOLUTION**
    - Child 1 month-5 years: 125–250 micrograms as required; maximum 1 mg per day
    - Child 6-11 years: 250 micrograms as required; maximum 1 mg per day
    - Child 12-17 years: 500 micrograms as required, doses higher than max. can be given under medical supervision; maximum 2 mg per day
    - Adult: 500 micrograms as required, doses higher than max. can be given under medical supervision; maximum 2 mg per day
  - **Severe or life-threatening acute asthma**
    - **BY INHALATION OF NEBULISED SOLUTION**
    - Child 1 month-11 years: 250 micrograms every 20–30 minutes for the first 2 hours, then 250 micrograms every 4–6 hours as required
    - Child 12-17 years: 500 micrograms every 4–6 hours as required
    - Adult: 500 micrograms every 4–6 hours as required

- **PHARMACOKINETICS**
  - The maximal effect of inhaled ipratropium occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

- **UNLICENSED USE**
  - The dose of ipratropium for severe or life-threatening acute asthma is unlicensed.

- **CAUTIONS**
  - **Cystic fibrosis**

- **SIDE-EFFECTS**
  - Rare: Ocular accommodation disorder

- **PREGNANCY**
  - Manufacturer advises only use if potential benefit outweighs the risk.

- **PARKING AND DISPENSING INFORMATION**
  - If dilution of ipratropium bromide nebuliser solution is necessary use only sterile sodium chloride 0.9%.

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be given advice on appropriate inhaler technique.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Nebuliser liquid**
    - **Ipratropium bromide (Non-proprietary)**
      - **Ipratropium bromide 250 microgram per 1 ml**
        - Ipratropium bromide 500micrograms/2ml nebuliser liquid unit dose vials | 20 unit dose pack | £2.93 DT price = £2.60
        - Ipratropium bromide 250micrograms/1ml nebuliser liquid unit dose vials | 20 unit dose pack | £4.58 DT price = £4.51
        - Ipratropium bromide 250micrograms/1ml nebuliser liquid Steri-Neb unit dose vials | 20 unit dose pack | £6.99 DT price = £4.51
        - Ipratropium 500micrograms/2ml nebuliser liquid Steri-Neb unit dose vials | 20 unit dose pack | £11.59 DT price = £2.60
    - **Atrovent UDV** (Boehringer Ingelheim Ltd)
      - **Ipratropium bromide 250 microgram per 1 ml**
        - Atrovent 500micrograms/2ml nebuliser liquid UDV | 20 unit dose pack | £4.87 DT price = £2.60 | 60 unit dose pack | £14.59
        - Atrovent 250micrograms/1ml nebuliser liquid UDV | 20 unit dose pack | £4.14 DT price = £4.51 | 60 unit dose pack | £12.44
    - **Respontin** (GlaxoSmithKline UK Ltd)
      - **Ipratropium bromide 250 microgram per 1 ml**
        - Respontin 500micrograms/2ml Nebules | 20 unit dose pack | £5.60 DT price = £2.60

- **Pressurised inhalation**
  - **Ipratropium bromide (Non-proprietary)**
    - **Ipratropium bromide 20 microgram per 1 dose**
      - Ipratropium bromide 20micrograms/dose inhaler CFC free | 200 dose pack | no price available DT price = £5.56
    - **Atrovent** (Boehringer Ingelheim Ltd)
      - **Ipratropium bromide 20 microgram per 1 dose**
        - Atrovent 20micrograms/dose inhaler CFC free | 200 dose pack | £5.56 DT price = £5.56

Ipratropium with salbutamol

17-Feb-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, ipratropium bromide above, salbutamol p. 244.

- **INDICATIONS AND DOSE**
  - **Bronchospasm in chronic obstructive pulmonary disease**
    - **BY INHALATION OF AEROSOL**
    - Adult: 0.5/2.5 mg 3–4 times a day

- **INTERACTIONS**
  - Appendix 1: beta₂ agonists, ipratropium

- **PRESCRIBING AND DISPENSING INFORMATION**
  - A mixture of ipratropium bromide and salbutamol (as sulphate); the proportions are expressed in the form x/y where x and y
are the strengths in milligrams of ipratropium and salbutamol respectively.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Nebuliser liquid**
  - Ipratropium with salbutamol (Non-proprietary)
  - Ipratropium bromide 200 microgram per 1 ml, Salbutamol (as Salbutamol sulfate) 1 mg per 1 ml Salbutamol 2.5mg/2.5ml / Ipratropium bromide 500micrograms/2.5ml nebuliser liquid unit dose vials | 60 unit dose (Pax) no available DT price = £24.10
  - Combivent (Boehringer Ingelheim Ltd)
  - Ipratropium bromide 200 microgram per 1 ml, Salbutamol (as Salbutamol sulfate) 1 mg per 1 ml Combivent nebuliser liquid 2.5ml UDVs | 60 unit dose (Pax) £24.10 DT price = £24.10
  - Ipramol (Teva UK Ltd)
  - Ipratropium bromide 200 microgram per 1 ml, Salbutamol (as Salbutamol sulfate) 1 mg per 1 ml Ipramol nebuliser solution 2.5ml Steri-Neb unit dose vials | 60 unit dose (Pax) £23.83 DT price = £24.10
  - Salipraneb (Actavis UK Ltd)
  - Ipratropium bromide 200 microgram per 1 ml, Salbutamol (as Salbutamol sulfate) 1 mg per 1 ml Salipraneb 0.5mg/2.5mg nebuliser solution 2.5ml ampoules | 60 ampoule (Pax) £17.50 DT price = £17.50

- **SIDE-EFFECTS**
  - Epistaxis
  - Drowsiness
  - Dry mouth
  - Anosmia
  - Diaphoresis
  - Urinary retention
  - Blurred vision
  - Skin rash
  - Acne
  - Acute myoccardial infarction
  - Cardiac disorders (particularly cardiac rhythm disorders)
BETA₂-ADRENOCEPTOR AGONISTS, SELECTIVE

Beta₂-adrenoceptor agonists, selective

12-Feb-2016

- **CONTRA-INDICATIONS** Severe pre-eclampsia
- **CAUTIONS** Arrhythmias, cardiovascular disease, diabetes (risk of hyperglycaemia and ketoacidosis, especially with intravenous use), hypertension, hyperthyroidism, hypokalaemia, susceptibility to QT-interval prolongation

### CAUTIONS, FURTHER INFORMATION
- Hypokalaemia. Potentially serious hypokalaemia may result from beta₂ agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, diuretics, and by hypoxia.
- **SIDE-EFFECTS** Angioedema, arrhythmias, behavioural disturbances, collapse, fine tremor (particularly in the hands), headache, hyperglycaemia (especially when given intravenously), hypersensitivity reactions, hypokalaemia (with high doses), hypotension, ketoacidosis (especially when given intravenously), muscle cramps, myocardial ischaemia, nervous tension, palpitation, paradoxical bronchospasm (occasionally severe), peripheral vasodilatation, rash, sleep disturbances, tachycardia, urticaria
- **PREGNANCY** Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control.
- **MONITORING REQUIREMENTS**
  - In severe asthma, plasma-potassium concentration should be monitored (risk of hypokalaemia).
  - In patients with diabetes, monitor blood glucose (risk of hyperglycaemia and ketoacidosis, especially when beta₂ agonist given intravenously).

### PATIENT AND CARER ADVICE
- Patient or carers should be advised to follow manufacturers’ instructions on the care and cleansing of inhaler devices.

### BETA₂-ADRENOCEPTOR AGONISTS, SELECTIVE > LONG-ACTING

### Bambuterol hydrochloride

- **DRUG ACTION** Bambuterol is a pro-drug of terbutaline.

#### INDICATIONS AND DOSE
- **Asthma** (patients who have previously tolerated beta₂-agonists) Other conditions associated with reversible airways obstruction (patients who have previously tolerated beta₂-agonists)
  - **BY MOUTH**
  - Adult: 20 mg once daily, dose to be taken at bedtime
- **Asthma** (patients who have not previously tolerated beta₂-agonists) Other conditions associated with reversible airways obstruction (patients who have not previously tolerated beta₂-agonists)
  - **BY MOUTH**
  - Adult: Initially 10 mg once daily for 1–2 weeks, then increased if necessary to 20 mg once daily, dose to be taken at bedtime
Formoterol fumarate
(Eformoterol fumarate)

INDICATIONS AND DOSE
Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy
• Nocturnal asthma in patients requiring long-term regular bronchodilator therapy
• Prophylaxis of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy
• Chronic asthma in patients who regularly use an inhaled corticosteroid

BY INHALATION OF POWDER
• Child 6–11 years: 12 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age groups; higher doses should be used rarely, and only when control is not maintained on the lower dose
• Child 12–17 years: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age groups; higher doses should be used rarely, and only when control is not maintained on the lower dose
• Adult: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily

BY INHALATION OF AEROSOL
• Child 12–17 years: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age groups; higher doses should be used rarely, and only when control is not maintained on the lower dose
• Adult: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily

Chronic obstructive pulmonary disease
• BY INHALATION OF POWDER
• BY INHALATION OF AEROSOL

Special populations
PREGNANCY
• Inhaled drugs for asthma can be taken as normal during pregnancy.
• Inhaled drugs for asthma can be taken as normal during breast-feeding.

INTERACTIONS
• See Appendix 1: beta₂ agonists

SIDE-EFFECTS
• Very rare QT-interval prolongation
• Frequency not known Dizziness, nausea, pruritus, taste disturbances

PREGNANCY
Inhaled drugs for asthma can be taken as normal during pregnancy.

BREAST FEEDING
Inhaled drugs for asthma can be taken as normal during breast-feeding.

PATIENT AND CARER ADVICE
Advise patients that short-acting beta₂ agonists should not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
• be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

CAUTIONS
High doses of beta₂ agonists can be dangerous in some children.

IMPORTANT SAFETY INFORMATION
CHM ADVICE
To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta₂ agonist (formoterol) should:
• be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
• not be initiated in patients with rapidly deteriorating asthma;
• be introduced at a low dose and the effect properly monitored before considering dose increase;
• be discontinued in the absence of benefit;
• not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
• be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

OXYS®

Chronic asthma
• BY INHALATION OF POWDER
• Child 6–17 years: 6–12 micrograms 1–2 times a day (max. per dose 12 micrograms), occasionally doses up to the maximum daily may be needed, reassess treatment if additional doses required on more than 2 days a week; maximum 48 micrograms per day
• Adult: 6–12 micrograms 1–2 times a day, increased if necessary up to 24 micrograms twice daily (max. per dose 36 micrograms), occasionally doses up to the maximum daily may be needed, reassess treatment if additional doses required on more than 2 days a week; maximum 72 micrograms per day

Relief of bronchospasm
• BY INHALATION OF POWDER
• Child 6–17 years: 6–12 micrograms
• Adult: 6–12 micrograms

Prophylaxis of exercise-induced bronchospasm
• BY INHALATION OF POWDER
• Child 6–17 years: 6–12 micrograms, dose to be taken before exercise
• Adult: 12 micrograms, dose to be taken before exercise

PHARMACOKINETICS
At recommended inhaled doses, the duration of action of formoterol is about 12 hours.

Manufacturers
• Bambuterol hydrochloride 20 mg Bambec tablets
• Bambuterol hydrochloride 10 mg Bambec tablets

Importance
There can be variation in the licensing of different medicines containing the same drug.

Tablet
• Bambuc (AstraZeneca UK Ltd)

Bambuterol hydrochloride 10 mg Bambuc 10 mg tablets | 28 tablet p/D $14.46 DT price = $14.46
Bambuterol hydrochloride 20 mg Bambuc 20 mg tablets | 28 tablet p/D $15.77 DT price = $15.77

Appendix

References
of treatment with a long-acting beta₂ agonist. Patient or carer should be given advice on how to administer formoterol fumarate inhalers.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Inhalation powder**

- Easyhaler (formoterol) (Orion Pharma (UK) Ltd)
  - Formoterol fumarate dihydrate 12 microgram per dose Easyhaler 12micrograms/dose dry powder inhaler 120 dose £23.75 DT price = £23.75
- Foradil (Novartis Pharmaceuticals UK Ltd)
  - Formoterol fumarate dihydrate 12 microgram Foradil 12microgram inhalation powder capsules with device 60 capsule £28.06 DT price = £28.06
- Oxis Turbohaler (AstraZeneca UK Ltd)
  - Formoterol fumarate dihydrate 6 microgram per dose Oxis 6 Turbohaler 60 dose £24.80 DT price = £24.80
  - Formoterol fumarate dihydrate 12 microgram per dose Oxis 12 Turbohaler 60 dose £24.80 DT price = £24.80

**Pressurised inhalation**

- Atimos Modulite (Chiesi Ltd)
  - Formoterol fumarate dihydrate 12 microgram per dose Atimos Modulite 12micrograms/dose inhaler 100 dose £30.06 DT price = £30.06

Combinations available: *Actidinium bromide with formoterol*, p. 238; *Beclometasone with formoterol*, p. 250; *Budesonide with formoterol*, p. 252; *Futicasone with formoterol*, p. 254

---

### Indacaterol

- **INDICATIONS AND DOSE**
  - Maintenance treatment of chronic obstructive pulmonary disease
    - **BY INHALATION OF POWDER**
    - Adult: 150 micrograms once daily, then increased to 300 micrograms once daily

- **CAUTIONS** Convulsive disorders
- **INTERACTIONS** → Appendix 1: beta₂ agonists
- **SIDE-EFFECTS**
  - Common or very common Cough, dizziness, nasopharyngitis, oropharyngeal pain, peripheral oedema, rhinorrhoea, sinusitis
  - Uncommon Atrial fibrillation, chest pain, paraesthesia, pruritus
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Use with caution in severe hepatic impairment—no information available.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer indacaterol inhalation powder.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Inhalation powder**
    - Onbrez Breezhaler (Novartis Pharmaceuticals UK Ltd)
      - Indacaterol (as Indacaterol maleate) 150 microgram Onbrez Breezhaler 150microgram inhalation powder capsules with device 30 capsule £32.19 DT price = £32.19
      - Indacaterol (as Indacaterol maleate) 300 microgram Onbrez Breezhaler 300microgram inhalation powder capsules with device 30 capsule £32.19 DT price = £32.19
  - Combinations available: *Glycopyrronium with indacaterol*, p. 239

---

### Olodaterol

- **INDICATIONS AND DOSE**
  - Maintenance treatment of chronic obstructive pulmonary disease
    - **BY INHALATION**
    - Adult: 5 micrograms once daily
  - **DOSE EQUIVALENCE AND CONVERSION**
    - 2 puffs is equivalent to 5 micrograms.

- **CAUTIONS** Aneurysm, convulsive disorders
- **INTERACTIONS** → Appendix 1: beta₂ agonists
- **SIDE-EFFECTS**
  - Uncommon Dizziness, nasopharyngitis
  - Rare Arthralgia, hypertension
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Use with caution in severe hepatic impairment—no information available.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer olodaterol solution for inhalation.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Pressurised inhalation**
    - Striverdi Respimat (Boehringer Ingelheim Ltd)
      - Olodaterol (as Olodaterol hydrochloride) 2.5 microgram per dose Striverdi Respimat 2.5micrograms/dose solution for inhalation cartridge with device 60 dose £26.35 DT price = £26.35
  - Combinations available: *Tiotropium with olodaterol*, p. 240

---

### Salmeterol

- **INDICATIONS AND DOSE**
  - Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy
  - Prevention of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy
  - Chronic asthma only in patients who regularly use an inhaled corticosteroid (not for immediate relief of acute asthma)
    - **BY INHALATION OF AEROSOL, OR BY INHALATION OF POWDER**
      - Child 5-11 years: 50 micrograms twice daily
      - Child 12-17 years: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily
      - Adult: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily
  - **CHRONIC OBSTRUCTIVE PULMONARY DISEASE**
    - **BY INHALATION OF AEROSOL, OR BY INHALATION OF POWDER**
    - Adult: 50 micrograms twice daily

- **PHARMACOKINETICS**
  - At recommended inhaled doses, the duration of action of salmeterol is about 12 hours.

- **UNLICENSED USE** Neovent® not licensed for use in children under 12 years.
**Salbutamol**

*(Albuterol)*

**INDICATIONS AND DOSE**

**Asthma | Other conditions associated with reversible airways obstruction**

- **By mouth using immediate-release medicines**
  - Adult: 4 mg 3–4 times a day, maximum single dose 8 mg (but unlikely to provide much extra benefit or to be tolerated), inhalation route preferred over oral route, use elderly dose for sensitive patients
  - Elderly: Initially 2 mg 3–4 times a day, maximum single dose 8 mg (but unlikely to provide much extra benefit or to be tolerated), inhalation route preferred over oral route

- **By subcutaneous injection, or by intramuscular injection**
  - Adult: 500 micrograms every 4 hours if required

- **By slow intravenous injection**
  - Adult: 250 micrograms, repeated if necessary, injection to be diluted to a concentration of 50 micrograms/mL, reserve intravenous beta,
  - agonists for those in whom inhalated therapy cannot be used reliably

- **By intravenous infusion**
  - Adult: Initially 5 micrograms/minute, adjusted according to response and heart rate, usual dose 3–20 micrograms/minute, higher doses may be required, reserve intravenous beta,
  - agonists for those in whom inhalated therapy cannot be used reliably

- **By inhalation of aerosol**
  - Adult: 100–200 micrograms, up to 4 times a day for persistent symptoms

- **By inhalation of nebulised solution**
  - Adult: 2.5–5 mg, repeated up to 4 times daily or more frequently in severe cases

**Prophylaxis of allergen- or exercise-induced bronchospasm**

- **By inhalation of aerosol**
  - Adult: 200 micrograms

**Acute asthma**

- **By intravenous injection**
  - Child 1–2 years: 5 micrograms/kg for 1 dose, dose to be administered over 5 minutes, reserve intravenous beta,
  - agonists for those in whom inhalated therapy cannot be used reliably or there is no current effect
  - Child 2–7 years: 15 micrograms/kg (max. per dose
  - 250 micrograms) for 1 dose, dose to be administered over 5 minutes, reserve intravenous beta,
  - agonists for those in whom inhalated therapy cannot be used reliably or there is no current effect

**Moderate, severe, or life-threatening acute asthma**

- **By inhalation of nebulised solution**
  - Child 1 month–4 years: 2.5 mg, repeat every
  - 20–30 minutes or when required, give via oxygen-driven nebuliser if available
  - Child 5–11 years: 2.5–5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
  - Child 12–17 years: 5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
  - Adult: 5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

Combination available: **Fluticasone with salmeterol**, p. 255
Moderate and severe acute asthma
▶ BY INHALATION OF AEROSOL
  ▶ Child: 2–10 puffs, each puff is to be inhaled separately, repeat every 10–20 minutes or when required, give via large volume spacer (and a close-fitting face mask in children under 3 years), each puff is equivalent to 100 micrograms
  ▶ Adult: 2–10 puffs, each puff is to be inhaled separately, repeat every 10–20 minutes or when required, give via large volume spacer, each puff is equivalent to 100 micrograms

Exacerbation of reversible airways obstruction (including nocturnal asthma)
Prophylaxis of allergen- or exercise-induced bronchospasm
▶ BY INHALATION OF AEROSOL
  ▶ Child: 100–200 micrograms, up to 4 times a day for persistent symptoms
  ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  ▶ Child 1 month–1 year: 100 micrograms/kg 3–4 times a day (max. per dose 2 mg), inhalation route preferred over oral route
  ▶ Child 2–5 years: 1–2 mg 3–4 times a day, inhalation route preferred over oral route
  ▶ Child 6–11 years: 2 mg 3–4 times a day, inhalation route preferred over oral route
  ▶ Child 12–17 years: 2–4 mg 3–4 times a day, inhalation route preferred over oral route

Chronic asthma
▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
  ▶ Child 3–11 years: 4 mg twice daily
  ▶ Child 12 years: 8 mg twice daily
  ▶ Adult: 8 mg twice daily

Uncomplicated premature labour (between 22 and 37 weeks of gestation)
(specialist supervision in hospital)
▶ BY INTRAVENOUS INFUSION
  ▶ Adult: Initially 10 micrograms/minute, rate increased gradually according to response at 10-minute intervals until contractions diminish then increase rate slowly until contractions cease (maximum rate 45 micrograms/minute), maintain rate for 1 hour after contractions have stopped, then gradually reduce by 50% every 6 hours, maximum duration 48 hours

ASMASAL CLICKHALER
Acute bronchospasm
▶ BY INHALATION OF POWDER
  ▶ Adult: 1–2 puffs, up to 4 times daily for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm
▶ BY INHALATION OF POWDER
  ▶ Adult: 1–2 puffs

EASYHALER SALBUTAMOL
Acute bronchospasm
▶ BY INHALATION OF POWDER
  ▶ Adult: Initially 100–200 micrograms, increased if necessary to 400 micrograms; maximum 800 micrograms per day

Prophylaxis of allergen- or exercise-induced bronchospasm
▶ BY INHALATION OF POWDER
  ▶ Adult: 200 micrograms

PULVINAL SALBUTAMOL
Acute bronchospasm
▶ BY INHALATION OF POWDER
  ▶ Child 5–17 years: Initially 200 micrograms, up to 800 micrograms daily for persistent symptoms
  ▶ Adult: Initially 200 micrograms, up to 800 micrograms daily for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm
▶ BY INHALATION OF POWDER
  ▶ Child 5–17 years: 200 micrograms
  ▶ Adult: 200 micrograms

SALBULIN NOVOLIZER
Acute bronchospasm
▶ BY INHALATION OF POWDER
  ▶ Adult: Initially 100–200 micrograms, up to 800 micrograms daily for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm
▶ BY INHALATION OF POWDER
  ▶ Adult: 200 micrograms

VENTOLIN ACCUHALER
Acute bronchospasm
▶ BY INHALATION OF POWDER
  ▶ Adult: 200 micrograms

PHARMACOKINETICS
At recommended inhaled doses, the duration of action of salbutamol is about 3 to 5 hours.

● UNLICENSED USE
  Syrup and tablets not licensed for use in children under 2 years. Modified-release tablets not licensed for use in children under 3 years.
  Injection and solution for intravenous infusion not licensed for use in children under 12 years.

● CONTRA-INDICATIONS
  > When used for uncomplicated premature labour Abruptio placentae · antepartum haemorrhage · cord compression · eclampsia · history of cardiac disease · intra-uterine fetal death · intra-uterine infection · placenta praevia · pulmonary hypertension · severe pre-eclampsia · significant risk factors for myocardial ischaemia · threatened miscarriage

● CAUTIONS
GENERAL CAUTIONS
  High doses of beta₂ agonists can be dangerous in some children

SPECIFIC CAUTIONS
  > With intravenous use Mild to moderate pre-eclampsia (when used for uncomplicated premature labour) · suspected cardiovascular disease (should be assessed by a cardiologist before initiating therapy for uncomplicated premature labour)

● INTERACTIONS ➔ Appendix 1: beta₂ agonists

● SIDE-EFFECTS
GENERAL SIDE-EFFECTS
  Lactic acidosis (with high doses) · nausea

SPECIFIC SIDE-EFFECTS
  > When used for uncomplicated premature labour Bronchospasm · muscle tension · pulmonary oedema · vomiting

● BREASTFEEDING
  Inhaled drugs for asthma can be taken as normal during breast-feeding.

● MONITORING REQUIREMENTS
  > In uncomplicated premature labour it is important to monitor blood pressure, pulse rate (should not exceed 120 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), blood glucose and lactate concentrations, and the patient’s fluid and electrolyte status (avoid over-hydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs).
DIRECTIONS FOR ADMINISTRATION

- With intravenous use in children: Dilute to a concentration of 50 micrograms/mL with Glucose 5%, Sodium Chloride 0.9%, or Water for injections.
- When used by inhalation: For nebulisation, dilute nebuliser solution with a suitable volume of sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; salbutamol and ipratropium bromide solutions are compatible and can be mixed for nebulisation.
- With intravenous use in adults: For bronchodilation by continuous intravenous infusion, dilute to a concentration of 200 micrograms/mL with glucose 5% or sodium chloride 0.9%. For premature labour by continuous intravenous infusion, dilute with glucose 5% to a concentration of 200 micrograms/mL for use in a syringe pump or for other infusion methods (preferably via controlled infusion device), dilute to a concentration of 20 micrograms/mL; close attention to patient’s fluid and electrolyte status essential.

PATIENT AND CARER ADVICE

- When used by inhalation: For inhalation by aerosol or dry powder, advise patients and carers not to exceed prescribed dose and to follow manufacturer’s directions; if a previously effective dose of inhaled salbutamol fails to provide at least 3 hours relief, a doctor’s advice should be obtained as soon as possible. For inhalation by nebuliser, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution.

Solution for injection

- Ventolin (GlaxoSmithKline UK Ltd)
  Salbutamol (as Salbutamol sulfate) 500 microgram per 1 ml: Ventolin 500micrograms/1ml solution for injection ampoules | 5 ampoule (Pod) £1.91

Solution for infusion

- Ventolin (GlaxoSmithKline UK Ltd)
  Salbutamol (as Salbutamol sulfate) 1 mg per 1 ml: Ventolin 5mg/ml solution for infusion ampoules | 10 ampoule (Pod) £24.81

Oral solution

- Salbutamol (Non-proprietary)
  Salbutamol (as Salbutamol sulfate) 400 microgram per 1 ml: Salbutamol 2mg/5ml oral solution sugar free sugar-free | 150 ml (Pod) no price available DT price = £1.15

- Ventolin (GlaxoSmithKline UK Ltd)
  Salbutamol (as Salbutamol sulfate) 400 microgram per 1 ml: Ventolin 2mg/5ml syrup sugar-free | 150 ml (Pod) £1.15 DT price = £1.15

Pressurised inhalation

- Salbutamol (Non-proprietary)
  Salbutamol (as Salbutamol sulfate) 100 microgram per 1 dose: Salbutamol 100micrograms/dose inhaler CFC free | 200 dose (Pod) £1.50 DT price = £1.50

- AirSalb (Sandoz Ltd)
  Salbutamol (as Salbutamol sulfate) 100 microgram per 1 dose: AirSalb 100micrograms/dose inhaler CFC free | 200 dose (Pod) £1.50 DT price = £1.50

- Airomir (Teva UK Ltd)
  Salbutamol (as Salbutamol sulfate) 100 microgram per 1 dose: Airomir 100micrograms/dose inhaler | 200 dose (Pod) £1.97 DT price = £1.50

- Airomir Autohaler (Teva UK Ltd)
  Salbutamol (as Salbutamol sulfate) 100 microgram per 1 dose: Airomir 100micrograms/dose Autohaler | 200 dose (Pod) £6.02 DT price = £6.30

- Salamol (Teva UK Ltd)
  Salbutamol (as Salbutamol sulfate) 100 microgram per 1 dose: Salbutamol 100micrograms/dose inhaler | 200 dose (Pod) £1.50 DT price = £1.20

Nebuliser liquid

- Salbutamol (Non-proprietary)
  Salbutamol (as Salbutamol sulfate) 1 mg per 1 ml: Salbutamol 2.5mg/2.5ml nebuliser liquid unit dose vials | 20 unit dose (Pod) £1.91 DT price = £1.91

  Salbutamol (as Salbutamol sulfate) 2 mg per 1 ml: Salbutamol 5mg/2.5ml nebuliser liquid unit dose vials | 20 unit dose (Pod) £3.82 DT price = £3.82

- Salamol Steri-Neb (Teva UK Ltd)
  Salbutamol (as Salbutamol sulfate) 1 mg per 1 ml: Salamol 2.5mg/2.5ml nebuliser liquid Steri-Neb unit dose vials | 20 unit dose (Pod) £1.91 DT price = £1.91

  Salbutamol (as Salbutamol sulfate) 2 mg per 1 ml: Salamol 5mg/2.5ml nebuliser liquid Steri-Neb unit dose vials | 20 unit dose (Pod) £3.82 DT price = £3.82

- Ventolin Evohaler (GlaxoSmithKline UK Ltd)
  Salbutamol (as Salbutamol sulfate) 100 microgram per 1 dose: Ventolin 100micrograms/dose Evohaler | 200 dose (Pod) £1.50 DT price = £1.20

Combinations available: Ipratropium with salbutamol, p. 239

Terbutaline sulfate

INDICATIONS AND DOSE

- Asthma: Other conditions associated with reversible airways obstruction

  - BY MOUTH
    - Adult: Initially 2.5 mg 3 times a day for 1–2 weeks, then increased to up to 5 mg 3 times a day, use by inhalation preferred over by mouth

  - BY SUBCUTANEOUS INJECTION, OR BY SLOW INTRAVENOUS
    - Adult: 250–500 micrograms up to 4 times a day, reserve intravenous beta₂ agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
 Airways disease, obstructive 247

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children For *continuous intravenous infusion*, dilute to a concentration of 5 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; if fluid-restricted, dilute to a concentration of 100 micrograms/mL.
- When used by inhalation For *nebulisation*, dilute nebuliser solution with sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; terbutaline and ipratropium bromide solutions are compatible and may be mixed for nebulisation.
- With intravenous use in adults For *bromodilution* by *continuous intravenous infusion*, dilute 1.5–2.5 mg with 500 mL glucose 5% or sodium chloride 0.9% and give over 8–10 hours. For *premature labour* by *continuous intravenous infusion*, dilute in glucose 5% and give via controlled infusion device preferably a syringe pump; if syringe pump available dilute to a concentration of 100 micrograms/mL; if syringe pump not available dilute to a concentration of 10 micrograms/mL; close attention to patient’s fluid and electrolyte status essential.
- **PATIENT AND CARER ADVICE**
  - For inhalation by dry powder, advise patients and carers not to exceed prescribed dose and to follow manufacturer’s directions; if a previously effective dose of inhaled terbutaline fails to provide at least 3 hours relief, a

**CORTICOSTEROIDS**

Airways disease, use of corticosteroids

**Asthma**

**Inhaled corticosteroids**

An inhaled corticosteroid used for 3–4 weeks may help to distinguish asthma from chronic obstructive pulmonary disease; clear improvement over 3–4 weeks suggests asthma. Corticosteroids are effective in asthma; they reduce airway inflammation (and hence reduce oedema and secretion of mucus into the airway).

An inhaled corticosteroid is used regularly for prophylaxis of asthma when patients require a beta₂ agonist more than twice a week, or if symptoms disturb sleep at least once a week, or if the patient has suffered an exacerbation in the last 2 years requiring systemic corticosteroid. Regular use of inhaled corticosteroids reduces the risk of exacerbation of asthma. Current and previous smoking reduces the effectiveness of inhaled corticosteroids and higher doses may be necessary.

Corticosteroid inhalers must be used regularly for maximum benefit; alleviation of symptoms usually occurs 3 to 7 days after initiation. Beclometasone dipropionate p. 249, budesonide p. 251, fluticasone p. 253, and mometasone furoate p. 255 appear to be equally effective. Preparations that combine a corticosteroid with a long-acting beta₂ agonist may be helpful for patients stabilised on the individual components in the same proportion.

In adults using an inhaled corticosteroid and a long-acting beta₂ agonist for the prophylaxis of asthma, who are poorly controlled, Symbicort® or DuoResp Spirax® (both containing budesonide with formoterol p. 252) can be used as relievers (instead of a short-acting beta₂ agonist), in addition to their regular use for the prophylaxis of asthma. Symbicort® can also be used in this way in adults using an inhaled corticosteroid with a dose greater than beclometasone dipropionate 400 micrograms daily, but who are poorly controlled (standard doses of other inhaled corticosteroids can be used). When starting this treatment, the total regular daily dose of inhaled corticosteroid should not be reduced. Patients must be carefully instructed on the appropriate dose and management of exacerbations before initiating this therapy. Patients using budesonide with formoterol as a reliever once a day or more should have their treatment reviewed regularly. The use of Symbicort® for both reliever and maintenance therapy is also used by some specialists in children 12–18 years [unlicensed]. Fostair® can also be used in adults as a reliever (instead of a short-acting beta₂ agonist) in addition to its regular use for the prophylaxis of asthma. It may be particularly useful for patients with poorly controlled asthma requiring reliever therapy, or for those who have had previous exacerbations of asthma which needed medical intervention. Patients requiring frequent daily use of Fostair® as a reliever should have their maintenance treatment reviewed. This approach has not been investigated with combination inhalers containing other corticosteroids and long-acting beta₂ agonists.

High doses of inhaled corticosteroid can be prescribed for patients who respond only partially to standard doses with a long-acting beta₂ agonist or another long-acting bronchodilator. High doses should be continued only if there is clear benefit over the lower dose. The recommended maximum dose of an inhaled corticosteroid should not generally be exceeded. However, if a higher dose is required, then it should be initiated and supervised by a specialist. The use of high doses of inhaled corticosteroid can minimise the requirement for an oral corticosteroid.

**Oral corticosteroids**

Systemic corticosteroid therapy may be necessary during episodes of stress, such as severe infection, or if the asthma is worsening, when higher doses are needed and access of inhaled drug to small airways may be reduced; patients may need a reserve supply of corticosteroid tablets.

In chronic asthma, when the response to other drugs has been inadequate, longer term administration of an oral corticosteroid may be necessary; in such cases high doses of an inhaled corticosteroid should be continued to minimise oral corticosteroid requirements. Patients taking long-term oral corticosteroids for asthma can often be transferred to an inhaled corticosteroid but the transfer must be slow, with gradual reduction in the dose of the oral corticosteroid, and at a time when the asthma is well controlled.

An acute attack of asthma should be treated with a short course of an oral corticosteroid starting with a high dose. Patients whose asthma has deteriorated rapidly usually respond quickly to corticosteroids. The dose can usually be stopped abruptly; tapering is not needed provided that the patient receives an inhaled corticosteroid in an adequate dose (apart from those on maintenance oral corticosteroid treatment or where oral corticosteroids are required for 3 or more weeks). In patients who have needed several courses of oral corticosteroids and in whom the possibility of a period on maintenance corticosteroids is being considered, it may be useful to taper the corticosteroid dose gradually to identify a threshold dose for asthma control. This should only be done after other standard options for controlling asthma have been tried.

An oral corticosteroid should normally be taken as a single dose in the morning to reduce the disturbance to circadian cortisol secretion. Dosage should always be titrated to the lowest dose that controls symptoms. Regular peak-flow measurements help to optimise the dose.

**Parenteral corticosteroids**

Hydrocortisone injection p. 637 has a role in the emergency treatment of acute severe asthma.
Chronic obstructive pulmonary disease

Inhaled corticosteroids
In chronic obstructive pulmonary disease inhaled corticosteroid therapy may reduce exacerbations when given in combination with an inhaled long-acting beta₂ agonist.

Oral corticosteroids
During an acute exacerbation of chronic obstructive pulmonary disease, prednisolone p. 639 should be given; treatment can be stopped abruptly. Prolonged treatment with oral prednisolone is of no benefit and maintenance treatment is not normally recommended.

Corticosteroids (inhaled)

- SIDE-EFFECTS
  - Very rare  Paradoxical bronchospasm
  - Frequency not known  Adrenal crisis (with prolonged high doses)  - adrenal suppression (with prolonged high doses)  - aggression (particularly in children)  - anxiety  - behavioural changes (particularly in children)  - bruising  - candidiasis of the mouth  - candidiasis of the throat  - cataracts  - coma (with prolonged high doses)  - Cushing’s syndrome (with moon face, striae and acne)  - depression  - dysphonia  - glaucoma (with prolonged high doses)  - hoarseness  - hyperactivity (particularly in children)  - hyperglycaemia (usually only with high doses)  - irritability (particularly in children)  - lower respiratory tract infections in older patients with chronic obstructive pulmonary disease (with high doses)  - pneumonia in older patients with chronic obstructive pulmonary disease (with high doses)  - reduced growth velocity (in children)  - reduced mineral bone density (with long-term treatment of high doses)  - side-effects applicable to systemic corticosteroids may also apply if absorption occurs following inhaled use  - sleep disturbances  - throat irritation

- SIDE-EFFECTS, FURTHER INFORMATION
  - Candidiasis  The risk of oral candidiasis can be reduced by using a spacer device with the corticosteroid inhaler; rinsing the mouth with water after inhalation of a dose may also be helpful. An anti-fungal oral suspension or oral gel can be used to treat oral candidiasis without discontinuing corticosteroid therapy.
  - Paradoxical bronchospasm  The potential for paradoxical bronchospasm (calling for discontinuation and alternative therapy) should be borne in mind—mild bronchospasm may be prevented by inhalation of a short-acting beta₂ agonist beforehand (or by transfer from an aerosol inhalation to a dry powder inhalation).
  - PREGNANCY  Inhaled drugs for asthma can be taken as normal during pregnancy.
  - BREAST FEEDING  Inhaled corticosteroids for asthma can be taken as normal during breast-feeding.
  - MONITORING REQUIREMENTS
    - The height and weight of children receiving prolonged treatment with inhaled corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.
  - NATIONAL FUNDING/ACCESS DECISIONS
    - NICE technology appraisals (TAs)
      - Inhaled corticosteroids for the treatment of chronic asthma in children under 12 years (November 2007) NICE TA131
        - For children under 12 years with chronic asthma in whom treatment with an inhaled corticosteroid is considered appropriate, the least costly product that is suitable for an individual child (taking into consideration NICE TAs 38 and 10), within its marketing authorisation is recommended. For children under 12 years with chronic asthma in whom treatment with an inhaled corticosteroid and a long-acting beta₂ agonist is considered appropriate, the following apply:
          - the use of a combination inhaler within its marketing authorisation is recommended as an option;
          - the decision to use a combination inhaler or two agents in separate inhalers should be made on an individual basis, taking into consideration therapeutic need and the likelihood of treatment adherence;
          - if a combination inhaler is chosen, then the least costly inhaler that is suitable for the individual child is recommended.

Beclometasone dipropionate
(Beclometasone dipropionate)

- INDICATIONS AND DOSE
  - Prophylaxis of asthma
    - BY INHALATION OF POWDER
      - Child 5–11 years: 100–200 micrograms twice daily, dose to be adjusted as necessary
      - Child 12–17 years: 200–400 micrograms twice daily, increased if necessary up to 800 micrograms twice daily, dose to be adjusted as necessary
      - Adult: 200–400 micrograms twice daily; increased if necessary up to 800 micrograms twice daily, dose to be adjusted as necessary
    - BY INHALATION OF POWDER
      - Child 6–11 years: 100–200 micrograms twice daily, dose to be adjusted as necessary
      - Child 12–17 years: 100–400 micrograms twice daily (max. per dose 1 mg twice daily), dose to be adjusted as necessary
      - Adult: 100–400 micrograms twice daily (max. per dose 1 mg twice daily), dose to be adjusted as necessary
    - ASMADEC CLICKHALER
      - Prophylaxis of asthma
        - BY INHALATION OF POWDER
          - Child 6–11 years: 100–200 micrograms twice daily, dose to be adjusted as necessary
          - Child 12–17 years: 100–400 micrograms twice daily (max. per dose 1 mg twice daily), dose to be adjusted as necessary
          - Adult: 100–400 micrograms twice daily (max. per dose 1 mg twice daily), dose to be adjusted as necessary
    - CLENIL MODULITE
      - Prophylaxis of asthma
        - BY INHALATION OF AEROSOL
          - Child 2–11 years: 100–200 micrograms twice daily
          - Child 12–17 years: 200–400 micrograms twice daily, adjusted according to response; increased if necessary up to 1 mg twice daily
          - Adult: 200–400 micrograms twice daily, adjusted according to response; increased if necessary up to 1 mg twice daily

Respiratory system

### BECLOMETASONE DIPROPIONATE

**Prophylaxis of asthma**
- By inhalation of aerosol
  - Child 12-17 years: 50–200 micrograms twice daily; increased if necessary up to 400 micrograms twice daily
  - Adult: 50–200 micrograms twice daily; increased if necessary up to 400 micrograms twice daily

**Potency**
Qvar® has extra-fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers and is approximately twice as potent as Clenil Modulite®.

**DOSE EQUIVALENCE AND CONVERSION**
- Dose adjustments may be required for some inhaler devices, see under individual preparations.

#### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE (JULY 2008)**
Beclometasone dipropionate CFC-free pressurised metered-dose inhalers (Qvar® and Clenil Modulite®) are not interchangeable and should be prescribed by brand name; Qvar® has extra-fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers, and is approximately twice as potent as Clenil Modulite®.

#### INTERACTIONS
- Appendix 1: corticosteroids

**INTERACTIONS**
- Beclometasone Dipropionate is not licensed for use in children under 18 years. Clenil Modulite® 200 and 250 are not licensed for use in children under 12 years. Qvar® is not licensed for use in children under 12 years.

**UNLICENSED USE**
- Easyhaler® Beclometasone Dipropionate is not licensed for use in children under 18 years. Clenil Modulite® 200 and 250 are not licensed for use in children under 12 years. Qvar® is not licensed for use in children under 12 years.

**PRESCRIBING AND DISPENSING INFORMATION**
The MHRA has advised (July 2008) that beclometasone dipropionate CFC-free inhalers should be prescribed by brand name. Clenil Modulite® Clenil Modulite® is not interchangeable with other CFC-free beclometasone dipropionate inhalers.

**QVAR® PREPARATIONS**
- When switching a patient with well-controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of Qvar® should be prescribed for 200–250 micrograms of beclometasone dipropionate or budesonide and for 100 micrograms of fluticasone propionate. When switching a patient with poorly controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of Qvar® should be prescribed for 100 micrograms of beclometasone dipropionate, budesonide, or fluticasone propionate; the dose of Qvar® should be adjusted according to response.

**PATIENT AND CARER ADVICE**
- Steroid card should be issued with high doses of inhaled beclometasone dipropionate. Medicines for Children leaflet: Beclometasone for asthma prevention (prophylaxis) www.medicinesforchildren.org.uk/beclometasone-inhaler-asthma-prevention-prophylaxis-0

**PROFESSION SPECIFIC INFORMATION**
- Dental practitioners’ formulary Clenil Modulite® 50 micrograms/ metered inhalation may be prescribed.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Inhalation Powder**
- Asmabec Clickhaler (Focus Pharmaceuticals Ltd)
  - Beclometasone dipropionate 100 microgram per 1 dose Asmabec 100 Clickhaler | 200 dose [POM] £9.81

**INDICATIONS AND DOSE**

**FOSTAIR NEUTHALER® 100/6**
**Asthma maintenance therapy**
- BY INHALATION OF POWDER
  - Adult: 1–2 inhalations twice daily; maximum 4 inhalations per day

**Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 50% of predicted**
- BY INHALATION OF POWDER
  - Adult: 2 inhalations twice daily

**DOSE EQUIVALENCE AND CONVERSION**
- For inhalation of powder, when switching patients from other beclometasone dipropionate formulations with non-extrafine particle size distribution to Fostair Neuthaler®, the dose should be adjusted according to response.
  - 1 inhalation is equivalent to 100 micrograms beclometasone dipropionate and 6 micrograms formoterol fumarate.

**FOSTAIR NEUTHALER® 200/6**
**Asthma maintenance therapy**
- BY INHALATION OF POWDER
  - Adult: 2 inhalations twice daily; maximum 4 inhalations per day

**DOSE EQUIVALENCE AND CONVERSION**
- For inhalation of powder, when switching patients from other beclometasone dipropionate formulations with non-extrafine particle size distribution to Fostair Neuthaler®, the dose should be adjusted according to response.

#### Easyhaler (beclometasone)
- Beclometasone dipropionate 200 microgram per 1 dose Easyhaler Beclometasone 200 micrograms/dose dry powder inhaler | 200 dose [POM] £14.93

**Pressurised inhalation**
- See under individual preparations.

**Beclometasone with formoterol**

09-Jun-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, beclometasone dipropionate p. 249, formoterol fumarate p. 242.

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 50% of predicted

**Fostair® 100/6**

**Asthma maintenance therapy**
- BY INHALATION OF AEROSOL
- Adult: 1–2 inhalations twice daily; maximum 4 inhalations per day

**Asthma, maintenance and reliever therapy**
- BY INHALATION OF AEROSOL
- Adult: Maintenance 1 inhalation twice daily; 1 inhalation as required, for relief of symptoms; maximum 8 inhalations per day

**DOSE EQUIVALENCE AND CONVERSION**
- For inhalation of aerosol, when switching patients from other beclometasone dipropionate and formoterol fumarate inhalers, dose should be adjusted according to response—100 micrograms of beclometasone dipropionate extrafine in Fostair® is equivalent to 250 micrograms of beclometasone dipropionate in a non-extrafine formulation.
- 1 inhalation is equivalent to 100 micrograms beclometasone dipropionate and 6 micrograms formoterol fumarate.

**Fostair® 200/6**

**Asthma maintenance therapy**
- BY INHALATION OF AEROSOL
- Adult: 2 inhalations twice daily; maximum 4 inhalations per day

**DOSE EQUIVALENCE AND CONVERSION**
- For inhalation of aerosol, when switching patients from other beclometasone dipropionate and formoterol fumarate inhalers, dose should be adjusted according to response—100 micrograms of beclometasone dipropionate extrafine in Fostair® is equivalent to 250 micrograms of beclometasone dipropionate in a non-extrafine formulation.
- 1 inhalation is equivalent to 200 micrograms beclometasone dipropionate and 6 micrograms formoterol fumarate.

### Fluticasone furoate with vilanterol

#### INDICATIONS AND DOSE

**RELVAR ELLIPTA® 184 MICROGRAMS/22 MICROGRAMS**

Prophylaxis of asthma
- **BY INHALATION OF POWDER**
  - Child 12-17 years: 1 inhalation once daily
  - Adult: 1 inhalation once daily

**RELVAR ELLIPTA® 92 MICROGRAMS/22 MICROGRAMS**

Prophylaxis of asthma
- **BY INHALATION OF POWDER**
  - Child 12-17 years: 1 inhalation once daily
  - Adult: 1 inhalation once daily

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 70% of predicted
- **BY INHALATION OF POWDER**
  - Adult: 1 inhalation once daily

#### INTERACTIONS

→ Appendix 1: beta, agonists, corticosteroids

#### SIDE-EFFECTS

Abdominal pain, back pain

#### PREGNANCY

Manufacturer advises use only if potential benefit outweighs risk.

#### BREAST FEEDING

Manufacturer advises avoid—no information available.

#### HEPATIC IMPAIRMENT

Max. dose fluticasone furoate 92 micrograms, vilanterol 22 micrograms.

**RELVAR ELLIPTA® 184 MICROGRAMS/22 MICROGRAMS**

Avoid in moderate to severe impairment.

#### PATIENT AND CARER ADVICE

A steroid card should be provided. Patients or carers should be given advice on how to administer fluticasone with vilanterol powder for inhalation.

#### NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (March 2014) that fluticasone furoate/vilanterol (Relvar Ellipta®) is accepted for restricted use within NHS Scotland in patients with severe chronic obstructive pulmonary disease with a forced expiratory volume in 1 second (FEV₁) less than 50% of the predicted normal value.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Inhalation powder**

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES

Mepolizumab

09-Feb-2017

DRUG ACTION

Mepolizumab is a humanised anti-interleukin-5 (anti-IL-5) monoclonal antibody; it reduces the production and survival of eosinophils

INDICATIONS AND DOSE

Add on treatment for severe refractory eosinophilic asthma (under expert supervision)

BY SUBCUTANEOUS INJECTION

Adult: 100 mg every 4 weeks

CAUTIONS

Helminth infection

CAUTIONS, FURTHER INFORMATION

Helminth infections. Manufacturer advises pre-existing helminth infections should be treated before initiation of therapy; if patients become infected during treatment and do not respond to anti-helminth treatment, consider treatment interruption.

INTERACTIONS → Appendix 1: monoclonal antibodies

SIDE-EFFECTS

Common or very common Back pain • eczema • headache • lower respiratory tract infection • nasal congestion • pharyngitis • pyrexia • upper abdominal pain • urinary tract infection

PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk—limited data available.

BREAST FEEDING

Manufacturer advises avoid—present in milk in animal studies.

PATIENT AND CARER ADVICE

Asthma Patients and their carers should be advised to seek medical advice if their asthma remains uncontrolled or worsens after initiation of treatment.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Mepolizumab for treating severe refractory eosinophilic asthma (January 2017) NICE TA431

Mepolizumab, as an add-on to optimised standard therapy, is recommended as an option for treating severe refractory eosinophilic asthma in adults, only if:

● the blood eosinophil count is 300 cells/micro litre or more in the previous 12 months and

● the person has agreed to and followed the optimised standard treatment plan and has had 4 or more asthma exacerbations requiring systemic corticosteroids in the previous 12 months or had continuous oral corticosteroids over the previous 6 months and

● the manufacturer provides mepolizumab with the discount agreed in the patient access scheme www.nice.org.uk/TA431

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2016) that mepolizumab (Nucala®) is accepted for restricted use within NHS Scotland as an add-on treatment for severe refractory eosinophilic asthma in adult patients who have eosinophils of at least 150 cells/micro litre (0.15 × 10⁷/L) at initiation of treatment and have had at least four asthma exacerbations in the preceding year or are receiving maintenance treatment with oral corticosteroids.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

Nucala (GlaxoSmithKline UK Ltd)▼

Mepolizumab 100 mg Nucala 100 mg powder for solution for injection vials | 1 vial [PO] £840.00 (Hospital only)

OMALIZUMAB

INDICATIONS AND DOSE

Prophylaxis of severe persistent allergic asthma

BY SUBCUTANEOUS INJECTION

Adult: Dose according to immunoglobulin E concentration and body-weight (consult product literature)

Add-on therapy for chronic spontaneous urticaria in patients who have had an inadequate response to H₁ antihistamine treatment

BY SUBCUTANEOUS INJECTION

Adult: 300 mg every 4 weeks

CAUTIONS

Autoimmune disease • susceptibility to helminth infection—discontinue if infection does not respond to anthelmintic

INTERACTIONS → Appendix 1: monoclonal antibodies

SIDE-EFFECTS

Common or very common Abdominal pain • arthralgia • headache • injection-site reactions • pyrexia • sinusitis • upper respiratory tract infection

Uncommon Bronchospasm • cough • diarrhoea • dizziness • drowsiness • dyspepsia • flushing • influenza-like illness • malaise • nausea • paraesthesia • pharyngitis • photosensitivity • postural hypotension • pruritus • rash • syncope • urticaria • weight gain

Rare Angioedema • antibody formation • laryngoelema • parasitic infection

downloaded from www.medicalbr.com
HEPATIC IMPAIRMENT

Frequency not known

PREGNANCY

Breastfeeding

Previously treated chronic spontaneous urticaria in patients aged 12 years and over, who have had an inadequate response to combination therapy with H1-antihistamines, leukotriene receptor antagonists and H2-antihistamines, used according to current treatment guidelines.

OMALIZUMAB FOR...—

▶ Omalizumab...—

Patients currently receiving omalizumab whose disease does not meet the criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA339

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2014) that omalizumab (Xolair®) is accepted for restricted use within NHS Scotland for the treatment of chronic spontaneous urticaria in patients aged 12 years and over, who have had an inadequate response to combination therapy with H1-antihistamines, leukotriene receptor antagonists and H2-antihistamines, used according to current treatment guidelines.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Xolair (Novartis Pharmaceuticals UK Ltd)

Omalizumab 150 mg per 1 ml

Xolair 150mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (POM) £256.15

Xolair 75mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (POM) £128.07

Reslizumab

18-May-2017

DRUG ACTION

Reslizumab is a humanised monoclonal antibody that interferes with interleukin-5 receptor binding, thereby reducing the survival and activity of eosinophils.

INDICATIONS AND DOSE

Severe eosinophilic asthma (adjunctive therapy when inadequately controlled by high-dose corticosteroids plus another standard treatment) (specialist use only)

BY INTRAVENOUS INFUSION

Adult: (consult product literature)

PHARMACOKINETICS

The half-life of reslizumab is approx. 24 days.

CAUTIONS

Hypersensitivity reactions • pre-existing helminth infection

CAUTIONS, FURTHER INFORMATION

Helminth infection

Manufacturer advises to treat pre-existing helminth infections before starting reslizumab—consider temporarily discontinuing reslizumab if patient becomes infected during therapy and does not respond to anti-helminth treatment.

Hypersensitivity reactions

Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur and manufacturer advises to monitor closely during treatment and for at least 20 minutes after completion of infusion; in the event of a hypersensitivity reaction, treatment should be permanently discontinued.

INTERACTIONS

→ Appendix 1: monoclonal antibodies

SIDE-EFFECTS

Uncommon

Anaphylaxis • myalgia

PREGNANCY

Manufacturer advises avoid—limited information available.

BREAST FEEDING

Manufacturer advises avoid during first few days after birth—risk of transfer of antibodies to infant cannot be excluded; present in milk in animal studies.

DIRECTIONS FOR ADMINISTRATION

For intravenous infusion, manufacturer advises give intermittently in Sodium chloride 0.9%; administer over 20–50 minutes through an in-line 0.2 micron filter.

HANDLING AND STORAGE

Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after preparation of infusion.

PATIENT AND CARER ADVICE

Manufacturer advises patients and their carers should be instructed to seek...
medical advice if their asthma remains uncontrolled or if symptoms worsen after initiation of treatment.

  - There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for infusion**
    - **EXCIPIENTS:** May contain Sucrose
    - **Cinqaero** (Teva UK Ltd) ▼
    - Resilizumab 10 mg per 1 ml Cinqaero 100mg/10ml concentrate for solution for infusion vials | 1 vial [POM] £49.99

**LEUKOTRIENE RECEPTOR ANTAGONISTS**

Leodtine receptor antagonists

**Overview**

The leoduine receptor antagonists, montelukast below and zafirlukast p. 259, block the effects of cysteinyl leukotrienes in the airways. They are effective in asthma when used alone or with an inhaled corticosteroid.

Montelukast has not been shown to be more effective than a standard dose of inhaled corticosteroid, but the two drugs appear to have an additive effect. The leoduine receptor antagonists may be of benefit in exercise-induced asthma and in those with concomitant rhinitis, but they are less effective in those with severe asthma who are also receiving high doses of other drugs.

**Montelukast**

- **INDICATIONS AND DOSE**
  - **Prophylaxis of asthma**
    - **BY MOUTH**
      - Child 6 months–5 years: 4 mg once daily, dose to be taken in the evening
      - Child 6–14 years: 5 mg once daily, dose to be taken in the evening
      - Child 15–17 years: 10 mg once daily, dose to be taken in the evening
      - Adult: 10 mg once daily, dose to be taken in the evening
  - **Symptomatic relief of seasonal allergic rhinitis in patients with asthma.**
    - **BY MOUTH**
      - Child 15–17 years: 10 mg once daily, dose to be taken in the evening
      - Adult: 10 mg once daily, dose to be taken in the evening

- **INTERACTIONS** → Appendix 1: montelukast

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · headache · hyperkinesia (in young children) · thirst
  - **Uncommon** Abnormal dreams · aggressive behaviour · agitation · anxiety · arthralgia · bruising · depression · dizziness · drowsiness · dry mouth · dyspepsia · epistaxis · hostility · hypoesthesia · irritability · malaise · muscle cramps · myalgia · oedema · paraesthesia · psychomotor hyperactivity · restlessness · seizures · sleep disturbances · sleep-walking
  - **Rare** Disturbance in attention · increased bleeding tendency · memory impairment · palpitation · tremor
  - **Very rare** Churg–Strauss syndrome · disorientation · erythema multiforme · erythema nodosum · hallucinations · hepatic disorders · hepatic eosinophilic infiltration · suicidal behaviour · suicidal thoughts

**SIDE-EFFECTS, FURTHER INFORMATION**

Churg–Strauss syndrome has occurred very rarely in association with the use of montelukast; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. Prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

- **PREGNANCY** Manufacturer advises avoid unless essential.
  - There is limited evidence for the safe use of montelukast during pregnancy; however, it can be taken as normal in women who have shown a significant improvement in asthma not achievable with other drugs before becoming pregnant.

- **BREAST FEEDING** Manufacturer advises avoid unless essential.

- **DIRECTIONS FOR ADMINISTRATION** Granules may be swallowed or mixed with cold, soft food (not liquid) and taken immediately.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of chewable tablet formulations may include cherry.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer montelukast granules.
  - Medicines for Children leaflet: Montelukast for asthma
    - www.medicinesforchildren.org.uk/montelukast-for-asthma

- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (June 2007) that Singulair® granules are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2–14 years with mild persistent asthma who have not recently had serious asthma attacks that required oral corticosteroid use and who are not capable of using inhaled corticosteroids; Singulair® granules should be initiated by a specialist in paediatric asthma.

**Singulair® Chewable Tablets**

The Scottish Medicines Consortium has advised (June 2007) that Singulair® chewable tablets are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2–14 years with mild persistent asthma who have not recently had serious asthma attacks that required oral corticosteroid use and who are not capable of using inhaled corticosteroids; Singulair® chewable tablets should be initiated by a specialist in paediatric asthma.

**PATIENT AND CARER ADVICE**

**Overview**

The mode of action of sodium cromoglicate p. 260 and nedocromil sodium below is not completely understood.

They may be of value in asthma with an allergic basis, but, in practice, it is difficult to predict who will benefit; they could probably be given for 4 to 6 weeks to assess response. Dose frequency is adjusted according to response but is usually 3 to 4 times a day initially; this may subsequently be reduced.

In general, *prophylaxis* with sodium cromoglicate is less effective than prophylaxis with corticosteroid inhalations. There is evidence of efficacy of nedocromil sodium in children aged 5–12 years. Sodium cromoglicate and nedocromil sodium are of no value in the treatment of acute attacks of asthma.

Sodium cromoglicate can prevent exercise-induced asthma. However, exercise-induced asthma may reflect poor overall control and the patient should be reassessed.

Sodium cromoglicate and nedocromil sodium may also have a role in allergic conjunctivitis; sodium cromoglicate is used also in allergic rhinitis and allergy-related diarrhoea.

**MAST-CELL STABILISERS**

### Cromoglicate and related therapy

**Overview**

The mode of action of sodium cromoglicate p. 260 and nedocromil sodium below is not completely understood.
**Sodium cromoglicate**

*(Sodium cromoglycate)*

**INDICATIONS AND DOSE**

Prophylaxis of asthma

- **BY INHALATION OF AEROSOL**
  - Child 5–17 years: Initially 10 mg 4 times a day, additional dose may also be taken before exercise, increased if necessary to 10 mg 6–8 times a day; maintenance 5 mg 4 times a day, 5 mg is equivalent to 1 puff
  - Adult: Initially 10 mg 4 times a day, additional dose may also be taken before exercise, increased if necessary to 10 mg 6–8 times a day; maintenance 5 mg 4 times a day, 5 mg is equivalent to 1 puff

**Food allergy (in conjunction with dietary restriction)**

- **BY MOUTH**
  - Child 2–13 years: Initially 100 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals
  - Child 14–17 years: Initially 200 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals
  - Adult: Initially 200 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals

**SIDE-EFFECTS**

- When used by inhalation: Discontinue if eosinophilic pneumonia occurs
- When used by inhalation: Bronchospasm, cough, eosinophilic pneumonia, headache, paradoxical bronchospasm, rhinitis, throat irritation
- With oral use: Joint pain, occasional nausea, rashes

**CAUTIONS**

- When used by inhalation: Discontinue if eosinophilic pneumonia occurs

**INTERACTIONS** → Appendix 1: roflumilast

**SIDE-EFFECTS**

- Common or very common: Abdominal pain, decreased appetite, diarrhoea, headache, insomnia, nausea, weight loss
- Uncommon: Anxiety, back pain, dizziness, dyspepsia, gastritis, gastro-oesophageal reflux, malaise, muscle spasm, myalgia, palpitation, rash, tremor, vertigo, vomiting

**CONTRA-INDICATIONS**

- Cancer (except basal cell carcinoma)
- Concomitant treatment with immunosuppressive drugs (except short-term systemic corticosteroids)
- History of depression associated with suicidal ideation or behaviour — moderate to severe cardiac failure, severe acute infectious disease — severe immunological disease

**PHOSPHODIESTERASE TYPE-4 INHIBITORS**

**Roflumilast**

**DRUG ACTION**

Roflumilast is a phosphodiesterase type-4 inhibitor with anti-inflammatory properties.

**INDICATIONS AND DOSE**

Adjunct to bronchodilators for the maintenance treatment of patients with severe chronic obstructive pulmonary disease associated with chronic bronchitis and a history of frequent exacerbations

- **BY MOUTH**
  - Adult: 500 micrograms once daily
### Aminophylline

**INDICATIONS AND DOSE**

**Severe acute asthma in patients not previously treated with theophylline**

- **BY SLOW INTRAVENOUS INJECTION**
  - Child: 5 mg/kg (max. per dose 500 mg), to be followed by intravenous infusion
  - Adult: 250–500 mg (max. per dose 5 mg/kg), to be followed by intravenous infusion

**Severe acute asthma**

- **BY INTRAVENOUS INFUSION**
  - Child 1 month–11 years: 1 mg/kg/hour, adjusted according to plasma-theophylline concentration
  - Child 12–17 years: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration
  - Adult: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration
  - Elderly: 300 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

**Severe acute exacerbation of chronic obstructive pulmonary disease in patients not previously treated with theophylline**

- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 250–500 mg (max. per dose 5 mg/kg), to be followed by intravenous infusion

**Severe acute exacerbation of chronic obstructive pulmonary disease**

- **BY INTRAVENOUS INFUSION**
  - Adult: 500–700 micrograms/kg/hour, adjusted according to plasma–theophylline concentration
  - Elderly: 300 micrograms/kg/hour, adjusted according to plasma–theophylline concentration

**Chronic asthma**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to 450 mg twice daily, adjusted according to plasma–theophylline concentration

**Reversible airway obstruction**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to 450 mg twice daily, adjusted according to plasma–theophylline concentration

---

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Daxas (AstraZeneca UK Ltd)**
  - Roflumilast 500 microgram | 30 tablet (POM) £37.71 DT price = £37.71

**SYMPATHOMIMETICS ➔ VASOCONSTRICTOR**

**Ephedrine hydrochloride**

- **INDICATIONS AND DOSE**
  - **Reversal of hypotension from spinal or epidural anaesthesia**
    - **BY SLOW INTRAVENOUS INJECTION**
    - Adult: 3–6 mg every 3–4 minutes (max. per dose 9 mg), adjusted according to response, injection solution to contain ephedrine hydrochloride 3 mg/ml; maximum 30 mg per course
  - **Reversible airways obstruction**
    - **BY MOUTH**
    - Adult: 15–60 mg 3 times a day
  - **Neuropathic oedema**
    - **BY MOUTH**
    - Adult: 30–60 mg 3 times a day

- **UNLICENSED USE** Not licensed for neuropathic oedema.

**CAUTIONS**

**GENERAL CAUTIONS**

- Diabetes mellitus - elderly - hypertension - hyperthyroidism - ischaemic heart disease - prostatic hypertrophy (risk of acute urinary retention)

**SPECIFIC CAUTIONS**

- With intravenous use Susceptibility to angle-closure glaucoma

**INTERACTIONS** ➔ Appendix 1: sympathomimetics, vasoconstrictor

**SIDE-EFFECTS**

- **Common or very common** Anxiety, arrhythmias, insomnia, restlessness, tachycardia, tremor
- With intravenous use: Anginal pain, anorexia, changes in blood-glucose concentration, confusion, difficulty in micturition, dizziness, dyspnoea, flushing, headache, hypersalivation, nausea, psychoses, sweating, urine retention, vasodilatation with hypertension, vomiting

- **Very rare**
  - With intravenous use: Angle-closure glaucoma
  - **Frequency not known** Increased lacrimation (can have adverse effects on contact lens wear)
- With intravenous use: Bradycardia
- With oral use: Cold extremities, dry mouth

**PREGNANCY**

- With oral use: Manufacturer advises avoid.
- With intravenous use: Increased fetal heart rate reported with parenteral ephedrine.

**BREAST FEEDING**

- Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.

**RENAI IMPAIRMENT** Use with caution.

**LESS SUITABLE FOR PRESCRIBING**

- Ephedrine tablets are less suitable and less safe for use as a bronchodilator than the selective beta₂ agonists.

**EXCEPTIONS TO LEGAL CATEGORY**

Airways disease, obstructive 261

Respiratory system 3
PHYLLOCOTIN CONTINUOUS® FORTE
Reversible airways obstruction

- By mouth using modified-release medicines
- Adult: Initially 350 mg twice daily for 1 week, then increased if necessary to 700 mg twice daily, increase dose according to plasma-theophylline concentration

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Dose adjustment may be necessary if smoking started or stopped during treatment.

DOSES AT EXTREMES OF BODY-WEIGHT
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal weight for height.

PHARMACOKINETICS
Aminophylline is a stable mixture or combination of theophylline and ethylenediamine; the ethylenediamine confers greater solubility in water. Theophylline is metabolised in the liver. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is decreased in smokers, and by alcohol consumption. Differences in the half-life of aminophylline are important because the toxic dose is close to the therapeutic dose.

- UNLICENSED USE Aminophylline injection not licensed for use in children under 6 months.
- CAUTIONS Arrhythmias following rapid intravenous injection - cardiac arrhythmias or other cardiac disease - elderly (increased plasma-theophylline concentration) - epilepsy - fever - hypertension - hyperthyroidism - peptic ulcer - risk of hypokalaemia
- INTERACTIONS → Appendix 1: aminophylline
- SIDE-EFFECTS Arrhythmias (especially if given rapidly by intravenous injection) - CNS stimulation - convulsions (especially if given rapidly by intravenous injection) - diarrhoea - gastric irritation - headache - hypotension (especially if given rapidly by intravenous injection) - insomnia - nausea - palpitation - tachycardia - vomiting
- SIDE-EFFECTS, FURTHER INFORMATION Hypokalaemia Potentially serious hypokalaemia may result from beta, agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

Overdose
Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

For specific details on the management of poisoning, see Theophylline, under Emergency treatment of poisoning p. 1254.

- ALLERGY AND CROSS-SENSITIVITY Allergy to ethylenediamine can cause urticaria, erythema, and exfoliative dermatitis.
- PREGNANCY Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.
- BREAST FEEDING Present in milk—irritability in infant reported; modified-release preparations preferable. Theophylline can be taken as normal during breastfeeding.
- HEPATIC IMPAIRMENT Reduce dose.

- MONITORING REQUIREMENTS Aminophylline is monitored therapeutically in terms of plasma-theophylline concentrations.
- Measurement of plasma-theophylline concentration may be helpful and is essential if a loading dose of intravenous aminophylline is to be given to patients who are already taking theophylline, because serious side-effects such as convulsions and arrhythmias can occasionally precede other symptoms of toxicity.
- In most individuals, a plasma-theophylline concentration of 10–20 mg/litre (55–110 micromol/litre) is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.
- If aminophylline is given intravenously, a blood sample should be taken 4–6 hours after starting treatment.
- With oral use Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary consult local guidelines).

- DIRECTIONS FOR ADMINISTRATION With intravenous use For intravenous injection, give very slowly over at least 20 minutes (with close monitoring).
- With intravenous use in children For intravenous infusion, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%.
- With intravenous use in adults For intravenous infusion, give continuously in Glucose 5% or Sodium Chloride 0.9%.
- With intramuscular use Aminophylline is too irritant for intramuscular use.

- PRESCRIBING AND DISPENSING INFORMATION Patients taking oral theophylline or aminophylline should not normally receive a loading dose of intravenous aminophylline.

Consider intravenous aminophylline for treatment of severe and life-threatening acute asthma only after consultation with senior medical staff.

- Modified release The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral aminophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

PHYLLOCOTIN CONTINUOUS® FORTE
Phyllocontin Continus® Forte tablets are for smokers and other patients where theophylline half-life is shorter.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

**NUELIN SA ® 175MG TABLETS**

**Reversible airways obstruction | Severe acute asthma | Chronic asthma**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 175–350 mg every 12 hours

**Chronic asthma**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 6–11 years: 175 mg every 12 hours
  - Child 12–17 years: 175–350 mg every 12 hours

**NUELIN SA ® 250 TABLETS**

**Reversible airways obstruction | Severe acute asthma | Chronic asthma**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 250–500 mg every 12 hours

**Chronic asthma**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 6–11 years: 125–250 mg every 12 hours
  - Child 12–17 years: 250–500 mg every 12 hours

**SLO-PHYLLIN ®**

**Chronic asthma**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 2–5 years: 60–120 mg every 12 hours
  - Child 6–11 years: 125–250 mg every 12 hours
  - Child 12–17 years: 250–500 mg every 12 hours

**UNIPHYLLIN CONTINUS ®**

**Chronic asthma**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 2–11 years: 9 mg/kg every 12 hours (max. per dose 200 mg), dose may be increased in some children with chronic asthma; increased to 10–16 mg/kg every 12 hours (max. per dose 400 mg), may be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose
  - Child 12–17 years: 200 mg every 12 hours, adjusted according to response to 400 mg every 12 hours, may be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose

**Reversible airways obstruction | Severe acute asthma | Chronic asthma**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 200 mg every 12 hours, adjusted according to response to 400 mg every 12 hours, may be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose adjustment may be necessary if smoking started or stopped during treatment.

**PHARMACOKINETICS**

Theophylline is metabolised in the liver. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is decreased in smokers, and by alcohol consumption. Differences in the half-life of theophylline are important because the toxic dose is close to the therapeutic dose.

**UNLICENSED USE**

*Slo-phyllin ®* capsules not licensed for use in children under 2 years.

**CAUTIONS**

- Cardiac arrhythmias or other cardiac disease • elderley (increased plasma-theophylline concentration) • epilepsy • fever • hypertension • hyperthyroidism • peptic ulcer • risk of hypokalaemia

**INTERACTIONS**

- Appendix 1: theophylline

**SIDE-EFFECTS**

- Arrhythmias • CNS stimulation • convulsions • diarrhoea • gastric irritation • headache • insomnia • nausea • palpitation • tachycardia • vomiting

**SIDE-EFFECTS. FURTHER INFORMATION**

- Hypokalaemia Potentially serious hypokalaemia may result from beta agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

**Overdose**

Theophylline in overdose can cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

For details on the management of poisoning, see Theophylline, under Emergency treatment of poisoning p. 1254.

**PREGNANCY**

Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.

**BREAST FEEDING**

Present in milk — irriatbility in infant reported; modified-release preparations preferable. Theophylline can be taken as normal during breast-feeding.

**HEPATIC IMPAIRMENT**

Reduce dose.

**MONITORING REQUIREMENTS**

- In most individuals, a plasma-theophylline concentration of 10–20 mg/litre (55–110 micromol/litre) is required for satisfactory bronchodilatation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects may occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.

- Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary — consult local guidelines).

**DIRECTIONS FOR ADMINISTRATION**

**SLO-PHYLLIN ®**

- In adults — Swallow whole with fluid or swallow enclosed granules with soft food (e.g. yoghurt).
- In children — Contents of the capsule (enteric-coated granules) may be sprinkled on to a spoonful of soft food (e.g. yoghurt) and swallowed without chewing.

**PRESCRIBING AND DISPENSING INFORMATION**

The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release
oral theophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as in-patient.

**PATIENT AND CARER ADVICE**

SLO-PHYLLIN® Patient or carer should be given advice on how to administer theophylline modified release capsules.

**MEDICINAL FORMS**

There can be variation in the licencing of different medicines containing the same drug.

**Modified-release tablet**

  - **BABYHALER**
    - For paediatric use with Flixotide®, and Ventolin® inhalers.

**PRESCRIBING AND DISPENSING INFORMATION**

Not available for NHS prescription.

- **Babyhaler** (Allen & Hanburys Ltd) | 1 device - No NHS indicative price available • Drug Tariff (Part IXa)

**HALERAI D**

- Device to place over pressurised (aerosol) inhalers to aid when strength in hands is impaired (e.g. in arthritis). For use with Flixotide®, Seretide®, Serevent®, and Ventolin® inhalers.

**PRESCRIBING AND DISPENSING INFORMATION**

Not available for NHS prescription.

- **Haleraid-120** (Allen & Hanburys Ltd) | 1 device - No NHS indicative price available • Drug Tariff (Part IXa)
- **Haleraid-200** (Allen & Hanburys Ltd) | 1 device - No NHS indicative price available • Drug Tariff (Part IXa)

**OPTICHAMBER**

- For use with all pressurised (aerosol) inhalers.
  - **Optichamber** (Respironics (UK) Ltd) | 1 device - NHS indicative price = £4.28 • Drug Tariff (Part IXa)
  - **Optichamber Diamond**
    - For use with all pressurised (aerosol) inhalers.

**2 Allergic conditions**

**Antihistamines, allergen immunotherapy and allergic emergencies**

**Antihistamines**

All antihistamines are of potential value in the treatment of nasal allergies, particularly seasonal allergic rhinitis (hayfever), and they may be of some value in vasomotor rhinitis. They reduce rhinorrhoea and sneezing but are usually less effective for nasal congestion. Antihistamines are used topically in the eye, in the nose, and on the skin.
Oral antihistamines are also of some value in preventing urticaria and are used to treat urticarial rashes, pruritus, and insect bites and stings; they are also used in drug allergies. Injections of chlorphenamine maleate p. 272 or promethazine hydrochloride p. 275 are used as an adjunct to adrenaline/epinephrine p. 216 in the emergency treatment of anaphylaxis and angioedema. Antihistamines (including cinnarizine p. 416, cyclizine p. 409, and promethazine teoclact p. 417) may also have a role in nausea and vomiting. Buclizine is included as an anti-emetic in a preparation for migraine. Antihistamines may also have a role in occasional insomnia.

All older antihistamines cause sedation but alimemazine tartept p. 271 and promethazine may be more sedating whereas chlorphenamine maleate and cyclizine may be less so. This sedating activity is sometimes used to manage the pruritus associated with some allergies. There is little evidence that any one of the older, ‘sedating’ antihistamines is superior to another and patients vary widely in their response.

Non-sedating antihistamines such as acrivastine p. 267, bilastine p. 268, cetirizine hydrochloride p. 268, desloratadine p. 269 (an active metabolite of loratadine p. 270), fexofenadine hydrochloride p. 269 (an active metabolite of terfenadine), levocetirizine hydrochloride p. 270 (an isomer of cetirizine hydrochloride), loratadine, and mizolastine p. 271 cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

**Allergen immunotherapy**

Immunotherapy using allergen vaccines containing house dust mite, animal dander (cat or dog), or extracts of grass, tree, and dust mite, animal dander (cat or dog), or extracts of grass, tree, dust mite, house dust, etc. can reduce symptoms of asthma and allergic rhinoconjunctivitis. A vaccine containing extracts of wasp and bee venom is used to reduce the risk of severe anaphylaxis and systemic reactions in individuals with hypersensitivity to wasp and bee stings. An oral preparation of grass pollen extract (Grazax®) is also licensed for disease-modifying treatment of grass pollen–induced rhinitis and conjunctivitis. Those requiring immunotherapy must be referred to a hospital specialist for accurate diagnosis, assessment, and treatment.

Omalizumab p. 256 is a monoclonal antibody that binds to immunoglobulin E (IgE). It is used as additional therapy in individuals with proven IgE-mediated sensitization to inhalable allergens, whose severe persistent allergic asthma cannot be controlled adequately with high dose inhaled corticosteroid together with a long-acting beta agonist. Omalizumab should be initiated by physicians in specialist centres experienced in the treatment of severe persistent asthma. Omalizumab is also indicated as add-on therapy for the treatment of chronic spontaneous urticaria in patients who have had an inadequate response to H1 antihistamine treatment.

**Allergic emergencies**

**Anaphylaxis**

Anaphylaxis is a severe, life-threatening, generalised or systemic hypersensitivity reaction. It is characterised by the rapid onset of respiratory and/or circulatory problems and is usually associated with skin and mucosal changes; prompt treatment is required. Patients with pre-existing asthma, especially poorly controlled asthma, have a particular risk of life-threatening reactions. Insect stings are a recognised risk (in particular wasp and bee stings). Latex and certain foods, including eggs, fish, cow’s milk protein, peanuts, sesame, shellfish, soy, and tree nuts may also precipitate anaphylaxis (see Food allergy p. 82). Medicinal products particularly associated with anaphylaxis include blood products, vaccines, hyposensitising (allergen) preparations, antibacterials, aspirin and other NSAIDs, and neuromuscular blocking drugs. In the case of drugs, anaphylaxis is more likely after parenteral administration; resuscitation facilities must always be available for injections associated with special risk. Anaphylactic reactions may also be associated with additives and excipients in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens.

**Treatment of anaphylaxis**

Adrenaline/epinephrine provides physiological reversal of the immediate symptoms associated with hypersensitivity reactions such as anaphylaxis and angioedema.

First-line treatment includes:

- securing the airway, restoration of blood pressure (laying the patient flat and raising the legs, or in the recovery position if unconscious or nauseous and at risk of vomiting);
- administering adrenaline/epinephrine (by intramuscular injection in a dose of 500 micrograms (a dose of 300 micrograms may be appropriate for immediate self-administration); the dose should be repeated if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function. Patients receiving beta-blockers require special consideration;
- administering high-flow oxygen and intravenous fluids is also of primary importance;
- administering an antihistamine such as chlorphenamine maleate, by slow intravenous injection or intramuscular injection is a useful adjunctive treatment, given after adrenaline.

- Administering an intravenous corticosteroid such as hydrocortisone p. 637 (preferably as sodium succinate) is of secondary value in the initial management of anaphylaxis because the onset of action is delayed for several hours, but should be given to prevent further deterioration in severely affected patients.

**Continuing respiratory deterioration** requires further treatment with bronchodilators including inhaled or intravenous salbutamol p. 244, inhaled ipratropium bromide p. 239, intravenous aminophylline p. 261, or intravenous magnesium sulfate p. 963 [uncensored indication] (as for acute severe asthma); in addition to oxygen, assisted respiration and possibly emergency tracheotomy may be necessary.

When a patient is so ill that there is doubt about the adequacy of the circulation, the initial injection of adrenaline/epinephrine may need to be given as a dilute solution by the intravenous route.

Cardiopulmonary arrest may follow an anaphylactic reaction; resuscitation should be started immediately. On discharge, patients should be considered for further treatment with an oral antihistamine and an oral corticosteroid for up to 3 days to reduce the risk of further reaction. Patients should be instructed to return to hospital if symptoms recur and to contact their general practitioner for follow-up.

- Patients who are suspected of having had a anaphylactic reaction should be referred to a specialist for specific allergy diagnosis. Avoidance of the allergen is the principal treatment; if appropriate, an adrenaline/epinephrine auto-injector should be given for self-administration or a replacement supplied.

**Intramuscular adrenaline (epinephrine)**

The intramuscular route is the first choice route for the administration of adrenaline/epinephrine in the management of anaphylaxis. Adrenaline/epinephrine is best given as an intramuscular injection into the anterolateral aspect of the middle third of the thigh; it has a rapid onset of action after intramuscular administration and in the shocked patient its absorption from the intramuscular site is faster and more reliable than from the subcutaneous site.
Patients with severe allergy should be instructed in the self-administration of adrenaline/epinephrine p. 216 by intramuscular injection.

Prompt injection of adrenaline/epinephrine is of paramount importance. The adrenaline/epinephrine doses recommended for the emergency treatment of anaphylaxis by appropriately trained healthcare professionals are based on the revised recommendations of the Working Group of the Resuscitation Council (UK).

### Dose of intramuscular injection of adrenaline (epinephrine) for the emergency treatment of anaphylaxis by healthcare professionals

<table>
<thead>
<tr>
<th>Age</th>
<th>Dose</th>
<th>Volume of adrenaline</th>
</tr>
</thead>
<tbody>
<tr>
<td>Child 1 month–5 years</td>
<td>150 micrograms</td>
<td>0.15 mL 1 in 1000 (1 mg/mL) adrenaline¹</td>
</tr>
<tr>
<td>Child 6–11 years</td>
<td>300 micrograms</td>
<td>0.3 mL 1 in 1000 (1 mg/mL) adrenaline</td>
</tr>
<tr>
<td>Child 12–17 years</td>
<td>500 micrograms</td>
<td>0.5 mL 1 in 1000 (1 mg/mL) adrenaline¹</td>
</tr>
<tr>
<td>Adult</td>
<td>500 micrograms</td>
<td>0.5 mL 1 in 1000 (1 mg/mL) adrenaline</td>
</tr>
</tbody>
</table>

These doses may be repeated several times if necessary at 5-minute intervals according to blood pressure, pulse and respiratory function.

1. Use suitable syringe for measuring small volume
2. 300 micrograms (0.3 mL) if child is small or prepubertal

**Intravenous adrenaline (epinephrine)**

Intravenous adrenaline/epinephrine should be given only by appropriately trained healthcare professionals based on the revised recommendations of the Working Group of the Resuscitation Council (UK). When the patient is severely ill and there is real doubt about the adequacy of the circulation and absorption after intramuscular injection, adrenaline/epinephrine can be given by slow intravenous injection repeated according to response; if multiple doses are required, adrenaline/epinephrine should be given as a slow intravenous infusion stopping when a response has been obtained.

It is important that, where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

The intravenous route is also used for cardiac resuscitation.

**Angioedema**

Angioedema is dangerous if laryngeal oedema is present. In this circumstance adrenaline/epinephrine injection and oxygen should be given as described under Anaphylaxis; antihistamines and corticosteroids should also be given. Tracheal intubation may be necessary.

**Hereditary angioedema**

The treatment of hereditary angioedema should be under specialist supervision. Unlike allergic angioedema, adrenaline/epinephrine, corticosteroids, and antihistamines should not be used for the treatment of acute attacks, including attacks involving laryngeal oedema, as they are ineffective and may delay appropriate treatment—intubation may be necessary. The administration of C1-esterase inhibitor p. 279, an endogenous complement blocker derived from human plasma, (in fresh frozen plasma or in partially purified form) can terminate acute attacks of hereditary angioedema; it can also be used for short-term prophylaxis before dental, medical or surgical procedures. Conestat alfa p. 279 and icatibant p. 279 are licensed for the treatment of acute attacks of hereditary angioedema in adults with C1-esterase inhibitor deficiency.

Tranexamic acid p. 107 and danazol p. 699 [unlicensed indication] are used for short-term and long-term prophylaxis of hereditary angioedema. Short-term prophylaxis with tranexamic acid or danazol is started several days before planned procedures (e.g. dental work) and continued for 2–5 days afterwards. Danazol should be avoided in children because of its androgenic effects.

### ANTIHISTAMINES > NON-SEDATING

#### Acrivastine

**INDICATIONS AND DOSE**

Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria

- **BY MOUTH**
  - Child 12–17 years: 8 mg 3 times a day
  - Adult: 8 mg 3 times a day

**CONTRA-INDICATIONS**

Avoid in acute porphyrias p. 969 (some antihistamines are thought to be safe) • elderly

**SIDE-EFFECTS**

- **Uncommon** Antimuscarinic effects • gastro-intestinal disturbances • headache • psychomotor impairment
- **Rare** Anaphylaxis • angioedema • angle-closure glaucoma (in adults) • arrhythmias • blood disorders • bronchospasm • confusion • convulsions • depression • dizziness • extrapyramidal effects • hypersensitivity reactions • hypotension • liver dysfunction • palpitation • photosensitivity reactions • rashes • sleep disturbances • tremor
- **Frequency not known** Blurred vision • drowsiness • dry mouth • urinary retention

**SIDE-EFFECTS, FURTHER INFORMATION**

Non-sedating antihistamines such as acrivastine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent. If drowsiness occurs, it may diminish after a few days of treatment.

Children and the elderly are more susceptible to side-effects.

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated if history of hypersensitivity to triprolidine.

**PREGNANCY**

Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

**BREAST FEEDING**

Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**RENAI IMPAIRMENT**

Avoid in severe impairment.

**PATIENT AND CARER ADVICE**

- Driving and skilled tasks
  - Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **Benadryl Allergy Relief** (McNeil Products Ltd)
  - Acrivastine 8 mg
  - Benadryl Allergy Relief 8 mg capsules | 24 capsule £4.95

2. adrenaline/epinephrine p. 216
3. adrenaline/epinephrine p. 216
4. adrenaline/epinephrine p. 216
Bilastine

22-May-2017

**INDICATIONS AND DOSE**
Symptomatic relief of allergic rhinoconjunctivitis and urticaria
- **BY MOUTH**
  - Child 12-17 years: 20 mg once daily
  - Adult: 20 mg once daily

**CONTRA-INDICATIONS**
Avoid in acute porphyrias p. 969 (some antihistamines are thought to be safe)

**SIDE-EFFECTS**
- **Common or very common**
  - Headache
  - Malaise
  - Abdominal pain
  - Nausea
  - Vomiting
  - Diarrhoea
  - Gastro-intestinal disturbances
  - Palpitation
  - Fatigue
  - Dizziness
  - Vertigo
  - Insomnia
  - Thirst
  - Anorexia
  - Appetite
  - Tinnitus
  - Thrombocytopenia
  - Hypersensitivity reactions
  - Other: antihistamines (non-sedating)

**SIDE-EFFECTS, FURTHER INFORMATION**
- Children and the elderly are more susceptible to side-effects.
- Non-sedating antihistamines such as bilastine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

**PREGNANCY**
Avoid.—limited information available. Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

**BREAST FEEDING**
Avoid.—no information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**DIRECTIONS FOR ADMINISTRATION**
Take tablet 1 hour before or after food or fruit juice.

**PATIENT AND CARER ADVICE**
Patients or carers should be given advice on how to administer bilastine tablets.

Driving and skilled tasks
Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Downloaded from www.medicalbr.com
Desloratadine 23-May-2017

● INDICATIONS AND DOSE
Symptomatic relief of allergy such as allergic rhinitis, urticaria, chronic idiopathic urticaria

▶ BY MOUTH
▶ Child 1-5 years: 1.25 mg once daily
▶ Child 6-11 years: 2.5 mg once daily
▶ Child 12-17 years: 5 mg once daily
▶ Adult: 5 mg once daily

PHARMACOKINETICS
Desloratadine is a metabolite of loratadine.

● CAUTIONS
Acute porphyrias p. 969

● INTERACTIONS ➔ Appendix 1: antihistamines (non-sedating)

● SIDE-EFFECTS
Uncommon Antimuscarinic effects • blurred vision • dry mouth • gastro-intestinal disturbances • headache • psychomotor impairment • urinary retention

Rare Anaphylaxis • angioedema • angle-closure glaucoma (in adults) • arrhythmias • blood disorders • bronchospasm • confusion • convulsions • depression • dizziness • extrapyramidal effects • hypersensitivity reactions • hypotension • liver dysfunction • myalgia • palpitation • photosensitivity reactions • rashes • sleep disturbances • tremor

Very rare Hallucinations

Frequency not known Drowsiness

SIDE-EFFECTS, FURTHER INFORMATION
Non-sedating antihistamines such as desloratadine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

If drowsiness occurs, it may diminish after a few days of treatment.

Children and the elderly are more susceptible to side-effects.

● ALLERGY AND CROSS-SENSITIVITY
Contra-indicated if history of hypersensitivity to loratadine.

● PREGNANCY
Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

● BREAST FEEDING
Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

● RENAL IMPAIRMENT
Use with caution in severe impairment.

● PRESCRIBING AND DISPENSING INFORMATION
Flavours of oral liquid formulations may include bubblegum.

Fexofenadine hydrochloride 22-May-2017

● INDICATIONS AND DOSE
Symptomatic relief of seasonal allergic rhinitis

▶ BY MOUTH
▶ Child 6-11 years: 30 mg twice daily
▶ Child 12-17 years: 120 mg once daily
▶ Adult: 120 mg once daily

Symptomatic relief of chronic idiopathic urticaria

▶ BY MOUTH
▶ Child 12-17 years: 180 mg once daily
▶ Adult: 180 mg once daily

PHARMACOKINETICS
Fexofenadine is a metabolite of terfenadine.

● INTERACTIONS ➔ Appendix 1: antihistamines (non-sedating)

● SIDE-EFFECTS
Uncommon Antimuscarinic effects • blurred vision • dry mouth • gastro-intestinal disturbances • headache • psychomotor impairment • urinary retention

Rare Anaphylaxis • angioedema • angle-closure glaucoma (in adults) • arrhythmias • blood disorders • bronchospasm • confusion • convulsions • depression • dizziness • extrapyramidal effects • hypersensitivity reactions • hypotension • liver dysfunction • myalgia • palpitation • photosensitivity reactions • rashes • sleep disturbances • tremor

Frequency not known Drowsiness

SIDE-EFFECTS, FURTHER INFORMATION
Non-sedating antihistamines such as fexofenadine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

If drowsiness occurs, it may diminish after a few days of treatment.

Children and the elderly are more susceptible to side-effects.

● PREGNANCY
Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

● BREAST FEEDING
Most antihistamines are present in breast milk in varying amounts; although not known to be

Tablets not licensed for use in children under 6 years. Syrup not licensed for use in children under 1 year.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN

Children under 6 years should not be given over-the-counter cough and cold medicines containing chlorphenamine.

CONTRA-INDICATIONS

Many antihistamines should be avoided in acute porphyrias p. 969 but chlorphenamine is thought to be safe

CAUTIONS

Epilepsy - prostatic hypertrophy (in adults) - pyloroduodenal obstruction - susceptibility to angle-closure glaucoma - urinary retention

INTERACTIONS

Appendix 1: antihistamines (sedating)

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Children and the elderly are more susceptible to side-effects.

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

PREGNANCY

Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

BREAST FEEDING

Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

HEPATIC IMPAIRMENT

Avoid in severe liver disease—increased risk of coma.

RENA L IMPAIRMENT

Avoid.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

MEDICINAL FORMS

**Cyproheptadine hydrochloride**

- **INDICATIONS AND DOSE**
  - Symptomatic relief of allergy such as hay fever, urticaria | Pruritus
    - **BY MOUTH**
      - Adult: 4 mg 3 times a day, usual dose 4–20 mg daily; maximum 32 mg per day

  - **CONTRA-INDICATIONS** Avoid in acute porphyrias p. 969 (some antihistamines are thought to be safe)
Hydroxyzine is a sedating antihistamine which exerts its actions by antagonising the effects of histamine.

**INDICATIONS AND DOSE**

**Pruritus**

- **By mouth**
  - Child 6 months–5 years: 5–15 mg daily in divided doses, dose adjusted according to weight; maximum 2 mg/kg per day.
  - Child 6–17 years (body-weight up to 40 kg): Initially 15–25 mg daily in divided doses, dose increased as necessary, adjusted according to weight; maximum 2 mg/kg per day.
  - Child 6–17 years (body-weight 40 kg and above): Initially 15–25 mg daily in divided doses, increased if necessary to 50–100 mg daily in divided doses, dose adjusted according to weight.
  - Adult: Initially 25 mg daily, dose to be taken at night; increased if necessary to 25 mg 3–4 times a day.

**SIDE-EFFECTS**

- Elderly: Initially 25 mg daily, dose to be taken at night; increased if necessary to 25 mg twice daily

**CONTRA-INDICATIONS**

- Acquired or congenital QT interval prolongation
- Avoid in acute porphyrias p. 969 (some antihistamines are thought to be safe)
- Predisposition to QT interval prolongation

**UNLICENSED USE**

- **Ucerax** preparations not licensed for use in children under 1 year.

**IMPORTANT SAFETY INFORMATION**

**MAH/CHM ADVICE: RISK OF QT-INTERVAL PROLONGATION AND TORSADE DE POINTES (APRIL 2015)**

Following concerns of heart rhythm abnormalities, the safety and efficacy of hydroxyzine has been reviewed by the European Medicines Agency. The review concludes that hydroxyzine is associated with a small risk of QT-interval prolongation and torsade de pointes; these events are most likely to occur in patients who have risk factors for QT prolongation, e.g. concomitant use of drugs that prolong the QT-interval, cardiovascular disease, family history of sudden cardiac death, significant electrolyte imbalance (low plasma-potassium or plasma-magnesium concentrations), or significant bradycardia. To minimise the risk of such adverse effects, the following dose restrictions have been made and new cautions and contra-indications added:

- Hydroxyzine is contra-indicated in patients with prolonged QT-interval or who have risk factors for QT-interval prolongation;
- Avoid use in the elderly due to increased susceptibility to the side-effects of hydroxyzine;
- Consider the risks of QT-interval prolongation and torsade de pointes before prescribing to patients taking drugs that lower heart rate or plasma-potassium concentration;
- In adults, the maximum daily dose is 100 mg;
- In children with body-weight up to 40 kg, the maximum daily dose is 2 mg/kg;
- In the elderly, the maximum daily dose is 50 mg (if use of hydroxyzine cannot be avoided);
- The lowest effective dose for the shortest period of time should be prescribed.

**CONTRA-INDICATIONS**

- Acquired or congenital QT interval prolongation
- Avoid in acute porphyrias
- Predisposition to QT interval prolongation

**SIDE-EFFECTS**

- Common or very common: Dry mouth, fatigue, headache
- Uncommon: Constipation, dizziness, insomnia, nausea
- Rare: Blood disorders, bronchospasm, liver dysfunction, rashes

**FREQUENCY NOT KNOWN**

- Agitation, alopecia, anorexia, anxiety, blurred vision, coma, confusion, convulsions (with high doses), depression, diarrhoea, drowsiness, dyskinesia (after stopping use), extrapyramidal effects, flushing, hallucinations, hypotension, impotence.
labyrinthitis - menstrual disturbances - myalgia - palpitation - priapism - psychomotor impairment - sleep disturbances - tachycardia - tinnitus - tremor (with high doses) - urinary retention - ventricular arrhythmias - vertigo - vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- **ALLERGY AND CROSS-SENSITIVITY** Manufacturer advises hydroxyzine should be avoided in patients with previous hypersensitivity to cetirizine or other piperazine derivatives, and aminophylline.
- **PREGNANCY** Manufacturers advise avoid - toxicity in animal studies with higher doses. Use in the latter part of the third trimester may cause irritability, paradoxical excitability, and tremor in the neonate.
- **BREAST FEEDING** Manufacturer advises avoid—expected to be present in milk but effect unknown.
- **HEPATIC IMPAIRMENT** Manufacturer advises reduce daily dose by one-third. Manufacturer advises avoid in severe liver disease—increased risk of coma.
- **RENAL IMPAIRMENT** Manufacturers advise reduce daily dose by half in moderate to severe renal impairment.

**EFFECT ON LABORATORY TESTS** May interfere with methacholine test—manufacturer advises stop treatment 96 hours prior to test. May interfere with skin testing for allergy—manufacturer advises stop treatment one week prior to test.

**PATIENT AND CARER ADVICE**
Driving and skilled tasks
Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
CAUTIONARY AND ADVISORY LABELS 2

- **Atarax** (Alliance Pharmaceuticals Ltd)
  - Hydroxyzine hydrochloride 10 mg Atarax 10mg tablets | 84 tablet (Pkt) £1.20 DT price = £1.20
  - Hydroxyzine hydrochloride 25 mg Atarax 25mg tablets | 28 tablet (Pkt) £0.62 DT price = £0.62

**Ketotifen**

**INDICATIONS AND DOSE**

- **Allergic rhinitis**
  - **BY MOUTH**
    - Child 3-17 years: 1 mg twice daily
    - Adult: 1 mg twice daily, increased if necessary to 2 mg twice daily, to be taken with food

- **Allergic rhinitis in readily sedated patients**
  - **BY MOUTH**
    - Adult: Initially 0.5–1 mg once daily, dose to be taken at night

- **CONTRA-INDICATIONS** Avoid in acute porphyrias p. 969
  (some antihistamines are thought to be safe)

- **CAUTIONS** Epilepsy - prostatic hypertrophy (in adults) - pyloroduodenal obstruction - susceptibility to angle-closure glaucoma - urinary retention

- **INTERACTIONS** → Appendix 1: antihistamines (sedating)

- **SIDE-EFFECTS**
  - **Common or very common** Excitation (in adults) - irritability - nervousness
  - **Uncommon** Cystitis
  - **Rare** Weight gain
  - **Very rare** Stevens-Johnson syndrome
  - **Frequency not known** Anaphylaxis - angioedema - angle-closure glaucoma (in adults) - antimuscarinic effects - arrhythmias - blood disorders - blurred vision - bronchospasm - confusion - convulsions - depression - dizziness - dry mouth - extrapyramidal effects - gastro-intestinal disturbances - headache - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - photosensitivity reactions - psychomotor impairment - rashes - sleep disturbances - tremor - urinary retention

**SIDE-EFFECTS, FURTHER INFORMATION**
Elderly are more susceptible to side effects.
Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.

- **PATIENT AND CARER ADVICE**
  Driving and skilled tasks
  Drowsiness may affect performance of skilled tasks (e.g. driving or cycling); sedating effects enhanced by alcohol.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**
CAUTIONARY AND ADVISORY LABELS 2, 21

- **Zaditen (CD Pharma AB)**
  - Ketotifen (as Ketotifen fumarate) 200 microgram per ml Zaditen 1mg/ml elixir sugar-free | 300 ml (Pkt) £8.91 DT price + £8.91

**Tablet**
CAUTIONARY AND ADVISORY LABELS 2, 21

- **Zaditen (CD Pharma AB)**
  - Ketotifen (as Ketotifen fumarate) 1 mg Zaditen 1mg tablets | 60 tablet (Pkt) £7.53

**Promethazine hydrochloride**

**INDICATIONS AND DOSE**
Symptomatic relief of allergy such as hay fever and urticaria | Insomnia associated with urticaria and pruritus

- **BY MOUTH**
  - Child 2–4 years: 5 mg twice daily, alternatively 5–15 mg once daily, dose to be taken at night
  - Child 5–9 years: 5–10 mg twice daily, alternatively 10–25 mg once daily, dose to be taken at night
  - Child 10–17 years: 10–20 mg 2–3 times a day, alternatively 25 mg once daily, dose to be taken at night, increased if necessary to 25 mg twice daily
  - Adult: 10–20 mg 2–3 times a day

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 25–50 mg (max. per dose 100 mg)
Emergency treatment of anaphylactic reactions

BY SLOW INTRAVENOUS INJECTION
- Adult: 25–50 mg, to be administered as a solution containing 2.5 mg/mL in water for injections; maximum 100 mg per course

Sedation (short-term use)

BY MOUTH
- Child 2–4 years: 15–20 mg
- Child 5–9 years: 20–25 mg
- Child 10–17 years: 25–50 mg
- Adult: 25–50 mg
- BY DEEP INTRAMUSCULAR INJECTION
- Adult: 25–50 mg

Nausea | Vomiting | Vertigo | Labyrinthine disorders | Motion sickness

BY MOUTH
- Child 2–4 years: 5 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
- Child 5–9 years: 10 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
- Child 10–17 years: 20–25 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
- Adult: 20–25 mg, to be taken at bedtime on night before travel, repeat following morning if necessary

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN
Children under 6 years should not be given over-the-counter cough and cold medicines containing promethazine.

CONTRA-INDICATIONS
- Many antihistamines should be avoided in acute porphyrias p. 969 but promethazine is thought to be safe - should not be given to children under 2 years, except on specialist advice, because the safety of such use has not been established

CAUTIONS
- Avoid extravasation with intravenous injection
- Epilepsy - prostatic hypertrophy (in adults) - pyloroduodenal obstruction - severe coronary artery disease - susceptibility to angle-closure glaucoma - urinary retention

INTERACTIONS
- Appendix 1: antihistamines (sedating)

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

FREQUENCY not known
- Antimuscarinic effects - blurred vision - drowsiness - dry mouth - gastro-intestinal disturbances - headache - psychomotor impairment - restlessness - urinary retention

SPECIFIC SIDE-EFFECTS
- With intramuscular use

Injection pain

SIDE-EFFECTS, FURTHER INFORMATION
- Children and the elderly are more susceptible to side-effects. Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

PREGNANCY
- Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

BREAST FEEDING
- Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

HEPATIC IMPAIRMENT
- Avoid in severe liver disease—increased risk of coma.

RENAL IMPAIRMENT
- Use with caution.

PATIENT AND CARER ADVICE
- Driving and skilled tasks: Drowsiness may affect the performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

PROFESSION SPECIFIC INFORMATION
- Dental practitioners’ formulary
- Promethazine Hydrochloride Tablets 10 mg or 25 mg may be prescribed.
- Promethazine Hydrochloride Oral Solution (elixir) 5 mg/5 mL may be prescribed.

LESS SUITABLE FOR PRESCRIBING
- Promethazine is less suitable for prescribing for sedation.

EXCEPTIONS TO LEGAL CATEGORY
- Prescription only medicine restriction does not apply to promethazine hydrochloride injection where administration is for saving life in emergency.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection
- EXCIPIENTS: May contain Sulphites
- Phenergan (Sanofi)
  - Promethazine hydrochloride 25 mg per 1 mL Phenergan 25mg/1ml solution for injection ampoules | 10 ampoule POM £6.74

Oral solution
- CAUTIONARY AND ADVISORY LABELS 2

  - Promethazine hydrochloride 1 mg per 1 ml Phenergan 5mg/5ml elixir sugar-free | 100 mL P £2.85 DT price + £2.85

Tablet
- CAUTIONARY AND ADVISORY LABELS 2
- Promethazine hydrochloride (Non-proprietary)
  - Promethazine hydrochloride 10 mg Promethazine hydrochloride 10mg tablets | 56 tablet POM £2.96 DT price + £2.96
- Phenergan (Sanofi)
  - Promethazine hydrochloride 25 mg Phenergan 25mg tablets | 56 tablet £4.65 DT price + £4.65
- Sominex (Teva UK Ltd)
  - Promethazine hydrochloride 20 mg Sominex 20mg tablets | 8 tablet P £1.89 | 16 tablet P £2.69

VACCINES

ALLERGEN-TYPE VACCINES

Bee venom extract

INDICATIONS AND DOSE
- Hypersensitivity to bee venom
- BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION
- DESENSITISING VACCINES
- In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:
seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
- hypersensitivity to wasp and bee venoms.

Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

**CONTRA-INDICATIONS** Consult product literature

**CAUTIONS** Consult product literature

**INTERACTIONS** → Appendix 1: bee venom extract

**SIDE-EFFECTS** Consult product literature.

Hypersensitivity reactions

Hypersensitivity reactions to immunotherapy (especially to wasp and bee venom extracts) can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore, cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), **even when mild**, the patient should be observed until these have resolved completely.

**PREGNANCY** Avoid.

**PRESCRIBING AND DISPENSING INFORMATION** Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- **Pharmalgen**® for bee and wasp venom allergy (February 2012) NICE TA246

**Pharmalgen**® is an option for the treatment of IgE-mediated bee and wasp venom allergy in those who have had:

- a severe systemic reaction to bee or wasp venom;
- a moderate systemic reaction to bee or wasp venom and who have a raised baseline serum-tryptase concentration, a high risk of future stings, or anxiety about future stings.

Treatment with **Pharmalgen**® should be initiated and monitored in a specialist centre experienced in venom immunotherapy.

www.nice.org.uk/TA246

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**2.1 Angioedema**

Other drugs used for Angioedema

Adrenaline/epinephrine, p. 216
DRUGS USED IN HEREDITARY ANGIOEDEMA

C1-esterase inhibitor

INDICATIONS AND DOSE

BERINERT®
Acute attacks of hereditary angioedema (under expert supervision)
- BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: 20 units/kg

Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)
- BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: 1000 units for 1 dose, to be administered less than 6 hours before procedure

CINRYZE®
Acute attacks of hereditary angioedema (under expert supervision)
- BY SLOW INTRAVENOUS INJECTION
- Adult: 1000 units, repeated if necessary for 1 dose, dose may be repeated if necessary

Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)
- BY SLOW INTRAVENOUS INJECTION
- Adult: 1000 units for 1 dose, to be administered up to 24 hours before procedure

Long-term prophylaxis of severe, recurrent attacks of hereditary angioedema where acute treatment is inadequate, or when oral prophylaxis is inadequate or not tolerated (under expert supervision)
- BY SLOW INTRAVENOUS INJECTION
- Adult: 1000 units every 3–4 days, interval between doses to be adjusted according to response

CAUTIONS
Vaccination against hepatitis A and hepatitis B may be required

SIDE-EFFECTS
Fever, headache, thrombosis (with high doses)

PREGNANCY
Manufacturer advises avoid unless essential.

PRESCRIBING AND DISPENSING INFORMATION
C1-esterase inhibitor is prepared from human plasma.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

ELECTROLYTES: May contain Sodium
- Berinert P (CSL Behring UK Ltd)
  - C1-esterase inhibitor 500 unit: Berinert 500unit powder and solvent for solution for injection vials | 1 vial | £467.50
  - C1-esterase inhibitor 1500 unit: Berinert 1,500unit powder and solvent for solution for injection vials | 1 vial | £1,402.50
- Cinryze (Shire Pharmaceuticals Ltd)
  - C1-esterase inhibitor 500 unit: Cinryze 500unit powder and solvent for solution for injection vials | 2 vial | £1,336.00

Conestat alfa

INDICATIONS AND DOSE
Acute attacks of hereditary angioedema in patients with C1-esterase inhibitor deficiency
- BY SLOW INTRAVENOUS INJECTION
  - Adult (body-weight up to 84 kg): 50 units/kg for 1 dose, to be administered over 5 minutes, dose may be repeated if necessary; maximum 2 doses per day
  - Adult (body-weight 84 kg and above): 4200 units for 1 dose, to be administered over 5 minutes, dose may be repeated if necessary; maximum 2 doses per day

CONTRA-INDICATIONS
Rabbit allergy

SIDE-EFFECTS
- Common or very common: Headache
- Uncommon: Abdominal discomfort, diarrhoea, nausea, paraesthesia, throat irritation, urticaria, vertigo

PREGNANCY
Use only if potential benefit outweighs risk—toxicity in animal studies.

BREAST FEEDING
Use only if potential benefit outweighs risk—no information available.

PRE-TREATMENT SCREENING
Test for immunoglobulin E (IgE) antibodies against rabbit allergens before starting treatment.

MONITORING REQUIREMENTS
Repeat immunoglobulin E (IgE) antibody testing annually or after 10 treatments—consult product literature.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection
- Ruconest (Pharming Group N.V.)

INDICATIONS AND DOSE
Acute attacks of hereditary angioedema in patients with C1-esterase inhibitor deficiency
- BY SUBCUTANEOUS INJECTION
  - Adult: 30 mg for 1 dose, then 30 mg after 6 hours if required, then 60 mg after 6 hours if required; maximum 3 doses per day

CAUTIONS
Ischaemic heart disease, stroke

INTERACTIONS
Appendix 1: Icatibant

SIDE-EFFECTS
Dizziness, erythema, headache, injection-site reactions, nausea, pruritus, pyrexia, rash

PREGNANCY
Manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies.

BREAST FEEDING
Manufacturer advises avoid for 12 hours after administration.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for Injection
- Firazyr (Shire Pharmaceuticals Ltd)
  - Icatibant (as Icatibant acetate) 10 mg per 1 ml: Firazyr 30mg/3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection | £1,395.00
3 Conditions affecting sputum viscosity

Mucolytics for cystic fibrosis

Overview
Mucolytics are prescribed to facilitate expectoration by reducing sputum viscosity. In some patients with chronic obstructive pulmonary disease and a chronic productive cough, mucolytics can reduce exacerbations; mucolytic therapy should be stopped if there is no benefit after a 4-week trial. Steam inhalation with postural drainage is effective in bronchiectasis and in some cases of chronic bronchitis.

Dornase alfa below is used to reduce sputum viscosity in patients with cystic fibrosis.

Nebulised hypertonic sodium chloride (3–7%) is used to mobilise lower respiratory tract secretions in mucus consolidation (e.g. cystic fibrosis). Nebulised hypertonic sodium chloride solution (3%) is used for mild to moderate acute viral bronchiolitis in infants.

Mannitol p. 282, administered by inhalation, improves mucus clearance and is licensed for the treatment of cystic fibrosis as an add-on therapy to standard care.

MUCOLYTICS

Carbocisteine

- **INDICATIONS AND DOSE**
  - **Reduction of sputum viscosity**
    - **BY MOUTH**
      - Adult: Initially 2.25 g daily in divided doses, then reduced to 1.5 g daily in divided doses, as condition improves

- **CONTRA-INDICATIONS** Active peptic ulceration
- **CAUTIONS** History of peptic ulceration (may disrupt the gastric mucosal barrier)
- **SIDE-EFFECTS**
  - Rare Gastro-intestinal bleeding
  - Frequency not known Erythema multiforme - Stevens-Johnson syndrome
- **PREGNANCY** Manufacturer advises avoid in first trimester.
- **BREAST FEEDING** Manufacturer advises avoid.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry, raspberry, cinnamon, or rum.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Oral solution**
    - Carbocisteine (Non-proprietary)
      - Carbocisteine 75 mg per 1 ml
        - Carbocisteine 750mg/10ml oral solution 10ml sachets sugar free sugar-free | 15 sachet [POM] £3.85 DT price = £3.85
      - Mucodyne (Sanofi)
        - Carbocisteine 50 mg per 1 ml
          - Mucodyne Paediatric 250mg/5ml syrup | 125 ml [POM] £12.60
          - Mucodyne 250mg/5ml syrup | 300 ml [POM] £8.39 DT price = £8.39
    - Mucodyne (Sanofi)
      - Carbocisteine 75 mg per 1 ml
        - Carbocisteine 375mg capsules | 120 capsule [PSt] £18.98 DT price = £9.36
      - Carbocisteine 375 mg
        - Carbocisteine 375mg capsules | 120 capsule [PSt] £18.98 DT price = £9.36

- **EDRONESTEINE**
  - **INDICATIONS AND DOSE**
    - Symptomatic treatment of acute exacerbations of chronic bronchitis
      - **BY MOUTH**
        - Adult: 300 mg twice daily for up to 10 days

- **CAUTIONS** History of peptic ulceration (may disrupt the gastric mucosal barrier)
- **SIDE-EFFECTS**
  - Very rare Abdominal pain - diarrhoea - headache - nausea - rash - taste disturbance - urticaria - vomiting
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises max. 300 mg daily in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 25 ml/minute/1.73 m²—no information available.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) Decisions
    - The Scottish Medicines Consortium (October 2007) has advised that erdosteine (Erdotin®) is not recommended for the symptomatic treatment of acute exacerbations of chronic bronchitis.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Capsule**
    - Erdotin (Galen Ltd)
      - Erdosteine 300 mg
        - Erdotin 300mg capsules | 20 capsule [PSt]
        - £4.25 DT price = £4.25

3.1 Cystic fibrosis

MUCOLYTICS

Dornase alfa

(Phosphorylated glycosylated recombinant human deoxyribonuclease 1 (rhDNase))

- **DRUG ACTION** Dornase alfa is a genetically engineered version of a naturally occurring human enzyme which cleaves extracellular deoxyribonucleic acid (DNA).

- **INDICATIONS AND DOSE**
  - Management of cystic fibrosis patients with a forced vital capacity (FVC) of greater than 40% of predicted to improve pulmonary function
    - **BY INHALATION OF NEBULISED SOLUTION**
      - Adult: 2500 units once daily, administered by jet nebuliser, patients over 21 years may benefit from twice daily dosage

- **DOSE EQUIVALENCE AND CONVERSION**
  - Dornase alfa 1000 units is equivalent to 1 mg

- **SIDE-EFFECTS**
  - Rare Chest pain - conjunctivitis - dyspepsia - dysphagia - dyspnoea - laryngitis - pharyngitis - pyrexia - rash - rhinitis - urticaria
  - **PREGNANCY** No evidence of teratogenicity; manufacturer advises use only if potential benefit outweighs risk.
  - **BREAST FEEDING** Amount probably too small to be harmful—manufacturer advises caution.
DIRECTIONS FOR ADMINISTRATION
Dornase alfa is administered by inhalation using a jet nebuliser, usually once daily at least 1 hour before physiotherapy; however, alternate-day therapy may be as effective as daily treatment.
For use undiluted with jet nebulisers only; ultrasonic nebulisers are unsuitable.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Nebuliser liquid
- Pulmozyme (Roche Products Ltd)
  Dornase alfa 1 mg per 1 ml Pulmozyme 2.5mg nebuliser liquid 2.5ml ampoules | 30 ampoule ® £496.43 OT price • £496.43

INDICATIONS AND DOSE
Treatment of cystic fibrosis in patients who have a G551D mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene (under expert supervision)
- BY MOUTH
  - Adult: 150 mg every 12 hours

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Manufacturer advises reduce dose to 150 mg twice a week with concurrent use of potent inhibitors of CYP3A4.
Manufacturer advises reduce dose to 150 mg once daily with concurrent use of moderate inhibitors of CYP3A4.

CONTRA-INDICATIONS
Organ transplantation (no information available)

INTERACTIONS ➔ Appendix 1: ivacaftor

SIDE-EFFECTS
- Common or very common Abdominal pain • diarrhoea • dizziness • ear discomort • headache • nasal congestion • nasopharyngitis • oropharyngeal pain • pharyngeal erythema • pharyngeal oedema • rash • rhinitis • tinnitus • upper respiratory tract infection
- Uncommon Gynaecomastia • nipple disorders • vestibular disorder

PREGNANCY
Manufacturer advises use only if potential benefit outweighs risk—no information available.

BREAST FEEDING
Manufacturer advises use only if potential benefit outweighs risk—no information available.

HEPATIC IMPAIRMENT
Max. 150 mg once daily in moderate impairment; in severe impairment, manufacturer recommends use only if potential benefit outweighs risk—starting dose 150 mg on alternate days, dosing interval adjusted according to clinical response and tolerability.

RENAL IMPAIRMENT
Caution in severe impairment.

PRE-TREATMENT SCREENING
If the patient's genotype is unknown, a validated genotyping method should be performed to confirm the presence of the G551D mutation in at least one allele of the CFTR gene before starting treatment.

MONITORING REQUIREMENTS
Manufacturer advises monitor liver function before treatment, every 3 months during the first year of treatment, then annually thereafter (more frequent monitoring should be considered in patients with a history of transaminase elevations).

DIRECTIONS FOR ADMINISTRATION
Tablets should be taken with fat-containing food.

PRESCRIBING AND DISPENSING INFORMATION
Ivacaftor should be prescribed by a physician experienced in the treatment of cystic fibrosis.

PATIENT AND CARER ADVICE
Patients or carers should be given advice on how to administer ivacaftor tablets.

Driving and skilled tasks
Manufacturer advises that patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (December 2016) that ivacaftor (Kalydeco®) is not recommended for use within NHS Scotland for the treatment of patients with cystic fibrosis aged 18 years and above who have an R117H mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene, as insufficient clinical and economic evidence was submitted.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Tablet
CAUTIONARY AND ADVISORY LABELS
- 25
- Kalydeco (Vertex Pharmaceuticals (UK) Ltd) ▼ Ivacaftor 150 mg Kalydeco 150mg tablets | 56 tablet £14,000.00

Lumacaftor with ivacaftor
The properties listed below are those particular to the combination only. For the properties of the components please consider, ivacaftor above.

INDICATIONS AND DOSE
Treatment of cystic fibrosis in patients who are homozygous for the F508del mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene (under expert supervision)
- BY MOUTH
  - Adult: 400/250 mg every 12 hours

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Manufacturer advises reduce initial dose to 200/125 mg daily for the first week in those also taking a potent inhibitor of CYP3A4.

DOSE EQUIVALENCE AND CONVERSION
- Dose expressed as x/y mg of lumacaftor/ivacaftor.

CAUTIONS
Forced expiratory volume in 1 second (FEV1) less than 40% of the predicted normal value—additional monitoring required at initiation of treatment • pulmonary exacerbation—no information available

INTERACTIONS ➔ Appendix 1: ivacaftor, lumacaftor

SIDE-EFFECTS
- Common or very common Dyspnoea • elevated transaminases (clinically significant) • flatulence • menstrual disturbances • metrorrhagia • nausea • rhinorrhea • vomiting
- Uncommon Cholestatic hepatitis • hepatic encephalopathy • hypertension

BREAST FEEDING
Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
Manufacturer advises reduce dose to 400/250 mg in the morning and 200/125 mg in the evening (600/375 mg total daily dose) in moderate impairment; reduce dose to 200/125 mg every 12 hours (400/250 mg total daily dose) in severe impairment. Manufacturer advises use with caution in severe impairment.

PRE-TREATMENT SCREENING
If the patient's genotype is unknown, a validated genotyping method should be performed to confirm the presence of the F508del mutation on both alleles of the CFTR gene before starting treatment.

MONITORING REQUIREMENTS
Manufacturer advises monitor blood pressure periodically during treatment.
**Mannitol**

**INDICATIONS AND DOSE**
Treatment of cystic fibrosis as an add-on therapy to standard care

- **BY INHALATION OF POWDER**
- **Adult:** Maintenance 400 mg twice daily, an initiation dose assessment must be carried out under medical supervision, for details of the initiation dose regimen, consult product literature

**CONTRA-INDICATIONS**
Bronchial hyperresponsiveness to inhaled mannitol - impaired lung function (forced expiratory volume in 1 second < 30% of predicted) - non-CF bronchiectasis

**CAUTIONS**
Asthma - haemoptysis

**SIDE-EFFECTS**
- **Common or very common** Cough - haemoptysis - headache - pharyngolaryngeal pain - throat irritation - vomiting - wheezing

**PREGNANCY**
Manufacturer advises avoid.

**BREAST FEEDING**
Manufacturer advises avoid.

**PRE-TREATMENT SCREENING**
Patients must be assessed for bronchial hyperresponsiveness to inhaled mannitol before starting the therapeutic dose regimen; an initiation dose assessment must be carried out under medical supervision—for details of the initiation dose regimen, consult product literature.

**DIRECTIONS FOR ADMINISTRATION**
The dose should be administered 5–15 minutes after a bronchodilator and before physiotherapy; the second daily dose should be taken 2–3 hours before bedtime.

**PATIENT AND CARER ADVICE**
Patients or carers should be given advice on how to administer mannitol inhalation powder.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- **Orkambi®** (Vertex Pharmaceuticals (UK) Ltd)
  - Ivacaftor 125 mg, Lumacaftor 200 mg to stop.
  - Manufacturer advises if a dose is more than 508 hours late, Missed doses
  - Manufacturer advises avoid.
  - Missed doses
  - Manufacturer advises avoid.

**Scottish Medicine Consortium (SMC) Decisions**
The Scottish Medicine Consortium has advised (May 2016) that lumacaftor with ivacaftor (Orkambi®) is not recommended within NHS Scotland for the treatment of cystic fibrosis in patients who are homozygous for the F508del mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene.

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicine Consortium, has advised (November 2013) that mannitol (Bronchitol®) is accepted for restricted use within NHS Scotland for the treatment of cystic fibrosis in adults aged 18 years and over as an add-on therapy to best standard of care. Mannitol is restricted to patients who are not currently using dornase alfa due to lack of response, intolerance, or ineligibility and have rapidly declining lung function and in whom other osmotic agents are considered unsuitable.

**Mannitol**

**INHALATION POWDER**

      - Bronchitol 40mg inhalation powder capsules with device | 10 capsule £0.00 no price available

**4 Cough and congestion**

**Aromatic inhalations, cough preparations and systemic nasal decongestants**

**Aromatic inhalations in adults**
Inhalations containing volatile substances such as eucalyptus oil are traditionally used and although the vapour may contain little of the additive it encourages deliberate inspiration of warm moist air which is often comforting in bronchitis; boiling water should not be used owing to the risk of scalding. Inhalations are also used for the relief of
Cough and congestion

nasal obstruction in acute rhinitis or sinusitis. Eucalyptus with menthol inhalation p. 284 is used to relieve sinusitis affecting the maxillary antrum.

Cough preparations in adults

Cough suppressants

Cough may be a symptom of an underlying disorder, such as asthma, gastro-oesophageal reflux disease, or rhinitis, which should be addressed before prescribing cough suppressants. Cough may be a side-effect of another drug, such as an ACE inhibitor, or it can be associated with smoking or environmental pollutants. Cough can also have a significant habit component. When there is no identifiable cause, cough suppressants may be useful, for example if sleep is disturbed. They may cause sputum retention and this may be harmful in patients with chronic bronchitis and bronchiectasis. Codeine phosphate p. 431 may be effective but it is constipating and can cause dependence; dextromethorphan and pholcodine below have fewer side-effects.

Sedating antihistamines are used as the cough suppressant component of many compound cough preparations on sale to the public; all tend to cause drowsiness which may reflect their main mode of action.

Demulcent and expectorant cough preparations

Demulcent cough preparations contain soothing substances such as syrup or glycerol and some patients believe that such preparations relieve a dry irritating cough. Preparations such as simple linctus have the advantage of being harmless and inexpensive; paediatric simple linctus is particularly useful in children.

Expectorants are claimed to promote expulsion of bronchial secretions, but there is no evidence that any drug can specifically facilitate expectoration. Compound preparations are on sale to the public for the treatment of cough and colds but should not be used in children under 6 years; the rationale for some is dubious. Care should be taken to give the correct dose and to not use more than one preparation at a time.

Systemic nasal decongestants

Nasal decongestants for administration by mouth may not be as effective as preparations for local application but they do not give rise to rebound nasal congestion on withdrawal. Pseudoephedrine hydrochloride p. 1100 is available over the counter; it has few sympathomimetic effects.

Aromatic inhalations in children

The use of strong aromatic decongestants (applied as rubs or to pillows) is not advised for infants under the age of 3 months. Carers of young infants in whom nasal obstruction with mucus is a problem can readily be taught appropriate techniques of suction aspiration but sodium chloride 0.9% p. 953 given as nasal drops is preferred; administration before feeds may ease feeding difficulties caused by nasal congestion.

Cough preparations in children

The use of over-the-counter cough suppressants containing codeine phosphate should be avoided in children under 12 years and in children of any age known to be CYP2D6 ultra-rapid metabolisers. Cough suppressants containing similar opioid analgesics such as dextromethorphan and pholcodine are not generally recommended in children and should be avoided in children under 6 years.

MHRA/CHM advice (March 2008 and February 2009)

Children under 6 years should not be given over-the-counter cough and cold medicines containing the following ingredients:

- brompheniramine, chlorphenamine maleate p. 272, diphenhydramine, doxylamine, promethazine, or triprolidine (antihistamines);
- dextromethorphan or pholcodine (cough suppressants);
- guaifenesin or ipecacuanha (expectorants);
- phenylephrine hydrochloride p. 183, pseudoephedrine hydrochloride, ephedrine hydrochloride p. 261, oxymetazoline, or xylometazoline hydrochloride p. 1100 (decongestants).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to five days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

COUGH AND COLD PREPARATIONS

Pholcodine

INDICATIONS AND DOSE

Dry cough

- BY MOUTH USING LINCTUS
  - Child 6-11 years: 2–5 mg 3–4 times a day
  - Child 12-17 years: 5–10 mg 3–4 times a day
  - Adult: 5–10 mg 3–4 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN

Children under 6 years should not be given over-the-counter cough and cold medicines containing pholcodine (cough suppressant).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to 5 days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

CONTRA-INDICATIONS

Bronchiectasis · bronchiolitis (in children) · chronic bronchitis · chronic obstructive pulmonary disease (in adults) · patients at risk of respiratory failure

CAUTIONS

Asthma · chronic cough · persistent cough · productive cough

INTERACTIONS

Appendix 1: pholcodine

SIDE-EFFECTS

Confusion · constipation · dizziness · drowsiness · excitation · nausea · rash · sputum retention · vomiting

PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk.

BREAST FEEDING

Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

HEPATIC IMPAIRMENT

Avoid in hepatic impairment.

RENA! IMPAIRMENT

Use with caution in renal impairment. Avoid in severe renal impairment.
**PR ESCRIBING AND DISPENSING INFORMATION** Pholcodine is not generally recommended for children. Flavours of oral liquid formulations may include orange. When prepared extemporaneously, the BP states Pholcodine Linctus, BP consists of pholcodine 5 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 1% and Pholcodine Linctus, Strong, BP consists of pholcodine 10 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 2%.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

- **Pholcodine (Non-proprietary)**
  - Pholcodine 1 mg per 1 ml Pholcodine 5mg/5ml linctus | 200 ml (£1.32 DT price = £1.32)

**MENTHOL AND DERIVATIVES**

**Eucalyptus with menthol**

**INDICATIONS AND DOSE**

**Aromatic inhalation for relief of nasal congestion**

- **By Inhalation**
  - Child: Add 5 mL to a pint of hot, not boiling, water and inhale the vapour; repeat after 4 hours if necessary
  - Adult: Add 5 mL to a pint of hot, not boiling, water and inhale the vapour; repeat after 4 hours if necessary

**PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Menthol and Eucalyptus Inhalation, BP 1980 consists of racementhon or levomenthon 2 g, eucalyptus oil 10 mL, light magnesium carbonate 7 g, water to 100 mL.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary

Menthol and Eucalyptus Inhalation BP, 1980 may be prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Inhalation vapour**

- **Eucalyptus with menthol (Non-proprietary)**
  - Menthol 20 mg per 1 ml, Magnesium carbonate light 70 mg per 1 ml, Eucalyptus oil 100 microlitres per 1 ml Menthol and Eucalyptus inhalation | 100 ml (£1.36 DT price = £1.36)

**RESINS**

**Benzoin tincture**

(Friars’ Balsam)

**INDICATIONS AND DOSE**

**Aromatic inhalation for relief of nasal congestion**

- **By Inhalation**
  - Child: Add 5 mL to a pint of hot, not boiling, water and inhale the vapour; repeat after 4 hours if necessary
  - Adult: Add 5 mL to a pint of hot, not boiling, water and inhale the vapour; repeat after 4 hours if necessary

**SIDE-EFFECTS**

Allergic contact dermatitis

**PRESCRIBING AND DISPENSING INFORMATION**

Not recommended (applied as a rub or to pillows) for infants under 3 months.

When prepared extemporaneously, the BP states Benzoin Tincture, Compound, BP consists of balsamic acids approx. 4.5%.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Liquid**

**CAUTIONARY AND ADVISORY LABELS**

- **Benzoin tincture (Non-proprietary)**
  - Balsamic acids 16.5 mg per 1 ml Benzoin tincture | 500 ml (£9.95 DT price = £9.95)

**5 Idiopathic pulmonary fibrosis**

Other drugs used for Idiopathic pulmonary fibrosis

Nintedanib, p. 918
ANTIFIBROTICS

Pirfenidone

- **DRUG ACTION** The exact mechanism of action of pirfenidone is not yet understood, but it is believed to slow down the progression of idiopathic pulmonary fibrosis by exerting both antifibrotic and anti-inflammatory properties.

- **INDICATIONS AND DOSE**
  
  **Treatment of mild to moderate idiopathic pulmonary fibrosis (initiated under specialist supervision)**
  
  - **BY MOUTH**
    - Adult: Initially 267 mg 3 times a day for 7 days, then increased to 534 mg 3 times a day for 7 days, then increased to 801 mg 3 times a day

  **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  
  Caution with concomitant use with ciprofloxacin—reduce dose of pirfenidone to 534 mg three times daily with high-dose ciprofloxacin (750 mg twice daily). Caution with concomitant use of drugs known to cause photosensitivity—if photosensitivity reaction or rash occurs, dose adjustment or treatment interruption may be required (consult product literature).

- **CONTRA-INDICATIONS** Cigarette smoking

- **CAUTIONS**
  
  Photosensitivity Avoid exposure to direct sunlight—if photosensitivity reaction or rash occurs, dose adjustment or treatment interruption may be required (consult product literature).

  Treatment interruption If treatment is interrupted for 14 consecutive days or more, the initial 1 week titration regimen should be repeated; if treatment is interrupted for less than 14 consecutive days, the dose can be resumed at the previous daily dose without titration.

- **INTERACTIONS**
  
  - **Common or very common** Abdominal discomfort · anorexia · arthralgia · constipation · diarrhoea · dizziness · dry skin · dysgeusia · dyspepsia · erythema · flatulence · gastritis · gastro-oesophageal reflux disease · headache · hot flush · insomnia · malaise · myalgia · nausea · non-cardiac chest pain · photosensitivity reaction · pruritus · raised hepatic enzymes · rash · somnolence · upper respiratory tract infection · urinary tract infection · vomiting · weight loss
  
  - **Rare** Raised bilirubin in combination with raised hepatic transaminases

- **SIDE-EFFECTS, FURTHER INFORMATION**
  
  Gastrointestinal side-effects may require dose reduction or treatment interruption—consult product literature.

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate hepatic impairment, particularly if concomitant use of CYP1A2 inhibitors. Avoid use in severe hepatic impairment.

- **RENAL IMPAIRMENT** Avoid use if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  
  - Monitor for weight loss.
  
  - Test liver function before treatment, then at monthly intervals for the next 6 months, and then every 3 months thereafter; review if abnormal liver function tests—dose reduction, treatment interruption or discontinuation may be required (consult product literature).

- **PATIENT AND CARER ADVICE**
  
  Driving and skilled tasks Dizziness or malaise may affect performance of skilled tasks (e.g. driving).

- **NATIONAL FUNDING/ACCESS DECISIONS**
  
  **NICE technology appraisals (TAs)**
  
  - Pirfenidone for treating idiopathic pulmonary fibrosis (April 2013) NICE TA282

  Pirfenidone is recommended as an option for treating idiopathic pulmonary fibrosis only if:

  - the patient has a forced vital capacity (FVC) between 50% and 80% predicted, and
  
  - the manufacturer provides pirfenidone with the discount agreed in the patient access scheme.

  Treatment should be discontinued if there is evidence of disease progression, defined as a decline in predicted FVC of 10% or more within any 12 month period.

  Patients currently receiving pirfenidone that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

  - www.nice.org.uk/TA282

  **Scottish Medicines Consortium (SMC) Decisions** The Scottish Medicines Consortium has advised (August 2013) that pirfenidone is accepted for restricted use within NHS Scotland for the treatment of mild to moderate idiopathic pulmonary fibrosis. Pirfenidone is restricted for use in patients with a predicted forced vital capacity less than or equal to 80%, and only whilst pirfenidone is available at the price agreed in the patient access scheme.

**6 Respiratory depression, respiratory distress syndrome and apnoea**

Respiratory stimulants

**Overview**

Respiratory stimulants (anaesthetic drugs) have a limited place in the treatment of ventilatory failure in patients with chronic obstructive pulmonary disease. They are effective only when given by intravenous injection or infusion and have a short duration of action. Their use has largely been replaced by ventilatory support including nasal intermittent positive pressure ventilation. However, occasionally when ventilatory support is contra-indicated and in patients with hypercapnic respiratory failure who are becoming drowsy or comatose, respiratory stimulants in the short term may arouse patients sufficiently to co-operate and clear their secretions.

Respiratory stimulants can also be harmful in respiratory failure since they stimulate non-respiratory as well as respiratory muscles. They should only be given under expert supervision in hospital and must be combined with active physiotherapy. There is at present no oral respiratory stimulant available for long-term use in chronic respiratory failure.
RESPIRATORY STIMULANTS

### Doxapram hydrochloride

**INDICATIONS AND DOSE**

**Postoperative respiratory depression**
- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 1–1.5 mg/kg, to be administered over at least 30 seconds, repeated if necessary after intervals of one hour, alternatively (by intravenous infusion) 2–3 mg/minute, adjusted according to response

**Acute respiratory failure**
- **BY INTRAVENOUS INFUSION**
  - Adult: 1.5–4 mg/minute, adjusted according to response, to be given concurrently with oxygen and whenever possible monitor with frequent measurement of blood gas tensions

**CONTRA-INDICATIONS**
- Cerebral oedema
- Cerebrovascular accident
- Coronary artery disease
- Epilepsy and other convulsive disorders
- Hyperthyroidism
- Physical obstruction of respiratory tract
- Severe hypertension
- Status asthmaticus

**CAUTIONS**
- Give with beta-agonist in bronchoconstriction
- Give with oxygen in severe irreversible airways obstruction or severely decreased lung compliance (because of increased work load of breathing)
- Hypertension
- Impaired cardiac reserve
- Phaeochromocytoma

**INTERACTIONS** → Appendix 1: doxapram

**SIDE-EFFECTS**
- Arrhythmias
- Bradycardia
- Bronchospasm
- Chest pain
- Confusion
- Convulsions
- Cough
- Dizziness
- Dyspnoea
- Extrasystoles
- Flushing
- Hallucination
- Headache
- Hyperactivity
- Hypertension
- Incontinence
- Laryngospasm
- Muscle spasms
- Nausea
- Perineal warmth
- Pyrexia
- Tachycardia
- Urinary retention
- Vomiting

**PREGNANCY**
- No evidence of harm, but manufacturer advises avoid unless benefit outweighs risk.

**HEPATIC IMPAIRMENT**
- Use with caution.

**MONITORING REQUIREMENTS**
- Frequent arterial blood gas and pH measurements are necessary during treatment to ensure correct dosage.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Doxapram hydrochloride (Non-proprietary)**
  - Doxapram hydrochloride 20 mg per 1 ml
  - Doxapram hydrochloride 200 mg/5ml solution for injection ampoules | 5 ampoule [PSTM] £110.00

**Infusion**
- **Doxapram hydrochloride (Non-proprietary)**
  - Doxapram hydrochloride 2 mg per 1 ml
  - Doxapram hydrochloride 1g/500ml infusion bags | 1 bag [PSTM] no price available

1 Dementia

Dementia 27-Sep-2016

Description of condition

Dementia is a progressive and largely irreversible clinical syndrome that is characterised by a widespread impairment of mental function. There are a number of conditions that cause the symptoms of dementia. Alzheimer’s disease accounts for most cases; other common causes include vascular dementia (due to cerebrovascular disease) and dementia with Lewy bodies. The symptoms of dementia include cognitive dysfunction (such as problems with memory, concentration and problem-solving), non-cognitive symptoms (such as psychiatric and behavioural problems) and difficulties with activities of daily living.

Aims of treatment

The aims of treatment are to promote independence, maintain function and treat symptoms.

Non-drug treatment

Patients with all types of mild-to-moderate dementia presenting with cognitive symptoms should be given the opportunity to participate in a structured group cognitive stimulation programme.

Drug treatment

Management of cognitive symptoms

When pharmacological treatments are used, they should be initiated and supervised by a specialist experienced in the management of dementia. The manufacturers of donepezil hydrochloride p. 288, galantamine p. 289, rivastigmine p. 290 and memantine hydrochloride p. 291 recommend that treatment should be reassessed on a regular basis.

Treatment should be continued only when it is considered to be having a worthwhile effect on symptoms. Donepezil hydrochloride, galantamine and rivastigmine (acetylcholinesterase inhibitors) are recommended for the treatment of cognitive symptoms of mild-to-moderate dementia due to Alzheimer’s disease. Memantine hydrochloride is a suitable alternative for patients with moderate Alzheimer’s disease when acetylcholinesterase inhibitors are contra-indicated or are not tolerated. Memantine hydrochloride is the drug of choice for patients with severe Alzheimer’s disease.

Pharmacological treatments are not recommended for the treatment of cognitive symptoms in cases of vascular dementia.

Management of non-cognitive symptoms

Patients with dementia who develop non-cognitive symptoms (such as delusions or anxiety) or ‘behaviour that challenges’ (such as aggression or agitation) should only be offered a pharmacological intervention if they are severely distressed or if there is an immediate risk of harm to the patient or others. Less severe non-cognitive symptoms are treated with non-pharmacological interventions, such as multisensory stimulation or aromatherapy.

Antipsychotic drugs

Patients with mild-to-moderate non-cognitive symptoms due to Alzheimer’s disease, vascular dementia, mixed dementias or dementia with Lewy bodies should not be prescribed antipsychotic drugs.

Patients with severe non-cognitive symptoms due to Alzheimer’s disease, vascular dementia, mixed dementias or dementia with Lewy bodies which are causing significant distress can be offered treatment with an antipsychotic drug (see Antipsychotic drugs under Psychoses and related disorders p. 364). Careful consideration should be given to the patient’s co-morbid conditions and the benefits and risks of treatment. The MHRA has reported (2009) a clear increased risk of stroke and a small increased risk of death when antipsychotic drugs are used in elderly patients with dementia. The balance of risks and benefits should be carefully assessed, including any previous history of stroke or transient ischaemic attack and any risk factors for cerebrovascular disease including hypertension, diabetes, smoking and atrial fibrillation.

Treatment with antipsychotic drugs should be started with a low dose and titrated upwards, with regular review. In patients who have dementia with Lewy bodies, careful monitoring for severe untoward reactions, such as neuroleptic sensitivity reactions, is recommended.
Acetylcholinesterase inhibitors and memantine

An acetylcholinesterase inhibitor may be used to manage non-cognitive symptoms in patients with mild-to-moderate dementia due to Alzheimer’s disease, if a non-pharmacological approach or an antipsychotic drug is inappropriate or ineffective.

Memantine hydrochloride may be considered in patients with severe symptoms, if a non-pharmacological approach or an antipsychotic drug is inappropriate or ineffective. Memantine hydrochloride may also be used in patients with moderate symptoms in whom acetylcholinesterase inhibitors are contra-indicated.

Patients who have dementia with Lewy bodies should be offered an acetylcholinesterase inhibitor for the treatment of non-cognitive symptoms. Acetylcholinesterase inhibitors are not recommended in patients with vascular dementia.

Management of violence, aggression, and extreme agitation

In cases of dementia associated with severe behavioural disturbance that requires urgent treatment (if violence, aggression and extreme agitation threaten the safety of the patient or others), an antipsychotic drug or a benzodiazepine may be given (see Antipsychotic drugs under Psychoses and related disorders p. 364; see Benzodiazepines under Hypnotics and anxiolytics p. 459). High doses or combinations of drugs should be avoided, and the lowest effective dose should be used. Oral treatment should be offered before parenteral administration. If intramuscular administration is needed for behavioural control, lorazepam p. 322, haloperidol p. 368 or olanzapine p. 379 should be used. Diazepam and chlorpromazine hydrochloride are not recommended. Intravenous administration should be used only in exceptional circumstances.

Useful Resources

Other drugs used for Dementia Risperidone, p. 383

ANTICHLORINERGASES  CENTRALLY ACTING

Donepezil hydrochloride

DRUG ACTION

Donepezil is a reversible inhibitor of acetylcholinesterase.

INDICATIONS AND DOSE

Mild to moderate dementia in Alzheimer’s disease

BY MOUTH

Adult: Initially 5 mg once daily for one month, then increased if necessary up to 10 mg daily, doses to be given at bedtime.

CAUTIONS

Asthma - chronic obstructive pulmonary disease - sick sinus syndrome - supraventricular conduction abnormalities - susceptibility to peptic ulcers

INTERACTIONS  Appendix 1: anticholinesterases, centrally acting

SIDE-EFFECTS

Common or very common Abnormal dreams - aggression - agitation - anorexia - diarrhoea - dizziness - fatigue - hallucinations - headache - insomnia - muscle cramps - nausea - pruritus - rash - syncope - urinary incontinence - vomiting

Uncommon Bradycardia - duodenal ulcers - gastric ulcers - gastro-intestinal haemorrhage - seizures

Rare AV block - extrapyramidal symptoms - hepatitis - potential for bladder outflow obstruction - sino-atrial block

Very rare Neuroleptic malignant syndrome

SIDE-EFFECTS, FURTHER INFORMATION

Acetylcholinesterase inhibitors can cause unwanted dose-related cholinergic effects and should be started at a low dose and the dose increased according to response and tolerability.

HEPATIC IMPAIRMENT

Caution in mild to moderate impairment. No information available for severe impairment.

DIRECTIONS FOR ADMINISTRATION

Donepezil orodispersible tablet should be placed on the tongue, allowed to disperse, and swallowed.

PATIENT AND CARER ADVICE

Patient or carers should be given advise on how to administer donepezil hydrochloride orodispersible tablets.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer’s disease—updated May 2016 NICE TA217

Donepezil can be used for the treatment of mild to moderate Alzheimer’s disease. Treatment should only be prescribed under the following conditions:

- treatment should be initiated on the advice of a specialist
- ensure that local arrangements for prescribing, supply and treatment review follow the NICE guideline on medicines optimisation
- treatment should continue only if it is considered to have a worthwhile effect on cognitive, global, functional, or behavioural symptoms.

Healthcare professionals should not rely solely on assessment scales to determine the severity of Alzheimer’s disease when the patient has learning or other disabilities, or other communication difficulties.

www.nice.org.uk/TA217

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral solution

Donepezil hydrochloride (Non-proprietary)

Donepezil hydrochloride 1 mg per 1 ml Donepezil 1mg/ml oral solution sugar free sugar-free 150 ml Cost £48.00 DT price = £48.00

Orodispersible tablet

Donepezil hydrochloride 5 mg Donepezil 5mg orodispersible tablets 28 tablet (Cost) £59.85

Donepezil 5mg orodispersible tablets sugar free sugar-free 28 tablet (Cost) £6.27-£50.87 DT price = £6.60

Donepezil hydrochloride 10 mg Donepezil 10mg orodispersible tablets sugar free sugar-free 28 tablet (Cost) £6.64-£71.31 DT price = £7.99

Aricept Evess (Eisai Ltd)

Donepezil hydrochloride 5 mg Aricept Evess 5mg orodispersible tablets sugar-free 28 tablet (Cost) £59.85 DT price = £6.60

Donepezil hydrochloride 10 mg Aricept Evess 10mg orodispersible tablets sugar-free 28 tablet (Cost) £83.89 DT price = £7.99

Tablet

Donepezil hydrochloride (Non-proprietary)

Donepezil hydrochloride 5 mg Donepezil 5mg tablets 28 tablet (Cost) £59.85 DT price = £0.89

Donepezil hydrochloride 10 mg Donepezil 10mg tablets 28 tablet (Cost) £83.89 DT price = £1.11

Aricept (Eisai Ltd)

Donepezil hydrochloride 5 mg Aricept 5mg tablets 28 tablet (Cost) £59.85 DT price = £0.89

Donepezil hydrochloride 10 mg Aricept 10mg tablets 28 tablet (Cost) £83.89 DT price = £1.11
Galantamine

- **DRUG ACTION** Galantamine is a reversible inhibitor of acetylcholinesterase and it also has nicotinic receptor agonist properties.

- **INDICATIONS AND DOSE**
  - **Mild to moderately severe dementia in Alzheimer's disease**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Adult: Initially 4 mg twice daily for 4 weeks, increased to 8 mg twice daily for at least 4 weeks; maintenance 8–12 mg twice daily
    - **BY MOUTH USING MODIFIED-RELEASE CAPSULES**
      - Adult: Initially 8 mg once daily for 4 weeks, increased to 16 mg once daily for at least 4 weeks; maintenance 16–24 mg daily

- **CAUTIONS** Avoid in gastro-intestinal obstruction; avoid in urinary outflow obstruction; avoid whilst recovering from bladder surgery; avoid whilst recovering from gastro-intestinal surgery; cardiac disease; chronic obstructive pulmonary disease; congestive heart failure; electrolyte disturbances; history of seizures; history of severe asthma; pulmonary infection; sick sinus syndrome; supraventricular conduction abnormalities; susceptibility to peptic ulcers; unstable angina

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain; bradycardia; decreased appetite; depression; diarrhoea; dizziness; dyspepsia; fatigue; hallucination; headache; hypertension; malaise; muscle spasm; nausea; syncope; tremor; vomiting; weight loss
  - Uncommon Arrhythmias; blurred vision; dehydration; first-degree AV block; flush; hypersomnolence; hypotension; muscular weakness; palpitation; paraesthesia; retching; seizures; sweating; taste disturbance; tinnitus
  - Rare Acute generalized exanthematous pustulosis; erythema multiforme; exacerbation of Parkinson's disease; hepatitis; Stevens-Johnson syndrome

SIDE-EFFECTS, FURTHER INFORMATION
Acetylcholinesterase inhibitors can cause unwanted dose-related cholinergic effects and should be started at a low dose and the dose increased according to response and tolerability.

- Serious skin reactions Serious skin reactions (including Stevens-Johnson syndrome and acute generalized exanthematous pustulosis) have been reported—manufacturer advises discontinue at the first appearance of skin rash.

- **PREGNANCY** Use with caution—toxicity in animal studies.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** For immediate-release preparations in moderate impairment, initially 4 mg once daily (preferably in the morning) for at least 7 days, then 4 mg twice daily for at least 4 weeks; max. 8 mg twice daily; avoid in severe impairment. For modified-release preparations in moderate impairment, initially 8 mg on alternate days (preferably in the morning) for 7 days, then 8 mg once daily for 4 weeks; max. 16 mg daily; avoid in severe impairment.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 9 mL/minute/1.73 m².

- **PATIENT AND CARER ADVICE** Manufacturer recommends that patients are warned of the signs of serious skin reactions; they should be advised to stop taking galantamine immediately and seek medical advice if symptoms occur.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Dementia 289

4 Nervous System

downloaded from www.medicalbr.com
**Rivastigmine**

**DRUG ACTION** Rivastigmine is a reversible non-competitive inhibitor of acetylcholinesterases.

**INDICATIONS AND DOSE**

**Mild to moderate dementia in Alzheimer’s disease**

- **BY MOUTH**
  - Adult: Initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily, dose to be increased at intervals of at least 2 weeks according to response and tolerance; usual dose 3–6 mg twice daily (max. per dose 6 mg twice daily), if treatment interrupted for more than several days, titrate from 1.5 mg twice daily

**Dose equivalence and conversion**

- When switching from oral to transdermal therapy, patients taking 3–6 mg by mouth daily should initially switch to 4.6 mg/24 hours patch, then titrate as above. Patients taking 9 mg by mouth daily should switch to 9.5 mg/24 hours patch if oral dose stable and well tolerated; if oral dose not stable or well tolerated, patients should switch to 4.6 mg/24 hours patch, then titrate as above. Patients taking 12 mg by mouth daily should switch to 9.5 mg/24 hours patch. The first patch should be applied on the day following the last oral dose.

- **CAUTIONS** Bladder outflow obstruction, conduction abnormalities, duodenal ulcers, gastric ulcers, history of asthma, history of chronic obstructive pulmonary disease, history of seizures, risk of fatal overdose with patch administration errors, sick sinus syndrome, susceptibility to ulcers

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain, agitation, anorexia, anxiety, bradycardia, confusion, diarrhoea, dizziness, drowsiness, dyspepsia, extrapyramidal symptoms, headache, increased salivation, insomnia, malaise, nausea, sweating, tremor, urinary incontinence, vomiting, weight loss, worsening of Parkinson’s disease
  - Uncommon Atrial fibrillation, AV block, depression, syncope
  - Rare Angina, duodenal ulceration, gastric ulceration, rash, seizures
  - Very rare Gastro-intestinal haemorrhage, hallucinations, hypertension, pancreatitis, tachycardia
  - Frequency not known Aggression, dehydration, hepatitis, restlessness, sick sinus syndrome, skin hypersensitivity reactions

**SIDE-EFFECTS, FURTHER INFORMATION**

Transdermal administration less likely to cause gastro-intestinal disturbance.

Treatment should be interrupted if gastro-intestinal side-effects occur and withheld until their resolution—titrate dose if necessary.

Acetylcholinesterase inhibitors can cause unwanted dose-related cholinergic effects and should be started at a low dose and the dose increased according to response and tolerability.

- **HEPATIC IMPAIRMENT** Titrate according to individual tolerability in mild to moderate impairment. Use with caution in severe impairment—no information available.

- **RENAL IMPAIRMENT** Titrate according to individual tolerability.

**MONITORING REQUIREMENTS** Monitor body-weight.

**DIRECTIONS FOR ADMINISTRATION**

- With transdermal use Apply patches to clean, dry, non-hairy, non-irritated skin on back, upper arm, or chest, removing after 24 hours and siting a replacement patch on a different area (avoid using the same area for 14 days).

**PATIENT AND CARER ADVICE**

EXELON® PATCHES Advise patients and carers of patch administration instructions, particularly to remove the previous day’s patch before applying the new patch—consult product literature.

26-Sep-2016
NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer’s disease—updated May 2016

NICE TA217

Rivastigmine can be used for the treatment of mild to moderate Alzheimer’s disease. Treatment should only be prescribed under the following conditions:

- treatment should be initiated on the advice of a specialist
- ensure that local arrangements for prescribing, supply and treatment review follow the NICE guideline on medicines optimisation
- treatment should continue only if it is considered to have a worthwhile effect on cognitive, global, functional, or behavioural symptoms.

Healthcare professionals should not rely solely on assessment scales to determine the severity of Alzheimer’s disease when the patient has learning or other disabilities, or other communication difficulties.

EXELON® PATCHES

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (October 2007) that Exelon® patches should be restricted for use in patients with moderately severe Alzheimer’s disease under the conditions of the NICE guidance (September 2007) and when a transdermal patch is an appropriate choice of formulation.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

- Rivastigmine (Non-proprietary)
  - Rivastigmine (as Rivastigmine hydrochloride tartrate) 2 mg per 1 ml
    - Almuriiva 2mg/ml oral solution | 120 ml (PO) £81.75–94.18
    - Rivastigmine 2mg/ml oral solution sugar free sugar-free | 120 ml (PO) £96.82 DT price = £96.82
- Transdermal patch
  - Rivastigmine (Non-proprietary)
    - Rivastigmine 4.6 mg per 24 hour
      - Almuriiva 4.6mg/24hours transdermal patches | 30 patch (PO) £77.97 DT price = £77.97
      - Rivastigmine 4.6mg/24hours transdermal patches | 30 patch (PO) £77.97 DT price = £77.97
    - Rivastigmine 9.5 mg per 24 hour
      - Almuriiva 9.5mg/24hours transdermal patches | 30 patch (PO) £77.97 DT price = £29.97
      - Rivastigmine 9.5mg/24hours transdermal patches | 30 patch (PO) £30.08 DT price = £29.97
    - Rivastigmine 13.3 mg per 24 hour
      - Rivastigmine 13.3mg/24hours transdermal patches | 30 patch (PO) £77.97 DT price = £77.97
      - Aziest (Dr Reddy’s Laboratories (UK) Ltd)
        - Rivastigmine 4.6 mg per 24 hour
          - Alzest 4.6mg/24hours transdermal patches | 30 patch (PO) £35.10 DT price = £77.97
          - Rivastigmine 9.5 mg per 24 hour
            - Alzest 9.5mg/24hours transdermal patches | 30 patch (PO) £19.99 DT price = £29.97
      - Exelon (Novartis Pharmaceuticals UK Ltd)
        - Rivastigmine 4.6 mg per 24 hour
          - Exelon 4.6mg/24hours transdermal patches | 30 patch (PO) £77.97 DT price = £77.97
          - Rivastigmine 9.5 mg per 24 hour
            - Exelon 9.5mg/24hours transdermal patches | 30 patch (PO) £77.97 DT price = £29.97
      - Prometax (Novartis Pharmaceuticals UK Ltd)
        - Rivastigmine 4.6 mg per 24 hour
          - Prometax 4.6mg/24hours transdermal patches | 30 patch (PO) £77.97 DT price = £77.97
          - Rivastigmine 9.5 mg per 24 hour
            - Prometax 9.5mg/24hours transdermal patches | 30 patch (PO) £77.97 DT price = £29.97
      - Rivate (Teva UK Ltd)
        - Rivastigmine 13.3 mg per 24 hour
          - Erastig 13.3mg/24hours transdermal patches | 30 patch (PO) £73.90 DT price = £77.97
        - Rivastigmine 4.6 mg per 24 hour
          - Voleze 4.6mg/24hours transdermal patches | 30 patch (PO) £77.97 DT price = £77.97

DOPAMINERGIC DRUGS

- Memantine hydrochloride

- DRUG ACTION
  - Memantine is a glutamate receptor antagonist.
  - INDICATIONS AND DOSE
    - Moderate to severe dementia in Alzheimer’s disease
      - BY MOUTH
        - Adult: Initially 5 mg once daily, then increased in steps of 5 mg every week; usual maintenance 20 mg daily; maximum 20 mg per day
      - CAUTIONS
        - Epilepsy · history of convulsions · risk factors for epilepsy
      - INTERACTIONS
        - Appendix 1: memantine
      - SIDE-EFFECTS
        - Common or very common Balance disorders · constipation · dizziness · drowsiness · dysphoria · headache · hypertension
        - Uncommon Abnormal gait · confusion · fatigue · hallucinations · heart failure · thrombosis · vomiting
        - Very rare Seizures
        - Frequency not known Depression · hepatitis · pancreatitis · psychosis · suicidal ideation
      - PREGNANCY
        - Manufacturer advises avoid unless essential—no information available.
      - BREAST FEEDING
        - Manufacturer advises avoid—no information available.
      - HEPATIC IMPAIRMENT
        - Avoid in severe impairment—no information available.
      - RENAL IMPAIRMENT
        - Reduce dose to 10 mg daily if eGFR 30–49 ml/minute/1.73 m², if well tolerated after at least 7 days dose can be increased in steps to 20 mg daily; reduce dose to 10 mg daily if eGFR 5–29 ml/minute/1.73 m². Avoid if eGFR less than 5 ml/minute/1.73 m².
      - DIRECTIONS FOR ADMINISTRATION
        - Oral solution should be dosed onto a spoon or into a glass of water.
NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer’s disease—updated May 2016

NICE TA217

Memantine is recommended as an option for managing moderate Alzheimer’s disease in patients who are unable to take acetylcholinesterase inhibitors, and for patients with severe disease; combination treatment with memantine and an acetylcholinesterase inhibitor is not recommended. Treatment should only be prescribed under the following conditions:

- treatment should be initiated on the advice of a specialist
- ensure that local arrangements for prescribing, supply and treatment review follow the NICE guideline on medicines optimisation
- treatment should continue only if it is considered to have a worthwhile effect on cognitive, global, functional, or behavioural symptoms.

Healthcare professionals should not rely solely on assessment scales to determine the severity of Alzheimer’s disease when the patient has learning or other disabilities, or other communication difficulties.

- Memantine hydrochloride 20 mg Nemdhatine 20mg tablets | 7 tablet [Pom] no price available | 28 tablet [Pom] £69.01 DT price = £1.43

Nemdhatine tablets treatment initiation pack | 28 tablet [Pom] £43.12

2 Epilepsy and other seizure disorders

Epilepsy

Control of the epilepsies

The object of treatment is to prevent the occurrence of seizures by maintaining an effective dose of one or more antiepileptic drugs. Careful adjustment of doses is necessary, starting with low doses and increasing gradually until seizures are controlled or there are significant adverse effects.

When choosing an antiepileptic drug, the presenting epilepsy syndrome should first be considered. If the syndrome is not clear, the seizure type should determine the choice of treatment. Concomitant medication, co-morbidity, age, and sex should also be taken into account.

The dosage frequency is often determined by the plasma-drug half-life, and should be kept as low as possible to encourage adherence with the prescribed regimen. Most antiepileptics, when used in the usual dosage, can be given twice daily. Lamotrigine p. 303, perampanel p. 307, fosphenytoin p. 308, which have long half-lives, can be given once daily at bedtime. However, with large doses, some antiepileptics may need to be given more frequently to avoid adverse effects associated with high peak plasma-drug concentration.

Management

When monotherapy with a first-line antiepileptic drug has failed, monotherapy with a second drug should be tried; the diagnosis should be checked before starting an alternative drug if the first drug showed lack of efficacy. The change from one antiepileptic drug to another should be cautious, slowly withdrawing the first drug only when the new regimen has been established. Combination therapy with two or more antiepileptic drugs may be necessary, but the concurrent use of antiepileptic drugs increases the risk of adverse effects and drug interactions. If combination therapy does not bring about worthwhile benefits, revert to the regimen (monotherapy or combination therapy) that provided the best balance between tolerability and efficacy. A single antiepileptic drug should be prescribed wherever possible.

MHRA/CHM advice: Antiepileptic drugs: new advice on switching between different manufacturers’ products for a particular drug (November 2013)

The CHM has reviewed spontaneous adverse reactions received by the MHRA and publications that reported potential harm arising from switching of antiepileptic drugs in patients previously stabilised on a branded product to a generic. The CHM concluded that reports of loss of seizure control and/or worsening of side-effects around the time of switching between products could be explained as chance associations, but that a causal role of switching could not be ruled out in all cases. The following guidance has been issued to help minimise risk:
Different antiepileptic drugs vary considerably in their characteristics, which influences the risk of whether switching between different manufacturers’ products of a particular drug may cause adverse effects or loss of seizure control;

Antiepileptic drugs have been divided into three risk-based categories to help healthcare professionals decide whether it is necessary to maintain continuity of supply of a specific manufacturer’s product. These categories are listed below;

- If it is felt desirable for a patient to be maintained on a specific manufacturer’s product this should be prescribed either by specifying a brand name, or by using the generic drug name and name of the manufacturer (otherwise known as the Marketing Authorisation Holder);
- This advice relates only to antiepileptic drug use for treatment of epilepsy; it does not apply to their use in other indications (e.g. mood stabilisation, neuropathic pain);
- Please report on a Yellow Card any suspected adverse reactions to antiepileptic drugs;
- Dispensing pharmacists should ensure the continuity of supply of a particular product when the prescription specifies it. If the prescribed product is unavailable, it may be necessary to dispense a product from a different manufacturer to maintain continuity of treatment of that antiepileptic drug. Such cases should be discussed and agreed with both the prescriber and patient (or carer);
- Usual dispensing practice can be followed when a specific product is not stated.

**Category 1**
Phenytoin, carbamazepine p. 297, phenobarbital, primidone p. 319. For these drugs, doctors are advised to ensure that their patient is maintained on a specific manufacturer’s product.

**Category 2**
Valproate, lamotrigine, perampanel, rufinamide p. 311, clobazam p. 320, clonazepam p. 321, oxcarbazepine p. 306, eslicarbazepine acetate p. 299, zonisamide p. 317, topiramate p. 315. For these drugs, the need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient and/or carer taking into account factors such as seizure frequency and treatment history.

**Category 3**
Levetiracetam p. 305, lamotrigine p. 302, tiagabine p. 314, gabapentin p. 301, pregabalin p. 310, ethosuximide p. 300, vigabatrin p. 316. For these drugs, it is usually unnecessary to ensure that patients are maintained on a specific manufacturer’s product unless there are specific concerns such as patient anxiety, and risk of confusion or dosing errors. Interactions.

**Antiepileptic hypersensitivity syndrome**
Antiepileptic hypersensitivity syndrome is a rare but potentially fatal syndrome associated with some antiepileptic drugs (carbamazepine, lamotrigine, oxcarbazepine, phenobarbital, phenytoin, primidone, and rufinamide); rarely cross-sensitivity occurs between some of these antiepileptic drugs. Some other antiepileptics (eslicarbazepine, stiripentol, and zonisamide) have a theoretical risk. The symptoms usually start between 1 and 8 weeks of exposure; fever, rash, and lymphadenopathy are most commonly seen. Other systemic signs include liver dysfunction, haematological, renal, and pulmonary abnormalities, vasculitis, and multi-organ failure. If signs or symptoms of hypersensitivity syndrome occur, the drug should be withdrawn immediately, the patient must not be re-exposed, and expert advice should be sought.

**Risk of suicidal thoughts and behaviour**
The MHRA has advised (August 2008) that all antiepileptic drugs are associated with a small increased risk of suicidal thoughts and behaviour. Symptoms may occur as early as one week after starting treatment. Patients should be advised to seek medical advice if they develop any mood changes, distressing thoughts, or feelings about suicide or harming themselves, and should be referred for appropriate treatment if necessary.

**Interactions**
Interactions between antiepileptics are complex and may increase toxicity without a corresponding increase in antiepileptic effect. Interactions are usually caused by hepatic enzyme induction or inhibition; displacement from protein binding sites is not usually a problem. These interactions are highly variable and unpredictable.

**Withdrawal**
Antiepileptic drugs should be withdrawn under specialist supervision. Avoid abrupt withdrawal, particularly of barbiturates and benzodiazepines, because this can precipitate severe rebound seizures. Reduction in dosage should be gradual and, in the case of barbiturates, withdrawal of the drug may take months. The decision to withdraw antiepileptic drugs from a seizure-free patient, and its timing, is often difficult and depends on individual circumstances. Even in patients who have been seizure-free for several years, there is a significant risk of seizure recurrence on drug withdrawal. In patients receiving several antiepileptic drugs, only one drug should be withdrawn at a time.

**Driving**
If a driver has a seizure (of any type) they must stop driving immediately and inform the Driver and Vehicle Licensing Agency (DVLA). Patients who have had a first unprovoked epileptic seizure or a single isolated seizure must not drive for 6 months; driving may then be resumed, provided the patient has been assessed by a specialist as fit to drive and investigations do not suggest a risk of further seizures.

Patients with established epilepsy may drive a motor vehicle provided they are not a danger to the public and are compliant with treatment and follow up. To continue driving, these patients must be seizure-free for at least one year (or have a pattern of seizures established for one year where there is no influence on their level of consciousness or the ability to act); also, they must not have a history of unprovoked seizures.

*Note:* additional criteria apply for drivers of large goods or passenger carrying vehicles—consult DVLA guidance.

Patients who have had a `seizure while asleep` are not permitted to drive for one year from the date of each seizure, unless:

- a history or pattern of sleep seizures occurring *only* ever while asleep has been established after the course of at least one year from the date of the first sleep seizure; or
- an established pattern of purely asleep seizures can be demonstrated over the course of three years if the patient has previously had seizures whilst awake (or awake and asleep).

The DVLA recommends that patients should not drive during medication changes or withdrawal of antiepileptic drugs, and for 6 months after their last dose. If a seizure occurs due to a prescribed change or withdrawal of epilepsy treatment, the patient will have their driving license revoked for 1 year; relicensing may be considered earlier if treatment has been reinstated for 6 months and no further seizures have occurred.
Pregnancy
Women of child-bearing potential should discuss with a specialist the impact of both epilepsy, and its treatment, on the outcome of pregnancy.

There is an increased risk of teratogenicity associated with the use of antiepileptic drugs (especially if used during the first trimester and particularly if the patient takes two or more antiepileptic drugs). Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term developmental disorders. There is also an increased risk of teratogenicity with phenytoin, primidone, phenobarbital, lamotrigine, and carbamazepine. Topiramate carries an increased risk of cleft palate if taken in the first trimester of pregnancy. There is not enough evidence to establish the risk of teratogenicity with other antiepileptic drugs.

Prescribers should also consider carefully the choice of antiepileptic therapy in pre-pubescent girls who may later become pregnant. Women of child-bearing potential who take antiepileptic drugs should be given advice about the need for an effective contraception method to avoid unplanned pregnancy. Some antiepileptic drugs can reduce the efficacy of hormonal contraceptives, and the efficacy of some antiepileptics may be affected by hormonal contraceptives.

Women who want to become pregnant should be referred to a specialist for advice in advance of conception. For some women, the severity of seizure or the seizure type may not pose a serious threat, and drug withdrawal may be considered; therapy may be resumed after the first trimester. If treatment with antiepileptic drugs must continue throughout pregnancy, then monotherapy is preferable at the lowest effective dose.

Once an unplanned pregnancy is discovered it is usually too late for changes to be made to the treatment regimen; the risk of harm to the mother and fetus from convulsive seizures outweighs the risk of continued therapy. The likelihood of a woman who is taking antiepileptic drugs having a baby with no malformations is at least 50%, and it is important that women do not stop taking essential drugs abruptly. Therefore, folic acid supplementation is advised before conception and throughout the first trimester. In the case of sodium valproate p. 312 and valproic acid p. 337 an urgent consultation is required to reconsider the benefits and risks of valproate therapy.

The concentration of antiepileptic drugs in the plasma can change during pregnancy. Doses of phenytoin, carbamazepine, and lamotrigine should be adjusted on the basis of plasma-drug concentration monitoring; the dose of other antiepileptic drugs should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. Plasma-drug concentration monitoring during pregnancy is also useful to check compliance. Additionally, in patients taking topiramate or levetiracetam, it is recommended that fetal growth should be monitored. Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol.

Routine injection of vitamin K at birth minimises the risk of neonatal haemorrhage associated with antiepileptics.

Withdrawal effects in the newborn may occur with some antiepileptic drugs, in particular benzodiazepines and phenobarbital.

Epilepsy and Pregnancy Register
All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

Breast-feeding
Women taking antiepileptic monotherapy should generally be encouraged to breast-feed; if a woman is on combination therapy or if there are other risk factors, such as premature birth, specialist advice should be sought.

All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones. Infants should also be monitored for adverse effects associated with the antiepileptic drug particularly with newer antiepileptics, if the antiepileptic is readily transferred into breast-milk causing high infant serum-drug concentrations (e.g. ethosuximide, lamotrigine, primidone, and zonisamide), or if slower metabolism in the infant causes drugs to accumulate (e.g. phenobarbital and lamotrigine). Serum-drug concentration monitoring should be undertaken in breast-fed infants if suspected adverse reactions develop; if toxicity develops it may be necessary to introduce formula feeds to limit the infant’s drug exposure, or to wean the infant off breast-milk altogether.

Primidone, phenobarbital, and the benzodiazepines are associated with an established risk of drowsiness in breast-fed babies and caution is required.

Withdrawal effects may occur in infants if a mother suddenly stops breast-feeding, particularly if she is taking phenobarbital, primidone, or lamotrigine.

Focal seizures with or without secondary generalisation
Carbamazepine p. 297 and lamotrigine p. 303 are first-line options for treating newly diagnosed focal seizures; oxcarbazepine p. 306, sodium valproate p. 312 and levetiracetam p. 305 may be used if carbamazepine or lamotrigine are unsuitable or not tolerated. If monotherapy is unsuccessful with two of these first-line antiepileptic drugs, adjunctive treatment may be considered. Options for adjunctive treatment include carbamazepine, clobazam p. 320, gabapentin p. 301, lamotrigine, levetiracetam, oxcarbazepine, sodium valproate, or topiramate p. 315. If adjunctive treatment is ineffective or not tolerated, a tertiary epilepsy specialist should be consulted who may consider eslicarbazepine acetate p. 299, lacosamide p. 302, phenobarbital p. 318, phenytoin p. 308, pregabalin p. 310, tiagabine p. 314, vigabatrin p. 316 and zonisamide p. 317.

Generalised seizures
Tonic-clonic seizures
Sodium valproate is the first-line treatment for newly diagnosed generalised tonic–clonic seizures (except in female patients who are premenopausal, see Valproate below). Lamotrigine is the alternative choice if sodium valproate is not suitable, but may exacerbate myoclonic seizures. In those with established epilepsy with generalised tonic–clonic seizures only, lamotrigine or sodium valproate may be prescribed as the first-line treatment. Carbamazepine and oxcarbazepine may also be considered in newly diagnosed and established tonic–clonic seizures, but may exacerbate myoclonic and absence seizures. Clobazam, lamotrigine, levetiracetam, sodium valproate or topiramate may be used as adjunctive treatment if monotherapy is ineffective or not tolerated.

Absence seizures
Ethosuximide p. 300, or sodium valproate (except in female patients who are premenopausal, see Valproate below), are the drugs of choice in absence seizures and syndromes; lamotrigine is a suitable alternative when ethosuximide and sodium valproate are unsuitable, ineffective or not tolerated. Sodium valproate should be used as the first choice if there is a high risk of generalised tonic–clonic seizures. A combination of any two of these drugs may be used if monotherapy is ineffective. Clobazam, clonazepam p. 321, levetiracetam, topiramate or zonisamide may be considered by a tertiary epilepsy specialist if adjunctive treatment fails.
Carbamazepine, gabapentin, oxcarbazepine, phenytoin, pregabalin, tiagabine and vigabatrin are not recommended in absence seizures or syndromes.

**Myoclonic seizures**

Myoclonic seizures (myoclonic jerks) occur in a variety of syndromes, and response to treatment varies considerably. Sodium valproate is the drug of choice in newly diagnosed myoclonic seizures (except in female patients who are premenopausal, see *Valproate* below); topiramate and levetiracetam are alternative options if sodium valproate is unsuitable but consideration should be given to the less favourable side-effect profile of topiramate. A combination of two of these drugs may be used if monotherapy is ineffective or not tolerated. If adjunctive treatment fails, a tertiary epilepsy specialist should be consulted and may consider clobazam, clonazepam, zonisamide or piracetam p. 386. Carbamazepine, gabapentin, oxcarbazepine, phenytoin, pregabalin, tiagabine and vigabatrin are not recommended for the treatment of myoclonic seizures.

Sodium valproate and levetiracetam are effective in treating the generalised tonic-clonic seizures that coexist with myoclonic seizures in idiopathic generalised epilepsy.

**Atonic and tonic seizures**

Atonic and tonic seizures are usually seen in childhood, in specific epilepsy syndromes, or associated with cerebral damage or mental retardation. They may respond poorly to the traditional drugs. Sodium valproate is the drug of choice (except in female patients who are premenopausal, see *Valproate* below); lamotrigine can also be added as adjunctive treatment. If adjunctive treatment is ineffective or not tolerated, a tertiary epilepsy specialist should be consulted, and may consider rufinamide p. 311 or topiramate.

Carbamazepine, gabapentin, oxcarbazepine, pregabalin, tiagabine or vigabatrin are not recommended in atonic and tonic seizures.

**Epilepsy syndromes**

Some drugs are licensed for use in particular epilepsy syndromes, such as lamotrigine and rufinamide in Lennox-Gastaut syndrome. The epilepsy syndromes are specific types of epilepsy that are characterised according to a number of features including seizure type, age of onset, and EEG characteristics.

**Antiepileptic drugs**

**Carbamazepine and related antiepileptics**

Carbamazepine is a drug of choice for simple and complex focal seizures and is a first-line treatment option for generalised tonic-clonic seizures. It can be used as adjunctive treatment for focal seizures when monotherapy has been ineffective. It is essential to initiate carbamazepine therapy at a low dose and build this up slowly.

Carbamazepine may exacerbate tonic, atonic, myoclonic and absence seizures and is therefore not recommended if these seizures are present.

Oxcarbazepine is licensed as monotherapy or adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures. It can also be considered for the treatment of primary generalised tonic-clonic seizures [unlicensed]. Oxcarbazepine is not recommended in tonic, atonic, absence or myoclonic seizures due to the risk of seizure exacerbation.

Eslicarbazepine acetate is licensed for adjunctive treatment in adults with focal seizures with or without secondary generalisation.

**E ethosuximide**

E ethosuximide is a first-line treatment option for absence seizures. It may also be prescribed as adjunctive treatment for absence seizures when monotherapy is ineffective. E ethosuximide is also licensed for myoclonic seizures.

**Gabapentin and pregabalin**

Gabapentin and pregabalin are used for the treatment of focal seizures with or without secondary generalisation. They are not recommended if tonic, atonic, absence or myoclonic seizures are present. Both are also licensed for the treatment of neuropathic pain. Pregabalin is licensed for the treatment of generalised anxiety disorder. Gabapentin is an effective treatment for migraine prophylaxis [unlicensed].

**Lamotrigine**

Lamotrigine is an antiepileptic drug recommended as a first-line treatment for focal seizures and primary and secondary generalised tonic-clonic seizures. It is also licensed for typical absence seizures in children (but efficacy may not be maintained in all children) and is an unlicensed treatment option in adults if first-line treatments have been unsuccessful. Lamotrigine can also be used as adjunctive treatment in atonic or tonic seizures if first-line treatment has failed [unlicensed]. Myoclonic seizures may be exacerbated by lamotrigine and it can cause serious rashes especially in children; dose recommendations should be adhered to closely.

Lamotrigine is used either as sole treatment or as an adjunct to treatment with other antiepileptic drugs. Valproate increases plasma-lamotrigine concentration, whereas the enzyme-inducing antiepileptics reduce it; care is therefore required in choosing the appropriate initial dose and subsequent titration. When the potential for interaction is not known, treatment should be initiated with lower doses, such as those used with valproate.

**Levetiracetam and brivaracetam**

Levetiracetam is used for monotherapy and adjunctive treatment of focal seizures with or without secondary generalisation, and for adjunctive treatment of myoclonic seizures in patients with juvenile myoclonic epilepsy and primary generalised tonic-clonic seizures. Levetiracetam may be prescribed alone and in combination for the treatment of myoclonic seizures, and under specialist supervision for absence seizures [both unlicensed].

Brivaracetam p. 296 is used as adjunctive therapy in the treatment of partial-onset seizures with or without secondary generalisation.

**Phenobarbital and primidone**

Phenobarbital p. 318 is effective for tonic-clonic and focal seizures but may be sedative in adults. It may be tried for atypical absence, atonic, and tonic seizures. Rebound seizures may be a problem on withdrawal.

Primidone p. 319 is largely converted to phenobarbital and this is probably responsible for its antiepileptic action. A low initial dose of primidone is essential.

**Phenytoin**

Phenytoin p. 308 is licensed for tonic-clonic and focal seizures but may exacerbate absence or myoclonic seizures and should be avoided if these seizures are present. It has a narrow therapeutic index and the relationship between dose and plasma-drug concentration is non-linear; small dosage increases in some patients may produce large increases in plasma concentration with acute toxic side-effects. Similarly, a few missed doses or a small change in drug absorption may result in a marked change in plasma-drug concentration. Monitoring of plasma-drug concentration improves dosage adjustment.

When only parenteral administration is possible, fosphenytoin sodium p. 300, a pro-drug of phenytoin, may be convenient to give. Unlike phenytoin (which should only be given intravenously), fosphenytoin sodium may also be given by intramuscular injection.

**Rufinamide**

Rufinamide p. 311 is licensed for the adjunctive treatment of seizures in Lennox-Gastaut syndrome. It may be considered...
by a tertiary specialist for the treatment of refractory tonic or atonic seizures [unlicensed].

**Topiramate**
Topiramate p. 315 can be given alone or as adjunctive treatment in generalised tonic-clonic seizures or focal seizures with or without secondary generalisation. It can be used as adjunctive treatment for seizures associated with Lennox–Gastaut syndrome and for absence, tonic and atonic seizures under specialist supervision [unlicensed]. It can also be considered as an option in myoclonic seizures [unlicensed]. Topiramate is also licensed for prophylaxis of migraine.

**Valproate**
Sodium valproate p. 312 is effective in controlling tonic-clonic seizures, particularly in primary generalised epilepsy. It is a drug of choice in primary generalised tonic-clonic seizures, focal seizures, generalised absences and myoclonic seizures, and can be tried in atypical absence seizures. It is recommended as a first-line option in atonic and tonic seizures. Sodium valproate has widespread metabolic effects and monitoring of liver function tests and full blood count is essential. Valproate should not be used in female children, in females of childbearing potential, and pregnant females, unless alternative treatments are ineffective or not tolerated, because of its high teratogenic potential; the benefits and risks of valproate therapy should be carefully reconsidered at regular treatment reviews, see *Important safety information* in the sodium valproate and valproic acid p. 337 drug monographs.

Valproic acid (as semisodium valproate) is licensed for acute mania associated with bipolar disorder.

**Zonisamide**
Zonisamide p. 317 can be used alone for the treatment of focal seizures with or without secondary generalisation in adults with newly diagnosed epilepsy, and as adjunctive treatment for refractory focal seizures with or without secondary generalisation in adults and children aged 6 years and above. It can also be used under the supervision of a specialist for refractory absence and myoclonic seizures [unlicensed indications].

**Benzodiazepines**
Clobazam p. 320 may be used as adjunctive therapy in the treatment of generalised tonic-clonic and refractory focal seizures. It may be prescribed under the care of a specialist for refractory absence and myoclonic seizures. Clonazepam p. 321 may be prescribed by a specialist for refractory absence and myoclonic seizures, but its sedative side-effects may be prominent.

**Other drugs**
Acetazolamide p. 1080, a carbonic anhydrase inhibitor, has a specific role in treating epilepsy associated with menstruation. Piracetam p. 386 is used as adjunctive treatment for cortical myoclonus.

**Status epilepticus**

**Convulsive status epilepticus**
Immediate measures to manage status epilepticus include positioning the patient to avoid injury, supporting respiration including the provision of oxygen, maintaining blood pressure, and the correction of any hypoglycaemia. Parenteral thiamine p. 989 should be considered if alcohol abuse is suspected; pyridoxine hydrochloride p. 988 should be given if the status epilepticus is caused by pyridoxine hydrochloride deficiency.

Seizures lasting longer than 5 minutes should be treated urgently with intravenous lorazepam p. 322 (repeated once after 10 minutes if seizures recur or fail to respond). Intravenous diazepam p. 327 is effective but it carries a high risk of thrombophlebitis (reduced by using an emulsion formulation). Absorption of diazepam from intramuscular injection or from suppositories is too slow for treatment of status epilepticus. Patients should be monitored for respiratory depression and hypotension.

Where facilities for resuscitation are not immediately available, diazepam can be administered as a rectal solution or midazolam oromucosal solution p. 323 can be given into the buccal cavity.

**Important**
If, after initial treatment with benzodiazepines, seizures recur or fail to respond 25 minutes after onset, phenytoin sodium, fosphenytoin sodium, or phenobarbital sodium should be used; contact intensive care unit if seizures continue. If these measures fail to control seizures 45 minutes after onset, anaesthesia with thiopental sodium p. 322, midazolam, or a non-barbiturate anaesthetic such as propofol p. 1220 [unlicensed indication], should be instituted with full intensive care support.

**Phenytoin sodium** can be given by slow intravenous injection, followed by the maintenance dosage if appropriate.

Alternatively, fosphenytoin sodium (a pro-drug of phenytoin), can be given more rapidly and when given intravenously causes fewer injection-site reactions than phenytoin sodium. Although it can also be given intramuscularly, absorption is too slow by this route for treatment of status epilepticus. Doses of fosphenytoin sodium should be expressed in terms of phenytoin sodium.

**Non-convulsive status epilepticus**
The urgency to treat non-convulsive status epilepticus depends on the severity of the patient’s condition. If there is incomplete loss of awareness, usual oral antiepileptic therapy should be continued or restarted. Patients who fail to respond to oral antiepileptic therapy or have complete lack of awareness can be treated in the same way as for convulsive status epilepticus, although anaesthesia is rarely needed.

**Febrile convulsions**

Brief *febrile convulsions* need no specific treatment; antipyretic medication (e.g. paracetamol p. 422), is commonly used to reduce fever and prevent further convulsions but evidence to support this practice is lacking. *Prolonged febrile convulsions* (those lasting 5 minutes or longer), or recurrent *febrile convulsions* without recovery must be treated actively (as for convulsive status epilepticus). Long-term anticonvulsant prophylaxis for febrile convulsions is rarely indicated.

**Other drugs used for Epilepsy and other seizure disorders** Magnesium sulfate, p. 963

### ANTIEPILEPTICS

**Brivaracetam**

- **INDICATIONS AND DOSE**
  - Adjunctive therapy of partial-onset seizures with or without secondary generalisation
    - By mouth, or by intravenous injection, or by intravenous infusion
      - Child 16–17 years: Initially 25–50 mg twice daily, adjusted according to response; usual maintenance 25–100 mg twice daily
      - Adult: Initially 25–50 mg twice daily, adjusted according to response; usual maintenance 25–100 mg twice daily

- **INTERACTIONS** → Appendix 1: antiepileptics
Epilepsy and other seizure disorders 297

Carbamazepine

- INDICATIONS AND DOSE
  - Focal and secondary generalised tonic-clonic seizures
  - Primary generalised tonic-clonic seizures
    - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
      - Adult: Initially 100–200 mg 1–2 times a day, increased in steps of 100–200 mg every 2 weeks; usual dose 0.8–1.2 g daily in divided doses; increased if necessary up to 1.6–2 g daily in divided doses
      - Elderly: Reduce initial dose
    - BY RECTUM
      - Adult: Up to 1 g daily in 4 divided doses for up to 7 days, for short-term use when oral therapy temporarily not possible
  - Trigeminal neuralgia
    - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
      - Adult: Initially 400 mg daily in divided doses, increased until symptoms controlled; usual dose 400–600 mg daily; maximum 1.6 g per day
  - Prophylaxis of bipolar disorder unresponsive to lithium
    - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
      - Adult: Initially 400 mg daily in divided doses, then reduced to 200 mg daily for usual treatment duration of 7–10 days, dose to be reduced gradually over 5 days
  - Adjunct in acute alcohol withdrawal
    - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
      - Adult: Initially 800 mg daily in divided doses, then reduced to 200 mg daily for usual treatment duration of 7–10 days, dose to be reduced gradually over 5 days
  - Diabetic neuropathy
    - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
      - Adult: Initially 100 mg 1–2 times a day, increased gradually according to response; usual dose 200 mg 3–4 times a day, increased if necessary up to 1.6 g daily
  - Focal and generalised tonic-clonic seizures
    - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
    - Child 1 month–11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily
    - Child 12–17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly

DOSE EQUIVALENCE AND CONVERSION
- Suppositories of 125 mg may be considered to be approximately equivalent in therapeutic

**Oral solution**
- **CAUTIONARY AND ADVISORY LABELS** 2, 8
- **EXCipients:** May contain Sorbitol
- **ELECTROLYTES:** May contain Sodium
  - **Briviact** (UCB Pharma Ltd)
    - **Brivaracetam 10 mg per 1 ml** Briviact 10mg/ml oral solution sugar-free
      - 300 ml [Pos] £115.83
  - **Tablet**
    - **CAUTIONARY AND ADVISORY LABELS** 2, 8, 25
      - **Briviact** (UCB Pharma Ltd)
      - **Brivaracetam 10 mg** Briviact 10mg tablets
        - 14 tablet [Pos] £34.64
      - **Brivaracetam 25 mg** Briviact 25mg tablets
        - 56 tablet [Pos] £129.64
      - **Brivaracetam 50 mg** Briviact 50mg tablets
        - 56 tablet [Pos] £129.64
      - **Brivaracetam 75 mg** Briviact 75mg tablets
        - 56 tablet [Pos] £129.64
      - **Brivaracetam 100 mg** Briviact 100mg tablets
        - 56 tablet [Pos] £129.64

**Nervous system**

- **SIDE-EFFECTS**
  - **Common or very common** Anxiety · constipation · decreased appetite · depression · dizziness · insomnia · irritability · malaise · nausea · somnolence · vertigo · vomiting
  - **Uncommon** Aggression · agitation · neutropenia · psychotic disorder · suicidal ideation
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises consider a starting dose of 25 mg twice daily in chronic liver disease; max. maintenance dose 75 mg twice daily in all stages of impairment.
- **TREATMENT CESSATION** Manufacturer advises avoid abrupt withdrawal—reduce daily dose in steps of 50 mg at weekly intervals, then reduce to 20 mg daily for a final week.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For intermittent intravenous infusion, manufacturer advises dilute in Glucose 5% or Sodium Chloride 0.9% or Lactated Ringer’s solution; give over 15 minutes.
  - With oral use Manufacturer advises oral solution can be diluted in water or juice shortly before swallowing.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - Manufacturer advises if switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the total daily dose and the frequency of administration should be maintained.
- **PATIENT AND CARER ADVICE**
  - Missed doses Manufacturer advises if one or more doses are missed, a single dose should be taken as soon as possible and the next dose should be taken at the usual time.
  - Driving and skilled tasks Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) Decisions**
    - The Scottish Medicines Consortium has advised (July 2016) that brivaracetam (Briviact®) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of partial-onset seizures with or without secondary generalisation in patients with refractory epilepsy. Treatment should be initiated by physicians who have appropriate experience in the treatment of epilepsy.
  - **All Wales Medicines Strategy Group (AWMSG) Decisions**
    - The All Wales Medicines Strategy Group has advised (October 2016) that Brivaracetam (Briviact®) is recommended as an option for restricted use within NHS Wales. Brivaracetam (Briviact®) should be restricted to use in the treatment of patients with refractory epilepsy, who remain uncontrolled with, or are intolerant to, other adjunctive anti-epileptic medicines, within its licensed indication as adjunctive therapy in the treatment of partial-onset seizures (POS) with or without secondary generalisation in adult and adolescent patients from 16 years of age with epilepsy. Brivaracetam (Briviact®) is not recommended for use within NHS Wales outside of this subpopulation.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Solution for injection**
  - **CAUTIONARY AND ADVISORY LABELS** 2
  - **ELECTROLYTES:** May contain Sodium
    - **Briviact** (UCB Pharma Ltd)
      - **Brivaracetam 10 mg per 1 ml** Briviact 50mg/5ml solution for injection vials
        - 10 vial [Pos] £222.75

effect to tablets of 100 mg but final adjustment should always depend on clinical response (plasma concentration monitoring recommended).

**CARBAGEN® SR**

### Focal and secondary generalised tonic-clonic seizures

#### Primary generalised tonic-clonic seizures

- **Adult:** Initially 100–400 mg daily in 1–2 divided doses, increased in steps of 100–200 mg every 2 weeks, dose should be increased slowly; usual dose 0.8–1.2 g daily in 1–2 divided doses, increased if necessary up to 1.6–2 g daily in 1–2 divided doses
- **Elderly:** Reduce initial dose

### Trigeminal neuralgia

- **Adult:** Initially 400 mg daily in 1–2 divided doses, increased until symptoms controlled; usual dose 400–600 mg daily in 1–2 divided doses; maximum 1.6 g per day

### Prophylaxis of bipolar disorder unresponsive to lithium

- **Adult:** Initially 400 mg daily in 2 divided doses, increased until symptoms controlled; usual dose 400–600 mg daily in 2 divided doses; maximum 1.6 g per day

#### By Mouth

- **Child 12 years:** Initially 100–400 mg daily in 1–2 divided doses, increased in steps of 100–200 mg every 2 weeks, dose should be increased slowly; usual dose 0.8–1.2 g daily in 2 divided doses, increased if necessary up to 1.6–2 g daily in 2 divided doses
- **Child 11 years:** Initially 5–10 mg/kg daily in 1–2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required, dose should be increased slowly; maintenance 10–15 mg/kg daily in 1–2 divided doses, increased if necessary up to 20 mg/kg daily in 1–2 divided doses
- **Child 10 years:** Initially 100–400 mg daily in 1–2 divided doses, increased in steps of 100–200 mg every 2 weeks, dose should be increased slowly; usual dose 0.8–1.2 g daily in 2 divided doses, increased if necessary up to 1.6–2 g daily in 2 divided doses
- **Elderly:** Reduce initial dose

### Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder

- **Child 5–11 years:** Initially 5 mg/kg daily in 1–2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required, dose should be increased slowly; maintenance 10–15 mg/kg daily in 1–2 divided doses, increased if necessary up to 20 mg/kg daily in 1–2 divided doses
- **Child 12–17 years:** Initially 100–400 mg daily in 1–2 divided doses, then increased to 400–1200 mg daily in 2 divided doses, increased if necessary up to 1.8 g daily in 1–2 divided doses; dose should be increased slowly

**TEGRETOL® PROLONGED RELEASE**

### Focal and secondary generalised tonic-clonic seizures

- **Adult:** Initially 100–400 mg daily in 2 divided doses, increased in steps of 100–200 mg every 2 weeks, dose should be increased slowly; usual dose 0.8–1.2 g daily in 2 divided doses, increased if necessary up to 1.6–2 g daily in 2 divided doses
- **Elderly:** Reduce initial dose

### Trigeminal neuralgia

- **Adult:** Initially 100–200 mg daily in 2 divided doses, some patients may require higher initial dose. After initial dose, increase according to response; usual dose 600–800 mg daily in 2 divided doses, increased if necessary up to 1.6 g daily in 2 divided doses, dose should be increased slowly

---

**Prophylaxis of bipolar disorder unresponsive to lithium**

- **BY MOUTH**

- **Child 12 years:** Initially 100–400 mg daily in 1–2 divided doses, increased in steps of 100–200 mg every 2 weeks, dose should be increased slowly; usual dose 0.8–1.2 g daily in 2 divided doses, increased if necessary up to 1.6–2 g daily in 1–2 divided doses

### Trigeminal neuralgia

- **BY MOUTH**

- **Child 12 years:** Initially 100–400 mg daily in 1–2 divided doses, increased in steps of 100–200 mg every 2 weeks, dose should be increased slowly; usual dose 0.8–1.2 g daily in 2 divided doses, increased if necessary up to 1.6–2 g daily in 2 divided doses

---

**SIDE-EFFECTS**

- **Common or very common** Allergic skin reactions • aplastic anaemia • ataxia • blood disorders • blurring of vision • dermatitis • dizziness • drowsiness • dry mouth • eosinophilia • fatigue • haemolytic anaemia • headache • hyponatraemia (leading in rare cases to water intoxication) • leucopenia • nausea • oedema • thrombocytopenia • unsteadiness • urticaria • vomiting

- **Uncommon** Constipation • diarrhoea • involuntary movements (including myasthenia) • visual disturbances

- **Rare** Abdominal pain • aggression • agitation • anorexia • cardiac conduction disorders • confusion • delayed multi-organ hypersensitivity disorder • depression • dysarthria • hallucinations • hepatitis • hypertension • hypotension • jaundice • lymph node enlargement • muscle weakness • paraesthesia • peripheral neuropathy • restlessness • systemic lupus erythematosus • vanishing bile duct syndrome

- **Very rare** Arthralgia • muscle spasm • acne • alopecia • alterations in skin pigmentation • angle-closure glaucoma • aseptic meningitis • AV block with syncope • circulatory collapse • conjunctivitis • dyspnoea • exacerbation of coronary artery disease • galactorrhoea • gynaecomastia • hearing disorders • hepatic failure • hirsutism • hypercholesterolaemia • impaired male fertility • interstitial nephritis • muscle pain • neuroleptic malignant syndrome • osteomalacia • osteoporosis • pancreatitis • photosensitivity • pneumonia • pneumonitis • psychosis • pulmonary hypersensitivity • purpura • renal failure • sexual dysfunction • Stevens–Johnson syndrome • stomatitis • sweating • taste disturbance • thromboembolism • thrombophlebitis • toxic epidermal necrolysis • urinary frequency • urinary retention

- **Frequency not known** Suicidal ideation

**SIDE-EFFECTS, FURTHER INFORMATION**

Some side-effects (such as headache, ataxia, drowsiness, nausea, vomiting, blurring of vision, dizziness, unsteadiness, and allergic skin reactions) are dose-related, and may be dose-limiting. These side-effects are more common at the start of treatment and in the elderly. Patients should be offered a modified-release preparation to reduce the risk of side-effects; altering the timing of medication may also be beneficial.

**SIDE-EFFECTS, FURTHER INFORMATION**

Some side-effects (such as headache, ataxia, drowsiness, nausea, vomiting, blurring of vision, dizziness, unsteadiness, and allergic skin reactions) are dose-related, and may be dose-limiting. These side-effects are more common at the start of treatment and in the elderly. Patients should be offered a modified-release preparation to reduce the risk of side-effects; altering the timing of medication may also be beneficial.
**Overdose**
For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 1249.

- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with carbamazepine. See under Epilepsy p. 292 for more information. Caution—cross-sensitivity reported with oxcarbazepine and with phenytoin.

- **PREGNANCY** Doses should be adjusted on the basis of plasma-drug concentration monitoring.

- **BREAST FEEDING** Amount probably too small to be harmful. Monitor infant for possible adverse reactions.

- **HEPATIC IMPAIRMENT** Metabolism impaired in advanced liver disease.

- **RENAL IMPAIRMENT** Use with caution.

- **PRE-TREATMENT SCREENING** Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

- **MONITORING REQUIREMENTS**
  - Plasma concentration for optimum response 4–12 mg/litre (20–50 micromol/litre) measured after 1–2 weeks.
  - Manufacturer recommends blood counts and hepatic and renal function tests (but evidence of practical value uncertain).

- **TREATMENT CESSATION** When stopping treatment with carbamazepine for bipolar disorder, reduce the dose gradually over a period of at least 4 weeks.

- **DIRECTIONS FOR ADMINISTRATION**
  - In children Oral liquid has been used rectally—should be retained for at least 2 hours (but may have laxative effect).
  - **Tegretol® PROLONGED RELEASE** Tegretol® Prolonged Release tablets can be halved but should not be chewed.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product.

- **PATIENT AND CARER ADVICE**
  - Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop.
  - Medicines for Children leaflet: Carbamazepine (oral) for preventing seizures [www.medicinesforchildren.org.uk/carbamazepine-oral-preventing-seizures-0](http://www.medicinesforchildren.org.uk/carbamazepine-oral-preventing-seizures-0)

- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary Carbamazepine Tablets may be prescribed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Modified-release tablet**

**Elicarbazepine acetate**

- **INDICATIONS AND DOSE**
  - Adjunctive treatment in adults with focal seizures with or without secondary generalisation
  - **BY MOUTH**
    - Adult: Initially 400 mg once daily for 1–2 weeks, then increased to 800 mg once daily (max. per dose 1.2 g)

- **CONTRA-INDICATIONS** Second- or third-degree AV block

- **CAUTIONS**
  - Elderly — hyponatraemia - PR-interval prolongation

- **INTERACTIONS**→ Appendix 1: antiepileptics

- **SIDE-EFFECTS**
  - **Common or very common**
    - Dizziness — drowsiness — fatigue — gastro-intestinal disturbances — headache — impaired coordination — rash — tremor — visual disturbances
  - **Uncommon**

---

Downloaded from www.medicalbr.com
disturbance • tinnitus • urinary tract infection • weight changes

- Very rare Leucopenia • pancreatitis • thrombocytopenia
- Frequency not known PR-interval prolongation • suicidal ideation

- ALLERGY AND CROSS-SENSITIVITY Antiepileptic hypersensitivity syndrome theoretically associated with eslicarbazepine. See under Epilepsy p. 292 for more information.

- PREGNANCY The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- HEPATIC IMPAIRMENT Avoid in severe impairment—no information available.

- RENAL IMPAIRMENT Reduce initial dose to 400 mg every other day for 2 weeks then 400 mg once daily if eGFR 30–60 mL/minute/1.73 m², adjusted according to response. Avoid if eGFR less than 30 mL/minute/1.73 m².

- PRE-TREATMENT SCREENING Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

- MONITORING REQUIREMENTS Monitor plasma-sodium concentration in patients at risk of hyponatraemia and discontinue treatment if hyponatraemia occurs.

- PRESCRIBING AND DISPENSING INFORMATION Switching between formulations: Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (October 2010) that eslicarbazepine (Zebinix®) is accepted for restricted use within NHS Scotland as adjunctive therapy in adults with focal seizures with or without secondary generalisation. It is restricted for use in refractory epilepsy.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 8

- Zebinix (Eisai Ltd)
  - Eslicarbazepine acetate 800 mg Zebinix 800 mg tablets | 30 tablet (POM) £136.00

---

**Ethosuximide**

- INDICATIONS AND DOSE

Absence seizures | Atypical absence seizures (adjunct) | Myoclonic seizures

- BY MOUTH
  - Child 1 month–5 years: Initially 5 mg/kg twice daily (max. per dose 125 mg), dose to be increased every 5–7 days; maintenance 10–20 mg/kg twice daily (max. per dose 500 mg), total daily dose may rarely be given in 3 divided doses
  - Child 6–17 years: Initially 250 mg twice daily, then increased in steps of 250 mg every 5–7 days; usual dose 500–750 mg twice daily, increased if necessary up to 1 g twice daily
  - Adult: Initially 500 mg daily in 2 divided doses, then increased in steps of 250 mg every 5–7 days; usual dose 1–1.5 g daily in 2 divided doses, increased if necessary up to 2 g daily

- CAUTIONS Avoid in acute porphyrias p. 969
- INTERACTIONS → Appendix 1: antiepileptics
- SIDE-EFFECTS
  - Common or very common Anorexia • abdominal pain • diarrhoea • gastro-intestinal disturbances • nausea • vomiting • weight loss
  - Uncommon Agitation • ataxia • dizziness • drowsiness • euphoria • fatigue • headache • hiccups • impaired concentration • irritability
  - Rare Depression • dyskinesia • gingival hypertrophy • increased libido • myopia • photophobia • psychosis • rash • sleep disturbances • tongue swelling • vaginal bleeding
  - Frequency not known Agranulocytosis • aplastic anaemia • blood disorders • hyperactivity • increase in seizure frequency • leukopenia • pancytopenia • Stevens-Johnson syndrome • suicidal ideation • systemic lupus erythematosus

SIDE-EFFECTS, FURTHER INFORMATION

- Blood disorders: Blood counts required if features of infection.
- PREGNANCY The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- BREAST FEEDING Present in milk. Hyperexcitability and sedation reported.
- HEPATIC IMPAIRMENT Use with caution.
- RENAL IMPAIRMENT Use with caution.
- PATIENT AND CARER ADVICE

Blood disorders: Patients or their carers should be told how to recognise signs of blood disorders, and advised to seek immediate medical attention if symptoms such as fever, mouth ulcers, bruising, or bleeding develop.

Medicines for Children leaflet: Ethosuximide for preventing seizures www.medicinesforchildren.org.uk/ethosuximide-for-preventing-seizures

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

CAUTIONARY AND ADVISORY LABELS 8

- Ethosuximide (Non-proprietary)
  - Ethosuximide 50 mg per 1 ml Ethosuximide 250 mg/5 ml syrup | 200 ml (POM) £173.00 DT price + £4.22

**Capsule**

CAUTIONARY AND ADVISORY LABELS 8

- Ethosuximide (Non-proprietary)
  - Ethosuximide 250 mg Ethosuximide 250 mg capsules | 56 capsule (POM) £173.00 DT price + £173.00

---

**Fosphenytoin sodium**

- DRUG ACTION Fosphenytoin is a pro-drug of phenytoin.

**Indications and dose**

Status epilepticus

- BY INTRAVENOUS INFUSION
  - Adult: Initially 20 mg(PE)/kg, dose to be administered at a rate of 100–150 mg(PE)/minute, then 4–5 mg (PE)/kg daily in 1–2 divided doses, dose to be administered at a rate of 50–100 mg(PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration
  - Elderly: Consider 10–25% reduction in dose or infusion rate

Prophylaxis or treatment of seizures associated with neurosurgery or head injury

- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INFUSION
  - Adult: Initially 10–15 mg(PE)/kg, intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute,
then 4–5 mg(PE)/kg daily in 1–2 divided doses, intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration

> Elderly: Consider 10–25% reduction in dose or infusion rate

**Temporary substitution for oral phenytoin**

> **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**
> Adult: Same dose and same dosing frequency as oral phenytoin therapy, intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute
> Elderly: Consider 10–25% reduction in dose or infusion rate

**DOSE EQUIVALENCE AND CONVERSION**

Doses are expressed as phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg = phenytoin sodium 1 mg.

**UNLICENSED USE** Fosphenytoin sodium doses in BNF may differ from those in product literature.

**CONTRA-INDICATIONS** Acute porphyrias p. 969 - second-degree heart block - sino-atrial block - sinus bradycardia - Stokes-Adams syndrome - third-degree heart block

**CAUTIONS** Heart failure - hypotension - injection solutions alkaline (irritant to tissues) - respiratory depression - resuscitation facilities must be available

**INTERACTIONS** > Appendix 1: antiepileptics

**SIDE-EFFECTS**

> Common or very common Alterations in respiratory function - arrhythmias - asthenia - cardiovascular collapse - cardiovascular depression (particularly if injection too rapid) - chills - CNS depression (particularly if injection too rapid) - dry mouth - dysarthria - ecchymosis - euphoria - hypotension - incoordination - pruritus - respiratory arrest - taste disturbance - tinnitus - vasodilatation - visual disturbances
> Uncommon Decreased reflexes - hypoacusis - hypoesthesia - increased reflexes - muscle spasm - muscle weakness - pain - stupor
> Frequency not known Confusion - extrapyramidal disorder - hyperglycaemia - purple glove syndrome - tonic seizures - twitching

**SIDE-EFFECTS, FURTHER INFORMATION**

Cardiovascular reactions Intravenous infusion of fosphenytoin has been associated with severe cardiovascular reactions including asystole, ventricular fibrillation, and cardiac arrest. Hypotension, bradycardia, and heart block have also been reported. The following are recommended:

- monitor heart rate, blood pressure, and respiratory function for duration of infusion;
- observe patient for at least 30 minutes after infusion;
- if hypotension occurs, reduce infusion rate or discontinue;
- reduce dose or infusion rate in elderly, and in renal or hepatic impairment.

**ALLERGY AND CROSS-SENSITIVITY** Cross-sensitivity reported with carbamazepine.

**PREGNANCY** Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING** Small amounts present in milk, but not known to be harmful.

**HEPATIC IMPAIRMENT** Consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus).

**RENAL IMPAIRMENT** Consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus).

**PRE-TREATMENT SCREENING** HLA-B* 1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).

**MONITORING REQUIREMENTS**

- Manufacturer recommends blood counts (but evidence of practical value uncertain).
- With intravenous use Monitor heart rate, blood pressure, ECG, and respiratory function for during infusion.

**DIRECTIONS FOR ADMINISTRATION** For intermittent intravenous infusion (Pro-Epanutin®), give in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of 1.5–25 mg (phenytoin sodium equivalent (PE))/mL.

**PRESCRIBING AND DISPENSING INFORMATION**

Prescriptions for fosphenytoin sodium should state the dose in terms of phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg = phenytoin sodium 1 mg.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**ELECTROLYTES:** May contain Phosphate

- Pro-Epanutin (Pfizer Ltd)

| Fosphenytoin sodium 75 mg per 1 ml | Pro-Epanutin 750mg/10ml concentrate for solution for injection vials | £400.00 (Hospital only) |

---

**Gabapentin**

**INDICATIONS AND DOSE**

Adjuvant treatment of focal seizures with or without secondary generalisation

**BY MOUTH**

- Child 6–11 years: 10 mg/kg once daily (max. per dose 300 mg) on day 1, then 10 mg/kg twice daily (max. per dose 300 mg) on day 2, then 10 mg/kg 3 times a day (max. per dose 300 mg) on day 3; usual dose 25–35 mg/kg daily in 3 divided doses, some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate, daily dose maximum to be given in 3 divided doses; maximum 70 mg/kg per day

- Child 12–17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate

- Adult: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day)

**Monotherapy for focal seizures with or without secondary generalisation**

**BY MOUTH**

- Child 6–11 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate

---
# Epilepsy and other seizure disorders

## Nervous system

### Peripheral neuropathic pain

- **BY MOUTH**
  - Adult: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day)

### Migraine prophylaxis

- **BY MOUTH**
  - Adult: Initially 300 mg daily, then increased to up to 2.4 g daily in divided doses, adjusted according to response

### Frequency not known

- Uncommon

### PREGNANCY

- Movement disorders during pregnancy and after birth, and adjustments made on a clinical basis.

### INTERACTIONS → Appendix 1: antiepileptics

### SIDE-EFFECTS

- Uncommon Palpitations

### PREGNANCY

- The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

### BREAST FEEDING

- Present in milk—manufacturer advises use only if potential benefit outweighs risk.

### RENAL IMPAIRMENT

- In adults Reduce dose to 0.6–1.8 g daily in 3 divided doses if eGFR 50–80 mL/minute/1.73 m². Reduce dose to 300–900 mg daily in 3 divided doses if eGFR 30–50 mL/minute/1.73 m². Reduce dose to 300 mg on alternate days (up to max. 600 mg daily) in 3 divided doses if eGFR 15–30 mL/minute/1.73 m². Reduce dose to 300 mg on alternate days (up to max. 300 mg daily) in 3 divided doses if eGFR less than 15 mL/minute/1.73 m²—consult product literature.

- In children Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m²; consult product literature.

### EFFECT ON LABORATORY TESTS

- False positive readings with some urinary protein tests.

### DIRECTIONS FOR ADMINISTRATION

- Capsules can be opened but the bitter taste is difficult to mask.

### PATIENT AND CARER ADVICE

- Medicines for Children leaflet: Gabapentin for preventing seizures www.medicinesforchildren.org.uk/gabapentin-for-preventing-seizures

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

### Lacosamide

#### INDICATIONS AND DOSE

- **By mouth, or by intravenous infusion**
  - Child 16–17 years: Initially 50 mg twice daily, infusion to be administered over 15–60 minutes (for up to 5 days), then increased, if tolerated, in steps of 50 mg twice daily, adjusted according to response, dose to be increased in weekly intervals; maintenance 100 mg twice daily (max. per dose 200 mg twice daily)
  - Adult: Initially 50 mg twice daily, infusion to be administered over 15–60 minutes (for up to 5 days), then increased, if tolerated, in steps of 50 mg twice daily, adjusted according to response, dose to be increased in weekly intervals; maintenance 100 mg twice daily (max. per dose 200 mg twice daily)
Adjuvent treatment of focal seizures with or without secondary generalisation (alternative loading dose regimen when it is necessary to rapidly attain therapeutic plasma concentrations) (under close medical supervision)

- By mouth
- By intravenous infusion
- Child 16–17 years: Loading dose 200 mg, infusion to be administered over 15–60 minutes (for up to 5 days), followed by maintenance 100 mg twice daily, to be given 12 hours after initial dose, then increased, if tolerated, in steps of 50 mg twice daily (max. per dose 200 mg twice daily), adjusted according to response, dose to be increased in weekly intervals
- Adult: Loading dose 200 mg, infusion to be administered over 15–60 minutes (for up to 5 days), followed by maintenance 100 mg twice daily, to be given 12 hours after initial dose, then increased, if tolerated, in steps of 50 mg twice daily (max. per dose 200 mg twice daily), adjusted according to response, dose to be increased in weekly intervals

## Contra-Indications
- Second- or third-degree AV block

## Cautions
- Conduction problems
- Elderly
- Risk of PR-interval prolongation
- Severe cardiac disease

## Interactions
- Appendix 1: antiepileptics
- Appendix 2: sedative hypnotics
- Patch 1: Second- or third-degree AV block
- Patch 2: Conduction problems

## Side-Effects
- Common or very common: Abnormal gait, blunted vision, cognitive disorder, constipation, depression, dizziness, drowsiness, fatigue, flatulence, headache, impaired coordination, nausea, nystagmus, pruritus, tremor, vomiting
- Rare: Multi-organ hypersensitivity reaction
- Frequency not known: Aggression, agitation, agranulocytosis, atrial fibrillation, atrial flutter, AV block, bradycardia, confusion, dry mouth, dysarthria, dyspepsia, euphoria, hypoesthesia, irritability, muscle spasm, PR-interval prolongation, psychosis, rash, suicidal ideation, tinnitus

## Allergy and Cross-sensitivity
- Antiepileptic hypersensitivity syndrome associated with lacosamide. See under Epilepsy p. 292 for more information.

## Pregnancy
- The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

## Breast Feeding
- Manufacturer advises avoid—present in milk in animal studies.

## Hepatic Impairment
- Titrate with caution in mild to moderate impairment if co-existing renal impairment. Caution in severe impairment—no information available.

## Renal Impairment
- Loading dose regimen can be considered in mild to moderate impairment—titrate above 200 mg with caution. Titrate with caution in severe impairment, max. 250 mg daily.
- In adults: Consult product literature for loading dose if eGFR less than 30 mL/minute/1.73 m².
- In children: Consult product literature for loading dose if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².

## Directions for Administration
- With intravenous use in children: For intravenous infusion, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%.
- With intravenous use in adults: For intravenous infusion (Vimpat®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. May be administered undiluted.

## Prescribing and Dispensing Information
- Flavours of syrup may include strawberry.

## Patient and Carer Advice
- Medicines for Children leaflet: Lacosamide for preventing seizures www.medicinesforchildren.org.uk/lacosamide-for-preventing-seizures

## National Funding/Access Decisions
- Scottish Medicines Consortium (SMC) Decisions
  The Scottish Medicines Consortium has advised (January 2009) that lacosamide (Vimpat®) is accepted for restricted use within NHS Scotland as adjunctive treatment for focal seizures with or without secondary generalisation in patients from 16 years. It is restricted for specialist use in refractory epilepsy.

## Medicinal Forms
- There can be variation in the licensing of different medicines containing the same drug.

### Solution for Infusion
- ELECTROLYTES: May contain Sodium
  - Vimpat (UCB Pharma Ltd)
    - Lacosamide 10 mg per 1 ml
      - Vimpat 200 mg/20 ml solution for infusion vials | 1 vial £29.70

### Oral Solution
- CAUTIONARY AND ADVISORY LABELS 8
- EXCIPIENTS: May contain Aspartame, propylene glycol
- ELECTROLYTES: May contain Sodium
  - Vimpat (UCB Pharma Ltd)
    - Lacosamide 10 mg per 1 ml
      - Vimpat 10 mg/ml syrup sugar-free | 200 ml £25.74 DT price = £25.74

### Tablet

  - Lacosamide 100 mg
    - Vimpat 100 mg tablets | 14 tablet £21.62
    - DT price = £21.62
  - Lacosamide 150 mg
    - Vimpat 150 mg tablets | 14 tablet £32.44
    - DT price = £32.44
  - Lacosamide 200 mg
    - Vimpat 200 mg tablets | 56 tablet £144.16 DT price = £144.16

### Lamotrigine

## Indications and Dose
- Monotherapy of focal seizures | Monotherapy of primary and secondary generalised tonic-clonic seizures | Monotherapy of seizures associated with Lennox-Gastaut syndrome
  - By mouth
  - Child 12–17 years: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily
  - Adult: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily

## Adjunctive Therapy of Focal Seizures with Valproate
- Monotherapy of primary and secondary generalised tonic-clonic seizures with valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndrome with valproate
  - By mouth
  - Child 2–11 years (body-weight up to 13 kg): Initially 2 mg once daily on alternate days for first 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to
300 micrograms/kg every 7–14 days; maintenance 1–5 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day

- Child 2–11 years (body-weight 13 kg and above): Initially 150 micrograms/kg once daily for 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7–14 days; maintenance 1–5 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day

- Child 12–17 years: Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

- Adult: Initially 25 mg once daily for 14 days, then increased in steps of up to 50 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

**Adjuvant therapy of focal seizures (with enzyme inducing drugs) without valproate**

**Adjuvant therapy of primary and secondary generalised tonic-clonic seizures (with enzyme inducing drugs) without valproate**

**Adjuvant therapy of seizures associated with Lennox-Gastaut syndromes (with enzyme inducing drugs) without valproate**

- **BY MOUTH**
  - Child 2–11 years: Initially 300 micrograms/kg twice daily for 14 days, then 600 micrograms/kg twice daily for further 14 days, then increased in steps of up to 1.2 mg/kg every 7–14 days; maintenance 5–15 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 400 mg per day
  - Child 12–17 years: Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 200–400 mg daily in 2 divided doses, increased if necessary up to 700 mg daily, dose titration should be repeated if restarting after interval of more than 5 days
  - Adult: Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 200–400 mg daily in 2 divided doses, increased if necessary up to 700 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

**Adjuvant therapy of focal seizures (without enzyme inducing drugs) without valproate**

**Adjuvant therapy of primary and secondary generalised tonic-clonic seizures (without enzyme inducing drugs) without valproate**

**Adjuvant therapy of seizures associated with Lennox-Gastaut syndromes (without enzyme inducing drugs) without valproate**

- **BY MOUTH**
  - Child 2–11 years: Initially 300 micrograms/kg daily in 1–2 divided doses for 14 days, then 600 micrograms/kg daily in 1–2 divided doses for further 14 days, then increased in steps of up to 600 micrograms/kg every 7–14 days; maintenance 1–10 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
  - Child 12–17 years: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

**Monotherapy or adjunctive therapy of bipolar disorder (without enzyme inducing drugs) without valproate**

- **BY MOUTH**
  - Adult: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

**Adjuvant therapy of bipolar disorder with valproate**

- **BY MOUTH**
  - Adult: Initially 25 mg once daily for 14 days, then 50 mg daily in 1–2 divided doses for further 14 days, then 100 mg daily in 1–2 divided doses for further 7 days; maintenance 200 mg daily in 1–2 divided doses, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days; maximum 400 mg per day

**Adjuvant therapy of bipolar disorder (with enzyme inducing drugs) without valproate**

- **BY MOUTH**
  - Adult: Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased to 100 mg twice daily for further 7 days, then increased to 150 mg twice daily for further 7 days; maintenance 200 mg twice daily, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days

**IMPORTANT SAFETY INFORMATION**

**SAFE PRACTICE**

Do not confuse the different combinations or indications.

- **CAUTIONS** Myoclonic seizures (may be exacerbated) • Parkinson’s disease (may be exacerbated)
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
  - Common or very common Blurred vision • aggression • agitation • arthralgia • ataxia • back pain • diarrhoea • diplopia • dizziness • drowsiness • dry mouth • headache • insomnia • nausea • nystagmus • rash • tremor • vomiting
  - Rare Conjunctivitis
  - Very rare Anaemia • blood disorders • confusion • exacerbation of Parkinson’s disease • hallucination • hepatic failure • hypersensitivity syndrome • increase in seizure frequency • leucopenia • lupus erythematosus-like reactions • movement disorders • pancytopenia • thrombocytopenia • unsteadiness
  - Frequency not known Aseptic meningitis • suicidal ideation

INDICATIONS AND DOSE

Monotherapy of focal seizures with or without secondary generalisation

- BY MOUTH, OR BY INTRAVENOUS INFUSION
  - Child 16-17 years: Initially 250 mg once daily for 1 week, then increased to 250 mg twice daily, then increased in steps of 250 mg twice daily (max. per dose 1.5 g twice daily), adjusted according to response, dose to be increased every 2 weeks
  - Adult: Initially 250 mg once daily for 1–2 weeks, then increased to 250 mg twice daily, then increased in steps of 250 mg twice daily (max. per dose 1.5 g twice daily), adjusted according to response, dose to be increased every 2 weeks

Adjunctive therapy of focal seizures with or without secondary generalisation

- BY MOUTH
  - Child 1–5 months: Initially 7 mg/kg once daily, then increased in steps of up to 7 mg/kg twice daily (max. per dose 21 mg/kg twice daily), dose to be increased every 2 weeks
  - Child 6 months–17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
  - Child 12–17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2–4 weeks
  - Adult: Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2–4 weeks

- BY INTRAVENOUS INFUSION
  - Child 4–17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
  - Child 12–17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks
  - Adult: Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2–4 weeks

Adjunctive therapy of myoclonic seizures and tonic-clonic seizures

- BY MOUTH, OR BY INTRAVENOUS INFUSION
  - Child 12–17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in
steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
- Child 12-17 years (body-weight 50 kg and above): Initially 250 mg/twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks
- Adult: Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2–4 weeks

- **UNLICENSED USE** Levetiracetam doses in BNF may differ from those in product literature. *Granules* not licensed for use in children under 6 years, for initial treatment in children with body-weight less than 25 kg, or for the administration of doses below 250 mg.
- **INTERACTIONS** → Appendix 1: antiepileptics
- **SIDE-EFFECTS**
  - Common or very common: Abdominal pain, aggression, anorexia, anxiety, ataxia, convulsion, cough, depression, diarrhoea, dizziness, drowsiness, dyspepsia, headache, insomnia, irritability, malaise, nasopharyngitis, nausea, rash, tremor, vertigo, vomiting.
  - Uncommon: Agitation, alopecia, amnesia, blurred vision, confusion, diplopia, eczema, impaired attention, leucopenia, myalgia, paraesthesia, pruritus, psychosis, suicidal ideation, thrombocytopenia, weight changes.
  - Rare: Agranulocytosis, choreoathetosis, drug reaction with eosinophilia and systemic symptoms (DRESS), dyskinesia, erythema multiforme, hepatic failure, hyponatraemia, neutropenia, pancreatitis, pancytopenia, Stevens-Johnson syndrome, toxic epidermal necrolysis.
  - Frequency not known: Completed suicide, pancytopenia.
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. It is recommended that the fetal growth should be monitored.
- **BREAST FEEDING** Present in milk—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT**
  - In adults: Halve dose in severe hepatic impairment if eGFR less than 60 mL/minute/1.73 m².
  - In children: Halve dose in severe hepatic impairment if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².
- **RENAL IMPAIRMENT**
  - In children: Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m² (consult product literature).
  - In adults: Maximum 2 g daily if eGFR 50–80 mL/minute/1.73 m². Maximum 1.5 g daily if eGFR 30–50 mL/minute/1.73 m². Maximum 1 g daily if eGFR less than 30 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use: For *intravenous infusion* (*Keppra*®), dilute requisite dose with at least 100 mL Glucose 5% or Sodium Chloride 0.9%; give over 15 minutes.
  - With oral use: For administration of *oral solution*, requisite dose may be diluted in a glass of water.
- **PRESCRIBING AND DISPENSING INFORMATION** If switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the intravenous dose should be the same as the established oral dose.
- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: *Levetiracetam for preventing seizures* | www.medicinesforchildren.org.uk/levetiracetam-for-preventing-seizures

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Oxcarbazepine**

- **INDICATIONS AND DOSE**
  - Monotherapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures
  - **BY MOUTH**
    - Child 6-17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maximum 46 mg/kg per day.
    - Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses
Adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

- BY MOUTH
  - Child 6–17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maintenance 15 mg/kg twice daily; maximum 46 mg/kg per day
  - Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

Treatment of primary generalised tonic-clonic seizures

- BY MOUTH
  - Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

DOSE ADJUSTMENTS DUE TO INTERACTIONS
In adjunctive therapy, the dose of concomitant antiepileptics may need to be reduced when using high doses of oxcarbazepine.

- UNLICENSED USE Not licensed for the treatment of primary generalised tonic-clonic seizures.
- CAUTIONS Avoid in acute porphyrias p. 969; cardiac conduction disorders · heart failure · hyponatraemia
- INTERACTIONS → Appendix 1: antiepileptics
- SIDE-EFFECTS
  - Common or very common Abdominal pain · acne · agitation · alopecia · amnesia · asthma · ataxia · confusion · constipation · depression · diarrhoea · diplopia · dizziness · drowsiness · headache · hyponatraemia · impaired concentration · nausea · nightmares · rash · tremor · visual disorders · vomiting
  - Uncommon Leucopenia · urticaria
  - Very rare Arrhythmias · atrioventricular block · hepatitis · multi-organ hypersensitivity disorders · pancreatitis · Stevens-Johnson syndrome · systemic lupus erythematosus · thrombocytopenia · toxic epidermal necrolysis
  - Frequency not known Aplastic anaemia · bone marrow depression · hypertension · hypothyroidism · neutropenia · osteoporotic bone disorders · pancytopenia · suicidal ideation
- PREGNANCY The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- BREAST FEEDING Amount probably too small to be harmful but manufacturer advises avoid.
- HEPATIC IMPAIRMENT Caution in severe impairment—no information available.
- RENAL IMPAIRMENT
  - In adults Halve initial dose if eGFR less than 30 mL/minute/1.73 m²; increase according to response at intervals of at least 1 week.
  - In children Halve initial dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m², increase according to response at intervals of at least 1 week.
- PRE-TREATMENT SCREENING Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

- MONITORING REQUIREMENTS
  - Monitor plasma-sodium concentration in patients at risk of hyponatraemia.
  - Monitor body-weight in patients with heart failure.
- PRESCRIBING AND DISPENSING INFORMATION Patients may need to be maintained on a specific manufacturer’s branded or generic oxcarbazepine product. Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.
- PATIENT AND CARER ADVICE
  - Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as lethargy, confusion, muscular twitching, fever, rash, blistering, mouth ulcers, bruising, or bleeding develop.
  - Medicines for Children: Oxcarbazepine for preventing seizures www.medicinesforchildren.org.uk/oxcarbazepine-for-preventing-seizures

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
  - Oral suspension
  - CAUTIONARY AND ADVISORY LABELS 3, 8
  - EXCIPIENTS: May contain Propylene glycol
  - Trileptal (Novartis Pharmaceuticals UK Ltd)

    - Oxcarbazepine 300 mg Oxcarbazepine 300mg tablets | 50 tablet (Pom) £22.61 DT price = £5.89
    - Oxcarbazepine 600 mg Oxcarbazepine 600mg tablets | 50 tablet (Pom) £45.19 DT price = £38.76
  - Trileptal (Novartis Pharmaceuticals UK Ltd)
    - Oxcarbazepine 150 mg Trileptal 150mg tablets | 50 tablet (Pom) £12.24 DT price = £8.42
    - Oxcarbazepine 300 mg Trileptal 300mg tablets | 50 tablet (Pom) £24.48 DT price = £5.89
    - Oxcarbazepine 600 mg Trileptal 600mg tablets | 50 tablet (Pom) £48.96 DT price = £38.76

Perampanel

- INDICATIONS AND DOSE
  - Adjunctive treatment of focal seizures with or without secondary generalised seizures
  - BY MOUTH
    - Child 12–17 years: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day
    - Adult: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day
  - DOSE ADJUSTMENTS DUE TO INTERACTIONS
    - Titrate at intervals of at least 1 week with concomitant carbamazepine, fosphenytoin, oxcarbazepine, or phenytoin.
  - INTERACTIONS → Appendix 1: antiepileptics
Phenytoin

INDICATIONS AND DOSE

Tonic-clonic seizures | Focal seizures

- BY MOUTH
  - Child 1 month–11 years: Initially 1.5–2.5 mg/kg twice daily, then adjusted according to response to 2.5–5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), dose also adjusted according to plasma-phenytoin concentration; maximum 300 mg per day
  - Child 12–17 years: Initially 75–150 mg twice daily, then adjusted according to response to 150–200 mg twice daily (max. per dose 300 mg twice daily), dose also adjusted according to plasma-phenytoin concentration

Tonic-clonic seizures | Focal seizures | Prevention and treatment of seizures during or following neurosurgery or severe head injury

- BY MOUTH
  - Adult: Initially 3–4 mg/kg daily, alternatively 150–300 mg once daily, alternatively 150–300 mg daily in 2 divided doses; usual maintenance 200–500 mg daily, to be taken preferably with or after food, dose to be increased gradually as necessary (with plasma-phenytoin concentration monitoring), exceptionally, higher doses may be used

Prevention and treatment of seizures during or following neurosurgery or severe head injury

- BY MOUTH
  - Child: Initially 2.5 mg/kg twice daily, then adjusted according to response to 4–8 mg/kg daily, dose also adjusted according to plasma-phenytoin concentration; maximum 300 mg per day

Status epilepticus | Acute symptomatic seizures associated with head trauma or neurosurgery

- INITIAL BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
  - Child 1 month–11 years: Loading dose 20 mg/kg, then (by slow intravenous injection or by intravenous infusion) 2.5–5 mg/kg twice daily
  - Child 12–17 years: Loading dose 20 mg/kg, then (by intravenous infusion or by slow intravenous injection) up to 100 mg 3–4 times a day
  - Adult: Loading dose 20 mg/kg (max. per dose 2 g), then (by intravenous infusion or by slow intravenous injection or by mouth) maintenance 100 mg every 6–8 hours adjusted according to plasma-concentration monitoring

DOSE EQUIVALENCE AND CONVERSION

Preparations containing phenytoin sodium are not bioequivalent to those containing phenytoin base (such as Epanutin Infatabs® and Epanutin® suspension); 100 mg of phenytoin sodium is approximately equivalent in therapeutic effect to 92 mg phenytoin base. The dose is the same for all phenytoin products when initiating therapy. However, if switching between these products the difference in phenytoin content may be clinically significant. Care is needed when making changes between formulations and plasma-phenytoin concentration monitoring is recommended.

UNLICENSED USE

- With intravenous use Phenytoin doses in BNF publications may differ from those in product literature.

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

Acute porphyrias p. 969

SPECIFIC CONTRA-INDICATIONS

- With intravenous use Second- and third-degree heart block · sino–atrial block · sinus bradycardia · Stokes–Adams syndrome

CAUTIONS

GENERAL CAUTIONS

Enteral feeding (interrupt feeding for 2 hours before and after dose; more frequent monitoring may be necessary)

SPECIFIC CAUTIONS

- With intravenous use Heart failure · hypotension · injection solutions alkaline (irritant to tissues) · respiratory depression · resuscitation facilities must be available

CAUTIONS, FURTHER INFORMATION

Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

 Intramuscular phenytoin should not be used (absorption is slow and erratic).

INTERACTIONS

Appendix 1: antiepileptics
SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Acne, anorexia, coarsening of facial appearance, constipation, dizziness, drowsiness, gingival hypertrophy and tenderness (maintain good oral hygiene), headache, hirsutism, insomnia, nausea, paraesthesia, rash, transient nervousness, tremor, vomiting

- **Rare** Leucopenia, aplastic anaemia, blood disorders, dyskinesia, hepatotoxicity, lupus erythematosus, lymphadenopathy, megaloblastic anaemia, osteomalacia, peripheral neuropathy, polyarteritis nodosa, Stevens-Johnson syndrome, thrombocytopenia, toxic epidermal necrolysis

- **Frequency not known** Hypersensitivity syndrome, interstitial nephritis, pneumonitis, polyarthropathy, suicidal ideation

SPECIFIC SIDE-EFFECTS

- **Common or very common**
  - With intravenous use Alterations in respiratory function, arrhythmias, cardiovascular collapse, cardiovascular depression (particularly if injection too rapid), CNS depression (particularly if injection too rapid), hypotension, respiratory arrest
  - Frequency not known With intravenous use Purple glove syndrome, tonic seizures

SIDE-EFFECTS, FURTHER INFORMATION

- Hypotoxicity Discontinue immediately and do not re-administer.
- Rash Discontinue; if mild re-introduce cautiously but discontinue immediately if recurrence.
- Use in adolescents Phenytoin may cause coarsening of the facial appearance, acne, hirsutism, and gingival hyperplasia and so may be particularly undesirable in adolescent patients.
- Bradycardia and hypotension
- With intravenous use Reduce rate of administration if bradycardia or hypotension occurs.

Overdose

Symptoms of phenytoin toxicity include nystagmus, diplopia, slurred speech, ataxia, confusion, and hyperglycaemia.

ALLERGY AND CROSS-SENSITIVITY Cross-sensitivity reported with carbamazepine. Antiepileptic hypersensitivity syndrome associated with phenytoin. See under Epilepsy p. 292 for more information.

PREGNANCY

Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction. Doses should be adjusted on the basis of plasma-drug concentration monitoring.

Breast feeding

Small amounts present in milk, but not known to be harmful.

Hepatic impairment

Reduce dose to avoid toxicity.

PRE-TREATMENT SCREENING

HLA-B*1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).

MONITORING REQUIREMENTS

- In adults The usual total plasma-phenytoin concentration for optimum response is 10–20 mg/litre (or 40–80 micromol/litre). In pregnancy, the elderly, and certain disease states where protein binding may be reduced, careful interpretation of total plasma-phenytoin concentration is necessary; it may be more appropriate to measure free plasma-phenytoin concentration.
  - In children Therapeutic plasma-phenytoin concentrations reduced in first 3 months of life because of reduced protein binding. Trough plasma concentration for optimum response: neonate–3 months, 6–15 mg/litre (25–60 micromol/litre); child 3 months–18 years, 10–20 mg/litre (40–80 micromol/litre).
- With intravenous use Monitor ECG and blood pressure.
- Manufacturer recommends blood counts (but evidence of practical value uncertain).

DIRECTIONS FOR ADMINISTRATION

Manufacturer advises each injection or infusion should be preceded and followed by an injection of Sodium Chloride 0.9% through the same needle or catheter to avoid local venous irritation.

- With intravenous use in children For intravenous injection, give into a large vein at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute).
- Manufacturer advises for intravenous infusion, dilute to a concentration not exceeding 10 mg/ml with Sodium Chloride 0.9% and give into a large vein through an in-line filter (0.22–0.50 micron). Give at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute).
- Complete administration within 1 hour of preparation.

- With intravenous use in adults Manufacturer advises for intravenous injection, give into a large vein at a rate not exceeding 50 mg/minute; rate of 25 mg/minute or lower may be more appropriate in some patients (including the elderly and those with heart disease). Manufacturer advises for intravenous infusion, dilute in 50–100 ml Sodium Chloride 0.9% (final concentration not to exceed 10 mg/ml) and give into a large vein through an in-line filter (0.22–0.50 micron) at a rate not exceeding 50 mg/minute; rate of 25 mg/minute or lower may be more appropriate in some patients (including the elderly and those with heart disease). Complete administration within 1 hour of preparation.

PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product.

PATIENT AND CARER ADVICE

Blood or skin disorders Patients or their carers should be told how to recognise signs of blood or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).

Rufinamide

∥ INDICATIONS AND DOSE

Adjunctive treatment of seizures in Lennox-Gastaut syndrome

∥ BY MOUTH

∥ Child 4–17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 500 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

∥ Child 4–17 years (body-weight 30–49 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 900 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

∥ Child 4–17 years (body-weight 50–69 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.2 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

∥ Child 4–17 years (body-weight 70 kg and above): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.6 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

∥ Adult (body-weight 30–49 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 900 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

∥ Adult (body-weight 50–69 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.2 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

∥ Adult (body-weight 70 kg and above): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.6 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

Adjunctive treatment of seizures in Lennox-Gastaut syndrome with valproate

∥ BY MOUTH

∥ Child 4–17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 300 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

∥ Adult (body-weight 50–69 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.2 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

∥ Adult (body-weight 70 kg and above): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.6 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

∥ INTERACTIONS ∆ Appendix 1: antiepileptics

∥ ALLERGY AND CROSS-SENSITIVITY Antiepileptic hypersensitivity syndrome associated with rufinamide. See under Epilepsy p. 292 for more information.

∥ PREGNANCY The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

∥ BREAST FEEDING Manufacturer advises avoid—no information available.

∥ HEPATIC IMPAIRMENT Caution and careful dose titration in mild to moderate impairment. Avoid in severe impairment.

———
Sodium valproate

**INDICATIONS AND DOSE**

All forms of epilepsy
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Child 1 month–11 years: Initially 10–15 mg/kg daily in 1–2 divided doses (max. per dose 600 mg); maintenance 25–30 mg/kg daily in 2 divided doses, doses up to 60 mg/kg daily in 2 divided doses may be used in infantile spasms; monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily
- Child 12–17 years: Initially 600 mg daily in 1–2 divided doses, increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily in 2 divided doses; maximum 2.5 g per day
- Adult: Initially 600 mg daily in 1–2 divided doses, then increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily, alternatively maintenance 20–30 mg/kg daily; maximum 2.5 g per day

Initiation of valproate treatment
- **INITIALLY BY INTRAVENOUS INJECTION**
- Adult: Initially 10 mg/kg, (usually 400–800 mg), followed by (by intravenous infusion or by intravenous injection) up to 2.5 g daily in 2–4 divided doses, alternatively (by continuous intravenous infusion) up to 2.5 g daily; (by intravenous injection or by

intravenous infusion or by continuous intravenous infusion) usual dose 1–2 g daily, alternatively (by intravenous injection or by intravenous infusion or by continuous intravenous infusion) usual dose 20–30 mg/kg daily, intravenous injection to be administered over 3–5 minutes

Continuation of valproate treatment
- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY CONTINUOUS INTRAVENOUS INFUSION**
- Adult: If switching from oral therapy to intravenous therapy give the same dose as current oral daily dose, give over 3–5 minutes by intravenous injection or in 2–4 divided doses by intravenous infusion

Migraine prophylaxis
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: Initially 200 mg twice daily, then increased if necessary to 1.2–1.5 g daily in divided doses

**EPILIM CHRONOSPHERE**

All forms of epilepsy
- **BY MOUTH**
- Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

**EPILIM CHRONO**

All forms of epilepsy
- **BY MOUTH**
- Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

**EPISENTA® CAPSULES**

All forms of epilepsy
- **BY MOUTH**
- Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

Mania
- **BY MOUTH**
- Adult: Initially 750 mg daily in 1–2 divided doses, adjusted according to response, usual dose 1–2 g daily in 1–2 divided doses, doses greater than 45 mg/kg daily require careful monitoring

**EPISENTA® GRANULES**

All forms of epilepsy
- **BY MOUTH**
- Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

**EPIVAL®**

All forms of epilepsy
- **BY MOUTH**
- Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

**UNLICENSED USE** Not licensed for migraine prophylaxis.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: VALPROATE AND RISK OF ABNORMAL PREGNANCY OUTCOMES**

Infants exposed to valproate in utero are at a high risk of serious developmental disorders (up to 30–40% risk) and congenital malformations (approx. 11% risk). Valproate should not be used in female children, females of childbearing potential or during pregnancy unless

*312 Epilepsy and other seizure disorders*
CONTRA-INDICATIONS Acute porphyrias p. 969 - known or suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths) - personal or family history of severe hepatic dysfunction

CAUTIONS Systemic lupus erythematosus

CAUTIONS, FURTHER INFORMATION Consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

LIVER TOXICITY Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

SIDE-EFFECTS

Common or very common Agitation - anxiety - ataxia - tremor - weight gain

Uncommon Angioedema - ataxia - coma - encephalopathy - increased alertness - lethargy - leucopenia - pancytopenia - paraesthesia - peripheral oedema - rash - reduced bone mineral density - syndrome of inappropriate secretion of antidiuretic hormone - vasculitis

Very rare Acne - gynaecomastia - hepatic dysfunction - hirsutism - increase in bleeding time - pancreatitis

Frequency not known Hypersensitivity reactions - suicidal ideation

SIDE-EFFECTS, FURTHER INFORMATION

Hepatic dysfunction Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.

Pancreatitis Discontinue treatment if symptoms of pancreatitis develop.

CONCEPTION AND CONTRACEPTION Valproate is associated with teratogenic risks and should not be used in females of child-bearing potential unless there is no safer alternative—this should be fully considered and discussed before prescribing for females of child-bearing age. Exclude pregnancy before treatment—effective contraception advised in females of child-bearing potential. In females planning to become pregnant, all efforts should be made to switch to appropriate alternative treatment prior to conception.

PREGNANCY Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term neurodevelopmental effects. Valproate should not be used during pregnancy unless there is no safer alternative and only after a careful discussion of the risks. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses or as modified-release tablets to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrininaemia) reported. Neonatal hepatotoxicity also reported.

Special prenatal monitoring should be instigated when valproate has been taken in pregnancy.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

BREAST FEEDING Present in milk—risk of haematological disorders in breast-fed newborns and infants.

HEPATIC IMPAIRMENT Avoid if possible—hepatotoxicity and hepatic failure may occasionally occur (usually in first 6 months). Avoid in active liver disease.

RENAI IMPAIRMENT Reduce dose.

MONITORING REQUIREMENTS

Plasma-valproate concentrations are not a useful index of efficacy, therefore routine monitoring is unhelpful.

Monitor liver function before therapy and during first 6 months especially in patients most at risk.

Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.

EFFECT ON LABORATORY TESTS False-positive urine tests for ketones.

TREATMENT CESSION Avoid abrupt withdrawal; if treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks.

DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Epilim ®, Episenta ®), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute Epilim ® with solvent provided then dilute with infusion fluid.

EPIVAL ® Tablets may be halved but not crushed or chewed.

EPISENTA ® CAPSULES Contents of capsule may be mixed with cold soft food or drink and swallowed immediately without chewing.

EPILIM ® SYRUP May be diluted, preferably in Syrup BP; use within 14 days.

EPISENTA ® GRANULES Granules may be mixed with cold soft food or drink and swallowed immediately without chewing.

EPILIM CHRONOSPHERE ® Granules may be mixed with soft food or drink that is cold or at room temperature, and swallowed immediately without chewing.
**314 Epilepsy and other seizure disorders**

- **PRESCRIBING AND DISPENSING INFORMATION**
  Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

  Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral sodium valproate product.

**EPILIM CHRONOSPHERE ®** Prescribe dose to the nearest whole 50-mg sachet.

- **PATIENT AND CARER ADVICE**
  Risk of abnormal pregnancy outcomes A patient guide and card should be provided to all female patients. Blood or hepatic disorders Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

  Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop.

  Medicines for Children leaflet: Sodium valproate for preventing seizures www.medicinesforchildren.org.uk/sodium-valproate-for-preventing-seizures

  MHRA advice: Valproate and the risk of abnormal pregnancy outcomes Female patients and their carers should be counselled on the risk of valproate treatment during pregnancy. Ensure female patients are provided with relevant resources, to support their understanding of the risks. In particular the prescriber must ensure the patient understands:

  - the risks associated with valproate during pregnancy;
  - the need to use effective contraception;
  - the need for regular review of treatment;
  - the need to rapidly consult if she is planning a pregnancy or becomes pregnant

**EPISENTE ® CAPSULES** Patients and carers should be counselled on the administration of capsules.

**EPISENTE ® GRANULES** Patients and carers should be counselled on the administration of granules.

**EPILEN CHRONOSPHERE ®** Patients and carers should be counselled on the administration of granules.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

**Modified-release tablet**

**Tiagabine**

- **INDICATIONS AND DOSE**
  Adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (with enzyme-inducing drugs)

  - **BY MOUTH**
    - Child 12–17 years: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours
every week; maintenance 30–45 mg daily in 2–3 divided doses

- Adult: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every week; maintenance 30–45 mg daily in 2–3 divided doses

**Adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (without enzyme-inducing drugs)**

- **BY MOUTH**
- Child 6–17 years: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every week; maintenance 15–30 mg daily in 2–3 divided doses
- Adult: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every week; maintenance 15–30 mg daily in 2–3 divided doses

### **CAUTIONS**
Avoid in acute porphyrias p. 969

**CAUTIONS, FURTHER INFORMATION**
Tiagabine should be avoided in absence, myoclonic, tonic and atonic seizures due to risk of seizure exacerbation.

**INTERACTIONS** ➔ Appendix 1: antiepileptics

**SIDE-EFFECTS**

- **Common or very common** Diarrhoea; dizziness; emotional lability; impaired concentration; nervousness; speech impairment; tiredness; tremor
- **Rare** Bruising; confusion; depression; drowsiness; non-convulsive status epilepticus; psychosis; suicidal ideation; visual disturbances
- **Frequency not known** Leucopenia

**PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**HEPATIC IMPAIRMENT** In mild to moderate impairment reduce dose, prolong the dose interval, or both. Avoid in severe impairment.

**PATIENT AND CARER ADVICE**
Driving and skilled tasks

May impair performance of skilled tasks (e.g. driving). Medicines for Children leaflet: Tiagabine for preventing seizures [www.medicinesforchildren.org.uk/tiagabine-for-preventing-seizures](http://www.medicinesforchildren.org.uk/tiagabine-for-preventing-seizures)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 21

- Gabitril (Teva UK Ltd)
  - Tiagabine (as Tiagabine hydrochloride monohydrate) 5 mg Gabitril 5mg tablets | 100 tablet [Pos] £52.04
  - Tiagabine (as Tiagabine hydrochloride monohydrate) 10 mg Gabitril 10mg tablets | 100 tablet [Pos] £104.09
  - Tiagabine (as Tiagabine hydrochloride monohydrate) 15 mg Gabitril 15mg tablets | 100 tablet [Pos] £156.13

**Topiramate**

**INDICATIONS AND DOSE**

**Monotherapy of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation**

- **BY MOUTH**
- Child 6–17 years: Initially 0.5–1 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 250–500 micrograms/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 50 mg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate titration regimens recommended above then smaller steps or longer interval between steps may be used; maximum 500 mg per day
- Adult: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25–50 mg every 1–2 weeks, dose to be taken in 2 divided doses; usual dose 100–200 mg daily in 2 divided doses, adjusted according to response, doses of 1 g daily have been used in refractory epilepsy; maximum 500 mg per day

**Adjunctive treatment of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation | Adjunctive treatment for seizures associated with Lennox-Gastaut syndrome**

- **BY MOUTH**
- Child 2–17 years: Initially 1–3 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 0.5–1.5 mg/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 2.5–4.5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate recommended titration regimen then smaller steps or longer interval between steps may be used; maximum 400 mg per day
- Adult: Initially 25–50 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25–50 mg every 1–2 weeks, dose to be taken in 2 divided doses; usual dose 200–400 mg daily in 2 divided doses; maximum 400 mg per day

**Migraine prophylaxis**

- **BY MOUTH**
- Adult: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25 mg every week; usual dose 50–100 mg daily in 2 divided doses; maximum 200 mg per day

**CAUTIONS** Avoid in acute porphyrias p. 969 - risk of metabolic acidosis - risk of nephrolithiasis—ensure adequate hydration (especially in strenuous activity or warm environment)

**INTERACTIONS** ➔ Appendix 1: antiepileptics

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain; aggression; agitation; alopecia; anaemia; anxiety; appetite changes; arthralgia; cognitive impairment; confusion; constipation; depression; diarrhoea; dizziness; drowsiness; dry mouth; dyspepsia; dysphonia; epistaxis; gastritis; impaired attention; impaired coordination; irritability; malaise; mood changes; movement disorders; muscle spasm; muscular weakness; myalgia; nausea; nephrolithiasis; nystagmus; paraesthesia; pruritus; rash; seizures; sleep disturbance; speech disorder; taste disturbance; tinnitus; tremor; urinary disorders; visual disturbances; vomiting
- **Uncommon** Abdominal distension; altered sense of smell; blepharospasm; blood disorders; bradycardia; dry eye; flatulence; flushing; gingival bleeding; glossodynia; haematuria; halitosis; hearing loss; hypokalaemia; hypotension; increased lacrimation; influenza-like symptoms; leucopenia; metabolic acidosis; mydriasis; neutropenia; palpitation; pancreatitis; panic attack; peripheral neuropathy; photophobia; postural hypotension; psychosis; reduced sweating; salivation; sexual dysfunction; skin discoloration; suicidal ideation; thirst; thrombocytopenia; urinary calculus
- **Rare** Abnormal skin odour; calcinosis; hepatic failure; hepatitis; periportal oedema; Raynaud’s syndrome; Stevens-Johnson syndrome; unilateral blindness
- **Very rare** Angle-closure glaucoma
Nervous system

PRESCRIBING AND DISPENSING INFORMATION

DIRECTION FOR ADMINISTRATION

TOPAMAX® CAPSULES Swallow whole or sprinkle contents of capsule on soft food and swallow immediately without chewing.

PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic topiramate product.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Topiramate for preventing seizures www.medicinesforchildren.org.uk/topiramate-for-preventing-seizures

TOPAMAX® CAPSULES Patients or carers should be given advice on how to administer Topamax® capsules.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

Vigabatrin

INDICATIONS AND DOSE

Adjunctive treatment of focal seizures with or without secondary generalisation not satisfactorily controlled with other antiepileptics (under expert supervision)

BY MOUTH

Child 1-23 months: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg)

Child 2-11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g)

Child 12-17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily

Adult: Initially 1 g once daily, alternatively initially 1 g daily in 2 divided doses, then increased in steps of 500 mg every week, adjusted according to response; usual dose 2–3 g daily; maximum 3 g per day

BY RECTUM

Child 1-23 months: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg)

Child 2-11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g)

Child 12-17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily

UNLICENSED USE Granules not licensed for rectal use. Tablets not licensed to be crushed and dispersed in liquid. Vigabatrin doses in BNF publications may differ from those in product literature.

CONTRA-INDICATIONS Visual field defects

CAUTIONS Elderly • history of behavioural problems • history of depression • history of psychosis

CAUTIONS, FURTHER INFORMATION Vigabatrin may worsen absence, myoclonic, tonic and atonic seizures.

Visual field defects Vigabatrin is associated with visual field defects. The onset of symptoms varies from 1 month to several years after starting. In most cases, visual field defects have persisted despite discontinuation, and further deterioration after discontinuation cannot be excluded. Product literature advises visual field testing before treatment and at 6-month intervals. Patients and their
carers should be warned to report any new visual symptoms that develop and those with symptoms should be referred for an urgent ophthalmological opinion. Gradual withdrawal of vigabatrin should be considered.

**INTERACTIONS**  
Appendix 1: antiepileptics

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, agitation, blurred vision, depression, dizziness, drowsiness, excitation (in children), headache, impaired concentration, impatience, irritability, nausea, nervousness, nystagmus, oedema, paraesthesia, paraolfactory, speech disorder, tremor, visual field defects, vomiting, weight gain
- **Uncommon** Ataxia, mania, occasional increase in seizure frequency (especially if myoclonic), psychosis, rash
- **Rare** Peripheral retinal neuropathy, retinial disorders, suicidal ideation
- **Very rare** Hepatitis, optic atrophy, optic neuritis
- **Frequency not known** Movement disorders in infantile spasms

**SIDE-EFFECTS, FURTHER INFORMATION**

- Encephalopathic symptoms. Encephalopathic symptoms including marked sedation, stupor, and confusion with non-specific slow wave EEG can occur rarely—reduce dose or withdraw.
- Visual field defects. About one-third of patients treated with vigabatrin have suffered visual field defects; counselling and careful monitoring for this side-effect are required.
- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- **BREAST FEEDING** Present in milk—manufacturer advises avoid.
- **RENAL IMPAIRMENT**
  - In adults Consider reduced dose or increased dose interval if eGFR less than 60 mL/minute/1.73 m².
  - In children Consider reduced dose or increased dose interval if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Closely monitor neurological function.
- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use. The contents of a sachet should be dissolved in water or a soft drink immediately before taking. Tablets may be crushed and dispersed in liquid.
  - With rectal use. Dissolve contents of sachet in small amount of water and administer rectally [unlicensed use].
- **PATIENT AND CARER ADVICE**
  - Patients and their carers should be warned to report any new visual symptoms that develop.
  - Medicines for children leaflet: Vigabatrin for preventing seizures
  - www.medicinesforchildren.org.uk/vigabatrin-for-preventing-seizures

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

- **Powder**
  - **CAUTIONARY AND ADVISORY LABELS** 3, 8, 13
  - **Sabril** (Sanofi)
    - Vigabatrin 500 mg Sabril 500mg oral powder sachets sugar-free | 50 sachet [Pack] £24.60 DT price = £24.60

- **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 3, 8
  - **Sabril** (Sanofi)
    - Vigabatrin 500 mg Sabril 500mg tablets | 100 tablet [Pack] £44.41 DT price = £44.41

**Zonisamide**

- **INDICATIONS AND DOSE**
  - Monotherapy for treatment of focal seizures with or without secondary generalisation in adults with newly diagnosed epilepsy
    - **BY MOUTH**
    - Adult: Initially 100 mg once daily for 2 weeks, then increased in steps of 100 mg every 2 weeks, usual maintenance dose 300 mg once daily; maximum 500 mg per day
  - **Adjunctive treatment for refractory focal seizures with or without secondary generalisation**
    - **BY MOUTH**
    - Child 6–17 years (body-weight 20–54 kg). Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 6–8 mg/kg once daily (max. per dose 500 mg once daily), dose to be increased at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4
    - Child 6–17 years (body-weight 55 kg and above): Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 300–500 mg once daily, dose to be increased at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4
    - Adult: Initially 50 mg daily in 2 divided doses for 7 days, then increased to 100 mg daily in 2 divided doses, then increased in steps of 100 mg every 7 days, usual maintenance 300–500 mg daily in 1–2 divided doses, dose to be increased at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4

- **CAUTIONS** Elderly: low body-weight or poor appetite—monitor weight throughout treatment (fatal cases of weight loss reported in children)—metabolic acidosis—monitor serum bicarbonate concentration in children and those with other risk factors (consider dose reduction or discontinuation if metabolic acidosis develops)—risk factors for renal stone formation (particularly predisposition to nephro lithiasis)

- **CAUTIONS, FURTHER INFORMATION**
  - Avoid overheating and ensure adequate hydration especially in children, during strenuous activity or if in warm environment (fatal cases of heat stroke reported in children).
  - **INTERACTIONS**  
  - Appendix 1: antiepileptics
  - **SIDE-EFFECTS**
    - **Common or very common** Abdominal pain, agitation, alopecia, anorexia, ataxia, confusion, constipation, depression, diarrhoea, dizziness, drowsiness, ecchymosis, fatigue, impaired attention, impaired memory, insomnia, irritability, nausea, nystagmus, paraesthesia, peripheral oedema, pruritus, psychosis, pyrexia, rash (consider withdrawal)—speech disorder, tremor, weight loss
    - **Uncommon** Aggression, cholecystitis, cholelithiasis, dyspepsia, hypokalaemia, pneumonia, seizures, suicidal ideation, urinary calculi, urinary tract infection, vomiting
    - **Very rare** Amnesia, aspiration, blood disorders, coma, dysphagia, hallucinations, heat stroke, hepatitis, hydronephrosis, impaired sweating, metabolic acidosis, myasthenic syndrome, neuroleptic malignant syndrome, pancreatitis, renal failure, renal tubular acidosis.
rhabdomyolysis • Stevens-Johnson syndrome • toxic epidermal necrolysis

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in sulfonamide hypersensitivity.

Antiepileptic hypersensitivity syndrome theoretically associated with zonisamide. See under Epilepsy p. 292 for more information.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use adequate contraception during treatment and for 4 weeks after last dose.

● **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

● **BREAST FEEDING** Manufacturer advises avoid for 4 weeks after last dose.

● **HEPATIC IMPAIRMENT** Initially increase dose at 2-week intervals if mild or moderate impairment. Avoid in severe impairment.

● **RENAL IMPAIRMENT** Initially increase dose at 2-week intervals; discontinue if renal function deteriorates.

● **TREATMENT CESSATION** Avoid abrupt withdrawal (consult product literature for recommended withdrawal regimens in children).

● **PRESCRIBING AND DISPENSING INFORMATION** Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients may need to be maintained on a specific manufacturer’s branded or generic zonisamide product.

● **PATIENT AND CARER ADVICE** Children and their carers should be made aware of how to prevent and recognise overheating and dehydration.

Medicines for Children leaflet: Zonisamide for preventing seizures www.medicinesforchildren.org.uk/zonisamide-for-preventing-seizures

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2014) that zonisamide (Zonegran®) is accepted for restricted use within NHS Scotland as adjunctive treatment of focal seizures, with or without secondary generalisation, in adolescents and children aged 6 years and above. It is restricted to use on advice from specialists in paediatric neurology or epilepsy.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**

**CAUTIONARY AND ADVISORY LABELS** 3, 8, 10

● Zonisamide (Non-proprietary)

Zonisamide 25 mg Zonisamide 25 mg capsules | 14 capsule POM £7.83–£8.82 DT price = £8.66

Zonisamide 50 mg Zonisamide 50 mg capsules | 56 capsule POM £41.74–£47.04 DT price = £46.16

Zonisamide 100 mg Zonisamide 100 mg capsules | 56 capsule POM £56.07–£62.72 DT price = £62.20

● Zonegran (Esial Ltd)

Zonisamide 25 mg Zonegran 25 mg capsules | 14 capsule POM £8.82 DT price = £8.66

Zonisamide 50 mg Zonegran 50 mg capsules | 56 capsule POM £47.04–£52.72 DT price = £52.20

Zonisamide 100 mg Zonegran 100 mg capsules | 56 capsule POM £52.72 DT price = £52.20

**ANTIEPILEPTICS > BARBITURATES**

**Phenobarbital**

(Phenobarbitone)

● **INDICATIONS AND DOSE**

All forms of epilepsy except typical absence seizures

▶ **BY MOUTH**

• Child 1 month–11 years: Initially 1–1.5 mg/kg twice daily, then increased in steps of 2 mg/kg/daily as required; maintenance 2.5–4 mg/kg 1–2 times a day

• Child 12–17 years: 60–180 mg once daily

• Adult: 60–180 mg once daily, dose to be taken at night

**Status epilepticus**

▶ **BY INTRAVENOUS INJECTION**

• Adult: 10 mg/kg (max. per dose 1 g), dose to be administered at a rate not more than 100 mg/minute, injection to be diluted 1 in 10 with water for injections

▶ **BY SLOW INTRAVENOUS INJECTION**

• Child 1 month–11 years: Initially 20 mg/kg, dose to be administered at a rate no faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day

• Child 12–17 years: Initially 20 mg/kg (max. per dose 1 g), dose to be administered at a rate no faster than 1 mg/kg/minute, then 300 mg twice daily

**DOSE EQUIVALENCE AND CONVERSION**

For therapeutic purposes phenobarbital and phenobarbital sodium may be considered equivalent in effect.

● **CAUTIONS**

Avoid in acute porphyrias p. 969 • children • debilitated • elderly • history of alcohol abuse • history of drug abuse • respiratory depression (avoid if severe)

**CAUTIONS, FURTHER INFORMATION**

Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

● **INTERACTIONS** → Appendix 1: antiepileptics

● **SIDE-EFFECTS**

▶ **Common or very common**

Agranulocytosis • allergic skin reactions • ataxia • behavioural disturbances • cholestasis • depression • drowsiness • hallucinations • hepatitis • hyperactivity particularly in the elderly and in children • hypotension • impaired cognition • impaired memory • irritability • lethargy • megaloblastic anaemia (may be treated with folic acid) • nystagmus • osteomalacia • paradoxical excitement (in adults) • respiratory depression • thrombocytopenia

▶ **Very rare**

Antiepileptic Hypersensitivity Syndrome • Stevens-Johnson syndrome • suicidal ideation • toxic epidermal necrolysis

▶ **Frequency not known**

Hyperkinesia (in children)

**Overdose**

For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 1249.

● **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with phenobarbital. See under Epilepsy p. 292 for more information.

● **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

● **BREAST FEEDING** Avoid if possible; drowsiness may occur.

● **HEPATIC IMPAIRMENT** May precipitate coma. Avoid in severe impairment.

● **RENAL IMPAIRMENT** Use with caution.

● **MONITORING REQUIREMENTS**

Plasma-phenobarbital concentration for optimum response is 15–40 mg/litre (60–180 micromol/litre);
however, monitoring the plasma-drug concentration is less useful than with other drugs because tolerance occurs. **TREATMENT CESSATION** Avoid abrupt withdrawal (dependence with prolonged use).

**DIRECTIONS FOR ADMINISTRATION**

- **With intravenous use in children**
- **With intravenous use in adults**

**PRESCRIBING AND DISPENSING INFORMATION** Some hospitals supply alcohol-free formulations of varying phenobarbital strengths.

Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients should be maintained on a specific manufacturer’s product.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Phenobarbital for preventing seizures www.medicinesforchildren.org.uk/phenobarbital-for-preventing-seizures

**MEDICINAL FORMS**

  - **Phenobarbital sodium 60 mg per 1 ml** Phenobarbital 60mg/1ml solution for injection ampoules | 10 ampoule | £85.82 CD3
  - **Phenobarbital sodium 200 mg per 1 ml** Phenobarbital 200mg/1ml solution for injection ampoules | 10 ampoule | £66.63–£69.96 CD3

- **Oral solution**
  - **Phenobarbital (Non-proprietary)**
    - Phenobarbital 3 mg per 1 ml Phenobarbital 15mg/5ml elixir | 500 ml | £83.00 DT price = £83.00 CD3

---

**INDICATIONS AND DOSE**

**All forms of epilepsy except typical absence seizures**

- **BY MOUTH**
  - Child 1 month–1 year: Initially 125 mg daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 125–250 mg twice daily
  - Child 2–4 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 250–375 mg twice daily
  - Child 5–8 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 375–500 mg twice daily
  - Child 9–17 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, increased to 250 mg twice daily, then increased in steps of 250 mg every 3 days (max. per dose 750 mg twice daily), adjusted according to response
  - Adult: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, increased to 500 mg daily in 2 divided doses, then increased in steps of 250 mg every 3 days, adjusted according to response; maintenance 0.75–1.5 g daily in 2 divided doses

**Essential tremor**

- **BY MOUTH**
  - Adult: Initially 50 mg daily, then adjusted according to response to up to 750 mg daily, dose to be increased over 2–3 weeks

**CAUTIONS** Avoid in acute porphyria · children · debilitated · elderly · history of alcohol abuse · history of drug abuse · respiratory depression (avoid if severe)

**CAUTIONS, FURTHER INFORMATION**

Consider vitamin D supplementation in patients who are immunomodulated for long periods or who have inadequate sun exposure or dietary intake of calcium.

**INTERACTIONS** → Appendix 1: antiepileptics

**SIDE-EFFECTS**

- **Common or very common**
  - Agranulocytosis · allergic skin reactions · ataxia · behavioural disturbances · cholostasis · depression · drowsiness · hallucinations · hepatitis · hyperactivity (in children) · hyperactivity particularly in the elderly · hypotension · impaired cognition · impaired memory · irritability · lethargy · megaloblastic anaemia (may be treated with folic acid) · nausea · nystagnmus · osteomalacia · paradoxical excitement (in adults) · respiratory depression · thrombocytopenia · visual disturbances
  - **Uncommon**
    - Dizziness · headache · vomiting
  - **Rare**
    - Arthralgia · lupus erythematosus · psychosis
  - **Very rare**
    - Antiepileptic Hypersensitivity Syndrome · Stevens-Johnson syndrome · suicidal ideation · toxic epidermal necrolysis

**FREQUENCY NOT KNOWN**

- **Dupuytren’s contracture**

**ALLERGY AND CROSS-SENSITIVITY**

Antiepileptic hypersensitivity syndrome associated with primidone. See under Epilepsy p. 292 for more information.

**PREGNANCY**

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**HEPATIC IMPAIRMENT** Reduce dose. May precipitate coma.

**RENAL IMPAIRMENT**

Use with caution.

**MONITORING REQUIREMENTS**

Monitor plasma concentrations of derived phenobarbital; plasma concentration for optimum response is 15–40 mg/litre (60–180 micromol/litre).

**TREATMENT CESSATION**

Avoid abrupt withdrawal (dependence with prolonged use).

**PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension

- **Oral suspension**

**Clobazam**

- **INDICATIONS AND DOSE**
  - **Adjunct in epilepsy**
    - **By mouth**
    - Child 6–17 years: Initially 5 mg daily, dose to be increased if necessary at intervals of 5 days, maintenance 0.3–1 mg/kg daily, daily doses of up to 30 mg may be given as a single dose at bedtime, higher doses should be divided; maximum 60 mg per day.
    - Adult: 20–30 mg daily, then increased if necessary up to 60 mg daily.
  - **Anxiety (short-term use)**
    - **By mouth**
    - Adult: 20–30 mg daily in divided doses, alternatively 20–30 mg once daily, dose to be taken at bedtime; increased if necessary up to 60 mg daily in divided doses, dose only increased in severe anxiety (in hospital patients), for debilitated patients, use elderly dose.
    - Elderly: 10–20 mg daily.

- **UNLICENSED USE** Not licensed for use in children under 6 years. Not licensed as monotherapy.

**IMPORTANT SAFETY INFORMATION**

Do not confuse with clonazepam.

- **CONTRA-INDICATIONS** Chronic psychosis (in adults) · hyperkinnesia · not for use alone to treat anxiety associated with depression (in adults) · obsessional states · phobic states · respiratory depression.

- **CAUTIONS** Muscle weakness · organic brain changes · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence.

- **CAUTIONS, FURTHER INFORMATION**

The effectiveness of clobazam may decrease significantly after weeks or months of continuous therapy.

- **INTERACTIONS** → Appendix 1: clobazam.

- **SIDE-EFFECTS**
  - **Common or very common** Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness · next day · muscle weakness · paradoxical increase in aggression.
  - **Uncommon** Changes in libido (in adults) · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache (in adults) · hypotension (in adults) · incontinence · salivation changes · slurred speech (in adults) · tremor · urinary retention (in adults) · vertigo (in adults) · visual disturbances.
  - **Rare** Apnoea · blood disorders · changes in libido (in children) · headache (in children) · hypotension (in children) · jaundice · respiratory depression · skin reactions · urinary retention (in children) · vertigo (in children).
  - **Frequency not known** Delusions (in children) · excitement (in children) · hallucinations (in children) · irritability (in children) · psychosis (in children) · restlessness (in children).

- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.
  All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.

- **HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

- **RENAI IMPAIRMENT** Start with small doses in severe impairment.

- **MONITORING REQUIREMENTS**
  - **In children** Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected noncompliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.

- **PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic clobazam product.

- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Clobazam for preventing seizures www.medicinesforchildren.org.uk/clobazam-preventing-seizures-0

- **NATIONAL FUNDING/ACCESS DECISIONS**

NHS restrictions Clobazam is not prescribable under the NHS except for epilepsy and endorsed ‘SLS’.

- **MEDIINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension.

**Oral suspension**

**INDICATIONS AND DOSE**

**All forms of epilepsy**

- **BY MOUTH**
  - Child 1–11 months: Initially 250 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 0.5–1 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
  - Child 1–4 years: Initially 250 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 1–2 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
  - Child 5–11 years: Initially 500 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 3–6 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
  - Child 12–17 years: Initially 1 mg once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, dose usually taken at night; may be given in 3–4 divided doses if necessary

**Panic disorders (with or without agoraphobia) resistant to antidepressant therapy**

- **BY MOUTH**
  - Adult: 1–2 mg daily

**ALL FORMS OF EPILEPSY | MYOCLONUS**

- Adult: Initially 1 mg once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3–4 divided doses if necessary

**Elderly**

- Initially 500 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3–4 divided doses if necessary

**UNLICENSED USE**

Clonazepam doses in BNF may differ from those in product literature. Use for panic disorders (with or without agoraphobia) resistant to antidepressant therapy is an unlicensed indication.

**IMPORTANT SAFETY INFORMATION**

Do **not** confuse with clonazepam.

**CONTRA-INDICATIONS**

- Coma • current alcohol abuse • current drug abuse • respiratory depression

**CAUTIONS**

- Acute porphyrias p. 969 • airways obstruction • brain damage • cerebellar ataxia • depression • spinal ataxia • suicidal ideation

**CAUTIONS, FURTHER INFORMATION**

The effectiveness of clonazepam may decrease significantly after weeks or months of continuous therapy.

**INTERACTIONS**

- Appendix 1: clonazepam

**SIDE-EFFECTS**

- **Common or very common**
  - Amnesia • bronchial hypersecretion in infants and small children • coordination disturbances • confusion • dependence • dizziness • drowsiness • fatigue • muscle hypotonia • nystagmus • poor concentration • restlessness • salivary hypersecretion in infants and small children • withdrawal symptoms (in children)
  - **Rare**
  - Aggression • anxiety • blood disorders • dysarthria • gastro-intestinal symptoms • headache • paradoxical effects • pruritus • respiratory depression • reversible hair loss • sexual dysfunction • skin pigmentation changes • suicidal ideation (in adults) • urinary incontinence • urticaria • visual disturbances on long-term treatment
  - **Very rare**
  - Increase in seizure frequency

**BREAST FEEDING**

Present in milk, and should be avoided if possible during breast-feeding.

All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.

**HEPATIC IMPAIRMENT**

Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

**RENAL IMPAIRMENT**

Start with small doses in severe impairment.

**MONITORING REQUIREMENTS**

- In children Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected noncompliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.

**PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral clonazepam product.

ANTIEPILEPTICS \textgreater{} BARBITURATES

Thiopental sodium

(Thiopentone sodium)

\textbf{INDICATIONS AND DOSE}

\textbf{Status epilepticus (only if other measures fail)}

\textgreater{} BY SLOW INTRAVENOUS INJECTION

Adult: 75–125 mg for 1 dose, to be administered as a 2.5% (25 mg/mL) solution

\textbf{Induction of anaesthesia}

\textgreater{} BY SLOW INTRAVENOUS INJECTION

Adult: Initially 100–150 mg, to be administered over 10–15 seconds usually as a 2.5% (25 mg/mL) solution, followed by 300–450 mg after 5–10 minutes if required, dose to be given in fit and premedicated adults; debilitated patients or adults over 65 years may require a lower dose or increased administration time, alternatively initially up to 4 mg/kg (max. per dose 500 mg)

\textbf{Anaesthesia of short duration}

\textgreater{} BY SLOW INTRAVENOUS INJECTION

Adult: Initially 100–150 mg, to be administered over 10–15 seconds usually as a 2.5% (25 mg/mL) solution, followed by 300–450 mg after 5–10 minutes if required, dose to be given in fit and premedicated adults; debilitated patients or adults over 65 years may require a lower dose or increased administration time, alternatively initially up to 4 mg/kg (max. per dose 500 mg)

\textbf{Reduction of raised intracranial pressure if ventilation controlled}

\textgreater{} BY SLOW INTRAVENOUS INJECTION

Adult: 1.5–3 mg/kg, repeated if necessary

\textbf{IMPORTANT SAFETY INFORMATION}

Thiopental sodium should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

\textbf{CONTRA-INDICATIONS}

Acute porphyrias p. 969 · myotonic dystrophy

\textbf{CAUTIONS}

Acute circulatory failure (shock) · avoid intravascular injection · cardiovascular disease · elderly · fixed cardiac output · hypovolaemia · reconstituted solution is highly alkaline (extravasation causes tissue necrosis and severe pain)

\textbf{INTERACTIONS} \rightarrow Appendix 1: thiopental

\textbf{SIDE-EFFECTS}

Arrhythmias · cough · headache · hypersensitivity reactions · hypotension · laryngeal spasm · myocardial depression · rash · sneezing

\textbf{PREGNANCY}

May depress neonatal respiration when used during delivery.

\textbf{BREAST FEEDING}

Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

\textbf{HEPATIC IMPAIRMENT}

Use with caution—reduce dose.

\textbf{RENAL IMPAIRMENT}

Caution in severe impairment.

\textbf{PATIENT AND CARER ADVICE}

Driving and skilled tasks

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

\textbf{MEDICINAL FORMS}

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

\textbf{Powder for solution for injection}

\textgreater{} BY INTRAMUSCULAR INJECTION

Adult: 50 micrograms/kg, to be administered 60–90 minutes before operation

\textbf{Pre-medication}

\textgreater{} BY MOUTH

Adult: 2–3 mg, to be taken the night before operation; 2–4 mg, to be taken 1–2 hours before operation

\textgreater{} BY SLOW INTRAVENOUS INJECTION

Adult: 50 micrograms/kg, to be administered 30–45 minutes before operation

\textgreater{} BY INTRAMUSCULAR INJECTION

Adult: 50 micrograms/kg, to be administered 60–90 minutes before operation

\textbf{Status epilepticus} \mid \textbf{Febrile convulsions} \mid \textbf{Convulsions caused by poisoning}

\textgreater{} BY SLOW INTRAVENOUS INJECTION

Child 1 month–11 years: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, then 100 micrograms/kg after 10 minutes (max. per dose 4 mg) if required for 1 dose, to be administered into a large vein

Child 12–17 years: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose, to be administered into a large vein

Adult: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose, to be administered into a large vein
UNLICENSED USE

IMPORTANT SAFETY INFORMATION
ANAESTHESIA
Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

CONTRA-INDICATIONS
Avoid injections containing benzyl alcohol in neonates • chronic psychosis (in adults) • CNS depression • compromised airway • hyperkinesis • not for use alone to treat depression (or anxiety associated with depression) (in adults) • obsessional states • phobic states • respiratory depression

CAUTIONS
Personality disorder (within the fearful group) • dependent, avoidant, obsessive-compulsive) may increase risk of dependence • muscle weakness • organic brain changes • parenteral administration

CAUTIONS, FURTHER INFORMATION
- Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.
- Special precautions for parenteral administration
  When given parenterally, facilities for managing respiratory depression with mechanical ventilation must be available. Close observation required until full recovery from sedation.

INTERACTIONS
- Appendix 1: lorazepam

SIDE-EFFECTS
- Common or very common Amnesia • ataxia (in children) • ataxia (especially in the elderly) • confusion (in children) • confusion (especially in the elderly) • dependence • drowsiness the next day • lightheadedness the next day • muscle weakness • paradoxical increase in aggression
- Uncommon Changes in libido (in adults) • dizziness • dysarthria • gastro-intestinal disturbances • gynaecomastia • headache (in adults) • hypotension (in adults) • incontinence • salivation changes • slurred speech (in adults) • tremor • urinary retention (in adults) • vertigo (in adults) • visual disturbances
- Rare Apnoea • blood disorders • changes in libido (in children) • headache (in children) • hypotension (in children) • jaundice • respiratory depression • skin reactions • urinary retention (in adults) • vertigo (in children)
- Frequency not known Delusions (in children) • excitement (in children) • hallucinations (in children) • irritability (in children) • marked respiratory depression, particularly with high dose and intravenous use (facilities for its treatment are essential) • pain (on intravenous injection) • psychosis (in children) • restlessness (in children) • thrombophlebitis (on intravenous injection)

BREAST FEEDING
Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

HEPATIC IMPAIRMENT
Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.
- In adults If treatment is necessary, benzodiazepines with shorter half-lives are safer.

RENAL IMPAIRMENT
Start with small doses in severe impairment.

DIRECTIONS FOR ADMINISTRATION
- With intravenous use in children For intravenous injection, dilute with an equal volume of Sodium Chloride 0.9% (for neonates, dilute injection solution to a concentration of 100 micrograms/mL). Give over 3–5 minutes; max. rate 50 micrograms/kg over 3 minutes.
- With intramuscular use in adults For intramuscular injection, solution for injection should be diluted with an equal volume of water for injections or sodium chloride 0.9% (but only use when oral and intravenous routes not possible).
- With intravenous use in adults For slow intravenous injection, solution for injection should preferably be diluted with an equal volume of water for injections or sodium chloride 0.9%.

PATIENT AND CARER ADVICE
Driving and skilled tasks
May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

PACIENTS given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to at least 24 hours after administration.

RESPONSIBLE persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Solution for injection
- EXCIPIENTS: May contain Benzyl alcohol, propylene glycol
  - Ativan (Pfizer Ltd)
    Lorazepam 4 mg per 1 ml Ativan 4mg/1ml solution for injectionampoules | 10 ampoule [Pom] £3.54 [CD4-1]

Tablet
- CAUTIONARY AND ADVISORY LABELS 2, 19
  - Lorazepam (Non-properitary)
    Lorazepam 1 mg Lorazepam 1mg tablets | 28 tablet [Ptm] £6.90 DT price = £4.41 [CD4-1] | 30 tablet [Pom] no price available [CD4-1]
    Lorazepam 2.5 mg Lorazepam 2.5mg tablets | 28 tablet [Ptm] £12.20 DT price = £12.20 [CD4-1] | 30 tablet [Pom] no price available [CD4-1]

Midazolam

INDICATIONS AND DOSE
Status epilepticus | Febrile convulsions
- BY BUCCAL ADMINISTRATION
  - Child 1–2 months: 300 micrograms/kg (max. per dose 2.5 mg), then 300 micrograms/kg after 10 minutes (max. per dose 2.5 mg) if required
  - Child 3–11 months: 2.5 mg, then 2.5 mg after 10 minutes if required
  - Child 1–4 years: 5 mg, then 5 mg after 10 minutes if required
  - Child 5–9 years: 7.5 mg, then 7.5 mg after 10 minutes if required
  - Child 10–17 years: 10 mg, then 10 mg after 10 minutes if required
  - Adult: 10 mg, then 10 mg after 10 minutes if required

Conscious sedation for procedures
- BY SLOW INTRAVENOUS INJECTION
  - Adult: Initially 2.5 mg, to be administered 5–10 minutes before procedure at a rate of approximately 2 mg/minute, increased in steps of 1 mg if required, usual total dose is 3.5–5 mg; maximum 7.5 mg per course
  - Elderly: Initially 0.5–1 mg, to be administered 5–10 minutes before procedure at a rate of continued
Sedation of patient receiving intensive care

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: 30–100 micrograms/kg, repeated if necessary, alternatively (by continuous intravenous infusion) 30–100 micrograms/kg/hour
  - Elderly: Lower doses needed

**Premedication**

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 70–100 micrograms/kg, to be administered 20–60 minutes before induction, for debilitated patients, use elderly dose
  - Elderly: 25–50 micrograms/kg, to be administered 20–60 minutes before induction

- **BY INTRAVENOUS INJECTION**
  - Adult: 1–2 mg, repeated if necessary, to be administered 5–30 minutes before procedure, for debilitated patients, use elderly dose
  - Elderly: 0.5 mg, repeated if necessary, initial dose to be administered 5–30 minutes before procedure, repeat dose slowly as required

**Induction of anaesthesia (but rarely used)**

- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 150–200 micrograms/kg daily in divided doses (max. per dose 5 mg), dose to be given at intervals of 2 minutes, maximum total dose 600 micrograms/kg, for debilitated patients, use elderly dose
  - Elderly: 50–150 micrograms/kg daily in divided doses (max. per dose 5 mg), dose to be given at intervals of 2 minutes, maximum total dose 600 micrograms/kg

**Sedation of patient receiving intensive care**

- **INITIALLY BY SLOW INTRAVENOUS INJECTION**
  - Adult: Initially 30–300 micrograms/kg, dose to be given in steps of 1–2.5 mg every 2 minutes, then (by slow intravenous injection or by continuous intravenous infusion) 30–200 micrograms/kg/hour, reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia, lower doses may be adequate if opioid analgesic also used

**Confusion and restlessness in palliative care (adjunct to antipsychotic)**

- **BY SUBCUTANEOUS INFUSION**
  - Adult: Initially 10–20 mg/24 hours, adjusted according to response; usual dose 20–60 mg/24 hours

**Convulsions in palliative care**

- **BY CONTINUOUS SUBCUTANEOUS INFUSION**
  - Adult: Initially 20–40 mg/24 hours

**SIDE-EFFECTS, FURTHER INFORMATION**

- Sedation Midazolam is associated with profound sedation when high doses are given or when it is used with certain other drugs.

**Overdose**

There have been reports of overdose when high strength midazolam has been used for conscious sedation. The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

**CONTRA-INDICATIONS** CNS depression • compromised airway • severe respiratory depression

**CAUTIONS** Cardiac disease • children (particularly if cardiovascular impairment) • concentration of midazolam in children under 15 kg not to exceed 1 mg/mL • debilitated patients (reduce dose)(in children) • hypothermia • hypovolaemia (risk of severe hypotension) • neonates • risk of airways obstruction and hyperventilation in children under 6 months (monitor respiratory rate and oxygen saturation) • vasoconstriction

**CAUTIONS, FURTHER INFORMATION**

- Recovery when used for sedation Midazolam has a fast onset of action, recovery is faster than for other benzodiazepines such as diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing.

**INTERACTIONS** → Appendix 1: midazolam

- **SIDE-EFFECTS** Amnesia • anaphylaxis • ataxia • blood disorders • bronchospasm • cardiac arrest • changes in libido (in adults) • confusion • convulsions (more common in neonates) • depression of consciousness • dizziness • drowsiness • dry mouth • dysarthria • euphoria • fatigue (in children) • gastro-intestinal disturbances • hallucinations • headache • heart rate changes • hicups • hypotension • incontinence • increased appetite • injection-site reactions • involuntary movements • jaundice • laryngospasm • muscle weakness • paradoxical aggression (especially in children and elderly) • paradoxical excitement (especially in children and elderly) • respiratory arrest (particularly with high doses or on rapid injection) • respiratory depression (may be severe with sedative and peri-operative use—facilities for its treatment are essential) • respiratory depression (particularly with high doses or on rapid injection) • restlessness (with sedative and peri-operative use) (in children) • salivation changes • severe disinhibition (with sedative and peri-operative use) (in children) • skin reactions • thrombosis • urinary retention • vertigo • visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

- Sedation Midazolam is associated with profound sedation when high doses are given or when it is used with certain other drugs.

**UNLICENSED USE** Oromucosal solution not licensed for use in children under 3 months. Oromucosal solution not licensed for use in adults over 18 years. Unlicensed oromucosal formulations are also available and may have different doses—refer to product literature.

**IMPORTANT SAFETY INFORMATION**

**ANAESTHESIA**

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

**PREScribing of Midazolam In Palliative Care**

The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be considered in palliative care and other situations where a higher strength may be more appropriate than administering the prescribed dose, and where the risk of overdose has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

**CONTRA-INDICATIONS** CNS depression • compromised airway • severe respiratory depression

**CAUTIONS** Cardiac disease • children (particularly if cardiovascular impairment) • concentration of midazolam in children under 15 kg not to exceed 1 mg/mL • debilitated patients (reduce dose)(in children) • hypothermia • hypovolaemia (risk of severe hypotension) • neonates • risk of airways obstruction and hyperventilation in children under 6 months (monitor respiratory rate and oxygen saturation) • vasoconstriction

**CAUTIONS, FURTHER INFORMATION**

- Recovery when used for sedation Midazolam has a fast onset of action, recovery is faster than for other benzodiazepines such as diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing.

**INTERACTIONS** → Appendix 1: midazolam

- **SIDE-EFFECTS** Amnesia • anaphylaxis • ataxia • blood disorders • bronchospasm • cardiac arrest • changes in libido (in adults) • confusion • convulsions (more common in neonates) • depression of consciousness • dizziness • drowsiness • dry mouth • dysarthria • euphoria • fatigue (in children) • gastro-intestinal disturbances • hallucinations • headache • heart rate changes • hicups • hypotension • incontinence • increased appetite • injection-site reactions • involuntary movements • jaundice • laryngospasm • muscle weakness • paradoxical aggression (especially in children and elderly) • paradoxical excitement (especially in children and elderly) • respiratory arrest (particularly with high doses or on rapid injection) • respiratory depression (may be severe with sedative and peri-operative use—facilities for its treatment are essential) • respiratory depression (particularly with high doses or on rapid injection) • restlessness (with sedative and peri-operative use) (in children) • salivation changes • severe disinhibition (with sedative and peri-operative use) (in children) • skin reactions • thrombosis • urinary retention • vertigo • visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

- Sedation Midazolam is associated with profound sedation when high doses are given or when it is used with certain other drugs.

**Overdose**

There have been reports of overdose when high strength midazolam has been used for conscious sedation. The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

**BREAST FEEDING** Small amount present in milk—avoid breast-feeding for 24 hours after administration (although amount probably too small to be harmful after single doses).

**HEPATIC IMPAIRMENT** Use with caution particularly in sedative doses; can precipitate coma. For status epilepticus and febrile convulsions: use with caution in mild to moderate impairment; avoid in severe impairment.

**RENAL IMPAIRMENT** Use with caution in chronic renal failure.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Hypnovel®), give continuously in Glucose 5% or Sodium chloride 0.9%.

**PREscribing and Dispensing Information**

Palliative care

For further information on the use of midazolam in palliative care, see www.palliativedrugs.com/formulary/en/midazolam.html.
PATIENT AND CARER ADVICE
Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

ANTIDEPRESSANTS > SEROTONIN RECEPTOR AGONISTS

Buspirone hydrochloride

INDICATIONS AND DOSE
Anxiety (short-term use)
- BY MOUTH
  - Adult: 5 mg 2–3 times a day, increased if necessary up to 45 mg daily, dose to be increased at intervals of 2–3 days; usual dose 15–30 mg daily in divided doses

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Manufacturer advises reduce dose to 2.5 mg twice daily with concurrent use of potent inhibitors of CYP3A4.

CONTRA-INDICATIONS
Acute porphyrias p. 969 • epilepsy

CAUTIONS
Does not alleviate symptoms of benzodiazepine withdrawal

CAUTIONS, FURTHER INFORMATION
A patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting buspirone.

INTERACTIONS ➔ Appendix 1: buspirone

SIDE-EFFECTS
- Common or very common Dizziness • excitement • headache • nausea • nervousness
- Rare Chest pain • confusion • drowsiness • dry mouth • fatigue • palpitation • seizures • sweating • tachycardia

PREGNANCY
Avoid.

BREAST FEEDING
Avoid.

HEPATIC IMPAIRMENT
Reduce dose in mild to moderate disease. Avoid in severe disease.

RENAL IMPAIRMENT
Reduce dose. Avoid if eGFR less than 20 mL/minute/1.73 m².

PATIENT AND CARER ADVICE
Driving and skilled tasks May affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet
- Buspirone hydrochloride (Non-proprietary)
  5 mg Buspirone 5mg tablets 30 tablet (Posm) £28.64 DT price = £3.19

- Buspirone hydrochloride 10 mg Buspirone 10mg tablets 30 tablet Posm £24.00 DT price = £3.85

HYPNOTICS, SEDATIVES AND ANXIOLYTICS > BENZODIAZEPINES

Benzodiazepines

CONTRA-INDICATIONS
Acute pulmonary insufficiency • marked neuromuscular respiratory weakness • sleep apnoea syndrome • unstable myasthenia gravis

CAUTIONS
Avoid prolonged use (and abrupt withdrawal thereafter) • debilitated patients (reduce dose)(in adults) • elderly (reduce dose)(in adults) • history of alcohol dependence or abuse • history of drug dependence or abuse • myasthenia gravis • respiratory disease

CAUTIONS, FURTHER INFORMATION
Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the...
impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

- **SIDE-EFFECTS**
  - **Overdose**
    Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. For details on the management of poisoning, see Benzodiazepines, under Emergency treatment of poisoning p. 1249.
  - **PREGNANCY**
    Risk of neonatal withdrawal symptoms when used during pregnancy. Avoid regular use and use only if there is a clear indication such as seizure control. High doses administered during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.
  - **RENAL IMPAIRMENT**
    Increased cerebral sensitivity to benzodiazepines.
  - **PATIENT AND CARER ADVICE**
    Driving and skilled tasks
    Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
    For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including benzodiazepines, see Drugs and driving under Guidance on prescribing p. 1.

### Alprazolam

- **INDICATIONS AND DOSE**
  - **Short-term use in anxiety**
    - **BY MOUTH**
      - Adult: 250–500 micrograms 3 times a day, increased if necessary up to 3 mg daily, for debilitated patients, use elderly dose
      - Elderly: 250 micrograms 2–3 times a day, increased if necessary up to 3 mg daily

- **CONTRA-INDICATIONS**
  - Chronic psychosis • hyperkinesia • not for use alone to treat depression (or anxiety associated with depression) • obsessive states • phobic states • respiratory depression

- **CAUTIONS**
  - Muscle weakness • organic brain changes • personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

- **INTERACTIONS** → Appendix 1: alprazolam

- **SIDE-EFFECTS**
  - **Common or very common**
    - Amnesia • ataxia (especially in the elderly) • confusion (especially in the elderly) • dependence • drowsiness the next day • lightheadedness the next day • muscle weakness • paradoxical increase in aggression
  - **Uncommon**
    - Changes in libido • dizziness • dysarthria • gastrointestinal disturbances • gynaecomastia • headache • hypotension • incontinence • salivation changes • slurred speech • tremor • urinary retention • vertigo • visual disturbances
  - **Rare**
    - Apnoea • blood disorders • jaundice • respiratory depression • skin reactions

- **BREAST FEEDING**
  - Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Start with smaller initial doses or reduce dose. Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer. Avoid in severe impairment.

- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks**
    - May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NHS restrictions**
    - Alprazolam tablets are not prescribable under the NHS.

### Chlordiazepoxide hydrochloride

- **INDICATIONS AND DOSE**
  - **Short-term use in anxiety**
    - **BY MOUTH**
      - Adult: 10 mg 3 times a day, increased if necessary to 60–100 mg daily in divided doses, for debilitated patients, use elderly dose
      - Elderly: 5 mg 3 times a day, increased if necessary to 30–50 mg daily in divided doses

- **TREATMENT OF ALCOHOL WITHDRAWAL IN MODERATE DEPENDENCE**
  - **BY MOUTH**
    - Adult: 10–30 mg 4 times a day, dose to be gradually reduced over 5–7 days, consult local protocols for titration regimens

- **TREATMENT OF ALCOHOL WITHDRAWAL IN SEVERE DEPENDENCE**
  - **BY MOUTH**
    - Adult: 10–50 mg 4 times a day and 10–40 mg as required for the first 2 days, dose to be gradually reduced over 7–10 days, consult local protocols for titration regimens; maximum 250 mg per day

- **CONTRA-INDICATIONS**
  - Chronic psychosis • hyperkinesia • not for use alone to treat depression (or anxiety associated with depression) • obsessive states • phobic states • respiratory depression

- **CAUTIONS**
  - Muscle weakness • organic brain changes • personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

- **INTERACTIONS** → Appendix 1: chlordiazepoxide

- **SIDE-EFFECTS**
  - **Common or very common**
    - Amnesia • ataxia (especially in the elderly) • confusion (especially in the elderly) • dependence • drowsiness the next day • lightheadedness the next day • muscle weakness • paradoxical increase in aggression
  - **Uncommon**
    - Changes in libido • dizziness • dysarthria • gastrointestinal disturbances • gynaecomastia • headache • hypotension • incontinence • salivation changes • slurred speech • tremor • urinary retention • vertigo • visual disturbances
  - **Rare**
    - Apnoea • blood disorders • jaundice • respiratory depression • skin reactions

- **BREAST FEEDING**
  - Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Start with smaller initial doses or reduce dose. Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer. Avoid in severe impairment.
**Diazepam**

**INDICATIONS AND DOSE**

**Muscle spasm of varied aetiology**
- **BY MOUTH**
  - Adult: 2–15 mg daily in divided doses, then increased if necessary to 60 mg daily, adjusted according to response, dose only increased in spas tic conditions

**Acute muscle spasm**
- **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
  - Adult: 10 mg, then 10 mg after 4 hours if required, intravenous injection to be administered into a large vein at a rate of no more than 5 mg/minute

**Tetanus**
- **BY INTRAVENOUS INJECTION**
  - Child: 100–300 micrograms/kg every 1–4 hours
  - Adult: 100–300 micrograms/kg every 1–4 hours

**BY INTRAVENOUS INFUSION, OR BY NASODUODENAL TUBE**
  - Child: 3–10 mg/kg, adjusted according to response, to be given over 24 hours
  - Adult: 3–10 mg/kg, adjusted according to response, to be given over 24 hours

**Muscle spasm in cerebral spasticity or in postoperative skeletal muscle spasm**
- **BY MOUTH**
  - Child 1-11 months: Initially 250 micrograms/kg twice daily
  - Child 1-4 years: Initially 2.5 mg twice daily
  - Child 5-11 years: Initially 5 mg twice daily
  - Child 12-17 years: Initially 10 mg twice daily; maximum 40 mg per day

**Anxiety**
- **BY MOUTH**
  - Adult: 2 mg 3 times a day, then increased if necessary to 15–30 mg daily in divided doses, for debilitated patients, use elderly dose
  - Elderly: 1 mg 3 times a day, then increased if necessary to 7.5–15 mg daily in divided doses

**Insomnia associated with anxiety**
- **BY MOUTH**
  - Adult: 5–15 mg daily, to be taken at bedtime

**Severe acute anxiety | Control of acute panic attacks | Acute alcohol withdrawal**
- **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
  - Adult: 10 mg, then 10 mg after at least 4 hours if required, intravenous injection to be administered into a large vein, at a rate of not more than 5 mg/minute

**Acute drug-induced dystonic reactions**
- **BY INTRAVENOUS INJECTION**
  - Adult: 5–10 mg, then 5–10 mg after at least 10 minutes as required, to be administered into a large vein, at a rate of not more than 5 mg/minute

**Acute anxiety and agitation**
- **BY RECTUM**
  - Adult: 500 micrograms/kg, then 500 micrograms/kg after 12 hours as required
  - Elderly: 250 micrograms/kg, then 250 micrograms/kg after 12 hours as required

**Premedication**
- **BY MOUTH**
  - Adult: 5–10 mg, to be given 1–2 hours before procedure, for debilitated patients, use elderly dose
  - Elderly: 2.5–5 mg, to be given 1–2 hours before procedure

**BY INTRAVENOUS INJECTION**
  - Adult: 100–200 micrograms/kg, to be administered into a large vein at a rate of not more than 5 mg/minute, immediately before procedure

**Sedation in dental procedures carried out in hospital**
- **BY MOUTH**
  - Adult: Up to 20 mg, to be given 1–2 hours before procedure

**Conscious sedation for procedures, and in conjunction with local anaesthesia**
- **BY MOUTH**
  - Adult: 5–10 mg, to be given 1–2 hours before procedure, for debilitated patients, use elderly dose
  - Elderly: 2.5–5 mg, to be given 1–2 hours before procedure

**BY INTRAVENOUS INJECTION**
  - Adult: 10–20 mg, to be administered into a large vein over 2–4 minutes, immediately before procedure

**Status epilepticus | Febrile convulsions | Convulsions due to poisoning**
- **BY INTRAVENOUS INJECTION**
  - Neonate: 300–400 micrograms/kg, then 300–400 micrograms/kg after 10 minutes if required, to be given over 3–5 minutes

  - Child: 1 month-11 years: 300–400 micrograms/kg (max. per dose 10 mg), then 300–400 micrograms/kg after 10 minutes if required, to be given over 3–5 minutes
  - Child 12-17 years: 10 mg, then 10 mg after 10 minutes if required, to be given over 3–5 minutes
  - Adult: 10 mg, then 10 mg after 10 minutes if required, administered at a rate of 1 mL (5 mg) per minute

  **continued**
Nervous system

▶ Common or very common

- headache (in adults)
- hypotension (in adults)
- incontinence
- salivation changes
- slurred speech (in adults)
- tremor
- urinary retention (in adults)
- vertigo (in adults)
- visual disturbances

▶ Rare
- Apnoea
- blood disorders
- changes in Libido (in children)
- headache (in children)
- hypotension (in children)
- jaundice
- respiratory depression
- skin reactions
- urinary retention (in children)
- vertigo (in children)

▶ Frequency not known
- Delusions (in children)
- excitement (in children)
- hallucinations (in children)
- hypotonia (when used for muscle spasm)
- irritability (in children)
- marked respiratory depression, particularly with high dose (facilities for its treatment are essential)
- psychosis (in children)
- restlessness (in children)

SPECIFIC SIDE-EFFECTS

- With intravenous use
  - Pain
  - thrombophlebitis
  - venous thrombosis (in adults)

▶ PREGNANCY
- Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol.

Epilepsy and Pregnancy Register
- All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

▶ BREAST FEEDING
- Present in milk, and should be avoided if possible during breast-feeding.

▶ HEPATIC IMPAIRMENT
- Start with smaller initial doses or reduce dose. Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half lives are safer, such as temazepam or oxazepam. Avoid in severe impairment.

▶ RENAL IMPAIRMENT
- Start with small doses in severe impairment.

▶ DIRECTIONS FOR ADMINISTRATION

- With intravenous use
  - Diazepam is adsorbed by plastics of infusion bags and giving sets. Emulsion formulation preferred for intravenous injection.

- With intravenous use in children
  - For continuous intravenous infusion of diazepam emulsion, dilute to a concentration of max. 400 micrograms/mL with Glucose 5% or 10%; max. 6 hours between addition and completion of infusion. For continuous intravenous infusion of diazepam solution, dilute to a concentration of max. 50 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%.

- With intravenous use in adults
  - For intravenous infusion (solution) (Diazepam, Wockhardt), give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of not more than 10 mg in 200 mL. For intravenous infusion (emulsion) (Diazemuls®), give continuously in Glucose 5% or 10%. May be diluted to a max. concentration of 200 mg in 500 mL; max. 6 hours between addition and completion of administration. May be given via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%.

- With intramuscular use or intravenous use in adults
  - Solution for injection should not be diluted, except for intravenous infusion.

- With intramuscular use in adults
  - Only use intramuscular route when oral and intravenous routes not possible.

▶ PRESCRIBING AND DISPENSING INFORMATION

- Palliative care
  - For further information on the use of diazepam in palliative care, see www.palliativedrugs.com/formulary/en/diazepam.html.

▶ PATIENT AND CARER ADVICE

- Driving and skilled tasks
  - May impair judgement and increase reaction time, and so affect ability to drive or perform skilled tasks; they

---

**IMPORTANT SAFETY INFORMATION**

**ANAESTHESIA**

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

**CONTRA-INDICATIONS**

Avoid injections containing benzyl alcohol in neonates, chronic psychosis (in adults), CNS depression, compromised airway, hyperkinesia, not for use alone to treat depression (or anxiety associated with depression) (in adults), obsessional states, phobic states, respiratory depression

**CAUTIONS**

**GENERAL CAUTIONS**

Muscle weakness, organic brain changes, parenteral administration (close observation required until full recovery from sedation), personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

**SPECIFIC CAUTIONS**

- With intravenous use
  - High risk of venous thrombophlebitis with intravenous use (reduced by using an emulsion formulation)

**CAUTIONS, FURTHER INFORMATION**

- Special precautions for intravenous injection
  - When given intravenously facilities for reversing respiratory depression with mechanical ventilation must be immediately available.

**INTERACTIONS**

- Appendix 1: diazepam

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Amnesia
- ataxia (especially in the elderly)
- confusion (especially in the elderly)
- drowsiness
- dizziness
- slurred speech

---

**UNLICENSED USE**

- Diazepam Desitin®, Diazepam Rectubes®, and Stesolid Rectal Tubes® not licensed for use in children under 1 year.
increase the effects of alcohol. Moreover the hangover effects of a night dose may impair performance on the following day.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

### INDICATIONS AND DOSE

**Anxiety (short-term use)**

- **BY MOUTH**
  - Adult: 15–30 mg 3–4 times a day, for debilitated patients, use elderly dose
  - Elderly: 10–20 mg 3–4 times a day

**Insomnia associated with anxiety**

- **BY MOUTH**
  - Adult: 15–25 mg once daily (max. per dose 50 mg), dose to be taken at bedtime

- **CONTRA-INDICATIONS** Chronic psychosis · hyperkinesia · not for use alone to treat depression (or anxiety associated with depression) · obsessional states · phobic states · respiratory depression

**CAUTIONS** Muscle weakness · organic brain changes · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

**CAUTIONS, FURTHER INFORMATION**

- Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

- **INTERACTIONS** → Appendix 1: oxazepam

- **SIDE-EFFECTS**
  - Common or very common Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
  - Uncommon Changes in libido · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache · hypotension · incontinence · salivation changes · slurred speech · tremor · urinary retention · vertigo · visual disturbances
  - Rare Apnoea · blood disorders · jaundice · respiratory depression · skin reactions

- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

- **HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives are safer. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Start with small doses in severe impairment.

- **PATIENT AND CARER ADVICE**

Driving and skilled tasks May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

- Oxazepam (Non-proprietary)
  - Oxazepam 10 mg Oxazepam 10 mg tablets | 28 tablet POM £7.97 DT price = £1.37 (CD4-1)
  - Oxazepam 15 mg Oxazepam 15 mg tablets | 28 tablet POM £7.97 DT price = £1.38 (CD4-1)
3.2 Attention deficit hyperactivity disorder

Attention deficit hyperactivity disorder (initiated by a specialist)

Management
Central nervous system stimulants include the amphetamines (dexamfetamine sulfate p. 333 and lisdexamfetamine mesilate p. 334) and related drugs (e.g. methylphenidate hydrochloride p. 331). They have very few indications and in particular, should not be used to treat depression, obesity, senility, debility, or for relief of fatigue.

CNS stimulants should be prescribed for children with severe and persistent symptoms of attention deficit hyperactivity disorder (ADHD), when the diagnosis has been confirmed by a specialist; children with moderate symptoms of ADHD can be treated with CNS stimulants when psychological interventions have been unsuccessful or are unavailable. Prescribing of CNS stimulants may be continued by general practitioners, under a shared-care arrangement. Treatment of ADHD often needs to be continuous into adolescence, and may need to be continued into adulthood.

Drug treatment of ADHD should be part of a comprehensive treatment programme. The choice of medication should take into consideration co-morbid conditions (such as tic disorders, Tourette syndrome, and epilepsy), the adverse effect profile, potential for drug misuse, tolerance and dependence; and preferences of the patient and carers. Methylphenidate hydrochloride and atomoxetine below are used for the management of ADHD; dexamfetamine sulfate and lisdexamfetamine mesilate are an alternative in children who do not respond to these drugs. Guanfacine p. 335, a non-stimulant alpha-2-adrenoceptor agonist, can be used in children for whom stimulants are not suitable, not tolerated, or ineffective. Therapeutic response to guanfacine should be evaluated every 3 months for the first year and then at least yearly, when prescribed for extended periods.

The need to continue drug treatment for ADHD should be reviewed at least annually. This may involve suspending treatment.

CNS STIMULANTS > CENTRALLY ACTING SYMPATHOMIMETICS

Atomoxetine 28-Sep-2016

330 Mental health disorders

HYPNOTICS, SEDATIVES AND ANXIOLYTICS > NON-BENZODIAZEPINE HYPNOTICS AND SEDATIVES

Meprobamate

**INDICATIONS AND DOSE**

Short-term use in anxiety—not recommended

- **BY MOUTH**
  - Adult: 400 mg 3–4 times a day
  - Elderly: Up to 200 mg 3–4 times a day

**IMPORTANT SAFETY INFORMATION**

The European Medicines Agency has recommended (January 2012) the suspension of all marketing authorisations for meprobamate because the risks, particularly of serious CNS side-effects, outweigh the benefits.

**CONTRA-INDICATIONS**

Acute porphyrias p. 969 • acute pulmonary insufficiency • respiratory depression

**CAUTIONS**

Abrupt withdrawal (may precipitate convulsions) • avoid prolonged use • debilitated elderly • epilepsy (may induce seizures) • history of alcohol abuse • history of drug abuse • marked personality disorder • muscle weakness • respiratory disease

**INTERACTIONS**

Appendix 1: meprobamate

**SIDE-EFFECTS**

- Common or very common
  - Amnesia • ataxia (especially in the elderly) • confusion (especially in the elderly) • dependence • drowsiness the next day • lightheadedness the next day • muscle weakness • paradoxical increase in aggression
  - Uncommon
  - Changes in libido • dizziness • dysarthria • gastro-intestinal disturbances • gynaecomastia • headache • hypotension • incontinence • salivation changes • slurred speech • tremor • urinary retention • vertigo • visual disturbances
  - Rare
  - Agranulocytosis • apnoea • blood disorders • jaundice • rashes • respiratory depression • skin reactions
  - Frequency not known
  - CNS effects • paradoxical excitement • paraesthesia • weakness

**PREGNANCY**

Avoid if possible.

**BREAST FEEDING**

Avoid. Concentration in milk may exceed maternal plasma concentrations fourfold and may cause drowsiness in infant.

**HEPATIC IMPAIRMENT**

Can precipitate coma.

**RENAL IMPAIRMENT**

Start with small doses in severe impairment. Increased cerebral sensitivity.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

**LESS SUITABLE FOR PRESCRIBING**

Meprobamate is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

  - Meprobamate 400 mg tablets 84 tablet pack £19.763 DT price = £19.763

[BNF 74] Downloaded from www.medicalbr.com
> Adult (body-weight up to 70 kg): Initially 500 micrograms/kg daily for 7 days; dose is increased according to response; maintenance 1.2 mg/kg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 1.8 mg/kg per day; maximum 120 mg per day.

> Adult (body-weight 70 kg and above): Initially 40 mg daily for 7 days; dose is increased according to response; maintenance 80–100 mg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 120 mg per day.

**UNLICENSED USE** Atomoxetine doses in BNF may differ from those in product literature.

**IN CHILDREN** Dosages above 100 mg daily not licensed.

**IN ADULTS** Dose maximum of 120 mg not licensed.

**CONTRA-INDICATIONS** Phaeochromocytoma · severe cardiovascular disease · severe cerebrovascular disease

**CAUTIONS** QT-interval prolongation · aggressive behaviour · cardiovascular disease · cerebrovascular disease · emotional lability · history of seizures · hostility · hypertension · mania · psychosis · structural cardiac abnormalities · susceptibility to angle-closure glaucoma · tachycardia

**INTERACTIONS** → Appendix 1: atomoxetine

**SIDE-EFFECTS**

DELMOSART®

EQUASYM®

Total daily dose of

DOSE EQUIVALENCE AND CONVERSION

When switching from immediate-release preparations to modified-release preparations—consult product literature.

CONCERTA® XL

Attention deficit hyperactivity disorder

BY MOUTH

Child 6-17 years: Initially 18 mg once daily, dose to be taken in the morning, increased in steps of 18 mg every week, adjusted according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 54 mg once daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 108 mg per day

Adult: Initially 18 mg once daily, dose to be taken in the morning; adjusted at weekly intervals according to response; maximum 108 mg per day

DOSE EQUIVALENCE AND CONVERSION

Total daily dose of 15 mg of standard-release formulation is considered equivalent to Concerta® XL 18 mg once daily.

DELMOSART® PROLONGED-RELEASE TABLET

Attention deficit hyperactivity disorder (under expert supervision)

BY MOUTH

Child 6-17 years: Initially 18 mg once daily, dose to be taken in the morning, then increased in steps of 18 mg every week if required, discontinue if no response after 1 month; maximum 54 mg per day

Adult: Initially 18 mg once daily, dose to be taken in the morning, then increased in steps of 18 mg every week if required, discontinue if no response after 1 month; maximum 54 mg per day

DOSE EQUIVALENCE AND CONVERSION

Total daily dose of 15 mg of standard-release formulation is considered equivalent to Delmosart® 18 mg once daily.

EQUASYM® XL

Attention deficit hyperactivity disorder

BY MOUTH

Child 6-17 years: Initially 10 mg once daily, dose to be taken in the morning before breakfast; increased gradually at weekly intervals if necessary; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day

Adult: Initially 10 mg once daily, dose to be taken in the morning before breakfast; increased gradually at weekly intervals if necessary; maximum 100 mg per day

MEDIKINET® XL

Attention deficit hyperactivity disorder

BY MOUTH

Child 6-17 years: Initially 10 mg once daily, dose to be taken in the morning with breakfast; adjusted at weekly intervals according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day

Adult: Initially 10 mg once daily, dose to be taken in the morning with breakfast; adjusted at weekly intervals according to response; maximum 100 mg per day

UNLICENSED USE

Doses over 60 mg daily not licensed; doses of Concerta XL over 54 mg daily not licensed.

CONTRA-INDICATIONS

Anorexia nervosa • arrhythmias • cardiomyopathy • cardiovascular disease • cerebrovascular disorders • heart failure • hyperthyroidism • phaeochromocytoma • psychosis • severe depression • severe hypertension • structural cardiac abnormalities • suicidal ideation • uncontrolled bipolar disorder • vasculitis

CAUTIONS

Agitation • alcohol dependence • anxiety • drug dependence • epilepsy (discontinue if increased seizure frequency) • family history of Tourette syndrome • susceptibility to angle-closure glaucoma • tics

DELmosart®, Concerta® XL: Dysphagia (dose form not appropriate) • restricted gastro-intestinal lumen (dose form not appropriate)

INTERACTIONS → Appendix 1: methylphenidate

SIDE-EFFECTS

Common or very common Abdominal pain • aggression • alopecia • anorexia • arrhythmias • arthralgia • asthenia • changes in blood pressure • cough • depression • diarrhoea • dizziness • drowsiness • dry mouth • dyspepsia • fever • growth restriction • headache • insomnia • irritability • movement disorders • nasopharyngitis • nausea • nervousness • palpitation • pruritus • rash • reduced weight • tachycardia • tics • vomiting

Uncommon Abnormal dreams • confusion • constipation • dysphoria • epistaxis • haematuria • muscle cramps • suicidal ideation • urinary frequency

Rare Angina • sweating • visual disturbances;

Very rare Angle-closure glaucoma • blood disorders • cerebral arteritis • dependence • erythema multiforme • exfoliative dermatitis • hepatic dysfunction • leucopenia • myocardial infarction • neuroleptic malignant syndrome • psychosis • seizures • thrombocytopenia • tolerance • Tourette syndrome

Frequency not known Bradycardia • convulsions • supraventricular tachycardia

PREGNANCY Limited experience—avoid unless potential benefit outweighs risk.

BREAST FEEDING Limited information available—avoid.

MONITORING REQUIREMENTS

Monitor for psychiatric disorders.

Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

TREATMENT CESSATION Avoid abrupt withdrawal.

DIRECTIONS FOR ADMINISTRATION

MEDIKINET® XL: Contents of capsule can be sprinkled on a tablespoon of apple sauce or yoghurt (then swallowed immediately without chewing).

EQUASYM® XL: Contents of capsule can be sprinkled on a tablespoon of apple sauce (then swallowed immediately without chewing).

PRESCRIBING AND DISPENSING INFORMATION

Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of methylphenidate, prescribers should specify the brand to be dispensed.
CONCERTA® XL Consists of an immediate-release component (22% of the dose) and a modified-release component (78% of the dose).

MEDIKINET® XL Consists of an immediate-release component (50% of the dose) and a modified-release component (50% of the dose).

EQUASYM® XL Consists of an immediate-release component (30% of the dose) and a modified-release component (70% of the dose).

PATIENT AND CARER ADVICE

Drugs and Driving Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects;

patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

2015 legislation regarding driving whilst taking certain drugs, may also apply to methylphenidate, see Drugs and driving under Guidance on prescribing p. 1.

DELMOSART® Manufacturer advises tablet membrane may pass through gastro-intestinal tract unchanged.

CONCERTA® XL Tablet membrane may pass through gastro-intestinal tract unchanged.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Methylphenidate, atomoxetine and dexamfetamine for attention deficit hyperactivity disorder (ADHD) (March 2006)

NICE TA98 Methylphenidate is recommended, within its licensed indications, as an option for the management of ADHD in children and adolescents.

www.nice.org.uk/TA98

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

CNS STIMULANTS CENTRALLY ACTING SYMPATHOMIMETICS AMFETAMINES

Dexamfetamine sulfate (Dexamphetamine sulfate)

INDICATIONS AND DOSE

Narcolepsy

BY MOUTH

Adult: Initially 10 mg daily in divided doses, increased in steps of 10 mg every week, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day.

Elderly: Initially 5 mg daily in divided doses, increased in steps of 5 mg every week, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day.

Refractory attention deficit hyperactivity disorder (initiated under specialist supervision)

BY MOUTH

Child 6–17 years: Initially 2.5 mg 2–3 times a day, increased in steps of 5 mg once weekly if required, increased if necessary up to 1 mg/kg daily, maintenance dose to be given in 2–4 divided doses, up to 20 mg daily (40 mg daily has been required in some children).

Adult: Initially 5 mg twice daily, dose is increased at weekly intervals according to response, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day.

UNLICENSED USE

Not licensed for use in adults for refractory attention deficit hyperactivity disorder.

CONTRA-INDICATIONS

Nervous system

MONITORING REQUIREMENTS

- Tics and Tourette syndrome: Discontinue use if tics occur.
- Growth restriction in children: Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity).

INTERACTIONS → Appendix 1: amphetamines

SIDE-EFFECTS

- Common or very common: Abdominal cramps, acidosis, aggression, alopecia, anhedonia, anorexia, ataxia, cardiomyopathy, cardiovascular collapse, cerebral vasculitis, chest pain, confusion, depression, diarrhoea, dizziness, dry mouth, dysphoria, euphoria, growth restriction in children, headache, hyperactivity, hyperypyrexia (in children), hyperreflexia, hypertension, impaired concentration, irritability, ischaemic colitis, malaise, mydriasis, myocardial infarction, nausea, nervousness, neuroleptic malignant syndrome, obsessive-compulsive behaviour, palpitations, panic attack, paranoia, psychosis, pyrexia (in adults), rash, renal impairment, restlessness, rhabdomyolysis, seizures, sexual dysfunction, sleep disturbances, stroke, sweating, tachycardia, taste disturbance, Tourette syndrome (in predisposed individuals), tremor, urticaria, visual disturbances, weight loss

- Very rare: Angle-closure glaucoma
- Frequency not known: Choreaathetoid movements (in predisposed individuals), dyskinesia (in predisposed individuals), increased appetite, tics (in predisposed individuals)

Overdose

PREGNANCY

Avoid (retrospective evidence of uncertain significance suggesting possible embryotoxicity).

BREAST FEEDING

Significant amount in milk—avoid.

RENAL IMPAIRMENT

Use with caution.

MONITORING REQUIREMENTS

- Monitor growth in children.
- Monitor for aggressive behaviour or hostility during initial treatment.
- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

TREATMENT CESSATION

Avoid abrupt withdrawal.

DIRECTIONS FOR ADMINISTRATION

- In children: Tablets can be halved.

PRESCRIBING AND DISPENSING INFORMATION

Data on safety and efficacy of long-term use not complete.

PATIENT AND CARER ADVICE

Drugs and Driving

Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amphetamines, see Drugs and driving under Guidance on prescribing p. 1.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Methylphenidate, atomoxetine and dexamphetamine for attention deficit hyperactivity disorder (ADHD) (March 2006) NICE TA98

Dexamphetamine is recommended, within its licensed indications, as an option for the management of ADHD in children and adolescents. www.nice.org.uk/TA98

MEDIcular FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release capsule, oral suspension, oral solution

Oral solution

- Dexamphetamine sulphate (Non-proprietary)

  Dexamphetamine sulphate 1 mg per 1 ml

  Dexamphetamine sulphate 5 mg/5 ml

  Oral solution sugar free sugar-free | 150 ml £29.44-£34.35 (CD)

  Dexamphetamine sulphate 10 mg

  Dexamphetamine sulphate 15 mg

  Dexamphetamine sulphate 20 mg

  Dexamphetamine sulphate 25 mg

  Dexamphetamine sulphate 50 mg

  Dexamphetamine sulphate 100 mg

Tablet

- Dexamphetamine sulphate (Non-proprietary)

  Dexamphetamine sulphate 5 mg

  Dexamphetamine sulphate 10 mg

  Dexamphetamine sulphate 20 mg

  Dexamphetamine sulphate 30 mg

  Dexamphetamine sulphate 40 mg

- Amfexa (Flynn Pharma Ltd)

  Amfexa 15 mg tablets | 30 tablet £11.89 (CD)

  Amfexa 30 mg tablets | 30 tablet £35.78 (CD)

  Amfexa 50 mg tablets | 30 tablet £79.56 (CD)

Lisdexamphetamine mesilate

- DRUG ACTION

  Lisdexamphetamine is a prodrug of dexamphetamine.

INDICATIONS AND DOSE

Attention deficit hyperactivity disorder refractory to methylphenidate (initiated by a specialist)

- BY MOUTH

  - Child: 6-17 years: Initially 30 mg once daily, increased in steps of 20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day

  - Adult: Initially 30 mg once daily, increased in steps of 20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day

- UNLICENSED USE

  Not licensed for use in adults for attention deficit hyperactivity disorder.

CONTRA-INDICATIONS

Advanced arteriosclerosis · agitated states · hyperexcitability · hyperthyroidism · moderate hypertension · severe hypertension · symptomatic cardiovascular disease

CAUTIONS

Anorexia · bipolar disorder · history of alcohol abuse · history of cardiac abnormalities · history of cardiovascular disease · history of drug abuse · may lower seizure threshold (discontinue if seizures occur) · psychosis · susceptibility to angle-closure glaucoma · tics · Tourette syndrome

CAUTIONS, FURTHER INFORMATION

- Tics and Tourette syndrome: Discontinue use if tics occur.
- Growth restriction in children: Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but...
withdraw slowly to avoid inducing depression or renewed hyperactivity).

- INTERACTIONS ➔ Appendix 1: amfetamines
- SIDE-EFFECTS
  - Common or very common Abdominal cramps • aggression • decreased appetite • diarrhoea • dizziness • drowsiness • dry mouth • dysphoria • growth restriction in children • headache • labile mood • malaise • mydriasis • nausea • pyrexia • sleep disturbances • tics • vomiting • weight loss
  - Uncommon Anorexia • anxiety • depression • dermatillomania • dysphoria • hallucination • hypertension • logorrhea • mania • palpitation • paranoia • rash • restlessness • sexual dysfunction • sweating • tachycardia • tremor • visual disturbances
  - Very rare Angle-closure glaucoma
  - Frequency not known Cardiomyopathy • choreoathetoid movements (in predisposed individuals) • dyskinesia (in predisposed individuals) • euphoria • seizures • Tourette syndrome (in predisposed individuals)

Overdose

- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid—present in human milk.
- RENAL IMPAIRMENT Max. dose 50 mg daily in severe impairment.
- MONITORING REQUIREMENTS
  - Monitor for aggressive behaviour or hostility during initial treatment.
  - Monitor growth in children.
  - Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

TREATMENT CESSION Avoid abrupt withdrawal.

DIRECTIONS FOR ADMINISTRATION

Swallow whole or mix contents of capsule in yoghurt or a glass of water or orange juice; contents should be dispersed completely and consumed immediately.

- PATIENT AND CARER ADVICE Patients and carers should be counselled on the administration of capsules.
- Drugs and Driving Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amphetamines, see Drugs and driving under Guidance on prescribing p. 1.

- MEDICINAL FORMS
  - Capsule
    - There can be variation in the licensing of different medicines containing the same drug.
    - Elvanse Capsule (Shire Pharmaceuticals Ltd) ➔ Appendix 1: amfetamines

Lisdexamfetamine dimesylate 40 mg Elvanse 40 mg capsules | 28 capsule (PoM) £52.82 DT price = £56.60 (CD)
Lisdexamfetamine dimesylate 50 mg Elvanse Adult 50 mg capsules | 28 capsule (PoM) £58.60 DT price = £68.60 (CD)
Lisdexamfetamine dimesylate 50 mg Elvanse 50 mg capsules | 28 capsule (PoM) £58.60 DT price = £68.60 (CD)
Lisdexamfetamine dimesylate 60 mg Elvanse 60 mg capsules | 28 capsule (PoM) £75.18 DT price = £75.18 (CD)
Lisdexamfetamine dimesylate 70 mg Elvanse 70 mg capsules | 28 capsule (PoM) £83.16 DT price = £83.16 (CD)

SYMPATHOMIMETICS ➔ ALPH2-ADRENERCEPTOR AGONISTS

Guanfacine 26-May-2016

- INDICATIONS AND DOSE
  - Attention deficit hyperactivity disorder in children for whom stimulants are not suitable, not tolerated or ineffective (initiated under specialist supervision)
    - BY MOUTH
      - Child 6–12 years (body-weight 25 kg and above): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 4 mg), for optimal weight-adjusted dose titrations, consult product literature
      - Child 13–17 years (body-weight 34–41.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 4 mg), for optimal weight-adjusted dose titrations, consult product literature
      - Child 13–17 years (body-weight 41.5–49.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 5 mg), for optimal weight-adjusted dose titrations, consult product literature
      - Child 13–17 years (body-weight 49.5–58.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 6 mg), for optimal weight-adjusted dose titrations, consult product literature
      - Child 13–17 years (body-weight 58.5 kg and above): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 7 mg), for optimal weight-adjusted dose titrations, consult product literature
  
DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises reduce dose by half with concurrent use of moderate and potent inhibitors of CYP3A4.

Manufacturer advises increase dose up to max. 7 mg daily with concurrent use of potent inducers of CYP3A4—no specific recommendation made for children.

- CAUTIONS
  - Bradycardia (risk of torsade de pointes) • heart block (risk of torsade de pointes) • history of cardiovascular disease • history of QT-interval prolongation • hypokalaemia (risk of torsade de pointes)
- INTERACTIONS ➔ Appendix 1: guanfacine
- SIDE-EFFECTS
  - Common or very common Abdominal pain • anxiety • bradycardia • constipation • decreased appetite • depression • diarrhoea • dizziness • dry mouth • enuresis • headache • hypotension • irritability • malaise • mood lability • nausea • rash • sleep disturbance • somnolence • vomiting • weight increase
3.3 Bipolar disorder and mania

Drugs for mania and hypomania

Overview
Antimanic drugs are used to control acute attacks and to prevent recurrence of episodes of mania or hypomania. Long-term treatment of bipolar disorder should continue for at least two years from the last manic episode and up to five years if the patient has risk factors for relapse.

An antidepressant drug may also be required for the treatment of co-existing depression, but should be avoided in patients with rapid-cycling bipolar disorder, a recent history of hypomania, or with rapid mood fluctuations.

Benzodiazepines
Use of benzodiazepines (such as lorazepam p. 322) may be helpful in the initial stages of treatment for behavioural disturbance or agitation; they should not be used for long periods because of the risk of dependence.

Antipsychotic drugs
Antipsychotic drugs (normally olanzapine p. 379, quetiapine p. 382, or risperidone p. 383) are useful in acute episodes of mania and hypomania; if the response to antipsychotic drugs is inadequate, lithium or valproate may be added. An antipsychotic drug may be used concomitantly with lithium or valproate in the initial treatment of severe acute mania.

Olanzapine can be used for the long-term management of bipolar disorder in patients whose manic episode responded to olanzapine therapy. It can be given either as monotherapy, or in combination with lithium or valproate if the patient has frequent relapses or continuing functional impairment.

Asenapine p. 338, a second-generation antipsychotic, is licensed for the treatment of moderate to severe manic episodes associated with bipolar disorder.

When discontinuing antipsychotics, the dose should be reduced gradually over at least 4 weeks if the patient is continuing with other antimanic drugs; if the patient is not continuing with other antimanic drugs or if there is a history of manic relapse, a withdrawal period of up to 3 months should be considered.

Carbamazepine
Carbamazepine p. 297 may be used under specialist supervision for the prophylaxis of bipolar disorder (manic-depressive disorder) in patients unresponsive to a combination of other prophylactic drugs; it is used in patients with rapid-cycling manic-depressive illness (4 or more affective episodes per year). The dose of carbamazepine should not normally be increased if an acute episode of mania occurs.

Valproate
Valproate (valproic acid p. 337 (as the semisodium salt) and sodium valproate p. 312) is used for the treatment of manic episodes associated with bipolar disorder. It must be started and supervised by a specialist experienced in managing bipolar disorder. Valproate (valproic acid and sodium valproate) is also used for the prophylaxis of bipolar disorder. Valproic acid and sodium valproate should not be used in female children, in females of childbearing potential and pregnant females, unless alternative treatments are ineffective or not tolerated, because of its high teratogenic potential; the benefit and risk of valproate therapy should be carefully considered at regular treatment reviews. In patients with frequent relapse or continuing functional
impairment, consider switching therapy to lithium or olanzapine, or adding lithium or olanzapine to valproate. If a patient taking valproate experiences an acute episode of mania that is not ameliorated by increasing the valproate dose, consider concomitant therapy with olanzapine,quetiapine, or risperidone.

**Lithium**

Lithium salts are used in the prophylaxis and treatment of mania, hypomania and depression in bipolar disorder (manic-depressive disorder), and in the prophylaxis and treatment of recurrent unipolar depression. Lithium is also used as concomitant therapy with antidepressant medication in patients who have had an incomplete response to treatment for acute bipolar depression and to augment other antidepressants in patients with treatment-resistant depression [unlicensed indication]. It is also licensed for the treatment of aggressive or self-harming behaviour.

The decision to give prophylactic lithium requires specialist advice, and must be based on careful consideration of the likelihood of recurrence in the individual patient, and the benefit of treatment weighed against the risks. The full prophylactic effect of lithium may not occur for six to twelve months after the initiation of therapy. Olanzapine or valproate (given alone or as adjunctive therapy with lithium) are alternative prophylactic treatments in patients who experience frequent relapses or continued functional impairment.

**Other drugs used for Bipolar disorder and mania**

Aripiprazole, p. 376 · Chlorpromazine hydrochloride, p. 367 · Haloperidol, p. 368 · Lamotrigine, p. 303 · Paliperidone, p. 380 · Perphenazine, p. 370 · Prochlorperazine, p. 371 · Zuclopenthixol acetate, p. 373

---

**Unlicensed Use**

Not licensed for migraine prophylaxis.

---

**Indications and Dose**

**Treatment of manic episodes associated with bipolar disorder**

- **BY MOUTH**
- Adult: Initially 750 mg daily in 2–3 divided doses, then increased to 1–2 g daily, adjusted according to response, doses greater than 45 mg/kg daily require careful monitoring

**Migraine prophylaxis**

- **BY MOUTH**
- Adult: Initially 250 mg twice daily, then increased if necessary to 1 g daily in divided doses

**Dose equivalence and conversion**

- Semisodium valproate comprises equimolar amounts of sodium valproate and valproic acid.

**Convulex®**

**Epilepsy**

- **BY MOUTH**
- Adult: Initially 600 mg daily in 2–4 divided doses, increased in steps of 150–300 mg every 3 days; usual maintenance 1–2 g daily in 2–4 divided doses, max. 2.5 g daily in 2–4 divided doses

**Dose equivalence and conversion**

- Convulex® has a 1:1 dose relationship with products containing sodium valproate, but nevertheless care is needed if switching or making changes.

---

**Antiepileptics**

**Valproic acid**

18-Apr-2017

**Contra-indications**

Acute porphyrias p. 969 · known or suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths) · personal or family history of severe hepatic dysfunction

**Caution**

Systemic lupus erythematosus

**Caution, further information**

- Liver toxicity
  - Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

- Consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

**Interactions**

Appendix 1: antiepileptics

**Side-effects**

- Common or very common
  - Diarrhoea · gastric irritation · hyperammonaemia · nausea · thrombocytopenia · transient hair loss (regrowth may be curly) · weight gain
- Uncommon
  - Anger · ataxia · behavioural disturbances · hyperactivity · increased alertness · tremor · vasculitis
- Rare
  - Anaemia · blood disorders · confusion · drowsiness · hallucinations · hearing loss · hepatic dysfunction · lethargy · leucopenia · pancytopenia · rash · stupor
- Very rare
  - Acne · coma · dementia · encephalopathy · enuresis · extrapyramidal symptoms · Fanconi’s syndrome · gynaecomastia · hirsutism · hyponatraemia · increase in bleeding time · pancreatitis · peripheral oedema · reduced bone mineral density · Stevens-Johnson syndrome · suicidal ideation · toxic epidermal necrolysis
- Frequency not known
  - Drug rash with eosinophilia and
systemic symptoms (DRESS) syndrome • hypersensitivity reactions • male infertility • menstrual disturbances • syndrome of inappropriate secretion of antidiuretic hormone

SIDE-EFFECTS, FURTHER INFORMATION

- Hepatic dysfunction Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.
- Pancreatitis Discontinue treatment if symptoms of pancreatitis develop.

CONCEPTION AND CONTRACEPTION Valproate is associated with teratogenic risks and should not be used in females of child-bearing potential unless there is no safer alternative—this should be fully considered and discussed before prescribing for females of child-bearing age. Effective contraception advised in females of child-bearing potential. In females planning to become pregnant, all efforts should be made to switch to appropriate alternative treatment prior to conception.

PREGNANCY Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term neurodevelopmental effects. Valproate should not be used during pregnancy unless there is no safer alternative and only after a careful discussion of the risks. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrininaemia). Neonatal hepatotoxicity also reported.

Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- BREAST FEEDING Present in milk—risk of haematological disorders in breast-fed newborns and infants.
- HEPATIC IMPAIRMENT Avoid if possible—hepatotoxicity and hepatic failure may occasionally occur (usually in first 6 months). Avoid in active liver disease.
- RENAL IMPAIRMENT Reduce dose.

MONITORING REQUIREMENTS

- Monitor closely if dose greater than 45 mg/kg daily.
- Monitor liver function before therapy and during first 6 months especially in patients most at risk.
- Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.

EFFECT ON LABORATORY TESTS False-positive urine tests for ketones.

TREATMENT CESSATION Avoid abrupt withdrawal; if treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks.

PRESCRIBING AND DISPENSING INFORMATION

CONVULEX®. Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral valproic acid product.

PATIENT AND CARER ADVICE

Risk of abnormal pregnancy outcomes. A patient guide and card should be provided to all female patients. Blood or hepatic disorders. Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

Pancreatitis. Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop.

MHRA advice: Valproate and the risk of abnormal pregnancy outcomes. Female patients and their carers should be counselled on the risk of valproate treatment during pregnancy. Ensure female patients are provided with relevant resources, to support their understanding of the risks. In particular the prescriber must ensure the patient understands:

- the risks associated with valproate during pregnancy;
- the need to use effective contraception;
- the need for regular review of treatment;
- the need to rapidly consult if she is planning a pregnancy or becomes pregnant.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

Gastro-resistant capsule

CAUTIONARY AND ADVISORY LABELS 8, 21, 25, 10

- Convulex (Pfizer Ltd) ▼ Valproic acid 150 mg | 100 capsule (POM) £3.68
- Valproic acid 300 mg | 100 capsule (POM) £7.35
- Valproic acid 500 mg | 100 capsule (POM) £12.25

Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 10, 21, 25

- Depakote (Sanofi) ▼ Valproic acid (as Valproate semisodium) 250 mg | 90 tablet (POM) £17.08 DT price = £17.08
- Valproic acid (as Valproate semisodium) 500 mg | 500 gastro-resistant tablets | 90 tablet (POM) £34.11 DT price = £34.11

ANTIPSYCHOTICS > SECOND-GENERATION

Asenapine

INDICATIONS AND DOSE

Monotherapy for the treatment of moderate to severe manic episodes associated with bipolar disorder

- BY MOUTH
  - Adult: Initially 10 mg twice daily, reduced to 5 mg twice daily, adjusted according to response

Combination therapy for the treatment of moderate to severe manic episodes associated with bipolar disorder

- BY MOUTH
  - Adult: Initially 5 mg twice daily, increased if necessary to 10 mg twice daily, adjusted according to response

CAUTIONS Dementia with Lewy Bodies

INTERACTIONS Appendix 1: asenapine

SIDE-EFFECTS Anxiety, dysphagia, glossodynia, hypersalivation, rhabdomyolysis, speech disturbance, taste disturbance, tongue swelling, transient oral hypoaesthesia, transient paraesthesia

PREGNANCY Use only if potential benefit outweighs risk—toxicity in animal studies.

BREAST FEEDING Avoid—no information available.

HEPATIC IMPAIRMENT Use with caution in moderate impairment. Avoid in severe impairment.

RENAL IMPAIRMENT Use with caution if eGFR less than 15 mL/minute/1.73 m²—no information available.

PATIENT AND CARER ADVICE Patient or carer should be given advice on how to administer asenapine sublingual tablet.
**Lithium salts**

- **CONTRA-INDICATIONS** Addison’s disease • cardiac insufficiency • dehydration • family history of Brugada syndrome • low sodium diets • personal history of Brugada syndrome • rhythm disorder • untreated hypothyroidism

- **CAUTIONS** Avoid abrupt withdrawal • cardiac disease • concurrent ECT (may lower seizure threshold) • diuretic treatment (risk of toxicity) • elderly (reduce dose) • epilepsy (may lower seizure threshold) • myasthenia gravis • psoriasis (risk of exacerbation) • QT interval prolongation • review dose as necessary in diarrhoea • review dose as necessary in intercurrent infection (especially if sweating profusely) • review dose as necessary in vomiting • surgery

- **SIDE-EFFECTS**
  - Very rare: Nystagmus
  - Frequency not known: Acneiform eruptions • alopecia • anorexia • arrhythmia • atrialgia • AV block • benign intracranial hypertension • bradycardia • cardiomyopathy • cognitive impairment • dry mouth • dysgeusia • ECG changes • electrolyte imbalance • encaphalopathy • euthyroid goitre • extrapyramidal side effects • fine tremor • gastritis • gastro-intestinal disturbances • hallucinations • hyperparathyroidism • hypersalivation • hyperthyroidism • hypothyroidism • kidney changes • leucocytosis • malaise • memory loss • myalgia • myasthenia gravis • nephrogenic diabetes insipidus • nephrotic syndrome • oedema • other skin disorders • parathyroid adenoma • peripheral neuropathy • polydipsia • psoriasis exacerbation • QT interval prolongation • Raynaud’s phenomenon • renal impairment • sexual dysfunction • sinus node dysfunction • speech disorder • thyroid changes • vertigo • weight changes

- **Overdose** Signs of intoxication require withdrawal of treatment and include increasing gastro-intestinal disturbances (vomiting, diarrhoea), visual disturbances, polyuria, muscle weakness, fine tremor increasing to coarse tremor, CNS disturbances (confusion and drowsiness increasing to lack of coordination, restlessness, stupor); abnormal reflexes, myoclonus, incontinence, hypnothermia. With severe overdoses seizures, cardiac arrhythmias (including sino-atrial block, bradycardia and first-degree heart block), blood pressure changes, circulatory failure, renal failure, coma and sudden death reported.

  For details on the management of poisoning, see Lithium, under Emergency treatment of poisoning p. 1249.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment for women of child bearing potential.

- **PREGNANCY** Dose requirements increased during the second and third trimesters (but on delivery return abruptly to normal). Avoid if possible, particularly in the first trimester (risk of teratogenicity, including cardiac abnormalities). Close monitoring of serum-lithium concentration advised in pregnancy (risk of toxicity in neonate).

- **BREAST FEEDING** Present in milk and risk of toxicity in infant—avoid.

- **RENAI IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment. In renal impairment monitor serum-lithium concentration closely and adjust dose accordingly.

- **MONITORING REQUIREMENTS**
  - Serum concentrations: Lithium salts have a narrow therapeutic/toxic ratio and should therefore not be prescribed unless facilities for monitoring serum-lithium concentrations are available.
  - Samples should be taken 12 hours after the dose to achieve a serum-lithium concentration of 0.4–1 mmol/litre (lower end of the range for maintenance therapy and elderly patients). A target serum-lithium concentration of 0.8–1 mmol/litre is recommended for acute episodes of mania, and for patients who have previously relapsed or have sub-syndromal symptoms. It is important to determine the optimum range for each individual patient.
  - Routine serum–lithium monitoring should be performed weekly after initiation and after each dose change until concentrations are stable, then every 3 months thereafter. Additional serum-lithium measurements should be made if a patient develops significant intercurrent disease or if there is a significant change in a patient’s sodium or fluid intake.
  - Renal function should be monitored at baseline and every 6 months thereafter (more often if there is evidence of deterioration or if the patient has other risk factors, such as starting ACE inhibitors, NSAIDs, or diuretics).

- **TREATMENT CESSATION** While there is no clear evidence of withdrawal or rebound psychosis, abrupt discontinuation of lithium increases the risk of relapse. If lithium is to be discontinued, the dose should be reduced gradually over a period of at least 4 weeks (preferably over a period of up to 3 months). Patients and their carers should be warned of the risk of relapse if lithium is discontinued abruptly. If lithium is stopped or is to be discontinued abruptly, consider changing therapy to an atypical antipsychotic or valproate.

- **PATIENT AND CARER ADVICE** Patients should be advised to report signs and symptoms of lithium toxicity, hypothyroidism, renal dysfunction (including polyuria and polydipsia), and benign intracranial hypertension (persistent headache and visual disturbance). Maintain adequate fluid intake and avoid dietary changes which reduce or increase sodium intake.

- **Driving and skilled tasks** May impair performance of skilled tasks (e.g. driving, operating machinery).

- **Lithium treatment packs** A lithium treatment pack should be given to patients on initiation of treatment with lithium. The pack consists of a patient information booklet, lithium alert card, and a record book for tracking serum-lithium concentration. Packs may be purchased from 3M

Lithium carbonate

**INDICATIONS AND DOSE**

- **Treatment and prophylaxis of mania**
- **Treatment and prophylaxis of bipolar disorder**
- **Treatment and prophylaxis of recurrent depression**
- **Treatment and prophylaxis of aggressive or self-harming behaviour**

**BY MOUTH**

- **Adult:** Initially 1–1.5 g daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**CAMCOLIT® IMMEDIATE-RELEASE TABLET**

**Treatment of mania**
- **Treatment of bipolar disorder**
- **Treatment of recurrent depression**
- **Treatment of aggressive or self-harming behaviour**

**BY MOUTH**

- **Adult:** Initially 1–1.5 g daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

- **Elderly:** Reduce initial dose, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**Prophylaxis of mania**
- **Prophylaxis of bipolar disorder**
- **Prophylaxis of recurrent depression**
- **Prophylaxis of aggressive or self-harming behaviour**

**BY MOUTH**

- **Adult:** Initially 300–400 mg daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**LIKSOKUM®**

**Treatment of mania**
- **Treatment of bipolar disorder**
- **Treatment of recurrent depression**
- **Treatment of aggressive or self-harming behaviour**

**BY MOUTH**

- **Adult:** Initially 450–675 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

- **Elderly:** Initially 225 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**Prophylaxis of mania**
- **Prophylaxis of bipolar disorder**
- **Prophylaxis of recurrent depression**
- **Prophylaxis of aggressive or self-harming behaviour**

**BY MOUTH**

- **Adult:** Initially 450 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

- **Elderly:** Initially 225 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**CAMCOLIT® MODIFIED-RELEASE TABLET**

**Treatment of mania**
- **Treatment of bipolar disorder**
- **Treatment of recurrent depression**
- **Treatment of aggressive or self-harming behaviour**

**BY MOUTH**

- **Adult:** Initially 1–1.5 g daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

- **Elderly:** Reduce initial dose, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**PRIADEL® TABLETS**

**Treatment and prophylaxis of mania**
- **Treatment and prophylaxis of bipolar disorder**
- **Treatment and prophylaxis of recurrent depression**
- **Treatment and prophylaxis of aggressive or self-harming behaviour**

**BY MOUTH**

- **Adult (body-weight up to 50 kg):** Initially 200–400 mg daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

- **Adult (body-weight 50 kg and above):** Initially 0.4–1.2 g once daily, alternatively initially 0.4–1.2 g daily in 2 divided doses, dose adjusted to achieve a serum-
lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

- Elderly: Initially 200–400 mg daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**DOSE EQUIVALENCE AND CONVERSION**

- Preparations vary widely in bioavailability; changing the preparation requires the same precautions as initiation of treatment.

### Lithium citrate

#### INDICATIONS AND DOSE

- Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour
- BY MOUTH
- Adult: Dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter; doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**DOSE EQUIVALENCE AND CONVERSION**

- Preparations vary widely in bioavailability; changing the preparation requires the same precautions as initiation of treatment.

**LI-LIQUID ®**

- Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour
- BY MOUTH
- Adult (body-weight up to 50 kg): Initially 509 mg daily in 2 divided doses, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter
- Adult (body-weight 50 kg and above): Initially 1.018–3.054 g daily in 2 divided doses, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter
- Elderly: Initially 509 mg daily in 2 divided doses, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter

**DOSE EQUIVALENCE AND CONVERSION**

- For Li-Liquid ®: Lithium citrate tetrahydrate 509 mg is equivalent to lithium carbonate 200 mg.
- Preparations vary widely in bioavailability; changing the preparation requires the same precautions as initiation of treatment.

**PRIADEL ® LIQUID**

- Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour
- BY MOUTH
- Adult (body-weight up to 50 kg): Initially 520 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter; doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- Adult (body-weight 50 kg and above): Initially 1.04–3.12 g daily in 2 divided doses, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised
- Elderly: Initially 520 mg twice daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**DOSE EQUIVALENCE AND CONVERSION**

- For Priadel ® liquid: Lithium citrate tetrahydrate 520 mg is equivalent to lithium carbonate 204 mg.
- Preparations vary widely in bioavailability; changing the preparation requires the same precautions as initiation of treatment.

3.4 Depression

Antidepressant drugs

Overview
Antidepressant drugs are effective for treating moderate to severe depression associated with psychomotor and physiological changes such as loss of appetite and sleep disturbance; improvement in sleep is usually the first benefit of therapy. Ideally, patients with moderate to severe depression should be treated with psychological therapy in addition to drug therapy. Antidepressant drugs are also effective for dysthymia (lower grade chronic depression typically of at least 2 years duration).

Antidepressant drugs should not be used routinely in mild depression, and psychological therapy should be considered initially; however, a trial of antidepressant therapy may be considered in cases refractory to psychological treatments or in those associated with psychosocial or medical problems.

Drug treatment of mild depression may also be considered in patients with a history of moderate or severe depression.

Choice
The major classes of antidepressant drugs include the tricyclic and related antidepressants, the selective serotonin re-uptake inhibitors (SSRIs), and the monoamine oxidase inhibitors (MAOIs). A number of antidepressant drugs cannot be accommodated easily into this classification.

There is little to choose between the different classes of antidepressant drugs in terms of efficacy, so choice should be based on the individual patient’s requirements, including the presence of concomitant disease, existing therapy, suicide risk, and previous response to antidepressant therapy. Since there may be an interval of 2 weeks before the antidepressant action takes place, electroconvulsive treatment may be required in severe depression when delay is hazardous or intolerable. During the first few weeks of treatment, there is an increased potential for agitation, anxiety, and suicidal ideation.

SSRIs are better tolerated and are safer in overdose than other classes of antidepressants and should be considered first-line for treating depression. In patients with unstable angina or who have had a recent myocardial infarction, sertraline p. 350 has been shown to be safe.

Tricyclic antidepressants have similar efficacy to SSRIs but are more likely to be discontinued because of side-effects; toxicity in overdose is also a problem. SSRIs are less sedating and have fewer antimuscarinic and cardiotoxic effects than tricyclic antidepressants.

MAOIs have dangerous interactions with some foods and drugs, and should be reserved for use by specialists.

Although anxiety is often present in depressive illness (and may be the presenting symptom), the use of an antipsychotic or an anxiolytic may mask the true diagnosis. Anxiolytics or antipsychotic drugs should therefore be used with caution in depression but they are useful adjuncts in agitation. Antidepressants with antipsychotics under specialist supervision may also be necessary in patients who have depression with psychotic symptoms.

St John’s wort (Hypericum perforatum) is a popular herbal remedy on sale to the public for treating mild depression. It should not be prescribed or recommended for depression because St John’s wort can induce drug metabolising enzymes and a number of important interactions with conventional drugs, including conventional antidepressants, have been identified. Furthermore, the amount of active ingredient varies between different preparations of St John’s wort and switching from one to another can change the degree of enzyme induction. If a patient stops taking St John’s wort, the concentration of interacting drugs may increase, leading to toxicity.

Management
Patients should be reviewed every 1–2 weeks at the start of antidepressant treatment. Treatment should be continued for at least 4 weeks (6 weeks in the elderly) before considering whether to switch antidepressant due to lack of efficacy. In cases of partial response, continue for a further 2–4 weeks (elderly patients may take longer to respond). Following remission, antidepressant treatment should be continued at the same dose for at least 6 months (about 12 months in the elderly), or for at least 12 months in patients receiving treatment for generalised anxiety disorder (as the likelihood of relapse is high). Patients with a history of recurrent depression should receive maintenance treatment for at least 2 years.

Hypotension and antidepressant therapy
Hypotension (usually in the elderly and possibly due to inappropriate secretion of antidiuretic hormone) has been associated with all types of antidepressants; however, it has been reported more frequently with SSRIs than with other antidepressants. Hypotension should be considered in all patients who develop drowsiness, confusion, or convulsions while taking an antidepressant.

Suicidal behaviour and antidepressant therapy
The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

Serotonin syndrome
Serotonin syndrome or serotonin toxicity is a relatively uncommon adverse drug reaction caused by excessive central and peripheral serotonergic activity. Onset of symptoms, which range from mild to life-threatening, can occur within hours or days following the initiation, dose escalation, or overdose of a serotonergic drug, the addition of a new serotonergic drug, or the replacement of one serotonergic drug by another without allowing a long enough washout period in-between, particularly when the first drug is an irreversible MAOI or a drug with a long half-life. Severe toxicity, which is a medical emergency, usually occurs with a combination of serotonergic drugs, one of which is generally an MAOI.

The characteristic symptoms of serotonin syndrome fall into 3 main areas, although features from each group may not be seen in all patients—neuromuscular hyperactivity (such as tremor, hyperreflexia, clonus, myoclonus, rigidity), autonomic dysfunction (tachycardia, blood pressure changes, hyperthermia, diaphoresis, shivering, diarrhoea), and altered mental state (agitation, confusion, mania).

Treatment consists of withdrawal of the serotonergic medication and supportive care; specialist advice should be sought.

Failure to respond
Failure to respond to initial treatment with an SSRI may require an increase in the dose, or switching to a different SSRI or mirtazapine p. 354. Other second-line choices include lorfenaprine p. 360, moclobemide p. 346, and reboxetine p. 346. Other tricyclic antidepressants and venlafaxine p. 351 should be considered for more severe
forms of depression; irreversible MAOIs should only be prescribed by specialists. Failure to respond to a second antidepressant may require the addition of another antidepressant of a different class, or use of an augmenting agent (such as lithium, aripiprazole p. 376 [unlicensed], olanzapine p. 379 [unlicensed], quetiapine p. 382, or risperidone p. 383 [unlicensed]), but such adjunctive treatment should be initiated only by doctors with special experience of these combinations. Electroconvulsive therapy may be initiated in severe refractory depression.

**Anxiety disorders and obsessive-compulsive disorder**

Management of acute anxiety generally involves the use of a benzodiazepine or buspirone hydrochloride p. 325. For chronic anxiety (of longer than 4 weeks’ duration) it may be appropriate to use an antidepressant. Combined therapy with a benzodiazepine may be required until the antidepressant takes effect. Patients with *generalised anxiety disorder*, a form of chronic anxiety, should be offered psychological treatment before initiating an antidepressant. If drug treatment is needed, an SSRI such as escitalopram p. 348, paroxetine p. 349, or sertraline p. 350 [unlicensed], can be used. Duloxetine p. 350 and venlafaxine p. 351 (serotonin and noradrenaline reuptake inhibitors) are also recommended for the management of generalised anxiety disorder; if the patient cannot tolerate SSRIs or serotonin and noradrenaline reuptake inhibitors (or if treatment has failed to control symptoms), pregabalin p. 310 can be considered.

**Panic disorder, obsessive-compulsive disorder, post-traumatic stress disorder**, and phobic states such as *social anxiety disorder* are treated with SSRIs. Clomipramine hydrochloride p. 356 or imipramine hydrochloride p. 359 can be used second-line in panic disorder [unlicensed]; clomipramine hydrochloride can also be used second-line for obsessive-compulsive disorder. Moclobemide p. 346 is licensed for the treatment of social anxiety disorder.

**Tricyclic and related antidepressant drugs**

**Choice**

Tricyclic and related antidepressants block the re-uptake of both serotonin and noradrenaline, although to different extents. For example, clomipramine hydrochloride is more selective for serotonergic transmission, and imipramine hydrochloride is more selective for noradrenergic transmission. Tricyclic and related antidepressant drugs can be roughly divided into those with additional sedative properties and those that are less sedating. Agitated and anxious patients tend to respond best to the sedative compounds, whereas withdrawn and apathetic patients will often obtain most benefit from the less sedating ones. Those with *sedative* properties include amitriptyline hydrochloride p. 355, clomipramine hydrochloride, dosulepin hydrochloride p. 357, doxepin p. 358, mianserin hydrochloride p. 353, trazodone hydrochloride p. 352, and trimipramine p. 362. Those with *less sedative* properties include imipramine hydrochloride, lofepramine p. 360, and nortriptyline p. 361.

Tricyclic and related antidepressants also have varying degrees of antimuscarinic side-effects and cardio toxicity in overdose, which may be important in individual patients. Lofepramine has a lower incidence of side-effects and is less dangerous in overdose but is infrequently associated with hepatic toxicity. Imipramine hydrochloride is also well established, but has more marked antimuscarinic side-effects than other tricyclic and related antidepressants. Amitriptyline hydrochloride and dosulepin hydrochloride are effective but they are particularly dangerous in overdose and are not recommended for the treatment of depression; dosulepin hydrochloride should be initiated by a specialist.

**Dosage**

About 10 to 20% of patients fail to respond to tricyclic and related antidepressant drugs and inadequate dosage may account for some of these failures. It is important to use doses that are sufficiently high for effective treatment but not so high as to cause toxic effects. Low doses should be used for initial treatment in the elderly. In most patients the long half-life of tricyclic antidepressant drugs allows *once-daily* administration, usually at night; the use of modified-release preparations is therefore unnecessary.

Some tricyclic antidepressants are used in the management of *panic* and other anxiety disorders. Some tricyclic antidepressants may also have a role in some forms of *neuralgia* and in *nocturnal enuresis* in children.

**Children and adolescents**

Studies have shown that tricyclic antidepressants are not effective for treating depression in children.

**Monoamine-oxidase inhibitors**

Monoamine-oxidase inhibitors are used much less frequently than tricyclic and related antidepressants, or SSRIs and related antidepressants because of the dangers of dietary and drug interactions and the fact that it is easier to prescribe MAOIs when tricyclic antidepressants have been unsuccessful than vice versa.

Tranylcypromine p. 345 has a greater stimulant action than phenelzine p. 345 or isocarboxazid p. 345 and is more likely to cause a hypertensive crisis. Isocarboxazid and phenelzine are more likely to cause hepatotoxicity than tranylcypromine.

Moclobemide should be reserved as a second-line treatment.

Phobic patients and depressed patients with atypical, hypochondriacal, or hysterical features are said to respond best to MAOIs. However, MAOIs should be tried in any patients who are refractory to treatment with other antidepressants as there is occasionally a dramatic response. Response to treatment may be delayed for 3 weeks or more and may take an additional 1 or 2 weeks to become maximal.

**Interactions**

Other antidepressants should not be started for 2 weeks after treatment with MAOIs has been stopped (3 weeks if starting clomipramine or imipramine). Conversely, an MAOI should not be started until:

- at least 2 weeks after a previous MAOI has been stopped (then started at a reduced dose)
- at least 7–14 days after a tricyclic or related antidepressant (3 weeks in the case of clomipramine or imipramine) has been stopped
- at least a week after an SSRI or related antidepressant (at least 5 weeks in the case of fluoxetine) has been stopped

**Other antidepressant drugs**

The thioxanthene fluoxetine p. 368 (Fluoxene®) has antidepressant properties when given by mouth in low doses. Fluoxetine is also used for the treatment of psychoses.

Vortioxetine p. 363, an antidepressant thought to directly modulate serotonergic receptor activity and inhibit the re-uptake of serotonin, is recommended in patients whose condition has responded inadequately to 2 antidepressants within the current episode.

**Other drugs used for Depression**

- Lithium carbonate, p. 340
- Lithium citrate, p. 341
ANTIDEPRESSANTS MELATONIN RECEPTOR AGONISTS

Agomelatine

DRUG ACTION A melatonin receptor agonist and a selective serotonin-receptor antagonist; it does not affect the uptake of serotonin, noradrenaline, or dopamine.

INDICATIONS AND DOSE

Major depression

BY MOUTH

Adult: 25 mg daily, dose to be taken at bedtime, dose to be increased if necessary after 2 weeks, increased if necessary to 50 mg daily, dose to be taken at bedtime

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Caution—dose adjustment may be necessary if smoking started or stopped during treatment.

CONTRA-INDICATIONS Dementia patients over 75 years of age

CAUTIONS Alcoholism bipolar disorder diabetes excessive alcohol consumption hypomania mania non-alcoholic fatty liver disease obesity

INTERACTIONS Appendix 1: agomelatine

SIDE-EFFECTS

Common or very common Abdominal pain agitation anxiety back pain constipation diarrhoea dizziness drowsiness fatigue headache increased serum transaminases nausea sleep disturbances sweating vomiting

Uncommon Blurred vision eczema paraesthesia restless legs syndrome tinnitus

Rare Hepatic failure hepatic injury hepatitis rash weight changes

Frequency not known Pruritus suicidal behaviour

SIDE-EFFECTS, FURTHER INFORMATION

Suicidal behaviour The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

PREGNANCY Manufacturer advises avoid.

BREAST FEEDING Avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT Manufacturer advises avoid in impairment (or if baseline serum transaminases exceed 3 times the upper limit of reference range).

RENAL IMPAIRMENT Caution in moderate to severe impairment.

MONITORING REQUIREMENTS Test liver function before treatment and after 3, 6, 12 and 24 weeks of treatment, and then regularly thereafter when clinically indicated (restart monitoring schedule if dose increased); discontinue if serum transaminases exceed 3 times the upper limit of reference range or symptoms of liver disorder.

PATIENT AND CARER ADVICE Patients should be given a booklet with more information on the risk of hepatic side-effects.

Hepatotoxicity Patients should be told how to recognise signs of liver disorder, and advised to seek immediate medical attention if symptoms such as dark urine, light coloured stools, jaundice, bruising, fatigue, abdominal pain, or pruritus develop.

ANTIDEPRESSANTS MONOAMINE-OXIDASE INHIBITORS

Monoamine-oxidase inhibitors

DRUG ACTION MAOIs inhibit monoamine oxidase, thereby causing an accumulation of amine neurotransmitters.

CONTRA-INDICATIONS Cerebrovascular disease not indicated in manic phase phaeochromocytoma

CAUTIONS Acute porphyria avoid in agitated patients blood disorders cardiovascular disease concurrent electroconvulsive therapy diabetes mellitus elderly (great caution) epilepsy severe hypertensive reactions to certain drugs and foods surgery

SIDE-EFFECTS

Common or very common Dizziness postural hypotension (especially in elderly)

Uncommon Agitation arrhythmias blurred vision confusion constipation convulsions difficulty in micturition drowsiness dry mouth elevated liver enzymes euphoria fatigue gastro-intestinal disturbances hallucinations headache hyperreflexia insomnia leucopenia myoclonic movement nervousness nystagmus oedema psychotic episodes with hypomanic behaviour purpura rashes sexual disturbances suicidal behaviour sweating tremors weakness weight gain with inappropriate appetite

Rare Fatal progressive hepatocellular necrosis

Frequency not known Jaundice hyponatraemia paraesthesia peripheral neuritis peripheral neuropathy (may be due to pyridoxine deficiency)

SIDE-EFFECTS, FURTHER INFORMATION

Risk of postural hypotension and hypertensive responses Discontinue use if palpitations or frequent headaches occur.

PREGNANCY Increased risk of neonatal malformations manufacturer advises avoid unless there are compelling reasons.

HEPATIC IMPAIRMENT MAOIs may cause idiosyncratic hepatotoxicity if used in patients with hepatic impairment.

MONITORING REQUIREMENTS Monitor blood pressure (risk of postural hypotension and hypertensive responses).

TREATMENT CESSATION Withdrawal If possible avoid abrupt withdrawal. MAOIs are associated with withdrawal symptoms on cessation of therapy. Symptoms include agitation, irritability, ataxia, movement disorders, insomnia, drowsiness, vivid dreams, cognitive impairment, and slowed speech. Withdrawal symptoms occasionally experienced when discontinuing MAOIs include hallucinations and paranoid delusions. If possible MAOIs should be withdrawn slowly.

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).
**Isocarboxazid**

**INDICATIONS AND DOSE**

**Depressive illness**
- **By mouth**
  - Adult: Initially 30 mg daily until improvement occurs, initial dose may be given in single or divided doses, dose may be increased if necessary after 4 weeks, increased to 60 mg daily for 4–6 weeks; dose to be increased under close supervision only, then reduced to 10–20 mg daily, usual maintenance dose, but up to 40 mg daily may be required
  - Elderly: 5–10 mg daily

**INTERACTIONS** → Appendix 1: monoamine-oxidase A and B inhibitors, irreversible

**BREAST FEEDING** Avoid.

**HEPATIC IMPAIRMENT** Avoid in hepatic impairment.

**RENAL IMPAIRMENT** Use with caution.

**LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

**Phenelzine**

**INDICATIONS AND DOSE**

**Depressive illness**
- **By mouth**
  - Adult: Initially 15 mg 3 times a day, response is usually seen within first week; dose may be increased if necessary after 2 weeks if response is not evident, increased if necessary to 15 mg 4 times a day, doses up to 30 mg three times a day may be used in hospital patients; response may not become apparent for up to 4 weeks; once satisfactory response has been achieved, reduce dose gradually to lowest suitable maintenance dose (15 mg on alternate days may be adequate)

**INTERACTIONS** → Appendix 1: monoamine-oxidase A and B inhibitors, irreversible

**BREAST FEEDING** Avoid—no information available.

**HEPATIC IMPAIRMENT** Avoid in hepatic impairment or if abnormal liver function tests.
346  Mental health disorders

**Antidepressants**  >  Monoamine-oxidase A inhibitors, reversible

### Moclobemide

- **Drug action**  Moclobemide is reported to act by reversible inhibition of monoamine oxidase type A (it is therefore termed a RIMA).

- **indications and dose**  
  **Depressive illness**
  - **by mouth**
  - Adult: Initially 300 mg daily in divided doses, adjusted according to response; usual dose 150–600 mg daily, dose to be taken after food.

- **Social anxiety disorder**
  - **by mouth**
  - Adult: Initially 300 mg daily for 3 days, then increased to 600 mg daily in 2 divided doses continued for 8–12 weeks to assess efficacy.

- **Dose adjustments due to interactions** Manufacturer advises reduce dose to half or one-third of the usual dose with concurrent use of cinetidine.

- **Contra-indications**  Acute confusional states - phaeochromocytoma.

- **Caution**  Avoid in agitated or excited patients (or give with sedative for up to 2–3 weeks) - may provoke manic episodes in bipolar disorders - thyrotoxicosis.

- **Interactions**  → Appendix 1: moclobemide

- **Side-effects**
  - Rare  Galactorrhoea - hyponatraemia - raised liver enzymes.
  - Frequency not known  Agitation - confusion - dizziness - dry mouth - gastrointestinal disorders - headache - oedema - paraesthesia - restlessness - skin reactions - sleep disturbances - visual disturbances.

- **Pregnancy**  Safety in pregnancy has not been established – manufacturer advises avoid unless there are compelling reasons.

- **Breast feeding**  Amount too small to be harmful, but patient information leaflet advises avoid.

- **Hepatic impairment**  Reduce dose in severe hepatic disease.

- **Treatment cessation**  Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

- **Patient and carer advice**  Moclobemide is claimed to cause less potentiation of the pressor effect of tyramine than the traditional (irreversible) MAOIs, but patients should avoid consuming large amounts of tyramine-rich food (such as mature cheese, yeast extracts and fermented soya bean products).

- **Medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension.

### Tablet

- **Cautionary and advisory labels**  10, 21

  - **Moclobemide (non-proprietary)**
    - Moclobemide 150 mg  Moclobemide 150 mg tablets  | 30 tablet  
      £22.12 DT price = £22.09
    - Moclobemide 300 mg  Moclobemide 300 mg tablets  | 30 tablet  
      £15.00 DT price = £13.99

### Antidepressants  >  Noradrenaline reuptake inhibitors

### Reboxetine

- **Drug action**  Reboxetine is a selective inhibitor of noradrenaline re-uptake.

- **Indications and dose**  
  **Major depression**
  - **by mouth**
  - Adult: 4 mg twice daily for 3–4 weeks, then increased if necessary to 10 mg daily in divided doses; maximum 12 mg per day.

- **Caution**  Bipolar disorder - history of cardiovascular disease - history of epilepsy - prostatic hypertrophy - susceptibility to angle-closure glaucoma - urinary retention.

- **Interactions**  → Appendix 1: reboxetine

- **Side-effects**
  - Common or very common  Anorexia - chills - constipation - dizziness - dry mouth - headache - impaired visual accommodation - impotence - insomnia - lowering of plasma-potassium concentration on prolonged administration in the elderly - nausea - palpitation - postural hypotension - sweating - tachycardia - urinary retention - vasodilation.
  - Very rare  Angle-closure glaucoma.

- **Pregnancy**  Use only if potential benefit outweighs risk — limited information available.

- **Breast feeding**  Small amount present in milk — use only if potential benefit outweighs risk.

- **Hepatic impairment**  Initial dose 2 mg twice daily, increased according to tolerance.

- **Renal impairment**  Initial dose 2 mg twice daily, increased according to tolerance.

- **Treatment cessation**  Caution — avoid abrupt withdrawal.

- **Patient and carer advice**  
  Driving and skilled tasks  Counselling advised.

- **Medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug.

### Tablet

- **Edronax (Pfizer Ltd)**
  - Reboxetine (as Reboxetine mesilate) 4 mg  Edronax 4 mg tablets  | 60 tablet  
    £18.91 DT price = £18.91

### Antidepressants  >  Selective serotonin re-uptake inhibitors

### Selective serotonin re-uptake inhibitors

- **Drug action**  Selectively inhibit the re-uptake of serotonin (5-hydroxytryptamine, 5-HT).

- **Contra-indications**  Poorly controlled epilepsy - SSRIs should not be used if the patient enters a manic phase.
CAUTIONS Cardiac disease; concurrent electroconvulsive therapy; diabetes mellitus; epilepsy (discontinue if convulsions develop); history of bleeding disorders (especially gastro-intestinal bleeding); history of mania; susceptibility to angle-closure glaucoma

SIDE-EFFECTS
- Common or very common Abdominal pain (dose-related) • constipation (dose-related) • diarrhoea (dose-related) • dyspepsia (dose-related) • gastro-intestinal effects (dose-related) • nausea (dose-related) • vomiting (dose-related)
- Uncommon Serotonin syndrome
- Very rare Angle-closure glaucoma
- Frequency not known Anaphylaxis • angioedema • anorexia with weight loss • anxiety • arthralgia • asthma • bleeding disorders • convulsions • dizziness • drowsiness • dry mouth • dyskinesias • eczematoses • galactorrhoea • hallucinations • headache • hypersensitivity reactions • hypomania • hypotension • increased appetite • insomnia • mania • movement disorders • myalgia • nervousness • photosensitivity • pruritus • rash • sexual dysfunction • suicidal behaviour • sweating • tremor • urinary retention • urticaria • visual disturbances • weight gain

SIDE-EFFECTS, FURTHER INFORMATION
- Hypersensitivity reactions If hypersensitivity reactions (including rash) occur, consider discontinuation—may be sign of impending serious systemic reaction, possibly associated with vasculitis.

OVERDOSE Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, mydriasis, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

For details on the management of poisoning, see: Selective serotonin re-uptake inhibitors, under Emergency treatment of poisoning p. 1249.

PREGNANCY Manufacturers advise avoid during pregnancy unless the potential benefit outweighs the risk. There is a small increased risk of congenital heart defects when taken during early pregnancy. If used during the third trimester there is a risk of neonatal withdrawal symptoms, and persistent pulmonary hypertension in the newborn has been reported.

TREATMENT CESSATION Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, electric shock sensation in the head, neck, and spine, tinnitus, sleep disturbances, fatigue, influenza-like symptoms, and sweating are the most common features of abrupt withdrawal of an SSRI or marked reduction of the dose; palpitation and visual disturbances can occur less commonly. The dose should be tapered over at least a few weeks to avoid these effects. For some patients, it may be necessary to withdraw treatment over a longer period; consider obtaining specialist advice if symptoms persist.

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

PATIENT AND CARER ADVICE
Driving and skilled tasks May also impair performance of skilled tasks (e.g. driving, operating machinery).
Escitalopram

**DRUG ACTION** Escitalopram is the active enantiomer of citalopram.

**INDICATIONS AND DOSE**

**Depressive illness** | **Generalised anxiety disorder** | **Obsessive-compulsive disorder**

- **BY MOUTH**
  - Adult: 10 mg once daily; increased if necessary up to 20 mg daily
  - Elderly: Initially 5 mg once daily; maximum 10 mg per day

**Panic disorder**

- **BY MOUTH**
  - Adult: Initially 5 mg once daily for 7 days, then increased to 10 mg daily; maximum 20 mg per day
  - Elderly: Initially 2.5 mg once daily; maximum 10 mg per day

**Social anxiety disorder**

- **BY MOUTH**
  - Adult: Initially 10 mg once daily for 2–4 weeks, dose to be adjusted after 2–4 weeks of treatment; usual dose 5–20 mg daily

**CONTRA-INDICATIONS** QT-interval prolongation

**CAUTIONS** Susceptibility to QT-interval prolongation

**INTERACTIONS** Appendix 1: SSRIs

**SIDE-EFFECTS**

- **Common or very common** Abnormal dreams, fatigue, paraesthesia, pyrexia, restlessness, sinusitis, yawning

- **Uncommon** Alopeoia, bruxism, confusion, epistaxis, menstrual disturbances, mydriasis, oedema, pruritus, syncope, tachycardia, taste disturbance, tinnitus

- **Rare** Aggression, bradycardia, depersonalisation

- **Frequency not known** Hepatitis, paradoxical increased anxiety during initial treatment of panic disorder (reduce dose), postural hypotension, QT interval prolongation, thrombocytopenia

**BREAST FEEDING** Present in breast milk; avoid.

**HEPATIC IMPAIRMENT** Initial dose 5 mg daily for 2 weeks, thereafter increased to max. 10 mg daily according to response; particular caution in severe impairment.

**RENAL IMPAIRMENT** Caution if eGFR less than 30 mL/minute/1.73m².

**DIRECTIONS FOR ADMINISTRATION** Oral drops can be mixed with water, orange juice, or apple juice before taking.

**PATIENT AND CARER ADVICE** Counselling on administration of oral drops advised.

Driving and skilled tasks

Patients should be counselled about the effects on driving.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral drops**

- **Escitalopram (Non-proprietary)**
  - Escitalopram (as Escitalopram oxalate) 20 mg per
  - 1 ml Escitalopram 20 mg oral drops sugar-free sugar-free | 15 ml (POM) no price available

  - Escitalopram (as Escitalopram oxalate) 20 mg Cipralex 20 mg tablets | 28 tablet (POM) £25.20 DT price = £1.49

Fluoxetine

**INDICATIONS AND DOSE**

**Major depression**

- **BY MOUTH**
  - Adult: Initially 20 mg daily, dose is increased after 3–4 weeks if necessary, and at appropriate intervals thereafter, daily dose may be administered as a single or divided dose; maximum 60 mg per day
  - Elderly: Initially 20 mg daily, dose is increased after 3–4 weeks if necessary, and at appropriate intervals thereafter, daily dose may be administered as a single or divided dose, usual maximum dose is 40 mg daily but doses up to 60 mg daily can be used

**Bulimia nervosa**

- **BY MOUTH**
  - Adult: 60 mg daily, daily dose may be administered as a single or divided dose
  - Elderly: Up to 40 mg daily, daily dose may be administered as a single or divided dose, usual maximum dose is 40 mg daily but doses up to 60 mg daily can be used

**Obsessive-compulsive disorder**

- **BY MOUTH**
  - Adult: 20 mg daily, increased if necessary up to 60 mg daily, daily dose may be administered as a single or divided dose, dose to be increased gradually, review treatment if inadequate response after 10 weeks, maximum 60 mg per day
  - Elderly: 20 mg daily, increased if necessary up to 40 mg daily, daily dose may be administered as a single or divided dose, dose to be increased gradually, review treatment if inadequate response after 10 weeks, usual maximum dose is 40 mg daily but doses up to 60 mg daily can be used

**PHARMACOKINETICS**

Consider the long half-life of fluoxetine when adjusting dosage (or in overdosage).

**INTERACTIONS** Appendix 1: SSRIs

**SIDE-EFFECTS** Alopeoia, changes in blood sugar, chills, confusion, diarrhoea, dysphagia, dysphonia, euphoria, flushing, haemorrhage, hepatitis, hypotension, impaired concentration, malaise, neuroleptic malignant syndrome-like event, palpitation, pharyngitis, priapism, pulmonary fibrosis, pulmonary inflammation, sleep disturbances...
taste disturbance • toxic epidermal necrolysis • urinary frequency • vasodilatation • yawning

- **BREAST FEEDING** Present in milk—avoid.
- **HEPATIC IMPAIRMENT** Reduce dose or increase dose interval.
- **DIRECTIONS FOR ADMINISTRATION** Dispersible tablets can be dispersed in water for administration or swallowed whole with plenty of water.
- **PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of dispersible tablets.

Driving and skilled tasks
Patients should be counselled about the effects on driving and skilled tasks.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

**Dispersible tablet**

**CAUTIONARY AND ADVISORY LABELS 10**

- **Olena** (AmCo)
  - Fluoxetine (as Fluoxetine hydrochloride) 20 mg: mg tablets sugar-free | 28 tablet [Disp] £3.44 DT price = £3.44

---

**Fluvoxamine maleate**

**INDICATIONS AND DOSE**

**Depressive illness**

- **BY MOUTH**
  - Adult: Initially 50–100 mg daily, dose to be taken in the evening, dose to be increased gradually, increased if necessary up to 300 mg daily, doses over 150 mg daily are given in divided doses; maintenance 100 mg daily

**Obsessive-compulsive disorder**

- **BY MOUTH**
  - Adult: Initially 50 mg daily, dose to be taken in the evening, dose is increased gradually if necessary after several weeks, increased if necessary up to 300 mg daily; maintenance 100–300 mg daily, doses over 150 mg daily are given in divided doses, if no improvement in obsessive-compulsive disorder within 10 weeks, treatment should be reconsidered

**INTERACTIONS** → Appendix 1: SSRIs

**SIDE-EFFECTS**

- **Common or very common** Malaise • palpitation • tachycardia
- **Uncommon** Ataxia • confusion • postural hypotension
- **Rare** Abnormal liver function, usually symptomatic (discontinue treatment)
- **Frequency not known** Neuroleptic malignant syndrome-like event • paraesthesia • taste disturbance

- **BREAST FEEDING** Present in milk—avoid.
- **HEPATIC IMPAIRMENT** Start with low dose.
- **RENAL IMPAIRMENT** Start with low dose.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks
Patients should be counselled about the effects on driving and skilled tasks.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- **Fluvoxamine maleate (Non-proprietary)**
  - Fluvoxamine maleate 50 mg Fluvoxamine 50mg tablets | 60 tablet [Disp] £25.32 DT price = £20.34
  - Fluvoxamine maleate 100 mg Fluvoxamine 100mg tablets | 30 tablet [Disp] £25.32 DT price = £20.34

**Paroxetine**

**INDICATIONS AND DOSE**

**Major depression** | **Social anxiety disorder** | **Post-traumatic stress disorder** | **Generalised anxiety disorder**

- **BY MOUTH**
  - Adult: 20 mg daily, dose to be taken in the morning, no evidence of greater efficacy at higher doses; maximum 50 mg per day
  - Elderly: 20 mg daily, dose to be taken in the morning, no evidence of greater efficacy at higher doses; maximum 40 mg per day

**Obsessive-compulsive disorder**

- **BY MOUTH**
  - Adult: Initially 20 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually, increased to 40 mg daily, no evidence of greater efficacy at higher doses; maximum 60 mg per day
  - Elderly: Initially 20 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually; maximum 40 mg per day

**Panic disorder**

- **BY MOUTH**
  - Adult: Initially 10 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually, increased to 40 mg daily, no evidence of greater efficacy at higher doses; maximum 60 mg per day
  - Elderly: Initially 10 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually; maximum 40 mg per day

**CAUTIONS**

Achlorhydria • high gastric pH

**CAUTIONS, FURTHER INFORMATION**

Achlorhydria or high gastric pH Causes reduced absorption of the oral suspension.

**INTERACTIONS** → Appendix 1: SSRIs
PREGNANCY

Increased risk of congenital malformations, especially if used in the first trimester.

BREAST FEEDING

Present in milk but amount too small to be harmful.

HEPATIC IMPAIRMENT

Reduce dose.

RENAL IMPAIRMENT

Reduce dose if eGFR less than 30 mL/minute/1.73 m².

SIDE-EFFECTS

Associated with a higher risk of withdrawal reactions.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Patients should be counselled about the effect on driving.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS

Paroxetine (as Paroxetine hydrochloride) 10 mg Paroxetine tablets | 28 tablet £17.03 DT price = £12.98
Paroxetine (as Paroxetine hydrochloride) 20 mg Paroxetine 20 mg tablets | 30 tablet £3.00 DT price = £1.56

Sertraline (as Sertraline hydrochloride) 50 mg Sertraline tablets | 30 tablet £55.23 DT price = £1.56
Sertraline (as Sertraline hydrochloride) 100 mg Sertraline tablets | 28 tablet £29.16 DT price = £1.26

ANTIDEPRESSANTS

SEROTONIN AND NORADRENALINE RE-UPTAKE INHIBITORS

Duloxetine

DRUG ACTION

Inhibits the re-uptake of serotonin and noradrenaline.

INDICATIONS AND DOSE

Major depressive disorder

BY MOUTH

Adult: 60 mg once daily

Generalised anxiety disorder

BY MOUTH

Adult: Initially 30 mg once daily, increased if necessary to 60 mg once daily; maximum 120 mg per day

Diabetic neuropathy

BY MOUTH

Adult: 60 mg once daily, discontinue if inadequate response after 2 months; review treatment at least every 3 months, maximum dose to be given in divided doses; maximum 120 mg per day

Moderate to severe stress urinary incontinence

BY MOUTH

Adult (female): 40 mg twice daily, patient should be assessed for benefit and tolerability after 2–4 weeks, alternatively initially 20 mg twice daily for 2 weeks, this can minimise side effects, then increased to 40 mg twice daily, the patient should be assessed for benefit and tolerability after 2–4 weeks.

CAUTIONS

Bleeding disorders · cardiac disease · elderly · history of mania · history of seizures · hypertension (avoid

350 Mental health disorders

SIDE-EFFECTS

Common or very common Abnormal dreams · raised cholesterol · yawning

Uncommon Arrhythmias · confusion · urinary incontinence

Rare Depersonalisation · neuroleptic malignant syndrome-like event · panic attacks · paradoxical increased anxiety during initial treatment of panic disorder (reduce dose) · restless legs syndrome

Very rare Acute glaucoma · hepatic disorders · hepatitis · peripheral oedema · priapism

Frequency not known Extrapyramidal reactions · orofacial dystonias · tinnitus · withdrawal reactions

PREGNANCY

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Sertraline (as Sertraline hydrochloride) 50 mg Soluble tablets | 28 tablet £19.25 DT price = £1.13
Sertraline (as Sertraline hydrochloride) 100 mg Sertraline tablets | 28 tablet £29.09 DT price = £1.26
Lustral tablets | 100 tablet £17.82 DT price = £1.13
Lustral tablets | 28 tablet £29.16 DT price = £1.26

INTERACTIONS

Appendix 1: SSRIs

SIDE-EFFECTS

Aggression · amnesia · bronchospasm · hepatitis · hypercholesterolaemia · hyperprolactinaemia · hypertension · hypoglycaemia · hypothyroidism · jaundice · leucopenia · liver failure · menstrual irregularities · palpitation · pancreatitis · paraesthesia · postural hypotension · stomatitis · tachycardia · tinnitus · urinary incontinence

BREAST FEEDING

Not known to be harmful but consider discontinuing breast-feeding.

HEPATIC IMPAIRMENT

Reduce dose or increase dose interval in mild or moderate impairment. Avoid in severe impairment.

RENAL IMPAIRMENT

Use with caution.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Patients should be counselled on the effects on driving and skilled tasks.
Venlafaxine

DRUG ACTION

A serotonin and noradrenaline re-uptake inhibitor.

INDICATIONS AND DOSE

Major depression

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: Initially 75 mg daily in 2 divided doses, then increased if necessary up to 375 mg daily, dose to be increased if necessary at intervals of at least 2 weeks, faster dose titration may be necessary in some patients; maximum 375 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

Adult: Initially 75 mg once daily, increased if necessary up to 375 mg once daily, dose to be increased if necessary at intervals of at least 2 weeks, faster dose titration may be necessary in some patients; maximum 375 mg per day

Generalised anxiety disorder

BY MOUTH USING MODIFIED-RELEASE MEDICINES

Adult: 75 mg once daily, increased if necessary up to 225 mg once daily, dose to be increased at intervals of at least 2 weeks; maximum 225 mg per day

Social anxiety disorder

BY MOUTH USING MODIFIED-RELEASE MEDICINES

Adult: 75 mg once daily, there is no evidence of greater efficacy at higher doses, increased if necessary up to 225 mg once daily, dose to be increased if necessary at intervals of at least 2 weeks; maximum 225 mg per day

CONTRA-INDICATIONS

Conditions associated with high risk of cardiac arrhythmia - uncontrolled hypertension

CAUTIONS

Diabetes - heart disease (monitor blood pressure) - history of bleeding disorders - history of epilepsy - history or family history of mania - susceptibility to angle-closure glaucoma

INTERACTIONS ➔ Appendix 1: venlafaxine

SIDE-EFFECTS

Common or very common

Uncommon

Rare

Very rare

Angle-closure glaucoma

Frequency not known

Duloxetine (as Duloxetine hydrochloride) 20 mg Ventreve 20mg gastro-resistant capsules | 28 capsule [Pom] £18.48 DT price = £2.94

Duloxetine (as Duloxetine hydrochloride) 40 mg Ventreve 40mg gastro-resistant capsules | 56 capsule [Pom] £36.96 DT price = £4.89

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2006) that duloxetine (Cymbalta)® should be restricted for use by specialists when other treatments for diabetic peripheral neuropathic pain are unsuitable or inadequate.
Johnson syndrome • suicidal behaviour • syndrome of inappropriate anti-diuretic hormone secretion • urticaria • vertigo

- **PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in animal studies. Risk of withdrawal effects in neonate.
- **BREAST FEEDING** Present in milk—avoid.
- **HEPATIC IMPAIRMENT** Consider reducing dose by 50% in mild or moderate impairment; use with caution and reduce dose by at least 50% in severe impairment.
- **RENAL IMPAIRMENT** Use half normal dose (immediate-release tablets may be given once daily) if eGFR less than 30 mL/minute/1.73 m². Use with caution.
- **TREATMENT CESSATION** Associated with a higher risk of withdrawal effects compared with other antidepressants. Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, tremor, sleep disturbances, and sweating are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks

May affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Antidepressants > Serotonin uptake inhibitors**

**Trazodone hydrochloride**

- **INDICATIONS AND DOSE**

Depressive illness (particularly where sedation is required)

- **BY MOUTH**

Adult: Initially 150 mg daily in divided doses, dose to be taken after food, alternatively initially 150 mg once daily, dose to be taken at bedtime, increased if necessary to 300 mg daily; increased if necessary to 600 mg daily in divided doses, higher dose for use in hospital patients only
SIDE-EFFECTS, FURTHER INFORMATION

Treatment should be stopped if the patient enters a manic phase. Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

CONTRA-INDICATIONS Acute porphyrias p. 969 - arrhythmias - during the manic phase of bipolar disorder - heart block - immediate recovery period after myocardial infarction

CAUTIONS Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - increased intra-ocular pressure - patients with a significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - prostatic hypertrophy - susceptibility to angle-closure glaucoma - urinary retention

CAUTIONS, FURTHER INFORMATION

Tricyclic and related antidepressants under Emergency treatment as required

Avoid during first trimester—limited information available. Monitor infant for signs of withdrawal if used until delivery.

PREGNANCY

Avoid during first trimester—limited information available. Monitor infant for signs of withdrawal if used until delivery.

BREAST FEEDING

The amount secreted into breast milk is too small to be harmful.

HEPATIC IMPAIRMENT

Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

RENA L IMPAIRMENT

Use with caution in severe impairment.

TREATMENT CESSION

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

PRESCRIBING AND DISPENSING INFORMATION

Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.

PATIENT AND CARER ADVICE

Effects of alcohol enhanced.

Driving and skilled tasks

Drowsiness may affect the performance of skilled tasks (e.g. driving).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

- **SIDE-EFFECTS**

  - Common or very common

- **PREGNANCY** Avoid.
Antidepressants > Tricyclic antidepressants

Amitriptyline hydrochloride

**Indications and Dose**

- **Abdominal pain or discomfort (in patients who have not responded to laxatives, loperamide, or antispasmodics)**
  - **By mouth**
  - Adult: Initially 5–10 mg daily, to be taken at night; increased in steps of 10 mg at least every 2 weeks as required; maximum 30 mg per day

- **Depressive illness (not recommended—increased risk of fatality in overdose)**
  - **By mouth**
  - Adult: Initially 75 mg daily in divided doses, alternatively initially 75 mg once daily, dose to be taken at bedtime, increased if necessary to 150–200 mg daily, dose to be increased gradually
  - Elderly: Initially 30–75 mg daily in divided doses, alternatively initially 30–75 mg once daily, dose to be taken at bedtime, increased if necessary to 150–200 mg daily, dose to be increased gradually

- **Neuropathic pain**
  - **By mouth**
  - Adult: Initially 10 mg once daily, increased if necessary to 75 mg once daily, dose to be taken at night, dose to be increased gradually, higher doses to be given on specialist advice

- **Migraine prophylaxis**
  - **By mouth**
  - Adult: Initially 10 mg once daily, then increased if necessary to 50–75 mg once daily (max. per dose 150 mg), dose to be taken at night

**Unlicensed use**

Not licensed for use in neuropathic pain. Not licensed for use in migraine prophylaxis. Not licensed for use in abdominal pain or discomfort in patients who have not responded to laxatives, loperamide, or antispasmodics.

**Contra-indications**

Acute porphyrias p. 969-arrhythmias during manic phase of bipolar disorder—heart block—immediate recovery period after myocardial infarction

**Caution**

Cardiovascular disease—chronic constipation—diabetes—epilepsy—history of bipolar disorder—history of psychosis—hyperthyroidism (risk of arrhythmias)—increased intra-ocular pressure—patients with a significant risk of suicide—phaeochromocytoma (risk of arrhythmias)—prostatic hypertrophy—susceptibility to angle-closure glaucoma—urinary retention

**Caution, Further Information**

Treatment should be stopped if the patient enters a manic phase. Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

**Interactions**

Appendix 1: tricyclic antidepressants

**Side-effects**

- **Common or very common** Abdominal pain—fatigue—hypertension—mydriasis—oedema—palpitation—restlessness—stomatitis
- **Rare** Dysarthria—extrapyramidal symptoms—paralytic ileus—tremor
- **Very rare** Neuroleptic malignant syndrome—precipitation of angle-closure glaucoma
- **Frequency not known** Agitation—alopecia—anorexia—anxiety—arrhythmia—blurred vision—breast enlargement—changes in blood sugar—chills (on withdrawal)—confusion—constipation—convulsions—delusions—dizziness—

sudden death of patients with cardiac disease • suicidal
behaviour • sweating • sweating (on withdrawal) •
tachycardia • taste disturbance • tinnitus • urinary retention •
urticaria • vivid dreams (on withdrawal) • vomiting •
weight gain • weight loss

SIDE-EFFECTS, FURTHER INFORMATION
The patient should be encouraged to persist with
treatment as some tolerance to these side-effects seems to
develop. They are reduced if low doses are given initially
and then gradually increased, but this must be balanced
against the need to obtain a full therapeutic effect as soon
as possible.

Oversed
Overdose with amitriptyline is associated with a
high rate of fatality. Symptoms of overdosage
may include dry mouth, coma of varying degree,
hypotension, hypothermia, hyperreflexia, extensor planter
response, convulsions, respiratory failure, cardiac
conduction defects, and arrhythmias. Dilated pupils and
urinary retention also occur. For details on the
management of poisoning, see Tricyclic and related
antidepressants, under Emergency treatment of poisoning
p. 1249.

PREGNANCY Use only if potential benefit outweighs risk.

BREAST FEEDING The amount secreted into breast milk is
too small to be harmful.

HEPATIC IMPAIRMENT Sedative effects are increased in
hepatic impairment. Avoid in severe liver disease.

TREATMENT CESSATION Withdrawal effects may occur
within 5 days of stopping treatment with antidepressant
drugs; they are usually mild and self-limiting, but in some
cases may be severe. The risk of withdrawal symptoms is
increased if the antidepressant is stopped suddenly after
regular administration for 8 weeks or more. The dose
should preferably be reduced gradually over about 4 weeks,
or longer if withdrawal symptoms emerge (6 months in
patients who have been on long-term maintenance
treatment). If possible tricyclic and related antidepressants
should be withdrawn slowly.

PRESCRIBING AND DISPENSING INFORMATION Limited
quantities of tricyclic antidepressants should be prescribed
at any one time because their cardiovascular and
epileptogenic effects are dangerous in overdosage.

PATIENT AND CARER ADVICE Effects of alcohol enhanced.

Driving and skilled tasks
Drowsiness may affect the performance of skilled tasks
(e.g. driving).

LESS SUITABLE FOR PRESCRIBING Amitriptyline
hydrochloride is less suitable for prescribing, see Tricyclic
and related antidepressant drugs in Antidepressant drugs
p. 342.

MEDICINAL FORMS
There can be variation in the licensing of different medicines
containing the same drug. Forms available from special-order
manufacturers include: oral suspension, oral solution

Triptafen (AMCo)
Perphenazine 2 mg, Amitriptyline hydrochloride 25 mg
Triptafen tablets | 100 tablet [PoM] £33.13

Clomipramine hydrochloride

INDICATIONS AND DOSE
Depressive illness

BY MOUTH

Adult: Initially 10 mg daily, then increased if necessary
to 30–150 mg daily divided doses, dose to be
increased gradually, alternatively increased if
necessary to 30–150 mg once daily, dose to be taken
at bedtime; maximum 250 mg per day

Elderly: Initially 10 mg daily, then increased to
30–75 mg daily, dose to be increased carefully over
approximately 10 days

Phobic and obsessional states

BY MOUTH

Adult: Initially 25 mg daily, then increased to
100–150 mg daily, dose to be increased gradually over
2 weeks; maximum 250 mg per day

Elderly: Initially 10 mg daily, then increased to
100–150 mg daily, dose to be increased gradually over
2 weeks; maximum 250 mg per day

Adjuvance treatment of cataplexy associated with
narcolepsy

BY MOUTH

Adult: Initially 10 mg daily, dose to be gradually
increased until satisfactory response; increased if
necessary to 10–75 mg daily
CONTRA-INDICATIONS Acute porphyrias p. 969 - arrhythmias - during the manic phase of bipolar disorder - heart block - immediate recovery period after myocardial infarction

CAUTIONS Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - increased intra-ocular pressure - patients with a significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - prostatic hypertrophy - susceptibility to angle-closure glaucoma - urinary retention

CAUTIONS, FURTHER INFORMATION

Treatment should be stopped if the patient enters a manic phase. Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

INTERACTIONS → Appendix 1: tricyclic antidepressants

SIDE-EFFECTS

Common or very common Abdominal pain - aggression - diarrhoea - fatigue - flushing - hypertension - impaired memory - muscle hypertonia - muscle weakness - mydriasis - myoclonus - restlessness - yawning

Rare Dysarthria - extrapyramidal symptoms - paralytic ileus - tremor

Very rare Allergic alveolitis - neuroleptic malignant syndrome - precipitation of angle-closure glaucoma

Frequency not known Agitation - alopecia - anorexia - anxiety - arrhythmias - blurred vision - breast enlargement - changes in blood sugar - chills (on withdrawal) - confusion - constipation - convulsions - delusions - dizziness - dry mouth - ECG changes - galactorrhoea - gynaecomastia - haematological reactions - hallucinations - headache (on withdrawal) - heart block - hepatic reactions - hypomania - hyponatraemia - increased appetite - influenza-like symptoms (on withdrawal) - insomnia (on withdrawal) - irritability - mania - movement disorders (on withdrawal) - myalgia (on withdrawal) - nausea - nausea (on withdrawal) - paraesthesia - photosensitivity - postural hypotension - pruritus - rash - sexual dysfunction - sleep disturbances - sudden death of patients with cardiac disease - suicidal behaviour - sweating - sweating (on withdrawal) - tachycardia - taste disturbance - tinnitus - urinary retention - urticaria - vivid dreams (on withdrawal) - vomiting - weight gain - weight loss

SIDE-EFFECTS, FURTHER INFORMATION

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

Overdose Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1249.

PREGNANCY Neonatal withdrawal symptoms reported if used during third trimester.

BREAST FEEDING The amount secreted into breast milk is too small to be harmful.

HEPATIC IMPAIRMENT Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

TREATMENT CESSATION Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible antidepressant treatment should be withdrawn slowly.

PRESCRIBING AND DISPENSING INFORMATION Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.

PATIENT AND CARER ADVICE Effects of alcohol enhanced. Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Dosulepin hydrochloride

(Dothiepin hydrochloride)

INDICATIONS AND DOSE

Depressive illness, particularly where sedation is required (not recommended—increased risk of fatality in overdose) (initiated by a specialist)

BY MOUTH

Adult: Initially 75 mg daily in divided doses, alternatively initially 75 mg once daily, dose to be taken at bedtime, increased if necessary to 150 mg daily, doses to be increased gradually; up to 225 mg daily in some circumstances (e.g. hospital use)

Elderly: Initially 50–75 mg daily in divided doses, alternatively initially 50–75 mg once daily, dose to be taken at bedtime, increased if necessary to 75–150 mg daily, doses to be increased gradually; up to 225 mg daily in some circumstances (e.g. hospital use)

CONTRA-INDICATIONS Acute porphyrias p. 969 - arrhythmias - during the manic phase of bipolar disorder - heart block - immediate recovery period after myocardial infarction

CAUTIONS Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - increased intra-ocular pressure - patients with a significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - prostatic hypertrophy - susceptibility to angle-closure glaucoma - urinary retention

CAUTIONS, FURTHER INFORMATION

PREG NTA

SIDE-EFFECTS, FURTHER INFORMATION

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

Overdose

Overdosage with dosulepin is associated with a relatively high rate of fatality. Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1249.

PREGNANCY

Use only if potential benefit outweighs risk.

BREAST FEEDING

The amount secreted into breast milk is too small to be harmful.

HEPATIC IMPAIRMENT

Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

TREATMENT CESSATION

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge. (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

PRESCRIBING AND DISPENSING INFORMATION

Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

A maximum prescription equivalent to 2 weeks' supply of 75 mg daily should be considered in patients with increased risk factors for suicide at initiation of treatment, during any dose adjustment, and until improvement occurs.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Ef fects of alcohol enhanced.

LESS SUITABLE FOR PRESCRIBING

Dosulepin hydrochloride is less suitable for prescribing, see Tricyclic and related antidepressant drugs in Antidepressant drugs p. 342.

INDICATIONS AND DOSE

Depressive illness (particularly where sedation is required)

BY MOUTH

Adult: Initially 75 mg daily in divided doses, alternatively 75 mg once daily, adjusted according to response, dose to taken at bedtime; maintenance 25–300 mg daily, doses above 100 mg given in 3 divided doses

Elderly: Start with lower doses and adjust according to response

CONTRA-INDICATIONS

Acute porphyrias p. 969 • arrhythmias • during manic phase of bipolar disorder • heart block • immediate recovery period after myocardial infarction

CAUTIONS

Cardiovascular disease • chronic constipation • diabetes • epilepsy • history of bipolar disorder • history of psychosis • hyperthyroidism (risk of arrhythmias) • increased intra-ocular pressure • patients with significant risk of suicide • phaeochromocytoma (risk of arrhythmias) • prostatic hypertrophy • susceptibility to angle-closure glaucoma • urinary retention

CAUTIONS, FURTHER INFORMATION

Treatment should be stopped if the patient enters a manic phase.

Elderly

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

SIDE-EFFECTS, FURTHER INFORMATION
The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

Overdose
Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1249.

PREGNANCY
Use with caution—limited information available.

BREAST FEEDING
The amount secreted into breast milk is too small to be harmful. Accumulation of metabolite may cause sedation and respiratory depression in neonate.

HEPATIC IMPAIRMENT
Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

RENAL IMPAIRMENT
Use with caution.

TREATMENT CESSION Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

PRESCRIBING AND DISPENSING INFORMATION
Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.

PATIENT AND CARER ADVICE
Effects of alcohol enhanced. Driving and skilled tasks
Drowsiness may affect performance of skilled tasks (e.g. driving).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Capsule

CAUTIONARY AND ADVISORY LABELS

INDICATIONS AND DOSE

Depressive illness

► BY MOUTH
   Adult: Initially up to 75 mg daily in divided doses, then increased to 150–200 mg daily, up to 150 mg may be given as a single dose at bedtime, dose to be increased gradually
   Elderly: Initially 10 mg daily, increased to 30–50 mg daily, dose to be increased gradually

Depressive illness in hospital patients

► BY MOUTH
   Adult: Initially up to 75 mg daily in divided doses, dose to be increased gradually, increased to up to 300 mg daily in divided doses

Nocturnal enuresis

► BY MOUTH
   Child 6–7 years: 25 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course
   Child 8–10 years: 25–50 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course
   Child 11–17 years: 50–75 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

CONTRA-INDICATIONS
Immediate recovery period after myocardial infarction (in adults) • acute porphyrias p. 969 • arrhythmia • during the manic phase of bipolar disorder • heart block

CAUTIONS
Cardiovascular disease • chronic constipation • diabetes • epilepsy • history of bipolar disorder • history of psychosis • hyperthyroidism (risk of arrhythmias) • increased intraocular pressure (in adults) • patients with a significant risk of suicide • phaeochromocytoma (risk of arrhythmias) • prostatic hypertrophy (in adults) • susceptibility to angle-closure glaucoma • urinary retention

CAUTIONS, FURTHER INFORMATION
Treatment should be stopped if the patient enters a manic phase.

In adults Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

Side-effects, further information

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

Overdose
Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Lofepramine is associated with the lowest risk of fatal overdose, in comparison with other tricyclic antidepressant drugs. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1249.
### Nortriptyline

#### INDICATIONS AND DOSE

**Depressive illness**

- **By mouth**
  - Adult: To be initiated at a low dose, then increased if necessary to 75–100 mg daily in divided doses, alternatively increased if necessary to 75–100 mg once daily; maximum 150 mg per day
  - Elderly: To be initiated at a low dose, then increased if necessary to 30–50 mg daily in divided doses

**Neuropathic pain**

- **By mouth**
  - Adult: Initially 10 mg once daily, to be taken at night, increased if necessary to 75 mg daily, dose to be increased gradually; higher doses to be given under specialist supervision

#### UNLICENSED USE

Not licensed for use in neuropathic pain.

#### CONTRA-INDICATIONS

Acute porphyrias p. 969 - arrhythmias - during the manic phase of bipolar disorder - heart block - immediate recovery period after myocardial infarction

#### CAUTIONS

Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - increased intra-ocular pressure - patients with a significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - prostatic hypertrophy - susceptibility to angle-closure glaucoma - urinary retention

#### CAUTIONS, FURTHER INFORMATION

Treatment should be stopped if the patient enters a manic phase. Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

#### SIDE-EFFECTS

- **Common or very common**
  - Fatigue
  - Hypertension
  - Mydriasis
  - Restlessness

- **Rare**
  - Extrapyramidal symptoms
  - Paralytic ileus

- **Very rare**
  - Neuroleptic malignant syndrome

- **Frequency not known**
  - Acute porphyrias

#### INTERACTIONS

→ Appendix 1: tricyclic antidepressants

#### TREATMENT CESSION

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

PATIENT AND CARER ADVICE

▶

CONTRA-INDICATIONS

Paralytic ileus

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS

Trimipramine

INDICATIONS AND DOSE

Depressive illness (particularly where sedation required)

BY MOUTH

Adult: Initially 50–75 mg daily in divided doses, alternatively initially 50–75 mg once daily, dose to be taken at bedtime, increased if necessary to 150–300 mg daily

Elderly: Initially 10–25 mg 3 times a day, maintenance 75–150 mg daily

CONTRA-INDICATIONS

Acute porphyrias p. 969 - arrhythmias - during the manic phase of bipolar disorder - heart block - immediate recovery period after myocardial infarction

CAUTIONS

Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - increased intra-ocular pressure - patients with a significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - prostatic hypertrophy - susceptibility to angle-closure glaucoma - urinary retention

CAUTIONS, FURTHER INFORMATION

Treatment should be stopped if the patient enters a manic phase. Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

INTERACTIONS

Appendix 1: tricyclic antidepressants

SIDE-EFFECTS

Rare Paralytic ileus

Very rare Neuroleptic malignant syndrome - precipitation of angle-closure glaucoma

Frequency not known Agitation - alopecia - anorexia - anxiety - arrhythmia - blurred vision - breast enlargement - changes in blood sugar - chills (on withdrawal) - confusion - constipation - convulsions - delusions - dizziness - dry mouth - dysarthria - ECG changes - extrapyramidal symptoms - galactorrhoea - gynaecomastia - haematological reactions - hallucinations - headache (on withdrawal) - heart block - hepatic reactions - hypomania - hypotonia - increased appetite - influenza-like symptoms (on withdrawal) - insomnia (on withdrawal) - irritability - mania - movement disorders (on withdrawal) - myalgia (on withdrawal) - nausea - nausea (on withdrawal) - paraesthesia - photosensitivity - postural hypotension - pruritus - rash - sexual dysfunction - sleep disturbances - sudden death of patients with cardiac disease - suicidal behaviour - sweating - sweating (on withdrawal) - tachycardia - taste disturbance - tinnitus - tremor - urinary retention - urticaria - vivid dreams (on withdrawal) - vomiting - weight gain - weight loss

SIDE-EFFECTS, FURTHER INFORMATION

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

Overdose

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 1249.

PREGNANCY

Use only if potential benefit outweighs risk.

BREAST FEEDING

The amount secreted into breast milk is too small to be harmful.

HEPATIC IMPAIRMENT

Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

TREATMENT CESSATION

Withdrawing effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

PRESCRIBING AND DISPENSING INFORMATION

Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.

PATIENT AND CARER ADVICE

Effects of alcohol enhanced.

Driving and skilled tasks

Drowsiness may affect the performance of skilled tasks (e.g. driving).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS

Trimipramine (as Trimipramine maleate) 10 mg Trimipramine 10mg tablets | 30 tablet | £1.79

Trimipramine (as Trimipramine maleate) 25 mg Trimipramine 25mg tablets | 30 tablet | £5.72

Trimipramine (as Trimipramine maleate) 50 mg Trimipramine 50mg tablets | 30 tablet | £12.93
OTHER ANTIDEPRESSANTS

Vortioxetine

**DRUG ACTION** Vortioxetine inhibits the re-uptake of serotonin (5-HT) and is an antagonist at 5-HT\(_3\) and an agonist at 5-HT\(_4\) receptors. This multimodal activity appears to be associated with antidepressant and anxiolytic-like effects.

**INDICATIONS AND DOSE**

**Major depression**

- **BY MOUTH**
  - Adult: Initially 10 mg once daily; adjusted according to response to 5–20 mg once daily
  - Elderly: Initially 5 mg once daily; increased if necessary up to 20 mg once daily

**SIDE-EFFECTS**

- **Common or very common** Abnormal dreams, constipation, diarrhea, dizziness, nausea, pruritus, vomiting
- **Rare** Flushing, night sweats
- **Frequency not known** Bleeding disorders

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk— toxicity in animal studies. If used during the later stages of pregnancy, there is a risk of neonatal withdrawal symptoms and persistent pulmonary hypertension in the newborn.

**BREAST FEEDING**

Manufacturer advises avoid— present in milk in animal studies.

**INTERACTIONS**

- **CONTRA-INDICATIONS** CNS depression, phaeochromocytoma
- **CAUTIONS** Risk factors for stroke
- **INTERACTIONS** Appendix 1: vortioxetine

### Benperidol

**INDICATIONS AND DOSE**

**Control of deviant antisocial sexual behaviour**

- **BY MOUTH**
  - Adult: 0.25–1.5 mg daily in divided doses, adjusted according to response for debilitated patients, use elderly dose
  - Elderly: Initially 0.125–0.75 mg daily in divided doses, adjusted according to response

**SIDE-EFFECTS**

- **Common or very common** Abnormal dreams, constipation, diarrhea, dizziness, nausea, pruritus, vomiting
- **Rare** Flushing, night sweats
- **Frequency not known** Bleeding disorders

**PREGNANCY**

Manufacturer advises avoid unless absolutely necessary. There is limited information available on the short- and long-term effects of antipsychotic drugs on the breast-fed infant. Animal studies indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary.

**BREAST FEEDING**

Manufacturer advises avoid— present in milk in animal studies.

**INTERACTIONS**

- **CONTRA-INDICATIONS** CNS depression, phaeochromocytoma
- **CAUTIONS** Risk factors for stroke
- **INTERACTIONS** Appendix 1: benperidol

**CONTRA-INDICATIONS**

**Psychoses and related disorders**

06-Mar-2017

**Advice of Royal College of Psychiatrists on doses of antipsychotic drugs above BNF upper limit**

Unless otherwise stated, doses in the BNF are licensed doses—any higher dose is therefore **unlicensed**

- Consider alternative approaches including adjuvant therapy and newer or second-generation antipsychotic drugs such as clozapine.
- Bear in mind risk factors, including obesity; particular caution is indicated in older patients, especially those over 70.
- Consider potential for drug interactions—see interactions: Appendix 1 (antipsychotics).
- Carry out ECG to exclude untoward abnormalities such as prolonged QT interval; repeat ECG periodically and reduce dose if prolonged QT interval or other adverse cardiac abnormality develops.
- Increase dose slowly and not more often than once weekly.
- Carry out regular pulse, blood pressure, and temperature checks; ensure that patient maintains adequate fluid intake.
- Consider high-dose therapy to be for limited period and review regularly; abandon if no improvement after 3 months (return to standard dosage).

**Important:** When prescribing an antipsychotic for administration on an emergency basis, the intramuscular dose should be **lower** than the corresponding oral dose (owing to absence of first-pass effect), particularly if the patient is very active (increased blood flow to muscle considerably increases the rate of absorption). The prescription should specify the dose for each route and should **not** imply that the same dose can be given by mouth or by intramuscular injection. The dose of antipsychotic for emergency use should be reviewed at least **daily**.

**Antipsychotic drugs**

Antipsychotic drugs are also known as 'neuroleptics' and (misleadingly) as 'major tranquillisers'. In the short term they are used to calm disturbed patients whatever the underlying psychopathology, which may be schizophrenia, brain damage, mania, toxic delirium, or agitated depression. Antipsychotic drugs are used to alleviate severe anxiety but this too should be a short-term measure.

**Schizophrenia**

The aim of treatment is to alleviate the suffering of the patient (and carer) and to improve social and cognitive functioning. Many patients require life-long treatment with antipsychotic medication. Antipsychotic drugs relieve positive psychotic symptoms such as thought disorder, hallucinations, and delusions, and prevent relapse; they are usually less effective on negative symptoms such as apathy and social withdrawal. In many patients, negative symptoms persist between episodes of treated positive symptoms, but earlier treatment of psychotic illness may protect against the development of negative symptoms over time. Patients with acute schizophrenia generally respond better than those with chronic symptoms.

Long-term treatment of a patient with a definitive diagnosis of schizophrenia is usually required after the first episode of illness in order to prevent relapses. Doses that are effective in acute episodes should generally be continued as prophylaxis.

First-generation antipsychotic drugs

The first-generation antipsychotic drugs act predominantly by blocking dopamine D₂ receptors in the brain. First-generation antipsychotic drugs are not selective for any of the four dopamine pathways in the brain and so can cause a range of side-effects, particularly extrapyramidal symptoms and elevated prolactin. The phenothiazine derivatives can be divided into 3 main groups:

- **Group 1:** chlorpromazine hydrochloride p. 367, levomepromazine p. 419, and promazine hydrochloride p. 386, generally characterised by pronounced sedative effects and moderate antimuscarinic and extrapyramidal side-effects.
- **Group 2:** pericyazine p. 370, generally characterised by moderate sedative effects, but fewer extrapyramidal side-effects than groups 1 or 3.
- **Group 3:** flufenazine decanoate p. 374, perphenazine p. 370, prochlorperazine p. 371, and trifluoperazine p. 372, generally characterised by fewer sedative and antimuscarinic effects, but more pronounced extrapyramidal side-effects than groups 1 and 2.

**Butyrophenones** (benperidol p. 363 and haloperidol p. 368) resemble the group 3 phenothiazines in their clinical properties. Thioxanthenes (flupentixol p. 368 and zuclopenthixol p. 373) have moderate sedative, antimuscarinic effects, and extrapyramidal effects.

**Diphenylbutyloperidines** (pimozide p. 371) and the substituted benzamides (sulpiride p. 372) have reduced sedative, antimuscarinic, and extrapyramidal effects.

**Second-generation antipsychotic drugs**

The second-generation antipsychotic drugs (sometimes referred to as atypical antipsychotic drugs) act on a range of receptors in comparison to first-generation antipsychotic drugs and have more distinct clinical profiles, particularly with regard to side-effects.

**Prescribing for the elderly**

The balance of risks and benefit should be considered before prescribing antipsychotic drugs for elderly patients. In elderly patients with dementia, antipsychotic drugs are associated with a small increased risk of mortality and an increased risk of stroke or transient ischaemic attack (see *Dementia* p. 287). Furthermore, elderly patients are particularly susceptible to postural hypotension and to hyper- and hypothermia in hot or cold weather. It is recommended that:

- Antipsychotic drugs should not be used in elderly patients to treat mild to moderate psychotic symptoms.
- Initial doses of antipsychotic drugs in elderly patients should be reduced (to half the adult dose or less), taking into account factors such as the patient’s weight, comorbidity, and concomitant medication.
- Treatment should be reviewed regularly.

**Prescribing of antipsychotic drugs in patients with learning disabilities**

When prescribing for patients with learning disabilities who are prescribed antipsychotic drugs and who are not experiencing psychotic symptoms, the following considerations should be taken into account:

- a reduction in dose or the discontinuation of long-term antipsychotic treatment;
- review of the patient’s condition after dose reduction or discontinuation of an antipsychotic drug;
- referral to a psychiatrist experienced in working with patients who have learning disabilities and mental health problems;
- annual documentation of the reasons for continuing a prescription if the antipsychotic is not reduced in dose or discontinued.

*BNF 74* Nervous system

---

downloaded from www.medicalbr.com
Side effects of antipsychotic drugs

Side-effects caused by antipsychotic drugs are common and contribute significantly to non-adherence to therapy.

**Extrapyramidal symptoms**

Extrapyramidal symptoms occur most frequently with the piperazine phenothiazines (fluphenazine, perphenazine, prochlorperazine, and trifluoperazine), the butyrophenones (benperidol and haloperidol), and the first-generation depot preparations. They are easy to recognise but cannot be predicted accurately because they depend on the dose, the type of drug, and on individual susceptibility.

Extrapyramidal symptoms consist of:
- **parkinsonian symptoms** (including tremor), which may occur more commonly in adults or the elderly and may appear gradually;
- **dystonia** (abnormal face and body movements) and **dyskinesia**, which occur more commonly in children or young adults and appear after only a few doses;
- **akathisia** (restlessness), which characteristically occurs after large initial doses and may resemble an exacerbation of the condition being treated;
- **tardive dyskinesia** (rhythmic, involuntary movements of tongue, face, and jaw), which usually develops on long-term therapy or with high dosage, but it may develop on short-term treatment with low doses—short-lived tardive dyskinesia may occur after withdrawal of the drug.

**Parkinsonian symptoms** remit if the drug is withdrawn and may be suppressed by the administration of antimuscarinic drugs. However, routine administration of such drugs is not justified because not all patients are affected and they may mask or worsen tardive dyskinesia.

**Tardive dyskinesia** is the most serious manifestation of extrapyramidal symptoms; it is of particular concern because it may be irreversible on withdrawing therapy and treatment is usually ineffective. In children, tardive dyskinesia is more likely to occur when the antipsychotic drug is withdrawn. However, some manufacturers suggest that drug withdrawal at the earliest signs of tardive dyskinesia (fine vermicular movements of the tongue) may halt its full development. Tardive dyskinesia occurs fairly frequently, especially in the elderly, and treatment must be carefully and regularly reviewed.

**Hyperprolactinaemia**

Most antipsychotic drugs, both first- and second-generation, increase prolactin concentration to some extent because dopamine inhibits prolactin release. Aripiprazole reduces prolactin because it is a dopamine-receptor partial agonist. Risperidone, amisulpride, and first-generation antipsychotic drugs are most likely to cause symptomatic hyperprolactinaemia. The clinical symptoms of hyperprolactinaemia include sexual dysfunction, reduced bone mineral density, menstrual disturbances, breast enlargement, and galactorrhea.

**Sexual dysfunction**

Sexual dysfunction is one of the main causes of non-adherence to antipsychotic medication; physical illness, psychiatric illness, and substance misuse are contributing factors. Antipsychotic-induced sexual dysfunction is caused by more than one mechanism. Reduced dopamine transmission and hyperprolactinaemia decrease libido; antimuscarinic effects can cause disorders of arousal; and alpha2-adrenoceptor antagonists are associated with erection and ejaculation problems in men. Risperidone and haloperidol commonly cause sexual dysfunction. If sexual dysfunction is thought to be antipsychotic-induced, dose reduction or switching medication should be considered.

**Cardiovascular side-effects**

Antipsychotic drugs have been associated with cardiovascular side-effects such as tachycardia, arrhythmias, and hypotension. QT-interval prolongation is a particular concern with pimozide and haloperidol. There is also a higher probability of QT-interval prolongation in patients using any intravenous antipsychotic drug, or any antipsychotic drug or combination of antipsychotic drugs with doses exceeding the recommended maximum. Cases of sudden death have occurred.

**Hyperglycaemia and weight gain**

Hyperglycaemia, and sometimes diabetes, can occur with antipsychotic drugs, particularly clozapine, olanzapine, quetiapine, and risperidone. All antipsychotic drugs may cause weight gain, but the risk and extent varies. Clozapine and olanzapine commonly cause weight gain.

**Hypotension and interference with temperature regulation**

Hypotension and interference with temperature regulation are dose-related side-effects that are liable to cause dangerous falls and hypothermia or hyperthermia in the elderly. Clozapine, chlorpromazine, lurasidone, and quetiapine can cause postural hypotension (especially during initial dose titration) which may be associated with syncope or reflex tachycardia in some patients.

**Neuroleptic malignant syndrome**

Neuroleptic malignant syndrome (hyperthermia, fluctuating level of consciousness, muscle rigidity, and autonomic dysfunction with pallor, tachycardia, labile blood pressure, sweating, and urinary incontinence) is a rare but potentially fatal side-effect of all antipsychotic drugs. Discontinuation of the antipsychotic drug is essential because there is no proven effective treatment, but bromocriptine and dantrolene have been used. The syndrome, which usually lasts for 5–7 days after drug discontinuation, may be unduly prolonged if depot preparations have been used.

**Blood dyscrasias**

Perform blood counts if unexplained infection or fever develops.

**Choice**

There is little meaningful difference in efficacy between each of the antipsychotic drugs (other than clozapine p. 377), and response and tolerability to each antipsychotic drug varies. There is no first-line antipsychotic drug which is suitable for all patients. Choice of antipsychotic medication is influenced by the patient’s medication history, the degree of sedation required (although tolerance to this usually develops), and consideration of individual patient factors such as risk of extrapyramidal side-effects, weight gain, impaired glucose tolerance, QT-interval prolongation, or the presence of negative symptoms.

**Negative symptoms**

Second generation antipsychotic drugs may be better at treating the negative symptoms of schizophrenia.

**Extrapyramidal side-effects**

Second-generation antipsychotic drugs should be prescribed if extrapyramidal side-effects are a particular concern. Of these, aripiprazole p. 376, clozapine, olanzapine p. 379, and quetiapine p. 382 are least likely to cause extrapyramidal side-effects. Although amisulpride p. 376 is a dopamine-receptor antagonist, extrapyramidal side-effects are less common than with the first-generation antipsychotic drugs because amisulpride selectively blocks mesolimbic dopamine receptors, and extrapyramidal symptoms are caused by blockade of the striatal dopamine pathway.

**QT interval**

Aripiprazole has negligible effect on the QT interval. Other antipsychotic drugs with a reduced tendency to prolong QT interval include amisulpride, clozapine, flupentixol p. 368, fluphenazine decanoate p. 374, olanzapine, perphenazine p. 370, prochlorperazine p. 371, risperidone p. 383, and sulpiride p. 372.

**Diabetes**

Schizophrenia is associated with insulin resistance and diabetes; the risk of diabetes is increased in patients with schizophrenia who take antipsychotic drugs. First-

### Sexual dysfunction and prolactin

The antipsychotic drugs with the lowest risk of sexual dysfunction are aripiprazole and quetiapine. Olanzapine may be considered if sexual dysfunction is judged to be secondary to hyperprolactinaemia. Hyperprolactinaemia is usually not clinically significant with aripiprazole, clozapine, olanzapine, and quetiapine treatment. When changing from other antipsychotic drugs, a reduction in prolactin concentration may increase fertility.

Patients should receive an antipsychotic drug for 4–6 weeks before it is deemed ineffective. Prescribing more than one antipsychotic drug at a time should be avoided except in exceptional circumstances (e.g. clozapine augmentation or when changing medication during titration) because of the increased risk of adverse effects such as extrapyramidal symptoms, QT-interval prolongation, and sudden cardiac death.

Clozapine is licensed for the treatment of schizophrenia in patients unresponsive to, or intolerant of, other antipsychotic drugs. Clozapine should be introduced if schizophrenia is not controlled despite the sequential use of two or more antipsychotic drugs (one of which should be a second-generation antipsychotic drug), each for at least 6–8 weeks. If symptoms do not respond adequately to an optimised dose of clozapine, plasma-clozapine concentration should be checked before adding a second antipsychotic drug to augment clozapine; allow 8–10 weeks’ treatment to assess response. Patients must be registered with a clozapine patient monitoring service.

### Monitoring

Full blood count, urea and electrolytes, and liver function test monitoring is required at the start of therapy with antipsychotic drugs, and then annually thereafter.

Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly.

Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly.

Before initiating antipsychotic drugs, an ECG may be required, particularly if physical examination identifies cardiovascular risk factors, if there is a personal history of cardiovascular disease, or if the patient is being admitted as an inpatient.

Blood pressure monitoring is advised before starting therapy and frequently during dose titration of antipsychotic drugs.

### Other uses

Some antipsychotic drugs can be used for the treatment of nausea and vomiting, choreas, and motor tics. Chlorpromazine hydrochloride p. 367 and haloperidol p. 368 can be used for intractable hiccup. Benperidol p. 363 is used in deviant antisocial sexual behaviour but its value is not established.

Psychomotor agitation should be investigated for an underlying cause; it can be managed with low doses of chlorpromazine hydrochloride or haloperidol used for short periods. Antipsychotic drugs can be used with caution for the short-term treatment of severe agitation and restlessness in the elderly.

### Equivalent doses of oral antipsychotics

These equivalences are intended only as an approximate guide; individual dosage instructions should also be checked; patients should be carefully monitored after any change in medication. Equivalent daily dose of antipsychotic drug:

- Chlorpromazine 100 mg
- Clozapine 50 mg
- Haloperidol 2–3 mg
- Pimozide 2 mg
- Risperidone 0.5–1 mg
- Sulpiride 200 mg
- Trifluoperazine 5 mg

**Important:** These equivalences must not be extrapolated beyond the maximum dose for the drug. Higher doses require careful titration in specialist units and the equivalences shown here may not be appropriate.

### Dosage

After an initial period of stabilisation, in most patients, the total daily oral dose can be given as a single dose. The Royal College of Psychiatrists has published advice on doses of antipsychotic drugs above BNF upper limit.

### Antipsychotic depot injections

Long-acting depot injections are used for maintenance therapy especially when compliance with oral treatment is unreliable. However, depot injections of conventional antipsychotics may give rise to a higher incidence of extrapyramidal reactions than oral preparations; extrapyramidal reactions occur less frequently with second-generation antipsychotic depot preparations, such as risperidone p. 383 and olanzapine embonate p. 384.

### Choice

There is no clear-cut division in the use of the conventional antipsychotics, but zuclopenthixol p. 373 may be suitable for the treatment of agitated or aggressive patients whereas flupentixol decanoate p. 373 can cause over-excitement in such patients. Zuclopenthixol decanoate p. 375 may be more effective in preventing relapses than other conventional antipsychotic depot preparations. The incidence of extrapyramidal reactions is similar for the conventional antipsychotics.

### Dosage

Individual responses to neuroleptic drugs are variable and to achieve optimum effect, dosage and dosage interval must be titrated according to the patient’s response.

### Equivalent doses of depot antipsychotics

<table>
<thead>
<tr>
<th>Antipsychotic drug/interval</th>
<th>Dosage (mg)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flupentixol decanoate / 2 weeks</td>
<td>40</td>
</tr>
<tr>
<td>Fluphenazine decanoate / 2 weeks</td>
<td>25</td>
</tr>
<tr>
<td>Haloperidol (as decanoate) / 4 weeks</td>
<td>100</td>
</tr>
<tr>
<td>Zuclopenthixol decanoate / 2 weeks</td>
<td>200</td>
</tr>
</tbody>
</table>

**Important:** These equivalences must not be extrapolated beyond the maximum dose for the drug.

These equivalences are intended only as an approximate guide; individual dosage instructions should also be checked; patients should be carefully monitored after any change in medication.

### Antipsychotics

**CAUTIONS** Blood dyscrasias · cardiovascular disease · conditions predisposing to seizures · depression · diabetes (may raise blood glucose) · epilepsy · history of jaundice · myasthenia gravis · Parkinson’s disease (may be exacerbated)(in adults) · photosensitisation (may occur with higher dosages) · prostatic hypertrophy (in adults) ·

---

*BNF 74* Mental health disorders

---

*downloaded from [www.medicalbr.com](http://www.medicalbr.com)*
Patients with schizophrenia should have physical health monitoring at the start of therapy, at 6 months, and then yearly. Patients taking antipsychotic drugs not normally associated with symptomatic hyperprolactinaemia should be considered for prolactin monitoring if they show symptoms of hyperprolactinaemia (such as breast enlargement and galactorrhoea).

Patients with schizophrenia should have physical health monitoring (including cardiovascular disease risk assessment) at least once per year.

In children Regular clinical monitoring of endocrine function should be considered when children are taking an antipsychotic drug known to increase prolactin levels; this includes measuring weight and height, assessing sexual maturation, and monitoring menstrual function.

TREATMENT CESSION There is a high risk of relapse if medication is stopped after 1–2 years. Withdrawal of antipsychotic drugs after long-term therapy should always be gradual and closely monitored to avoid the risk of acute withdrawal syndromes or rapid relapse. Patients should be monitored for 2 years after withdrawal of antipsychotic medication for signs and symptoms of relapse.

PATIENT AND CARER ADVICE As photosensitisation may occur with higher dosages, patients should avoid direct sunlight.

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced.

Antipsychotics, First-generation

Chlorpromazine hydrochloride

INDICATIONS AND DOSE

Schizophrenia and other psychoses | Mania | Short-term adjunctive management of severe anxiety | Psychomotor agitation, excitement, and violent or dangerously impulsive behaviour

BY MOUTH

Adult: Initially 25 mg 3 times a day, adjusted according to response, alternatively initially 75 mg once daily, adjusted according to response, dose to be taken at night; maintenance 75–300 mg daily, increased if necessary up to 1 g daily, this dose may be required in psychoses; use a third to half adult dose in the elderly or debilitated patients

BY RECTUM

Adult: 100 mg every 6–8 hours, dose expressed as chlorpromazine base

Intractable hiccup

BY MOUTH

Adult: 25–50 mg 3–4 times a day

Relief of acute symptoms of psychoses (under expert supervision)

BY DEEP INTRAMUSCULAR INJECTION

Adult: 25–50 mg every 6–8 hours

Nausea and vomiting of terminal illness (where other drugs have failed or are not available)

BY MOUTH

Child 1–5 years: 500 micrograms/kg every 4–6 hours; maximum 40 mg per day

Child 6–11 years: 500 micrograms/kg every 4–6 hours; maximum 75 mg per day

Child 12–17 years: 10–25 mg every 4–6 hours

Adult: 10–25 mg every 4–6 hours

BY DEEP INTRAMUSCULAR INJECTION

Child 1–5 years: 500 micrograms/kg every 6–8 hours; maximum 40 mg per day

Child 6–11 years: 500 micrograms/kg every 6–8 hours; maximum 75 mg per day

Child 12–17 years: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops

Adult: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops

BY RECTUM

Adult: 100 mg every 6–8 hours

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose adjustment may be necessary if smoking started or stopped during treatment.

DOSE EQUIVALENCE AND CONVERSION

For equivalent therapeutic effect 100 mg chlorpromazine base given rectally as a suppository = 20–25 mg chlorpromazine hydrochloride by intramuscular injection = 40–50 mg of chlorpromazine base or hydrochloride given by mouth.
RENAL IMPAIRMENT
Start with small doses in severe renal impairment because of increased cerebral sensitivity.

HANDLING AND STORAGE
Owing to the risk of contact sensitisation, pharmacists, nurses, and other health workers should avoid direct contact with chlorpromazine; tablets should not be crushed and solutions should be handled with care.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, suppository.

Table
CAUTIONARY AND ADVISORY LABELS 2, 11
- Chlorpromazine hydrochloride (Non-proprietary)
  Chlorpromazine hydrochloride 25 mg Chlorpromazine 25 mg tablets | 28 tablet [PO] £4.92 DT price = £1.70
  Chlorpromazine hydrochloride 50 mg Chlorpromazine 50 mg tablets | 28 tablet [PO] £5.28 DT price = £1.74
  Chlorpromazine hydrochloride 100 mg Chlorpromazine 100 mg tablets | 28 tablet [PO] £5.70 DT price = £1.78

Solution for injection
- Largactil (Sanofi)
  Chlorpromazine hydrochloride 25 mg per 1 ml Largactil 50 mg/2 ml solution for injection ampoules | 10 ampoule [PO] £7.51

Oral solution
CAUTIONARY AND ADVISORY LABELS 2, 11
- Chlorpromazine hydrochloride (Non-proprietary)
  Chlorpromazine hydrochloride 5 mg per 1 ml Chlorpromazine 25 mg/5 ml syrup | 150 ml [PO] £2.35 DT price = £2.35
  Chlorpromazine 25 mg/5 ml oral solution sugar free sugar-free | 150 ml [PO] £2.35 DT price = £2.35
  Chlorpromazine 25 mg/5 ml oral solution | 150 ml [PO] £2.35 DT price = £2.35
  Chlorpromazine hydrochloride 20 mg per 1 ml Chlorpromazine 100 mg/5 ml oral solution | 150 ml [PO] £5.50 DT price = £5.50

Flupentixol
(Flupenthixol)

INDICATIONS AND DOSE
Schizophrenia and other psychoses, particularly with apathy and withdrawal but not mania or psychomotor hyperactivity
- BY MOUTH
  - Adult: Initially 3–9 mg twice daily, adjusted according to response, for debilitated patients, use elderly dose; maximum 18 mg per day
  - Elderly: Initially 0.75–4.5 mg twice daily, adjusted according to response

Depressive illness
- BY MOUTH
  - Adult: Initially 1 mg once daily, dose to be taken in the morning, increased if necessary to 2 mg after 1 week, doses above 2 mg to be given in divided doses, last dose to be taken before 4 pm; discontinue if no response after 1 week at maximum dosage; maximum 3 mg per day
  - Elderly: Initially 500 micrograms daily, dose to be taken in the morning, then increased if necessary to 1 mg after 1 week, doses above 1 mg to be given in divided doses, last dose to be taken before 4 pm; discontinue if no response after 1 week at maximum dosage; maximum 1.5 mg per day

CONTRA-INDICATIONS
Circulatory collapse · CNS depression · comatose states · excitable patients · impaired consciousness · overactive patients · phaeochromocytoma

CAUTIONS
Acute porphyrias p. 969 · cardiac disorders · cardiovascular disease · cerebral arteriosclerosis · elderly · parkinsonism · QT-interval prolongation · senile confusional states

INTERACTIONS
Appendix 1: flupentixol

SIDE-EFFECTS
Asthenia · dyspnoea · hypersalivation · myalgia · sudden death · tarsode pointes
SIDE-EFFECTS, FURTHER INFORMATION
Less sedating but extrapyramidal symptoms frequent.

PREGNANCY
Avoid unless potential benefit outweighs risk.

BREAST FEEDING
Present in breast milk—avoid.

HEPATIC IMPAIRMENT
Can precipitate coma. Consider serum-flupentixol concentration monitoring in hepatic impairment.

RENAL IMPAIRMENT
Start with small doses of antipsychotic drugs in severe renal impairment because of increased cerebral sensitivity. Manufacturer advises caution in renal failure.

PATIENT AND CARER ADVICE
Although drowsiness may occur, can also have an alerting effect so should not be taken in the evening.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Table
CAUTIONARY AND ADVISORY LABELS 2
- Depixol (Flupentixol dihydrochloride) (Lundbeck Ltd)
  Flupentixol (as Flupentixol dihydrochloride) 3 mg Depixol 3 mg tablets | 100 tablet [PO] £13.92 DT price = £13.92
  Flupentixol (as Flupentixol dihydrochloride) 500 microgram Fluanxol 500 microgram tablets | 60 tablet [PO] £2.88 DT price = £2.88
  Flupentixol (as Flupentixol dihydrochloride) 1 mg Fluanxol 1 mg tablets | 60 tablet [PO] £4.86 DT price = £4.86

Haloperidol

INDICATIONS AND DOSE
Nausea and vomiting
- BY INTRAMUSCULAR INJECTION
  - Adult: 1–2 mg

Nausea and vomiting in palliative care
- BY MOUTH
  - Adult: Initially 1.5 mg 1–2 times a day, increased if necessary to 5–10 mg daily in divided doses
  - BY CONTINUOUS SUBCUTANEOUS INFUSION
  - Adult: 5–15 mg, to be administered over 24 hours
  - BY SUBCUTANEOUS INFUSION
  - Adult: 2.5–10 mg/24 hours
Schizophrenia | Psychoses | Mania and hypomania | Organic brain damage (depending on symptoms)

- **BY MOUTH**
